   If $x\in\bigcup_{j\in J} B_{\beta(j)_1,\beta(j)_2}$ then $\exists j\in J$ such that $x\in B_{\beta(j)_1,\beta(j)_2}$ which as $\beta(j)\in\bigcup_{i\in I}\{i\}\times I_i$ proves that $x\in\bigcup_{\sigma\in\bigcup_{i\in I}\{i\}\times I_i} B_{\sigma_1,\sigma_2}$. Hence $\bigcup_{j\in J} B_{\beta(j)_1,\beta(j)_2}\subseteq\bigcup_{\sigma\in\bigcup_{i\in I}\{i\}\times I_i} B_{\sigma_1,\sigma_2}$ which combined with [eq: 20.61] results in

$$\bigcup_{\sigma\in\bigcup_{i\in I}\{i\}\times I_i} B_{\sigma_1,\sigma_2}=\bigcup_{j\in J} B_{\beta(j)_1,\beta(j)_2} \tag{20.62}$$

   Substituting the above in [eq: 20.60] proves finally that

$$\bigcup_{i\in I} A_i = \bigcup_{i\in I}\left(\bigcup_{j\in I_i} B_{i,j}\right) = \bigcup_{j\in J} B_{\beta(j)_1,\beta(j)_2}$$

2. Assume that additional $\{A_i\}_{i\in I}$ is pairwise disjoint and $\forall i\in I$ $\{B_{i,j}\}_{j\in I_i}$ is pairwise disjoint then by [theorem: 20.118]

$$\{B_{\sigma_1,\sigma_2}\}_{\sigma\in\bigcup_{i\in I}\{i\}\times I_i} \text{ pairwise disjoint} \tag{20.63}$$

Let $i,j\in J$ with $i\neq j$ then as β is injective we have $\beta(i)\neq\beta(j)$ hence we have by the above $B_{\beta(i)_1,\beta(j)_2}=\varnothing$ proving that

$$\{B_{\beta(i)_1,\beta(i)_2}\}_{i\in J} \text{ is pairwise disjoint}$$ □

Definition 20.120. (Monotone set function) *Let X be a set, $\mathcal{A}\subseteq\mathcal{P}(X)$ then a set function $\mu:\mathcal{A}\to[0,\infty]$ is **monotone** if $\forall A,B\in\mathcal{A}$ then $\mu(A)\leqslant\mu(B)$.*

Definition 20.121. (Additive set function) *Let X be a set, $\mathcal{A}\subseteq\mathcal{P}(X)$ then a set function $\mu:\mathcal{A}\to[0,\infty]$ is **finite additive on $\mathcal{A}$** if $\forall\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{A}$, $n\in\mathbb{N}$ pairwise disjoint with $\bigcup_{i\in\{1,\dots,n\}}A_i\in\mathcal{A}$ we have*

$$\mu\left(\bigcup_{i\in\{1,\dots,n\}}A_i\right)=\sum_{i=1}^{n}\mu(A_i)$$

Definition 20.122. (Sub-additive set function) *Let X be a set, $\mathcal{A}\subseteq\mathcal{P}(X)$ then a set function μ: $\mathcal{A}\to[0,\infty]$ is sub-additive if $\forall\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{A}$ with $\bigcup_{i\in\{1,\dots,n\}}A_i\in\mathcal{A}$ we have*

$$\mu\left(\bigcup_{i\in\{1,\dots,n\}}A\right)\leqslant\sum_{i=1}^{n}\mu(A_i)$$

Definition 20.123. (Countable additive set function) *Let X be a set, $\mathcal{A}\subseteq\mathcal{P}(X)$ then a set function μ: $\mathcal{A}\to[0,\infty]$ is **countable additve on $\mathcal{A}$** if $\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$, $n\in\mathbb{N}$ pairwise disjoint with $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}$ we have*

$$\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)=\sum_{i=1}^{\infty}\mu(A_i)$$

Definition 20.124. (Countable sub-additive set function) *Let X be a set, $\mathcal{A}\subseteq\mathcal{P}(X)$ then a set function $\mu:\mathcal{A}\to[0,\infty]$ is countable sub-additive if $\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ with $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}$ we have*

$$\mu\left(\bigcup_{i\in\mathbb{N}}A\right)\leqslant\sum_{i=1}^{\infty}\mu(A_i)$$

Countable sets are either finite or denumerable,, $n\in\mathbb{N}$ so you can ask yourselve why we talk about countable additivity instead of denumerable additivity [because $\mathbb{N}$ is denumerable]. However the next theorem shows that countable additivity implies finite additivity justifying the use of the term countable additivity.

Theorem 20.125. *Let X be a set, $\mathcal{A}\subseteq\mathcal{P}(X)$ such that $\varnothing\in\mathcal{A}$ and $\mu:\mathcal{A}\to[0,\infty]$ a countable additive set function on $\mathcal{A}$ satisfying $\mu(\varnothing)=0$ is finite additive on $\mathcal{A}$.*

Note 20.126. The requirement that $\varnothing\in\mathcal{A}$ and $\mu(\varnothing)=0$ is essential for the proof to work.

Proof. Let $n\in\mathbb{N}$, $\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{A}$ be a pairwise disjoint finite family such that $\bigcup_{i\in\{1,\dots,n\}}A_i\in\mathcal{A}$. Define

$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A} \text{ by } B_i=\begin{cases}A_i \text{ if } i\in\{1,\dots,n\}\\ \varnothing \text{ if } i\in\{n+1,\dots,\infty\}\end{cases}\underset{\varnothing,A_i\in\mathcal{A}}{\in}\mathcal{A}$$

Let $x\in\bigcup_{i\in\mathbb{N}}B_i$ then there exist a $i\in\mathbb{N}$ such that $x\in B_i$. Assume that $i\in\{n+1,\dots,\infty\}$ then $x\in B_i=\varnothing$ a contradiction so we must have that $i\in\{1,\dots,n\}$. Hence $x\in B_i=A_i$ proving that $x\in\bigcup_{i\in\{1,\dots,n\}}A_i$, so

$$\bigcup_{i\in\mathbb{N}}B_i\subseteq\bigcup_{i\in\{1,\dots,n\}}A_i \tag{20.64}$$

Further if $x \in \bigcup_{i\in\{1,\ldots,n\}} A_i$ then there exist a $i \in \{1,\ldots,n\}$ such that $x \in A_i = B_i$ so that $x \in \bigcup_{i\in\mathbb{N}} B_i$ proving that $\bigcup_{i\in\{1,\ldots,n\}} A_i \subseteq \bigcup_{i\in\{1,\ldots,n\}} B_i$. Combining this with [eq: 20.64] proves that

$$\bigcup_{i\in\mathbb{N}} B_i = \bigcup_{i\in\{1,\ldots,n\}} A_i \in \mathcal{A} \tag{20.65}$$

Let $i, j \in \mathbb{N}$ with $i \neq j$ then we have the following possible cases:

$\boldsymbol{i \in \{1,\ldots,n\} \wedge j \in \{1,\ldots,n\}}$. Then $B_i \bigcap B_j = A_i \bigcap A_j \underset{i\neq j}{=} \varnothing$

$\boldsymbol{i \in \{n+1,\ldots,\infty\} \wedge j \in \{1,\ldots,n\}}$. Then $B_i \bigcap B_j = \varnothing \bigcap A_j = \varnothing$

$\boldsymbol{i \in \{1,\ldots,n\} \wedge j \in \{n+1,\ldots,\infty\}}$. Then $B_i \bigcap B_j = A_i \bigcap \varnothing = \varnothing$

$\boldsymbol{i \in \{n+1,\ldots,\infty\} \wedge j \in \{n+1,\ldots,\infty\}}$. Then $B_i \bigcap B_j = \varnothing \bigcap \varnothing = \varnothing$

Hence we conclude that

$$\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ is pairwise disjoint} \tag{20.66}$$

As by [eq: 20.65] $\bigcup_{i\in\mathbb{N}} B_i \in \mathcal{A}$ we have by the above and the countable additivity of μ that

$$\mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) = \sum_{i=1}^{\infty} \mu(B_i) \tag{20.67}$$

Next we have

$$\begin{aligned}
\mu\left(\bigcup_{i\in\{1,\ldots,n\}} A_i\right) &\underset{\text{[eq: 20.65]}}{=} \mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) \\
&\underset{\text{[eq: 20.67]}}{=} \sum_{i=1}^{\infty} \mu(B_i) \\
&\underset{\text{[theorem: 20.97]}}{=} \sum_{i=1}^{n} \mu(B_i) + \sum_{i=n+1}^{\infty} \mu(B_i) \\
&= \sum_{i=1}^{n} \mu(A_i) + \sum_{i=n+1}^{\infty} \mu(\varnothing) \\
&\underset{\mu(\varnothing)=0\wedge\text{[theorem: 20.94]}}{=} \sum_{i=1}^{n} \mu(A_i)
\end{aligned}$$

Hence $\forall \{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{A}$, $n \in \mathbb{N}$ pairwise disjoint we have $\mu\left(\bigcup_{i\in\{1,\ldots,n\}} A_i\right) = \sum_{i=1}^{n} \mu(A_i)$ proving that μ is finite additive on $\mathcal{A}$. □

Theorem 20.127. *Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ such that $\varnothing \in \mathcal{A}$ and $\mu: \mathcal{A} \to [0,\infty]$ a countable sub-additive function then μ is sub-additivity.*

Proof. Let $n \in \mathbb{N}$, $\{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{A}$ be a finite family such that $\bigcup_{i\in\{1,\ldots,n\}} A_i \in \mathcal{A}$. Define

$$\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \begin{cases} A_i \text{ if } i \in \{1,\ldots,n\} \\ \varnothing \text{ if } i \in \{n+1,\ldots,\infty\} \end{cases} \underset{\varnothing, A_i \in \mathcal{A}}{\in} \mathcal{A}$$

Let $x \in \bigcup_{i\in\mathbb{N}} B_i$ then there exist a $i \in \mathbb{N}$ such that $x \in B_i$. Assume that $i \in \{n+1,\ldots,\infty\}$ then $x \in B_i = \varnothing$ a contradiction so we must have that $i \in \{1,\ldots,n\}$. Hence $x \in B_i = A_i$ proving that $x \in \bigcup_{i\in\{1,\ldots,n\}} A_i$, so

$$\bigcup_{i\in\mathbb{N}} B_i \subseteq \bigcup_{i\in\{1,\ldots,n\}} A_i \tag{20.68}$$

Further if $x \in \bigcup_{i\in\{1,\ldots,n\}} A_i$ then there exist a $i \in \{1,\ldots,n\}$ such that $x \in A_i = B_i$ so that $x \in \bigcup_{i\in\mathbb{N}} B_i$ proving that $\bigcup_{i\in\{1,\ldots,n\}} A_i \subseteq \bigcup_{i\in\{1,\ldots,n\}} B_i$. Combining this with [eq: 20.68] proves that

$$\bigcup_{i\in\mathbb{N}} B_i = \bigcup_{i\in\{1,\ldots,n\}} A_i \in \mathcal{A} \tag{20.69}$$

As $\bigcup_{i\in\mathbb{N}} B_i \in \mathcal{A}$ and μ is countable additive it follows that

$$\mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) \leqslant \sum_{i=1}^{\infty} \mu(B_i) \tag{20.70}$$

$$\begin{aligned}
\mu\left(\bigcup_{i\in\{1,\dots,n\}} A_i\right) &\underset{\text{[eq: 20.69]}}{=} \mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) \\
&\underset{\text{[eq: 20.70]}}{\leqslant} \sum_{i=1}^{\infty} \mu(B_i) \\
&\underset{\text{[theorem: 20.97]}}{=} \sum_{i=1}^{n} \mu(B_i) + \sum_{i=n+1}^{\infty} \mu(B_i) \\
&= \sum_{i=1}^{n} \mu(A_i) + \sum_{i=n+1}^{\infty} \mu(\varnothing) \\
&\underset{\mu(\varnothing)=0\wedge\text{[theorem: 20.94]}}{=} \sum_{i=1}^{n} \mu(A_i)
\end{aligned}$$

□

20.3 Rings, algebras and σ-algebras

Definition 20.128. (Ring) *Let X be a set then $\mathcal{R} \subseteq \mathcal{P}(X)$ [the set of subsets of X] is a **ring** on X if $\mathcal{R}$ satisfies:*

1. $\mathcal{R} \neq \varnothing$
2. *If $A, B \in \mathcal{R}$ then $A \bigcup B \in \mathcal{R}$ [in other words $\mathcal{R}$ is $\cup$-stable]*
3. *If $A,\ B \in \mathcal{R}$ then $A \setminus B \in \mathcal{R}$*

Rather trivial examples of rings are the following:

Example 20.129. Let X be a set then $\{\varnothing\}$ is a ring on X

Proof.

1. As $\varnothing \in \{\varnothing\}$ we have that $\{\varnothing\} \neq \varnothing$
2. If $A, B \in \{\varnothing\}$ then $A = B = \varnothing$ so that $A \bigcup B = \varnothing \in \{\varnothing\}$
3. If If $A, B \in \{\varnothing\}$ then $A = B = \varnothing$ so that $A \setminus B = \varnothing \setminus \varnothing = \varnothing \in \{\varnothing\}$ □

Example 20.130. Let X be a set then $\mathcal{P}(X)$ is a ring on X

Proof. As $X \subseteq X$ $X \in \mathcal{P}(X)$ so that

$$\mathcal{P}(X) \neq \varnothing$$

If $A, B \in \mathcal{P}(X)$ then $A, B \subseteq X$ so that $A \bigcup B \subseteq X$ and $A \setminus B \subseteq X$ so that

$$A \bigcup B \in \mathcal{P}(X) \text{ and } A \setminus B \in \mathcal{P}(X)$$ □

Theorem 20.131. *Let X be a set and $\mathcal{R}$ a ring on X then we have*

1. $\varnothing \in \mathcal{R}$
2. *If $n \in \mathbb{N}$ and $\{A_i\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{R}$ a finite family of sets in $\mathcal{R}$ then $\bigcup_{i\in\{1,\dots,n\}} A_i \in \mathcal{R}$*
3. *If $A, B \in \mathcal{R}$ then $A \bigcap B \in \mathcal{R}$ [in other words $\mathcal{R}$ is $\cap$-stable]*

4. *If $n \in \mathbb{N}$ and $\{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{R}$ a finite family of sets in $\mathcal{R}$ then $\bigcap_{i \in \{1,\ldots,n\}} A_i \in \mathcal{R}$*

Proof.

1. As $\mathcal{R} \neq \varnothing$ there exist a $A \in \mathcal{R}$ so that $\varnothing = A \setminus A \in \mathcal{R}$
2. This follows from [theorem: 20.116].
3. If $A, B \in \mathcal{R}$ then $A \setminus B \in \mathcal{R}$ so that $A \setminus (A \setminus B) \in \mathcal{R}$ which as $A \setminus (A \setminus B) \underset{\text{[theorem: 1.33]}}{=} A \bigcap B$ proves that $A \bigcap B \in \mathcal{R}$.
4. This follows from [theorem: 20.116]. □

A algebra on X is a ring such that X is a element of the ring.

Definition 20.132. (Algebra) *Let X be a set then $\mathcal{A} \subseteq \mathcal{P}(X)$ is a **algebra** on X if $\mathcal{A}$ satisfies*

1. *$\mathcal{A}$ is a ring on X*
2. *$X \in \mathcal{R}$*

Example 20.133. Let $X \neq \varnothing$ be a non empty set then $\{\varnothing\}$ is a ring [see example: 20.129] but not a algebra because $X \notin \{\varnothing\}$, however $\{X, \varnothing\}$ is a algebra on X.

Proof.

1. As $X, \varnothing \in \{X, \varnothing\}$ $\{X, \varnothing\} \neq \varnothing$
2. If $A, B \in \{X, \varnothing\}$ then we have either:

   $\boldsymbol{A = X \wedge B = X}$**.** Then $A \bigcup B = X \in \{X, \varnothing\}$ and $A \setminus B = X \setminus X = \varnothing \in \{X, \varnothing\}$

   $\boldsymbol{A = \varnothing \wedge B = X}$**.** Then $A \bigcup B = X \in \{X, \varnothing\}$ and $A \setminus B = \varnothing \setminus X = \varnothing \in \{X, \varnothing\}$

   $\boldsymbol{A = X \wedge B = \varnothing}$**.** Then $A \bigcup B = X \in \{X, \varnothing\}$ and $A \setminus B = X \setminus \varnothing = X \in \{X, \varnothing\}$

   $\boldsymbol{A = \varnothing \wedge B = \varnothing}$**.** Then $A \bigcup B = \varnothing \in \{X, \varnothing\}$ and $A \setminus B = \varnothing \setminus \varnothing = \varnothing \in \{X, \varnothing\}$ □

Example 20.134. Let X be a set then $\mathcal{P}(X)$ is a ring on X

Proof. Using [example: 20.130] it follows that $\mathcal{A}$ is a ring. Further as $X \subset X$ it follows that $X \in \mathcal{P}(X)$. □

The following summarizes some trivial properties of a algebra.

Theorem 20.135. *Let X be a set and $\mathcal{A}$ a algebra on X then we have:*

1. *$\varnothing \in \mathcal{A}$*
2. *$X \in \mathcal{A}$*
3. *$\forall A, B \in \mathcal{A}$ we have that $A \bigcup B \in \mathcal{A}$, $A \bigcap B \in \mathcal{A}$ and $A \setminus B \in \mathcal{A}$*
4. *If $n \in \mathbb{N}$ and $\{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A}$ a finite family of sets in $\mathcal{A}$ then $\bigcup_{i \in \{1,\ldots,n\}} A_i \in \mathcal{A}$*
5. *If $n \in \mathbb{N}$ and $\{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A}$ a finite family of sets in $\mathcal{A}$ then $\bigcap_{i \in \{1,\ldots,n\}} A_i \in \mathcal{A}$*
6. *$\forall A \in \mathcal{A}$ we have that $X \setminus A \in \mathcal{A}$*

Proof.

1. As $\mathcal{A}$ is a ring this follows from [theorem: 20.131].
2. This is stated in the definition of a algebra.
3. As $\mathcal{A}$ is a ring this follows from [theorem: 20.131] and the definition of a ring.
4. As $\mathcal{A}$ is a ring this follows from [theorem: 20.131].
5. As $\mathcal{A}$ is a ring this follows from [theorem: 20.131].
6. As $X \in \mathcal{A}$ and $A \in \mathcal{A}$ we have by (3) that $X \setminus A \in \mathcal{A}$. □

In most books we have the following equivalent definitons of a algebra

Theorem 20.136. *Let X be a set and $\mathcal{A} \subseteq \mathcal{P}(X)$ then the following are equivalent:*

1. *$\mathcal{A}$ is a algebra on X*
2. *$\mathcal{A}$ satisifes:*
   a. $X \in \mathcal{A}$
   b. $\forall A \in \mathcal{A}$ *we have* $X \setminus A \in \mathcal{A}$
   c. $\forall A, B \in \mathcal{A}$ *we have* $A \bigcap B \in \mathcal{A}$ *[in other words $\mathcal{A}$ is $\cap$-stable]*
3. *$\mathcal{A}$ satisfies:*
   a. $X \in \mathcal{A}$
   b. $\forall A \in \mathcal{A}$ *we have* $X \setminus A \in \mathcal{A}$
   c. $\forall A, B \in \mathcal{A}$ *we have* $A \bigcup B \in \mathcal{A}$ *[in other words $\mathcal{A}$ is $\cup$-stable]*
4. *$\mathcal{A}$ satisfies:*
   a. $X \in \mathcal{A}$
   b. $\forall A, B \in \mathcal{A}$ *we have* $A \setminus B \in \mathcal{A}$

Proof.

1 $\Rightarrow$ 2. If $\mathcal{A}$ is a algebra then by definition $\mathcal{A}$ is a ring and $X \in \mathcal{A}$ so that

1. $X \in \mathcal{A}$
2. $\forall A \in \mathcal{A}$ we have, as $X \in \mathcal{A}$, that $X \setminus A \in \mathcal{A}$ [by the definition of a ring].
3. $\forall A, B \in \mathcal{A}$ we have by the definition of a ring that $A \setminus B \in \mathcal{A}$.

2 $\Rightarrow$ 3. We have:

1. $X \in \mathcal{A}$ by the hypothesis.
2. $X \setminus A$ by the hypothesis.
3. Let $A, B \in \mathcal{A}$ then we have that $X \setminus A \in \mathcal{A}$ and $X \setminus B \in \mathcal{A}$ so that $(X \setminus A) \bigcap (X \setminus B) \in \mathcal{A}$, hence
$$X \setminus \big((X \setminus A) \bigcap (X \setminus B)\big) \in \mathcal{A}$$
Further we have
$$\begin{aligned} X \setminus \big((X \setminus A) \bigcap (X \setminus B)\big) &\underset{\text{[theorem: 1.31]}}{=} (X \setminus (X \setminus A)) \bigcup (X \setminus (X \setminus B)) \\ &\underset{A, B \subseteq X \wedge \text{[theorem: 1.33]}}{=} A \bigcup B \end{aligned}$$
so that $A \bigcup B \in \mathcal{A}$.

3 $\Rightarrow$ 4. We have

1. $X \in \mathcal{A}$ by the hypothesis
2. Let $A, B \in \mathcal{A}$ then $X \setminus A \in \mathcal{A}$ so that $(X \setminus A) \bigcup B \in \mathcal{A}$ hence
$$X \setminus \big((X \setminus A) \bigcup B\big) \in \mathcal{A}$$
Further we have
$$\begin{aligned} X \setminus \big((X \setminus A) \bigcup B\big) &\underset{\text{[theorem: 1.31]}}{=} (X \setminus (X \setminus A)) \bigcap (X \setminus B) \\ &\underset{A \subseteq X \wedge \text{[theorem: 1.33]}}{=} A \bigcap (X \setminus B) \\ &\underset{A, B \subseteq X \wedge \text{[theorem: 1.33]}}{=} A \setminus B \end{aligned}$$
so that $A \setminus B \in \mathcal{A}$

4 ⇒ 1. Then we have

1. $X \in \mathcal{A}$ by the hypothesis.
2. If $A, B \in \mathcal{A}$ then by the hypothesis $A \setminus B \in \mathcal{A}$ so that $A \setminus (A \setminus B) \in \mathcal{A}$, as by [theorem: 1.33] $A \setminus (A \setminus B) = A \bigcap B$ it follows that $A \bigcap B \in \mathcal{A}$ hence we have proved that

$$\forall A, B \in \mathcal{A} \text{ we have } A \bigcap B \in \mathcal{A}$$

Further if $A, B \in \mathcal{A}$ then as $X \in \mathcal{A}$ we have that $(X \setminus A), (X \setminus B) \in \mathcal{A}$ so that $(X \setminus A) \bigcap (X \setminus B) \in \mathcal{A}$, hence we have that

$$X \setminus \big((X \setminus A) \bigcap (X \setminus B)\big) \in \mathcal{A}$$

Now

$$\begin{aligned} X \setminus \big((X \setminus A) \bigcap (X \setminus B)\big) &\underset{\text{[theorem: 1.31]}}{=} (X \setminus (X \setminus A)) \bigcup (X \setminus (X \setminus B)) \\ &\underset{A, B \subseteq X \wedge \text{[theorem: 1.33]}}{=} A \bigcup B \end{aligned}$$

proving that

$$\forall A, B \in \mathcal{A} \text{ we have } A \bigcup B \in \mathcal{A}$$

So as $X \in \mathcal{A} \Rightarrow \mathcal{A} \neq \varnothing$ and $\forall A, B \in \mathcal{A}$ we have $A \bigcup B \in \mathcal{A}$ and $A \setminus B \in \mathcal{A}$ it follows that $\mathcal{A}$ is a algebra. □

We also want to deal with countable unions of sets and for this we define a sigma algebra.

Definition 20.137. *Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ then $\mathcal{A}$ is a sigma algebra [noted as σ-algebra] on X if*

1. $X \in \mathcal{A}$
2. $\forall A \in \mathcal{A}$ *we have* $X \setminus A \in \mathcal{A}$
3. *If* $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ *is a countable family of sets in* $\mathcal{A}$ *then* $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$

***Note* 20.138.** *If $A, B \in \mathcal{A}$ then if we define $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ by $A_i = \begin{cases} A & \text{if } i = 1 \\ B & \text{if } i \in \{, \ldots, \infty\} \end{cases}$ then*

$$A \bigcup B = A_1 \bigcup \left(\bigcup_{i \in \{2, \ldots, \infty\}} A_i \right) = \bigcup_{i \in \mathbb{N}} A_i$$

so that every σ-algebra on X is a algebra. So we have

$$\sigma\text{-algebra} \underset{\text{is}\,a}{\Rightarrow} \text{algebra} \underset{\text{is}\,a}{\Rightarrow} \text{ring}$$

Definition 20.139. (Measurable Space) *Let X be a non empty set and $\mathcal{A}$ a σ-algebra on X then the couple $\langle X, \mathcal{A} \rangle$ is called a* ***measurable space****.*

We have the following equivalent definitions of a σ-algebra

Theorem 20.140. *Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ then we have the following equivalences:*

1. *$\mathcal{A}$ is a σ-algebra on X*
2. *$\mathcal{A}$ is a algebra and $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$* ***pairwise disjoint*** *we have $\bigsqcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$*
3. *$\mathcal{A}$ is a algebra and $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$*
4. *$\mathcal{A}$ satisfies:*
   a. $\varnothing \in \mathcal{A}$
   b. $\forall A \in \mathcal{A}$ *we have* $X \setminus A \in \mathcal{A}$
   c. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ *we have* $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$

5. *$\mathcal{A}$ satisfies:*
   a. $\varnothing \in \mathcal{A}$
   b. $\forall A \in \mathcal{A}$ *we have* $X \setminus A \in \mathcal{A}$
   c. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ *we have* $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{A}$
6. *$\mathcal{A}$ satisfies:*
   a. $X \in \mathcal{A}$
   b. $\forall A \in \mathcal{A}$ *we have* $X \setminus A \in \mathcal{A}$
   c. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ *we have* $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{A}$

Proof.

1 ⇒ 2. As $\mathcal{A}$ is a sigma-algebra it follows that

$$\mathcal{A} \text{ is a algebra}$$

Further if $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ is pairwise disjoint then by the definition of a σ-algebra it follows that

$$\bigsqcup_{i \in \mathbb{N}} A_i \underset{\text{def}}{=} \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

2 ⇒ 3. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ and define

$$\{B_i\}_{i \in \mathbb{N}} \text{ by } B_i = \begin{cases} A_1 \text{ if } i = 1 \\ A_i \setminus \bigcup_{j \in \{1, \ldots, i-1\}} A_j \text{ if } i \in \{2, \ldots, \infty\} \end{cases}$$

As $\mathcal{A}$ is a algbra we have by [theorem: 20.135] it follows that $\forall i \in \mathbb{N}$ we have $B_i \in \mathcal{A}$ so that

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$$

Further by [lemma: 20.113] $\{B_i\}_{i \in \mathbb{N}}$ is pairwise disjoint so that by (2)

$$\bigsqcup_{i \in \mathbb{N}} B_i \in \mathcal{A}$$

As further $\bigcup_{i \in \mathbb{N}} A_i \underset{\text{[lemma: 20.113]}}{=} \bigsqcup_{i \in \mathbb{N}} B_i$ it follows that

$$\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

3 ⇒ 4. As $\mathcal{A}$ is a algebra we have by [theorem: 20.135] that

$$\varnothing \in \mathcal{A}$$

$$\forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A}$$

Finally by the definition of a σ-algebra we have

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ we have } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

4 ⇒ 5. We have by (3) that

$$\varnothing \in \mathcal{A} \text{ and } \forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A}$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$. If $i \in \mathbb{N}$ then as $A_i \in \mathcal{A}$ it follows that $X \setminus A_i \in \mathcal{A}$ we have by (3) that $\bigcup_{i \in \mathbb{N}} (X \setminus A_i) \in \mathcal{A}$ so that

$$X \setminus \left(\bigcup_{i \in \mathbb{N}} (X \setminus A_i) \right) \in \mathcal{A}$$

As

$$\begin{aligned} X \setminus \left(\bigcup_{i \in \mathbb{N}} (X \setminus A_i) \right) &\underset{\text{[theorem: 2.132]}}{=} \bigcap_{i \in \mathbb{N}} (X \setminus (X \setminus A_i)) \\ &\underset{A_i \subseteq X \wedge \text{[theorem: 1.33]}}{=} \bigcap_{i \in \mathbb{N}} A_i \end{aligned}$$

it follows that

$$\forall \{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ we have } \bigcap_{i\in\mathbb{N}} A_i \in \mathcal{A}$$

5 ⇒ 6. By (4) we have that $\varnothing \in \mathcal{A}$ so that by (4) again we have

$$X = X \setminus \varnothing \in \mathcal{A}$$

further by (4) we have

$$\forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A} \text{ and } \forall \{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ we have } \bigcap_{i\in\mathbb{N}} A_i \in \mathcal{A}$$

6 ⇒ 1. By (1) we have

$$X \in \mathcal{A} \text{ and } \forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A}$$

Further if $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ then $\forall i \in \mathbb{N}$ we have $A_i \in \mathcal{A}$ so that $X \setminus A_i \in \mathcal{A}$. Hence we have

$$X \setminus \left(\bigcap_{i\in\mathbb{N}} (X \setminus A_i) \right) \in \mathcal{A}$$

Now

$$\begin{aligned} X \setminus \left(\bigcap_{i\in\mathbb{N}} (X \setminus A_i) \right) &\underset{\text{[theorem: 2.132]}}{=} \bigcup_{i\in\mathbb{N}} (X \setminus (X \setminus A_i)) \\ &\underset{A_i \subseteq X \wedge \text{[theorem: 1.33]}}{=} \bigcup_{i\in\mathbb{N}} A_i \end{aligned}$$

so that

$$\forall \{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ we have } \bigcup_{i\in\mathbb{N}} A_i \in \mathcal{A}$$

This proves that $\mathcal{A}$ is a σ-algebra.

□

Example 20.141. Let $X \neq \varnothing$ be a set then $\{\varnothing\}$ is not a σ-algebra on X [see example: 20.129] but $\{\varnothing, X\}$ is a σ-algebra on X.

Proof. Using [example: 20.129] it follows that $\{\varnothing, X\}$ is a algebra on X so that

$$X \in \mathcal{A} \text{ and } \forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A}$$

Let $\{A_i\}_{i\in\mathbb{N}} \subseteq \{\varnothing, X\}$ then we have two cases to consider:

$\forall i \in \mathbb{N}$ we have $A_i \neq \varnothing$. Then $\forall i \in \mathbb{N}$ $A_i = X$ so that $\bigcap_{i\in\mathbb{N}} A_i = X \in \mathcal{A}$

$\exists i \in \mathbb{N}$ with $A_i = \varnothing$. Then $\bigcap_{i\in\mathbb{N}} A_i = \varnothing \in \mathcal{A}$

so that $\bigcap_{i\in\mathbb{N}} A_i \in \mathcal{A}$. Applying then [theorem: 20.140] proves that $\{\varnothing, X\}$ is a σ-algebra on X. □

Example 20.142. Let X be a set then $\mathcal{P}(X)$ is a σ-algebra on X

Proof. Using [example: 20.134] $\mathcal{P}(X)$ is a algebra on X. Further for $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{P}(X)$ we have $\forall i \in \mathbb{N}$ that $A_i \subseteq X$ so that $\bigcup_{i\in\mathbb{N}} A_i \subseteq X$ proving that $\bigcup_{i\in\mathbb{N}} A_i \in \mathcal{P}(X)$. Applying then [theorem: 20.140] proves that $\mathcal{P}(X)$ is a σ-algebra on X. □

Theorem 20.143. *Let X be a set, $\mathcal{A}$ a σ-algebra on X, I a countable set, $\{A\}_{i\in I} \subseteq \mathcal{A}$ a countable family of element of $\mathcal{A}$ then we have*

1. $\bigcup_{i\in I} A_i \in \mathcal{A}$
2. $\bigcap_{i\in I} A_i \in \mathcal{A}$

Proof.

1. For I we have either

   ***I* is finite.** Then there exist a bijection $\beta: \{1,\ldots,n\} \to I$ where $n \in \mathbb{N}_0$. Let $x \in \bigcup_{i\in I} A_i$ then there exist a $i \in I$ such that $x \in A_i$. As β is a bijection hence surjective there exist a $j \in \{1,\ldots,n\}$ such that $i = \beta(j)$ so that $x \in A_{\beta(j)} \subseteq \bigcup_{j\in\{1,\ldots,n\}} A_{\beta(j)}$. Hence we have that

   $$\bigcup_{i\in I} A_i \subseteq \bigcup_{j\in\{1,\ldots,n\}} A_{\beta(i)} \tag{20.71}$$

   Likewise if $x \in \bigcup_{j\in\{1,\ldots,n\}} A_{\beta(i)}$ then there exist a $j \in \{1,\ldots,n\}$ such that $x \in A_{\beta(j)}$ which as $\beta(j) \in I$ proves that $x \in \bigcup_{i\in I} A_i$, hence $\bigcup_{j\in\{1,\ldots,n\}} A_{\beta(i)} \subseteq \bigcup_{i\in I} A_i$. Combining this with [eq: 20.71] proves that

   $$\bigcup_{i\in I} A_i = \bigcup_{j\in\{1,\ldots,n\}} A_{\beta(i)}$$

   As $\forall j \in \{1,\ldots,n\}$ $A_{\beta(i)} \in \mathcal{A}$ [because $\beta(i) \in I$] it follows, as a σ-algebra is a ring, from [theorem: 20.131] that $\bigcup_{j\in\{1,\ldots,n\}} A_{\beta(i)} \in \mathcal{A}$. Hence

   $$\bigcup_{i\in I} A_i \in \mathcal{A}$$

   ***I* is denumerable.** Then there exist a bijection $\beta: \mathbb{N} \to I$. Let $x \in \bigcup_{i\in I} A_i$ then there exist a $i \in I$ such that $x \in A_i$. As β is a bijection hence surjective there exist a $j \in \mathbb{N}$ such that $i = \beta(j)$ so that $x \in A_{\beta(j)} \subseteq \bigcup_{j\in\mathbb{N}} A_{\beta(j)}$. Hence we have that

   $$\bigcup_{i\in I} A_i \subseteq \bigcup_{j\in\mathbb{N}} A_{\beta(i)} \tag{20.72}$$

   Likewise if $x \in \bigcup_{j\in\mathbb{N}} A_{\beta(i)}$ then there exist a $j \in \mathbb{N}$ such that $x \in A_{\beta(j)}$ which as $\beta(j) \in I$ proves that $x \in \bigcup_{i\in I} A_i$, hence $\bigcup_{j\in\mathbb{N}} A_{\beta(i)} \subseteq \bigcup_{i\in I} A_i$. Combining this with [eq: 20.72] proves that

   $$\bigcup_{i\in I} A_i = \bigcup_{j\in\mathbb{N}} A_{\beta(i)}$$

   As $\forall j \in \mathbb{N}$ $A_{\beta(i)} \in \mathcal{A}$ [because $\beta(i) \in I$] it follows, as a σ-algebra is a ring, from [theorem: 20.131] that $\bigcup_{j\in\mathbb{N}} A_{\beta(i)} \in \mathcal{A}$. Hence

   $$\bigcup_{i\in I} A_i \in \mathcal{A}$$

2. Let $i \in I$ then $A_i \in \mathcal{A}$ hence $X \setminus A_i \in \mathcal{A}$ so that by (1) $\bigcup_{i\in I} (X \setminus A_i) \in \mathcal{A}$ from which it follows that

   $$X \setminus \left(\bigcup_{i\in I} (X \setminus A_i) \right) \in \mathcal{A}$$

   As we have

   $$\begin{aligned} X \setminus \left(\bigcup_{i\in I} (X \setminus A_i) \right) &\underset{\text{[theorem: 2.132]}}{=} \bigcap_{i\in I} (X \setminus (X \setminus A_i)) \\ &\underset{A_i \subseteq X \wedge \text{[theorem: 1.33]}}{=} \bigcap_{i\in I} A_i \end{aligned}$$

   it follows that

   $$\bigcap_{i\in I} A_n \in \mathcal{A}$$

   □

If we have already proved that a subset of $\mathcal{P}(X)$ is a algebra on X then the following theorem will be usefull to prove that this subset is actually a σ-algebra.

Theorem 20.144. *Let X be a set and let $\mathcal{A}$ be a algebra on X then we have:*

1. *If $\forall \{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N}$ $A_i \subseteq A_{i+1}$ we have $\bigcup_{i\in\mathbb{N}} A_i \in \mathcal{A}$ then $\mathcal{A}$ is a σ-algebra on X.*

2. *If* $\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ *with* $\forall i\in\mathbb{N}\ A_{i+1}\subseteq A_i$ *we have* $\bigcap_{i\in\mathbb{N}}A_i\in\mathcal{A}$ *then* $\mathcal{A}$ *is a* σ*-algebra on* X*.*

Proof.

1. Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$. Define $\{B_i\}_{i\in\mathbb{N}}$ by $B_i=\bigcup_{j\in\{1,\ldots,i\}}A_i$ then as $\mathcal{A}$ is a algebra we have by [theorem: 20.135] that $\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$. Further for $i\in\mathbb{N}$ we have
$$B_i=\bigcup_{j\in\{1,\ldots,i\}}B_j\subseteq\bigcup_{j\in\{1,\ldots,i+1\}}B_j=B_{i+1}$$
hence by the hypothese we have
$$\bigcup_{i\in\mathbb{N}}B_i\in\mathcal{A}\tag{20.73}$$
As $\forall i\in\mathbb{N}$ we have $A_i\subseteq\bigcup_{j\in\{1,\ldots,i\}}A_j=B_i$ it follows that
$$\bigcup_{i\in\mathbb{N}}A_i\subseteq\bigcup_{i\in\mathbb{N}}B_i\tag{20.74}$$
Further if $x\in\bigcup_{i\in\mathbb{N}}B_i$ then there exist a $i\in\mathbb{N}$ such that $x\in B_i=\bigcup_{j\in\{1,\ldots,i\}}A_j$, hence there exist a $j\in\{1,\ldots,i\}$ such that $x\in A_j\subseteq\bigcup_{i\in\mathbb{N}}A_i$. This proves that $\bigcup_{i\in\mathbb{N}}B_i\subseteq\bigcup_{i\in\mathbb{N}}A_i$ which combined with [eq: 20.74] gives us $\bigcup_{i\in\mathbb{N}}A_i=\bigcup_{i\in\mathbb{N}}B_i$, hence using [eq: 20.73] we have that
$$\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}$$
Applying then [theorem: 20.140] it follows that $\mathcal{A}$ is a σ-algebra.
2. Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ be such that $\forall i\in\mathbb{N}$ we have $A_i\subseteq A_{i+1}$. Let $i\in\mathbb{N}$ then as $\mathcal{A}$ is a algebra $X\setminus A_i\in\mathcal{A}$, further if $x\in X\setminus A_{i+1}$ then $x\in X$ and $x\notin A_i$ [as $A_i\subseteq A_{i+1}$] so that $x\in X\setminus A_i$. Hence $\{X\setminus A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ and $\forall i\in\mathbb{N}$ we have $X\setminus A_{i+1}\subseteq X\setminus A_i$ so by the hypothesis we have that $\bigcap_{i\in\mathbb{N}}(X\setminus A_i)\in\mathcal{A}$. As $\mathcal{A}$ is a algebra we have then that
$$X\setminus\left(\bigcap_{i\in\mathbb{N}}(X\setminus A_i)\right)\in\mathcal{A}$$
Further $X\setminus(\bigcap_{i\in\mathbb{N}}(X\setminus A_i))\underset{\text{[theorem: 2.132]}}{=}\bigcup_{i\in\mathbb{N}}(X\setminus(X\setminus A_i))\underset{A_i\subseteq X\wedge\text{[theorem: 1.33]}}{=}\bigcup_{i\in\mathbb{N}}A_i$ so that $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}$. Hence we have proved that $\forall\{A_i\}_{i\in\mathcal{A}}\subseteq\mathcal{A}$ with $\forall i\in\mathbb{N}\ A_i\subseteq A_{i+1}\ \bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}$ ao that by (1) $\mathcal{A}$ is a σ-algebra. □

We show now how we can generate a σ algebra based on a arbitrary subset of $\mathcal{P}(X)$. First we prove that for a non empty collection of σ-algebra's the intersection of this collection is again a σ-algebra.

Lemma 20.145. *Let* X *be a set and* $\mathfrak{A}$ *a non empty set of* σ*-algebra's on* X *then* $\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$ *is a* σ*-algebra on* X*.*

Proof. As $\mathfrak{A}\neq\varnothing$ there exist a $\mathcal{S}\in\mathfrak{A}$ with $\mathcal{S}\subseteq\mathcal{P}(X)$ so that we have by [theorem: 1.63] that $\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}\subseteq\mathcal{S}\subseteq\mathcal{P}(X)$ proving that
$$\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}\subseteq\mathcal{P}(X)$$
As $\forall\mathcal{A}\in\mathfrak{A}$ $\mathcal{A}$ is a σ-algebra on X we have by [theorem: 20.140] that $X\in\mathcal{A}$ hence
$$X\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$$
Let $A\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$ then for $\mathcal{A}\in\mathfrak{A}$ we have $A\in\mathcal{A}$ so that $X\setminus A\in\mathcal{A}$ which as $\mathcal{A}\in\mathfrak{A}$ was chosen arbitrary proves that $X\setminus A\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$. Hence as $A\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$ was chosen arbitrary we have that
$$\forall A\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}\text{ we have }X\setminus A\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$$

If $\{A_i\}_{i\in\mathbb{N}}\subseteq\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$ then for $\mathcal{A}\in\mathfrak{A}$ we have $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ so that $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}$ which as $\mathcal{A}\in\mathfrak{A}$ was chosen arbitrary proves that $\bigcup_{i\in\mathbb{N}}A\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$. Hence as $\{A_i\}_{i\in\mathbb{N}}\subseteq\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$ was chosen arbitrary we have that

$$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}\text{ we have }\bigcup_{i\in\mathbb{N}}A\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$$

□

We use now the above theorem to show how we can generate a σ-algebra out of a non empty subset of $\mathcal{P}(X)$.

Theorem 20.146. *Let X be a set $\mathcal{A}\subseteq\mathcal{P}(X)$ then there exist a **unique** algebra $\sigma[\mathcal{A}]$ on X such that:*

1. $\mathcal{A}\subseteq\sigma[\mathcal{A}]$
2. *If $\mathcal{B}$ is another σ-algebra with $\mathcal{A}\subseteq\mathcal{B}$ then $\sigma[\mathcal{A}]\subseteq\mathcal{B}$*

This unique smallest σ-algebra that contains $\mathcal{A}$ is called the σ-algebra generated by $\mathcal{A}$

Proof. Define $\mathfrak{A}=\{\mathcal{T}|\mathcal{T}$ is a σ-algebra on X with $\mathcal{A}\subseteq\mathcal{T}\}$. As $\mathcal{A}\subseteq\mathcal{P}(X)$ and $\mathcal{P}(X)$ and $\mathcal{P}(X)$ is a σ-algebra on X [see example: 20.142] it follows that $\mathcal{P}(X)\in\mathfrak{A}$ hence $\mathfrak{A}$ is not empty. Using then previous lemma [lemma: 20.145] it follows that

$$\bigcap_{\mathcal{T}\in\mathfrak{A}}\mathcal{T}\text{ is a }\sigma\text{-algebra on }X$$

As $\forall\mathcal{T}\in\mathfrak{A}$ $\mathcal{A}\subseteq\mathcal{T}$ it follows from [theorem: 1.63] that

$$\mathcal{A}\subseteq\bigcap_{\mathcal{T}\in\mathfrak{A}}\mathcal{T}$$

Finally assume that $\mathcal{B}$ is another σ-algebra on X such that $\mathcal{A}\subseteq\mathcal{B}$ then $\mathcal{B}\in\mathfrak{A}$ so that by [theorem: 1.63]

$$\bigcap_{\mathcal{T}\in\mathfrak{A}}\mathcal{T}\subseteq\mathcal{B}$$

Taking $\sigma[\mathcal{A}]=\bigcap_{\mathcal{T}\in\mathfrak{A}}\mathcal{T}$ then proves the theorem. □

We introduce now the concept of a measurable supspace.

Theorem 20.147. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space and $A\in\mathcal{A}$ then for $\mathcal{A}_{|A}$ defined by*

$$\mathcal{A}_{|A}=\{B\in\mathcal{A}|B\subseteq A\}\subseteq\mathcal{A}$$

we have

1. $\mathcal{A}_{|A}=\{A\bigcap B|B\in\mathcal{A}\}$
2. *$\mathcal{A}_{|A}$ is a σ-algebra on A making $\langle A,\mathcal{A}_{|A}\rangle$ a measurable space*

A measurable subspace of $\langle X,\mathcal{A}\rangle$ is every measurable space of the form $\langle A,\mathcal{A}_{|A}\rangle$ where $A\in\mathcal{A}$.

***Note* 20.148.** *If $A=X$ then we have $\mathcal{A}_{|X}=\{X\bigcap B|B\in\mathcal{A}\}=\{B|B\in\mathcal{A}\}=\mathcal{A}$ so that we have $\langle X,\mathcal{A}_{|X}\rangle=\langle X,\mathcal{A}\rangle$.*

Proof.

1. If $B\in\mathcal{A}_{|A}$ then we have $B\in\mathcal{A}$ and $B\subseteq A\Rightarrow B=B\bigcap A$ so that $B\in\{A\bigcap B|B\in\mathcal{A}\}$ which proves that

$$\mathcal{A}_{|A}\subseteq\left\{A\bigcap B|B\in\mathcal{A}\right\}$$

   Further if $B\in\{A\bigcap B|B\in\mathcal{A}\}$ then there exist a $B'\in\mathcal{A}$ such that $B=A\bigcap B'$. As $A\in\mathcal{A}$ we have that $B=A\bigcap B'\in\mathcal{A}$, further $B=A\bigcap B'\subseteq A$, hence we have that $B\in\mathcal{A}_{|A}$ proving that

$$\left\{A\bigcap B|B\in\mathcal{A}\right\}\subseteq\mathcal{A}_{|A}$$

2. As $A\in A$ and $A\subseteq A$ we have that

$$A\in\mathcal{A}_{|A}$$

Let $C \in \mathcal{A}_{|A}$ then $C \in \mathcal{A}$ and $C \subseteq A$. As also $A \in \mathcal{A}$ it follows from [theorems: 20.140(2)] that $A \bigcap (X \setminus C) \in \mathcal{A}$. Further $A \bigcap (X \setminus C) \underset{\text{[theorem: 1.25]}}{=} (A \bigcap X) \setminus C \underset{A \subseteq X}{=} A \setminus C$ so that $A \setminus C \in \mathcal{A}$ which, as $A \setminus C \subseteq C$ proves that $A \setminus C \in \mathcal{A}_{|A}$. Hence we have proved that

$$\forall C \in \mathcal{A}_{|A} \text{ we have } A \setminus C \in \mathcal{A}_{|A}$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_{|A}$ then $\forall i \in \mathbb{N}$ we have $A_i \in \mathcal{A}$ and $A_i \subseteq A$ so it follows that $\bigcup_{i \in \mathbb{N}} A_i \subseteq A$ and, as $\mathcal{A}$ is a σ-algebra, that $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$. Hence $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}_{|A}$ in other words

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_{|A} \text{ we have } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}_{|A}$$ □

A special case of a σ-algebra in the context of topological spaces is the Borel algebra.

Definition 20.149. *Let $\langle X, \mathcal{T} \rangle$ be a topological space then the Borel algebra on X noted as $\mathcal{B}[X, \mathcal{T}]$ is defined to be $\mathcal{B}[X, \mathcal{T}] = \sigma[\mathcal{T}]$. In other words the Borel algebra on a topological space is the σalgebra generated by $\mathcal{T}$.*

Theorem 20.150. *Let $\langle X, \mathcal{T} \rangle$ be a topological space then $\mathcal{B}[X, \mathcal{T}] = \sigma[\{C \subseteq X | C \text{ is closed}\}]$.*

Proof. If $C \in \{C \subseteq X | C \text{ is closed}\}$ then C is closed, hence there exist a open $U \in \mathcal{T}$ such that $C = X \setminus U$. As $U \in \mathcal{T} \in \sigma[\mathcal{T}]$ it follows that $C = X \setminus U \in \sigma[\mathcal{T}]$. So $\{C \subseteq X | C \text{ is closed}\} \subseteq \sigma[\mathcal{T}]$ a σ-algebra, hence using [theorem: 20.146[we have

$$\sigma[\{C \subseteq X | C \text{ is closed}\}] \subseteq \sigma[\mathcal{T}]$$

If $U \in \mathcal{T}$ then $X \setminus U$ is closed hence $X \setminus U \in \{C \subseteq X | C \text{ is closed}\} \in \sigma[\{C \subseteq X | C \text{ is closed}\}]$, hence $U = X \setminus (X \setminus U) \in \sigma[\{C \subseteq X | C \text{ is closed}\}]$ proving that $\mathcal{T} \subseteq \sigma[\{C \subseteq X | C \text{ is closed}\}]$. So using [theorem: 20.146[we have

$$\sigma[\mathcal{T}] \subseteq \sigma[\{C \subseteq X | C \text{ is closed}\}]$$

This proves that

$$\mathcal{B}[X, \mathcal{T}] = \sigma[\mathcal{T}] = \sigma[\{C \subseteq X | C \text{ is closed}\}]$$ □

20.3.1 Borel algebra on $\mathbb{R}$

Definition 20.151. *Let $\langle \mathbb{R}, \mathcal{T}_{||} \rangle$ be the set of real numbers with the canonical topology $\mathcal{T}_{||}$ based on the absolute value norm [see theorem: 14.99] then then $\mathcal{B}[\mathbb{R}]$ is the Borel algebra based on $\mathcal{T}_{||}$. In other words*

$$\mathcal{B}[\mathbb{R}] = \mathcal{B}[\mathbb{R}, \mathcal{T}_{||}] = \sigma[\mathcal{T}_{||}]$$

We will now find equivalent definitions for $\mathcal{B}[\mathbb{R}]$ that will be usefull if we define a measure. First we introduce the concept of bounded intervals on $\mathbb{R}$.

Definition 20.152. *We define the following set of bounded intervals:*

1. $\mathcal{I}_{[]} = \{[a, b] | a, b \in \mathbb{R} \wedge [a, b] \neq \varnothing\}$ *[the set of non empty closed bounded intervals]*
2. $\mathcal{I}_{[[} = \{[a, b[| a, b \in \mathbb{R} \wedge [a, b[\neq \varnothing\}$ *[the set of non empty right open bounded intervals]*
3. $\mathcal{I}_{]]} = \{]a, b] | a, b \in \mathbb{R} \wedge]a, b] \neq \varnothing\}$ *[the set of non empty left open bounded intervals]*
4. $\mathcal{I}_{][} = \{]a, b[| a, b \in \mathbb{R} \wedge]a, b[\neq \varnothing\}$ *[the set of non empty open bounded intervals]*
5. $\mathcal{I} = \mathcal{I}_{[]} \bigcup \mathcal{I}_{[[} \bigcup \mathcal{I}_{]]} \bigcup \mathcal{I}_{][}$

***Note* 20.153.** *If $b = a$ then $]a, b[= [a, b[=]a, b] = \varnothing$ and if $b < a$ then $[a, b] = [a, b[=]a, b] =]a, b[= \varnothing$ then we have valid bounded intervals but they are not elements of $\mathcal{I}_{[]}$, $\mathcal{I}_{[[}$, $\mathcal{I}_{]]}$ and $\mathcal{I}_{][}$. One reason to exclude these intervals is that the boundary points of these intevals are not well defined [for eample $[1, 0[= [2, 0[= [0, 0[$ which is needed for defining the length of the interval based on the boundary points.*

For case to case analysis the following lemma will be usefull.

Lemma 20.154. *We have that $\mathcal{I}_{[]}$, $\mathcal{I}_{[[}$, $\mathcal{I}_{]]}$ and $\mathcal{I}_{][}$ are pairwise disjoint. In other words we have*

$$\begin{aligned}
\mathcal{I}_{[]}\bigcap \mathcal{I}_{[[} &= \varnothing\\
\mathcal{I}_{[]}\bigcap \mathcal{I}_{]]} &= \varnothing\\
\mathcal{I}_{[]}\bigcap \mathcal{I}_{][} &= \varnothing\\
\mathcal{I}_{[[}\bigcap \mathcal{I}_{[]} &= \varnothing\\
\mathcal{I}_{[[}\bigcap \mathcal{I}_{]]} &= \varnothing\\
\mathcal{I}_{[[}\bigcap \mathcal{I}_{][} &= \varnothing\\
\mathcal{I}_{]]}\bigcap \mathcal{I}_{[]} &= \varnothing\\
\mathcal{I}_{]]}\bigcap \mathcal{I}_{[[} &= \varnothing\\
\mathcal{I}_{]]}\bigcap \mathcal{I}_{][} &= \varnothing\\
\mathcal{I}_{][}\bigcap \mathcal{I}_{[]} &= \varnothing\\
\mathcal{I}_{][}\bigcap \mathcal{I}_{[[} &= \varnothing\\
\mathcal{I}_{][}\bigcap \mathcal{I}_{]]} &= \varnothing
\end{aligned}$$

so that

$$\mathcal{I} = \mathcal{I}_{[]}\bigsqcup \mathcal{I}_{[[}\bigsqcup \mathcal{I}_{]]}\bigsqcup \mathcal{I}_{][}$$

Proof. We have to check the following cases:

$\mathcal{I}_{[]}\bigcap \mathcal{I}_{[[}$. If $I \in \mathcal{I}_{[]}\bigcap \mathcal{I}_{[[}$ then $\varnothing \neq I = [a,b] = [c,d[$. As $[a,b] \neq \varnothing$ it follows from [theorem: 3.139] that $a \leqslant b$ so that $b \in [a,b] = [c,d[$ hence $c \leqslant b < d$. Using [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $c \leqslant b < x < d$ proving that $x \in [c,d[= [a,b]$ so that $b < x \leqslant b$ leading to the contradiction $b < b$. Hence we have

$$\mathcal{I}_{[]}\bigcap \mathcal{I}_{[[} = \varnothing \tag{20.75}$$

$\mathcal{I}_{[]}\bigcap \mathcal{I}_{]]}$. If $I \in \mathcal{I}_{[]}\bigcap \mathcal{I}_{]]}$ then $\varnothing = [a,b] =]c,d]$. As $[a,b] \neq \varnothing$ it follows from [theorem: 3.139] that $a \leqslant b$ so that $a \in [a,b] =]c,d]$ hence $c < a \leqslant d$. Using [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $c < x < a \leqslant d$ proving that $x \in]c,d] = [a,b]$ so that $a \leqslant x < a$ leading to the contradiction $a < a$. Hence we have

$$\mathcal{I}_{[]}\bigcap \mathcal{I}_{]]} = \varnothing \tag{20.76}$$

$\mathcal{I}_{[]}\bigcap \mathcal{I}_{][}$. If $I \in \mathcal{I}_{[]}\bigcap \mathcal{I}_{][}$ then $\varnothing \neq I = [a,b] =]c,d[$. As As $[a,b] \neq \varnothing$ it follows from [theorem: 3.139] that $a \leqslant b$ so that $b \in [a,b] =]c,d[$ hence $c < b < d$. Using [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $c < b < x < d$ proving that $x \in]c,d[= [a,b]$ so that $b < x \leqslant b$ leading to the contradiction $b < b$. Hence we have

$$\mathcal{I}_{[]}\bigcap \mathcal{I}_{][} = \varnothing \tag{20.77}$$

$\mathcal{I}_{[[}\bigcap \mathcal{I}_{[]}$. Then we have

$$\mathcal{I}_{[[}\bigcap \mathcal{I}_{[]} = \mathcal{I}_{[]}\bigcap \mathcal{I}_{[[} \underset{[\text{eq; } 20.75]}{=} \varnothing$$

$\mathcal{I}_{[[}\bigcap \mathcal{I}_{]]}$. If $I \in \mathcal{I}_{[[}\bigcap \mathcal{I}_{]]}$ then $\varnothing \neq I = [a,b[=]c,d]$. As $[a,b] \neq \varnothing$ it follows from [theorem: 3.139] that $a < b$ so that $a \in [a,b[=]c,d]$ hence $c < a \leqslant d$. Using [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $c < x < a \leqslant d$ proving that $x \in]c,d] = [a,b[$ so that $a \leqslant x < a$ leading to the contradiction $a < a$. Hence we have

$$\mathcal{I}_{[[}\bigcap \mathcal{I}_{]]} = \varnothing \tag{20.78}$$

$\mathcal{I}_{[[}\bigcap \mathcal{I}_{][}$. If $I \in \mathcal{I}_{[[}\bigcap \mathcal{I}_{][}$ then $\varnothing \neq I = [a,b[=]c,d[$. As $[a,b] \neq \varnothing$ it follows from [theorem: 3.139] that $a < b$ so that $a \in [a,b[=]c,d]$ hence $c < a < d$. Using [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $c < x < a < d$ proving that $x \in]c,d[= [a,b[$ so that $a \leqslant x < a$ leading to the contradiction $a < a$. Hence we have

$$\mathcal{I}_{[[}\bigcap \mathcal{I}_{][} = \varnothing \tag{20.79}$$

$\mathcal{I}_{]]}\bigcap\mathcal{I}_{[]}$. Then we have

$$\mathcal{I}_{]]}\bigcap\mathcal{I}_{[]}=\mathcal{I}_{[]}\bigcap\mathcal{I}_{]]}\underset{[\text{eq: }20.76]}{=}\varnothing$$

$\mathcal{I}_{]]}\bigcap\mathcal{I}_{[[}$. If $I\in\mathcal{I}_{]]}\bigcap\mathcal{I}_{[[}$ then $I=]a,b]=[c,d[$. As $]a,b]\neq\varnothing$ we have by [theorem: 3.139] that $a<b$ so that $b\in]a,b]=[c,d[$ hence $c\leqslant b<d$. Using [theorem: 10.32] there exist a $x\in\mathbb{R}$ such that $c\leqslant b<x<d$ proving that $x\in[c,d[=]a,b]$ so that $b<x\leqslant b$ leading to the contradiction $b<b$. Hence we have

$$\mathcal{I}_{]]}\bigcap\mathcal{I}_{[[}=\varnothing \tag{20.80}$$

$\mathcal{I}_{]]}\bigcap\mathcal{I}_{]][}$. If $I\in\mathcal{I}_{]]}\bigcap\mathcal{I}_{]][}$ then $I=]a,b]=]c,d[$. As $]a,b]\neq\varnothing$ we have by [theorem: 3.139] that $a<b$ so that $b\in]a,b]=]c,d[$ hence $c<b<d$. Using [theorem: 10.32] there exist a $x\in\mathbb{R}$ such that $c<b<x<d$ proving that $x\in]c,d[=]a,b]$ so that $b<x\leqslant b$ leading to the contradiction $b<b$. Hence we have

$$\mathcal{I}_{]]}\bigcap\mathcal{I}_{]][}=\varnothing \tag{20.81}$$

$\mathcal{I}_{]][}\bigcap\mathcal{I}_{[]}$. Then we have

$$\mathcal{I}_{]][}\bigcap\mathcal{I}_{[]}=\mathcal{I}_{[]}\bigcap\mathcal{I}_{]][}\underset{[\text{eq: }20.77]}{=}\varnothing$$

$\mathcal{I}_{]][}\bigcap\mathcal{I}_{[[}$. Then we have

$$\mathcal{I}_{]][}\bigcap\mathcal{I}_{[[}=\mathcal{I}_{[[}\bigcap\mathcal{I}_{]][}\underset{[\text{eq: }20.79]}{=}\varnothing$$

$\mathcal{I}_{]][}\bigcup\mathcal{I}_{]]}$. Then we have

$$\mathcal{I}_{]][}\bigcap\mathcal{I}_{]]}=\mathcal{I}_{]]}\bigcap\mathcal{I}_{]][}\underset{[\text{eq: }20.81]}{=}\varnothing$$

□

The following allows us to switch between the different types of non empty bounded intervals.

Lemma 20.155. *Let $a,b\in\mathbb{R}$ the we have*

1. $]a,b]=\bigcap_{n\in\mathbb{N}}\left]a,b+\frac{1}{n}\right[$
2. $[a,b[=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},b\right[$
3. $[a,b]=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},b\right]$
4. $[a,b]=\bigcap_{n\in\mathbb{N}}\left[a,b+\frac{1}{n}\right[$
5. $[a,b]=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},b+\frac{1}{n}\right[$
6. $]-\infty,a]=\bigcap_{n\in\mathbb{N}}\left]-\infty,a+\frac{1}{n}\right[$
7. $[a,\infty[=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},\infty\right[$
8. $]a,b]=\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b\right]$
9. $[a,b[=\bigcup_{n\in\mathbb{N}}\left[a,b-\frac{1}{n}\right]$
10. $]a,b[=\bigcup_{n\in\mathbb{N}}\left]a,b-\frac{1}{n}\right]$
11. $]a,b[=\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b\right[$
12. $]a,b[=\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b-\frac{1}{n}\right]$
13. $]-\infty,a[=\bigcup_{n\in\mathbb{N}}\left]-\infty,a-\frac{1}{n}\right]$
14. $]a,\infty[=\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},\infty\right[$
15. $[a,b[=[a,\infty[\setminus[b,\infty[$
16. $]a,b]=]-\infty,b]\setminus]-\infty,a]$
17. $]a,\infty[=\mathbb{R}\setminus]-\infty,a]$

Proof.

1. Let $x \in]a,b]$ then $a < x \leqslant b$ and as $\forall n \in \mathbb{N}\ b < b + \frac{1}{n}$ we have $a < x < b + \frac{1}{n}$ so it follows that $x \in \left]a, b + \frac{1}{n}\right[$. Hence
$$]a,b] \subseteq \bigcap_{n \in \mathbb{N}} \left]a, b + \frac{1}{n}\right[\tag{20.82}$$
If $x \in \bigcap_{n \in \mathbb{N}} \left]a, b + \frac{1}{n}\right[$ then $\forall n \in \mathbb{N}\ x \in \left]a, b + \frac{1}{n}\right[$ or $a < x < b + \frac{1}{n}$ which by [corollary: 10.31] proves that $a < x \leqslant b$ hence $x \in]a,b]$. So it follows that $\bigcap_{n \in \mathbb{N}} \left]a, b + \frac{1}{n}\right[\subseteq]a,b]$ which using [eq: 20.82] proves that
$$]a,b] = \bigcap_{n \in \mathbb{N}} \left]a, b + \frac{1}{n}\right[$$

2. Let $x \in [a,b[$ then $a \leqslant x < b$ and as $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < a$ it follows that $x \in \left]a - \frac{1}{n}, b\right[$. Hence
$$[a,b[\subseteq \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right[\tag{20.83}$$
If $x \in \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right[$ then $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < x < b \Rightarrow a < x + \frac{1}{n} \wedge x < b$ which by [corollary: 10.31] proves that $a \leqslant x < b$ hence $x \in [a,b[$. So $\bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right[\subseteq [a,b[$ which using [eq: 20.83] prove that
$$[a,b[= \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right[$$

3. Let $x \in [a,b]$ then $a \leqslant x < b$ and as $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < a \Rightarrow x \in \left]a - \frac{1}{n}, b\right]$. Hence
$$[a,b] \subseteq \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right] \tag{20.84}$$
If $x \in \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right]$ then $\forall n \in \mathbb{N}$ then $a - \frac{1}{n} < x \leqslant b$ or $a < x + \frac{1}{n}$ which by [corollary: 10.31] proves that $a \leqslant x$ giving $x \in [a,b]$. So we have $\bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right] \subseteq [a,b]$ which combined with [eq: 20.84] gives
$$[a,b] = \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right]$$

4. Let $x \in [a,b]$ then $a \leqslant x \leqslant b$ then $\forall n \in \mathbb{N}$ we have $a \leqslant x \leqslant b < b + \frac{1}{n}$. Which proves that
$$[a,b] \subseteq \bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n}\right[\tag{20.85}$$
If $x \in \bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n}\right[$ then $\forall n \in \mathbb{N}$ we have $a \leqslant x < b + \frac{1}{n}$. Using [corollary: 10.31] we have $x \leqslant b$ proving that $x \in [a,b]$. Hence $\bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n}\right[\subseteq [a,b]$ which combined with [eq: 20.85] gives
$$[a,b] = \bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n}\right[$$

5. Let $x \in [a,b]$ then $a \leqslant x \leqslant b$ and as $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < x < b + \frac{1}{n}$ it follows that $x \in \left]a - \frac{1}{n}, b + \frac{1}{n}\right[$. Hence
$$[a,b] \subseteq \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b + \frac{1}{n}\right[\tag{20.86}$$
Let $x \in \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b + \frac{1}{n}\right[$ then $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < x \wedge x < b + \frac{1}{n} \Rightarrow a < x + \frac{1}{n} \wedge x < b + \frac{1}{n}$. Using [corollary: 10.31] we have $a \leqslant x \wedge x \leqslant b$ or $x \in [a,b]$. Hence $\bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b + \frac{1}{n}\right[\subseteq [a,b]$ which together with [eq: 20.86] proves
$$[a,b] = \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b + \frac{1}{n}\right[$$

6. Let $x \in]-\infty, a]$ then $x \leqslant a$ and as $\forall n \in \mathbb{N}$ we have $x < a + \frac{1}{n}$ it follows that $x \in \left]-\infty, a + \frac{1}{n}\right[$. Hence

$$]-\infty, a] \subseteq \bigcap_{n \in \mathbb{N}} \left]-\infty, a + \frac{1}{n}\right[\tag{20.87}$$

Let $x \in \bigcap_{n \in \mathbb{N}} \left]-\infty, a + \frac{1}{n}\right[$ then $\forall n \in \mathbb{N}$ we have $x < a + \frac{1}{n}$ which by [corollary: 10.31] gives $x \leqslant a$ or $x \in]-\infty, a]$. Hence $\bigcap_{n \in \mathbb{N}} \left]-\infty, a + \frac{1}{n}\right[\subseteq]-\infty, a]$ which together with [eq: 20.87] proves

$$\bigcap_{n \in \mathbb{N}} \left]-\infty, a + \frac{1}{n}\right[=]-\infty, a]$$

7. Let $x \in [a, \infty[$ then $a \leqslant x$ so that $\forall n \in \mathbb{N}_9$ we have $a - \frac{1}{n} < x$ giving $x \in \left]a - \frac{1}{n}, \infty\right[$ proving that

$$[a, \infty[\subseteq \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, \infty\right[\tag{20.88}$$

Let $x \in \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, \infty\right[$ then $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < x \Rightarrow a < x + \frac{1}{n}$ which by [corollary: 10.31] proves that $x \in [a, \infty[$. Hence $\bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, \infty\right[\subseteq [a, \infty]$ which together with [eq: 20.88] proves that

$$[a, \infty[= \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, \infty\right[$$

8. Let $x \in]a, b]$ then $a < x \leqslant b$ and using [corollary: 10.30] there exists a $n \in \mathbb{N}$ such that $a < a + \frac{1}{n} < x \leqslant b$ proving that $x \in \left[a + \frac{1}{n}, b\right]$. Hence

$$]a, b] \subseteq \bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, b\right] \tag{20.89}$$

Let $x \in \bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, b\right]$ then there exists a $n \in \mathbb{N}$ such that $x \in \left[a + \frac{1}{n}, b\right] \Rightarrow a < a + \frac{1}{n} \leqslant x \leqslant b$. Hence $x \in]a, b]$ proving that $\bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, b\right] \subseteq]a, b]$ which by [eq: 20.89] gives

$$]a, b] = \bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, b\right]$$

9. Let $x \in [a, b[$ then $a \leqslant x < b$ and using [corollary: 10.30] there exists a $n \in \mathbb{N}$ such that $a \leqslant x < x + \frac{1}{n} < b \Rightarrow a \leqslant x \wedge x < b - \frac{1}{n}$ proving that $x \in \left[a, b - \frac{1}{n}\right]$. So

$$a, b[\subseteq \bigcup_{n \in \mathbb{N}} \left[a, b - \frac{1}{n}\right] \tag{20.90}$$

If $x \in \bigcup_{n \in \mathbb{N}} \left[a, b - \frac{1}{n}\right]$ then $\exists n \in \mathbb{N}$ such that $x \in \left[a, b - \frac{1}{n}\right] \Rightarrow a \leqslant x \leqslant b - \frac{1}{n} < b$ proving that $x \in [a, b[$. Hence $\bigcup_{n \in \mathbb{N}} \left[a, b - \frac{1}{n}\right] \subseteq [a, b[$ which combined with 20.90 gives

$$[a, b[= \bigcup_{n \in \mathbb{N}} \left[a, b - \frac{1}{n}\right]$$

10. Let $x \in]a, b[$ then $a < x < b$ and using [corollary: 10.30] there exists a $n \in \mathbb{N}$ such that $a < x < x + \frac{1}{n} < b$ hence $a < x < b - \frac{1}{n}$ proving that $x \in \left]a, b - \frac{1}{n}\right]$. So

$$]a, b[\subseteq \bigcup_{n \in \mathbb{N}} \left]a, b - \frac{1}{n}\right] \tag{20.91}$$

If $x \in \bigcup_{n \in \mathbb{N}} \left]a, b - \frac{1}{n}\right]$ then $\exists n \in \mathbb{N}$ such that $a < x \leqslant b - \frac{1}{n} < b \Rightarrow x \in]a, b[$ proving that $\bigcup_{n \in \mathbb{N}} \left]a, b - \frac{1}{n}\right] \subseteq]a, b[$. Combining this with [eq: 20.91] gives

$$]a, b[= \bigcup_{n \in \mathbb{N}} \left]a, b - \frac{1}{n}\right]$$

11. Let $x \in]a,b[$ then $a<x<b$ and using [corollary: 10.30] there exists a $n \in \mathbb{N}$ such that $a<a+\frac{1}{n}<x<b$ proving that $x \in \left[a+\frac{1}{n},b\right[$. Hence

$$]a,b[\subseteq \bigcup_{n\in\mathbb{N}} \left[a+\frac{1}{n},b\right[\tag{20.92}$$

If $x \in \bigcup_{n\in\mathbb{N}} \left[a+\frac{1}{n},b\right[$ then $\exists n \in \mathbb{N}$ such that $a<a+\frac{1}{n}<x<b \Rightarrow x \in]a,b[$ proving that $\bigcup_{n\in\mathbb{N}} \left[a+\frac{1}{n},b\right[\subseteq]a,b[$. Combining this with [eq: 20.92] gives

$$]a,b[= \bigcup_{n\in\mathbb{N}} \left[a+\frac{1}{n}\right[$$

12. Let $x \in]a,b[$ then $a<x<b$ and using [corollary: 10.30] there exists $n_1,n_2 \in \mathbb{N}$ such that $a<a+\frac{1}{n_1}<x<x+\frac{1}{n_2}<b \Rightarrow a+\frac{1}{n_1}<x<b-\frac{1}{n_2}$. Take $m=\max(n_1,n_2)$ then $\frac{1}{m} \leqslant \frac{1}{n_1},\frac{1}{n_2}$ so that $a+\frac{1}{m} \leqslant a+\frac{1}{n_1}<x<b-\frac{1}{n_2} \leqslant b-\frac{1}{m}$ proving that $x \in \left[a+\frac{1}{m},b-\frac{1}{m}\right]$. Hence

$$]a,b[\subseteq \bigcup_{n\in\mathbb{N}} \left[a+\frac{1}{m},b-\frac{1}{m}\right] \tag{20.93}$$

If $x \in \bigcup_{n\in\mathbb{N}} \left[a+\frac{1}{n},b-\frac{1}{n}\right]$ then $\exists n \in \mathbb{N}$ such that $x \in \left[a+\frac{1}{n},b-\frac{1}{n}\right] \Rightarrow a<a+\frac{1}{n} \leqslant x<b-\frac{1}{n}<b$ proving that $a<x<b$ or $x \in]a,b[$. So $\bigcup_{n\in\mathbb{N}} \left[a+\frac{1}{n},b-\frac{1}{n}\right] \subseteq]a,b[$ which together with [eq: 20.93] gives

$$]a,b[= \bigcup_{n\in\mathbb{N}} \left[a+\frac{1}{m},b-\frac{1}{m}\right]$$

13. Let $x \in]-\infty,a[$ then $x<a$ and using [corollary: 10.30] there exists a $n \in \mathbb{N}$ such that $x+\frac{1}{n}<a \Rightarrow x<a-\frac{1}{n} \Rightarrow x \in \left]-\infty,a-\frac{1}{n}\right]$ proving that

$$]-\infty,a[\subseteq \bigcup_{n\in\mathbb{N}} \left]-\infty,a-\frac{1}{n}\right] \tag{20.94}$$

If $x \in \bigcup_{n\in\mathbb{N}} \left]-\infty,a-\frac{1}{n}\right]$ then $\exists n \in \mathbb{N}$ such that $x \in \left]-\infty,a-\frac{1}{n}\right] \Rightarrow x \leqslant a-\frac{1}{n}<a$ giving $x \in]-\infty,a[$ and proving that $\bigcup_{n\in\mathbb{N}}]-\infty,a] \subseteq]-\infty,a[$. Using this together with [eq: 20.94] proves

$$]-\infty,a[= \bigcup_{n\in\mathbb{N}} \left]-\infty,a-\frac{1}{n}\right]$$

14. Let $x \in]a,\infty[$ then $a<x$ and using [corollary: 10.30] there exists a $n \in \mathbb{N}$ such that $a+\frac{1}{n}<x \Rightarrow x \in \left[a+\frac{1}{n},\infty\right[$. Hence

$$]a,\infty[\subseteq \bigcup_{n\in\mathbb{N}} \left[a+\frac{1}{n},\infty\right[\tag{20.95}$$

If $x \in \bigcup_{n\in\mathbb{N}} \left[a+\frac{1}{n},\infty\right[$ then $\exists n \in \mathbb{N}$ such that $x \in \left[a+\frac{1}{n},\infty\right[\Rightarrow a<a+\frac{1}{n} \leqslant x$ hence $x \in]a,\infty[$. This proves that $\bigcup_{n\in\mathbb{N}} \left[a+\frac{1}{n},\infty\right[\subseteq]a,\infty[$, combining this with [eq: 20.95] gives

$$]a,\infty[= \bigcup_{n\in\mathbb{N}+0} \left[a+\frac{1}{n},\infty\right[$$

15. Let $x \in [a,b[$ then $a \leqslant x \wedge x<b \Rightarrow a \leqslant x \wedge \neg(b \leqslant x)$ so that $x \in [a,\infty[$ and $x \notin [b,\infty[$ proving that

$$[a,b[\subseteq [a,\infty[\setminus [b,\infty[\tag{20.96}$$

If $x \in [a,\infty[\setminus [b,\infty[$ then $a \leqslant x \wedge \neg(b \leqslant x)$ or $a \leqslant x$ and $x<b$ proving that $[a,\infty[\setminus [b,\infty[\subseteq [a,b[$. Combining this with [eq: 20.96] proves that

$$[a,b[= [a,\infty[\setminus [b,\infty[$$

16. Let $x \in]a,b]$ then $a < x \wedge x \leqslant b$ then $\neg(x \leqslant a) \wedge x \leqslant b$ so that $x \notin]-\infty,a] \wedge x \in]-\infty,b]$ proving that $x \in]-\infty,b[\setminus]-\infty,a]$. For the opposite inclusion let $x \in]-\infty,b]\setminus]-\infty,a]$ then $x \leqslant b$ and $\neg(x \leqslant a)$ proving that $x \leqslant b$ and $a < x$ or $x \in]a,b]$. Hence
$$]a,b] =]-\infty,b]\setminus]-\infty,a]$$
17. If $x \in]a,\infty[$ then $x \in \mathbb{R} \wedge a < x$ so that $x \nleqslant a \Rightarrow x \notin]-\infty,a]$ hence $x \in \mathbb{R}\setminus]-\infty,a]$, further if $x \in \mathbb{R}\setminus]-\infty,a]$ then $x \in \mathbb{R} \wedge x \notin]-\infty,a] \Rightarrow x \nleqslant a \Rightarrow a < x$ or $x \in]a,\infty[$ hence
$$]a,\infty[= \mathbb{R}\setminus]-\infty,a]$$

□

We are now ready to prove alternative forms for $\mathcal{B}[\mathbb{R}]$.

Theorem 20.156. *We have the following alternative forms for* $\mathcal{B}[\mathbb{R}] \underset{definition}{=} \sigma[\mathcal{T}_{||}]$
$$\begin{aligned}
\sigma[\{C \subseteq \mathbb{R} | C \text{ is closed in } \mathcal{T}_{||}\}] &\underset{[theorem:\ 20.150]}{=} \mathcal{B}[\mathbb{R}] \\
&= \sigma[\mathcal{T}_{||}] \\
&= \sigma[\mathcal{I}_{]|}] \\
&= \sigma[\mathcal{I}_{]]}] \\
&= \sigma[\mathcal{I}_{[]}] \\
&= \sigma[\mathcal{I}_{[[}] \\
&= \sigma[\{[a,\infty[| a \in \mathbb{R}\}] \\
&= \sigma[\{]a,\infty[| a \in \mathbb{R}\}] \\
&= \sigma[\{]-\infty,a] | a \in \mathbb{R}\}] \\
&= \sigma[\{]-\infty,a[| a \in \mathbb{R}\}]
\end{aligned}$$

Proof. Let $U \in \mathcal{T}_{||}$ then by [corollary: 14.105] there exist a countable family $\{]a_i,b_i[\}_{i\in I} \subseteq \mathcal{I}_{]|}$ such that
$$\forall i \in I\ ]a_i,\beta_i[\neq \varnothing \text{ and } U = \bigcup_{i\in I}]a_i,\beta_i[\tag{20.97}$$

As $\mathcal{I}_{]|} \subseteq \sigma[\mathcal{I}_{]|}]$ which is a σ-algebra it follows from [theorem: 20.143] that $U = \bigcup_{i\in I}]a_i,\beta_i[\in \sigma(\mathcal{I}_{]|})$. As $U \in \mathcal{T}_{||}$ was chosen arbitrary it follows that $\mathcal{T}_{||} \subseteq \sigma[\mathcal{I}_{]|}]$. Using then [theorem: 20.146] it follows that
$$\mathcal{B}[\mathbb{R}] \underset{\text{def}}{=} \sigma[\mathcal{T}_{||}] \subseteq \sigma[\mathcal{I}_{]|}] \tag{20.98}$$

If $]a,b[\in \mathcal{I}_{]|}$ then by [lemma: 20.155] $]a,b[= \bigcup_{n\in\mathbb{N}} \left]a,b-\frac{1}{n}\right]$. Let $n \in \mathbb{N}$ then we have either:

$\boldsymbol{\left]a,b-\frac{1}{n}\right] = \varnothing}$. Then $\left]a,b-\frac{1}{n}\right] = \varnothing \in \sigma[\mathcal{I}_{]]}]$

$\boldsymbol{\left]a,b-\frac{1}{n}\right] \neq \varnothing}$. Then $\left]a,b-\frac{1}{n}\right] \in \sigma[\mathcal{I}_{]]}]$

so that $\left\{\left]a,b-\frac{1}{n}\right]\right\}_{n\in\mathbb{N}} \subseteq \sigma[\mathcal{I}_{]]}]$ from which it follows by [lemma: 20.143] that
$$]a,b[= \bigcup_{n\in\mathbb{N}} \left]a,b-\frac{1}{n}\right] \in \sigma[\mathcal{I}_{]]}]$$
. Hence we have $\mathcal{I}_{]|} \subseteq \sigma[\mathcal{I}_{]]}]$ a σ-algebra on $\mathbb{R}$. Using [theorem: 20.146] it follows then that
$$\sigma[\mathcal{I}_{]|}] \subseteq \sigma[\mathcal{I}_{]]}] \tag{20.99}$$

If $]a,b] \in \mathcal{I}_{]]}$ then by [lemma: 20.155] $]a,b] = \bigcup_{n\in\mathbb{N}} \left[a+\frac{1}{n},b\right]$. For $n \in \mathbb{N}$ we have either:

$\boldsymbol{\left[a+\frac{1}{n},b\right] = \varnothing}$. Then $\left[a+\frac{1}{n},b\right] = \varnothing \in \sigma[\mathcal{I}_{[]}]$

$\boldsymbol{\left[a+\frac{1}{n},b\right] \neq \varnothing}$. Then $\left[a+\frac{1}{n},b\right] \in \mathcal{I}_{[]} \subseteq \sigma[\mathcal{I}_{[]})[]$

so that $\left\{\left[a+\frac{1}{n},b\right]\right\}_{n\in\mathbb{N}}\subseteq\sigma[\mathcal{I}_{[]}]$ from which it follows by [theorem: 20.143] that

$$]a,b]=\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b\right]\in\sigma[\mathcal{I}_{[]}]$$

Hence we have $\mathcal{I}_{]]}\subseteq\sigma[\mathcal{I}_{[]}]$ a σ-algebra on $\mathbb{R}$ so that by [theorem: 20.146]

$$\sigma[\mathcal{I}_{]]}]\subseteq\sigma[\mathcal{I}_{[]}] \tag{20.100}$$

If $[a,b]\in\mathcal{I}_{[]}$ then by [lemma: 20.155] $[a,b]=\bigcap_{n\in\mathbb{N}}\left[a,b+\frac{1}{n}\right[$. For $n\in\mathbb{N}$ we have either:

$\left[\boldsymbol{a},\boldsymbol{b}+\frac{\mathbf{1}}{\boldsymbol{n}}\right[=\varnothing$. Then $\left[a,b+\frac{1}{n}\right[=\varnothing\in\sigma[\mathcal{I}_{[[}]$

$\left[\boldsymbol{a},\boldsymbol{b}+\frac{\mathbf{1}}{\boldsymbol{n}}\right[\neq\varnothing$. Then $\left[a,b+\frac{1}{n}\right[\in\sigma[\mathcal{I}_{[[}]$

so that $\left\{\left[a,b+\frac{1}{n}\right[\right\}_{n\in\mathbb{N}}\subseteq\sigma[\mathcal{I}_{[[}]$ form which it it follows by [theorem: 20.143] that

$$[a,b]=\bigcap_{n\in\mathbb{N}}\left[a,b+\frac{1}{n}\right[\in\sigma[\mathcal{I}_{[[}]$$

Hence we have $\mathcal{I}_{[]}\subseteq\sigma[\mathcal{I}_{[[}]$ a σ-algebra on $\mathbb{R}$ so that by [theorem: 20.146]

$$\sigma[\mathcal{I}_{[]}]\subseteq\sigma[\mathcal{T}_{[[}] \tag{20.101}$$

If $[a,b[\in\mathcal{I}_{[[}$ then by [lemma: 20.155] $[a,b[=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},b\right[$. As $\forall n\in\mathbb{N}$ $\left]a-\frac{1}{n},b\right[$ is open it follows that $\left\{\left]a-\frac{1}{n},b\right[\right\}_{n\in\mathbb{N}}\subseteq\mathcal{T}_{||}$ so that by [theorem 20.143] $[a,b[=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},b\right[\in\sigma[\mathcal{T}_{||}]$. Hence we have that $\mathcal{I}_{[[}\subseteq\sigma[\mathcal{T}_{||}]$ so that

$$\sigma[\mathcal{I}_{[[}]\subseteq\sigma[\mathcal{T}_{||}]\underset{\text{def}}{=}\mathcal{B}[\mathbb{R}] \tag{20.102}$$

Combining [eqs: 20.98, 20.99, 20.100, 20.101 and 20.102] it follows that

$$\mathcal{B}[\mathbb{R}]=\sigma[\mathcal{T}_{||}]=\sigma[\mathcal{I}_{]]}]=\sigma[\mathcal{I}_{]]}]=\sigma[\mathcal{I}_{[]}]=\sigma[\mathcal{I}_{[[}] \tag{20.103}$$

If $[a,b[\in\mathcal{I}_{[[}$ then using [lemma: 20.155] we have that

$$[a,b]=[a,\infty]\setminus[b,\infty[\underset{\text{[theorem: 20.135]}}{\in}\sigma[\{[a,\infty[|a\in\mathbb{R}\}]$$

proving $\mathcal{I}_{[[}\subseteq\sigma[\{[a,\infty[|a\in\mathbb{R}\}]$ a σ-algebra. Hence using [theorem: 20.146] we have

$$\sigma[\mathcal{I}_{[[}]\subseteq\sigma[\{[a,\infty[|a\in\mathbb{R}\}] \tag{20.104}$$

If $[a,\infty[\in\{[a,\infty[|a\in\mathbb{R}\}$ then using [lemma: 20.155] we have that $[a,\infty[=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},\infty\right[$. As $\left\{\left]a-\frac{1}{n},\infty\right[\right\}_{n\in\mathbb{N}}\subseteq\left\{\left]a-\frac{1}{n},\infty\right[|n\in\mathbb{N}\right\}\subseteq\sigma[\{]a,\infty[|a\in\mathbb{R}\}]$ it follows from [theorem: 20.143] that

$$[a,\infty[=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},\infty\right[\in\sigma[\{]a,\infty[|a\in\mathbb{R}\}]$$

Hence $\{[a,\infty[|a\in\mathbb{R}\}\subseteq\sigma[\{]a,\infty[|a\in\mathbb{R}\}]$ so that by [theorem: 20.146]

$$\sigma[\{[a,\infty[|a\in\mathbb{R}\}]\subseteq\sigma[\{]a,\infty[|a\in\mathbb{R}\}] \tag{20.105}$$

Let $]a,\infty[\in\{]a,\infty[|a\in\mathbb{R}\}$ then by [lemma: 20.155] $]a,\infty[=\mathbb{R}\setminus]-\infty,a]\in\sigma[\{]-\infty,a]|a\in\mathbb{R}\}]$ so that $\{]a,\infty[|a\in\mathbb{R}\}\subseteq\sigma[\{]-\infty,a]|a\in\mathbb{R}\}]$. Using [theorem: 20.146] it follows that

$$\sigma[\{]a,\infty[|a\in\mathbb{R}\}]\subseteq\sigma[\{]-\infty,a]|a\in\mathbb{R}\}] \tag{20.106}$$

Let $]-\infty,a]\in\{]-\infty,a]|a\in\mathbb{R}\}$ then by [lemma: 20.155] $]-\infty,a]=\bigcap_{n\in\mathbb{N}}\left]-\infty,a+\frac{1}{n}\right[$. As $\left\{\left]-\infty,a+\frac{1}{n}\right[\right\}_{n\in\mathbb{N}}\subseteq\{]-\infty,a[|a\in\mathbb{R}\}\subseteq\sigma[\{]-\infty,a[|a\in\mathbb{R}\}]$ it follows from [theorem: 20.143] that $]-\infty,a]=\bigcap_{n\in\mathbb{N}}\left]-\infty,a+\frac{1}{n}\right[\in\sigma[\{]-\infty,a[|a\in\mathbb{R}\}]$. Hence

$$\{]-\infty,a]|a\in\mathbb{R}\}\subseteq\sigma[\{]-\infty,a[|a\in\mathbb{R}\}]$$

which by [theorem: 20.146] proves that

$$\sigma[\{]-\infty,a]|a\in\mathbb{R}\}]\subseteq\sigma[\{]-\infty,a[|a\in\mathbb{R}\}] \tag{20.107}$$

Let $]-\infty,a[\in\{]-\infty,a[|a\in\mathbb{R}\}$ then as $]-\infty,a[$ is open it follows that $\{]-\infty,a[|a\in\mathbb{R}\}\subseteq\mathcal{T}_{||}\subseteq\sigma[\mathcal{T}_{||}]$ and using [theorem: 20.146] it follows that

$$\sigma[\{]-\infty,a[|a\in\mathbb{R}\}]\subseteq\sigma[\mathcal{T}_{||}]\underset{[\text{eq: }20.103]}{=}\sigma[\mathcal{I}_{[[}] \tag{20.108}$$

Combining [eqs: 20.104, 20.105, 20.106, 20.107 and 20.108] gives

$$\sigma[\mathcal{I}_{[[}]=\sigma[\{[a,\infty[|a\in\mathbb{R}\}]=\sigma[\{]a,\infty[|a\in\mathbb{R}\}]=\sigma[\{]-\infty,a]|a\in\mathbb{R}\}]=\sigma[\{]-\infty,a[|a\in\mathbb{R}\}]$$

Finally combining the above with [eq: 20.103] proves that

$$\begin{aligned}\mathcal{B}[\mathbb{R}] &= \sigma[\mathcal{T}_{||}]\\ &= \sigma[\mathcal{I}_{]][}]\\ &= \sigma[\mathcal{I}_{]]}]\\ &= \sigma[\mathcal{I}_{[]}]\\ &= \sigma[\mathcal{I}_{[[}]\\ &= \sigma[\{[a,\infty[|a\in\mathbb{R}\}]\\ &= \sigma[\{]a,\infty[|a\in\mathbb{R}\}]\\ &= \sigma[\{]-\infty,a]|a\in\mathbb{R}\}]\\ &= \sigma[\{]-\infty,a[|a\in\mathbb{R}\}]\end{aligned}$$

□

20.3.2 Borel algebra on $\overline{\mathbb{R}}$

Definition 20.157. *Let $\langle\overline{\mathbb{R}},\mathcal{T}_{\overline{\mathbb{R}}}\rangle$ be the topological space consisting of the extended real numbers with the canonical topology $\mathcal{T}_{\overline{\mathbb{R}}}$ [see definition: 20.47] then the Borel algebra on $\overline{\mathbb{R}}$ is noted as $\mathcal{B}[\overline{\mathbb{R}}]$ hence*

$$\mathcal{B}[\overline{\mathbb{R}}]=\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$$

Just as in the real case we formulate some alternative definitions for the Borel algebra on the extended real numbers.

Lemma 20.158. *We have*

1. *$\forall a\in\mathbb{R}$ we have $[a,\infty]=\bigcap_{n\in\mathbb{N}_0}\left]a-\frac{1}{n},\infty\right]$*
2. *$\{\infty\}=\bigcap_{n\in\mathbb{N}_0}]n,\infty]$*
3. *$\{-\infty\}=\bigcap_{n\in\mathbb{N}_0}[-\infty,-n[$*

Proof.

1. Let $n\in\mathbb{N}$ then if $x\in[a,\infty]$ $a\leqslant x\leqslant\infty\Rightarrow a-\frac{1}{n}<a\leqslant x\leqslant\infty$ so that $[a,\infty]\subseteq\left]a-\frac{1}{n},\infty\right]$, hence

$$[a,\infty]\subseteq\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},\infty\right] \tag{20.109}$$

   If $x\in\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},\infty\right]$. Assume that $x<a$ then using [theorem: 10.30] there exist a $n\in\mathbb{N}$ such that $x+\frac{1}{n}<a$ or $x<a-\frac{1}{n}$ so that $x\notin\left]a-\frac{1}{n},\infty\right]$ contradicting $x\in\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},\infty\right]$. Hence the assumption is wrong and we have $a\leqslant x\leqslant\infty$ so that $x\in[a,\infty]$ proving that $\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},\infty\right]\subseteq[a,\infty[$, combining this with [eq: 20.109] results in

$$[a,\infty]=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},\infty\right]$$

2. As $\forall n\in\mathbb{N}$ we have $n<\infty\leqslant\infty$ it follows that $\infty\in\bigcap_{n\in\mathbb{N}}]n,\infty]$ so that

$$\{\infty\}\subseteq\bigcap_{n\in\mathbb{N}}]n,\infty] \tag{20.110}$$

Let $x \in \bigcap_{n\in\mathbb{N}}]n,\infty]$. Then $x \in [1,\infty] \Rightarrow -\infty < 1 < x \leqslant \infty$ so that $x \notin -\infty$. Assume that $x \neq \infty$ then $x \in \mathbb{R}$ and by [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $x < n \Rightarrow x \in \notin]n,\infty]$ contradicting $x \in \bigcap_{n\in\mathbb{N}}]n,\infty]$, hence the assumption is wrong and we must have that $x = \infty \in \{\infty\}$. So $\bigcap_{n\in\mathbb{N}}]n,\infty] \subseteq \{\infty\}$ which combined with [eq: 20.110] proves that

$$\{\infty\} = \bigcap_{n\in\mathbb{N}}]n,\infty]$$

3. As $\forall n \in \mathbb{N}$ we have $-\infty \leqslant -\infty < -n$ it follows that $-\infty \in \bigcap_{n\in\mathbb{N}} [-\infty,-n[$ so that

$$\{-\infty\} \subseteq \bigcap_{n\in\mathbb{N}} [-\infty,-n[\tag{20.111}$$

Let $x \in \bigcap_{n\in\mathbb{N}} [-\infty,-n[$. Then $x \in [-\infty,-1[\Rightarrow x < -1 < \infty$ so that $x \notin \infty$. Assume that $x \neq -\infty$ then $x \in \mathbb{R}$ and by [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $-x < n \Rightarrow -n < x$ so that $x \notin [-\infty,-n[$ contradicting $x \in \bigcap_{n\in\mathbb{N}} [-\infty,-n[$, hence the assumption is wrong and we must have that $x = -\infty \in \{-\infty\}$. So $\bigcap_{n\in\mathbb{N}} [-\infty,-n[\subseteq \{-\infty\}$ which combined with [eq: 20.111] proves that

$$\{\infty\} = \bigcap_{n\in\mathbb{N}} [-\infty,-n[$$

□

Lemma 20.159. *For $\sigma[\{]a,\infty]|a \in \mathbb{R}\}]$ we have the following*

1. $\forall a \in \mathbb{R}$ *we have that* $[a,\infty] \in \sigma[\{]a,\infty]|a \in \mathbb{R}\}]$
2. $\forall a \in \mathbb{R}$ *we have that* $[-\infty,a] \in \sigma[\{]a,\infty]|a \in \mathbb{R}\}]$
3. $\forall a,b \in \mathbb{R}$ *we have that* $]a,b[\in \sigma[\{]a,\infty]|a \in \mathbb{R}\}]$
4. $\forall U \in \mathcal{T}_{||}$ *we have that* $U \in \sigma[\{]a,\infty]|a \in \mathbb{R}\}]$
5. $\{\infty\} \in \sigma[\{]a,\infty]|a \in \mathbb{R}\}]$
6. $\{-\infty\} \in \sigma[\{]a,\infty]|a \in \mathbb{R}\}]$

Proof.

1. Let $a \in \mathbb{R}$ then $\left\{\left]a-\frac{1}{n},\infty\right]\right\}_{n\in\mathbb{N}_0} \subseteq \{]a,\infty]|a \in \mathbb{R}\} \subseteq \sigma(\{]a,\infty]|a \in \mathbb{R}\})$, hence $\bigcup_{n\in\mathbb{N}_0} \left]a-\frac{1}{n},\infty\right] \in \sigma(\{]a,\infty]|a \in \mathbb{R}\})$. As $[a,\infty] \underset{\text{[lemma: 20.158]}}{=} \bigcup_{n\in\mathbb{N}_0} \left]a-\frac{1}{n},\infty\right]$ we have that

$$[a,\infty] \in \sigma(\{]a,\infty]|a \in \mathbb{R}\})$$

2. Let $a \in \mathbb{R}$ then

$$\begin{aligned}
x \in \overline{\mathbb{R}} \setminus [a,\infty] \quad &\Leftrightarrow \quad x \in [-\infty,\infty] \wedge x \notin [a,\infty] \\
&\Leftrightarrow \quad (-\infty \leqslant x \wedge x \leqslant \infty) \wedge \neg(a \leqslant x \leqslant \infty) \\
&\Leftrightarrow \quad (-\infty \leqslant x \wedge x \leqslant \infty) \wedge (x < a \vee \infty < x) \\
&\underset{\infty<x \text{ is false}}{\Leftrightarrow} \quad -\infty \leqslant x \wedge x \leqslant \infty \wedge x < a \\
&\Leftrightarrow \quad -\infty \leqslant x \wedge x < a \\
&\Leftrightarrow \quad x \in [-\infty,a[
\end{aligned}$$

proving that $[-\infty,a[= \overline{\mathbb{R}} \setminus [a,\infty]$ which, as by (1) $[a,\infty] \in \sigma(\{]a,\infty]|a \in \mathbb{R}\})$ and $\sigma(\{]a,\infty]|a \in \mathbb{R}\})$ is a σ-algebra, proves

$$[-\infty,a[\in \sigma(\{]a,\infty]|a \in \mathbb{R}\})$$

3. Let $a,b \in \mathbb{R}$ with $a \leqslant b$ then

$$\begin{aligned}
x \in]a,\infty] \bigcap [-\infty,b[\quad &\Leftrightarrow \quad x \in]a,\infty] \wedge x \in [-\infty,b[\\
&\Leftrightarrow \quad a < x \wedge x \leqslant \infty \wedge -\infty \leqslant x \wedge x < b \\
&\Leftrightarrow \quad a < x \wedge x < b \\
&\Leftrightarrow \quad x \in]a,b[
\end{aligned}$$

proving that $]a,b[=]a,\infty]\bigcap[-\infty,b[$. As $]a,\infty]\in\sigma(\{]a,\infty]|a\in\mathbb{R}\})$ and by (2) $[-\infty,b[\in\sigma(\{]a,\infty]|a\in\mathbb{R}\})$ we have that $]a,\infty]\bigcap[-\infty,b[\in\sigma\{]a,\infty]|a\in\mathbb{R}\}$. So

$$]a,b[\in\sigma(\{]a,\infty]|a\in\mathbb{R}\})$$

4. Let U be a open set in $\mathbb{R}$ then by [corollary: 14.105] there exist a countable set I and family $\{]a_i,b_i[\}_{i\in I}$ such that $U=\bigcup_{i\in I}]a_i,b_i[$. By (3) it follows that $\{]a_i,b_i[\}_{i\in I}\subseteq\sigma(\{]a,\infty]|a\in\mathbb{R}\})$ so that using [theorem: 20.143] $U=\bigcup_{i\in I}]a_i,b_i[\in\sigma(\{]a,\infty]|a\in\mathbb{R}\})$.
5. Using [lemma: 20.158] we have that $\{\infty\}=\bigcap_{n\in\mathbb{N}_0}]n,\infty]$ which, as $\{]n,\infty]\}_{n\in\mathbb{N}_0}\subseteq(\{]a,\infty]|a\in\mathbb{R}\})$, proves that
$$\{\infty\}\in\sigma(\{]a,\infty]|a\in\mathbb{R}\})$$
6. Using [lemma: 20.158] we have that $\{-\infty\}=\bigcap_{n\in\mathbb{N}_0}[-\infty,-n[$ which, as by (2) $\{[-\infty,-n]\}_{n\in\mathbb{N}_0}\in\sigma(\{]a,\infty]|a\in\mathbb{R}\})$, proves by [theorem: 20.140] that
$$\{-\infty\}\in\sigma(\{]a,\infty]|a\in\mathbb{R}\})$$ □

Lemma 20.160. $\mathcal{B}[\overline{\mathbb{R}}]\underset{definition}{=}\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]=\sigma[\{]a,\infty]|a\in\mathbb{R}\}]$

Proof. Let $I\in\{]a,\infty]|a\in\mathbb{R}\}$ then there exist a $a\in\mathbb{R}$ such that $I=]a,\infty]$. By [definition: 20.45] it follows that $I\in\mathcal{B}_\infty\subseteq\mathcal{T}_{\overline{\mathbb{R}}}$, so that $\{]a,\infty]|a\in\mathbb{R}\}\subseteq\mathcal{T}_{\overline{\mathbb{R}}}\subseteq\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$. Hence using [theorem: 20.146]

$$\sigma[\{]a,\infty]|a\in\mathbb{R}\}]\subseteq\sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \tag{20.112}$$

For the opposite inclusion, let $U\in\mathcal{T}_{\overline{\mathbb{R}}}$ then by [theorem: 20.48] we have that $U\bigcap\mathbb{R}\in\mathcal{T}_{||}$. From $\overline{\mathbb{R}}=\mathbb{R}\bigcup\{-\infty\}\bigcup\{\infty\}$ it follows that

$$U=U\bigcap\overline{\mathbb{R}}=(U\bigcap\mathbb{R})\bigcup(U\bigcap\{-\infty\})\bigcup(U\bigcap\{\infty\}) \tag{20.113}$$

Now as $U\bigcap\mathbb{R}\in\mathcal{T}_{||}$ we have by [lemma: 20.159] that

$$U\bigcap\mathbb{R}\in\sigma[\{]a,\infty]|a\in\mathbb{R}\}] \tag{20.114}$$

Also $U\bigcap\{-\infty\}$ is either $\emptyset\in\sigma[\{]a,\infty]|a\in\mathbb{R}\}]$ or $\{-\infty\}$ and as by [lemma: 20.159] $\{-\infty\}\in\sigma[\{]a,\infty]|a\in\mathbb{R}\}]$ we have that

$$U\bigcap\{-\infty\}\in\sigma[\{]a,\infty]|a\in\mathbb{R}\}] \tag{20.115}$$

Finally $U\bigcap\{\infty\}$ is either $\emptyset\in\sigma[\{]a,\infty]|a\in\mathbb{R}\}]$ or $\{\infty\}$ and as by [lemma: 20.159] $\{\infty\}\in\sigma[\{]a,\infty]|a\in\mathbb{R}\}]$ it follows that

$$U\bigcap\{\infty\}\in\sigma[\{]a,\infty]|a\in\mathbb{R}\}] \tag{20.116}$$

From [eqs: 20.113, 20.114, 20.115 and 20.116] it follows that $U\in\sigma[\{]a,\infty]|a\in\mathbb{R}\}]$. Hence $\mathcal{T}_{\overline{\mathbb{R}}}\subseteq\sigma[\{]a,\infty]|a\in\mathbb{R}\}]$ [a sigma algebra on $\overline{\mathbb{R}}$] so that $\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]\subseteq\sigma[\{]a,\infty]|a\in\mathbb{R}\}]$, combining this with [eq: 20.112] gives

$$\sigma[\{]a,\infty]|a\in\mathbb{R}\}]=\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$$ □

The relation between $\mathcal{B}[\mathbb{R}]$ and $\mathcal{B}[\overline{\mathbb{R}}]$ is expressed in the following theorem.

Lemma 20.161. $\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]=\{U\in\mathcal{P}[\overline{\mathbb{R}}]|U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]\}\underset{\mathcal{B}[\mathbb{R}]=\sigma[\mathcal{T}_{||}]}{=}\{U\in\mathcal{P}(\overline{\mathbb{R}})|U\bigcap\mathbb{R}\in\sigma[\mathcal{T}_{||}]\}$

Proof. First we prove that

$$\left\{U\in\mathcal{P}[\overline{\mathbb{R}}]|U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]\right\}\text{ is a }\sigma\text{-algebra on }\overline{\mathbb{R}} \tag{20.117}$$

Proof. As $\overline{\mathbb{R}}\bigcap\mathbb{R}=\mathbb{R}\in\mathcal{B}[\mathbb{R}]$ it follows that

$$\overline{\mathbb{R}}\in\left\{U\in\mathcal{P}[\overline{\mathbb{R}}]|U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]\right\} \tag{20.118}$$

Let $U \in \{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\}$ then $U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]$ hence $\mathbb{R} \setminus (U \bigcap \mathbb{R}) \in \mathcal{B}[\mathbb{R}]$, further

$$(\overline{\mathbb{R}} \setminus U) \bigcap \mathbb{R} \underset{\text{[theorem: 1.33]}}{=} (\overline{\mathbb{R}} \bigcap \mathbb{R}) \setminus U = \mathbb{R} \setminus U \text{ and } \mathbb{R} \setminus \left(U \bigcap \mathbb{R}\right) \underset{\text{[eq: 1.31]}}{=} (\mathbb{R} \setminus U) \bigcup (\mathbb{R} \setminus \mathbb{R}) = \mathbb{R} \setminus U$$

so that $(\overline{\mathbb{R}} \setminus U) \bigcap \mathbb{R} = \mathbb{R} \setminus (U \bigcap \mathbb{R}) \in \mathcal{B}[\mathbb{R}]$, proving that $(\overline{\mathbb{R}} \setminus U) \in \{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\}$. In other words

$$\forall U \in \left\{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\right\} \text{ we have } \overline{\mathbb{R}} \setminus U \in \left\{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\right\} \tag{20.119}$$

Let $\{U_i\}_{i \in \mathbb{N}} \subseteq \{U \in \mathcal{P}(\overline{\mathbb{R}}) | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\}$ then $\forall i \in \mathbb{N}$ $U_i \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]$ so that $(\bigcup_{i \in \mathbb{N}} U_i) \bigcap \mathbb{R} = \bigcup_{i \in \mathbb{N}} (U_i \bigcap \mathbb{R}) \in \mathcal{B}[\mathbb{R}]$. Hence

$$\forall \{U_i\}_{i \in \mathbb{N}} \subseteq \left\{U \in \mathcal{P}(\overline{\mathbb{R}}) | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\right\} \bigcup_{i \in \mathbb{N}} \left(U_i \bigcap \mathbb{R}\right) \in \mathcal{B}[\mathbb{R}] \tag{20.120}$$

Finally [eqs: 20.118, 20.119 and 20.120] proves [eq: 20.117]. □

Take $U \in \mathcal{T}_{\overline{\mathbb{R}}}$ then by [theorem: 20.48] we have that $U \bigcap \mathbb{R} \in \mathcal{T}_{||} \subseteq \sigma[\mathcal{T}_{||}] \underset{\text{definition}}{=} \mathcal{B}[\mathbb{R}]$ proving that $U \in \{U \in \mathcal{P}(\overline{\mathbb{R}}) | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\}$ so that

$$\mathcal{T}_{\overline{\mathbb{R}}} \subseteq \left\{U \in \mathcal{P}(\overline{\mathbb{R}}) | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\right\}$$

and as $\{U \in \mathcal{P}(\overline{\mathbb{R}}) | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\}$ is a σ-algebra on $\overline{\mathbb{R}}$ [see eq: 20.117] it follows from [theorem: 20.146] that

$$\mathcal{B}[\overline{\mathbb{R}}] \underset{\text{definition}}{=} \sigma(\mathcal{T}_{\overline{\mathbb{R}}}) \subseteq \left\{U \in \mathcal{P}(\overline{\mathbb{R}}) | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\right\} \tag{20.121}$$

For the opposite inclusion define

$$S = \left\{U \bigcap \mathbb{R} | U \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]\right\} \subseteq \mathcal{P}(\mathbb{R}) \tag{20.122}$$

then as $\mathcal{T}_{\overline{\mathbb{R}}} \subseteq \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ we have

$$\mathcal{T}_{||} \underset{\text{[theorem: 20.48]}}{=} \left\{U \bigcap \mathbb{R} | U \in \mathcal{T}_{\overline{\mathbb{R}}}\right\} \subseteq \left\{U \bigcap \mathbb{R} | U \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]\right\} = S \tag{20.123}$$

Further as $\mathbb{R} \in \mathcal{T}_{||} \underset{\text{[theorem: 20.48]}}{\subseteq} \mathcal{T}_{\overline{\mathbb{R}}} \subseteq \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ we have for $U \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ that $U \bigcap \mathbb{R} \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ proving

$$S \subseteq \sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \tag{20.124}$$

Next we prove that

$$S \text{ is a } \sigma\text{-algebra on } \mathbb{R} \tag{20.125}$$

Proof. As $\mathbb{R} = \mathbb{R} \bigcap \mathbb{R}$ and $\mathbb{R} \in \mathcal{T}_{\mathbb{R}} \underset{\text{[theorem: 20.48]}}{\subseteq} \mathcal{T}_{\overline{\mathbb{R}}} \subseteq \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ it follows that

$$\mathbb{R} \in \mathcal{S} \tag{20.126}$$

If $A \in \mathcal{S}$ then there exist a $U \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ such that $A = U \bigcap \mathbb{R}$ so that

$$\mathbb{R} \setminus A = \mathbb{R} \setminus \left(U \bigcap \mathbb{R}\right) \underset{\text{[eq: 1.31]}}{=} (\mathbb{R} \setminus U) \bigcup (\mathbb{R} \setminus \mathbb{R}) = \mathbb{R} \setminus U$$

which, as $\mathbb{R}, U \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \underset{\text{[eq: 20.136]}}{\Rightarrow} \mathbb{R} \setminus U \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$, proves that

$$\mathbb{R} \setminus A \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$$

Hence $(\mathbb{R} \setminus A) \bigcap \mathbb{R} = \mathbb{R} \setminus A \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ so that $\mathbb{R} \setminus A \in \mathcal{S}$. Summarized

$$\forall A \in \mathcal{S} \text{ we have } \mathbb{R} \setminus A \in S \tag{20.127}$$

If $\{A_i\}_{i \in \mathbb{N}} \subseteq S$ then there exists a $\{U_i\}_{i \in \mathbb{N}} \subseteq \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ such that $\forall i \in \mathbb{N}$ we have $A_i = U_i \bigcap \mathbb{R}$, then $\bigcup_{i \in \mathbb{N}} A_i = (\bigcup_{i \in \mathbb{N}} (U_i \bigcap \mathbb{R})) = (\bigcup_{i \in \mathbb{N}} U_i) \bigcap \mathbb{R}$ which, as $\bigcup_{i \in \mathbb{N}} U_i \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$. proves that $\bigcup_{i \in \mathbb{N}} A_i \in S$. In other words

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq S \text{ we have } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{S} \tag{20.128}$$

Finally [eqs: 20.126, 20.127 and 20.128] proves that S is a σ-algebra on $\mathbb{R}$ thus proving [eq: 20.125]. □

So we have proved that $\mathcal{T}_{||} \subseteq S$ [see eq: 20.123] and S is a σ-algebra on $\mathbb{R}$ from which it follows, using [theorem: 20.146], that

$$\mathcal{B}[\mathbb{R}] \underset{\text{definition}}{=} \sigma[\mathcal{T}_{\mathbb{R}}] \subseteq S \underset{\text{[eq: 20.124]}}{\subseteq} \sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \tag{20.129}$$

Let $A \in \{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\}$ then $A \subseteq \overline{\mathbb{R}}$ so that $A = A \bigcap \bar{\mathbb{R}} = A \bigcap (\mathbb{R} \bigcup \{-\infty\}, \{\infty\})$ giving

$$A = (A \bigcap \mathbb{R}) \bigcap (A \bigcap \{-\infty\}) \bigcap (A \bigcap \{\infty\}) \tag{20.130}$$

where

1. $A \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}] \underset{\text{[eq: 20.129]}}{\Rightarrow} A \bigcap \mathbb{R} \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$
2. $A \bigcap \{-\infty\}$ is either $\emptyset \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ or $\{-\infty\} \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ [as $-\infty$ is closed [theorem: 20.49] and closed sets are part of $\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ by [theorem: 20.150]].
3. $A \bigcap \{-\infty\}$ is either $\emptyset \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ or $\{\infty\} \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ [as ∞ is closed by [theorem: 20.49]and closed sets are part of $\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ by [theorem: 20.150]].

From the above we conclude that $\{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} \subseteq \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ which combined with [eq: 20.121] proves that

$$\sigma[\mathcal{T}_{\overline{\mathbb{R}}}] = \left\{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\right\}$$ □

Summarizing the above two lemmas in a theorem we get:

Theorem 20.162. *The Borel algebra on $\overline{\mathbb{R}}$ satisfies*

$$\begin{aligned}
\mathcal{B}[\overline{\mathbb{R}}] &\underset{\text{defintion}}{=} \sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \\
&\underset{\text{[theorem: 20.150]}}{=} \sigma[\{C | C \text{ is closed in } \mathcal{T}_{\overline{\mathbb{R}}}\}] \\
&= \sigma[\{]a, \infty] | a \in \mathbb{R}\}] \\
&= \left\{U \subseteq \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\right\}
\end{aligned}$$

Further we have that

$$\mathcal{B}[\mathbb{R}] \subseteq \mathcal{B}[\overline{\mathbb{R}}]$$

Proof. The first part of the theorem follows from [lemma: 20.161] and [lemma: 20.161]. For the last part. Let $A \in \mathcal{B}[\mathbb{R}]$ then $A \subseteq \mathbb{R} \subseteq \overline{\mathbb{R}}$ so that $A \in \mathcal{P}(\overline{\mathbb{R}})$ and $A = A \bigcap R \in \mathcal{B}[\mathbb{R}]$ hence $A \in \{U \subseteq \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} = \mathcal{B}[\overline{\mathbb{R}}]$. Hence we have $\mathcal{B}[\mathbb{R}] \subseteq \mathcal{B}[\overline{\mathbb{R}}]$. □

20.3.3 Borel algebra on $\mathbb{R}^n$

Definition 20.163. *Let $n \in \mathbb{N}$ then the Borel algebra on $\mathbb{R}^n$ is noted as $\mathcal{B}[\mathbb{R}^n]$ so*

$$\mathcal{B}[\mathbb{R}^n] = \sigma[\mathbb{R}^n, \mathcal{T}_{\|\|_n}]$$

where $\mathcal{T}_{\|\|_n}$ is the canonical topology on $\mathbb{R}^n$ [see example: 14.95]

First we extend the concept of generalized intervals to intervals on $\mathbb{R}^n$

Definition 20.164. *Let $n \in \mathbb{N}$ and $x, y \in \mathbb{R}^n$ then $x \leqslant_n y$ if $\forall i \in \{1, \ldots, n\}$ $x_i < y_i$*

This relation makes $\langle \mathbb{R}^n, \leqslant_n \rangle$ a partial ordered set.

Theorem 20.165. *Let $n \in \mathbb{N}$ then $\langle \mathbb{R}^n, \leqslant_n \rangle$ is a partial ordered set.*

***Note* 20.166.** *As for $(1,2)$, $(2,1)$ we that $(1,2) \nleqslant_2 (2,1)$ and $(2,1) \nleqslant_2 (1,2)$ $\leqslant_n$ is not a total or full order.*

Proof. We have

reflexivity. If $x \in \mathbb{R}^n$ then $\forall i \in \{1, \ldots, n\}$ we have $x_i = x_i \Rightarrow x_i \leqslant x_i$ proving that $x \leqslant_n x$.

anti-symmetry. If $x, y \in \mathbb{R}^n$ satisfies $x \leqslant y \wedge y \leqslant x$ then we have $\forall i \in \mathbb{N}$ we have $x_i \leqslant y_i$ and $y_i \leqslant x_i$ so that $x_i = y_i$ from which it follows that $x = y$.

transitivity. If $x \leqslant_n y$ and $y \leqslant_n z$ then we have $\forall i \in \{1, \ldots, n\}$ that $x_i \leqslant y_i \wedge y_i \leqslant z_i \Rightarrow x_i \leqslant z_i$ from which it follows that $x \leqslant_n z$. □

Using this order relation we can extend the concept of intervals to intervals in $\mathbb{R}^n$.

Definition 20.167. *Let $n \in \mathbb{N}_0$, $a, b \in \mathbb{R}^n$ such that $a \leqslant_n b$ then we have*

$$\begin{aligned}
[a,b] &= \{x \in \mathbb{R}^n | a \leqslant_n x \wedge x \leqslant_n b\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } a_i \leqslant x_i \wedge x_i \leqslant b_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } x_i \in [a_i, b_i]\} \\
&= \prod_{i \in \{1, \ldots, n\}} [a_i, b_i] \\
[a,b[&= \{x \in \mathbb{R}^n | a \leqslant_n x \wedge x <_n b\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } a_i \leqslant x_i \wedge x_i < b_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } x_i \in [a_i, b_i[\} \\
&= \prod_{i < \{1, \ldots, n\}} [a_i, b_i[\\
]a,b] &= \{x \in \mathbb{R}^n | a <_n x \wedge x \leqslant_n b\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } a_i < x_i \wedge x_i \leqslant b_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } x_i \in]a_i, b_i]\} \\
&= \prod_{i \in \{1, \ldots, n\}}]a_i, b_i] \\
]a,b[&= \{x \in \mathbb{R}^n | a <_n x \wedge x <_n b\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } a_i < x_i \wedge x_i < b_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } x_i \in]a_i, b_i[\} \\
&= \prod_{i < \{1, \ldots, n\}}]a_i, b_i[\\
]-\infty, a] &= \{x \in \mathbb{R}^n | x \leqslant_n a\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } x_i \leqslant a_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } x_i \in]-\infty, a_i]\} \\
&= \prod_{i < \{1, \ldots, n\}}]-\infty, a_i] \\
]-\infty, a[&= \{x \in \mathbb{R}^n | x < a\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } x_i < a_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } x_i \in]-\infty, a_i[\} \\
&= \prod_{i < \{1, \ldots, n\}}]-\infty, a_i[\\
[a, \infty[&= \{x \in \mathbb{R}^n | a \leqslant_n x\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } a_i \leqslant x_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } x_i \in [a_i, \infty[\} \\
&= \prod_{i < \{1, \ldots, n\}} [a_i, \infty[\\
]a, \infty[&= \{x \in \mathbb{R}^n | a <_n x\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } a_i < x_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1, \ldots, n\} \text{ we have } x_i \in]a_i, \infty[\} \\
&= \prod_{i < \{1, \ldots, n\}}]a_i, \infty[
\end{aligned}$$

To simply notation we have also the following definitions:

Definition 20.168. *Let $n \in \mathbb{N}_0$ and $a, b \in \mathbb{R}$ then we define the following sets*

1. $[a,b]^n = \{x \in \mathbb{R}^n | a \leqslant x_i \leqslant b\}$
2. $[a,b[^n = \{x \in \mathbb{R}^n | a \leqslant x_i < b\}$
3. $]a,b]^n = \{x \in \mathbb{R}^n | a < x_i \leqslant b\}$
4. $]a,b[^n = \{x \in \mathbb{R}^n | a < x_i < b\}$
5. $]-\infty,a]^n = \{x \in \mathbb{R}^n | x_i \leqslant a\}$
6. $]-\infty,a[^n = \{x \in \mathbb{R}^n | x_i < a\}$
7. $[a,\infty[^n = \{x \in \mathbb{R}^n | a \leqslant x_i\}$
8. $]a,\infty[^n = \{x \in \mathbb{R}^n | a < x_i\}$

We specify now the sufficient and necessary condition for a interval in $\mathbb{R}^n$ to be empty.

Lemma 20.169.
Let $n \in \mathbb{N}$ and $a, b \in \mathbb{R}^n$ then we have

1. $[a,b[= \emptyset \Leftrightarrow \exists i \in \{1,\ldots,n\}$ *such that* $a_i \geqslant b_i$
2. $]a,b] = \emptyset \Leftrightarrow \exists i \in \{1,\ldots,n\}$ *such that* $a_i \geqslant b_i$
3. $]a,b[= \emptyset \Leftrightarrow \exists i \in \{1,\ldots,n\}$ *such that* $a_i \geqslant b_i$

Proof.

1. As $[a,b[= \prod_{i \in \{1,\ldots,n\}} [a_i,b_i[$ we have

   $\Rightarrow$. If $[a,b[= \emptyset$ then by [theorem 3.110] $\exists i \in \{1,\ldots,n\}$ such that $[a_i,b_i[= \emptyset$. If $a_i < b_i$ then by [theorem: 10.32] there exists a $x \in \mathbb{R}$ such that $a_i < x < b_i \Rightarrow x \in [a_i,b_i[$ contradicting $[a_i,b_i[= \emptyset$, so we must have $a_i \geqslant b_i$.

   $\Leftarrow$. If there exists a $i \in \{1,\ldots,n\}$ with $a_i \geqslant b_i$ then if $x \in [a_i,b_i[$ we have $a_i \leqslant x \wedge x < b_i \leqslant a_i$ leading to the contradiction $a_i < a_i$ so $[a_i,b_i[= \emptyset$. Hence using [theorem 3.110] $[a,b[= \varnothing$.

2.

   $\Rightarrow$. If $]a,b] = \emptyset$ then by [theorem 3.110] $\exists i \in \{1,\ldots,n\}$ such that $]a_i,b_i] = \emptyset$. If $a_i < b_i$ then by [theorem: 10.32] there exists a $x \in \mathbb{R}$ such that $a_i < x < b_i \Rightarrow x \in]a_i,b_i]$ contradicting $]a_i,b_i] = \emptyset$, so we must have $a_i \geqslant b_i$.

   $\Leftarrow$. If there exists a $i \in \{1,\ldots,n\}$ with $a_i \geqslant b_i$ then if $x \in]a_i,b_i]$ we have $a_i < x \wedge x \leqslant b_i \leqslant a_i$ leading to the contradiction $a_i < a_i$ so $]a_i,b_i] = \emptyset$. Hence using [theorem 3.110] $]a,b] = \varnothing$.

3.

   $\Rightarrow$. If $]a,b[= \emptyset$ then by [theorem 3.110] $\exists i \in \{1,\ldots,n\}$ such that $]a_i,b_i[= \emptyset$. If $a_i < b_i$ then by [theorem: 10.32] there exists a $x \in \mathbb{R}$ such that $a_i < x < b_i \Rightarrow x \in]a_i,b_i[$ contradicting $]a_i,b_i[= \emptyset$, so we must have $a_i \geqslant b_i$.

   $\Leftarrow$. If there exists a $i \in \{1,\ldots,n\}$ with $a_i \geqslant b_i$ then if $x \in]a_i,b_i[$ we have $a_i < x \wedge x < b_i \leqslant a_i$ leading to the contradiction $a_i < a_i$ so $]a_i,b_i[= \emptyset$. Hence using [theorem 3.110] $]a,b] = \varnothing$. □

To be able to use half open intervals in $\mathbb{R}^n$ of the form $[a,b]$ to generate the Borel algebra on $\mathbb{R}^n$ we introduce Dyadic intervals. We prove then that any open sets in $\langle \mathbb{R}^n, \mathcal{T} \rangle$ is a countable union of Diadic intervals. First we define the set of half open intervals on $\mathbb{R}^n$

Definition 20.170. *Let $n \in \mathbb{N}$ then*

$$\mathcal{R}^n = \{[a,b[| a,b \in \mathbb{R}^n \wedge a < b\}$$

***Note* 20.171.** *Note as $a < b$ we have by [lemma: 20.169] that $\forall i \in \{1,\ldots,n\}$ $a_i < b_i$ so that $[a_i,b_i[\neq \varnothing$*

The following lemma allows us to define a function that maps a element of $\mathcal{R}^n$ to its endpoints. Using this we can define then the volume of elements of $\mathcal{R}^n$.

Lemma 20.172. *Let $n \in \mathbb{N}$ and $\{x_i\}_{i\in\{1,\dots,n\}} \subseteq \mathbb{R}^+$ then $\prod_{i\in\{1,\dots,n\}} x_i \in \mathbb{R}^+$*

Proof. We prove this by induction, so let

$$S = \left\{ n \in \mathbb{N} | \text{If } \{x_i\}_{i\in\{1,\dots,n\}} \subseteq \mathbb{R}^+ \text{ then } \prod_{i\in\{1,\dots,n\}} x_o \right\}$$

then we have:

$1 \in S$. If $\{x_i\}_{i\in\{1\}} \subseteq \mathbb{R}^+$ then $\prod_{i\in\{1\}} x_i = x_1 \in \mathbb{R}^+$ which proves that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $\{x_i\}_{i\in\{1,\dots,n+1\}} \subseteq [0,\infty]$ then as $n \in S$ we have $\prod_{i=1}^n x_i \in \mathbb{R}^+$, as also $x_i \in \mathbb{R}^+$ it follows from [theorem: 10.14] that

$$0 \leqslant \left(\prod_{i\in\{1,\dots,n\}} x_i \right) \cdot x_{n+1} = \prod_{i\in\{1,\dots,n+1\}} x_i$$

so that $n+1 \in \mathbb{N}$ □

Lemma 20.173. *Let $n \in \mathbb{N}$ and $I \in \mathcal{R}^n$ then there exist a **unique** a $a, b \in \mathbb{R}^n$ with $a < b$ such that $I = [a, b[$*

Proof. If $I \in \mathcal{R}^n$ then by definition of $\mathcal{R}^n$ there exist a $a, b \in \mathbb{R}^n$ with $a < b$ such that $I = [a, b[$. Assume that there exists also a $a', b' \in \mathbb{R}^n$ such that $I = [a', b'[$. Then $\prod_{i\in\{1,\dots,n\}} [a_i, b_i[= \prod_{i\in\{1,\dots,n\}} [a'_i, b'_i[$ and $\forall i \in \{1,\dots,n\}$ $[a_i, b_i[\neq \varnothing$, hence using [theorem: 3.113] we have that

$$\forall i \in \{1,\dots,n\} \text{ that } \varnothing \neq [a_i, b_i[= [a'_i, b'_i[$$

Let $i \in \{1,\dots,n\}$ then as $\varnothing \neq [a_i, b_i[= [a'_i, b'_i[$ it follows from [theorem: 3.144] that $a_i = a'_i$ and $b_i = b'_i$ proving uniqueness.. □

Thanks to the above lemmas the following is well defined.

Definition 20.174. *Let $n \in \mathbb{N}$ then we define:*

1. $\text{begin}: \mathcal{R}^n \to \mathbb{R}$ *by* $\text{begin}(I) = a$ *where* $I = [a, b[$ *and* $a < b$
2. $\text{end}: \mathcal{R}^n \to \mathbb{R}$ *by* $\text{end}(I) = b$ *where* $I = [a, b[$ *and* $a < b$
3. $v^n: \mathcal{R}^n \to]0, \infty[= \mathbb{R}^n$ *where* $v^n(I) = \prod_{i\in\{1,\dots,n\}} (\text{begin}(I)_i - \text{end}(I)_i)$

***Note* 20.175.** *As* $\text{begin}(I) < \text{end}(I)$ *we have* $\forall i \in \{1,\dots,n\}$

$$\text{begin}(I)_i < \text{end}(I)_i \Rightarrow \text{end}(I)_i - \text{begin}(I)_i \in [0,\infty] \text{ so that by [lemma: 20.172]}$$

$v^n(R) \in \mathbb{R}^+$ as is needed in (3).

We introduce now Dyadic cubes that forms a countable subset of $\mathcal{R}^n$.

Definition 20.176. (Dyadic Cubes) *Let $n \in \mathbb{N}$, $m \in \mathbb{N}_0$ then we define $\mathcal{D}^n_m$ by*

$$\mathcal{D}^n_m = \left\{ \left[\frac{z}{2^m}, \frac{z+1}{2^m} \right[\middle| z \in \mathbb{Z}^n \right\} \subseteq \mathcal{R}^n$$

Elements of $\mathcal{D}^n_m$ are called Dyadic cubes of order m. Further $\mathcal{D}^n$ defined by

$$\mathcal{D}^n = \bigcup_{m\in\mathbb{N}_0} \mathcal{D}^n_m \subseteq \mathcal{R}^n$$

is the set of all Dyadic cubes.

***Note* 20.177.** *As $\frac{z}{2^m} < \frac{z+1}{2^m}$ we have that $\frac{z}{2^m} \in \left[\frac{z}{2^m}, \frac{z+1}{2^m}\right[$ so that Dyadic cubes are not empty.*

Lemma 20.178. *Let $k,l\in\mathbb{N}_0$ with $k\leqslant l$, $r,q\in\mathbb{Z}$ then for $\left[\frac{r}{2^l},\frac{r+1}{2^l}\right]$, $\left[\frac{q}{2^k},\frac{q+1}{2^k}\right[$ we have*

$$\left[\frac{r}{2^l},\frac{r+1}{2^l}\right[\bigcap\left[\frac{q}{2^k},\frac{q+1}{2^k}\right[\neq\emptyset\ \Rightarrow\ \left[\frac{r}{2^l},\frac{r+1}{2^l}\right[\subseteq\left[\frac{q}{2^k},\frac{q+1}{2^k}\right[$$
$$\left[\frac{r}{2^l},\frac{r+1}{2^l}\right[\bigcap\left[\frac{q}{2^k},\frac{q+1}{2^k}\right[=\emptyset\ \Rightarrow\ \left[\frac{r}{2^l},\frac{r+1}{2^l}\right[\nsubseteq\left[\frac{q}{2^k},\frac{q+1}{2^k}\right[$$

in other words. We have either $\left[\frac{r}{2^l},\frac{r+1}{2^l}\right[\bigcap\left[\frac{q}{2^k},\frac{q+1}{2^k}\right[=\emptyset$ or $\left[\frac{r}{2^l},\frac{r+1}{2^l}\right[\subseteq\left[\frac{q}{2^k},\frac{q+1}{2^k}\right[$ but not both.

Proof. Take $I=\left[\frac{q}{2^l},\frac{q+1}{2^l}\right[$ and $J=\left[\frac{r}{2^k},\frac{r+1}{2^k}\right[$. As $k\leqslant l$ we have $0\leqslant l-k=n$. Next

$$\begin{aligned}J&=\left[\frac{r}{2^k},\frac{r+1}{2^k}\right[\\&=\left[\frac{r}{2^k}\cdot\frac{2^{l-k}}{2^{l-k}},\frac{r+1}{2^k}\cdot\frac{2^{l-k}}{2^{l-k}}\right[\\&=\left[\frac{r\cdot 2^{l-k}}{2^l},\frac{r\cdot 2^{l-k}+2^{l-k}}{2^l}\right[\\&=\left[\frac{r\cdot 2^n}{2^l},\frac{r\cdot 2^n+2^n}{2^l}\right[\end{aligned}\tag{20.131}$$

Assume that $I\bigcap J\neq\emptyset$ so that $\exists x\in I\bigcap J$ giving

$$\frac{q}{2^l}\leqslant x<\frac{q+1}{2^l}\wedge\frac{r\cdot 2^n}{2^l}\leqslant x<\frac{r\cdot 2^n+2^n}{2^l}\tag{20.132}$$

If now $\frac{q+1}{2^l}\leqslant\frac{r\cdot 2^n}{2^l}$ then $x<\frac{q+1}{2^l}\leqslant\frac{r\cdot 2^n}{2^l}\leqslant x$ giving the contradiction $x<x$ so we must have

$$\frac{r\cdot 2^n}{2^l}<\frac{q+1}{2^l}\tag{20.133}$$

Further if $\frac{r\cdot 2^n+2^n}{2^l}\leqslant\frac{q}{2^l}$ then $x<\frac{r\cdot 2^n+2^n}{2^l}\leqslant\frac{q}{2^l}\leqslant x$ giving the contradiction $x<x$ again so we must have that

$$\frac{q}{2^l}<\frac{r\cdot 2^n+2^n}{2^l}\tag{20.134}$$

Multiplying 20.133 and 20.134 by 2^l gives $r\cdot 2^n<q+1\wedge q<r\cdot 2^n+2^n$. As $r\cdot 2^n,q+1,r\cdot 2^n+2^n\in\mathbb{Z}$ we have by [theorem: 10.28] that $r\cdot 2^n+1\leqslant q+1\wedge q+1\leqslant r\cdot 2^n+2^n\Rightarrow r\cdot 2^n\leqslant q\wedge q+1\leqslant r\cdot 2^n+2^n$. Dividing by 2^l gives:

$$\frac{r\cdot 2^n}{2^l}\leqslant\frac{q}{2^l}\wedge\frac{q+1}{2^l}\leqslant\frac{r\cdot 2^n+2^n}{2^l}\tag{20.135}$$

Next if $x\in I\bigcap J$ then $\frac{q}{2^l}\leqslant x<\frac{q+1}{2^l}\underset{20.135}{\Rightarrow}\frac{r\cdot 2^n}{2^l}\leqslant x<\frac{r\cdot 2^n+2^n}{2^l}$ proving using 20.131 that $x\in J$. Hence we have

$$\text{If } I\bigcap J\neq\emptyset \text{ then } I\subseteq J$$

Finally if $I\bigcap J=\emptyset$ then if $I\subseteq J$ we have $\emptyset=I\bigcap J=I$ a contradiction as $\frac{q}{2^l}\in I$. Hence we have either $I\bigcap J=\emptyset$ or $I\subseteq J$ but not both. □

Theorem 20.179. *Let $n\in\mathbb{N}$ then we have*

1. *$\forall m\in\mathbb{N}_0$ and $\forall R,Q\in\mathcal{D}_m^n$ with $R\neq Q$ we have $R\bigcap Q=\varnothing$*
2. *Let $k,l\in\mathbb{N}_0$ with $k\leqslant l$ then if $R\in\mathcal{D}_l^n$ and $R\in\mathcal{D}_k^n$ we have that*

$$R\bigcap Q\neq\varnothing\ \Rightarrow\ R\subseteq Q$$
$$R\bigcap Q=\varnothing\ \Rightarrow\ R\nsubseteq Q$$

3. *$\forall m\in\mathbb{N}_0$ we have that $\mathbb{R}^n=\bigsqcup_{R\in\mathcal{D}_m^n}R$ [here $\bigsqcup_{R\in\mathcal{D}_m^n}R$ is a disjoint union because of (1)].*

4. *$\forall m \in \mathbb{N}_0$ and $\forall R \in \mathcal{D}_m^n$ we have that $v^n(R) = \frac{1}{2^{n \cdot m}} < 1$*

Proof.

1. Let $m \in \mathbb{N}_0$ and $R, Q \in \mathcal{D}_m^n$ with $R \neq Q$. Then there exist $r, z \in \mathbb{Z}^n$ such that

$$R = \left[\frac{r}{2^m}, \frac{r+1}{2^m}\right[= \prod_{i \in \{1,\ldots,n\}} \left[\frac{r_i}{2^m}, \frac{r_i}{2^m}\right[\text{ and } Q = \left[\frac{z}{2^m}, \frac{z+1}{2^m}\right[= \prod_{i \in \{1,\ldots,n\}} \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m}\right[$$

As $R \neq Q$ there exist a $i \in \{1,\ldots,n\}$ such that $\left[\frac{r_i}{2^m}, \frac{r_i+1}{2^m}\right[\neq \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m}\right[$, hence we must have that $r_i \neq z_i$. We can always assume that $r_i < z_i$ [if not exchange R and Q] so that $r_i + 1 \leqslant z_i$ [as $r_i, z_i \in \mathbb{Z}$ we can use [theorem: 10.28]]. Assume that $x \in \left[\frac{r_i}{2^m}, \frac{r_i+1}{2^m}\right[\bigcap \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m}\right[$ then $\frac{r_i}{2^m} \leqslant x < \frac{r_i+1}{2^m} \leqslant \frac{z_i}{2^m} \leqslant x < \frac{z_i+1}{2^m}$ leading to the contradiction $x < x$ hence we must have that $\left[\frac{r_i}{2^m}, \frac{r_i+1}{2^m}\right[\bigcap \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m}\right[= \varnothing$. Using [theorem: 3.110] it follows that $\prod_{i \in \{1,\ldots,n\}} \left[\frac{r_i}{2^m}, \frac{r_i}{2^m}\right[\bigcap \prod_{i \in \{1,\ldots,n\}} \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m}\right[$ or

$$R \bigcap Q = \varnothing$$

2. Let $k, l \in \mathbb{N}_0$ with $k \leqslant l$ and $R \in \mathcal{D}_l^n$, $Q \in \mathcal{D}_k^n$ then there exists $r, q \in \mathbb{Z}^n$ with $R = \left[\frac{r}{2^m}, \frac{r+1}{2^m}\right[$, $Q = \left[\frac{z}{2^m}, \frac{z+1}{2^m}\right[$. Assume that $R \nsubseteq Q$ then we have either

   $\boldsymbol{\exists i \in \{1,\ldots,n\} \vDash \left[\frac{r_i}{2^m}, \frac{r_i+1}{2^m}\right[\bigcap \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m}\right[= \varnothing}$. Then using [theorem: 3.110] we have $R \bigcap Q = \varnothing$

   $\boldsymbol{\exists i \in \{1,\ldots,n\} \vDash \left[\frac{r_i}{2^m}, \frac{r_i+1}{2^m}\right[\bigcap \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m}\right[\neq \varnothing}$. Then using [lemma: 20.178] we have $\forall i \in \{1,\ldots,n\}$ that $\left[\frac{r_i}{2^m}, \frac{r_i+1}{2^m}\right[\subseteq \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m}\right[$. Applying [theorem: 3.111] proves that $R \subseteq Q$ contradicting $R \nsubseteq Q$. So this case never applies.

   So we conclude that if $R \nsubseteq \mathbb{Q}$ then $R \bigcap Q = \varnothing$ or using contraposition we have

$$\text{If } R \bigcap Q \neq \varnothing \text{ then } R \subseteq Q$$

   On the other hand if $R \bigcap Q = \varnothing$ and $R \subseteq Q$ then $\varnothing \neq R = R \bigcap Q = \varnothing$ s controdiction so we have

$$\text{If } R \bigcap Q = \varnothing \text{ then } R \nsubseteq Q$$

3. Let $m \in \mathbb{N}$ and $x \in \mathbb{R}^n$ then $\forall i \in \{1,\ldots,n\}$ we have $x_i \in \mathbb{R}$. Using [theorem: 10.30] there exist a $z_i \in \mathbb{Z}$ such that $z_i \leqslant x_i \cdot 2^m < z_i + 1$, hence $\frac{z_i}{2^m} \leqslant x_i < \frac{z_i+1}{2^m}$. So if we take $z = (z_1, \ldots, z_m)$ then $x \in \prod_{i \in \{1,\ldots,n\}} \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m}\right[= \left[\frac{z}{2^m}, \frac{z+1}{2^m}\right[\in \mathcal{D}_m^n$ proving that $\mathbb{R}^n \subseteq \bigcup_{R \in \mathcal{D}_m^n} R$. As $\forall R \in \mathcal{D}_m^n$ $R \subseteq R^n$ we have proved that

$$R^n = \bigcup_{R \in \mathcal{D}_m^n} R$$

   Finally by (1) we have that $\forall R, R' \in \mathcal{D}_m^n$ with $R \neq R'$ we have $R \bigcap R' = \varnothing$ so that

$$R^n = \bigsqcup_{R \in \mathcal{D}_m^n} R$$

4. If $R \in \mathcal{R}_m^n$ then $\exists z \in \mathbb{Z}^n$ such that $R = \prod_{i \in \{1,\ldots,n\}} \left[\frac{z_i}{2^n}, \frac{z_i+1}{2^n}\right[$ so that

$$v^n(R) = \prod_{i=1}^n \left(\frac{z_i + 1 - z_i}{2^m}\right) = \prod_{i=1}^n \frac{1}{2^m} = \frac{1}{2^{n \cdot m}} \qquad \square$$

One of the reasons that we introduce the Dyadic cubes as a subset of $\mathcal{R}^n$ is that $\mathcal{D}_m^n$ is a denumerable set in contrast with $\mathcal{R}^n$ which we need giving the definition of a σ-algebra. This is proved in the next lemma.

Lemma 20.180. *Let $n \in \mathbb{N}$ then*

1. *$\forall m \in \mathbb{N}_0$ $\mathcal{D}_m^n$ is denumerable.*

2. *$\mathcal{D}^n$ is denumerable*

Proof.

1. Let $m \in \mathbb{N}_0$ then as $\mathbb{Z}$ is denumerable [see theorem: 10.5] we have by [theorem: 6.67] that $\mathbb{Z}^n$ is also denumerable. Define now $\beta: \mathbb{Z}^n \to \mathcal{D}^n_m$ by $\beta(z) = \left[\frac{z}{2^m}, \frac{z+1}{2^m}\right[$ then β is a bijection.

   injectivity. If $\beta(z) - \beta(w)$ then $\left[\frac{z}{2^m}, \frac{z+1}{2^m}\right[= \left[\frac{w}{2^m}, \frac{w+1}{2^m}\right[$. Using the fact that a Dyadic cube is not empty together with [lemma: 20.173] gives $\frac{z}{2^m} = \frac{w}{2^m}$ proving that $z = w$.

   surjectivity. This follows from the definition of $\mathcal{D}^n_m$

   So $\mathcal{D}^n_m$ is denumerable.

2. Using [theorem: 6.69] it follows that $\mathcal{D}^n = \bigcup_{m \in \mathbb{N}} \mathcal{D}^n_m$ is denumerable □

We are now finally ready to prove that every non empty open set on $\mathbb{R}^n$ can be written as a denumerable union of pairwise disjoint Dyadic cubes.

Lemma 20.181. *Let $n \in \mathbb{N}$, $\mathcal{T}_{\|\|_n}$ the canonical topology on $\mathbb{R}$ [see example: 14.95] then if $\varnothing \neq U \in \mathcal{T}_{\|\|_n}$ there exist a **pairwise disjoint family** $\{D_i\}_{i \in \mathbb{N}} \subseteq \mathcal{D}^n$ such that $U = \bigsqcup_{i \in \mathbb{N}} D_i$.*

Proof. Let $\varnothing \neq U \in \mathcal{T}_{\|\|_n}$ be a non empty open set in $\mathbb{R}^n$. Given $m \in \mathbb{N}_0$ define

$$\mathcal{S}_m = \{D \in \mathcal{D}^n_m | D \subseteq U\} \subseteq \mathcal{D}^n_m \tag{20.136}$$

and recursively

$$\mathcal{T}_m = \begin{cases} S_0 \text{ if } m = 0 \\ \{D \in \mathcal{S}_m | \forall i \in \{0, \ldots, m-1\} \text{ we have } \forall R \in \mathcal{T}_i \text{ that } R \bigcap D = \varnothing\} \text{ if } m \in \mathbb{N} \end{cases} \tag{20.137}$$

Using the above definitions we have the following inclusions

$$\forall m \in \mathbb{N}_0 \text{ we have } \mathcal{T}_m \subseteq \mathcal{S}_m \subseteq \mathcal{D}^n_m \subseteq \mathcal{D}^n \tag{20.138}$$

Further we define

$$\mathcal{T} = \bigcup_{m \in \mathbb{N}_0} \mathcal{T}_m \tag{20.139}$$

If $D \in \mathcal{D}$ then there exist a $i \in \mathbb{N}_0$ such that $D \in \mathcal{T}_i \subseteq \mathcal{S}_i$ proving by [eq: 20.136] that $D \subseteq U$, hence we have

$$\bigcup_{D \in \mathcal{T}} D \subseteq U \tag{20.140}$$

Proving the opposite inclusion is a little more difficult. Let $x \in U$ then there exist a $\varepsilon \in \mathbb{R}^+$ such that $x \in B_{\|\|_n}(x, \varepsilon) \subseteq U$. Using the Archimedean property of the real numbers [see theorem: 10.30] there exist $n_\varepsilon \in \mathbb{N}$ such that

$$0 < \frac{1}{n_x} < \varepsilon \tag{20.141}$$

Using [theorem: 20.179 (3)] there exist a $D_x \in \mathcal{D}^n_{n_x}$ such that

$$D_x = \left[\frac{z}{2^{n_x}}, \frac{z+1}{2^{n_x}}\right[= \prod_{i \in \{1, \ldots, n\}} \left[\frac{z_i}{2^{n_x}}, \frac{z_i+1}{2^{n_x}}\right[\in \mathcal{D}^n_{n_x} \text{ such that } x \in D_x$$

from which it follows that

$$\forall i \in \{1, \ldots, n\} \text{ we have } \frac{z_i}{2^{n_x}} \leqslant x_i < \frac{z_i+1}{2^{n_x}} \tag{20.142}$$

Let $y \in D_x$ then $y \in \prod_{i \in \{1, \ldots, n\}} \left[\frac{z_i}{2^{n_x}}, \frac{z_i+1}{2^{n_x}}\right[$ so that

$$\forall i \in \{1, \ldots, n\} \text{ we have } \frac{z_i}{2^{n_x}} \leqslant y_i < \frac{z_i+1}{2^{n_x}} \tag{20.143}$$

Hence we have

$$\begin{aligned}
y_i - x_i &\underset{\text{[eq: 20.143}}{<} \frac{z_i+1}{2^{n_x}} - x_i \\
&\underset{\text{[eq: 20.142]}}{\leqslant} \frac{z_i+1}{2^{n_x}} - \frac{z_i}{2^{n_x}} \\
&= \frac{1}{2^{n_x}} \\
&\underset{\text{[eq: 20.141}}{<} \varepsilon \\
x_i - y_i &\underset{\text{[eq: 20.142]}}{<} \frac{z_i+1}{2^{n_x}} - y_i \\
&\underset{\text{[eq: 20.143}}{\leqslant} \frac{z_i+1}{2^{n_x}} - \frac{z_i}{2^{n_x}} \\
&\underset{\text{[eq: 20.141}}{<} \varepsilon
\end{aligned}$$

which proves that $\forall i \in \{1, \ldots, n\}\ |y_i - x_i| < \varepsilon$. Hence $\|y - x\|_n = \max(\{|y_i - x_i| | i \in \{1, \ldots, n\}\}) < \varepsilon$ so that $y \in B_{\|\|_n}(x, \varepsilon)$. In conclusion

$$x \in D_x \subseteq B_{\|\|_n}(x, \varepsilon) \subseteq U$$

As $D_x \in \mathcal{D}^n_{n_x}$ it follows from the above and [eq: 20.136] that

$$x \in D_x \in S_{n_x} \tag{20.144}$$

Define now

$$\mathcal{K}_x = \{i \in \{0, \ldots, n_x\} | \exists D \in \mathcal{S}_i | x \in D\} \subseteq \{0, \ldots, n_x\} \tag{20.145}$$

Then by [eq: 20.144] $n_x \in \mathcal{K}_x$ so that $\mathcal{K}_x \neq \varnothing$, as further $\mathcal{K}_x$ is finite it follows that

$$m_x = \min(\mathcal{K}_x) \text{ exist} \tag{20.146}$$

For $m_x \in \mathcal{K}_x \subseteq \{0, \ldots, n_x\}$ we have now two possible cases:

$m_x = 0$. then $\exists D \in S_0$ such that $x \in D$. As by [eqs: 20.137, 20.139] $S_0 = \mathcal{T}_0$ and $\mathcal{T}_0 \in \mathcal{T}$ we that $x \in D \in \mathcal{T}$. In other words $x \in \bigcup_{D \in \mathcal{T}} D$.

$m_x \in \{1, \ldots, n_x\}$. Then $\exists D \in \mathcal{S}_{m_x} \underset{\text{[eq: 20.136]}}{\subseteq} \mathcal{D}^n_{m_x}$ such that $x \in D$ and $\forall i \in \{0, \ldots, m_x - 1\}$ we have that $\forall R \in \mathcal{S}_i$ that $x \notin R$. Let $i \in \{0, \ldots, m_x - 1\}$ and assume that $\exists R \in \mathcal{S}_i \subseteq \mathcal{D}^n_i$ such that $R \bigcap D \neq \varnothing$ then by [theorem: 20.179 (2)] and the fact that $i \leqslant m_x$ it follows that $D \subseteq R$, as $x \in D$ it follows that $x \in R$ contradicing $x \notin R$ hence the assumption is wrong and we must have that $\forall R \in \mathcal{S}_i$ we have that $R \bigcap D = \varnothing$. As this is true $\forall i \in \{0, \ldots, m_x - 1\}$ it follows from [definition: 20.137] that $D \in \mathcal{T}_{m_x} \underset{\text{[eq: 20.139]}}{\subseteq} \mathcal{T}$. In other words we have $x \in D \in \mathcal{T}$ which proves that $x \in \bigcup_{D \in \mathcal{T}} D$.

So in all cases we have that $x \in \bigcup_{D \in \mathcal{T}} D$ which as $x \in U$ was chosen arbitrary proves that $U \subseteq \bigcup_{D \in \mathcal{T}} D$. Combining this with [eq: 20.139] proves that

$$U = \bigcup_{D \in \mathcal{T}} D \tag{20.147}$$

Next we must prove that U is a pairwise disjoint union. Let $D, E \in \mathcal{T} = \bigcup_{m \in \mathbb{N}_0} \mathcal{T}_m$ with $D \neq E$ then there exist $k, l \in \mathbb{N}_0$ such that $D \in \mathcal{T}_k \subseteq \mathcal{D}^n_k$ and $E \in \mathcal{T}_l \subseteq \mathcal{D}^n_l$. For k, l we have the following possible cases:

$k = l$. Then using [theorem: 20.179 (1)] it follows that $D \bigcap E = \varnothing$.

$k < l$. Then using [eq: 20.137] that $D \bigcap E = \varnothing$.

$l < k$. Then using [eq: 20.137] that $D \bigcap E = \varnothing$.

combining the above with [eq: 20.147] gives then

$$\forall D, E \in \mathcal{T} \text{ with } D \neq E \text{ we have } D \bigcap E = \varnothing \tag{20.148}$$

Next we prove that $\mathcal{T}$ is denumerable, first we prove that $\mathcal{T}$ is not finite (hence by definition infinite). Assume that $\mathcal{T}$ is finite. As $U \neq \varnothing$ we must have that $\mathcal{T} \neq \varnothing$ [because $\bigcup_{D \in \varnothing} D = \varnothing$] so that $m = \min(\{(\text{begin}(D))_1 | D \in \mathcal{T}\})$ exist. Hence there exist a $R = [a, b[\in \mathcal{T}$ such that $a_1 = m$. As $a \in [a, b[= R$ and by [eq: 20.148] $R \subseteq U$ it follows that $a \in U$. Hence there exist a $\varepsilon \in \mathbb{R}^+$ such that $a \in B_{\|\|_n}(a, \varepsilon) \subseteq U$. Define e by $(e)_i = \begin{cases} 1 \text{ i=1} \\ 0 \text{ if } i \in \{2, \ldots, n\} \end{cases}$ then for $i \in \{1, \ldots, n\}$ we have

$$\left|\left(a - \left(a - \frac{\varepsilon}{2} \cdot e\right)\right)_i\right| = \left|\frac{\varepsilon}{2} \cdot e_i\right| = \left|\frac{\varepsilon}{2}\right| \cdot \left|\begin{cases} 1 \text{ if } i = 1 \\ 0 \text{ if } i \in \{2, \ldots, n\} \end{cases}\right| \leqslant \frac{\varepsilon}{2} < \varepsilon$$

so that $\left\|a - \left(a - \frac{\varepsilon}{2} \cdot e\right)\right\|_n < \varepsilon$. Hence $a - \frac{\varepsilon}{2} \cdot e \in B_{\|\|_n}(a, \varepsilon) \subseteq U$ then by [eq: 20.148] there exist a $D' \in \mathcal{T}$ such that $a - \frac{\varepsilon}{2} \cdot e \in D'$. As $D' = [\text{begin}(D'), \text{end}(D')[$ it follows that $\text{begin}(D') \leqslant a - \frac{\varepsilon}{2} \cdot e$ so that $(\text{begin}(D'))_1 \leqslant \left(a - \frac{\varepsilon}{2} \cdot e\right)_1 = a_1 - \frac{\varepsilon}{2} \cdot 1 = m - \frac{\varepsilon}{2}$. As $m = \min(\{(\text{begin}(D))_1 | D \in \mathcal{T}\})$ $m \leqslant (\text{begin}(D'))_1$ which leads to the contradiction $m \leqslant m - \frac{\varepsilon}{2} < m$, so the assumption is wrong and we must have that

$$\mathcal{T} \text{ is not finite or } \mathcal{T} \text{ is infinite} \tag{20.149}$$

As $\mathcal{D}^n$ is denumerable [see theorem: 20.180] and $\mathcal{T} \underset{\text{[eq: 20.138]}}{\subseteq} \mathcal{D}^n$ it follows from the above and [theorem: 6.60] that

$$\mathcal{T} \text{ is denumerable}$$

So there exist a bijection $\beta: \mathbb{N} \to \mathcal{T}$. define then $\{D_i\}_{i \in \mathbb{N}} \subseteq \mathcal{T} \subseteq \mathcal{D}^n$ by $D_i = \beta(i)$ then we have

$$\bigcup_{i \in \mathbb{N}} D_i \underset{\text{[theorem: 2.119]}}{=} \bigcup_{D \in \mathcal{T}} D = U$$

Further if $i, j \in \mathbb{N}$ with $i \neq j$ then as β is a bijection, hence injective, it follows that $D_i \neq D_j$, so that using [eq: 20.148] we have $D_i \bigcap D_j = \varnothing$. Hence

$$U = \bigsqcup_{i \in \mathbb{N}} D_i$$

□

Lemma 20.182. *Let $n \in \mathbb{N}$ and $R \in \mathcal{R}^n$ with $R \neq \varnothing$ then there exist a sequence $\{U_i\}_{i \in \mathbb{N}} \subseteq \mathcal{T}_{\|\|_n}$ of open sets such that $R = \bigcap_{i \in \mathbb{N}} U_i$*

Proof. As $R \in \mathcal{R}^n$ there exists a $a, b \in \mathbb{R}^n$ with $a \leqslant b$ such that $R = [a, b[= \prod_{i \in \{1, \ldots, n\}} [a_i, b_i[$. Define then $\{U_i\}_{i \in \mathbb{N}}$ by $U_i = \prod_{j \in \{1, \ldots, n\}} \left]a_j - \frac{1}{j}, b_j\right[$. As $\left]a_j - \frac{1}{i}, b_j\right[\in \mathcal{T}_{||}$ [see theorem: 14.99] and $T_{\|\|_n}$ is the product topology based on $\mathcal{T}_{||}$ [see 14.95] it follows that $\{U_i\}_{i \in \mathbb{N}} \subseteq \mathcal{T}_{\|\|_n}$. Let $i \in \mathbb{N}$ and $x \in R$ then we have $\forall j \in \{1, \ldots, n\}$ that $x_j \in [a_j, b_j[\Rightarrow a_j \leqslant x_j < b_j \Rightarrow a_j - \frac{1}{i} < a_j \leqslant x_j < b_j \Rightarrow x_j \in \left]a_j - \frac{1}{i}, b_j\right[$, proving using [theorem: 3.111] that $R \subseteq U_i$. Hence we have

$$R \subseteq \bigcap_{i \in \mathbb{N}} U_i \tag{20.150}$$

For the opposite inequality let $x \in \bigcap_{i \in \mathbb{N}} U_i$ then $\forall i \in \mathbb{N}$ we have $x \in U_i$ so that $\forall j \in \{1, \ldots, n\}$ we have $x_j \in \left]a_j - \frac{1}{i}, b_j\right[\Rightarrow a_j - \frac{1}{i} < x_j < b_j$. Assume that $\exists j \in \{1, \ldots, n\}$ such that $x_j < a_j$ then using [theorem: 10.30] there exists a $i \in \mathbb{N}$ such that $x_j < x_j + \frac{1}{i} < a_j \Rightarrow x_j < a_j - \frac{1}{i}$ contradicting the fact that $a_j - \frac{1}{i} < x_j$. Hence $\forall j \in \{1, \ldots, n\}$ we have $a_j \leqslant x_j < b_j$ proving that $x \in R$ so that $\bigcap_{i \in \mathbb{N}} U_i \subseteq R$. This together with [eq: 20.150] proves

$$R = \bigcap_{i \in \mathbb{N}} U_i$$

□

We are ready now to prove a alternative definition for the Borel algebra on $\mathbb{R}^n$.

Theorem 20.183. *Let $n \in \mathbb{N}$ then we have*

$$\sigma[\{C \subseteq \mathbb{R}^n | C \text{ is close in } \mathcal{T}_{\|\|_n}\}] = \mathcal{B}[\mathbb{R}^n] = \sigma[\mathcal{R}^n]$$

Proof. Using [theorem: 20.150] we have

$$\sigma[\{C \subseteq \mathbb{R}^n | C \text{ is close in } \mathcal{T}_{\|\|_n}\}] \underset{\text{[theorem: 20.150]}}{=} \mathcal{B}[\mathbb{R}^n, \mathcal{T}_{\|\|_n}] \underset{\text{def}}{=} \mathcal{B}[\mathbb{R}^n]$$

so we only have to prove that $\mathcal{B}[\mathbb{R}^n, \mathcal{T}_{\|\|_n}] = \sigma[\mathcal{R}^n]$. Let $U \in \mathcal{T}_{\|\|_n}$ then we have either:

$U = \varnothing$. Then $U = \varnothing \in \sigma[\mathcal{R}^n]$.

$U \neq \varnothing$. Then using [lemma: 20.181] there exist a sequence $\{D_i\}_{i\in\mathbb{N}} \subseteq \mathcal{D}^n \subseteq \mathcal{R}^n$ such that $U = \bigcup_{i\in\mathbb{N}} D_i$ which as $\sigma[\mathcal{R}^n]$ is a σ-algebra proves that $U \in \sigma[\mathcal{R}^n]$

Hence we have $\mathcal{T}_{\|\|_n} \subseteq \sigma[\mathcal{R}^n]$ which by [theorem: 20.146] gives

$$\sigma[\mathcal{T}_{\|\|_n}] \subseteq \sigma[\mathcal{R}^n] \tag{20.151}$$

For the opposite inclusion let $R \in \mathcal{R}^n$ then by [lemma: 20.182] there exist a $\{U_i\}_{i\in\mathbb{N}} \subseteq \mathcal{T}_{\|\|_n}$ such that $R = \bigcap_{i\in\mathbb{N}} U_i$. As $\sigma[\mathcal{T}_{\|\|_n}]$ is a σ-alebra we have by [theorem: 20.143] that $R \in \sigma[\mathcal{T}_{\|\|_n}]$. Hence $\mathcal{R}^n \subseteq \sigma[\mathcal{T}_{\|\|_n}]$ which by [theorem: 20.146] gives $\sigma[\mathcal{R}^n] \subseteq \sigma[\mathcal{T}_{\|\|_n}]$. Combining this with [eq: 20.151] gives

$$\sigma[\mathcal{R}^n] = \sigma[\mathcal{T}_{\|\|_n}] \underset{\text{def}}{=} \mathcal{B}[\mathbb{R}^n, \mathcal{T}_{\|\|_n}] = \mathcal{B}[\mathbb{R}^n]$$ □

Definition 20.184. *Let $n \in \mathbb{N}$ then for $i \in \{1, \ldots, n\}$ and $a \in \mathbb{R}$ we define $]-\infty, a[_i \subseteq \mathbb{R}^n$ by*

$$]-\infty, a[_i = \{x \in \mathbb{R} | x_i < a\}$$

The set $]-\infty, a[_i$ is called a lower half open space. The set of all lower half spaces is noted as $\mathcal{H}^n$ hence

$$\mathcal{H}^n = \{]-\infty, a[_i | i \in \{1, \ldots, n\} \wedge a \in \mathbb{R}\}$$

It turns out that every lower half space is a open set.

Lemma 20.185. *Let $n \in \mathbb{N}$ then $\mathcal{H}^n \subseteq \mathcal{T}_{\|\|_n}$ [the canonical topology on $\mathbb{R}^n$]*

Proof. Let $H \in \mathcal{H}^n$ then there exists a $i \in \{1, \ldots, n\}$ and a $a \in \mathbb{R}$ such that $H = \{x \in \mathbb{R}^n | x_i < a\}$. Take $x \in H$ then $x_i < a$ so that $\varepsilon = a - x_i > 0$. Let $y \in B_{\|\|_n}(x, \varepsilon)$ then

$$y_i - x_i \leqslant |y_i - x_i| \leqslant \max(\{|y_i - x_i| | i \in \{1, \ldots, n\}\}) < \varepsilon = a - x_i$$

proving that $y_i < a$ so that $y \in H$. Hence $x \in B_{\|\|_{\max}}(x, \varepsilon) \subseteq H$ which proves that H is open. □

Next we show that every half open interval can be written as a finite intersection of lower half open spaces.

Lemma 20.186. *Let $n \in \mathbb{N}$, $a, b \in \mathbb{R}^n$ then $[a, b[= \bigcap_{i\in\{1,\ldots,n\}} (]-\infty, b_i[_i \setminus]-\infty, a_i[)$*

Proof. Let $x \in [a, b[$ then $\forall i \in \{1, \ldots, n\}$ we have $a_i \leqslant x_i \wedge x_i < b_i$ or $\neg(x_i < a_i) \wedge x_i < b_i$ so that $x \notin]-\infty, a_i[\wedge x \in]-\infty, b_i[\Rightarrow x \in]-\infty, b_i[_i \setminus]-\infty, a_i[$. Hence we have

$$[a, b[\subseteq \bigcap_{i\in\{1,\ldots,n\}} (]-\infty, b_i[_i \setminus]-\infty, a_i[) \tag{20.152}$$

For the opposite inclusion, let $x \in \bigcap_{i\in\{1,\ldots,n\}} (]-\infty, b_i[_i \setminus]-\infty, a_i[)$ then $\forall i \in \{1, \ldots, n\}$ we have $x \in]-\infty, b_i[_i \setminus]-\infty, a_i[_i$ hence $x_i < b_i \wedge \neg(x_i < a_i) \Rightarrow x_i < b_i \wedge a_i \leqslant x_i$ proving that $x \in [a, b[$. So $\bigcap_{i\in\{1,\ldots,n\}} (]-\infty, b_i[_i \setminus]-\infty, a_i[) \subseteq [a, b[$ which together with [eq: 20.152] proves that

$$[a, b[= \bigcap_{i\in\{1,\ldots,n\}} (]-\infty, b_i[_i \setminus]-\infty, a_i[)$$ □

Finally we have a alternative definition of $\mathcal{B}[\mathbb{R}]$ that will be needed later in [theorem: 20.452].

Theorem 20.187. *Let $n \in \mathbb{N}$ then $\mathcal{B}[\mathbb{R}^n] = \sigma[\mathcal{H}^n]$*

Proof. If $H \in \mathcal{H}^n$ then H is open [see lemma: 20.185], so that $H \in \sigma[\mathcal{T}_{\mathbb{R}^n}] \underset{\text{[theorem: 20.286]}}{=} \mathcal{B}[\mathbb{R}^n]$. Hence $\mathcal{H}^n \subseteq \mathcal{B}[\mathbb{R}^n]$ giving

$$\sigma[\mathcal{H}^n] \subseteq \mathcal{B}[\mathbb{R}^n] \tag{20.153}$$

Let $R \in \mathcal{R}^n$ then $\exists a, b \in \mathbb{R}^n$ such that $R = [a, b[$, using the previous lemma [see lemma: 20.186] we have then that $R = [a, b[= \bigcap_{i \in \{1, \ldots, n\}} (]-\infty, b_i[_i \setminus]-\infty, a_i[_i) \in \sigma[\mathcal{H}^n]$. So $\sigma[\mathcal{R}^n] \subseteq \sigma[\mathcal{H}^n]$ which as $\sigma[\mathcal{R}] \underset{\text{[theorem: 20.286]}}{=} \mathcal{B}[\mathbb{R}^n]$ proves that $\mathcal{B}[\mathbb{R}^n] \subseteq \sigma[\mathcal{H}^n]$. Combining this with 20.153] gives

$$\sigma[\mathcal{H}^n] = \mathcal{B}[\mathbb{R}^n]$$

□

20.4 Measures

20.4.1 Measure definition and properties

For a measurable space we have some simplication in the definitions of additivity, sub-additivity, countable additivity and countable sub-additivity bexause of the extra properties of a σ-algebra.

Theorem 20.188. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space [see definition: 20.139] and $\mu: \mathcal{A} \to [0, \infty[$ a function then we say that:*

1. *μ is **finite additive** $\Leftrightarrow$ for every **pairwise disjoint** families $\{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A}$ where $n \in \mathbb{N}$ we have*
$$\mu\left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i\right) = \sum_{i=1}^{n} \mu(A_i)$$
2. *μ is **finite sub-additive** $\Leftrightarrow$ for every $\{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A}$, $n \in \mathbb{N}$ we have that*
$$\mu\left(\bigcup_{i \in \{1, \ldots, n\}} A_i\right) \leqslant \sum_{i=1}^{n} \mu(A_i)$$
3. *μ is **countable additive** $\Leftrightarrow$ for all **pairwise disjoint** $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have that*
$$\mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \mu(A_i)$$
4. *μ is **countable sub-additive** if $\Leftrightarrow$ for all $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have*
$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \leqslant \sum_{i=1}^{\infty} \mu(A_i)$$

Proof.

1. This follows from the fact that $\forall \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A}$ we have as $\mathcal{A}$ is a σ-algebra that $\bigcup_{i \in \{1, \ldots, n\}} A_i \in \mathcal{A}$ and the definition of additivity [see definition: 20.121].
2. This follows from the fact that $\forall \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A}$ we have as $\mathcal{A}$ is a σ-algebra that $\bigcup_{i \in \{1, \ldots, n\}} A_i \in \mathcal{A}$ and the definition of sub-additivity [see definition: 20.122].
3. This follows from the fact that $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have as $\mathcal{A}$ is a σ-algebra that $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$ and the definition of countable additivity [see definition: 20.123].
4. This follows from the fact that $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have as $\mathcal{A}$ is a σ-algebra that $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$ and the definition of countable sub-additivity [see definition: 20.124]. □

Using mathematical induction it is easy to specify a neccesary and sufficient condition for finite additivity and finite sub additivity.

Lemma 20.189. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \to [0, \infty]$ a function then we have*

1. *μ is finate additive $\Leftrightarrow$ $\forall A, B \in \mathcal{A}$ with $A \bigcap B = \emptyset$ we have $\mu(A \bigcup B) = \mu(A) + \mu(B)$*
2. *μ is finite sub additive $\Leftrightarrow$ $\forall A, B \in \mathcal{A}$ we have $\mu(A \bigcup B) \leqslant \mu(A) + \mu(B)$*

Proof.

1.

$\Rightarrow$. Let $A, B \in \mathcal{A}$ with $A \bigcap B = \emptyset$ then $\{A_i\}_{i \in \{1, \ldots, 2\}}$ defined by $A_i = \begin{cases} A \text{ if } i = 1 \\ B \text{ if } i = 2 \end{cases}$ is pairwise disjoint and $\{A_i\}_{i \in \{1, \ldots, 2\}} \subseteq \mathcal{A}$. So by assumption we have that

$$\mu\left(A \bigcup B\right) = \mu\left(\bigcup_{i \in \{1, \ldots, 2\}} A_i\right) = \sum_{i=1}^{2} \mu(A_i) = \mu(A_1) + \mu(A_2) = \mu(A) + \mu(B)$$

$\Leftarrow$. Let

$$\mathcal{S} = \left\{ n \in \mathbb{N}_0 | \text{If } \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A} \text{ is a pairwise disjoint family then we have that } \mu\left(\bigcup_{i \in \{1, \ldots, n\}} A_i\right) = \sum \mu(A_i) \right\}$$

then we have:

$1 \in \mathcal{S}$. Let $\{A_i\}_{i \in \{1, \ldots, 1\}} \subseteq \mathcal{A}$ then $\mu\left(\bigcup_{i \in \{1, \ldots, 1\}} A_i\right) = \mu(A_1) = \sum_{i=1}^{1} \mu(A_i)$ proving that $1 \in \mathcal{S}$

$n \in \mathcal{S} \Rightarrow n + 1 \in \mathcal{S}$. Let $\{A_i\}_{i \in \{1, \ldots, n+1\}} \subseteq \mathcal{A}$ be pairwise disjoint. Take $A = \bigcup_{i \in \{1, \ldots, n\}} A_i$ and $B = A_{n+1}$, then $A \bigcup B = \bigcup_{i \in \{1, \ldots, n+1\}} A_i$ and $A \bigcap B = \left(\bigcup_{i \in \{1, \ldots, n\}} A_i\right) \bigcap A_{n+1} = \bigcup_{i \in \{1, \ldots, n\}} (A_i \bigcap A_{i+1}) = \emptyset$. Hence we have

$$\begin{aligned} \mu\left(\bigcup_{i \in \{1, \ldots, n\}} A_i\right) &= \mu\left(A \bigcup B\right) \\ &= \mu(A) + \mu(B) \\ &= \mu\left(\bigcup_{i \in \{1, \ldots, n\}} A_i\right) + \mu(A_{n+1}) \\ &\underset{n \in \mathcal{S}}{=} \left(\sum_{i=1}^{n} \mu(A_i)\right) + \mu(A_{n+1}) \\ &= \sum_{i=1}^{n+1} \mu(A_i) \end{aligned}$$

proving that $n + 1 \in \mathcal{S}$.

Using mathematical induction we have that $\mathbb{N} = \mathcal{S}$. So $\forall \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A}$ pairwise disjoint we have $\mu\left(\bigcup_{i \in \{1, \ldots, n+1\}} A_i\right) = \sum_{i=1}^{n} \mu(A_i)$

2.

$\Rightarrow$. Let $A, B \in \mathcal{A}$ then $\{A_i\}_{i \in \{1, \ldots, 2\}}$ defined by $A_i = \begin{cases} A \text{ if } i = 1 \\ B \text{ if } i = 2 \end{cases}$ satisfies $\{A_i\}_{i \in \{1, \ldots, 2\}} \subseteq \mathcal{A}$. So by assumption we have that

$$\mu\left(A \bigcup B\right) = \mu\left(\bigcup_{i \in \{1, \ldots, 2\}} A_i\right) \leqslant \sum_{i=1}^{2} \mu(A_i) = \mu(A_1) + \mu(A_2) = \mu(A) + \mu(B)$$

$\Leftarrow$. Let

$$\mathcal{S} = \left\{ n \in \mathbb{N}_0 | \forall \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A} \text{ we have } \mu\left(\bigcup_{i \in \{1, \ldots, n\}} A_i\right) \leqslant \sum_{i=1}^{n} \mu(A_i) \right\}$$

then:

$1 \in \mathcal{S}$. Let $\{A_i\}_{i \in \{1, \ldots, 1\}} \subseteq \mathcal{A}$ then $\mu\left(\bigcup_{i \in \{1, \ldots, 1\}} A_i\right) = \mu(A_1) = \sum_{i=1}^{1} \mu(A_i)$ proving that $1 \in \mathcal{S}$

$\boldsymbol{n \in \mathcal{S} \Rightarrow n+1 \in \mathcal{S}}$. Let $\{A_i\}_{i\in\{1,\ldots,n+1\}} \subseteq \mathcal{A}$ pairwise disjoint. Take $A = \bigcup_{i\in\{1,\ldots,n\}} A_i$ and $B = A_{n+1}$, then $A \bigcup B = \bigcup_{i\in\{1,\ldots,n+1\}} A_i$. Hence we have

$$\begin{aligned}
\mu\left(\bigcup_{i\in\{1,\ldots,n\}} A_i\right) &= \mu\left(A \bigcup B\right) \\
&\leqslant \mu(A) + \mu(B) \\
&= \mu\left(\bigcup_{i\in\{1,\ldots,n\}} A_i\right) + \mu(A_{n+1}) \\
&\leqslant_{n\in\mathcal{S}} \left(\sum_{i=1}^{n} \mu(A_i)\right) + \mu(A_{n+1}) \\
&= \sum_{i=1}^{n+1} \mu(A_i)
\end{aligned}$$

proving that $n+1 \in \mathcal{S}$.

Using mathematical induction we have that $\mathbb{N} = \mathcal{S}$. So $\forall \{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{A}$ we have $\mu\left(\bigcup_{i\in\{1,\ldots,n+1\}} A_i\right) \leqslant \sum_{i=1}^{n} \mu(A_i)$ □

Theorem 20.190. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space then if $\mu: \mathcal{A} \to [0,\infty]$ satisfies:*

1. $\mu(\varnothing) = 0$
2. *μ is countable additive*

then μ is additive.

Proof. This was actually proved in [theorem: 20.190]. □

Definition 20.191. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space then $\mu: \mathcal{A} \to [0,\infty]$ is a measure on $\mathcal{A}$ if*

1. $\mu(\varnothing) = 0$
2. *For every **pairwise disjoint** $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ we have*

$$\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \mu(A_i)$$

[in other word μ is countable additve].

A trivial example of a measure is the following.

Example 20.192. Let $\langle X, \mathcal{A}\rangle$ be a measurable space then $\mu: \mathcal{A} \to [0,\infty]$ defined by $\mu(A) = 0$ is a measure on $\mathcal{A}$.

Proof. We have

1. $\mu(\varnothing) = 0$
2. If $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ then $\sum_{i=1}^{\infty} \mu(A_i) = \sum_{i=1}^{\infty} 0 \underset{\text{[example: 20.94]}}{=} 0 = \mu(\bigcup_{i\in\mathbb{N}} A_i)$ □

Definition 20.193. (Measure Space) *A measure space is a triple $\langle X, \mathcal{A}, \mu\rangle$ where X is a non empty set, $\mathcal{A}$ is a σ-algebra on X and $\mu: \mathcal{A} \to [0,\infty]$ is a measure on $\mathcal{A}$.*

Once we have defined a measure space we can define σ-finite sets and σ-finite measures.

Definition 20.194. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space then $A \subseteq X$ is **σ-finite under μ** if there exist a $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N}$ $\mu(A_i) < \infty$ such that $A = \bigcup_{i\in\mathbb{N}} A_i$.*

We can refine the above condition to disjoint sets.

Theorem 20.195. *Let $\langle X, \mathcal{A}, \mu\rangle$ be measure space and $A \subseteq X$ then we have*

$$A \text{ is } \sigma\text{-finite under } \mu \Leftrightarrow \exists \{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ paorwise disjoint with } \forall i \in \mathbb{N}\ \mu(A_i) < \infty \text{ such that } A = \bigsqcup_{i\in\mathbb{N}} A_i$$

Proof.

⇒. As A is σ-finite under μ there exist a $\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ such that $A = \bigcup_{i\in\mathbb{N}} B_i$. Define now

$$\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ by } A_i = \begin{cases} B_i \text{ if } i = 1 \\ A_i \setminus \bigcup_{j\in\{1,\ldots,i-1\} \text{ if } i\in\mathbb{N}\setminus\{1\}} B_i \end{cases} \in \mathcal{A} \text{ and } \forall i \in \mathbb{N}\ A_i \subseteq B_i$$

then by [lemma: 20.113] we have that 0

$$\{A_i\}_{i\in\mathbb{N}} \text{ is pairwise disjoint and } \bigsqcup_{i\in\mathbb{N}} A_i = \bigcup_{i\in\mathbb{N}} B_i = A$$

Further, as $\forall i \in \mathbb{N}$ we have $A_i \subseteq B_i$, it follows that $\mu(A_i) \leqslant \mu(B_i) < \infty$.

⇐. This is trivial. □

Definition 20.196. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space then a measure $\mu: \mathcal{A} \to [0, \infty]$ is a **σ-finite measure** if X is σ-finite. In other words μ is σ-finite if there exists a $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N}\ \mu(A_i) < \infty$ such that $X = \bigcup_{i\in\mathbb{N}} A_i$.*

We look now at new ways of defining new measures based on existing measures.

Theorem 20.197. *Let $\langle X, \mathcal{A}\rangle$ be a measureable space then we have:*

1. *If $\mu_1: \mathcal{A} \to [0, \infty]$ and $\mu_2: \mathcal{A} \to [0, \infty]$ are measures on $\mathcal{A}$ then*

$$\mu_1 + \mu_2: \mathcal{A} \to [0, \infty] \text{ defined by } (\mu_1 + \mu_2)(A) = \mu_1(A) + \mu_2(A)$$

is a measure on $\mathcal{A}$.

2. *If $\mu: \mathcal{A} \to [0, \infty]$ is a measure on $\mathcal{A}$ and $\alpha \in [0, \infty]$ then*

$$\alpha \cdot \mu: \mathcal{A} \to [0, \infty] \text{ defined by } (\alpha \cdot \mu)(A) = \alpha \cdot \mu(A)$$

Proof.

1. First we have

$$(\mu_1 + \mu_2)(\emptyset) = \mu_1(\emptyset) + \mu_2(\emptyset) = 0 + 0 = 0$$

Secondly if $\{A_i\}_{i\in\mathbb{N}_0} \subseteq \mathcal{A}$ is pairwise disjoint then

$$\begin{aligned} (\mu_1 + \mu_2)\left(\bigsqcup_{i\in\mathbb{N}_0} A_i\right) &= \mu_1\left(\bigsqcup_{i\in\mathbb{N}_0} A_i\right) + \mu_2\left(\bigsqcup_{i\in\mathbb{N}_0} A_i\right) \\ &= \sum_{i=1}^{\infty} \mu_1(A_i) + \sum_{i=1}^{\infty} \mu_2(A_i) \\ &\underset{\text{[theorem: 20.96]}}{=} \sum_{i=1}^{\infty} (\mu_1(A_i) + \mu_2(A_i)) \\ &= \sum_{i=1}^{\infty} (\mu_1 + \mu_2)(A_i) \end{aligned}$$

proving that $\mu_1 + \mu_2$ is a measure.

2. First we have

$$(\alpha \cdot \mu)(\emptyset) = \alpha \cdot \mu(\emptyset) = \alpha \cdot 0 = 0$$

Secondly if $\{A_i\}_{i\in\mathbb{N}_0}\subseteq\mathcal{A}$ is pairwise disjoint then

$$\begin{aligned}(\alpha\cdot\mu)\left(\bigsqcup_{i\in\mathbb{N}_0}A_i\right) &= \alpha\cdot\mu\left(\bigsqcup_{i\in\mathbb{N}_0}A_i\right)\\ &= \alpha\cdot\sum_{i=1}^{\infty}\mu(A_i)\\ &\underset{\text{[theorem: 20.96]}}{=} \sum_{i=1}^{\infty}(\alpha\cdot\mu(A_i))\\ &= \sum_{i=1}^{\infty}(\alpha\cdot\mu)(A_i)\end{aligned}$$

proving that $\alpha\cdot\mu$ is a measure. □

Theorem 20.198. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space and let $\mathcal{B}$ a σ-algebra on X such that $\mathcal{B}\subseteq\mathcal{A}$ then $\langle X,\mathcal{B},\mu_{|\mathcal{B}}\rangle$ is a measure space where $\mu_{|\mathcal{B}}$ is the restriction of μ to $\mathcal{B}$ defined by*

$$\mu_{|\mathcal{B}}:\mathcal{B}\to[0,\infty]\ \textit{where}\ \mu_{|\mathcal{B}}(B)=\mu(B)$$

Proof. As $\mathcal{B}$ is already a σ-algebra on X we only have to proof that $\mu_{|\mathcal{B}}$ is a measure on $\mathcal{B}$.

1. As $\emptyset\in\mathcal{B}\subseteq\mathcal{A}$ we have $\mu_{|\mathcal{B}}(\emptyset)=\mu(\emptyset)=0$
2. If $\{A_i\}_{i\in\mathbb{N}_0}\subseteq\mathcal{B}\subseteq\mathcal{A}$ is a pairwise disjoint family then

$$\mu_{|\mathcal{B}}\left(\bigsqcup_{i\in\mathbb{N}_0}A_i\right)=\mu\left(\bigsqcup_{i\in\mathbb{N}_0}A_i\right)=\sum_{i=1}^{\infty}\mu(A_i)=\sum_{i=1}^{\infty}\mu_{|\mathcal{B}}(A_i)$$ □

Theorem 20.199. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space, $A\in\mathcal{A}$ and define*

$$\mathcal{A}_{|A}=\{B\in\mathcal{A}|B\subseteq A\}\subseteq\mathcal{A}$$

$$\mu_{|\mathcal{A}_{|A}}:\mathcal{A}_{|A}\to[0,\infty]\ \textit{by}\ \mu_{|\mathcal{A}_{|A}}(B)=\mu(B)$$

then we have that

1. $\mathcal{A}_{|A}=\{A\bigcap B|B\in\mathcal{A}\}$
2. *$\mathcal{A}_{|A}$ is a σ-algebra on A*
3. *$\mu_{|\mathcal{A}_{|A}}$ is a measure on $\mathcal{A}_{|A}$ making $\langle A,\mathcal{A}_{|A},\mu_{|\mathcal{A}_{|A}}\rangle$ a measure space*

Measure spaces of the form $\langle A,\mathcal{A}_{|A},\mu_{|\mathcal{A}_{|A}}\rangle$ are called ***measure subspaces of*** *$\langle X,\mathcal{A},\mu\rangle$*

***Note* 20.200.** *If $A=X$ then $\mathcal{A}_{|X}=\{X\bigcap B|B\in\mathcal{A}\}=\mathcal{A}$ so that $\mu_{|\mathcal{A}_{|X}}=\mu$, in other words we have that $\langle X,\mathcal{A}_{|X},\mu_{|\mathcal{A}_{|X}}\rangle=\langle X,\mathcal{A},\mu\rangle$.*

Proof. Using [theorem: 20.147] it follows that

$$\mathcal{A}_{|A}=\left\{B\bigcap A|B\in\mathcal{A}\right\}\text{ and }\mathcal{A}_{|\mathcal{A}}\text{ is a }\sigma\text{-algebra}$$

As additional $\mathcal{A}_{|B}\subseteq\mathcal{A}$ it follows from the previous theorem [theorem: 20.198] that $\mu_{|\mathcal{A}_{|A}}$ is a measure on $\mathcal{A}_{|A}$. □

Theorem 20.201. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space then*

1. *$\forall A,B\in\mathcal{A}$ with $A\subseteq B$ we have $\mu(A)\leqslant\mu(B)$*
2. *$\forall A,B\in\mathcal{A}$ with $A\subseteq B$ and $\mu(A)<\infty$ we have $\mu(B\setminus A)=\mu(B)-\mu(A)$*

Proof.

1. If $A \subseteq B$ then $A \bigcap (B \setminus A) = \varnothing$ and $B = A \bigcup (B \setminus A)$ so that by [theorem: 20.190] we have
$$\mu(B) = \mu(A) + \mu(B \setminus A)$$
Further as $0 \leqslant \mu(B \setminus A)$ we have by [theorem: 20.32] that $\mu(A) \leqslant \mu(B)$.
2. If $A \subseteq B$ and $\mu(A) < \infty$ then as $0 \leqslant \mu(A)$ we have that $\mu(A) \in \mathbb{R}$, further by (1)
$$\mu(B) = \mu(A) + \mu(B \setminus A)$$
so that by [theorem: 20.28] $\mu(B \setminus A) = \mu(B) - \mu(A)$. □

Definition 20.202. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then μ is a **finite measure** if $\mu(X) < \infty$*

We have the following equivalent definition of a finite measure.

Theorem 20.203. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space*
$$\mu \text{ is a finite measure} \Leftrightarrow \forall A \in \mathcal{A} \text{ we have } \mu(A) < \infty$$

Proof.

⇒. If $A \in \mathcal{A}$ then $A \subseteq X$ so that by [theorem: 20.201] $\mu(A) \leqslant \mu(X) < \infty$.

⇐. If $\forall A \in \mathcal{A}$ $\mu(A) < \infty$ we have as $X \in \mathcal{A}$ that $\mu(X) < \infty$. □

Theorem 20.204. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ then there exist a **pairwise disjoint family** $\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ such that*
$$\forall i \in \mathbb{N} \text{ we have } B_i \subseteq A_i$$
and
$$\bigcup_{i \in \mathbb{N}} A_i = \bigsqcup_{i \in \mathbb{N}} B_i$$

Proof. Using [lemma: 20.113] we have for $\{B_i\}_{i \in \mathbb{N}}$ defined by
$$B_i = \begin{cases} A_1 \text{ if } i = 1 \\ A_i \setminus \bigcup_{j \in \{1, \ldots, i-1\}} A_j \text{ if } i \in \{2, \ldots, \infty\} \end{cases}$$
that
$$\forall i \in \mathbb{N} \text{ we have } B_i \subseteq A_i$$
$$\bigcup_{i \in \mathbb{N}} B_i = \bigcup_{i \in \mathbb{N}} A_i$$
and
$$\forall i, j \in \mathbb{N} \text{ with } i \neq j \text{ then } B_i \bigcap B_j \neq \varnothing$$
Let $i \in \mathbb{N}$ then we have either:

$i = 1$. Then $B_i = B_1 = A_1 \in \mathcal{A}$

$1 < i$. Then by [theorems: 20.140, 20.135] $B_i = A_i \setminus \bigcup_{j \in \{1, \ldots, i-1\}} A_j \in \mathcal{A}$

so that
$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$$ □

Theorem 20.205. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then for every $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have*
$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \leqslant \sum_{i=1}^{\infty} \mu(A_i)$$

Proof. Using [theorem: 20.204] there exists a **pairwise disjoint** family $\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ such that

$$\forall i\in\mathbb{N}\ B_i\subseteq A_i \text{ and } \bigsqcup_{i\in\mathbb{N}} B_i=\bigcup_{i\in\mathbb{N}} A_i \tag{20.154}$$

So

$$\begin{aligned}\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right) &\underset{\text{[eq: 20.154]}}{=} \mu\left(\bigsqcup_{i\in\mathbb{N}} B_i\right)\\ &= \sum_{i=1}^{\infty}\mu(B_i)\\ &\underset{\text{[eq: 20.154]}\wedge\text{[theorem: 20.96]}}{\leqslant} \sum_{i=1}^{\infty}\mu(A_i)\end{aligned}$$

□

Theorem 20.206. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space then*

1. *If $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ satisfies $\forall i\in\mathbb{N}\ A_i\leqslant A_{i+1}$ then*

$$\mu\left(\bigcup_{i\in\mathbb{N}_0} A_i\right)=\lim_{i\to\infty}\mu(A_i)=\sup\left(\{\mu(A_i)|i\in\mathbb{N}\}\right)$$

2. *$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ satisfies $\forall i\in\mathbb{N}\ A_{i+1}\leqslant A_i$ and $\exists k\in\mathbb{N}$ such that $\mu(A_k)<\infty$ then*

$$\mu\left(\bigcap_{i\in\mathbb{N}} A_i\right)=\lim_{i\to\infty}\mu(A_i)=\inf\left(\{\mu(A_i)|i\in\mathbb{N}\}\right)$$

Proof.

1. Define

$$\{B_i\}_{i\in\mathbb{N}} \text{ by } B_i=\begin{cases} A_1 \text{ if } i=1\\ A_i\setminus A_{i-1} \text{ if } i\in\{2,\ldots,\infty\}\end{cases}\in\mathcal{A}$$

Let $i,j\in\mathbb{N}$ with $i\neq j$ then we may always assume that $i<j$ [otherwise exchange i and j]. Assume that $x\in B_i\bigcap B_j$ then we have for i either:

$i=1$. Then $1=i<j\Rightarrow 1\leqslant j-1$ so that $x\in B_i=B_1=A_1\subseteq A_{j-1}$. Further as $x\in B_j=A_j\setminus A_{j-1}$ we have $x\notin A_{j-1}$ contradicting that we have also $x\in A_{j-1}$.

$1<i$. Then $i<j\Rightarrow i\leqslant j-1$ so that $A_i\subseteq A_{j-1}$. As $x\in B_i=A_i\setminus A_{i-1}$ it follows that $x\in A_i\Rightarrow x\in A_{j-1}$ but as $x\in B_j=A_j\setminus A_{j-1}$ we have that $x\notin A_{j-1}$ hence we have a contradiction.

so the assumption must be wrong proving that $B_i\bigcap B_j=\varnothing$. Hence

$$\forall i,j\in\mathbb{N} \text{ we have } B_i\bigcap B_j=\varnothing \tag{20.155}$$

Next if $n\in\mathbb{N}$ then $\forall i\in\{1,\ldots,n\}$ we have that $B_i=\begin{cases} A_1\subseteq A_i \text{ if } i=1\\ A_i\setminus A_{i-1}\subseteq A_i \text{ if } i\in\{2,\ldots,\infty\}\end{cases}\subseteq A_i\subseteq A_n$ so that

$$\bigcup_{i\in\{1,\ldots,n\}} B_i\subseteq A_n \tag{20.156}$$

Further if $x\in A_n$ then $n\in\{i\in\{1,\ldots,n\}|x\in A_i\}\subseteq\{1,\ldots,n\}$ so that $m=\min\left(\{i\in\{1,\ldots,n\}|x\in A_i\}\right)$ exists. We have now two cases to consider for m:

$m=1$. then $x\in A_1=B_1\subseteq\bigcup_{i\in\{1,\ldots,n\}} B_i$

$1<m$. then $x\notin A_{m-1}$ and $x\in A_m$ so that $x\in A_m\setminus A_{m-1}=B_m\subseteq\bigcup_{i\in\{1,\ldots,n\}} B_i$

proving that $A_n\subseteq\bigcup_{i\in\{1,\ldots,n\}} B_i$ which by [eq: 20.156] gives $A_n=\bigcup_{i\in\{1,\ldots,n\}} B_i$. Hence

$$\forall n\in\mathbb{N} \text{ we have } A_n=\bigsqcup_{i\in\{1,\ldots,n\}} B_i \tag{20.157}$$

From the above it follows that $\forall n \in \mathbb{N}\ A_n \subseteq \bigcup_{i \in \{1,\ldots,n\}} B_i \subseteq \bigcup_{i \in \mathbb{N}} B_i$ proving that $\bigcup_{n \in \mathbb{N}} A_n \subseteq \bigcup_{n \in \mathbb{N}} B_n$, futher $\forall i \in \mathbb{N}$ we have $B_i = \begin{cases} A_1 \subseteq A_i \text{ if } i = 1 \\ A_i \setminus A_{i-1} \subseteq A_i \text{ if } i \in \{2,\ldots,\infty\} \end{cases} \subseteq A_i$ so that $\bigcup_{i \in \mathbb{N}} B_i \subseteq \bigcup_{i \in \mathbb{N}} A_i$. Hence we have taking in account [eq: 20.155]

$$\bigcup_{i \in \mathbb{N}} A_i = \bigsqcup_{i \in \mathbb{N}} B_i \tag{20.158}$$

Next we have

$$\begin{aligned}
\mu\left(\bigcup_{i \in \mathbb{N}_0} A_i\right) &= \mu\left(\bigsqcup_{i \in \mathbb{N}_0} B_i\right) \\
&= \sum_{i=1}^{\infty} \mu(B_i) \\
&\underset{\text{def}}{=} \lim_{n \to \infty}\left(\sum_{i=1}^{n} \mu(B_i)\right) \\
&\underset{\text{[theorem: 20.190]}}{=} \lim_{n \to \infty}\left(\mu\left(\bigsqcup_{i \in \{1,\ldots,n\}} B_i\right)\right) \\
&\underset{20.157}{=} \lim_{n \to \infty} \mu(A_n)
\end{aligned}$$

So that

$$\mu\left(\bigcup_{i \in \mathbb{N}_0} A_i\right) = \lim_{n \to \infty} \mu(A_n)$$

As $\forall i \in \mathbb{N}$ we have $A_i \subseteq A_{i+1} \underset{\text{[theorem: 20.201]}}{\Rightarrow} \mu(A_i) \leqslant \mu(A_{i+1})$ so that by [theorem: 20.89]

$$\lim_{n \to \infty} \mu(A_n) = \sup\left(\{\mu(A_n) | n \in \mathbb{N}\}\right)$$

2. First we consider the cases where $k = 1$. Then $\forall i \in \mathbb{N}$ we have $A_i \subseteq A_1$ so that by [theorem: 20.201] $\mu(A_i) \leqslant \mu(A_1) < \infty$ proving that

$$\forall i \in \mathbb{N} \text{ we have } \mu(A_i) < \infty \tag{20.159}$$

Define $\{B_i\}_{i \in \mathbb{N}}$ by $B_i = A \setminus A_i$. Let $i \in \mathbb{N}$ then for $x \in B_i$ we have $x \in A_1 \wedge x \notin A_i \supseteq A_{i+1}$ so that $x \in A_1 \setminus A_{i+1} = B_{i+1}$. Hence we have

$$\forall i \in \mathbb{N}\ B_i \subseteq B_{i+1} \tag{20.160}$$

So using (1) it follows that

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \lim_{i \to \infty} \mu(B_i) \tag{20.161}$$

Now

$$\begin{aligned}
A_1 \setminus \left(\bigcup_{i \in \mathbb{N}} B_i\right) &\underset{\text{[theorem: 2.132]}}{=} \bigcap_{i \in \mathbb{N}} (A_1 \setminus B_i) \\
&= \bigcap_{i \in \mathbb{N}} (A_1 \setminus (A_1 \setminus A_i)) \\
&\underset{A_i \subseteq A_1 \wedge \text{[theorem: 2.132]}}{=} \bigcap_{i \in \mathbb{N}} A_i
\end{aligned} \tag{20.162}$$

As $\forall i \in \mathbb{N}\ B_i = A_1 \setminus A_i \subseteq A_1$ it follows that

$$\mu(B_i) \underset{\text{[theorem: 20.201]}}{\leqslant} \mu(A_1) < \infty \tag{20.163}$$

and $\bigcup_{i \in \mathbb{N}} B_i \subseteq A_1$ so that

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \underset{\text{[theorem: 20.201]}}{\leqslant} \mu(A_1) < \infty \tag{20.164}$$

Next

$$\begin{aligned}
\mu\left(\bigcap_{i\in\mathbb{N}} A_i\right) &\underset{\text{[eq: 20.162]}}{=} \mu\left(A_1\setminus\left(\bigcup_{i\in\mathbb{N}} B_i\right)\right)\\
&\underset{\text{[eq: 20.164]}\wedge\text{[theorem: 20.201}}{=} \mu(A_1)-\mu\left(\bigcup_{i\in\mathbb{N}} B_i\right)\\
&\underset{\text{[eq: 20.161]}}{=} \mu(A_1)-\lim_{i\to\infty}\mu(B_i)\\
&= \mu(A_1)-\lim_{i\to\infty}\mu(A_1\setminus A_i)\\
&\underset{\text{[eq: 20.163]}\wedge\text{[theorem: 20.201}}{=} \mu(A_1)-\lim_{i\to\infty}(\mu(A_1)-\mu(A_i))\\
&\underset{\text{[theorems: 20.82, 20.71]]}}{=} \mu(A_1)-\left(\mu(A_1)-\lim_{i\to\infty}\mu(A_i)\right)\\
&= \lim_{i\to\infty}\mu(A_i)
\end{aligned}$$

hence we have that

$$\forall\{A_i\}_{i\in\mathbb{N}} \text{ with } \mu(A_1)<\infty \text{ and } \forall i\in\mathbb{N}\ A_{i+1}\subseteq A \text{ we have } \mu\left(\bigcap_{i\in\mathbb{N}} A_i\right)=\lim_{i\to\infty}\mu(A_i) \tag{20.165}$$

Next we proof the general case where $1<k$. Define $\{C_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ by $C_i=A_{i+(k-1)}$ then we have as $\mu(A_k)<\infty$ that $\mu(C_1)=A_{1+(k-1)}=A_1<\infty$. Further $\forall i\in\mathbb{N}$ we have that $C_{i+1}=A_{(i+(k-1))+1}\subseteq A_{i+(k-1)}=C_i$. So all conditions of [eq: 20.165] are satisfied and we have that

$$\mu\left(\bigcap_{i\in\mathbb{N}} C_i\right)=\lim_{i\to\infty}\mu(C_i)$$

As $\lim_{i\to\infty}\mu(C_i)=\lim_{i\to\infty}A_{i+(k-1)}\underset{\text{[theorem: 20.81]}}{=}\lim_{i\to\infty}A_i$ so that we have

$$\mu\left(\bigcap_{i\in\mathbb{N}} C_i\right)=\lim_{i\to\infty}\mu(A_i) \tag{20.166}$$

Let $x\in\bigcap_{i\in\mathbb{N}}A_i$. Then $\forall i\in\mathbb{N}$ we have, as $i+(k-1)\in\mathbb{N}$ [because $1<k$], that $x\in A_{i+(k-1)}=C_i$ hence

$$\bigcap_{i\in\mathbb{N}} A_i\subseteq\bigcap_{i\in\mathbb{N}} C_i \tag{20.167}$$

Let $x\in\bigcap_{i\in\mathbb{N}}C_i$. Let $i\in\mathbb{N}$ then we have for i either:

$\boldsymbol{i\in\{1,\ldots,k-1\}}$. Then $x\in C_1=A_{1+(k-1)}=A_k\underset{i\leqslant k-1<k}{\subseteq}A_i$ so that $x\in A_i$.

$\boldsymbol{i\in\{k,\ldots,\infty\}}$. Then $i-(k-1)\in\mathbb{N}$ so that $x\in C_{i-(k-1)}=A_{(i-(k-1))+(k-1)}=A_i$ hence $x\in A_i$

as $i\in\mathbb{N}$ was choosen arbitrary it follows that $x\in\bigcap_{i\in\mathbb{N}}A_i$, Hence $\bigcap_{i\in\mathbb{N}}C_i\subseteq\bigcap_{i\in\mathbb{N}}A_i$ which combined with [eq: 20.167] proves that

$$\bigcap_{i\in\mathbb{N}} A_i=\bigcap_{i\in\mathbb{N}} C_i \tag{20.168}$$

So combining [eq: 20.166] and [eq: 20.168] it follows that

$$\mu\left(\bigcap_{i\in\mathbb{N}} A_i\right)=\lim_{i\to\infty}\mu(A_i)$$

which proves the case $1<k$. □

The above theorem has the following inverse which provides ways to prove if a set function is actually a mesure.

Theorem 20.207. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space and $\mu: \mathcal{A} \to [0, \infty]$ a funtion that satisfies:*

1. $\mu(\varnothing) = 0$
2. *If $n \in \mathbb{N}, \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A}$ is a **pairwise disjoint family** then*

$$\mu\left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i\right) = \sum_{i=1}^{n} \mu(A_i)$$

then we have:

1. *If $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ that satisfies $\forall i \in \mathbb{N}\ A_i \subseteq A_{i+1}$ we have that $\lim_{i \to \infty} \mu(A_i)$ exists and $\mu(\bigcup_{i \in \mathbb{N}} A_i) = \lim_{i \to \infty} \mu(A_i)$ then μ is a measure on $\mathcal{A}$.*
2. *If $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ that satisfies $\forall i \in \mathbb{N}\ A_{i+1} \subseteq A_i$ and $\bigcap_{i \in \mathbb{N}} A_i = \varnothing$ we have that $\lim_{i \to \infty} \mu(A_i)$ exists and $\mu(\bigcap_{i \in \mathbb{N}} A_i) = 0$ then μ is a measure on $\mathcal{A}$.*

Proof.

1. Let $\{A_i\}_{i \in \mathbb{N}_o} \subseteq \mathcal{A}$ be a pairwise disjoint family. Define

$$\{B_i\}_{i \in \mathbb{N}} \text{ by } B_i = \bigsqcup_{j \in \{1, \ldots, i\}} A_j \in \mathcal{A}$$

then by [lemma: 20.114] we have that

$$\bigsqcup_{i \in \mathbb{N}} A_i = \bigcup_{i \in \mathbb{N}} B_i \text{ and } \forall i \in \mathbb{N} \text{ we have } B_i \subseteq B_{i+1} \tag{20.169}$$

Then by the hypothesis

$$\lim_{i \to \infty} B_i \text{ exist and } \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \lim_{i \to \infty} \mu(B_i) \tag{20.170}$$

Next

$$\begin{aligned}
\mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &\underset{\text{[eq: 20.169]}}{=} \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \\
&\underset{\text{[eq: 20.170]}}{=} \lim_{i \to \infty} \mu(B_i) \\
&= \lim_{i \to \infty} \mu\left(\bigsqcup_{j \in \{1, \ldots, i\}} A_j\right) \\
&\underset{\text{hypothesis}}{=} \lim_{i \to \infty} \left(\sum_{j=1}^{i} \mu(A_j)\right) \\
&\underset{\text{def}}{=} \sum_{j=1}^{\infty} \mu(A_j)
\end{aligned}$$

proving countable additivity. Hence μ is a measure on $\mathcal{A}$.

2. Let $\{A_i\}_{i \in \mathbb{N}_o} \subseteq \mathcal{A}$ be a pairwise disjoint family. Define

$$\{B_i\}_{i \in \mathbb{N}} \text{ by } B_i = \bigsqcup_{j \in \{i+1, \ldots, \infty\}} A_j \underset{\text{[theorem: 20.190]}}{\in} \mathcal{A}$$

Let $i \in \mathbb{N}$ then $B_{i+1} = \bigcup_{j \in \{i+2, \ldots, \infty\}} A_j \subseteq \bigcup_{j \in \{i+1, \ldots, n\}} A_j = B_i$ so that

$$\forall i \in \mathbb{N} \text{ we have } B_{i+1} \subseteq B_i$$

Let $x \in \bigcap_{i \in \mathbb{N}} B_i$ then $x \in B_1 = \bigcup_{j \in \{2, \ldots, \infty\}} A_j$ so that $\exists k \in \{2, \ldots, \infty\}$ such that $x \in A_k$, as $x \in \bigcap_{i \in \mathbb{N}} B_i$ we must have that $x \in B_k = \bigcup_{j \in \{k+1, \ldots, \infty\}} A_j$ so that $\exists l \in \{k+1, \ldots, \infty\}$ such that $x \in A_l$. Hence it follows that $x \in A_k \bigcap A_l \underset{k \neq l}{=} \varnothing$ leading to the contradiction $x \in \varnothing$. Hence we have that

$$\bigcap_{i \in \mathbb{N}} B_i = \varnothing$$

Let $i \in \mathbb{N}$ then $\bigsqcup_{j\in\mathbb{N}} A_j = \left(\bigsqcup_{j\in\{1,\ldots,i\}} A_j\right)\bigcup\left(\bigsqcup_{j\in\{i+1,\ldots,\infty\}} A_j\right)$. Assume $x\in\left(\bigsqcup_{j\in\{1,\ldots,i\}} A_j\right)\bigcap\left(\bigsqcup_{j\in\{i+1,\ldots,\infty\}} A_j\right)$ then there exist a $k\in\{1,\ldots,i\}$ and a $l\in\{i+1,\ldots,\infty\}$ such that $x\in A_k \wedge x\in A_l \Rightarrow x\in A_k\bigcap A_l \underset{k\neq l}{=} \varnothing$ leading to the contradiction $x\in\varnothing$. Hence we must have that $\left(\bigsqcup_{j\in\{1,\ldots,i\}} A_j\right)\bigcap\left(\bigsqcup_{j\in\{i+1,\ldots,\infty\}} A_j\right)=\varnothing$. By the hypothesis we have then

$$\begin{aligned}
\mu\left(\bigcup_{j\in\mathbb{N}} A_j\right) &= \mu\left(\left(\bigsqcup_{j\in\{1,\ldots,i\}} A_j\right)\bigsqcup\left(\bigsqcup_{j\in\{i+1,\ldots,\infty\}} A_j\right)\right)\\
&\underset{\mu \text{ is finite additive}}{=} \mu\left(\bigsqcup_{j\in\{1,\ldots,i\}} A_j\right)+\mu\left(\bigsqcup_{j\in\{i+1,\ldots,\infty\}} A_j\right)\\
&\underset{\mu \text{ is finite additive}}{=} \sum_{j=1}^{i}\mu(A_j)+\mu\left(\bigsqcup_{j\in\{i+1,\ldots,\infty\}} A_j\right)\\
&= \sum_{j=1}^{i}\mu(A_j)+\mu(B_i) \qquad (20.171)
\end{aligned}$$

By [definition: 20.92]

$$\lim_{i\to\infty}\sum_{j=1}^{i}\mu(A_j) \text{ exist and } \sum_{i=1}^{\infty}\mu(A_i)=\lim_{i\to\infty}\sum_{j=1}^{i}\mu(A_j) \qquad (20.172)$$

and by the hypothesis

$$\lim_{i\to\infty}\mu(B_i) \text{ exist and } \lim_{i\to\infty}\mu(B_i)=0 \qquad (20.173)$$

Next we have

$$\begin{aligned}
\mu\left(\bigcup_{j\in\mathbb{N}} A_j\right) &\underset{\text{[theorem: 20.71]}}{=} \lim_{i\to\infty}\left(\mu\left(\bigcup_{j\in\mathbb{N}} A_j\right)\right)\\
&\underset{\text{[eq: 20.171}}{=} \lim_{i\to\infty}\left(\sum_{j=1}^{i}\mu(A_j)+\mu(B_i)\right)\\
&\underset{\text{[theorem: 20.82]}\wedge\text{[eqs: 20.172, 20.173]}}{=} \lim_{i\to\infty}\sum_{j=1}^{i}\mu(A_j)+\lim_{i\to\infty}\mu(B_i)\\
&\underset{\text{[eqs: 20.172, 20.173]}}{=} \sum_{i=1}^{\infty}\mu(A_i)+0\\
&= \sum_{i=1}^{\infty}\mu(A_i)
\end{aligned}$$

So μ is countable additive proving that μ is a measure.

□

20.4.2 Carathéodory Theorem

The Carathéodory theorem provides a general method for constructing a measure. Given a set X and a non negative set function on $\mathcal{P}(X)$ the Carathéodory theorem allows us to reduce $\mathcal{P}(X)$ to a σ-algebra on X such that the restriction of the set function to this σ-algebra is a measure on this σ-algebra. The idea is that $\mathcal{P}(X)$ is in general to big to be used as a σ-algebra on which we can define a measure. As the restriction of the set function is a measure it must satisfies some extra conditions. For example every σ-algebra contains $\varnothing$ and a measure must map $\varnothing$ to 0 so the set function on $\mathcal{P}(X)$ must also map $\varnothing$ to 0. This is the idea of a outer-measure.

Definition 20.208. (Outer Measure) *Let X be a set then $\mu^*:\mathcal{P}(X)\to[0,\infty]$ is a **outer measure** on X if*

1. $\mu^*(\varnothing)=0$

2. *For $A, B \in \mathcal{P}(X)$ with $A \subseteq B$ we have $\mu^*(A) \leqslant \mu^*(B)$ [in other words μ^* is monoton]*
3. *$\forall \{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{P}(X)$ we have $\mu^*(\bigcup_{i\in\mathbb{N}} A_i) \leqslant \sum_{i=1}^{\infty} \mu^*(A_i)$ [in otherwords $\mu^\star$ is countable sub-additive]*

It is easy to prove that a outer measure is finitely sub-additive.

Theorem 20.209. *Let X be a set and $\mu^*: \mathcal{P}(X) \to [0,\infty]$ is a outer measure on X, $n \in \mathbb{N}$ and $\{A_i\}_{i\in\{1,\ldots,n\}} \in \mathcal{P}(X)$ then $\mu^*\left(\bigcup_{i\in\{1,\ldots,n\}} A_i\right) \leqslant \sum_{i=1}^{n} \mu^\star(A_i)$*

Proof. Define $\{C_i\}_{i\in\mathbb{N}} \subseteq \mathcal{P}(X)$ by $C_i = \begin{cases} A_i \text{ if } i \in \{1,\ldots,n\} \\ \varnothing \text{ if } i \in \{n+1,\ldots,\infty\} \end{cases}$ then we have

$$\begin{aligned}
\mu^*\left(\bigcup_{i\in\{1,\ldots,n\}} A_i\right) &= \mu^*\left(\bigcup_{i\in\{1,\ldots,n\}} C_i\right) \\
&\underset{\mu^* \text{ is a outer measure}}{\leqslant} \sum_{i=1}^{\infty} \mu^*(C_i) \\
&\underset{[\text{theorem: } 20.97]}{=} \sum_{i=1}^{n} \mu^*(C_i) + \sum_{i=n+1}^{\infty} \mu^*(C_i) \\
&= \sum_{i=1}^{n} \mu^*(A_i) + \sum_{i=n+1}^{\infty} 0 \\
&\underset{[\text{theorem: } 20.94]}{=} \sum_{i=1}^{n} \mu^*(A_i)
\end{aligned}$$

□

We need now to reduce $\mathcal{P}(X)$ to a σ-algebra in such a way that the restriction of the outer-measure to this σ-algebra becomes a measure. This is the idea of μ^*-measurable sets.

Definition 20.210. (μ^*-measurable sets) *Let X be a set and $\mu^*: \mathcal{P}(X) \to [0,\infty]$ a outer measure on X then $A \in \mathcal{P}(X)$ is μ^*-measurable if*

$$\forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) = \mu^*\left(B \bigcap A\right) + \mu^*(B \setminus A)$$

The set of all μ^*-measurable sets in $\mathcal{P}(X)$ is noted as $\mathcal{M}[\mu^*]$, hence

$$\mathcal{M}[\mu^*] = \left\{A \in \mathcal{P}(X) | \forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) = \mu^*\left(B \bigcap A\right) + \mu^*(B \setminus A)\right\}$$

Using the properties of a outer-measure we can simplify the above definition.

Theorem 20.211. *Let X be a set and $\mu^*: \mathcal{P}(X) \to [0,\infty]$ and $A \in \mathcal{P}(X)$ then we have*

$$A \text{ is } \mu^*\text{-measurable} \Leftrightarrow \forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) \geqslant \mu^*\left(B \bigcap A\right) + \mu^*(B \setminus A)$$

Hence we have the following alternative definition for $\mathcal{M}[\mu^*]$

$$\mathcal{M}[\mu^*] = \left\{A \in \mathcal{P}(X) | \forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) \geqslant \mu^*\left(B \bigcap A\right) + \mu^*(B \setminus A)\right\}$$

Proof.

- **$\Rightarrow$.** This is trivial as $\mu^*(B) = \mu^*(B \bigcap A) + \mu^*(B \setminus A)$ implies $\mu^*(B) \geqslant \mu^*(B \bigcap A) + \mu^*(B \setminus A)$.
- **$\Leftarrow$.** Let $B \in \mathcal{P}(X)$ then as $B = (B \bigcap A) \bigcup (B \setminus A)$ we have by [theorem: 20.209] that $\mu^*(B) \leqslant \mu^*(B \bigcap A) + \mu^*(B \setminus A)$, combining this with the hypothesis it follows that

$$\mu^*(B) = \mu^*\left(B \bigcap A\right) + \mu^*(B \setminus A)$$

□

Theorem 20.212. *Let X be a set, $\mu^*: \mathcal{P}(X) \to [0,\infty]$ a outer measure and $A \in \mathcal{P}(X)$ then*

1. *If $\mu^*(A) = 0$ then $A \in \mathcal{M}[\mu^*]$.*

2. *If* $\mu^*(X\setminus A)=0$ *then* $A\in\mathcal{M}[\mu^*]$.

Proof.

1. Let $B\in\mathcal{P}(X)$ then as $B\bigcap A\subseteq A$ we have $\mu^*(B\bigcap A)\leqslant\mu^*(A)=0$ so that $\mu^*(B\bigcap A)$, further as $B\setminus A\subseteq B$ we have $\mu^*(B\setminus A)\leqslant\mu^*(B)$. Hence it follows that $\forall B\in\mathcal{P}(X)$ we have
$$\mu^*\big(B\bigcap A\big)+\mu^*(B\setminus A)\leqslant\mu^*(B)$$
proving by the previous theorem [theorem: 20.211] that $A\in\mathcal{M}[\mu^*]$.
2. Let $B\in\mathcal{P}(X)$ then as $B\setminus A\subseteq X\setminus A$ we have $\mu^*(B\setminus A)\subseteq\mu^*(X\setminus A)=0$ so that $\mu^*(B\setminus A)=0$, further as $B\bigcap A\subseteq B$ we have $\mu^*(B\bigcap A)\leqslant\mu^*(B)$. Hence it follows that
$$\mu^*\big(B\bigcap A\big)+\mu^*(B\setminus A)\leqslant\mu^*(B)$$
proving by the previous theorem [theorem: 20.211] that $A\in\mathcal{M}[\mu^*]$. □

We prove now that $\mathcal{M}[\mu^*]$ is a σ-algebra and the restriction of μ^* on $\mathcal{M}[\mu^*]$ is a measure on $\mathcal{M}[\mu^*]$.

Theorem 20.213. (Carathéodory Theorem) *Let* X *be a set and* $\mu^*:\mathcal{P}(X)\to[0,\infty]$ *a outer measure on* X *then we have:*

1. $\mathcal{M}[\mu^*]$ *is a* σ*-algebra on* X.
2. $(\mu^*)_{|\mathcal{M}[\mu^*]}:\mathcal{M}[\mu^*]\to[0,\infty]$ *is a measure on* $\mathcal{M}[\mu^*]$.

Proof.

1. Let $B\in\mathcal{P}(X)$ then
$$\mu^*(B)=\mu^*\big(B\bigcap X\big)+0=\mu^*\big(B\bigcap X\big)+\mu^\star(\varnothing)=\mu^*\big(B\bigcap X\big)+\mu^\star(B\setminus X)$$
proving that
$$X\in\mathcal{M}[\mu^*]\tag{20.174}$$
If $A\in\mathcal{M}[\mu^*]$ then for $B\in\mathcal{P}(X)$ we have
$$\begin{aligned}\mu^*\big(B\bigcap(X\setminus A)\big)+\mu^*(B\setminus(X\setminus A)) &\underset{B\subseteq X\wedge[\text{theorem: 1.33 (6)}]}{=}\mu^*\big(B\bigcap(X\setminus A)\big)+\mu^*\big(B\bigcap A\big)\\ &\underset{B\subseteq X\wedge[\text{theorem: 1.33 (8)}]}{=}\mu^*(B\setminus A)+\mu^*\big(B\bigcap A\big)\\ &\underset{A\in\mathcal{M}[\mu^*]}{=}\mu^*(B)\end{aligned}$$
so that $X\setminus A\in\mathcal{M}[\mu^*]$. Hence we have
$$\forall A\in\mathcal{M}[\mu^*]\text{ we have }X\setminus A\in\mathcal{M}[\mu^*]\tag{20.175}$$
Let $A,B\in\mathcal{M}[\mu^*]$ then for $C\in\mathcal{P}(X)$ we have
$$\begin{aligned}\mu^*\big(C\bigcap(A\bigcup B)\big) &\underset{A\in\mathcal{M}[\mu^*]}{=}\mu^*\big((C\bigcap(A\bigcup B))\bigcap A\big)+\mu^*\big((C\bigcap(A\bigcup B))\setminus A\big)\\ &=\mu^*\big(C\bigcap((A\bigcup B)\bigcap A)\big)+\mu^*\big((C\bigcap(A\bigcup B))\setminus A\big)\\ &=\mu^*\big(C\bigcap A\big)+\mu^*\big((C\bigcap(A\bigcup B))\setminus A\big)\\ &\underset{[\text{theorem: 1.25 (7)}]}{=}\mu^*\big(C\bigcap A\big)+\mu^*\big(C\bigcap((A\bigcup B)\setminus A)\big)\\ &\underset{[\text{theorem: 1.25 (6)}]}{=}\mu^*\big(C\bigcap A\big)+\mu^*\big(C\bigcap((A\setminus A)\bigcup(B\setminus A))\big)\\ &=\mu^*\big(C\bigcap A\big)+\mu^*\big(C\bigcap(B\setminus A)\big)\end{aligned}$$
proving that
$$\mu^*\big(C\bigcap(A\bigcup B)\big)=\mu^*\big(C\bigcap A\big)+\mu^*\big(C\bigcap(B\setminus A)\big)\tag{20.176}$$

So we have

$$\begin{aligned}
\mu^*\left(C\bigcap\left(A\bigcup B\right)\right)+\mu^*\left(C\setminus\left(A\bigcup B\right)\right) &\underset{\text{[eq: 20.176]}}{=}\\
\mu^*\left(C\bigcap A\right)+\mu^*\left(C\bigcap\left(B\setminus A\right)\right)+\mu^*\left(C\setminus\left(A\bigcup B\right)\right) &\underset{\text{[theorem: 1.31(1)]}}{=}\\
\mu^*\left(C\bigcap A\right)+\mu^*\left(C\bigcap\left(B\setminus A\right)\right)+\mu^*\left(\left(C\setminus A\right)\setminus B\right) &\underset{\text{[theorem: 1.25(7)]}}{=}\\
\mu^*\left(C\bigcap A\right)+\mu^*\left(\left(C\setminus A\right)\bigcap B\right)+\mu^*\left(\left(C\setminus A\right)\setminus B\right) &\underset{B\in\mathcal{M}[\mu^*]}{=}\\
\mu^*\left(C\bigcap A\right)+\mu^\star\left(C\setminus A\right) &\underset{A\in\mathcal{M}[\mu^*]}{=}\\
\mu^*(C)
\end{aligned}$$

proving that $A\bigcup B$ is μ^*-measurable. Hence we have

$$\forall A,B\in\mathcal{M}[\mu^*] \text{ we have that } A\bigcup B\in\mathcal{M}[\mu^*] \text{ [in other words } \mathcal{M}[\mu^*] \text{ is } \cup\text{-stable]} \tag{20.177}$$

From [eqs: 20.174, 20.175 and 20.177] and [theorem: 20.136] it follows that

$$\mathcal{M}[\mu^*] \text{ is a algebra} \tag{20.178}$$

Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{M}[\mu^*]$ **pairwise disjoint** and $B\in\mathcal{P}(X)$. We show then by mathematical induction that $\forall n\in\mathbb{N}$

$$\mu^*(B)=\sum_{i=1}^{n}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right) \tag{20.179}$$

Proof. Define

$$S=\left\{n\in\mathbb{N}|\mu^*(B)=\sum_{i=1}^{n}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)\right\}$$

then we have:

$1\in S$. As $A_1\in\mathcal{M}[\mu^*]$ we have

$$\begin{aligned}
\mu^*(B) &= \mu^*\left(B\bigcap A_1\right)+\mu^*\left(B\setminus A_1\right)\\
&= \sum_{i=1}^{1}\mu^*\left[B\bigcap A_i\right]+\mu^*\left(B\setminus\bigsqcup_{i\in\{1\}}A_i\right)
\end{aligned}$$

which proves that $1\in\mathcal{S}$

$n\in S\Rightarrow n+1\in S$. If $x\in B\bigcap A_{n+1}$ then $x\in B$ and $x\in A_{n+1}$ then $\forall i\in\{1,\ldots,n\}$ we have by pairwise disjointedness $x\notin A_i$ so that $x\notin\bigsqcup_{i\in\{1,\ldots,n\}}A_i$ or $x\in\left(B\setminus\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)\bigcap A_{n+1}$. Hence $B\bigcap A_{n+1}\subseteq\left(B\setminus\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)\bigcap A_{n+1}\subseteq B\bigcap A_{n+1}$. Summarized

$$\left(B\setminus\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)\bigcap A_{n+1}=B\bigcap A_{n+1} \tag{20.180}$$

As $A_{n+1}\in\mathcal{M}[\mu^*]$ we have

$$\begin{aligned}
\mu^*\left(B\setminus\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right) &=\\
\mu^*\left(\left(B\setminus\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)\bigcap A_{n+1}\right)+\mu^*\left(\left(B\setminus\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)\setminus A_{n+1}\right) &\underset{\text{[eq: 20.180]}}{=}\\
\mu^*\left(B\bigcap A_{n+1}\right)+\mu^*\left(\left(B\setminus\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)\setminus A_{n+1}\right) &\underset{\text{[theorem: 1.31]}}{=}\\
\mu^*\left(B\bigcap A_{n+1}\right)+\mu^*\left(B\setminus\left(\left(\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)\bigcup A_{n+1}\right)\right) &=\\
\mu^*\left(B\bigcap A_{n+1}\right)+\mu^*\left(B\setminus\left(\bigsqcup_{i\in\{1,\ldots,n+1\}}A_i\right)\right)
\end{aligned}$$

proving that

$$\mu^*\left(B\setminus\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)=\mu^*\left(B\bigcap A_{n+1}\right)+\mu^*\left(B\setminus\left(\bigsqcup_{i\in\{1,\ldots,n+1\}}A_i\right)\right)\tag{20.181}$$

Finally

$$\begin{aligned}\mu^*(B)&\underset{n\in S}{=}\sum_{i=1}^{n}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)\\&\underset{\text{[eq: 20.181]}}{=}\sum_{i=1}^{n}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\bigcap A_{n+1}\right)+\mu^*\left(B\setminus\left(\bigsqcup_{i\in\{1,\ldots,n+1\}}A_i\right)\right)\\&=\sum_{i\asymp 1}^{n+1}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\left(\bigsqcup_{i\in\{1,\ldots,n+1\}}A_i\right)\right)\end{aligned}$$

which proves that $n+1\in\mathcal{S}$.

Mathematical induction proves then [eq: 20.179]. □

Let $n\in\mathbb{N}$ then we have $\bigsqcup_{i\in\{1,\ldots,n\}}A_i\subseteq\bigsqcup_{i\in\mathbb{N}}A_i$ so that $B\setminus\bigcup_{i\in\mathbb{N}}A_i\subseteq B\setminus\bigcup_{i\in\{1,\ldots,n\}}A_i$ hence $\mu^*(B\setminus\bigcup_{i\in\mathbb{N}}A_i)\leqslant\mu^*(B\setminus\bigcup_{i\in\{1,\ldots,n\}}A_i)$. So

$$\begin{aligned}\sum_{i=1}^{n}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\bigcup_{i\in\mathbb{N}}A_i\right)&\leqslant\sum_{i=1}^{n}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\bigcup_{i\in\{1,\ldots,n\}}A_i\right)\\&\underset{\text{[eq: 20.179]}}{=}\mu^*(B)\end{aligned}\tag{20.182}$$

Next

$$\begin{aligned}\sum_{i=1}^{\infty}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\mathbb{N}}A_i\right)&=\\\lim_{n\to\infty}\left(\sum_{i=1}^{n}\mu^*\left(B\bigcap A_i\right)\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\mathbb{N}}A_i\right)&\underset{\text{[theorem: 20.82]}}{=}\\\lim_{n\to\infty}\left(\sum_{i=1}^{n}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\mathbb{N}}A_i\right)\right)&\underset{\text{[theorem: 20.82]}\wedge\text{[eq: 20.182]}}{\leqslant}\\\lim_{n\to\infty}\mu^*(B)&\underset{\text{[theorem: 20.71]}}{=}\\\mu^*(B)&\end{aligned}$$

proving that $\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{M}[\mu^*]$ and $B\in\mathcal{P}(X)$

$$\sum_{i=1}^{\infty}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\mathbb{N}}A_i\right)\leqslant\mu^*(B)\tag{20.183}$$

Hence we have for $\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{M}[\mu^*]$ and $B\in\mathcal{P}(X)$ that

$$\begin{aligned}\mu^*\left(B\bigcap\left(\bigsqcup_{i\in\mathbb{N}}A_i\right)\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\mathbb{N}}A_i\right)&=\\\mu^*\left(\bigcup_{i\in\mathbb{N}}\left(B\bigcap A_i\right)\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\mathbb{N}}A_i\right)&\underset{\mu^*\text{ is a outer measure}}{\leqslant}\\\sum_{i=1}^{\infty}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\mathbb{N}}A_i\right)&\underset{\text{[eq: 20.183]}}{\leqslant}\mu^*(B)\end{aligned}$$

So by [theorem: 20.211] it follows that $\bigsqcup_{i\in\mathbb{N}}A_i$ is $\mu^\star$-measureable. Hence we have proved that

$$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{M}[\mu^*]\text{ pairwise disjoint we have }\bigsqcup_{i\in\mathbb{N}}A_i\in\mathcal{M}[\mu^*]\tag{20.184}$$

As $\mathcal{M}[\mu^*]$ is a algebra [see eq: 20.178] we can use the alternative definition for a σ-algbra [see theorem: 20.140] and the above to prove that

$$\mathcal{M}[\mu^*] \text{ is a } \sigma\text{-algebra}$$

2. Let $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{M}[\mu^*]$ a pairwise disjoint family then for $B = \bigsqcup_{j\in\mathbb{N}} A_i \in \mathcal{P}(X)$ we have

$$\begin{aligned}
\sum_{i=1}^{\infty} (\mu^*)_{|\mathcal{M}[\mu^*]}(A_i) &= \sum_{i=1}^{\infty} \mu^*(A_i) \\
&= \sum_{i=1}^{\infty} \mu^*\left(\left(\bigcup_{j\in\mathbb{N}} A_j\right)\bigcap A_i\right) + 0 \\
&= \sum_{i=1}^{\infty} \mu^*\left(\left(\bigcup_{j\in\mathbb{N}} A_j\right)\bigcap A_i\right) + \mu^*\left(\left(\bigcup_{j\in\mathbb{N}} A_j\right)\setminus\left(\bigcup_{j\in\mathbb{N}} A_j\right)\right) \\
&= \sum_{i=1}^{\infty} \mu^*(B\bigcap A_i) + \mu^*\left(B\setminus\left(\bigcup_{j\in\mathbb{N}} A_j\right)\right) \\
&\underset{\text{[eq: 20.183]}}{\leqslant} \mu^*(B) \\
&= \mu^*\left(\bigsqcup_{i\in\mathbb{N}} A_i\right) \\
&= (\mu^*)_{|\mathcal{M}[\mu^*]}\left(\bigsqcup_{i\in\mathbb{N}} A_i\right)
\end{aligned}$$

As further by the sub-additivity of μ^* we have

$$(\mu^*)_{|\mathcal{M}[\mu^*]}\left(\bigsqcup_{i\in\mathbb{N}} A_i\right) = \mu^*\left(\bigcup_{i\in\mathbb{N}} A_i\right) \leqslant \sum_{i=1}^{\infty} \mu^*(A_i) = \sum_{i=1}^{\infty} (\mu^*)_{|\mathcal{M}[\mu^*]}(A_i)$$

it follows that

$$(\mu^*)_{|\mathcal{M}[\mu^*]}\left(\bigsqcup_{i\in\mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} (\mu^*)_{|\mathcal{M}[\mu^*]}(A_i)$$

which together with $(\mu^*)_{|\mathcal{M}[\mu^*]}(\varnothing) = \mu^\star(\varnothing) = 0$ proves

$$(\mu^*)_{|\mathcal{M}[\mu^*]} \text{ is a measure on } \mathcal{M}[\mu^*]$$

□

20.4.3 Uniqueness of measure extensions

Let X be a set, $\mathcal{G} \subseteq \mathcal{P}(X)$ and $\sigma[\mathcal{G}]$ is the σ-algebra generated by $\mathcal{G}$ [see theorem: 20.146] then if we have a set function on $\mathcal{G}$ that we extend to a measure on $\sigma[\mathcal{G}]$ we can ask ourselves if the extension is unique. The answer is true if $\mathcal{G}$ and the set function satisfies certain conditions. To prove this we introduce the concept of a Dynkin system.

20.4.3.1 Dynkin systems

Definition 20.214. (Dynkin System) *Let X be a set then $\mathfrak{D} \subseteq \mathcal{P}(X)$ is a **Dynkin system** on X if*

1. *$X \in \mathfrak{D}$*
2. *If $D \in \mathfrak{D}$ then $X \setminus D \in \mathfrak{D}$*
3. *If $\{D_i\}_{i\in\mathbb{N}} \subseteq \mathfrak{D}$ is a **pairwise disjoint family** then $\bigsqcup_{i\in\mathbb{N}} D_i \in \mathfrak{D}$*

***Note* 20.215.** *Using [definition: 20.137] every σ-algebra is automatical a Dynkin system however the opposite is in general not true.*

Some of the properties of a Dynkin system are similar to the properties of a σ-algebra.

Theorem 20.216. *Let X be a set and $\mathfrak{D}$ is a Dynkin system on X then we have:*

1. $\varnothing \in \mathfrak{D}$
2. *Let $n \in \mathbb{N}$ and $\{D_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathfrak{D}$ pairwise disjoint then $\bigsqcup_{i\in\{1,\ldots,n\}} D_i \in \mathfrak{D}$*

Proof.

1. As $X \in \mathfrak{D}$ we have that $\varnothing = X \setminus X \in \mathfrak{D}$
2. Define $\{E_i\}_{i\in\mathbb{N}} \subseteq \mathfrak{D}$ by $E_i = \begin{cases} \varnothing \text{ if } i \in \{n+1,\ldots,\infty\} \\ D_i \text{ if } i \in \{1,\ldots,n\} \end{cases}$. Let $i, j \in \mathbb{N}$ with $i \neq j$ then we have either

   $\boldsymbol{i \leqslant n \wedge j \leqslant n}$. Then $E_i \bigcap E_j = D_i \bigcap D_j = \varnothing$

   $\boldsymbol{n < i \wedge j \leqslant n}$. Then $E_i \bigcap E_j = \varnothing \bigcap D_j = \varnothing$

   $\boldsymbol{i \leqslant n \wedge n < j}$. Then $E_i \bigcap E_j = D_i \bigcap D_j = \varnothing$

   $\boldsymbol{n < i \wedge n < j}$. Then $E_i \bigcap E_j = \varnothing \bigcap \varnothing = \varnothing$

   which proves that $\{E_i\}_{i\in\mathbb{N}}$ is pairwise disjoint. So

   $$\bigsqcup_{i\in\mathbb{N}} E_i \in \mathfrak{D}$$

   If $x \in \bigcup_{i\in\{1,\ldots,n\}} D_i$ then $\exists i \in \{1,\ldots,n\}$ such that $x \in D_i = E_i$ so that $x \in \bigcup_{i\in\mathbb{N}} E_i$. If $x \in \bigcup_{i\in\mathbb{N}} E_i$ then there exist a $i \in \mathbb{N}$ such that $x \in E_i$, as $\forall i \in \{n+1,\ldots,\infty\}$ $E_i = \varnothing$ we must have that $i \in \{1,\ldots,n\}$ so that $E_i = D_i$ proving that $x \in \bigcup_{i\in\{1,\ldots,n\}} D_i$. Hence we have

   $$\bigsqcup_{i\in\{1,\ldots,n\}} D_i = \bigsqcup_{i\in\mathbb{N}} E_i \in \mathfrak{D}$$

□

Example 20.217. Let X be a set then $\mathcal{P}(X)$ is a Dynkin system on X

Proof. As $\mathcal{P}(X)$ is a σ-algebra on X [see example: 20.142] and every σ-algebra is a Dynkin system it follows that $\mathcal{P}(X)$ is a Dynkin system on X. □

Given a set of subsets of X we can, just like with σ-algebras, find the smallest Dynkin system that contains the set of subsets.

Lemma 20.218. *Let X be a set and $\mathcal{X}$ a non empty set of Dynkin systems on X then $\bigcap_{\mathfrak{D}\in\mathcal{X}} \mathfrak{D}$ is a Dynkin system on X.*

Proof. As $\mathcal{X} \neq \varnothing$ there exist a $\mathfrak{D} \in \mathcal{X}$ with $\mathfrak{D} \subseteq \mathcal{P}(X)$ so that we have by [theorem: 1.63] that $\bigcap_{\mathcal{D}\in\mathcal{X}} \mathcal{D} \subseteq \mathfrak{D} \subseteq \mathcal{P}(X)$ proving that

$$\bigcap_{\mathcal{D}\in\mathcal{X}} \mathcal{D} \subseteq \mathcal{P}(X)$$

As $\forall \mathcal{D} \in \mathfrak{D}$ $\mathcal{D}$ is a Dynkin system on X we have $X \in \mathcal{A}$ hence

$$X \in \bigcap_{\mathcal{D}\in\mathcal{X}} \mathcal{D}$$

Let $A \in \bigcap_{\mathcal{D}\in\mathcal{X}} \mathcal{D}$ then for $\mathcal{D} \in \mathcal{X}$ we have $A \in \mathcal{D}$ so that $X \setminus A \in \mathcal{D}$ which as $\mathcal{D} \in \mathcal{X}$ was chosen arbitrary proves that $X \setminus A \in \bigcap_{\mathcal{D}\in\mathcal{X}} \mathcal{D}$. Hence as $A \in \bigcap_{\mathcal{D}\in\mathcal{X}} \mathcal{D}$ was chosen arbitrary we have that

$$\forall A \in \bigcap_{\mathcal{D}\in\mathcal{X}} \mathcal{D} \text{ we have } X \setminus A \in \bigcap_{\mathcal{D}\in\mathcal{X}} \mathcal{D}$$

If $\{D_i\}_{i\in\mathbb{N}} \subseteq \bigcap_{\mathcal{D}\in\mathcal{X}} \mathcal{D}$ is pairwise disjoint then for $\mathcal{D} \in \mathcal{X}$ we have $\{D_i\}_{i\in\mathbb{N}} \subseteq \mathcal{D}$ so that $\bigsqcup_{i\in\mathbb{N}} D_i \in \mathcal{D}$ which as $\mathcal{D} \in \mathcal{X}$ was chosen arbitrary proves that $\bigcup_{i\in\mathbb{N}} D_i \in \bigcap_{\mathcal{D}\in\mathcal{X}} \mathcal{D}$. Hence as $\{D_i\}_{i\in\mathbb{N}} \subseteq \bigcap_{\mathcal{D}\in\mathcal{X}} \mathcal{D}$ was chosen arbitrary we have that

$$\text{For every pairwise disjoint family } \{D_i\}_{i\in\mathbb{N}} \subseteq \bigcap_{\mathcal{D}\in\mathcal{X}} \mathcal{D} \text{ we have } \bigcup_{i\in\mathbb{N}} D_i \in \bigcap_{\mathcal{D}\in\mathcal{X}} \mathcal{D}$$

□

Theorem 20.219. *Let X be a set $\mathcal{D} \subseteq \mathcal{P}(X)$ then there exist a* ***unique*** *Dynkin system $\delta[\mathcal{A}]$ on X such that:*

1. $\mathcal{D} \subseteq \delta[\mathcal{D}]$
2. *If $\mathfrak{D}'$ is another Dynkin system with $\mathcal{D} \subseteq \mathfrak{D}'$ then $\delta[\mathcal{D}] \subseteq \mathfrak{D}'$*
3. $\delta[\mathcal{D}] \subseteq \sigma[\mathcal{D}]$

This unique smallest Dynkin system that contains $\mathcal{D}$ is called the Dynkin system generated by $\mathcal{D}$

Proof.

1. Define $\mathcal{X} = \{\mathfrak{D} \subseteq \mathcal{P}(X) | \mathfrak{D}$ is a Dynkin system on X and $\mathcal{D} \subseteq \mathfrak{D}\}$ then as $\mathcal{P}(X)$ is a Dynkin system [see example: 20.217] and $\mathcal{D} \subseteq \mathcal{P}(X)$ it follows that $\mathcal{X} \neq \varnothing$. Hence by [lemma: 20.218] it follows that, if we take $\delta[\mathcal{D}] = \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D}$, that
$$\delta[\mathcal{D}] \text{ is a Dynkin system on } X$$
If $D \in \mathcal{D}$ then, as $\forall \mathfrak{D} \in \mathcal{X}$ we have by defintion of $\mathcal{X}$ that $\mathcal{D} \subseteq \mathfrak{D}$, it follows that $D \in \mathfrak{D}$, hence $D \in \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D}$. So that
$$\mathcal{D} \subseteq \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D} = \delta[\mathcal{D}]$$
2. Assume that $\mathfrak{D}'$ is another Dynkin system on X such that $\mathcal{D} \subseteq \mathfrak{D}'$ then $\mathfrak{D}' \in \mathcal{X}$ so that by [theorem: 1.63]
$$\delta[\mathcal{D}] = \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D} \subseteq \mathfrak{D}'$$
3. As $\mathcal{D} \subseteq \sigma[\mathcal{D}]$, $\sigma[\mathcal{D}]$ is a σ-algebra hence a Dynkin system on X it follows from (2) that
$$\delta[\mathcal{D}] \subseteq \sigma[\mathcal{D}]$$
□

We show now the sufficient and necessary condition for a Dynkin system to be a σ-algebra.

Theorem 20.220. *Let X be a set and $\mathfrak{D}$ a Dynkin system on X then we have*
$$\mathfrak{D} \text{ is a } \sigma\text{-algebra} \Leftrightarrow \forall A, B \in \mathfrak{D} \text{ we have } A \bigcap B \in \mathfrak{D} \text{ [in other words } \mathfrak{D} \text{ is } \cap\text{-stable]}$$

Proof.

$\Rightarrow$. Let $A, B \in \mathfrak{D}$ then, as $\mathfrak{D}$ is a σ-algebra, it follows from [theorems: 20.140, 20.136] that $A \bigcap B \in \mathcal{A}$.

$\Leftarrow$. As $\mathfrak{D}$ is a Dynkin system and $\cap$-stable we have already that
$$X \in \mathfrak{D}, \forall D \in \mathfrak{D} \text{ we have } X \setminus D \in \mathfrak{D} \text{ and } \forall A, B \in \mathfrak{D} \text{ we have } A \bigcap B \in \mathfrak{D} \tag{20.185}$$
Let $\{D_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}$. Define
$$\{E_i\}_{i \in \mathbb{N}} \text{ by } E_i = \begin{cases} D_1 \text{ if } i = 1 \\ D_i \bigcap \left(\bigcap_{j \in \{1, \ldots, i-1\}} (X \setminus D_j)\right) \text{ if } i \in \{2, \ldots \infty\} \end{cases} \underset{\text{[eq: 20.185]} \wedge \text{[theorem: 20.116]}}{\in} \mathfrak{D}$$
Then $\forall i \in \mathbb{N}$ we have
$$E_i = \begin{cases} D_1 \subseteq D_i \text{ if } i = 1 \\ D_i \bigcap \left(\bigcap_{j \in \{1, \ldots, i-1\}} (X \setminus D_j)\right) \subseteq D_i \text{ if } i \in \{2, \ldots, \infty\} \end{cases} \subseteq D_i \tag{20.186}$$
so that
$$\bigcup_{i \in \mathbb{N}} E_i \subseteq \bigcup_{i \in \mathbb{N}} D_i \tag{20.187}$$
If $x \in \bigcup_{i \in \mathbb{N}} D_i$ then there exist a $k \in \mathbb{N}$ such that $x \in D_k$. Define
$$S = \{i \in \{1, \ldots, k\} | x \in D_i\} \subseteq \{1, \ldots, k\}$$
then $k \in S \Rightarrow S \neq \varnothing$ and S is finite so that $m = \min(S)$ exists. For m we have either:

$m = 1$. Then $x \in D_1 = E_1 \subseteq \bigcup_{i \in \mathbb{N}} E_i$

$1 < m$. Then $x \in D_m$ and $\forall i \in \{1, \ldots, m-1\}$ $x \notin D_i \Rightarrow x \in X \setminus D_i$ so that

$$x \in D_m \bigcap \left(\bigcap_{i \in \{1, \ldots, m-1\}} (X \setminus D_i) \right) = E_m \subseteq \bigcup_{i \in \mathbb{N}} E_i$$

Hence $\bigcup_{i \in \mathbb{N}} D_i \subseteq \bigcup_{i \in \mathbb{N}} E_i$ and we have by [eq: 20.187] that

$$\bigcup_{i \in \mathbb{N}} E_i = \bigcup_{i \in \mathbb{N}} D_i \tag{20.188}$$

Let $i, j \in \mathbb{N}$ with $i \neq j$ then we may always assume that $i < j$ [otherwise exchange i and j]. Assume that $x \in E_i \bigcap E_j$ then $x \in E_i \underset{\text{[eq: 20.186]}}{\subseteq} D_i$ and $x \in E_j = D_j \bigcap \left(\bigcap_{k \in \{1, \ldots, j-1\}} (X \setminus D_k) \right) \subseteq (X \setminus D_i) \Rightarrow x \notin D_i$ so that we reach the contradiction $x \in D_i$ and $x \notin D_i$. Hence we have

$$\forall i, j \in \mathbb{N} \text{ with } i \neq j \text{ we have } E_i \bigcap E_j = \varnothing$$

So by the definition of a Dynkin system it follows that

$$\bigcup_{i \in \mathbb{N}} D_i \underset{\text{[eq: 20.188]}}{=} \bigcup_{i \in \mathbb{N}} E_i \in \mathfrak{D}$$

Finally by the above, [eq: 20.185] and [definition: 20.137] it follows that $\mathfrak{D}$ is a σ-algebra on X. □

Theorem 20.221. *If $\mathcal{D} \subseteq \mathcal{P}(\mathcal{A})$ is such that $\forall A, B \in \mathfrak{D}$ $A \bigcap B \in \mathcal{D}$ [in other words $\mathfrak{D}$ is $\cap$-stable] then $\delta(\mathcal{D}) = \sigma(\mathcal{D})$*

Proof. Using [theorem: 20.219] it follows that

$$\delta[\mathcal{D}] \subseteq \sigma[\mathcal{D}] \tag{20.189}$$

For the opposite inclusion. Defiine for every $D \in \delta[\mathcal{D}]$

$$\mathfrak{D}_D = \left\{ E \subseteq X \,|\, E \bigcap D \in \delta[\mathcal{D}] \right\} \tag{20.190}$$

As $X \subseteq X$ and $X \bigcap D = D \in \delta[\mathcal{D}]$ it follows that

$$X \in \mathfrak{D}_D \tag{20.191}$$

Let $E \in \mathfrak{D}_D$ then $X \setminus E \subseteq X$ and

$$\begin{aligned}
X \setminus \left(\left(E \bigcap D \right) \bigcup (X \setminus D) \right) &\underset{\text{[theorem: 1.31]}}{=} \left(X \setminus \left(E \bigcap D \right) \right) \bigcap (X \setminus (X \setminus D)) \\
&\underset{\text{[theorem: 1.33]} \wedge D \subseteq X}{=} \left(X \setminus \left(E \bigcap D \right) \right) \bigcap D \\
&\underset{\text{[theorem: 1.31]}}{=} \left((X \setminus E) \bigcup (X \setminus D) \right) \bigcap D \\
&\underset{\text{[theorem: 1.30]}}{=} \left((X \setminus E) \bigcap D \right) \bigcup \left((X \setminus D) \bigcap D \right) \\
&= \left((X \setminus E) \bigcap D \right) \bigcup \varnothing \\
&= (X \setminus E) \bigcap D
\end{aligned}$$

Further $(E \bigcap D) \bigcap (X \setminus D) = \varnothing$ so that

$$(X \setminus E) \bigcap D = X \setminus \left(\left(E \bigcap D \right) \bigsqcup (X \setminus D) \right) \tag{20.192}$$

As $E \in \mathfrak{D}_D$ we have by [eq: 20.190] that $E \bigcap D \in \delta[\mathcal{D}]$, further as $\delta[\mathcal{D}]$ is a Dynkin system and $D \in \delta[\mathcal{D}]$ it follows that $X \setminus D \in \delta[\mathcal{D}]$ so that $(E \bigcap D) \bigsqcup (X \setminus D) \in \delta[\mathcal{D}]$ and finally that

$$X \setminus \left(\left(E \bigcap D \right) \bigsqcup (X \setminus D) \right) \in \delta[\mathcal{D}]$$

Hence by [eq: 20.192] it follows that

$$\forall E \in \mathfrak{D}_D \text{ that } X \setminus E \in \mathfrak{D}_D \tag{20.193}$$

Let $\{D_i\}_{i\in\mathbb{N}}\subseteq\mathfrak{D}_D$ be pairwise disjoint then $\forall i,j\in\mathbb{N}$ with $i\neq j$ we have $(D_i\bigcap D)\bigcap(D_j\bigcap D)\subseteq D_i\bigcap D_j=\varnothing$, further $\forall i\in\mathbb{N}$ we have by the definition of $\mathfrak{D}_D$ that $D_i\bigcap D\in\delta[\mathcal{D}]$. Hence $\{D_i\bigcap D\}_{i\in\mathbb{N}}\subseteq\delta[\mathcal{D}]$ is pairwise disjoint, so that, as $\delta[\mathcal{D}]$ is a Dynkin system, we have

$$\left(\bigsqcup_{i\in\mathbb{N}}D_i\right)\bigcap D=\bigsqcup_{i\in\mathbb{N}}\left(D_i\bigcap D\right)\in\delta[\mathcal{D}]$$

proving that

$$\bigsqcup_{i\in\mathbb{N}}D_i\in\mathfrak{D}_D \tag{20.194}$$

From [eqs: 20.191. 20.193 and 20.194] it follows that $\mathfrak{D}_D$ is a Dynkin system on X, hence

$$\forall D\in\delta[\mathcal{D}]\text{ we have that }\mathfrak{D}_D\text{ is a Dynkin system} \tag{20.195}$$

Let $G\in\mathcal{D}\subseteq\delta[\mathcal{D}]$ then by the hypothesis we have $\forall D\in\mathcal{D}$ that $G\bigcap D\in\mathcal{D}\Rightarrow D\in\mathfrak{D}_G$, hence $\mathcal{D}\subseteq\mathfrak{D}_G$. As $\mathfrak{D}_G$ is a Dynkin system and $\delta[\mathcal{D}]$ is the smallest Dynkin system containing $\mathcal{D}$ it follows that $\delta[\mathcal{D}]\subseteq\mathfrak{D}_G$. Hence we have proved that

$$\forall G\in\mathcal{D}\text{ we have }\delta[\mathcal{D}]\subseteq\mathfrak{D}_G \tag{20.196}$$

Let $G\in\mathcal{D}$ and $D\in\delta[\mathcal{D}]\underset{\text{[eq: 20.196]}}{\subseteq}\mathfrak{D}_G$ then by the definition of $\mathfrak{D}_G$ we have $G\bigcap D\in\delta[\mathcal{D}]$ so that $G\in\mathfrak{D}_D$. In other words $\forall D\in\delta[\mathcal{D}]$ we have $\forall G\in\mathcal{D}$ that $G\in\mathfrak{D}_D$ proving that

$$\forall D\in\delta[\mathcal{D}]\text{ we have }\mathcal{D}\subseteq\mathfrak{D}_D$$

As $\delta[\mathcal{D}]$ is the smallest Dynkin system containg $\mathcal{D}$ and $\mathfrak{D}_D$ is a Dynkin system [see eq: 20.195] it follows from the above that

$$\forall D\in\delta[\mathcal{D}]\text{ that }\delta[\mathcal{D}]\subseteq\mathfrak{D}_D$$

Let $A,B\in\delta[\mathcal{D}]$ then by the above $\delta[\mathcal{D}]\subseteq\mathfrak{D}_B$ and as $A\in\delta(\mathcal{D})$ we have $A\in\mathfrak{D}_B\underset{\text{[eq: 20.190]}}{\Rightarrow}A\bigcap B\in\delta[\mathcal{D}]$. So we have that

$$\forall A,B\in\delta[\mathcal{D}]\text{ we have }A\bigcap B\in\delta[\mathcal{D}]\text{ where }\delta[\mathcal{D}]\text{ is a Dynkin system}$$

Hence by [theorem: 20.220] it follows finally that

$$\delta[\mathcal{D}]\text{ is a }\sigma\text{-algebra}$$ □

20.4.3.2 Uniqueness theorem

We are now ready to prove that every set function on $\mathcal{G}\subseteq\mathcal{P}(X)$ has a unique extension to a measure on $\sigma[\mathcal{G}]$ if certain conditions are met.

Theorem 20.222. *Let X be a set, $\mathcal{G}\subseteq\mathcal{P}(X)$ such that:*

1. *$\forall A,B\in\mathcal{G}$ we have $A\bigcap B\in\mathcal{G}$ [in other words $\mathcal{G}$ is $\cap$-stable]*
2. *$\exists\{G_i\}_{i\in\mathbb{N}}\subseteq\mathcal{G}$ such that $\forall i\in\mathbb{N}$ we have $G_i\subseteq G_{i+1}$, $\mu(G_i)<\infty$ and $\bigcup_{i\in\mathbb{N}}G_i=X$*

Then if $\mu:\sigma[\mathcal{G}]\to[0,\infty]$ and $\nu:\sigma[\mathcal{G}]\to[0,\infty]$ are two measures defined on $\sigma[\mathcal{G}]$ [the σ-algebra generated from $\mathcal{G}$] such that $\forall A\in\mathcal{G}$ we have $\mu(A)=\nu(A)$ then

$$\mu=\nu$$

Proof. Given $n\in\mathbb{N}$ define

$$\mathfrak{D}_n=\left\{A\in\sigma[\mathcal{G}]|\mu\left(G_n\bigcap A\right)=\nu\left(G_n\bigcap A\right)\right\}\subseteq\sigma[\mathcal{G}] \tag{20.197}$$

We prove then that $\mathfrak{D}_n$ is a Dynkin system for every $n\in\mathbb{N}$. Take $G\in\mathcal{G}$ then $G,G_n\in\mathcal{G}$ so that by (1) $G_n\bigcap G\in\mathcal{G}$, as μ, ν are the same on $\mathcal{G}$ we have $\mu(G_n\bigcap G)=\nu(G_n\bigcap G)$. Hence we have

$$\mathcal{G}\subseteq\mathfrak{D}_n \tag{20.198}$$

As $X\in\sigma[\mathcal{G}]$ and $\mu(G_n\bigcap X)=\mu(G_n)\underset{G_n\in\mathcal{G}}{=}\nu(G_n)=\nu(G_n\bigcap X)$ it follows that

$$X\in\mathfrak{D}_n \tag{20.199}$$

Let $A \in \mathfrak{D}_n$ then we have $G_n \setminus (G_n \bigcap A) \underset{\text{[theorem: 1.31]}}{=} (G_n \setminus G_n) \bigcup (G_n \setminus A) = \varnothing \bigcup (G_n \setminus A) = G_n \setminus A$ so that

$$G_n \setminus \left(G_n \bigcap A\right) = G_n \setminus A \tag{20.200}$$

Further $\mu(G_n \bigcap A) \underset{\text{[theorem: 20.201]}}{\leqslant} \mu(G_n) \underset{(2)}{<} \infty$ and $\nu(G_n \bigcap A) \underset{\text{[theorem: 20.201]}}{\leqslant} \nu(G_n) \underset{(n)}{<} \infty$ so that by [theorem: 20.201]

$$\mu\left(G_n \setminus \left(G_n \bigcap A\right)\right) = \mu(G_n) - \mu\left(G_n \bigcap A\right) \wedge \nu\left(G_n \setminus \left(G_n \bigcap A\right)\right) = \nu(G_n) - \nu\left(G_n \bigcap A\right) \tag{20.201}$$

hence

$$\begin{aligned}
\mu\left(G_n \bigcap (X \setminus A)\right) &\underset{\text{[theorem: 1.33(8)]}}{=} \mu(G_n \setminus A) \\
&\underset{\text{[eq: 20.200]}}{=} \mu\left(G_n \setminus \left(G_n \bigcap A\right)\right) \\
&\underset{\text{[eq: 20.201]}}{=} \mu(G_n) - \mu\left(G_n \bigcap A\right) \\
&\underset{A \in \mathfrak{D}_n}{=} \mu(G_n) - \nu\left(G_n \bigcap A\right) \\
&\underset{G_n \in \mathcal{G}}{=} \nu(G_n) - \nu\left(G_n \bigcap A\right) \\
&\underset{\text{[eq: 20.201]}}{=} \nu\left(G_n \setminus \left(G_n \bigcap A\right)\right) \\
&\underset{\text{[eq: 20.200]}}{=} \nu(G_n \setminus A) \\
&\underset{\text{[theorem: 1.33]}}{=} \nu\left(G_n \bigcap (X \setminus A)\right)
\end{aligned}$$

proving that $(X \setminus A) \in \mathfrak{D}_n$, further as $A \in \mathfrak{D}_n \subseteq \sigma[\mathcal{G}]$ we have $X \setminus A \in \sigma[\mathcal{G}]$. Hence

$$\forall A \in \mathfrak{D}_n \text{ we have } X \setminus A \in \mathfrak{D}_n \tag{20.202}$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}_n$ be a pairwise disjoint family. Then $\forall i \in \mathbb{N}$ with $i \neq j$ we have $(G_n \bigcap A_i) \bigcap (G_n \bigcap A_j) \subseteq A_i \bigcap A_j = \varnothing$ so that $\{G_n \bigcap A_i\}_{i \in \mathbb{N}}$ is pairwise disjoint. Hence

$$\mu\left(\bigsqcup_{i \in \mathbb{N}} \left(G_n \bigcap A_i\right)\right) = \sum_{i \in \mathbb{N}} \mu\left(G_n \bigcap A_i\right) \underset{A_i \in \mathfrak{D}_n}{=} \sum_{i \in \mathbb{N}} \nu\left(G_n \bigcap A_i\right) = \nu\left(\bigsqcup_{i \in \mathbb{N}} \left(G_n \bigcap A_i\right)\right)$$

which, as $G_n \bigcap \left(\bigsqcup_{i \in \mathbb{N}} A_i\right) = \bigsqcup_{i \in \mathbb{N}} (G_n \bigcap A_i)$ and $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}_n \subseteq \sigma[\mathcal{G}]$, proves that

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}_n \text{ we have } \bigsqcup_{i \in \mathbb{N}} A \in \mathfrak{D}_n \tag{20.203}$$

By [eqs: 20.199, 20.202 and 20.203] we have

$$\mathfrak{D}_n \text{ is a Dynkin system} \tag{20.204}$$

As $\forall A, B \in \mathcal{G}$ we have by (1) that $A \bigcap B \in \mathcal{G}$ we have by [theorem: 20.221] that

$$\delta[\mathcal{G}] = \sigma[\mathcal{G}] \tag{20.205}$$

As by [eq: 20.198] $\mathcal{G} \subseteq \mathfrak{D}_n$ and $\mathfrak{D}_n$ is a Dynkin system it follows that

$$\sigma[\mathcal{G}] \underset{\text{[eq: 20.205]}}{=} \delta[\mathcal{G}] \subseteq \mathfrak{D}_n \underset{\text{[eq: 20.197]}}{\subseteq} \sigma[\mathcal{G}]$$

Hence we have $\forall n \in \mathbb{N}$ that $\sigma[\mathcal{G}] = \mathfrak{D}_n$ so that using the definition of $\mathcal{D}_n$ [see eq: 20.197]

$$\forall n \in \mathbb{N} \text{ we have } \forall A \in \sigma[\mathcal{G}] \text{ that } \mu\left(G_n \bigcap A\right) = \nu\left(G_n \bigcap A\right) \tag{20.206}$$

Let $A \in \sigma[\mathcal{G}]$ then $\forall i \in \mathbb{N}$ we have $G_i \bigcap A \subseteq G_{i+1} \bigcap A \in \sigma[\mathcal{G}]$ and

$$A = A \bigcap X = A \bigcap \left(\bigcup_{i \in \mathbb{N}} G_i\right) = \bigcup_{i \in \mathbb{N}} \left(G_i \bigcap A\right) \tag{20.207}$$

so that by [theorem: 20.206] we have that

$$\lim_{i\to\infty}\mu\left(G_i\bigcap A\right)\text{ exists and }\lim_{i\to\infty}\mu\left(G_i\bigcap A\right)=\mu\left(\bigcup_{i\in\mathbb{N}}\left(G_i\bigcap A\right)\right)\underset{\text{[eq: 20.207]}}{=}\mu(A) \tag{20.208}$$

and

$$\lim_{i\to\infty}\nu\left(G_i\bigcap A\right)\text{ exists and }\lim_{i\to\infty}\nu\left(G_i\bigcap A\right)=\mu\left(\bigcup_{i\in\mathbb{N}}\left(G_i\bigcap A\right)\right)\underset{\text{[eq: 20.207]}}{=}\nu(A) \tag{20.209}$$

Hence we have for $A\in\sigma[\mathcal{G}]$ that

$$\mu(A)\underset{\text{[eq: 20.208]}}{=}\lim_{i\to\infty}\mu\left(G_i\bigcap A\right)\underset{\text{[eq: 20.206]}}{=}\lim_{i\to\infty}\nu\left(G_i\bigcap A\right)\underset{\text{[eq: 20.209]}}{=}\nu(A)$$

proving that

$$\mu=\nu$$

□

20.4.4 Constructing measures and σ-algebras

20.4.4.1 Constructing outer measures

Let X be a set then given $\mathcal{G}\subseteq\mathcal{P}(X)$ we want to extend a function $\mu:\mathcal{G}\to[0,\infty]$ to a measure on a σ-algebra containing $\mathcal{G}$. To use the Carathéodory theorem for this task we have to construct a outer measure out of μ. This is the subject of this section. First we need some definitions that specifies the minimum requirements for this task.

Definition 20.223. (Proto-Ring) *Let X be a set then $\mathcal{S}\subseteq\mathcal{P}(X)$ is a **proto-ring** on X if*

$$\varnothing\subseteq\mathcal{S}$$

Definition 20.224. (Proto-Measure) *Let X be a set then and $\mathcal{S}$ a proto-ring on X then a function μ: $\mathcal{S}\to[0,\infty]$ is a **proto-measure** on $\mathcal{S}$ if*

$$\mu(\varnothing)=0$$

Next we shown how to construct a outer-measure from a proto-measure.

Theorem 20.225. *Let X be a set, $\mathcal{S}\subseteq\mathcal{P}(X)$ a proto-ring and $\mu:\mathcal{S}\to[0,\infty]$ a proto-measure on $\mathcal{S}$ then*

1. $$\mu^*:\mathcal{P}(X)\to[0,\infty]\text{ defined by }\mu^*(A)=\begin{cases}\inf\left(\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\}\right)\text{ if }\mathcal{S}[A]\neq\varnothing\\ \infty\text{ if }\mathcal{S}[A]=\varnothing\end{cases}$$

   where

   $$\mathcal{S}[A]=\left\{\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}|A\subseteq\bigcup_{i\in\mathbb{N}}A_i\right\}$$

   is a outer measure.

2. *If additional we have that*

   a. $\forall A,B\in S$ *that* $A\bigcap B\in\mathcal{S}$

   b. $\forall A,B\in\mathcal{S}$ *with* $A\subseteq B$ *we have* $\mu(A)\leqslant\mu(B)$

   c. $\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}$ *with* $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{S}$ *we have* $\mu(\bigcup_{i\in\mathbb{N}}A_i)\leqslant\sum_{i=1}^{\infty}\mu(A_i)$

   then

   $$\forall A\in\mathcal{S}\text{ we have }\mu^*(A)=\mu(A)$$

***Note* 20.226.** *The outer measure defined in (1) is not neccesary a extension of μ, for that we need the extra conditions 2.a, 2.b, 2.c.*

Proof.

1. Define $\{N_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}$ by $N_i=\varnothing\in\mathcal{S}$ then $\varnothing\subseteq\bigcup_{i\in\mathbb{N}}N_i$ so that $\{N_i\}_{i\in\mathbb{N}}\in\mathcal{S}[\varnothing]$, hence $\mathcal{S}[\varnothing]\neq\oslash$. So $0=\sum_{I=1}^{\infty}\mu(\varnothing)=\sum_{i=1}^{\infty}\mu(N_i)\in\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\}$, hence

$$0\leqslant\inf\left(\left\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\right\}\right)\leqslant 0$$

proving that $\mu^*(\varnothing)=\inf(\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\})=0$. Hence we have

$$\mu^*(\varnothing)=0 \tag{20.210}$$

Let $A,B\in\mathcal{P}(X)$ with $A\subseteq B$. Then for $S[B]$ we have either:

$\boldsymbol{S[B]=\varnothing}$. Then $\mu^*[A]\leqslant\infty=\mu^*[B]$

$\boldsymbol{\mathcal{S}[B]\neq\varnothing}$. If $\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[B]$ then $\{A_i\}_{i\in\mathbb{N}}\subseteq S$ and $B\subseteq\bigcup_{i\in\mathbb{N}}A_i$ hence, as $A\subseteq B$ we have $A\subseteq\bigcup_{i\in\mathbb{N}}A_i$ so that $\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]$. Hence

$$\varnothing\neq\mathcal{S}[B]\subseteq S[A]$$

From the above it follows that

$$\left\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[B]\right\}\subseteq\left\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\right\},$$

so that by [theorem: 3.77]

$$\begin{aligned}\mu^*[A] &= \inf\left(\left\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\right\}\right)\\ &\leqslant \inf\left(\left\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[B]\right\}\right)\\ &= \mu^*[B]\end{aligned}$$

To summarize

$$\forall A,B\in\mathcal{P}(X)\text{ with }A\subseteq B\text{ we have }\mu^*(A)\leqslant\mu^*(B) \tag{20.211}$$

Let $\{T_i\}_{i\in\mathbb{N}}\subseteq\mathcal{P}(X)$ then we have two cases to consider:

$\boldsymbol{\exists i\in\mathbb{N}}$ such that $\boldsymbol{\mu^*(T_i)=\infty}$. Then $\mu^*(\bigcup_{i\in\mathbb{N}}T_i)\leqslant\infty=\sum_{i=1}^{\infty}\mu^*(A_i)$

$\boldsymbol{\forall i\in\mathbb{N}}$ we have $\boldsymbol{\mu^*(T_i)<\infty}$. Then we must have $\forall i\in\mathbb{N}$ that $\mathcal{S}[T_i]\neq\infty$ so that

$$\mu^*(T_i)=\inf\left(\left\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[T_i]\right\}\right)$$

Take $\varepsilon\in\mathbb{R}^+$. Given $n\in\mathbb{N}$ we have, as $\mu^*(T_n)<\infty$, that $\mu^*(T_n)<\mu^*(T_n)+\frac{\varepsilon}{2^n}$, so as $\mu^*(T_n)=\inf(\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[T_n]\})$, there exist a $\{I_{n,i}\}_{i\in\mathbb{N}}\in\mathcal{S}[T_n]$ with $T_n\subseteq\bigcup_{i\in\mathbb{N}}I_{n,i}$ such that $\mu^*(T_n)\leqslant\sum_{i=1}^{\infty}\mu(I_{n,i})<\mu^*(T_n)+\frac{\varepsilon}{2^n}$. Hence we have

$$\mu^*(T_n)\leqslant\sum_{i=1}^{\infty}\mu(I_{n,i})<\mu^*(T_n)+\frac{\varepsilon}{2^n}\text{ and }T_n\subseteq\bigcup_{i\in\mathbb{N}}I_{n,i} \tag{20.212}$$

As $\mathbb{N}\times\mathbb{N}$ is denumerable [see theorem: 6.63] there exist a bijection $\beta:\mathbb{N}\to\mathbb{N}\times\mathbb{N}$. Let $x\in\bigcup_{i\in\mathbb{N}}T_i$ then $\exists k\in\mathbb{N}$ such that $x\in T_k\underset{\text{[eq: 20.212]}}{\subseteq}\bigcup_{i\in\mathbb{N}}I_{k,i}$, hence $\exists l\in\mathbb{N}$ such that $x\in I_{k,l}$. As $(k,l)\in\mathbb{N}\times\mathbb{N}$ there exist a $i\in\mathbb{N}$ such that $\beta(i)=(k,l)$ so that $x\in I_{\beta(i)_1,\beta(i)_2}\subseteq\bigcup_{i\in\mathbb{N}}I_{\beta(i)_1,\beta(i)_2}$. To summarize we have proved that

$$\bigcup_{i\in\mathbb{N}}T_i\subseteq\bigcup_{i\in\mathbb{N}}I_{\beta(i)_1,\beta(i)_2}\text{ so that }\{I_{\beta(i)_1,\beta(i)_2}\}_{i\in\mathbb{N}}\in\mathcal{S}\left[\bigcup_{i\in\mathbb{N}}T_i\right] \tag{20.213}$$

Hence $\mathcal{S}[\bigcup_{i\in\mathbb{N}} T_i] \neq \varnothing$ so that

$$\begin{aligned}
\mu^*\left(\bigcup_{i\in\mathbb{N}} T_i\right) &= \inf\left(\left\{\sum_{i=1}^{\infty} \mu(A_i) | \{A_i\}_{i\in\mathbb{N}} \in \mathcal{S}\left[\bigcup_{i\in\mathbb{N}} T_i\right]\right\}\right) \\
&\underset{\text{[eq: 20.213]}}{\leqslant} \sum_{i=1}^{\infty} \mu(I_{\beta(i)_1,\beta(i)_2}) \\
&\underset{\text{[lemma: 20.105]}}{=} \sum_{i=1}^{\infty}\left(\sum_{j=1}^{\infty} \mu(I_{i,j})\right) \\
&\underset{\text{[eq: 20.212]}}{\leqslant} \sum_{i=1}^{\infty}\left(\mu^*(T_i) + \frac{\varepsilon}{2^i}\right) \\
&\underset{\text{[theorem: 20.96]}}{=} \sum_{i=1}^{\infty} \mu^*(T_i) + \sum_{i=1}^{\infty} \frac{\varepsilon}{2^i} \\
&\underset{\text{[theorem: 20.96]}}{=} \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon \cdot \sum_{i=1}^{\infty} \frac{1}{2^i} \\
&= \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon \cdot \lim_{n\to\infty} \sum_{i=1}^{n} \frac{1}{2^i} \\
&\underset{\text{[theorem: 20.68]}\wedge\text{[examle: 14.354]}}{=} \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon \cdot \frac{\frac{1}{2}}{1-\frac{1}{2}} \\
&= \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon
\end{aligned}$$

Hence we have

$$\forall \varepsilon \in \mathbb{R}^+ \text{ that } \mu^*\left(\bigcup_{i\in\mathbb{N}} T_i\right) \leqslant \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon$$

which, as $\varepsilon \in \mathbb{R}^+$ is choosen arbitrary, proves by [theorem: 20.40] that

$$\mu^*\left(\bigcup_{i\in\mathbb{N}} T_i\right) < \sum_{i=1}^{\infty} \mu^*(T_i).$$

To summarize we have in all cases that

$$\forall \{T_i\}_{i\in\mathbb{N}} \subseteq \mathcal{P}(X) \text{ we have } \mu^*\left(\bigcup_{i\in\mathbb{N}} T_i\right) \leqslant \sum_{i=1}^{\infty} \mu^*(T_i) \tag{20.214}$$

Taking in account the definition of a outer measure and [eqs: 20.210, 20.211 and 20.214] it follows that

$$\mu^* \text{ is a outer measure on } X$$

2. If $A \in \mathcal{S}$ then for $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{S}$ defined by $A_i = \left\{\begin{array}{l} A \text{ if } i=1 \\ \varnothing \text{ if } i \in \{2,\ldots,\infty\} \end{array}\right. \in \mathcal{S}$ we have $A = \bigcup_{i\in\mathbb{N}} A_i$ so that $A \in S[A] \Rightarrow \mathcal{S}[A] \neq \varnothing$ and

$$\sum_{i=1}^{\infty} \mu(A_i) \underset{\text{[theorem: 20.97]}}{=} \sum_{i=1}^{1} \mu(A_i) + \sum_{i=2}^{\infty} \mu(A_i) = \mu(A_1) + \sum_{i=2}^{\infty} 0 = \mu(A)$$

so that $\mu(A) \in \{\sum_{i=1}^{\infty} \mu(A_i) | \{A_i\}_{i\in\mathbb{N}} \in S[A]\}$. Hence

$$\mu^*(A) = \inf\left(\left\{\sum_{i=1}^{\infty} \mu(A_i) | \{A_i\}_{i\in\mathbb{N}} \in S[A]\right\}\right) \leqslant \mu(A)$$

proving that

$$\forall A \in \mathcal{S} \text{ we have } \mu^*(A) \leqslant \mu(A) \tag{20.215}$$

For the opposite inequality, let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}[A]$ then $A\subseteq\bigcup_{i\in\mathbb{N}}A_i$ so that $\bigcup_{i\in\mathbb{N}}(A\bigcap A_i)=A\in\mathcal{S}$. By (2.a) we have $\{A\bigcap A_i\}_{i\in\mathbb{N}}\subseteq S$ and further

$$\mu(A)=\mu\left(\bigcup_{i\in\mathbb{N}}(A\bigcap A_i)\right)\underset{(2.c)}{\leqslant}\sum_{i=1}^{\infty}\mu(A\bigcap A_i)\underset{(2.b)}{\leqslant}\sum_{i=1}^{\infty}\mu(A_i)$$

Hence $\mu(A)$ is a lower bound of $\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in S[A]\}$, therefore $\mu(A)\leqslant\mu^*(A)$. Combining this with [eq: 20.215] gives finally

$$\mu(A)=\mu^*(A)$$

□

As is mentioned in [note: 20.226] if we want that the above theorem extend a proto-measure to a outer measure we need extra conditions on the proto-ring and the proto-measure. This motivates the definition of a semi-ring and a pre-measure below.

Definition 20.227. (Semi-Ring) *Let X be a set then $S\subseteq\mathcal{P}(X)$ is a **semi-ring** on X if*

1. $\varnothing\in\mathcal{S}$
2. $\forall A,B\in\mathcal{S}$ *we have* $A\bigcap B\in\mathcal{S}$ *[in other words $\mathcal{S}$ is $\bigcap$-stable]*
3. $\forall A,B\in\mathcal{S}$ *there exist a finite pairwise disjoint family* $\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ *such that*

$$A\setminus B=\bigsqcup_{i\in\{1,\dots,n\}}A_i$$

***Note* 20.228.** *As by (2) $\mathcal{S}$ is $\cap$-stable it follows from [lemma: 20.116] that $\forall\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ we have that $\bigcap_{i\in\{1,\dots,n\}}A_i\in\mathcal{S}$.*

***Note* 20.229.** *As $\varnothing\in\mathcal{S}$ it follows from the definition of a proto-ring [see definition: 20.223] that every semi-ring is a proto-ring.*

Definition 20.230. (Pre-Measure) *Let X be a set, $\mathcal{S}$ a semi-ring on X then a set function $\mu:\mathcal{S}\to[0,\infty]$ is a pre-measure if*

1. $\mu(\varnothing)=0$
2. *For every pairwise disjoint family* $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}$ *such that* $\bigsqcup_{i\in\mathbb{N}}A_i\in\mathcal{S}$ *we have that*

$$\mu\left(\bigsqcup_{i\in\mathbb{N}}A_i\right)=\sum_{i=1}^{\infty}\mu(A_i)$$

In other words $\mu:\mathcal{S}\to[0,\infty]$ is countable addive on $\mathcal{A}$]

***Note* 20.231.** *As $\mu(\varnothing)=0$ it follows from the definition of a proto-measure [see definition: 20.224] that that a pre-measure on a semi-ring is a proto-measure on a proto-ring.*

The above definitions do not exactly cover the extra conditions 1.a, 2.b and 2.c in [theorem: 20.225]. The next theorems will ensure that this will be satisfied by semi-rings and pre-measures.

Lemma 20.232. *Let X be a set, $\mathcal{S}$ a semi-ring on X, $n\in\mathbb{N}$, $\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}$ and $A\in\mathcal{S}$ then there exist a pairwise disjoint family $\{B_i\}_{i\in\{1,\dots,m\}}\subseteq\mathcal{S}$, $m\in\mathbb{N}$ such that*

$$A\setminus\bigcup_{i\in\{1,\dots,n\}}A_i=\bigsqcup_{i\in\{1,\dots,m\}}B_i$$

Proof. We use induction to prove this. Let $A\in\mathcal{S}$ and define

$$S_A=\left\{n\in\mathbb{N}|\text{If }\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}_i\text{ then there exist a pairwise disjoint }\{B_i\}_{i\in\{1,\dots,m\}}\subseteq\mathcal{S},m\in\mathbb{N}\text{ such that }A\setminus\bigcup_{i\in\{1,\dots,n\}}A_i=\bigsqcup_{i\in\{1,\dots,m\}}B_i\right\}$$

then we have:

$1 \in S_A$. If $\{A_i\}_{i\in\{1\}} \subseteq \mathcal{S}$ then $A \setminus \bigcup_{i\in\{1\}} A_i = A \setminus A_1$. As $\mathcal{S}$ is a semi-ring it follows that there exist a pairwise disjoint family $\{B_i\}_{i\in\{1,\ldots,m\}} \subseteq \mathcal{S}$, $m \in \mathbb{N}$ such that $A \setminus \bigcup_{i\in\{1\}} A_i = A \setminus A_1 = \bigsqcup_{i\in\{1,\ldots,m\}} B_i$ which proves that $1 \in \mathcal{S}$.

$n \in S_A \Rightarrow n+1 \in S_A$. Let $\{A_i\}_{i\in\{1,\ldots,n+1\}} \subseteq \mathcal{S}$ then as $n \in S$ there exist a $\{B_i\}_{i\in\{1,\ldots,m\}} \subseteq \mathcal{S}$ pairwise disjoint such that

$$A \setminus \bigcup_{i\in\{1,\ldots,n\}} A_i = \bigsqcup_{i\in\{1,\ldots,m\}} B_i \tag{20.216}$$

Further we have

$$\begin{aligned} A \setminus \bigcup_{i\in\{1,\ldots,n+1\}} A_i &= A \setminus \left(\left(\bigcup_{i\in\{1,\ldots,n\}} A_i \right) \bigcup A_{n+1} \right) \\ &\underset{\text{[theorem: 1.31]}}{=} \left(A \setminus \left(\bigcup_{i\in\{1,\ldots,n\}} A_i \right) \right) \setminus A_{n+1} \\ &\underset{\text{[eq: 20.216]}}{=} \left(\bigsqcup_{i\in\{1,\ldots,m\}} B_i \right) \setminus A_{n+1} \\ &\underset{\text{[theorem: 2.133]}}{=} \bigsqcup_{i\in\{1,\ldots,m\}} (B_i \setminus A_{n+1}) \end{aligned} \tag{20.217}$$

If $i, j \in \{1,\ldots,m\}$ with $i \neq j$ then we have $(B_i \setminus A_{n+1}) \bigcap (B_j \setminus A_{n+1}) \subseteq B_i \bigcap B_j = \varnothing$ proving that

$$\{B_i \setminus A_{n+1}\}_{i\in\{1,\ldots,m\}} \text{ is pairwise disjoint} \tag{20.218}$$

Let $i \in \{1,\ldots,m\}$ then as $\mathcal{S}$ is a semi-ring and $B_i, A_{n+1} \in \mathcal{S}$ there exist a pairwise disjoint $\{C_{i,j}\}_{j\in\{1,\ldots,n_i\}} \subseteq \mathcal{S}$ such that

$$B_i \setminus A_{n+1} = \bigsqcup_{j\in\{1,\ldots,n_i\}} C_{i,j} \tag{20.219}$$

Hence using [lemma: 20.118]

$$\bigsqcup_{i\in\{1,\ldots,m\}} (B_i \setminus A_{n+1}) = \bigsqcup_{\sigma\in\bigcup_{i\in\{1,\ldots,m\}}\{i\}\times\{1,\ldots,n_i\}} C_{\sigma_1,\sigma_2} \tag{20.220}$$

and

$$\{C_{\sigma_1,\sigma_2}\}_{\sigma\in\bigcup_{i\in\{1,\ldots,m\}}\{i\}\times\{1,\ldots,n_i\}} \subseteq \mathcal{S} \text{ is pairwise disjoint} \tag{20.221}$$

As $\bigcup_{i\in\{1,\ldots,m\}} \{i\} \times \{1,\ldots,n_i\}$ is finite [see theorems: 6.41, 6.36] there exist a bijection such that $\beta: \{1,\ldots,N\} \to \bigcup_{i\in\{1,\ldots,m\}} \{i\} \times \{1,\ldots,n_i\}$. Let $i, j \in \{1,\ldots,N\}$ with $i \neq j$ then, as β is injective, we have $\beta(i) \neq \beta(j)$. For $\beta(i)_1$, $\beta(j)_1$ we have either:

$\beta(i)_1 = \beta(j)_1$. Then we must have that $\beta(i)_2 \neq \beta(j)_2$ so that

$$C_{\beta(i)_1,\beta(i)_2} \bigcap C_{\beta(j)_1,\beta(j)_2} = C_{\beta(i)_1,\beta(i)_2} \bigcap C_{\beta(i)_1,\beta(j)_2} = \varnothing$$

$\beta(i)_1 \neq \beta(j)_1$. Then we have

$$\begin{aligned} C_{\beta(i)_1,\beta(i)_2} \bigcap C_{\beta(j)_1,\beta(j)_2} &\subseteq \left(\bigcup_{k\in\{1,\ldots,n_{\beta(i)_1}\}} C_{\beta(i)_1,k} \right) \bigcap \left(\bigcup_{k\in\{1,\ldots,n_{\beta(j)_1}\}} C_{\beta(j)_1,k} \right) \\ &= B_{\beta(i)_1} \bigcap B_{\beta(j)_1} \\ &= \varnothing \end{aligned}$$

which proves that

$$\{C_{\beta(i)_1,\beta(i)_2}\}_{i\in\{1,\ldots,N\}} \subseteq \mathcal{S} \text{ is pairwise disjoint} \tag{20.222}$$

Further

$$\begin{aligned} A\setminus\bigcup_{i\in\{1,\dots,n+1\}}A_i &\underset{\text{[eq: 20.217]}}{=} \bigsqcup_{i\in\{1,\dots,m\}}(B_i\setminus A_{n+1}) \\ &\underset{\text{[eq: 20.219]}}{=} \bigsqcup_{\sigma\in\bigcup_{i\in\{1,\dots,m\}}\{i\}\times\{1,\dots,n_i\}} C_{\sigma_1,\sigma_2} \\ &\underset{\text{[theorem: 2.119]}}{=} \bigsqcup_{i\in\{1,\dots,N\}} C_{\beta(i)_1,\beta(i)_2} \end{aligned}$$

which proves that $n+1\in\mathcal{S}$. □

Theorem 20.233. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu:\mathcal{S}\to[0,\infty]$ a pre-measure then $\forall\{A_i\}_{i\in\{1,\dots,n\}}\subseteq S$ pairwise disjoint, $n\in\mathbb{N}$ with $\bigcup_{i\in\{1,\dots,n\}}A_i\in\mathcal{S}$ we have*

$$\mu\left(\bigcup_{i\in\{1,\dots,n\}}A_i\right)=\sum_{i=1}^{n}A_i$$

In other words a pre-measure is additive.

Proof. As for a pre-measure we have $\mu(\varnothing)=0$ and $\mu:\mathcal{S}\to[0,\infty]$ is countable additive it follows from [theorem: 20.190] that $\mu:\mathcal{S}\to[0,\infty]$ is additive. In other words $\forall\{A_i\}_{i\in\{1,\dots,n\}}\subseteq S$ pairwise disjoint, $n\in\mathbb{N}$ with $\bigcup_{i\in\{1,\dots,n\}}A_i\in\mathcal{S}$ we have

$$\mu\left(\bigcup_{i\in\{1,\dots,n\}}A_i\right)=\sum_{i=1}^{n}A_i$$

□

Theorem 20.234. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu:\mathcal{S}\to[0,\infty]$ a additive set function [see definition: 20.121] then we have:*

1. *$\forall A\in\mathcal{S}$ and $\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ **pairwise disjoint** such that $\bigcup_{i\in\{1,\dots,n\}}A_i\subseteq A$ we have*

$$\sum_{i=1}^{n}\mu(A_i)\leqslant\mu(A)$$

2. *$\forall A,B\in\mathcal{S}$ with $A\subseteq B$ we have $\mu(A)\leqslant\mu(B)$*

Proof.

1. As $A\in\mathcal{S}$ and $\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ then by [lemma: 20.232] there exist a pairwise disjoint $\{B_i\}_{i\in\{1,\dots,m\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ such that

$$A\setminus\bigcup_{i\in\{1,\dots,m\}}A_i=\bigsqcup_{i\in!,\dots,m}B_i \tag{20.223}$$

Define

$$\{D_i\}_{i\in\{1,\dots,n+m\}}\subseteq\mathcal{S}\text{ by }D_i=\begin{cases}A_i\text{ if }i\in\{1,\dots,n\}\\ B_{i-n}\text{ if }i\in\{n+1,\dots,n+m\}\end{cases}\subseteq\mathcal{S}$$

Let $i,j\in\{1,\dots,n+m\}$ with $i\neq j$ then we can always assume that $i<j$ [otherwise exchange i and j]. For i we have either:

$i\in\{1,\dots,n\}$. Then for j we have either:

$j\in\{1,\dots,n\}$. Then $D_i\bigcap D_j=A_i\bigcap A_j\underset{\text{is pairwise disjoint}}{\underset{\{A_i\}_{i\in\{1,\dots,n\}}}{=}}\varnothing$

$j\in\{n+1,\dots,n+m\}$. Then

$$D_i\bigcap D_j=A_i\bigcap B_{j-n}\subseteq A_i\bigcap\left(A\setminus\bigcup_{i\in\{1,\dots,n\}}A_i\right)=\varnothing$$

$i\in\{n+1,\dots,n+m\}$. Then as $i<j$ we have $j\in\{n+1,\dots,n+m\}$ so that

$$D_i\bigcap D_j=B_{i-n}\bigcap B_{j-n}\underset{i-n\neq j-n}{=}\varnothing$$

hence

$$\{D_i\}_{i\in\{1,\dots,n+m\}}\subseteq\mathcal{S}\text{ is pairwise disjoint}\tag{20.224}$$

Further as $\bigsqcup_{i\in\{1,\dots,n\}}A_i\subseteq A$ we have

$$\begin{aligned}
A &\underset{\text{[theorem: 1.35]}}{=} \left(A\setminus\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\bigcup\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\\
&= \left(\bigsqcup_{i\in\{1,\dots,m\}}B_i\right)\bigsqcup\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\\
&= \left(\bigsqcup_{i\in\{1,\dots,m\}}D_{i+n}\right)\bigsqcup\left(\bigsqcup_{i\in\{1,\dots,n\}}D_i\right)\\
&\underset{\text{[theorem: 2.119]}}{=} \left(\bigsqcup_{i\in\{n+1,\dots,n+m\}}D_i\right)\bigsqcup\left(\bigsqcup_{i\in\{1,\dots,n\}}D_i\right)\\
&\underset{\text{[theorem: 2.128]}}{=} \bigsqcup_{i\in\{1,\dots,n+m\}}D_i
\end{aligned}\tag{20.225}$$

So as $\bigsqcup_{i\in\{1,\dots,n+m\}}D_i=A\in\mathcal{S}$ we have

$$\begin{aligned}
\mu(A) &\underset{\text{[eq: 20.225]}}{=} \mu\left(\bigsqcup_{i\in\{1,\dots,n+m\}}D_i\right)\\
&\underset{\mu\text{ is additive}}{=} \sum_{i=1}^{n+m}\mu(D_i)\\
&= \sum_{i=1}^{n}\mu(D_i)+\sum_{i=n+1}^{n+m}\mu(D_i)\\
&= \sum_{i=1}^{n}\mu(A_i)+\sum_{i=n+1}^{n+m}\mu(D_i)
\end{aligned}$$

so that by [theorem: 20.32] we have

$$\sum_{i=1}^{n}\mu(A_i)\leqslant\mu(A)$$

2. Let $A,B\in\mathcal{S}$ with $A\subseteq B$. Take then $\{A_i\}_{i\in\{1\}}\subseteq\mathcal{S}$ by $A_i=A$ then we have $\bigsqcup_{i\in\{1\}}A_i=A\subseteq B$, hence by (1) it follows that $\mu(A)=\sum_{i=1}^{1}\mu(A_i)\leqslant\mu(B)$ □

Corollary 20.235. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu:\mathcal{S}\to[0,\infty]$ a pre-measure on $\mathcal{S}$ [see definition: 20.230] then we have:*

1. *$\forall A\in\mathcal{S}$ and $\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ pairwise disjoint such that $\bigcup_{i\in\{1,\dots,n\}}A_i\subseteq A$ we have*

$$\sum_{i=1}^{n}\mu(A_i)\leqslant\mu(A)$$

2. *$\forall A,B\in\mathcal{S}$ with $A\subseteq B$ we have $\mu(A)\leqslant\mu(B)$*

Proof. As a pre-measure is additive [see theorem: 20.233] this follows from the previous theorem [theorem: 20.234]. □

Theorem 20.236. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu:\mathcal{S}\to[0,\infty]$ a pre-measure then*

$$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}\text{ with }\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{S}\text{ we have }\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)\leqslant\sum_{i=0}^{\infty}\mu(A_i)$$

In other words μ is countable sub-addtive.

Proof. Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}$ be a sequence such that $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{S}$. Define

$$\{B_i\}_{i\in\mathbb{N}} \text{ by } B_i=\begin{cases} A_1 \text{ if } i=1 \\ A_i\setminus\bigcup_{j\in\{1,\dots,i-1\}}A_j \text{ if } i\in\{2,\dots,\infty\}\end{cases}$$

then by [lemma: 20.113]

$$\{B_i\}_{i\in\mathbb{N}} \text{ is pairwise disjoint and } \bigcup_{i\in\mathbb{N}}A_i=\bigsqcup_{i\in\mathbb{N}}B_i \text{ and } \forall i\in\mathbb{N}\ B_i\subseteq A_i \tag{20.226}$$

Note that the sets B_i are not elements of $\mathcal{S}$, however we will show that each B_i is a finite pairwise disjoint union of sets in $\mathcal{S}$ so that we can write $\bigcup_{i\in\mathbb{N}}A_i$ as countable pairwise disjoint union of elements of $\mathcal{S}$, allowing use to apply countable additivity. Let $i\in\mathbb{N}$ then we have either:

- $\boldsymbol{i=1}$**.** Define $n_1=1$ and $\{C_{1,j}\}_{j\in\{1,\dots,n_1\}}\subseteq\mathcal{S}$ by $C_{1,1}=A_1\in\mathcal{S}$ then $\{C_{1,j}\}_{j\in\{1,\dots,n_1\}}\subseteq S$ is pairwise disjoint and $B_1=A_1=\bigsqcup_{i\in\{1,\dots,n_1\}}C_{1,j}$
- $\boldsymbol{i\in\{2,\dots,\infty\}}$**.** By [lemma: 20.232] there exist a pairwise disjoint family $\{C_{i,j}\}_{j\in\{1,\dots,n_i\}}\subseteq\mathcal{S}$ such that $B_i=A_i\setminus\bigcup_{j\in\{1,\dots,i-1\}}A_j=\bigsqcup_{j\in\{1,\dots,n_i\}}C_{i,j}$.

Hence we have

$$\forall i\in\mathbb{N}\ \exists\{C_{i,j}\}_{j\in\{1,\dots,n_i\}}\subseteq\mathcal{S} \text{ pairwise disjoint such that } B_i=\bigsqcup_{j\in\{1,\dots,n_i\}}C_{i,j} \tag{20.227}$$

By [corollary: 6.75] it follows that $\bigcup_{i\in\mathbb{N}}\{i\}\times\{1,\dots,n_i\}$ is denumerable, hence there exist a bijection

$$\beta:\mathbb{N}\to\bigcup_{i\in\mathbb{N}}\{i\}\times\{1,\dots,n_i\}$$

Using the above and [eq: 20.227] allows us to use [corollary: 20.119] giving

$$\{C_{\beta(i)_1\beta(i)_2}\}_{i\in\mathbb{N}}\subseteq\mathcal{S} \text{ is pairwise disjoint and } \bigcup_{i\in\mathbb{N}}A_i\underset{\text{[eq: 20.226]}}{=}\bigsqcup_{i\in\mathbb{N}}B_i=\bigsqcup_{i\in\mathbb{N}}C_{\beta(i)_1,\beta(i)_2} \tag{20.228}$$

So we have as $\bigsqcup_{i\in\mathbb{N}}C_{\beta(i)_1,\beta(i)_2}=\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{S}$ that

$$\begin{aligned}\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right) &\underset{\text{[eq: 20.228]}}{=} \mu\left(\bigsqcup_{i\in\mathbb{N}}C_{\beta(i)_1,\beta(i)_2}\right)\\ &\underset{\mu\text{ is a pre-measure}}{=}\sum_{i=1}^{\infty}\mu(C_{\beta(i)_1,\beta(i)_2})\\ &\underset{\text{[theorem: 20.104]}}{=}\sum_{i=1}^{\infty}\left(\sum_{j=1}^{n_i}\mu(C_{i,j})\right)\end{aligned} \tag{20.229}$$

As $\forall i\in\mathbb{N}\ \bigcup_{j\in\{1,\dots,n_i\}}C_{i,j}\underset{\text{[eq: 20.227]}}{=}B_i\subseteq A_i$ it follows from [corollary: 20.235(1)] and [eq: 20.228] that $\sum_{j=1}^{n_i}\mu(C_{i,j})\leqslant\mu(A_i)$, which combined with [eq: 20.229] and [theorem: 20.96] gives

$$\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)\leqslant\sum_{i=1}^{\infty}A_j$$

□

We can now combine the above theorems to prove a version of [theorem: 20.225] for semi-rings and pre-measures.

Theorem 20.237. *Let X be a set, $\mathcal{S}\subseteq\mathcal{P}(X)$ a semi-ring and $\mu:\mathcal{S}\to[0,\infty]$ a pre-measure on $\mathcal{S}$ then*

$$\mu^*:\mathcal{P}(X)\to[0,\infty] \textit{ defined by } \mu^*(A)=\begin{cases}\inf\left(\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\}\right) \textit{ if } \mathcal{S}[A]\neq\varnothing\\ \infty \textit{ if } \mathcal{S}[A]=\varnothing\end{cases}$$

where

$$\mathcal{S}[A]=\left\{\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}|A\subseteq\bigcup_{i\in\mathbb{N}}A_i\right\}$$

is a outer measure and

$$\forall A \in \mathcal{S} \text{ we have } \mu^*(A) = \mu(A)$$

so that

$$\mu^* \text{ is a extension of } \mu$$

Proof. As μ is a pre-measure [see definition: 20.230] we have that $\mu(\varnothing) = 0$ hence

$$\mu \text{ is a proto-measure on } \mathcal{S}$$

Using [theorems: 20.235, 20.236] it follows that

$$\forall A, B \in \mathcal{S} \text{ with } A \subseteq B \text{ we have } \mu(A) \leqslant \mu(B)$$

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq S \text{ such that } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{S} \text{ we have } \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \leqslant \sum_{i=1}^{\infty} \mu(A_i)$$

and as $\mathcal{S}$ is a semi-ring we have

$$\forall A, B \in \mathcal{S} \text{ we have } A \bigcap B \in \mathcal{S}$$

So all conditions for [theorem: 20.225] are satisfies so that

$$\mu^* \text{ is a outer measure on } S \text{ and } \forall A \in \mathcal{S} \text{ we have } \mu^*(A) = \mu(A)$$ □

In the above proof we use the fact that a pre-measure is countable sub-additive [see theorem 20.236] but never the countable additivity that is part of the definition of a pre-measure. So why do we define a pre-measure to be countable additive and not just countable sub-additive? The answer lies in proving the existance of a **unique extension** of a pre-measure on a semi-ring $\mathcal{S}$ to a measure on $\sigma[\mathcal{S}]$. To extend the pre-measure μ on $\mathcal{S}$ we first use the previous theorem [theorem: 20.225] to create a outer-measure μ^* that extend μ [here the need for countable sub-additivity], next use the Carathéodory theorem [theorem: 20.213] to find a measure on $\mathcal{M}[\mu^*]$. However to make sure that the constructed measure is also a measure on $\sigma[\mathcal{S}]$ we still have to prove that $\sigma[\mathcal{S}] \subseteq \mathcal{M}[\mu^*]$ and this is where we need additivity of μ. The countable additivity of a pre-measure ensures additional the additivity and countable sub-additivity of the pre-measure. Another way to look at this is the following, if μ on S is extended to a countable additive measure on $\sigma[\mathcal{S}]$ then we must have, as $\mathcal{S} \subseteq \sigma[\mathcal{S}]$, that μ is also countable additive.

Theorem 20.238. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu: \mathcal{S} \to [0, \infty]$ a pre-measure on $\mathcal{S}$ and define*

$$\mu^*: \mathcal{P}(X) \to [0, \infty] \text{ defined by } \mu^*(A) = \begin{cases} \infty \text{ if } \mathcal{S}[A] = \varnothing \\ \inf\left(\{\sum_{i=1}^{\infty} \mu(A_i) | \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[A]\}\right) \end{cases}$$

where

$$\mathcal{S}[A] = \left\{ \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S} | A \subseteq \bigcup_{i \in \mathbb{N}} A_i \right\}$$

and

$$\mathcal{M}[\mu^*] = \left\{ A \in \mathcal{P}(X) | \forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) = \mu^\star\left(B \bigcap A\right) + \mu^*(B \setminus A) \right\}$$

then

$$\mu^* \text{ is a outer measure}$$

$$\mathcal{M}[\mu^*] \text{ is a } \sigma\text{-algebra on } X$$

and

$$(\mu^*)_{|\mathcal{S}} = \mu \text{ [in other words } \mu^* \text{ extends } \mu$$

and

$$(\mu^*)_{|\mathcal{M}[\mu^*]}: \mathcal{M}[\mu^*] \to [0, \infty] \text{ is a measure on } \mathcal{M}[\mu^*]$$

and

$$\mathcal{S} \subseteq \mathcal{M}[\mu^*]$$

so that by [theorem: 20.146]

$$\sigma[\mathcal{S}] \subseteq \mathcal{M}[\mu^*]$$

and by [theorem: 20.198]

$$(\mu^*)_{|\sigma[\mathcal{S}]}: \sigma[\mathcal{S}] \to [0,\infty] \text{ is a measure on } \sigma[\mathcal{S}]$$

Hence

$$\langle X, \mathcal{M}[\mu^*], (\mu^*)_{\mathcal{M}[\mu^*]}\rangle \text{ and } \langle X, \sigma[\mathcal{S}], (\mu^*)_{|\sigma[\mathcal{S}]}\rangle \text{ are measure spaces}$$

where

$$\forall A \in \mathcal{S} \text{ we have } \mu(A) = \mu^*(A) = (\mu^*)_{|\mathcal{M}[\mu^*]}(A) = (\mu^*)_{|\sigma[\mathcal{S}]}$$

If additional there exist a $\{G_i\}_{i\in\mathbb{N}} \subseteq \mathcal{S}$ *such that* $\forall i \in \mathbb{N}\ G_i \subseteq G_{i+1} \wedge \mu(G_i) < \infty$ *and* $X = \bigcup_{i\in\mathbb{N}} G_i$ *then if* ν: $\sigma[\mathcal{S}] \to [0,\infty]$ *is a another measure on* $\sigma[\mathcal{S}]$ *such that* $\nu_{|\mathcal{S}} = (\mu^*)_{|\mathcal{S}}$ *then*

$$\nu = (\mu^*)_{|\sigma[\mathcal{S}]}$$

In other words the extension of μ *to a measure* $(\mu^*)_{|\sigma[\mathcal{S}]}$ *on* $\sigma[\mathcal{S}]$ *is unique.*

***Note* 20.239.** *We need additivity on* μ *to prove that* $\mathcal{S} \subseteq \mathcal{M}[\mu^*]$ *which is essential for the last part of the theorem.*

Proof. Using [theorem: 20.237] we have

$$\mu^*: \mathcal{P}(X) \to [0,\infty] \text{ defined by } \mu^*(A) = \begin{cases} \inf\left(\{\sum_{i=1}^{\infty} \mu(A_i) | \{A_i\}_{i\in\mathbb{N}} \in \mathcal{S}[A]\}\right) \text{ if } \mathcal{S}[A] \neq \varnothing \\ \infty \text{ if } \mathcal{S}[A] = \varnothing \end{cases} \tag{20.230}$$

where

$$\mathcal{S}[A] = \left\{\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{S} | A \subseteq \bigcup_{i\in\mathbb{N}} A_i\right\} \tag{20.231}$$

is a outer measure and

$$\forall A \in \mathcal{S} \text{ we have } \mu^*(A) = \mu(A) \text{ hence } (\mu^*)_{|\mathcal{S}} = \mu \tag{20.232}$$

As μ^* is a outer measure we can use the Carathéodory [theorem: 20.213] so that

$$\mathcal{M}[\mu^*] = \left\{A \in \mathcal{P}(X) | \forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) = \mu^\star\left(B \bigcap A\right) + \mu^*(B \setminus A)\right\}$$

is a σ-algebra on X and

$$(\mu^*)_{|\mathcal{M}[\mu^*]}: \mathcal{M}[\mu^*] \to [0,\infty] \text{ is a measure on the } \sigma\text{-algebra } \mathcal{M}[\mu^*] \tag{20.233}$$

so that

$$\langle X, \mathcal{M}[\mu^*], (\mu^*)_{|\mathcal{M}[\mu^*]}\rangle \text{ a measure space} \tag{20.234}$$

Next we have to prove that $\mathcal{S} \subseteq \mathcal{M}[\mu^*]$. Let $R, T \in \mathcal{S}$ then as $\mathcal{S}$ is a semi-ring there exist a $m \in \mathbb{N}$, $\{S_i\}_{i\in\{1,\ldots,m\}} \subseteq \mathcal{S}$ pairwise disjoint such that

$$T \setminus R = \bigsqcup_{i\in\{1,\ldots,m\}} S_i \text{ and } R \bigcap T \in \mathcal{S} \tag{20.235}$$

Define now

$$\{D_i\}_{i\in\{1,\ldots,m+1\}} \subseteq \mathcal{S} \text{ by } D_i = \begin{cases} S_i \text{ if } i \in \{1,\ldots,m\} \\ R \bigcap T \text{ if } i = m+1 \end{cases} \in \mathcal{S}$$

Let $i, j \in \{1,\ldots,m+1\}$ with $i \neq j$ then we may always assume that $i < j$ [otherwise exchange i and j], so that we have the following possibilities for j:

$\boldsymbol{j = m+1}$**.** Then, as $i < j$, $i \in \{1,\ldots,m\}$ so that

$$\begin{aligned} D_i \bigcap D_j &= S_i \bigcap \left(R \bigcap T\right) \\ &\subseteq \left(\bigsqcup_{i\in\{1,\ldots,m\}} S_i\right) \bigcap \left(R \bigcap T\right) \\ &\underset{\text{[eq: 20.235]}}{=} (T \setminus R) \bigcap \left(R \bigcap T\right) \\ &\subseteq (T \setminus R) \bigcap R \\ &= \varnothing \end{aligned}$$

henve we have $D_i \bigcap D_j = \varnothing$.

$\boldsymbol{j \in \{1, \ldots, m\}}$. Then, as $i < j$, $i \in \{1, \ldots, m\}$ so that $D_i \bigcap D_j = S_i \bigcap S = \varnothing$ which proves that

$$\{D_i\}_{i \in \{1, \ldots, m+1\}} \subseteq \mathcal{S} \text{ is pairwise disjoint}$$

Further

$$\begin{aligned} T &= (T \setminus R) \bigcup (T \bigcap R) \\ &= \left(\bigcup_{i \in \{1, \ldots, m\}} S_i \right) \bigcup (T \bigcap R) \\ &= \left(\bigcup_{i \in \{1, \ldots, m\}} D_i \right) \bigcup D_{m+1} \\ &= \bigsqcup_{i \in \{1, \ldots, m+1\}} D_i \end{aligned}$$

Hence

$$\bigsqcup_{i \in \{1, \ldots, m+1\}} D_i = T \in \mathcal{S} \tag{20.236}$$

As by [theorem: 20.233] μ is additive on S we have

$$\begin{aligned} \mu(T) &\underset{\text{[eq: 20.236]}}{=} \mu\left(\bigsqcup_{i \in \{1, \ldots, m+1\}} D_i \right) \\ &\underset{\mu \text{ is additive}}{=} \sum_{i=1}^{m+1} \mu(D_i) \\ &= \mu(D_{m+1}) + \sum_{i=1}^{m} \mu(D_i) \\ &= \mu\big(R \bigcap T\big) + \sum_{i=1}^{m} \mu(S_i) \end{aligned}$$

hence

$$\mu(T) = \mu\big(R \bigcap T\big) + \sum_{i=1}^{m} \mu(S_i) \tag{20.237}$$

Further as a outer measure is sub-additive [see definition: 20.208 and theorem: 20.127] we have

$$\begin{aligned} \mu^*\big(R \bigcap T\big) + \mu^*(T \setminus R) &\underset{\text{[eq: 20.235]}}{=} \mu^*\big(R \bigcap T\big) + \mu^*\left(\bigsqcup_{i \in \{1, \ldots, m\}} S_i \right) \\ &\underset{\text{sub-additivity of } \mu^*}{\leqslant} \mu^*\big(R \bigcap T\big) + \sum_{i=1}^{m} \mu^*(S_i) \\ &\underset{\text{[eq: 20.232]}}{=} \mu\big(R \bigcap T\big) + \sum_{i=1}^{m} \mu(S_i) \\ &\underset{\text{[eq: 20.237]}}{=} \mu(T) \end{aligned}$$

To summarize we have proved the following:

$$\forall R, S \in \mathcal{S} \text{ we have that } \mu^*\big(R \bigcap T\big) + \mu^*(T \setminus R) \leqslant \mu(T) \tag{20.238}$$

Let $A \in \mathcal{S}$ and take $B \in \mathcal{P}(X)$. For B we have either:

$\boldsymbol{\mathcal{S}[B] = \varnothing}$. Then $\mu^\star(B \setminus A) + \mu^*(B \bigcap A) \leqslant \infty = \mu^*(B)$

$\boldsymbol{S[B] \neq 0}$. Let $\{A_i\}_{i\in\mathbb{N}} \in \mathcal{S}[B]$ then we have

$$\begin{aligned}
\sum_{i=1}^{\infty} \mu^*\big(A_i \bigcap A\big) + \sum_{i=1}^{\infty} \mu^*(A_i \setminus A) &\underset{\text{[theorem: 20.96]}}{=} \\
\sum_{i=1}^{\infty} \big(\mu^*\big(A_i \bigcap A\big) + \mu^*(A_i \setminus A)\big) &\underset{\text{[theorem: 20.96] and [eq: 20.238]}}{\leqslant} \sum_{i=1}^{\infty} \mu(A_i) \qquad (20.239)
\end{aligned}$$

As $\{A_i\}_{i\in\mathbb{N}} \in \mathcal{S}[B]$ we have $B \subseteq \bigcup_{i\in\mathbb{N}} A_i$ so that

$$B \setminus A \subseteq \left(\bigcup_{i\in\mathbb{N}} A_i\right) \setminus A = \bigcup_{i\in\mathbb{N}} (A_i \setminus A) \text{ and } B \bigcap A \subseteq \left(\bigcup_{i\in\mathbb{N}} A_i\right) \bigcap A = \bigcup_{i\in\mathbb{N}} \big(A_i \bigcap A\big)$$

As μ^* is a outer measure hence monotone by definition [see definition: 20.208(2)] it follows from the above that

$$\mu^*(B \setminus A) \leqslant \mu^*\left(\bigcup_{i\in\mathbb{N}} (A_i \setminus A)\right) \text{ and } \mu^*\big(B \bigcap A\big) \leqslant \mu^*\left(\bigcup_{i\in\mathbb{N}} \big(A_i \bigcap A\big)\right) \qquad (20.240)$$

Further using the sub-additivity of a outer measure [see definition: 20.208(3)] we have

$$\mu^*\left(\bigcup_{i\in\mathbb{N}} (A_i \setminus A)\right) \leqslant \sum_{i=1}^{\infty} \mu^*(A_i \setminus A) \text{ and } \mu^*\left(\bigcup_{i\in\mathbb{N}} \big(A_i \bigcap A\big)\right) \leqslant \sum_{i=1}^{\infty} \mu^*\big(A_i \bigcap A\big)$$

which combined with [eq: 20.240] gives

$$\mu^*(B \setminus A) \leqslant \sum_{i=1}^{\infty} \mu^*(A_i \setminus A) \text{ and } \mu^*\big(B \bigcap A\big) \leqslant \sum_{i=1}^{\infty} \mu^*\big(A_i \bigcap A\big)$$

so that

$$\begin{aligned}
\mu^*(B \setminus A) + \mu^*\big(B \bigcap A\big) &\leqslant \sum_{i=1}^{\infty} \mu^*(A_i \setminus A) + \sum_{i=1}^{\infty} \mu^*\big(A_i \bigcap A\big) \\
&\underset{\text{[eq: 20.239]}}{\leqslant} \sum_{i=1}^{\infty} \mu(A_i)
\end{aligned}$$

So $\mu^*(B \setminus A) + \mu^*(B \bigcap A)$ is a lower bound for $\{\sum_{i=1}^{\infty} \mu(A_i) | \{A_i\}_{i\in\mathbb{N}} \in \mathcal{S}[B]\}$ so that

$$\mu^*(B \setminus A) + \mu^*\big(B \bigcap A\big) \leqslant \inf\left(\left\{\sum_{i=1}^{\infty} \mu(A_i) | \{A_i\}_{i\in\mathbb{N}} \in \mathcal{S}[B]\right\}\right) \underset{\text{[eq: 20.230]}}{=} \mu^*(B)$$

So in all cases we have that $\mu^*(B \setminus A) + \mu^*(B \bigcap A) \leqslant \mu^*(B)$ which by [theorem: 20.211] means that $A \in \mathcal{M}[\mu^*]$. As $A \in \mathcal{S}$ was chosen arbitrary we conclude that

$$\mathcal{S} \subseteq \mathcal{M}[\mu^*] \qquad (20.241)$$

As $\mathcal{M}[\mu^*]$ is a σ-algebra it follows from [theorem: 20.146] that

$$\mathcal{S} \subseteq \sigma[\mathcal{S}] \subseteq \mathcal{M}[\mu^*] \qquad (20.242)$$

From the above, [eq: 20.233] and [theorem: 20.198] it follows that

$$(\mu^*)_{|\sigma[\mathcal{S}]} \underset{\text{[theorem: 2.86 (3)]}}{=} ((\mu^*)_{|\mathcal{M}[\mu^*]})_{|\sigma(\mathcal{S})} \text{ is a measure on } \sigma[\mathcal{S}]$$

making

$$\langle X, \sigma[\mathcal{S}], (\mu^*)_{|\sigma[\mathcal{S}]} \rangle \text{ a measure space}$$

Finally assume additional that there exist a $\{G_i\}_{i\in\mathbb{N}} \subseteq \mathcal{S}$ such that $\forall i \in \mathbb{N}\ G_i \subseteq G_{i+1} \wedge \mu(G_i) < \infty$. Let ν: $\sigma[\mathcal{S}] \to [0,\infty]$ be a measure such that $\forall A \in \mathcal{S}$ we have $\mu(A) = \nu(A)$ then as $(\mu^*)_{|\sigma[\mathcal{S}]}(A) = \mu^*(A) \underset{\text{[eq: 20.232]}}{=} \mu(A)$ it follows that $\forall A \in \mathcal{S}\ (\mu^*)_{|\sigma[\mathcal{S}]}(A) = \nu(A)$. Hence by [theorem: 20.222] it follows that

$$(\mu^*)_{|\sigma[\mathcal{S}]} = \nu$$

proving uniqueness. □

20.4.4.2 Contents and pre-measures

So given a pre-measure μ on a semi-ring $\mathcal{S}$ we can extend μ to a measure on $\sigma[\mathcal{S}]$ and from there to a measure on $\mathcal{M}[\mathcal{S}]$. In the next section we show a way of proving that a additive set-function on a ring [see definition: 20.128] can be extended [if certain conditions are satisfied] to a pre-measure. First we show that every ring is actually a semi-ring.

Theorem 20.240. *Let X be a set, $\mathcal{R} \subseteq \mathcal{P}(X)$ a ring [see definition: 20.128] then $\mathcal{R}$ is a semi-ring [see definition: 20.227].*

Proof. As $\mathcal{R}$ is a ring we have by [theorem: 20.131] that

$$\varnothing \in \mathcal{R} \text{ and } \forall A, B \in \mathcal{R} \text{ we have } A \bigcap B \in \mathcal{R}$$

Further if $A, B \in \mathcal{R}$ then by the definition of a ring [see definition: 20.128] $A \setminus B \in \mathcal{R}$. So if we define $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{R}$ by $A_1 = A \setminus B$ we have that $A \setminus B = \bigsqcup_{i \in \{1\}} A_i$. Hence we have proved that

$$\forall A, B \in \mathcal{R} \;\; \exists \{A_i\}_{i \in \{1, \ldots, m\}} \subseteq \mathcal{R} \text{ pairwise disjointsuch that } A \setminus B = \bigsqcup_{i \in \{1, \ldots, m\}} A_i$$

□

Next we define what a **content** is.

Definition 20.241. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring then $\mu: \mathcal{S} \to [0, \infty]$ is a **content** on $\mathcal{S}$ if*

1. $\mu(\varnothing) = 0$
2. $\forall \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ *pairwise disjoint such that* $\bigsqcup_{i \in \{1, \ldots, n\}} A_i \in \mathcal{S}$ *we have* $\mu\left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i\right) = \sum_{i=1}^{n} \mu(A_i)$.

*A content is **finite** if $\forall A \in \mathcal{S}$ $\mu(A) < \infty$.*

***Note* 20.242.** *If $\mathcal{S}$ is a ring then (2) can be replaced by*

$$\forall \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{S},\ n \in \mathbb{N} \text{ we have } \mu\left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i\right) = \sum_{i=1}^{n} \mu(A_i)$$

because [theorem: 20.131] ensures that $\bigsqcup_{i \in \{1, \ldots, n\}} A_i \in \mathcal{S}$.

Lemma 20.243. *Let X be a set $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring then a pre-measure $\mu: \mathcal{S} \to [0, \infty]$ is a content*

Proof. From the definition of a pre-measure [see definition: 20.230] it follows that

$$\mu(\varnothing) = 0$$

Further $\forall \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{S}, n \in \mathbb{N}$ pairwise disjoint such that $\bigsqcup_{i \in \{1, \ldots, n\}} A_i \in \mathcal{S}$ we have by [theorem: 20.233] that

$$\mu\left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i\right) = \sum_{i=1}^{n} \mu(A_i)$$

□

We have a simpler equivalent definition of a content on a ring.

Theorem 20.244. *Let X be a set, $\mathcal{R}$ a ring on X and $\mu: \mathcal{R} \to [0, \infty]$ a function such that $\mu(\varnothing) = 0$ [in other words μ is a proto-measure] then*

$$\mu \text{ is a content} \Leftrightarrow \forall A, B \in \mathcal{R} \text{ with } A \bigcap B = \varnothing \text{ we have } \mu\left(A \bigsqcup B\right) = \mu(A) + \mu(B)$$

Proof.

- **$\Rightarrow$.** Let $A, B \in \mathcal{R}$ with $A \bigcap B = \varnothing$ and define $\{A_i\}_{i \in \{1,2\}} \subseteq \mathcal{R}$ by $A_1 = A$ and $A_2 = B$, then $\{A_i\}_{i \in \{1,2\}}$ is pairwise disjoint and $\mu(A \bigsqcup B) = \mu\left(\bigcup_{i \in \{1,2\}} A_i\right) = \sum_{i=1}^{2} \mu(A_i) = \mu(A) + \mu(B)$.
- **$\Leftarrow$.** We prove this by induction so let

$$\mathcal{S} = \{n \in \mathbb{N} | \text{if } \{A_i\}_{i \in \{1, \ldots, n\}} \text{ is a pairwise disjoint family of sets in } \mathcal{R}\}$$

then we have

$1 \in \mathcal{S}$. If $\{A_i\}_{i \in \{1,\dots,1\}}$ is a pairwise disjoint family of sets in $\mathcal{R}$ then

$$\mu\left(\bigsqcup_{i \in \{1,\dots,1\}} A_i\right) = \mu(A_1) = \sum_{i=1}^{1} \mu(A_i)$$

proving that $1 \in \mathcal{S}$.

$n \in \mathcal{S} \Rightarrow n+1 \in \mathcal{S}$. If $\{A_i\}_{i \in \{1,\dots,n+1\}}$ is a pairwise disjoint family of sets in $\mathcal{R}$ then we have $\bigsqcup_{i \in \{1,\dots,n+1\}} A_i = \left(\bigsqcup_{i \in \{1,\dots,n\}} A_i\right) \bigsqcup A_{n+1}$ so that

$$\begin{aligned}
\mu\left(\bigsqcup_{i \in \{1,\dots,n+1\}} A_i\right) &= \mu\left(\bigsqcup_{i \in \{1,\dots,n+1\}} A_i\right) \\
&= \mu\left(\left(\bigsqcup_{i \in \{1,\dots,n\}} A_i\right) \bigsqcup A_{n+1}\right) \\
&= \mu\left(\bigsqcup_{i \in \{1,\dots,n\}} A_i\right) + \mu(A_{n+1}) \\
&\underset{n \in \mathcal{S}}{=} \left(\sum_{i=1}^{n} \mu(A_i)\right) + \mu(A_{n+1}) \\
&= \sum_{i=1}^{n+1} \mu(A_i)
\end{aligned}$$

proving that $n+1 \in \mathcal{S}$. □

A content has the following properties:

Theorem 20.245. *Let X be a set, $\mathcal{R}$ a ring on X and $\mu: \mathcal{R} \to [0,\infty]$ a content on $\mathcal{R}$ then we have:*

1. *$\forall A, B \in \mathcal{R}$ we have $\mu(A \bigcup B) + \mu(A \bigcap B) = \mu(A) + \mu(B)$*
2. *$\forall A, B \in \mathcal{R}$ with $A \subseteq B$ we have $\mu(A) \leqslant \mu(B)$ [μ is monotone].*
3. *$\forall A, B \in \mathcal{R}$ with $A \subseteq B$ and $\mu(A) < \infty$ we have $\mu(B \setminus A) = \mu(B) - \mu(A)$.*
4. *$\forall \{A_i\}_{i \in \{1,\dots,n\}} \subseteq \mathcal{R}$, $n \in \mathbb{N}$ we have $\mu\left(\bigcup_{i \in \{1,\dots,n\}} A_i\right) \leqslant \sum_{i=1}^{n} \mu(A_i)$ [sub-additivity]*
5. *$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ pairwise disjoint such that $\bigsqcup_{i \in \mathbb{N}} A_i \in \mathcal{R}$ we have $\sum_{i=1}^{\infty} \mu(A_i) \leqslant \mu(\bigsqcup_{i \in \mathbb{N}} A_i)$.*

Proof. First as $\mathcal{R}$ is a ring we have that $\forall A, B \in \mathcal{R}$ $B \setminus A \in \mathcal{R}$, further

1. As $A \bigcup (B \setminus A) \underset{\text{[theorem: 1.35]}}{=} A \bigcup B$ with $A \bigcap (B \setminus A) \underset{\text{[theorem: 1.35]}}{=} \varnothing$ and μ is a content we have

$$\mu\left(A \bigcup B\right) = \mu(A) + \mu(B \setminus A) \tag{20.243}$$

Further $B \underset{\text{[theorem: 1.35]}}{=} (A \bigcap B) \bigcup (B \setminus A)$ with $(A \bigcap B) \bigcap (B \setminus A) \underset{\text{[theorem: 1.35]}}{=} \varnothing$ so that

$$\mu(B) = \mu\left(A \bigcap B\right) + \mu(B \setminus A) \tag{20.244}$$

For $\mu(B \setminus A)$ we have either:

$\mu(B \setminus A) < \infty$. As μ is non negative we can sum [eq: 20.243] and [eq: 20.244] giving

$$\mu\left(A \bigcup B\right) + \mu\left(A \bigcap B\right) + \mu(B \setminus A) = \mu(B) + \mu(A) + \mu(B \setminus A)$$

and we can use [theorem: 20.28] to get

$$\mu\left(A \bigcup B\right) + \mu\left(A \bigcap B\right) = \mu(B) + \mu(A)$$

$\mu(B \setminus A) = \infty$. Then

$$\mu\left(A \bigcup B\right) \underset{\text{[eq: 20.243]}}{=} \mu(A) + \mu(B \setminus A) = \mu(A) + \infty = \infty$$

and

$$\mu(B) \underset{\text{[eq: 20.244]}}{=} \mu\big(A \bigcap B\big) + \mu(B \setminus A) = \mu\big(A \bigcap B\big) + \infty = \infty$$

so that

$$\mu\big(A \bigcup B\big) + \mu\big(A \bigcap B\big) = \infty + \mu\big(A \bigcap B\big) = \infty = \mu(A) + \infty = \mu(A) + \mu(B)$$

So in all cases we have

$$\mu\big(A \bigcup B\big) + \mu\big(A \bigcap B\big) = \mu(B) + \mu(A)$$

2. If $A, B \in \mathcal{R}$ with $A \subseteq B$ then $A \bigcup B = B$ so that

$$\mu(B) = \mu\big(A \bigcup B\big) \underset{\text{[eq: 20.243]}}{=} \mu(A) + \mu(B \setminus A) \tag{20.245}$$

then by [theorem: 20.32] it follows that

$$\mu(A) \leqslant \mu(B)$$

3. As $A \subseteq B$ we have by [eq: 20.245] that $\mu(B) = \mu(A) + \mu(B \setminus A)$ so as $\mu(A) < \infty$ we can safely add $-\mu(A)$ to both sides giving

$$\mu(B) - \mu(A) = \mu(A) + \mu(B \setminus A) - \mu(A) = \mu(B \setminus A)$$

4. Let $\{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{R}$ and define

$$\{B_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{R} \text{ by } B_i = \begin{cases} A_1 \text{ if } i = 1 \\ A_i \setminus \bigcup_{j \in \{1, \ldots, i-1\}} A_j \end{cases} \underset{\mathcal{R} \text{ is a ring and [theorem: 20.131]}}{\in} \mathcal{R}$$

so that

$$\{B_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{R} \text{ and } \forall i \in \{1, \ldots, n\}\ B_i \subseteq A_i \underset{(2)}{\Rightarrow} \mu(B_i) \leqslant \mu(A_i) \tag{20.246}$$

Using [lemma: 20.113] we have that

$$\{B_i\}_{i \in \{1, \ldots, n\}} \text{ is pairwise disjoint and } \bigcup_{i \in \{1, \ldots, n\}} A_i = \bigsqcup_{i \in \{1, \ldots, n\}} B_i \tag{20.247}$$

Hence

$$\begin{aligned} \mu\left(\bigcup_{i \in \{1, \ldots, n\}} A_i\right) &\underset{\text{[eq: 20.247]}}{=} \mu\left(\bigsqcup_{i \in \{1, \ldots, n\}} B_i\right) \\ &\underset{\text{[definition: 20.241]}}{=} \sum_{i=1}^{n} \mu(B_i) \\ &\underset{\text{[eq: 20.246]}}{\leqslant} \sum_{i=1}^{n} \mu(A_i) \end{aligned}$$

5. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ be a pairwise disjoint sequence of sets in $\mathcal{R}$ such that $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{R}$. Let $n \in \mathbb{N}$ then we have $\bigsqcup_{i \in \{1, \ldots, n\}} A_i \subseteq \bigsqcup_{i \in \mathbb{N}} A_i$ so that

$$\sum_{i=1}^{n} \mu(A_i) \underset{\text{[definition: 20.241]}}{=} \mu\left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i\right) \underset{(2)}{\leqslant} \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \tag{20.248}$$

Hence $\mu(\bigcup_{i \in \mathbb{N}} A_i)$ is a upper bound of $\{\sum_{i=1}^{n} \mu(A_i) | n \in \mathbb{N}\}$ so that

$$\sup\left(\left\{\sum_{i=1}^{n} \mu(A_i) | n \in \mathbb{N}\right\}\right) \leqslant \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right)$$

Hence

$$\sum_{i=1}^{\infty} \mu(A_i) \underset{\text{[definition: 20.92]}}{=} \sup\left(\left\{\sum_{i=1}^{n} \mu(A_i) | n \in \mathbb{N}\right\}\right) \leqslant \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right)$$

□

Similar to [theorems: 20.206, 20.207] we have the following neccesary and sufficient conditions for a content to be a pre-measure.

Theorem 20.246. *Let X be a set, $\mathcal{R}\subseteq X$ a ring on X and $\mu:\mathcal{R}\to[0,\infty]$ a content then for the following statements:*

1. *μ is a pre-measure*
2. *$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ such that $\forall i\in\mathbb{N}\ A_i\subseteq A_{i+1}$ and $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{R}$ we have $\mu(\bigcup_{i\in\mathbb{N}}A_i)=\lim\limits_{i\to\infty}\mu(A_i)$.*
3. *$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ such that $\forall i\in\mathbb{N}\ A_{i+1}\subseteq A_i$ and $\mu(A_i)<\infty$ and $\bigcap_{i\in\mathbb{N}}A_i\in\mathcal{R}$ we have $\mu(\bigcap_{i\in\mathbb{N}}A_i)=\lim\limits_{i\to\infty}\mu(A_i)$.*
4. *$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ such that $\forall i\in\mathbb{N}\ A_{i+1}\subseteq A_i$ and $\mu(A_i)<\infty$ and $\bigcap_{i\in\mathbb{N}}A_i=\varnothing$ we have $\lim\limits_{i\to\infty}\mu(A_i)=0$.*

we have $(1)\Leftrightarrow(2)\Rightarrow(3)\Leftrightarrow(4)$, Further if μ is finite then $(1)\Leftrightarrow(2)\Leftrightarrow(3)\Leftrightarrow(4)$

Proof. First as $\mathcal{R}$ is a ring we have by [theorem: 20.131] that

$$\forall\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{R}\ \bigcup_{i\in\{1,\dots,n\}}A_i\in\mathcal{R}\text{ and }\bigcap_{i\in\{1,\dots,n\}}A_i\in\mathcal{R}\tag{20.249}$$

(1) ⇒ (2). Let$\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ be such that $\forall i\in\mathbb{N}\ A_i\subseteq A_{i+1}$ and $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{R}$. Define

$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}\text{ by }B_i=\begin{cases}A_1\text{ if }i=1\\A_i\setminus A_{i-1}\text{ if }i\in\{2,\dots,\infty\}\end{cases}\underset{\mathcal{R}\text{ is a ring}}{\in}\mathcal{R}$$

Then by the above definition we have

$$\forall i\in\mathbb{N}\ B_i\subseteq A_i\tag{20.250}$$

Let $i,j\in\mathbb{N}$ with $i\neq j$. We may always assume that $i<j$ [otherwise exchange i and j], then for i we have either

$i=1$. Then $1<j$ so that $B_1=A_1$ and $B_j=A_j\setminus A_{j-1}$. As $1<j\Rightarrow 1\leqslant j-1$ we have $A_1\subseteq A_{j-1}$ so that by [theorem: 1.33] $B_j=A_j\setminus A_{j-1}\subseteq A_j\setminus A_1=A_j\setminus B_1$. Hence

$$B_i\bigcap B_j=B_1\bigcap(A_j\setminus B_1)=\varnothing$$

$i\in\{2,\dots,\infty\}$. Then $i,j\in\{2,\dots,\infty\}$ so that $B_i=A_i\setminus A_{i-1}\wedge B_j=A_j\setminus A_{j-1}$. As $i<j\Rightarrow i\leqslant j-1$ we have $B_i\subseteq A_i\subseteq A_{j-1}$ so that by [theorem: 1.33] $B_j=A_j\setminus A_{j-1}\subseteq A_j\setminus B_i$. Hence

$$B_j\bigcap B_i\subseteq(A_j\setminus B_i)\bigcap B_i=\varnothing$$

Hence it follows that

$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}\text{ is pairwise disjoint}\tag{20.251}$$

Let $n\in\mathbb{N}$. As $\forall i\in\{1,\dots,n\}$ we have $B_i\underset{\text{[eq: 20.250]}}{\subseteq}A_i\subseteq A_n$ so that

$$\bigsqcup_{i\in\{1,\dots,n\}}B_i\subseteq A_n\tag{20.252}$$

If $x\in A_n$ then $n\in\{i\in\{1,\dots,n\}|x\in A_i\}$ a finite set so that $j=\min(\{i\in\{1,\dots,n\}|x\in A_i\})$ exists. For j we have either:

$j=1$. Then $x\in A_1=B_1$ so that $x\in\bigsqcup_{i\in\{1,\dots,n\}}B_i$

$1<j$. Then $x\in A_j$ and $x\notin A_{j-1}$ so that $x\in A_j\setminus A_{j-1}=B_j\subseteq\bigsqcup_{i\in\{1,\dots,n\}}B_i$

hence $A_n\subseteq\bigsqcup_{i\in\{1,\dots,n\}}B$ which combined with [eq: 20.252] we have

$$\forall n\in\mathbb{N}\text{ we have }A_n=\bigsqcup_{i\in\{1,\dots,n\}}B_i\tag{20.253}$$

Let $x \in \bigcup_{n\in\mathbb{N}} A_n$ then $\exists n \in \mathbb{N}$ so that $x \in A_n$ and by [eq: 20.253] $\exists m \in \{1,\ldots,n\} \subseteq \mathbb{N}$ such that $x \in B_m$, hence $\bigcup_{n\in\mathbb{N}} A_n \subseteq \bigcup_{i\in\mathbb{N}} B_i$. As also $B_n \underset{\text{[eq: 20.250]}}{\subseteq} A_n \subseteq \bigcup_{n\in\mathbb{N}} A_n$ it follows that

$$\bigsqcup_{i\in\mathbb{N}} B_i = \bigcup_{i\in\mathbb{N}} A_i \in \mathcal{S} \tag{20.254}$$

As μ is a pre-measure hence countable additive we have that

$$\begin{aligned}
\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right) &= \mu\left(\bigsqcup_{i\in\mathbb{N}} B_i\right) \\
&= \sum_{i=1}^{\infty} \mu(B_i) \\
&\underset{\text{[definition: 20.92]}}{=} \lim_{i\to\infty} \sum_{j=1}^{i} \mu(B_i) \\
&\underset{\text{[theorem: 20.233]}}{=} \lim_{i\to\infty} \mu\left(\bigcup_{j=1}^{i} B_j\right) \\
&\underset{\text{[eq: 20.253]}}{=} \lim_{i\to\infty} \mu(A_i)
\end{aligned}$$

Hence we have

$$\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right) = \lim_{i\to\infty} \mu(A_i)$$

(2) ⇒ (1). As for a content $\mu(\varnothing) = 0$ we only have to prove countable additivity. Let $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{R}$ be a pairwise disjoint sequence of sets in $\mathcal{R}$ such that $\bigcup_{i\in\mathbb{N}} A_i$. Define

$$\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{R} \text{ by } B_i = \bigsqcup_{j\in\{1,\ldots,i\}} A_j$$

Then we have

$$\forall i \in \mathbb{N}\ B_i = \bigsqcup_{j\in\{1,\ldots,i\}} A_i \subseteq \left(\bigsqcup_{j\in\{1,\ldots,i\}} A_i\right) \bigcup A_{i+1} = \bigsqcup_{j\in\{1,\ldots,i+1\}} A_i = B_{i+1} \tag{20.255}$$

If $x \in \bigsqcup_{i\in\mathbb{N}} A_i$ then $\exists i \in \mathbb{N}$ such that $x \in A_i \subseteq \bigsqcup_{j\in\{1,\ldots,i\}} A_i = B_i \subseteq \bigcup_{i\in\mathbb{N}} B_i$, hence $\bigcup_{i\in\mathbb{N}} A_i \subseteq \bigcup_{i\in\mathbb{N}} B_i$, as also $B_i = \bigcup_{j\in\{1,\ldots,i\}} A_j \subseteq \bigcup_{j\in\mathbb{N}} B_j$ it follows that $\bigcup_{i\in\mathbb{N}} B_i \subseteq \bigcup_{j\in\mathbb{N}} B_j$. Hence

$$\bigcup_{i\in\mathbb{N}} B_i = \bigsqcup_{i\in\mathbb{N}} A_i \in \mathcal{R} \tag{20.256}$$

Using (1) together with [eqs: 20.255, 20.256] it follows that

$$\mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) = \lim_{i\to\infty} \mu(B_i) = \lim_{i\to\infty} \mu\left(\bigsqcup_{j\in\{1,\ldots,i\}} A_j\right) \tag{20.257}$$

A μ is a content hence additive we have $\forall i \in \mathbb{N}$ that $\mu\left(\bigsqcup_{j\in\{1,\ldots,i\}} A_j\right) = \sum_{j=1}^{i} \mu(A_j)$ so that by the above

$$\mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) = \lim_{i\to\infty} \sum_{j=1}^{i} \mu(A_j) \underset{\text{[definition: 20.92]}}{=} \sum_{i=1}^{\infty} \mu(A_i)$$

Finally using [eq: 20.256] it follows that

$$\mu\left(\bigsqcup_{i\in\mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \mu(A_i)$$

proving countable additivity.

(2) ⇒ (3). Let $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{R}$ such that $\forall i \in \mathbb{N}\ \mu(A_i) < \infty$, $A_{i+1} \subseteq A_i$ and $\bigcap_{i\in\mathbb{N}} A_i \in \mathcal{R}$. Define

$$\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{R} \text{ by } B_i = A_1 \setminus A_i \underset{\mathcal{R} \text{ is a ring}}{\in} \mathcal{R}$$

Then we have

$$\forall i \in \mathbb{N}\ B_i = A_1 \setminus A_i \underset{\text{[theorem: 1.33]}}{\subseteq} A_1 \setminus A_{i+1} = B_i \tag{20.258}$$

and

$$A_1 \setminus \left(\bigcap_{i \in \mathbb{N}} A_i \right) \underset{\text{[theorem: 2.132]}}{=} \bigcup_{i \in \mathbb{N}} (A_1 \setminus A_i) = \bigcup_{i \in \mathbb{N}} B_i \tag{20.259}$$

As $\mathcal{R}$ is a ring and $A_1, \bigcap_{i \in \mathbb{N}} A_i \in \mathcal{R}$ we have that $\bigcup_{i \in \mathbb{N}} B_i = A_1 \setminus (\bigcap_{i \in \mathbb{N}} A_i) \in \mathcal{R}$. Hence we can apply (2)

$$\mu\left(A_1 \setminus \bigcap_{i \in \mathbb{N}} A_i \right) = \mu\left(\bigcup_{i \in \mathbb{N}} B_i \right) \underset{(2)}{=} \lim_{i \to \infty} \mu(B_i) = \lim_{i \to \infty} \mu(A_1 \setminus A_i) \tag{20.260}$$

Let $i \in \mathbb{N}$ then $\bigcap_{i \in \mathbb{N}} A_i \subseteq A_i$ so that by [theorem: 20.245 (2)] $\mu(\bigcap_{i \in \mathbb{N}} A_i) \leqslant \mu(A_i) < \infty$, further we have $A_1 \setminus A_i \subseteq A_1 \Rightarrow \mu(A_1 \setminus A_i) \leqslant \mu(A_1) < \infty$. Hence using [theorem: 20.245(3)] we have

$$\forall i \in \mathbb{N} \text{ that } \mu(B_i) = \mu(A_1 \setminus A_i) = \mu(A_1) - \mu(A_i) \tag{20.261}$$

and

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i \right) \underset{\text{[eq: 20.259]}}{=} \mu\left(A_1 \setminus \bigcap_{i \in \mathbb{N}} A_i \right) = \mu(A_1) - \mu\left(\bigcap_{i \in \mathbb{N}} A_i \right) \tag{20.262}$$

So

$$\begin{aligned} \mu(A_1) - \mu\left(\bigcap_{i \in \mathbb{N}} A_i \right) &\underset{\text{[eqs: 20.260, 20.262]}}{=} \lim_{i \to \infty} \mu(A_1 \setminus A_i) \\ &\underset{\text{[eq; 20.261]}}{=} \lim_{i \to \infty} (\mu(A_1) - \mu(A_i)) \\ &\underset{\text{[theorem: 20.82]}}{=} \mu(A_1) - \lim_{i \to \infty} \mu(A_i) \end{aligned}$$

As $\mu(A_1) < \infty \Rightarrow \mu(A_1) \in \mathbb{R}$ we can safely subtract $\mu(A)$ from both sides from the above equation to get $-\mu\left(\bigcap_{i \in \mathbb{N}} A_i = -\lim_{i \to \infty} \mu(A_i) \right.$ from which it follows that

$$\mu\left(\bigcap_{i \in \mathbb{N}} A_i \right) = \lim_{i \to \infty} \mu(A_i)$$

(3) ⇒ (4). Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ be such that $\forall i \in \mathbb{N}\ A_{i+1} \subseteq A_i$ and $\mu(A_i) < \infty$ and $\bigcap_{i \in \mathbb{N}} A_i = \varnothing \in \mathcal{S}$ then by (3) we have

$$0 = \mu(\varnothing) = \mu\left(\bigcap_{i \in \mathbb{N}} A_i \right) = \lim_{i \to \infty} \mu(A_i)$$

(4) ⇒ (3). Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ be such that $\forall i \in \mathbb{N}\ A_{i+1} \subseteq A_i$ and $\mu(A_i) < \infty$ and $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{R}$. Take $A = \bigcap_{i \in \mathbb{N}} A_i \in \mathcal{R}$ and define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R} \text{ by } B_i = A_i \setminus A \underset{\mathcal{R} \text{ is a ring}}{\in} \mathcal{R}$$

then we have

$$\forall i \in \mathbb{N} \text{ that } B_{i+1} = A_{i+1} \setminus A \subseteq A_i \setminus A = B_i$$

Further we have

$$\varnothing = A \setminus A = \left(\bigcap_{i \in \mathbb{N}} A_i \right) \setminus A \underset{\text{[theorem: 2.133]}}{=} \bigcap_{i \in \mathbb{N}} (A_i \setminus A) = \bigcap_{i \in \mathbb{N}} B_i$$

Hence using (4) we have

$$0 = \lim_{i \to \infty} \mu(B_i) = \lim_{i \to \infty} (A_i \setminus A) \tag{20.263}$$

As $A = \bigcap_{i \in \mathbb{N}} A_i \subseteq A_i$ it follows from [theorem: 20.245(2)] that $\mu(A) \leqslant \mu(A_i) < \infty$, hence we have by [theorem: 20.245(3)] that

$$\forall i \in \mathbb{N} \text{ we have } \mu(A_i \setminus A) = \mu(A_i) - \mu(A) \tag{20.264}$$

Hence we have

$$\begin{aligned} 0 &\underset{\text{[eq: 20.263]}}{=} \lim_{i\to\infty}\mu(A_i\setminus A) \\ &\underset{\text{[eq: 20.264]}}{=} \lim_{i\to\infty}(\mu(A_i)-\mu(A)) \\ &\underset{\text{[theorem: 20.82]}}{=} \lim_{i\to\infty}\mu(A_i)-\mu(A) \end{aligned}$$

As $\mu(A)<\infty \Rightarrow \mu(A)\in\mathbb{R}$ we have

$$\mu\left(\bigcap_{i\in\mathbb{N}} A_i\right)=\mu(A)=\lim_{i\to\infty}\mu(A_i)$$

Now for the last part we have to prove that if μ is finite then $(4)\Rightarrow(2)$ [because then from $(1)\Leftrightarrow(2)\Rightarrow(3)\Leftrightarrow(4)$ it follows that $(1)\Leftrightarrow(2)\Leftrightarrow(3)\Leftrightarrow 4$].

(4) ⇒ (2). Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ is such that $\forall i\in\mathbb{N}$ we have $A_i\subseteq A_{i+1}$ and $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{R}$. Take $A=\bigcup_{i\in\mathbb{N}}A_i$ and define

$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R} \text{ by } B_i=A\setminus A_i \underset{\mathcal{R}\text{ is a ring}}{\in} \mathcal{R}$$

Then we have

$$\forall i\in\mathbb{N} \text{ that } B_{i+1}=A\setminus A_{i+1} \underset{\text{[theorem: 1.33]}}{\subseteq} A\setminus A_i=B_i \text{ and } \mu(B_i) \underset{\mu\text{ is finite}}{<} \infty$$

Further we have

$$\varnothing=A\setminus A=A\setminus\left(\bigcup_{i\in\mathbb{N}}A_i\right) \underset{\text{[theorem: 2.133]}}{=} \bigcap_{i\in\mathbb{N}}(A\setminus A_i)=\bigcap_{i\in\mathbb{N}}B_i$$

So using (4) we have that

$$\lim_{i\to\infty}\mu(A\setminus A_i)=\lim_{i\to\infty}\mu(B_i)=0 \tag{20.265}$$

Let $i\in\mathbb{N}$ then, as $A_i\subseteq\bigcup_{i\in\mathbb{N}}A_i=A$ and $\mu(A_i)\underset{\mu\text{ is finite}}{<}\infty$, it follows from [theorem: 20.245(3)] that $\mu(A\setminus A_i)=\mu(A)-\mu(A_i)$. Hence we have

$$\begin{aligned} 0 &\underset{\text{[eq: 20.265]}}{=} \lim_{i\to\infty}\mu(A\setminus A_i) \\ &= \lim_{i\to\infty}(\mu(A)-\mu(A_i)) \\ &\underset{\text{[theorem: 20.82]}}{=} \mu(A)-\lim_{i\to\infty}\mu(A_i) \end{aligned}$$

As μ is finite it follows from the above that

$$\mu\left(\bigsqcup_{i\in\mathbb{N}}A_i\right)=\mu(A)=\lim_{i\to\infty}\mu(A_i)$$ □

The above equivalences allows us to determine if a content on a ring is a pre-measure. However this is not always simple. If we assume a ring on a topological space then proving becomes easier if we make use of the properties of the topological space. For this we introduce approximation by compact classes. First recap the definition of a compact class [see definition: 14.243].

Definition 20.247. *Let X be a set then $\mathcal{C}\subseteq\mathcal{P}(X)$ is a* ***compact class*** *if $\forall\{K_i\}_{i\in\mathbb{N}}\subseteq\mathcal{C}$ with $\bigcap_{i\in\mathbb{N}}K_i=\varnothing$ there exist a $N\in\mathbb{N}$ such that $\bigcap_{i\in\{1,\dots,N\}}K_i=\varnothing$.*

We have then the following theorem that can be used to determine if a content is a pre-measure.

Theorem 20.248. *Let X be a set, $\mathcal{R}$ a ring on X and $\mu: X\to[0,\infty]$ a* ***finite*** *content. If there exist a compact class $\mathcal{C}\subseteq\mathcal{P}(X)$ such that $\forall A\in\mathcal{R}$ and $\forall\varepsilon\in\mathbb{R}^+$ we have that $\exists K_\varepsilon\in\mathcal{C}$ and $\exists A_\varepsilon\in\mathcal{R}$ such that*

$$A_\varepsilon\subseteq K_\varepsilon\subseteq A \text{ and } \mu(A\setminus A_\varepsilon)<\varepsilon$$

then μ is a pre-measure. In other words if we can 'approximate' $\mathcal{R}$ by a complex class $\mathcal{C}$ then μ is a pre-measure.

Proof. Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ be such that

$$\forall i\in\mathbb{N} \text{ we have } A_{i+1}\subseteq A_i \text{ and } \bigcap_{i\in\mathbb{N}} A_i=\varnothing \tag{20.266}$$

As μ is finite we have also

$$\forall i\in\mathbb{N} \text{ we have } \mu(A_i)<\infty \tag{20.267}$$

So if we prove that $\lim_{i\to\infty}\mu(A_i)=0$ then it follows from [theorem: 20.246] that μ is a pre-measure. Let $\varepsilon\in\mathbb{R}^+$ and $n\in\mathbb{N}$ then by the assumption there exist a $K_{n,\varepsilon}\in\mathcal{C}$ and a $R_{n,\varepsilon}\in\mathcal{R}$ such that $R_{n,\varepsilon}\subseteq K_{n,\varepsilon}\subseteq A_n$ and $\mu(A\setminus R_{n,\varepsilon})<\frac{\varepsilon}{2^n}$. Hence there exist a $\{K_{n,\varepsilon}\}_{n\in\mathbb{N}}\subseteq\mathcal{C}$ and $\{R_{n,e}\}_{n\in\mathbb{N}}\subseteq\mathcal{R}$ such that

$$\forall n\in\mathbb{N} \text{ we have } R_{n,\varepsilon}\subseteq K_{n,\varepsilon}\subseteq A_n \text{ and } \mu(A\setminus R_{n,\varepsilon})<\frac{\varepsilon}{2^n} \tag{20.268}$$

Then we have

$$\bigcap_{n\in\mathbb{N}} K_{n,\varepsilon}\subseteq\bigcap_{n\in\mathbb{N}} A_n \underset{\text{[eq: 20.266]}}{=} \varnothing$$

so that by the definition of a compact class there exist a $N_\varepsilon\in\mathbb{N}$ such that $\bigcap_{n\in\{1,\dots,N_\varepsilon\}} K_{n,\varepsilon}=\varnothing$. As $\bigcap_{n\in\{1,\dots,N_\varepsilon\}} R_{n,\varepsilon} \underset{\text{[eq: 20.268]}}{\subseteq} \bigcap_{n\in\{1,\dots,N_\varepsilon\}} K_{n,\varepsilon}$ it follows that

$$\bigcap_{n\in\{1,\dots,N_\varepsilon\}} R_{n,\varepsilon}=\bigcap_{n\in\{1,\dots,N_\varepsilon\}} K_{n,\varepsilon}=\varnothing \tag{20.269}$$

Let $n\in\{1,\dots,N_\varepsilon\}$ then $A_{N_\varepsilon} \underset{\text{[eq: 20.266]}}{\subseteq} A_n$ so that $A_{N_\varepsilon}\subseteq\bigcap_{n\in\{1,\dots,N_\varepsilon\}} A_n\subseteq A_{N_\varepsilon}$ proving that

$$A_{N_\varepsilon}=\bigcap_{n\in\{1,\dots,N_\varepsilon\}} A_n \tag{20.270}$$

Let $x\in\bigcap_{n\in\{1,\dots,N_\varepsilon\}} A_n$. Assume that $x\notin\bigcup_{n\in\{1,\dots,N_\varepsilon\}}(A_n\setminus R_{n,\varepsilon})$ then $\forall n\in\{1,\dots,N_\varepsilon\}$ we have $x\notin A_n\setminus R_{n,\varepsilon}$, as $x\in\bigcap_{n\in\{1,\dots,N_\varepsilon\}} A_n\subseteq A_n$, it follows that $x\in R_{n,\varepsilon}$. So $x\in\bigcap_{n\in\{1,\dots,N_\varepsilon\}} R_{n,\varepsilon}$ contradicting [eq: 20.269]. Hence the assumption is wrong and we must have that $x\in\bigcup_{n\in\{1,\dots,N_\varepsilon\}}(A_n\setminus R_{n,\varepsilon})$ proving

$$A_{N_\varepsilon} \underset{\text{[eq: 20.270]}}{=} \bigcap_{n\in\{1,\dots,N_\varepsilon\}} A_n\subseteq\bigcup_{n\in\{1,\dots,N_\varepsilon\}}(A_n\setminus R_{n,\varepsilon}) \underset{\mathcal{R}\text{ is a ring}}{\in} \mathcal{R} \tag{20.271}$$

Hence using the above we have

$$\begin{aligned}
\mu(A_{N_\varepsilon}) &\underset{\text{[theorem: 20.245(2)]}\wedge\text{[eq:20.271]}}{\leqslant} \mu\left(\bigcup_{n\in\{1,\dots,N_\varepsilon\}}(A_n\setminus R_{n,\varepsilon})\right)\\
&\underset{\text{[definition: 20.241]}\wedge\text{[eq:20.271]}}{=} \sum_{i=1}^{N_\varepsilon}\mu(A_n\setminus R_{n,\varepsilon})\\
&\underset{\text{[eq: 20.268]}}{\leqslant} \sum_{i=1}^{N_\varepsilon}\frac{\varepsilon}{2^n}\\
&= \varepsilon\cdot\sum_{i=1}^{N}\left(\frac{1}{2}\right)^n\\
&\underset{\text{[lemma: 14.353]}}{=} \varepsilon\cdot\left(\frac{1}{2}\right)\cdot\frac{1-\left(\frac{1}{2}\right)^n}{1-\frac{1}{2}}\\
&= \varepsilon\cdot\left(1-\frac{1}{2^n}\right)\\
&< \varepsilon
\end{aligned}$$

So we have proved that

$$\forall\varepsilon\in\mathbb{R}^+ \text{ there exist a } N_\varepsilon\in\mathbb{N} \text{ such that } \forall n\in\{N_\varepsilon,\dots,\infty\} \text{ we have } |\mu(A_n)-0|=\mu(A_n)\leqslant\mu(A_{N_\varepsilon})<\varepsilon$$

which proves that $\lim_{\mathbb{R}}\limits_{n\to\infty}\mu(A_n)=0$. Using the fact that μ is finite and [theorem: 20.74] it follows that

$$\lim_{n\to\infty}\mu(A_i)=0$$

So using [theorem: 20.246] it follows that μ is a pre-measure. □

The above theorem is especially usefull if we have a ring on a topological Hausdorff space because every set of compact sets is a compact class [see theorem: 14.244]. This is expressed in the following theorem.

Theorem 20.249. *Let $\langle X,\mathcal{T}\rangle$ be a Hausdorff topological space,, $\mathcal{R}$ a ring on X and $\mu\colon X\to[0,\infty]$ a **finite** content. If $\forall A\in\mathcal{R}$ and $\forall\varepsilon\in\mathbb{R}^+$ we have that $\exists K_\varepsilon$ compact and $\exists A_\varepsilon\in\mathcal{R}$ such that*

$$A_\varepsilon\subseteq K_\varepsilon\subseteq A \text{ and } \mu(A\setminus A_\varepsilon)<\varepsilon$$

then μ is a pre-measure.

Proof. If $\mathcal{C}=\{A\in\mathcal{P}(X)|A \text{ is compact}\}$ is the set of compact subsets of X then by [theorem: 14.244] $\mathcal{C}$ is a compact class. The proof follows then from [theorem: 20.248]. □

Proving that $\mathcal{R}\subseteq\mathcal{P}(X)$ is a ring is not always possible, especially proving that $\forall A,B\in\mathcal{R}$ we have that $A\setminus B\in\mathcal{R}$. For example the difference of two half-open intervals in $\mathcal{I}_{[[}$ is not always a half-open interval, hence $\mathcal{R}_{[[}$ is not a ring, however it will be proved later that $\mathcal{I}_{[[}$ is a semi-ring on $\mathbb{R}$. Luckely it turns out that a semi-ring with a content on it can easely be extended to a ring with a content on it. First we show how we can extend a semi-ring to a smallest ring containing the semi-ring.

Definition 20.250. *Let X be a set, $\mathcal{S}\subseteq\mathcal{P}(X)$ a semi-ring on X then $\mathcal{R}[\mathcal{S}]$ is defined by*

$$\mathcal{R}[\mathcal{S}]=\left\{\bigsqcup_{i\in\{1,\dots,n\}}A_i|n\in\mathbb{N}\wedge\{A_i\}_{i\in\{1,\dots,n\}}\subseteq S \text{ is pairwise disjoint}\right\}$$

***Note* 20.251.** *As for $A,B\in\mathcal{S}$ we have by definition of a semi-ring that $\exists\{C_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ pairwise disjoint such that $A\setminus B=\bigsqcup_{i\in\{1,\dots,n\}}C_i$ it follows that*

$$\forall A,B\in\mathcal{S} \text{ we have } A\setminus B\in\mathcal{S}$$

To prove that $\mathcal{R}[\mathcal{S}]$ we have to prove that $\varnothing\in\mathcal{R}[\mathcal{S}]$ and $\forall A,B\in\mathcal{R}[\mathcal{S}]$ that $A\bigcup B\in\mathcal{R}[\mathcal{S}]\wedge A\setminus B\in\mathcal{R}[\mathcal{S}]$. We start with proving that $\forall A,B\in\mathcal{R}[\mathcal{S}]$ $A\bigcup B\in\mathcal{R}[\mathcal{S}]$ using the following two lemma's.

Lemma 20.252. *Let X be a set, $\mathcal{S}\subseteq\mathcal{P}(X)$ a semi-ring on X, $A\in\mathcal{S}$ and $B\in\mathcal{R}[\mathcal{S}]$ then*

$$A\bigcup B\in\mathcal{R}[\mathcal{S}]$$

Proof. As $B\in\mathcal{R}[\mathcal{S}]$ there exist a pairwise disjoint $\{B_i\}_{i\in\{1,\dots,,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ such that

$$B=\bigsqcup_{i\in\{1,\dots,n\}}B_i$$

Define

$$\{C_i\}_{i\in\{1,\dots,n+1\}} \text{ by } C_i=\begin{cases}B_i\setminus A \text{ if } i\in\{1,\dots,n\}\\ A \text{ if } i=n+1\end{cases}$$

Then if $x\in A\bigcup B$ we have either:

***x* ∈ *A*.** Then $x\in C_{n+1}\subseteq\bigcup_{i\in\{1,\dots,n+1\}}C_i$

***x* ∉ *A*.** Then we must have that $x\in B$ so that there exist a $i\in\{1,\dots,n\}$ such that

$$x\in B_i\underset{x\in A}{\Rightarrow}x\in B_i\setminus A\in C_i\subseteq\bigcup_{i\in\{1,\dots,n+1\}}C_i$$

proving that

$$A\bigcup B\subseteq\bigcup_{i\in\{1,\dots,n+1\}}C_i \tag{20.272}$$

Let $x \in \bigcup_{i \in \{1,\ldots,n+1\}} C_i$ then there exist a $i \in \{1,\ldots,n+1\}$ such that $x \in C_i$. For i we have either

$i \in \{1,\ldots,n\}$. Then $x \in C_i = B_i \setminus A \subseteq B_i \subseteq \bigcup_{i \in \{1,\ldots,n\}} B_i = B \subseteq A \bigcup B$

$i = n+1$. Then $x \in C_{n+1} = A \bigcup B$

hence $\bigcup_{i \in \{1,\ldots,n+1\}} C_i \subseteq A \bigcup B$. Combining this with [eq: 20.272] results in

$$A \bigcup B = \bigcup_{i \in \{1,\ldots,n+1\}} C_i \tag{20.273}$$

Let $i, j \in \{1,\ldots,n+1\}$ with $i \neq j$ then for i we have either:

$i \in \{1,\ldots,n\}$. Then for j we have either:

$j \in \{1,\ldots,n\}$. Then $C_i \bigcap C_j = (B_i \setminus A) \bigcap (B_j \setminus A) \subseteq B_i \bigcap B_j = \varnothing$

$j = n+1$. Then $C_i \bigcap C_j = (B_i \setminus A) \bigcap A = \varnothing$

$i = n+1$. Then as $i \neq j$ we have that $j \in \{1,\ldots,n\}$ so that $C_i \bigcap C_j = A \bigcap (B_j \setminus A) = \varnothing$

hence

$$\{C_i\}_{i \in \{1,\ldots,n+1\}} \text{ is pairwise disjoint so that } A \bigcup B = \bigsqcup_{i \in \{1,\ldots,n+1\}} C_i \tag{20.274}$$

Let $i \in \{1,\ldots,n+1\}$ then we have either:

$i \in \{1,\ldots,n\}$. As $A, B_i \in \mathcal{S}$ and S is a semi-ring there exist a pairwise disjoint $\{D_{i,j}\}_{j \in \{1,\ldots,n_i\}} \subseteq \mathcal{S}$ such that $C_i = B_i \setminus A = \bigsqcup_{i \in \{1,\ldots,n_i\}} D_{i,j}$.

$i = n+1$. Take $n_1 = 1$ and $\{D_{1,j}\}_{j \in \{1\}} \subseteq \mathcal{S}$ by $D_{1,1} = A$ so that $C_{n+1} = \bigsqcup_{i \in \{1,\ldots,n_i\}} D_{1,j}$

Summarized we have that

$$\forall i \in \{1,\ldots,n+1\}\ \exists \{D_{i,j}\}_{j \in \{1,\ldots,n\}} \subseteq \mathcal{S} \text{ with } C_i = \bigsqcup_{i \in \{1,\ldots,n_i\}} D_{i,j} \tag{20.275}$$

As $\bigcup_{i \in \{1,\ldots,n+1\}} \{i\} \times \{1,\ldots,n_i\}$ is finite by [theorems: 6.41, 6.36] there exists a bijection

$$\beta : \{1,\ldots,N\} \to \bigcup_{i \in \{1,\ldots,n+1\}} \{i\} \times \{1,\ldots,n_i\} \tag{20.276}$$

Using [eqs: 20.274, 20.275 and 20.276] allows us to apply [theorem: 20.119] that

$$\{D_{\beta(i)_1 \beta(i)2}\}_{i \in \{1,\ldots,N\}} \subseteq \mathcal{S} \text{ is pairwise disjoint and } \bigsqcup_{i \in \{1,\ldots,n+1\}} C_i = \bigsqcup_{i \in \{1,\ldots,N\}} D_{\beta(i)_1, \beta(i)_2}$$

Hence using [eq: 20.274] it follows that $A \bigcup B = \bigsqcup_{i \in \{1,\ldots,N\}} D_{\beta(i)_1, \beta(i)_2}$ which proves that

$$A \bigcup B \in \mathcal{S}[\mathcal{R}]$$

□

We use the above lemma in a proof by induction to prove that that $\mathcal{R}[\mathcal{S}]$ is $\cup$-stable.

Lemma 20.253. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring on X and $A, B \in \mathcal{R}[\mathcal{S}]$ then $A \bigcup B \in \mathcal{R}[\mathcal{S}]$*

Proof. Let $B \in \mathcal{R}[\mathcal{S}]$ and define

$$\mathcal{S}_B = \left\{ n \in \mathbb{N} | \text{If } \{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{S} \text{ pairwise disjoint then } \left(\bigsqcup_{i \in \{1,\ldots,n\}} A_i \right) \bigcup B \in \mathcal{R}[\mathcal{S}] \right\}$$

then we have:

$1 \in \mathcal{S}_B$. If $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}$ is pairwise disjoint then, as $A_1 \in \mathcal{S}$, we have by [lemma: 20.252] that $\left(\bigsqcup_{i \in \{1\}} A_i\right) \bigcup B = A_1 \bigcup B \in \mathcal{R}[\mathcal{S}]$ which proves that $1 \in \mathcal{S}_B$.

$n \in \mathcal{S}_B \Rightarrow n+1 \in \mathcal{S}_B$. Let $\{A_i\}_{i \in \{1,\ldots,n+1\}} \subseteq \mathcal{S}$ be a pairwise disjoint family of sets in $\mathcal{S}$. As $\{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{S}$ is pairwise disjoint and $n \in \mathcal{R}[\mathcal{S}]$ we have that

$$\left(\bigsqcup_{i \in \{1,\ldots,n\}} A_i \right) \bigcup B \in \mathcal{R}[\mathcal{S}]$$

Hence, as $A_{n+1} \in \mathcal{S}$, we have by the previous lemma [lemma: 20.252] that

$$A_{n+1} \bigcup \left(\left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i \right) \bigcup B \right) \in \mathcal{R}[\mathcal{S}]$$

which as $A_{n+1} \bigcup \left(\left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i \right) \bigcup B \right) = \left(\bigsqcup_{i \in \{1, \ldots, n+1\}} A_i \right) \bigcup B$ proves that

$$\left(\bigsqcup_{i \in \{1, \ldots, n+1\}} A_i \right) \bigcup B$$

so that $n+1 \in \mathcal{S}$.

Mathematical induction proves then that $\mathcal{S}_B = \mathbb{N}$. Finally if $A \in \mathcal{R}[\mathcal{S}]$ then there exist a $\{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{S}$ such that $A = \bigsqcup_{i \in \{1, \ldots, n\}} A_i$, hence, as $n \in \mathbb{N} = \mathcal{S}_B$, it follows that $A \bigcup B = \left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i \right) \bigcup B \in \mathcal{R}[\mathcal{S}]$. □

Next we have to prove that $\forall A, B \in \mathcal{R}[\mathcal{S}]$.

Lemma 20.254. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring on X, $A \in \mathcal{R}[\mathcal{S}]$ and $B \in \mathcal{S}$ then $A \setminus B \in \mathcal{R}[\mathcal{S}]$.*

Proof. We use mathematical induction in the proof. Define

$$S_B = \left\{ n \in \mathbb{N} | \text{If } \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{S} \text{ pairwise disjoint then } \left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i \right) \setminus B \in \mathcal{R}[\mathcal{S}] \right\}$$

then we have:

- $\boldsymbol{1 \in S_B}$**.** Let $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}$ pairwise disjoint then $\left(\bigsqcup_{i \in \{1\}} A_i \right) \setminus B = A_1 \setminus B \in \mathcal{R}[S]$ [using the note in the definition of $\mathcal{R}[\mathcal{S}]$ see [definition: 20.250]], hence $1 \in S_B$.
- $\boldsymbol{n \in S_B \Rightarrow n+1 \in S_B}$**.** Let $\{A_i\}_{i \in \{1, \ldots, n+1\}} \subseteq \mathcal{S}$ pairwise disjoint. Then we have

$$\begin{aligned} \left(\bigsqcup_{i \in \{1, \ldots, n+1\}} A_i \right) \setminus B &= \left(\left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i \right) \bigsqcup A_{n+1} \right) \setminus B \\ &= \left(\left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i \right) \setminus B \right) \bigsqcup (A_{n+1} \setminus B) \end{aligned} \tag{20.277}$$

As $n \in S_B$ we have that $\left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i \right) \setminus B \in \mathcal{R}[\mathcal{S}]$ so that there exists a pairwise disjoint $\{C_i\}_{i \in \{1, \ldots, k\}} \subseteq \mathcal{S}$, $k \in \mathbb{N}$ such that

$$\left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i \right) \setminus B = \bigsqcup_{j \in \{1, \ldots, k\}} C_j \tag{20.278}$$

Further as A_{n+1}, $B \in S$ and S is a semi-ring there exist a pairwise disjoint $\{D_i\}_{i \in \{1, \ldots, l\}} \subseteq \mathcal{S}$, $l \in \mathbb{N}$ such that

$$A_{n+1} \setminus B = \bigsqcup_{i \in \{1, \ldots, l\}} D_i \tag{20.279}$$

Define

$$\{E_i\}_{i \in \{1, \ldots, k+l\}} \subseteq \mathcal{S} \text{ by } E_i = \begin{cases} C_i \in \mathcal{S} \text{ if } i \in \{1, \ldots, k\} \\ D_{i-k} \in \mathcal{S} \text{ if } i \in \{k+1, \ldots, k+l\} \end{cases} \tag{20.280}$$

Let $i \in \{1, \ldots, k+l\}$ then we have either

- $\boldsymbol{i \in \{1, \ldots, k\}}$**.** Then

$$E_i = C_i \underset{\text{[eq: 20.278}}{\subseteq} \left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i \right) \setminus B \underset{\text{[eq: 20.277]}}{\subseteq} \left(\bigsqcup_{i \in \{1, \ldots, n+1\}} A_i \right) \setminus B$$

- $\boldsymbol{i \in \{k+1, \ldots, k+l\}}$**.** Then

$$E_i = D_{i-k} \underset{\text{[eq: 20.279]}}{\subseteq} A_{n+1} \setminus B \underset{\text{[eq: 20.277]}}{\subseteq} \left(\bigsqcup_{i \in \{1, \ldots, n+1\}} A_i \right) \setminus B$$

which proves that

$$\bigcup_{i\in\{1,\ldots,k+l\}} E_i \subseteq \left(\bigsqcup_{i\in\{1,\ldots,n+1\}} A_i\right)\setminus B \tag{20.281}$$

If $x\in\left(\bigsqcup_{i\in\{1,\ldots,n+1\}} A_i\right)\setminus B=\left(\left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right)\setminus B\right)\bigsqcup(A_{n+1}\setminus B)$ then we have either:

$\boldsymbol{x\in\left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right)\setminus B}$**.** Then by [eq: 20.279] there exist a $i\in\{1,\ldots,k\}$ such that $x\in C_i \underset{\text{[eq: 20.280]}}{=} E_i\subseteq\bigcup_{i\in\{1,\ldots,k+l\}} E_i$

$\boldsymbol{x\in A_{n+1}\setminus B}$**.** Then by [eq: 20.279] there exist a $i\in\{1,\ldots,l\}$ such that

$$x\in D_i=D_{(i+k)-k}=E_{i+k}\subseteq\bigcup_{i\in\{1,\ldots,k+l\}} E_i$$

which proves that $\left(\bigsqcup_{i\in\{1,\ldots,n+1\}} A_i\right)\setminus B\subseteq\bigcup_{i\in\{1,\ldots,k+l\}} E_i$. Combininig this with [eq: 20.281] proves that

$$\left(\bigsqcup_{i\in\{1,\ldots,n+1\}} A_i\right)\setminus B=\bigcup_{i\in\{1,\ldots,k+l\}} E_i \tag{20.282}$$

Let $i,j\in\{1,\ldots,k+l\}$ with $i\neq j$ then without losing generality we may assume that $i<j$ [otherwise exchange i and j]. For i we have either:

$\boldsymbol{i\in\{1,\ldots,k\}}$**.** Then for j we have either:

$\boldsymbol{j\in\{1,\ldots,k\}}$**.** Then $E_i\bigcap E_j=C_i\bigcap C_j=\varnothing$

$\boldsymbol{j\in\{k+1,\ldots,k+l\}}$**.** Then

$$\begin{aligned}
E_i\bigcap E_j &= C_i\bigcap D_{j-k}\\
&\underset{\text{[eq: 20.278]}}{\subseteq}\left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right)\bigcap D_{j-k}\\
&\underset{\text{[eq: 20.279]}}{\subseteq}\left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right)\bigcap A_{n+1}\\
&= \bigsqcup_{i\in\{1,\ldots,n\}}\left(A_i\bigcap A_{n+1}\right)\\
&\underset{i\neq n+1}{=}\varnothing
\end{aligned}$$

$\boldsymbol{i\in\{k+1,\ldots,k+l\}}$**.** As $i<j$ we have $j\in\{k+1,\ldots,k+l\}$ so that

$$E_i\bigcap E_j=D_{i-k}\bigcap D_{j-k}=\varnothing$$

which proves that

$$\{E_i\}_{i\in\{1,\ldots,k+l\}}\subseteq\mathcal{S}\text{ is pairwise disjoint and }\left(\bigsqcup_{i\in\{1,\ldots,n+1\}} A_i\right)\setminus B\underset{\text{[eq: 20.282]}}{=}\bigsqcup_{i\in\{1,\ldots,k+l\}} E_i$$

So using the definition of $\mathcal{R}[\mathcal{S}]$ it follows that $\left(\bigsqcup_{i\in\{1,\ldots,n+1\}} A_i\right)\setminus B\in\mathcal{R}[\mathcal{S}]$ which proves that $n+1\in\mathcal{S}_B$

By mathematical induction it follows that

$$S_B=\mathbb{N}$$

Finally let $A\in\mathcal{R}[\mathcal{S}]$ then there exist a pairwise disjoint $\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{S}$ such that $A=\bigsqcup_{i\in\{1,\ldots,n\}} A_i$. As $n\in\mathbb{N}=S_B$ we have that $A\setminus B=\left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right)\setminus B\in\mathcal{R}[\mathcal{S}]$. □

Next we use mathematical induction to prove that $\forall A,B\in\mathcal{R}[S]$ we have $A\setminus B\in\mathcal{R}[\mathcal{S}]$.

Lemma 20.255. *Let X be a set, $\mathcal{S}\subseteq\mathcal{P}(X)$ a semi-ring on X then $\forall A,B\in\mathcal{R}[\mathcal{S}]$ we have that $A\setminus B\in\mathcal{R}[\mathcal{S}]$.*

Proof. Let $A \in \mathcal{R}[\mathcal{S}]$ and define

$$S_A = \left\{ n \in \mathbb{N} | \text{If } \{B_i\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{S} \text{ is pairwise disjoint then } A \setminus \bigsqcup_{i\in\{1,\dots,n\}} B_i \in \mathcal{R}[\mathcal{S}] \right\}$$

then we have:

$1 \in S_A$. Let $\{B_i\}_{i\in\{1\}} \subseteq \mathcal{S}$ be pairwise disjoint then by the previous lemma [lemma: 20.254] we have that $A \setminus \bigsqcup_{i\in\{1\}} B_i = A \setminus B_1 \in \mathcal{R}[\mathcal{S}]$ which proves that $1 \in \mathcal{S}_A$.

$n \in S_A \Rightarrow n+1 \in S_A$. Let $\{B_i\}_{i\in\{1,\dots,n+1\}} \subseteq \mathcal{S}$ be pairwise disjoint. Then

$$\begin{aligned} A \setminus \bigsqcup_{i\in\{1,\dots,n+1\}} B_i &= A \setminus \left(\left(\bigsqcup_{i\in\{1,\dots,n\}} B_i \right) \bigsqcup B_{n+1} \right) \\ &\underset{\text{[theorem: 1.31]}}{=} \left(A \setminus \bigsqcup_{i\in\{1,\dots,n\}} B_i \right) \setminus B_{n+1} \end{aligned}$$

As $n \in S_A$ we have that $A \setminus \bigsqcup_{i\in\{1,\dots,n\}} B_i \in \mathcal{R}[\mathcal{S}]$ so that by [lemma: 20.254] $\left(A \setminus \bigsqcup_{i\in\{1,\dots,n\}} B_i\right) \setminus B_{n+1} \in \mathcal{R}[\mathcal{S}]$. Hence $A \setminus \bigsqcup_{i\in\{1,\dots,n+1\}} B_i \in \mathcal{R}[\mathcal{S}]$ which proves that $n+1 \in \mathcal{S}_A$.

Mathematical induction proves that

$$\mathcal{S}_A = \mathbb{N}$$

Finally if $B \in \mathcal{R}[\mathcal{S}]$ then by definition of $\mathcal{R}[\mathcal{S}]$ there exist a pairwise disjoint $\{B_i\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that $B = \bigsqcup_{i\in\{1,\dots,n\}} B_i$. As $n \in \mathbb{N} = \mathcal{S}_A$ $A \setminus B = A \setminus \bigsqcup_{i\in\{1,\dots,n\}} B_i \in \mathcal{R}[\mathcal{S}]$. □

We are now ready to prove that $\mathcal{R}[\mathcal{S}]$ is a ring

Theorem 20.256. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring on X then $\mathcal{R}[\mathcal{S}]$ is a ring on X such that:*

1. *$\mathcal{S} \subseteq \mathcal{R}[\mathcal{S}]$*
2. *If $\mathcal{T}$ is another ring on X with $\mathcal{S} \subseteq \mathcal{T}$ then $\mathcal{R}[\mathcal{S}]$*

In other words the set of all disjoint finite unions of sets in $\mathcal{S}$ is the smallest ring covering $\mathcal{S}$

Proof. Let Let $A \in \mathcal{S}$ and define $\{A_i\}_{i\in\{1\}} \subseteq \mathcal{S}$ by $A_1 = A$ then $\{A_i\}_{i\in\{1\}}$ is pairwise disjoint and $A = \bigsqcup_{i\in\{1\}} A_i$, hence $A \in \mathcal{R}[\mathcal{S}]$ proving that

$$\mathcal{S} \subseteq \mathcal{R}[\mathcal{S}] \tag{20.283}$$

As $\mathcal{S}$ is a semi-ring we have $\varnothing \in \mathcal{S}$ so by the above we have

$$\varnothing \in \mathcal{R}[\mathcal{S}] \tag{20.284}$$

Let $A, B \in \mathcal{R}[\mathcal{S}]$ then by [lemma: 20.253] and [lemma:20.255] we have that

$$A \bigcup B \in \mathcal{R}[\mathcal{S}] \text{ and } A \setminus B \in \mathcal{R}[\mathcal{S}] \tag{20.285}$$

So by [eqs: 20.283, 20.284 and 20.285] it follows that

$$\mathcal{R}[\mathcal{S}] \text{ is a ring on } X$$

It remains to prove that $\mathcal{R}[\mathcal{S}]$ is the smallest ring containing $\mathcal{S}$. So let $\mathcal{T}$ be another ring such that $\mathcal{S} \subseteq \mathcal{T}$. If $A \in \mathcal{R}[\mathcal{S}]$ then then there exist a pairwise disjoint finite family $\{A_i\}_{i\in\{1,\dots,k\}} \subseteq \mathcal{S} \subseteq \mathcal{T}$ such that $A = \bigsqcup_{i\in\{1,\dots,k\}} A_i$. As $\mathcal{T}$ is a ring it follows from [theorem: 20.131] that $A = \bigsqcup_{i\in\{1,\dots,k\}} A_i \in \mathcal{T}$ which proves that

$$\mathcal{R}[\mathcal{S}] \subseteq \mathcal{T}$$

□

Next we want to extend a content on a semi-ring $\mathcal{S}$ to a content on the ring $\mathcal{R}[\mathcal{S}]$.

Theorem 20.257. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu: \mathcal{S} \to [0,\infty]$ a content on $\mathcal{S}$ then*

1. *There exist a content $\nu: \mathcal{R}[\mathcal{S}] \to [0,\infty]$ such that $\nu_{|\mathcal{S}} = \mu$ [in other words ν is a extension of μ]*
2. *If $\omega: \mathcal{R}[\mathcal{S}] \to [0,\infty]$ is another content such that $\omega_{|\mathcal{S}} = \mu$ then $\omega = \nu$ [in other words the extension is unique].*
3. *If μ is finite then ν is finite.*

Proof.

1. First we proof existence. Let $A \in \mathcal{R}[\mathcal{S}]$ then there exist a pairwise disjoint finite family $\{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that $A = \sqcup_{i\in\{1,\ldots,n\}} A_i$. As ν will be a content on $\mathcal{R}[\mathcal{S}]$ we must have that $\nu(A) = \sum_{i=1}^n \nu(A_i) \underset{A_i\in\Sigma}{=} \sum_{i=1}^n \mu(A_i)$. So it make sense to define

$$\nu: \mathcal{R}[\mathcal{S}] \to [0,\infty] \text{ by } \nu(A) = \sum_{i=1}^n \mu(A_i)$$

$$\text{where } \{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{S}, n \in \mathbb{N} \text{ is pairwise disjoint and } A = \bigsqcup_{i\in\{1,\ldots,n\}} A_i$$

Of course this only works if $\nu(A)$ is independent of the chosen family $\{A_i\}_{i\in\{1,\ldots,n\}}$. So assume that for $A \in \mathcal{R}[\mathcal{S}]$ we have two pairwise disjoint families $\{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ and $\{B_i\}_{i\in\{1,\ldots,m\}} \subseteq \mathcal{S}$, $m \in \mathbb{N}$ such that

$$A = \bigsqcup_{i\in\{1,\ldots,n\}} A_i = \bigsqcup_{i\in\{1,\ldots,m\}} B_i$$

Then we have

$$\begin{aligned}
\sum_{i=1}^n \mu(A_i) &\underset{A_i\bigcap A = A_i}{=} \sum_{i=1}^n \mu\big(A_i \bigcap A\big) \\
&= \sum_{i=1}^n \mu\left(A_i \bigcap \left(\bigsqcup_{j\in\{1,\ldots,m\}} B_j\right)\right) \\
&\underset{\text{[theorem: 2.130]}}{=} \sum_{i=1}^n \mu\left(\bigsqcup_{j\in\{1,\ldots,m\}} \mu\big(A_i \bigcap B_j\big)\right) \\
&\underset{A_i\bigcap B_j\in\mathcal{S}}{=} \sum_{i=1}^n \left(\sum_{j=1}^m \mu\big(A_i \bigcap B_j\big)\right) \\
&\underset{\text{[theorem: 20.101]}}{=} \sum_{j=1}^m \left(\sum_{i=1}^n \mu\big(A_i \bigcap B_j\big)\right) \\
&\underset{A_i\bigcap B_j\in\mathcal{S}}{=} \sum_{j=1}^m \mu\left(\bigsqcup_{i\in\{1,\ldots,n\}} \big(A_i \bigcap B_j\big)\right) \\
&\underset{\text{[theorem: 2.130]}}{=} \sum_{j=1}^m \mu\left(\left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right) \bigcap B_j\right) \\
&= \sum_{j=1}^m \mu\big(A \bigcap B_j\big) \\
&= \sum_{j=1}^m \mu(B_j)
\end{aligned}$$

proving that $\nu: \mathcal{R}[\mathcal{S}] \to [0,\infty]$ is well defined. Next we prove that ν is a extension of $\mathcal{S}$. Let $A \in \mathcal{S}$ then if we define $\{A_i\}_{i\in\{1\}} \subseteq \mathcal{S}$ by $A_1 = A$ then $\{A_i\}_{i\in\{1\}}$ is clearly disjoint and $\bigsqcup_{i\in\{1\}} A_i = A_1 = A$ so that $\nu(A) = \sum_{i=1}^1 \mu(A_i) = \mu(A_1) = \mu(A)$ proving that

$$\nu_{|\mathcal{S}} = \mu \tag{20.286}$$

Next we use [theorem: 20.244] to prove that ν is a content on $\mathcal{R}[\mathcal{S}]$. As $\varnothing \in \mathcal{S}$ we have by [eq: 20.286] that

$$\nu(\varnothing) \underset{\varnothing\in\mathcal{S}}{=} \mu(\varnothing) = 0 \tag{20.287}$$

Let $A, B \in \mathcal{R}[\mathcal{S}]$ such that $A \bigcap B = \varnothing$ then there exist pairwise disjoint families $\{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ and $\{B_i\}_{i\in\{1,\ldots,m\}} \subseteq \mathcal{S}$, $m \in \mathbb{N}$ such that $A = \bigsqcup_{i\in\{1,\ldots,n\}} A_i$, $B = \bigsqcup_{i\in\{1,\ldots,m\}}$. Define

$$\{C_i\}_{i\in\{1,\ldots,n+m\}} \subseteq \mathcal{S} \text{ by } C_i = \begin{cases} A_i \text{ if } i \in \{1,\ldots,n\} \\ B_{i-n} \text{ if } i \in \{n+1,\ldots,n+m\} \end{cases}$$

Let $i,j\in\{1,\ldots,n+m\}$ with $i\neq j$ then we may assume that $i<j$ [otherwise exchange i and j], for i we have either:

$\boldsymbol{i\in\{1,\ldots,n\}}$. Then for j we have either:

$\boldsymbol{j\in\{1,\ldots,n\}}$. Then $C_i\bigcap C_j=A_i\bigcap A_j\underset{i\neq j}{=}\varnothing$.

$\boldsymbol{j\in\{n+1,\ldots,n+m\}}$. Then $C_i\bigcap C_j=A_{i-n}\bigcap B_{j-n}\subseteq A\bigcap B=\varnothing$.

$\boldsymbol{i\in\{n+1,\ldots,n+m\}}$. Then $j\in\{n+1,\ldots,n+m\}$ $C_i\bigcap C_j=A_{i-n}\bigcap B_{j-n}\underset{i-n\neq j-n}{=}\varnothing$

proving that

$$\{C_i\}_{i\in\{1,\ldots,n+m\}}\subseteq\mathcal{S}\text{ is pairwise disjoint}\tag{20.288}$$

Let $x\in A\bigcup B$ then either $x\in A=\bigcup_{i\in\{1,\ldots,n\}}A_i\Rightarrow\exists i\in\{1,\ldots,n\}$ with $x\in A_i=C_i$ or $x\in B=\bigcup_{i\in\{1,\ldots,m\}}B_i\Rightarrow\exists i\in\{1,\ldots,m\}$ with $x\in B_i=C_{i+n}$, hence $x\in\bigcup_{i\in\{1,\ldots,n+m\}}C_i$, proving that

$$A\bigsqcup B\subseteq\bigcup_{i\in\{1,\ldots,n+m\}}C_i.\tag{20.289}$$

For $i\in\{1,\ldots,n+m\}$ we have either $i\in\{1,\ldots,n\}$ then $C_i=A_i\subseteq A\bigcup B$ or $i\in\{n+1,\ldots,n+m\}$ then $C_i=B_{i-n}\subseteq A\bigcup B$, hence in all cases we have $C_i\subseteq A\bigcup B$. This proves that $\bigcup_{i\in\{1,\ldots,n+m\}}C_i\subseteq A\bigcup B$ which combines with [eq: 20.289] gives

$$A\bigsqcup B=\bigsqcup_{i\in\{1,\ldots,n+m\}}C_i\tag{20.290}$$

Hence we have

$$\begin{aligned}
\nu(A\bigcup B) &= \nu\left(\bigsqcup_{i\in\{1,\ldots,n+m\}}C_i\right)\\
&\underset{\text{def}}{=}\sum_{i=1}^{n+m}\mu(C_i)\\
&\underset{\text{[theorem: 11.23]}}{=}\sum_{i=1}^{n}\mu(C_i)+\sum_{i=n+1}^{n+m}\mu(C_i)\\
&=\sum_{i=1}^{n}\mu(A_i)+\sum_{i=n+1}^{n+m}\mu(B_{i-n})\\
&\underset{\text{[theorem: 11.12]}}{=}\sum_{i=1}^{n}\mu(A_i)+\sum_{i=1}^{m}\mu(B_i)\\
&=\nu(A)+\nu(B)
\end{aligned}$$

proving that

$$\forall A,B\in\mathcal{R}[\mathcal{S}]\text{ with }A\bigcap B=\varnothing\text{ we have }\nu\big(A\bigsqcup B\big)=\nu(A)+\nu(B)\tag{20.291}$$

Using [eqs: 20.287, 20.291] we can apply]theorem: 20.244] to prove that

$$\nu\colon\mathcal{R}[\mathcal{S}]\to[0,\infty]\text{ is a content on }\mathcal{R}[\mathcal{S}]$$

2. Let $\omega\colon\mathcal{R}[\mathcal{S}]\to[0,\infty]$ be another content on $\mathcal{R}[S]$ such that $\omega_{|\mathcal{S}}=\mu$. Let $A\in\mathcal{R}[\mathcal{S}]$ then there exist a pairwise disjoint family $\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ such that $A=\bigsqcup_{i\in\{1,\ldots,n\}}A_i$. Hence

$$\begin{aligned}
\omega(A) &= \omega\left(\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)\\
&\underset{\omega\text{ is a content}}{=}\sum_{i=1}^{n}\omega(A_i)\\
&\underset{\omega_{|\mathcal{S}}=\mu}{=}\sum_{i=1}^{n}\mu(A_i)\\
&\underset{\text{def of }\nu}{=}\nu(A)
\end{aligned}$$

so that

$$\omega = \nu$$

3. If $A \in \mathcal{R}[\mathcal{S}]$ then there exist a finite pairwise disjoint family $\{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that $A = \bigsqcup_{i\in\{1,\ldots,n\}} A_i$. Then $\nu(A) = \sum_{i=1}^{n} \mu(A) < \infty$ [because μ is assumed to be finite]. □

We can now rephrase [theorem: 20.248] to work with semi-rings instead of rings.

Theorem 20.258. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu: X \to [0,\infty]$ a **finite** content. If there exist a compact class $\mathcal{C} \subseteq \mathcal{P}(X)$ such that*

1. *$\forall \{K_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{C}$, $n \in \mathbb{N}$ we have that $\bigcup_{i\in\{1,\ldots,n\}} K_i \in \mathcal{C}$*
2. *$\forall A \in \mathcal{S}$ and $\forall \varepsilon \in \mathbb{R}^+$ we have that $\exists K_\varepsilon \in \mathcal{C}$ and $\exists A_\varepsilon \in \mathcal{S}$ such that*

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A \text{ and } \mu(A) - \mu(A_\varepsilon) < \varepsilon$$

then

$$\mu \text{ is a pre-measure}$$

Proof. Using [theorem: 20.257] there exist a **finite** content $\overline{\mu}: \mathcal{R}[S] \to [0,\infty]$ on the ring $\mathcal{R}[\mathcal{S}]$ such that

$$(\overline{\mu})_{|\mathcal{S}_{[[}} = \mu \tag{20.292}$$

Let $A \in \mathcal{R}[\mathcal{S}]$ then by definition there exist a pairwise disjoint $\{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that $A = \bigsqcup_{i\in\{1,\ldots,n\}} A_i$. Let $\varepsilon \in \mathbb{R}^+$ then by the hypothesis there exists $\{A_{i,\varepsilon}\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{S}$ and $\{K_{i,\varepsilon}\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{C}$ such that

$$\forall i \in \{1,\ldots,n\} \text{ we have } A_{i,\varepsilon} \subseteq K_{i,\varepsilon} \subseteq A_i \text{ and } \mu(A_i) - \mu(A_{i,\varepsilon}) < \frac{\varepsilon}{2^n} \tag{20.293}$$

Define

$$K_\varepsilon = \bigcup_{i\in\{1,\ldots,n\}} K_{i,\varepsilon} \in \mathcal{C} \text{ [hypothesis]} \tag{20.294}$$

and

$$A_\varepsilon = \bigcup_{i\in\{1,\ldots,n\}} A_{i,\varepsilon} \in \mathcal{R}[\mathcal{S}] \text{ [because } \mathcal{S} \subseteq \mathcal{R}[\mathcal{S}] \text{ and } \mathcal{R}[\mathcal{S}] \text{ is a ring hence } \cup\text{-stable]} \tag{20.295}$$

then we have

$$A_\varepsilon = \bigcup_{i\in\{1,\ldots,n\}} A_{i,\varepsilon} \underset{\text{[eq: 20.293]}}{\subseteq} \bigcup_{i\in\{1,\ldots,n\}} K_{i,\varepsilon} = K_\varepsilon$$

and

$$K_\varepsilon = \bigcup_{i\in\{1,\ldots,n\}} K_{i,\varepsilon} \underset{\text{[eq: 20.293]}}{\subseteq} \bigcup_{i\in\{1,\ldots,n\}} A_i = A$$

so that we have

$$A_\varepsilon \in \mathcal{R}[\mathcal{S}],\ K_\varepsilon \in \mathcal{C} \text{ and } A_\varepsilon \subseteq K_\varepsilon \subseteq A \tag{20.296}$$

Next

$$\begin{aligned}
A \setminus A_\varepsilon &= \left(\bigcup_{i\in\{1,\ldots,n\}} A_i\right) \setminus \left(\bigcup_{j\in\{1,\ldots,n\}} A_{j,\varepsilon}\right) \\
&\underset{\text{[theorem: 2.133]}}{=} \bigcup_{i\in\{1,\ldots,n\}} \left(A_i \setminus \left(\bigcup_{j\in\{1,\ldots,n\}} A_{j,\varepsilon}\right)\right) \\
&\underset{\text{[theorem: 2.132]}}{=} \bigcup_{i\in\{1,\ldots,n\}} \left(\bigcap_{j\in\{1,\ldots,n\}} (A_i \setminus A_{j,\varepsilon})\right) \\
&\subseteq \bigcup_{i\in\{1,\ldots,n\}} (A_i \setminus A_{i,\varepsilon})
\end{aligned}$$

Further if $i, j \in \{1,\ldots,n\}$ with $i \neq j$ then $(A_i \setminus A_{i,\varepsilon}) \bigcap (A_j \setminus A_{j,\varepsilon}) \subseteq A_i \bigcap A_j = \varnothing$. To summarize we have that

$$A \setminus A_\varepsilon \subseteq \bigsqcup_{i\in\{1,\ldots,n\}} (A_i \setminus A_{i,\varepsilon}) \text{ and } \{A_i \setminus A_{i,\varepsilon}\}_{i\in\{1,\ldots,n\}} \text{ is pairwise disjoint} \tag{20.297}$$

As $\overline{\mu}$ is a **finite** content on the ring $\mathcal{R}[\mathcal{S}]$ and $\forall i \in \{1,\dots,n\}$ $A_i \setminus A_{i,\varepsilon} \in \mathcal{R}[\mathcal{S}]$ [because $\mathcal{R}[\mathcal{S}]$ is a ring and A, $A_\varepsilon, A_i, A_{i,\varepsilon} \in \mathcal{R}[\mathcal{S}]$] we have

$$\begin{aligned}
\overline{\mu}(A \setminus A_\varepsilon) &\underset{\text{[theorem:20.245(2)]}}{\leqslant} \overline{\mu}\left(\bigsqcup_{i\in\{1,\dots,n\}} (A_i \setminus A_{i,\varepsilon})\right) \\
&= \sum_{i=1}^{n} \overline{\mu}(A_i \setminus A_{i,\varepsilon}) \\
&\underset{\text{[theorem: 20.245(3)]}}{=} \sum_{i=1}^{n} (\overline{\mu}(A_i) - \overline{\mu}(A_{i,\varepsilon})) \\
&\underset{\overline{\mu}\text{ extends }\mu}{=} \sum_{i=1}^{n} (\mu(A_i) - \mu(A_{i,\varepsilon})) \\
&\underset{\text{[eq: 20.293]}}{\leqslant} \sum_{i=1}^{m} \frac{\varepsilon}{2^i} \\
&= \varepsilon \cdot \sum_{i=1}^{n} \left(\frac{1}{2}\right)^i \\
&\underset{\text{[lemma: 14.353]}}{=} \varepsilon \cdot \left(\frac{1}{2}\right) \cdot \frac{1-\left(\frac{1}{2}\right)^n}{1-\frac{1}{2}} \\
&= \varepsilon \cdot \left(1 - \left(\frac{1}{2}\right)^n\right) \\
&< \varepsilon
\end{aligned}$$

Hence

$$\overline{\mu}(A \setminus A_\varepsilon) < \varepsilon \tag{20.298}$$

Using [eq: 20.296] and [eq: 20.298] allows us to apply [theorem: 20.248] proving that

$$\overline{\mu} \text{ is a pre-measure on } \mathcal{R}[\mathcal{S}]$$

As μ is a content

$$\mu(\varnothing) = 0 \tag{20.299}$$

Let $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{S}$ be pairwise disjoint such that $\bigsqcup_{i\in\mathbb{N}} A_i \in \mathcal{S}$ then we have

$$\begin{aligned}
\mu\left(\bigsqcup_{i\in\mathbb{N}} A_i\right) &\underset{\text{[eq: 20.292]}}{=} \overline{\mu}\left(\bigsqcup_{i\in\mathbb{N}} A_i\right) \\
&\underset{\overline{\mu}\text{ is a pre-measure}}{=} \sum_{i=1}^{\infty} \overline{\mu}(A_i) \\
&\underset{\text{[eq: 20.292]}}{=} \sum_{i=1}^{\infty} \mu(A_i)
\end{aligned}$$

which together with [eq: 20.301] proves that μ is a pre-measure. □

If we deal with topological spaces then we have a even simpler test to see if the extension of a content on a semi-ring $\mathcal{S}$ to the ring $\mathcal{R}[\mathcal{S}]$.

Theorem 20.259. *Let $\langle X, \mathcal{T}\rangle$ be a topological space, $\mathcal{S}$ a semi-ring on X and $\mu: X \to [0,\infty]$ a **finite** content. If $\forall A \in \mathcal{S}$ and $\forall \varepsilon \in \mathbb{R}^+$ there exists a compact K_ε and a $A_\varepsilon \in \mathcal{S}$ such that*

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A \text{ and } \mu(A) - \mu(A_\varepsilon) < \varepsilon$$

then

$$\mu: \mathcal{R}[\mathcal{S}] \to [0,\infty] \text{ is a pre-measure}$$

Proof. First using [theorem: 14.244] it follows that

$$\mathcal{C} = \{A \in \mathcal{P}(X) | A \text{ is compact}\} \text{ is a compact class} \tag{20.300}$$

Further:

1. $\forall \{K_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{C}$, $n \in \mathbb{N}$ we have by [theorem: 14.229] that $\bigcup_{i \in \{1,\ldots,n\}} K_i$ is compact hence $\bigcup_{i \in \{1,\ldots,n\}} K_i \in \mathcal{C}$.
2. $\forall A \in \mathcal{S}$ and $\forall \varepsilon \in \mathbb{R}^+$ we have by the hypothesis that $\exists K_\varepsilon \in \mathcal{C}$ and $\exists A_\varepsilon \in \mathcal{S}$ such that

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A \text{ and } \mu(A) - \mu(A_\varepsilon) < \varepsilon$$

So using the previous theorem [theorem: 20.258] we have that μ is a pre-measure. □

20.4.4.3 Using the Carathéodory theorem on $\mathbb{R}$

We use now the theory developped in the previous sections to construct a σ-algebra and a measure on $\mathbb{R}$. The procedure that we will follow is the following:

1. Prove that $\mathcal{I}_{[[} = \{[a,b[| a,b \in \mathbb{R} \wedge [a,b] \neq \varnothing\} \bigcup \{\varnothing\}$ [see theorem: 20.156] is semi-ring.
2. Prove that $\text{len}: \mathcal{I}_{[[} \bigcup \{\varnothing\} \to [0,\infty]$ defines by $\text{len}(I) = \begin{cases} b-a \text{ if } I = [a,b[\in \mathcal{I}_{[[} \\ 0 \text{ if } I = \varnothing \end{cases}$ [the function that calculates the lenght of a half-open interval] is a finite content on the semi-ring $\mathcal{I}_{[[}$.
3. Use [theorem: 20.258] to extend the function len to a pre-measure on the ring $\mathcal{R}[\mathcal{S}]$
4. Use [theorem: 20.238] a derivate of the Carathéodore Theorem to extend the pre-measure to a measure [the Lebesgue measure] on a σ-algebra [the Lebesgue algebra on $\mathbb{R}$] that contains $\sigma[\mathcal{I}_{[[}] = \mathcal{B}[\mathbb{R}]$ and whose restriction on $\mathcal{B}[\mathbb{R}]$ is also a measure.

Definition 20.260. *The set $\mathcal{S}_{[[} \subseteq \mathcal{P}(\mathbb{R})$ is defined by*

$$\mathcal{S}_{[[} = \{[a,b[| a,b \in \mathbb{R}\}$$

Theorem 20.261. *$S_{[[} = \mathcal{I}_{[[} \bigcup \{\varnothing\}$ and $\{\varnothing\} \bigcap \mathcal{I}_{[[} = \varnothing$ in other words*

$$\mathcal{S}_{[[} = \mathcal{I}_{[[} \bigsqcup \{\varnothing\}$$

where $\mathcal{I}_{[[} \underset{\text{[definition: 20.152]}}{=} \{[a,b[| a,b \in \mathbb{R} \wedge [a,b[\neq \varnothing\}$

Proof. If $I \in \mathcal{S}_{[[}$ then there exists $a,b \in \mathbb{R}$ such that $I = [a,b[$. For a,b we have either

$a < b$. Then $[a,b[\neq \varnothing$ so that $I \in \mathcal{I}_{[[} \subseteq \mathcal{I}_{[[} \bigcup \{\varnothing\}$

$b \leqslant a$. Then $[a,b[= \varnothing$ so that $I \in \{\varnothing\} = \mathcal{I}_{[[} \bigcup \{\varnothing\}$

hence we have that

$$\mathcal{S}_{[[} \subseteq \mathcal{I}_{[[} \bigcup \{\varnothing\} \tag{20.301}$$

If $I \in \mathcal{I}_{[[} \bigcup \{\varnothing\}$ then either we have:

$I \in \mathcal{I}_{[[}$. Then $\exists a,b \in \mathbb{R}$ such that $I = [a,b[$ so that $I \in \mathcal{S}_{[[}$.

$I \in \{\varnothing\}$. Then $I = \varnothing = [0,0[$ so that $I \in \mathcal{S}_{[[}$

which proves that $\mathcal{I}_{[[} \bigcup \{\varnothing\} \subseteq \mathcal{S}$. Combining this with [eq: 20.301] gives

$$S_{[[} = \mathcal{I}_{[[} \bigcup \{\varnothing\}$$

Further if $I \in \mathcal{I}_{[[} \bigcap \{\varnothing\}$ then $I = \varnothing$ and there exists a $a,b \in \mathbb{R}$ such that $I = [a,b[\neq \varnothing$ which is a contradiction. Hence

$$\mathcal{I}_{[[} \bigcap \{\varnothing\} = \varnothing$$

□

Theorem 20.262. $\mathcal{S}_{[[} = \mathcal{I}_{[[} \bigsqcup \{\varnothing\}$ where $\mathcal{I}_{[[} = \{[a,b[| a,b \in \mathbb{R}$ *such that* $[a,b[\neq \varnothing\}$ *is a semi-ring.*

Proof.

1. $\varnothing \in \mathcal{I}_{[[} \bigcup \{\varnothing\} = \mathcal{S}_{[[}$
2. If $[a, b[$, $[c, d[\in \mathcal{S}_{[[}$ then we have either:

   $\boldsymbol{[a, b[= \varnothing \wedge [c, d[= \varnothing}$. Then $[a, b[\bigcap [c, d[= \varnothing \bigcap \varnothing = \varnothing \in \mathcal{S}_{[[}$.

   $\boldsymbol{[a, b[\in \mathcal{I}_{[[} \wedge [c, d[= \varnothing}$. Then $[a, b[\bigcap [c, d[= [a, b[\bigcap \varnothing = \varnothing \in \mathcal{S}_{[[}$.

   $\boldsymbol{[a, b[= \varnothing \wedge [c, d[\in \mathcal{I}_{[[}}$. Then $[a, b[\bigcap [c, d[= \varnothing \bigcap [c, d[= \varnothing \in \mathcal{S}_{[[}$.

   $\boldsymbol{[a, b[\in \mathcal{I}_{[[} \wedge [c, d[\in \mathcal{I}_{[[}}$. Then for $[a, b[\bigcap [c, d[$ we have either

   $\boldsymbol{[a, b[\bigcap [c, d[= \varnothing}$. Then $[a, b[\bigcap [c, d[= \varnothing \in \mathcal{S}_{[[}$

   $\boldsymbol{[a, b[\bigcap [c, d[\neq \varnothing}$. Then for a we have either:

   $\boldsymbol{a \leqslant c}$. For b we have either:

   $\boldsymbol{b \leqslant d}$. Let $y \in [c, b[$ then $a \leqslant c \leqslant y < b \leqslant d$ so that $y \in [a, b[\wedge y \in [c, d[$ hence $y \in [a, b[\bigcap [c, d[$, proving that

   $$[c, b[\subseteq [a, b[\bigcap [c, d[$$

   Let $y \in [a, b[\bigcap [c, d[$ then $y \in [a, b[\wedge y \in [c, d[$ so that

   $$a \leqslant y < b \wedge c \leqslant y < d \Rightarrow c \leqslant y < b$$

   proving that $y \in [c, b[$ so that $[a, b[\bigcap [c, d[\subseteq [c, b[$. Hence

   $$\varnothing \neq [a, b[\bigcap [c, d[= [c, b[\in \mathcal{I}_{[[} \subseteq \mathcal{S}_{[[}$$

   $\boldsymbol{d < b}$. Let $y \in [c, d[$ then $a \leqslant c \leqslant y < d < b$ so that $y \in [a, b[$ hence $[c, d[\subset [a, b[$ so that

   $$\varnothing \neq [c, d[= [a, b[\bigcap [c, d[$$

   $\boldsymbol{c < a}$. For b we have either:

   $\boldsymbol{b \leqslant d}$. Let $y \in [a, b[$ then $c < a \leqslant y < b \leqslant d$ so that $y \in [c, d[$ hence $[a, b[\subseteq [c, d[$ so that

   $$\varnothing \neq [a, b[\subseteq [a, b[\bigcap [c, d[$$

   $\boldsymbol{d < b}$. Let $y \in [a, d[$ then $c < a \leqslant y < d < b$ so that $y \in [a, b[\wedge [c, d[$ hence $y \in [a, b[\bigcap [c, d[$, proving that

   $$\varnothing \neq [a, d[\subseteq [a, b[\bigcap [c, d[$$

   Let $y \in [a, b[\bigcap [c, d[$ then $y \in [a, b[\wedge y \in [c, d[$ so that

   $$a \leqslant y < b \wedge c \leqslant y < d \Rightarrow a \leqslant y < d$$

   proving that $y \in [a, d[$ or $[a, b[\bigcap [c, d[\subseteq [a, d[$. Hence

   $$\varnothing \neq [a, b[\bigcap [c, d[= [a, d[\in \mathcal{I}_{[[} \subseteq \mathcal{S}_{[[}$$

   so in all cases we have that

   $$[a, b[\bigcap [c, d[\in \mathcal{S}_{[[}$$

3. Let $[a, b[, [c, d[\in \mathcal{S}_{[[}$ then we have either:

   $\boldsymbol{[a, b[= \varnothing \wedge [c, d[= \varnothing}$. Then $[a, b[\setminus [c, d[= \varnothing \setminus \varnothing = \varnothing = \bigsqcup_{i \in \{1\}} A_i$ where $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}_{[[}$ is defined by $A_i = \varnothing$.

   $\boldsymbol{[a, b[\in \mathcal{I}_{[[} \wedge [c, d[= \varnothing}$. Then $[a, b[\setminus [c, d[= [a, b[\setminus \varnothing = [a, b[= \bigsqcup_{i \in \{1\}} A_i$ where $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}_{[[}$ is defined by $A_i = [a, b[$.

   $\boldsymbol{[a, b[= \varnothing \wedge [c, d[\in \mathcal{I}_{[[}}$. Then $[a, b[\setminus [c, d[= \varnothing \setminus [c, d[= \varnothing = \bigsqcup_{i \in \{1\}} A_i$ where $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}_{[[}$ is defined by $A_i = \varnothing$.

$\boldsymbol{[a,b[\in\mathcal{I}_{[[}\wedge[c,d[\in\mathcal{I}_{[[}}$. Then for $[a,b[\bigcap[c,d[$ we have either:

$\boldsymbol{[a,b[\bigcap[c,d[=\varnothing}$. Then $[a,b[\setminus[c,d[=[a,b[=\bigsqcup_{i\in\{1\}}A_i$ where $\{A_i\}_{i\in\{1\}}\subseteq\mathcal{S}_{[[}$ is defined by $A_i=[a,b[$.

$\boldsymbol{[a,b[\bigcap[c,d[\neq\varnothing}$. As $[a,b[\neq\varnothing\neq[c,d[$ we have

$$a<b\wedge c<d \tag{20.302}$$

further there exist a x such that

$$a\leqslant x<b\wedge c\leqslant x<d\Rightarrow a<d\wedge c<b \tag{20.303}$$

$\boldsymbol{a\leqslant c}$. Then for b we have either:

$\boldsymbol{b\leqslant d}$. Let $y\in[a,c[$ then $a\leqslant y<c\underset{\text{[eq: 20.303]}}{<}b$ so that $y\in[a,b[$. Assume that $y\in[c,d[$ then $c\leqslant y$ contradicting $y<c$ hence $y\notin[c,d[$ so that $y\in[a,b[\setminus[c,d[$. Hence

$$[a,c[\subseteq[a,b[\setminus[c,d[\tag{20.304}$$

On the other hand if $y\in[a,b[\setminus[c,d[$ we have $a\leqslant y<b\leqslant d$ and $\neg(c\leqslant y<d)\Rightarrow y<c\vee d\leqslant y$. Assume that $d\leqslant y$ then as also $y<b\leqslant d\Rightarrow y<d$ we would have a contradiction so that we must have $y<c$. Hence we have $a\leqslant y<c$ which proves that $[a,b[\setminus[c,d[\subseteq[a,c[$ so that, using [eq: 20.304] we have

$$[a,b[\setminus[c,d[=[a,c[\in\mathcal{S}_{[[}=\mathcal{I}_{[[}\bigcup\{\varnothing\}$$

So if we define $\{A_i\}_{i\in\{1\}}\subseteq\mathcal{S}_{[[}$ by $A_1=[a,c[$ we have

$$[a,b[\setminus[c,d[=\bigsqcup_{i\in\{1\}}A_i$$

$\boldsymbol{d<b}$. Let $y\in[a,c[\bigcap[d,b[$ then $a\leqslant y<c\wedge d\leqslant y<b$, as by [eq: 20.302] $c<d$ we reach the contradictib $y<y$ so that

$$[a,c[\bigcap[d,b[=\varnothing \tag{20.305}$$

Let $y\in[a,c[\bigcup[d,b[$ then we have either:

$\boldsymbol{y\in[a,c[}$. Then $a\leqslant y<c\underset{\text{[eq: 20.303]}}{<}b$ so that $y\in[a,b]$. Assume that $y\in[c,d[$ then $c\leqslant y<d$ contradicting $y<c$ hence we have $y\notin[c,d[$ so

$$y\in[a,b[\setminus[c,d]$$

$\boldsymbol{y\in[d,b[}$. Then $a\underset{\text{[eq: 20.303]}}{<}d\leqslant y<b$ so that $y\in[a,b[$. Assume that $y\in[c,d[$ then $c\leqslant y<d$ contradicting $d\leqslant y$ hence we must have $y\notin[c,d[$ or

$$y\in[a,b[\setminus[c,d[$$

as in all cases we have $y\in[a,b[\setminus[c,d[$ it follows that

$$[a,c[\bigcup[d,b[\subseteq[a,b[\setminus[c,d[\tag{20.306}$$

On the other hand if $y\in[a,b[\setminus[c,d[$ then

$$\begin{aligned}a\leqslant y<b\wedge\neg(c\leqslant y\wedge y<d)&=\\ a\leqslant y<b\wedge(y<c\vee d\leqslant y)&=\\ (a\leqslant y<b\wedge y<c)\vee(a\leqslant y<b\wedge d\leqslant y)&\end{aligned}$$

so that $y\in[a,c[\vee y\in[d,b[\Rightarrow y\in[a,c[\bigcup[d,b[$ which proves that $[a,b[\setminus[c,d[\subseteq[a,c[\bigcup[d,b[$. Combining this with [eq: 20.306]

$$[a,b[\setminus[c,d[=[a,c[\bigcup[d,b[$$

Hence if we define $\{A_i\}_{i\in\{1,2\}} \subseteq \mathcal{I}_{[[} \bigcup \{\varnothing\}$ by $A_1 = [a,c[$, $A_2 = [d,b[$ then $\{A_i\}_{i\in\{1,2\}}$ is pairwise disjoint and

$$[a,b[\setminus[c,d[= \bigsqcup_{i\in\{1,2\}} A_i$$

c < a. Then for b we have either:

b ⩽ d. If $y \in [a,b[$ then $c < a \leqslant y < b \leqslant d$ so that $y \in [c,d[$, hence $[a,b[\subseteq [c,d[$ so that $[a,b[\setminus[c,d[= \varnothing$. Hence if we define $\{A_i\}_{i\in\{1\}} \subseteq \mathcal{S}_{[[}$ by $A_1 = \varnothing$ it follows that

$$[a,b[\setminus[c,d[= \bigsqcup_{i\in\{1\}} A_i$$

d < b. Let $y \in [d,b[$ then $a \underset{\text{[eq: 20.303]}}{<} d \leqslant y < b$ so that $y \in [a,b[$. Assume that $y \in [c,d[$ then $c \leqslant y < d$ contradicting $d \leqslant y$. Hence $y \in [a,b[\setminus[c,d[$ proving that

$$[d,b[\subseteq [a,b[\setminus[c,d] \tag{20.307}$$

If $y \in [a,b[\setminus[c,d]$ then

$$\begin{aligned}
a \leqslant y < b \wedge \neg(c \leqslant y < d) &= \\
a \leqslant y < b \wedge (y < c \vee d \leqslant y) &= \\
(a \leqslant y < b \wedge y < c) \vee (a \leqslant y < b \wedge d \leqslant y) &\underset{c<a}{=} \\
(c < a \leqslant y < b \wedge y < c) \vee (c < a \leqslant y < b \wedge d \leqslant y) &\underset{c \not< c}{=} \\
c < a \leqslant y < b \wedge d \leqslant y &
\end{aligned}$$

so that $y \in [d,b[$. Hence $[a,b[\setminus[c,d[\subseteq [d,b[$ which combined with [eq: 20.307] gives

$$[a,b[\setminus[c,d[= [d,b[$$

Define $\{A_i\}_{i\in\{1\}} \subseteq \mathcal{S}_{[[}$ by $A_1 = [d,b[$ then

$$[a,b[\setminus[c,d[= \bigsqcup_{i\in\{1\}} A_i$$

So in all cases we found a pairwise disjoint family $\{A_i\}_{i\in\{1,\ldots,m\}} \subseteq \mathcal{S}_{[[}$ such that

$$[a,b[\setminus[c,d[= \bigsqcup_{i\in\{1,\ldots,m\}} A_i$$

□

Theorem 20.263. *For $\mathcal{S}_{[[} = \mathcal{I}_{[[} \bigsqcup \{\varnothing\}$ where $\mathcal{I}_{[[} = \{[a,b[| a,b \in \mathbb{R}$ such that $[a,b[\neq \varnothing\}$ then*

$$\sigma[\mathcal{S}_{[[}] = \sigma[\mathcal{I}_{[[}]$$

so that using [theorem: 20.156]

$$\begin{aligned}
\sigma[\{C \subseteq \mathbb{R} | C \text{ is closed in } \mathcal{T}_{||}\}] &\underset{\text{[theorem: 20.150]}}{=} \mathcal{B}[\mathbb{R}] \\
&= \sigma[\mathcal{T}_{||}] \\
&= \sigma[\mathcal{I}_{][}] \\
&= \sigma[\mathcal{I}_{]]}] \\
&= \sigma[\mathcal{I}_{[]}] \\
&= \sigma[\mathcal{I}_{[[}] \\
&= \sigma[\mathcal{S}_{[[}] \\
&= \sigma[\{[a,\infty[| a \in \mathbb{R}\}] \\
&= \sigma[\{]a,\infty[| a \in \mathbb{R}\}] \\
&= \sigma[\{]-\infty,a] | a \in \mathbb{R}\}] \\
&= \sigma[\{]-\infty,a[| a \in \mathbb{R}\}]
\end{aligned}$$

Proof. As $\mathcal{I}_{[[} \subseteq \mathcal{S}_{[[} \subseteq \sigma[\mathcal{S}_{[[}]$ it follows from [theorem: 20.146] and the fact that $\sigma[\mathcal{S}_{[[}]$ is a σ-algebra that

$$\sigma[\mathcal{I}_{[[}] \subseteq \sigma[\mathcal{S}_{[[}] \tag{20.308}$$

Let $A \in \mathcal{S}_{[[}$ then either $A \in \mathcal{I}_{[[} \subseteq \sigma[\mathcal{I}_{[[}]$ or $A = \varnothing \in \sigma[\mathcal{I}_{[[}]$ which proves that $\mathcal{S}_{[[} \subseteq \sigma[\mathcal{I}_{[[}]$. Hence using [theorem: 20.146] and the fact that $\sigma[\mathcal{I}_{[[}]$ is a σ-algebra it follows that $\sigma[\mathcal{S}_{[[}] \subseteq \sigma[\mathcal{I}_{[[}]$. Combining this with [eq: 20.308] proves that

$$\sigma[\mathcal{S}_{[[}] = \sigma[\mathcal{I}_{[[}]$$

□

Definition 20.264. *We define*

$$\text{begin}: \mathcal{I}_{[[} \to \mathbb{R} \text{ by } \text{begin}(I) = a \text{ where } I = [a, b[$$

$$\text{end}: \mathcal{I}_{[[} \to \mathbb{R} \text{ by } \text{end}(I) = b \text{ where } I = [a, b[$$

***Note* 20.265.** *If $\varnothing \neq I = [a, b[= [c, d[$ then by [theorem: 3.144(7)] we have $a = c \wedge b = d$ so these functions are well defined.*

***Note* 20.266.** *As $I \neq \varnothing$ we have always that* $\text{begin}(I) < \text{end}(I)$

We define

$$\text{begin}: \mathcal{I}_{[[} \to \mathbb{R} \text{ by } \text{begin}(I) = a \text{ where } I = [a, b[$$

$$\text{end}: \mathcal{I}_{[[} \to \mathbb{R} \text{ by } \text{end}(I) = b \text{ where } I = [a, b[$$

Note 20.267. If $\varnothing \neq I = [a, b[= [c, d[$ then by [theorem: 3.144(7)] we have $a = c \wedge b = d$ these functions are well defined.

Note 20.268. As $I \neq \varnothing$ we have that $\text{begin}(I) < \text{end}(I)$

Using the above two functions we can now define the length function.

Definition 20.269. *We define*

$$\text{len}: \mathcal{S}_{[[} \to [0, \infty] \text{ by } \text{len}(I) = \begin{cases} 0 \text{ if } I = \varnothing \\ \text{end}(I) - \text{begin}(I) \text{ if } I \in \mathcal{I}_{[[} \end{cases}$$

In other words the function len *calculates the length of a interval.*

To simplify the proof that len is a content we need to order the half open intervals based on their boundary points. We define now a total order on $\mathcal{I}_{[[}$ the set of half-open intervals.

Theorem 20.270. *The relation $\preccurlyeq \subseteq \mathcal{I}_{[[} \times \mathcal{I}_{[[}$ defined by*

$$[a, b[\preccurlyeq [c, d[\text{ if } a < c \vee (a = c \wedge b \leqslant d)$$

is a total order on $\mathcal{I}_{[[}$ making $\langle \mathcal{I}_{[[}, \preccurlyeq \rangle$ a totally ordered set.

Proof. We have

reflexivity. Let $[a, b[\in \mathcal{I}_{[[}$ then as $a = a$ and $b = b \Rightarrow b \leqslant b$ it follows that $[a, b[\preccurlyeq [a, b[$ proving reflectivity.

anti-symmetry. Let $[a, b[, [c, d[\in \mathcal{I}_{[[}$ be such that $[a, b[\preccurlyeq [c, d[$ and $[c, d[\preccurlyeq [a, b[$. As $[a, b[\preccurlyeq [c, d[$ we have either:

***a* < *c*.** Then as $[c, d[\preccurlyeq [a, b[$ we have either $c = a$ or $c < a$ which both give a contradiction, so this cases never occurs.

$a=c$. Then from $[a,b[\preccurlyeq[c,d[$ it follows that $b\leqslant d$ and from $[c,d[\preccurlyeq[a,b[$ it follows that $d\leqslant b$. Hence we have $a=c\wedge b=d$ so that $[a,b[=[c,d[$

transitivity. Assume that $[a,b[\preccurlyeq[c,d[$ and $[c,d[\preccurlyeq[e,f[$. As $[a,b[\preccurlyeq[c,d[$ we have either:

$a<c$. Then as $[c,d[\preccurlyeq[e,f[$ we have either:

$c<e$. Then $a<e$ so that $[a,b[\preccurlyeq[e,f[$

$c=e$. Then $a<e$ so that $[a,b[\preccurlyeq[e,f[$

$a=c$. Then as $[a,b[\preccurlyeq[c,d[$ we must have that

$$b\leqslant d$$

As $[c,d[\preccurlyeq[e,f[$ we have either:

$c<e$. Then $a<e$ so that $[a,b[\preccurlyeq[e,f[$.

$c=e$. Then as $[c,d[\preccurlyeq[e,f[$ we have that $d\leqslant f$ which combined with $a=c=e$ proves that $[a,b[\preccurlyeq[e,f[$.

So in all cases we have $[a,b[\preccurlyeq[e,f[$ proving transitivity.

totally. If $[a,b[,[c,d[$ then, as $a,b,c,d\in\mathbb{R}$ and $\langle\mathbb{R},\leqslant\rangle$ is totally ordered, we have for a,c either:

$a<c$. Then $[a,b[\preccurlyeq[c,d[$

$a=c$. Then as $\langle\mathbb{R},\leqslant\rangle$ is totally ordered we have for b,d either:

$b<d$. Then $[a,b[\preccurlyeq[c,d]$

$d\leqslant b$. Then $[c,d[\preccurlyeq[a,b[$

$c<a$. Then $[c,d[\preccurlyeq[a,b[$ □

So we can sort half open intervals which will be used in the next lemma.

Theorem 20.271. *Let $n\in\mathbb{N}$, $\{[a_i,b_i[\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{I}_{[[}$ pairwise disjoint such that*

$$\bigcup_{i\in\{1,\dots,n\}}[a_i,b_i[\in\mathcal{I}_{[[}$$

then there exist a bijection $\sigma:\{1,\dots,n\}\to\{1,\dots,n\}$ such that

$$\forall i\in\{1,\dots,n-1\}\text{ we have }b_{\sigma(i)}=a_{\sigma(i+1)}$$

and

$$\bigcup_{i\in\{1,\dots,n\}}[a_i,b_i[=[a_{\sigma(1)},b_{\sigma(n)}]$$

Proof. For $n\in\mathbb{N}$ we have either:

$n=1$. Take $\sigma=\mathrm{Id}_{\{1\}}:\{1\}\to\{1\}$ then σ is a bijection, further as $\{1,\dots,n-1\}=\varnothing$ we have vacuously that $\forall i\in\{1,\dots,n-1\}\ b_{\sigma(i)}=a_{\sigma(i+1)}$, finally $\bigcup_{i\in\{1\}}[a_i,b_i[=[a_1,b_1[=[a_{\sigma(1)},b_{\sigma(1)}[$.

$n\in\{2,\dots,\infty\}$. As $\langle\mathcal{I}_{[[},\preccurlyeq\rangle$ is totally ordered there exist by [corollary: 6.55] a bijection $\sigma:\{1,\dots,n\}\to\{1,\dots,n\}$ such that

$$\forall i,j\in\{1,\dots,n\}\text{ with }i\leqslant j\text{ we have }[a_{\sigma(i)},b_{\sigma(i)}[\preccurlyeq[a_{\sigma(j)},\beta_{\sigma(j)}[\tag{20.309}$$

Let $i,j\in\{1,...,n\}$ with $i\leqslant j$ then as $[a_{\sigma(i)},b_{\sigma(i)}[\preccurlyeq[a_{\sigma(j)},\beta_{\sigma(j)}[$ we have either $a_{\sigma(i)}<a_{\sigma(j)}\Rightarrow a_{\sigma(i)}\leqslant a_{\sigma(j)}$ or $a_{\sigma(i)}=a_{\sigma(i+1)}\Rightarrow a_{\sigma(i)}\leqslant a_{\sigma(j)}$ so that

$$\forall i,j\in\{1,\dots,n\}\text{ with }i\leqslant j\text{ we have }a_{\sigma(i)}\leqslant a_{\sigma(j)} \tag{20.310}$$

Futher by [theorem: 20.112] we have that

$$\{[a_{\sigma(i)},b_{\sigma(i)}[\}_{i\in\{1,\dots,n\}}\text{ is pairwise disjoint} \tag{20.311}$$

Assume that there exist a $k \in \{1, \ldots, n-1\}$ such that $a_{\sigma(k+1)} < b_{\sigma(k)}$. Then by [eq: 20.310] $a_{\sigma(k)} \leqslant a_{\sigma(k+1)} < b_{\sigma(k)}$ from which it follows that $a_{\sigma(k+1)} \in [a_{\sigma(k)}, b_{\sigma(k)}[\bigcap [a_{\sigma(k+1)}, b_{\sigma(k+1)}[$ contradicting $[a_{\sigma(k)}, b_{\sigma(k)}[\bigcap [a_{\sigma(k+1)}, b_{\sigma(k+1)}[\underset{\text{[eq: 20.311]}}{=} \varnothing$. Hence the assumtion is wrong and we conclude that

$$\forall i \in \{1, \ldots, n-1\} \text{ we have } b_{\sigma(i)} \leqslant a_{\sigma(i+1)} \tag{20.312}$$

As $\bigcup_{i \in \{1, \ldots, n\}} [a_i, b_i[\in \mathcal{I}_{[[}$ there exist a $c, d \in \mathbb{R}$ with $c < d$ such that

$$\bigcup_{i \in \{1, \ldots, n\}} [a_{\sigma(i)}, b_{\sigma(i)}[\underset{\text{[theorem: 2.119]}}{=} \bigcup_{i \in \{1, \ldots, n\}} [a_i, b_i[= [c, d[\tag{20.313}$$

If $i = \{1, \ldots, n-1\}$ then by [eq: 20.312] we have $b_{\sigma(i)} \leqslant a_{\sigma(i+1)}$ and as $i \leqslant n-1 < n \Rightarrow i+1 \leqslant n$ it follows from [eq: 20.310] that $a_{\sigma(i+1)} \leqslant a_{\sigma(n)} < b_{\sigma(n)}$ so that $b_{\sigma(i)} < b_{\sigma(n)}$, hence

$$\forall i \in \{1, \ldots, n\} \text{ we have } b_{\sigma(i)} \leqslant b_{\sigma(n)} \tag{20.314}$$

Let $i \in \{1, \ldots, n\}$ then for $x \in [a_{\sigma(i)}, b_{\sigma(i)}[$ we have $a_{\sigma(1)} \underset{\text{[eq: 20.310]}}{\leqslant} a_{\sigma(i)} < x < b_{\sigma(i)} \underset{\text{[eq: 20.314]}}{\leqslant} b_{\sigma(n)}$ so that $x \in [a_{\sigma(1)}, b_{\sigma(n)}[$ hence $[a_{\sigma(i)}, b_{\sigma(i)}[\subseteq [a_{\sigma(n)}, b_{\sigma(n)}[$. So

$$[c, d[\underset{\text{[eq: 20.313]}}{=} \bigcup_{i \in \{1, \ldots, n\}} [a_{\sigma(i)}, b_{\sigma(i)}[\subseteq [a_{\sigma(1)} b_{\sigma(n)}[\tag{20.315}$$

As $[c, d[\subseteq [a_{\sigma(1)} b_{\sigma(n)}[$ it follows from [theorem: 3.144(9)] that

$$a_{\sigma(1)} \leqslant c \wedge d \leqslant b_{\sigma(n)} \tag{20.316}$$

As $a_{\sigma(1)} \in [a_{\sigma(1)}, b_{\sigma(1)}[\subseteq \bigcup_{i \in \{1, \ldots, n\}} [a_{\sigma(i)}, b_{\sigma(i)}[\underset{\text{[eq: 20.313]}}{=} [c, d]$ it follows that $c \leqslant a_{\sigma(1)}$ which combined with [eq: 20.316] proves that

$$a_{\sigma(1)} = c \tag{20.317}$$

As $a_{\sigma(n)} \in [a_{\sigma(n)}, b_{\sigma(n)}[\subseteq \bigcup_{i \in \{1, \ldots, n\}} [a_{\sigma(i)}, b_{\sigma(i)}[\underset{\text{[eq: 20.313]}}{=} [c, d[$ we have $c \leqslant a_{\sigma(n)} < d$. Assume that $d < b_{\sigma(n)}$ then $a_{\sigma(n)} < d < b_{\sigma(n)}$, proving that $d \in [a_{\sigma(n)}, b_{\sigma(n)}[\subseteq [c, d[$ leading to the contradiction $d < d$. Hence we must have $b_{\sigma(n)} \leqslant d$ which combined with [eq: 20.316] proves

$$b_{\sigma(n)} = d \tag{20.318}$$

Summarizing [eqs: 20.313, 20.317 and 20.318] we have

$$\bigsqcup_{i \in \{1, \ldots, n\}} [a_i, b_i[= \bigsqcup_{i \in \{1, \ldots, n\}} [a_{\sigma(i)}, b_{\sigma(i)}[= [a_{\sigma(1)}, b_{\sigma(n)}[\tag{20.319}$$

Assume now that there exist a $k \in \{1, \ldots, n-1\}$ such that $b_{\sigma(k)} \neq a_{\sigma(k+1)}$. If $a_{\sigma(k+1)} < b_{\sigma(k)}$ then by [eq: 20.312] $b_{\sigma(k)} \leqslant a_{\sigma(k+1)}$ and we reach the contradiction $a_{\sigma(k+1)} < a_{\sigma(k+1)}$ so we must have that $b_{\sigma(k)} < a_{\sigma(k+1)}$. Hence there exist a $x \in \mathbb{R}$ such that

$$b_{\sigma(k)} < x < a_{\sigma(k+1)} \text{ so that } x \notin [a_{\sigma(k)}, b_{\sigma(k)}[\text{ and } x \notin [a_{\sigma(k+1)}, b_{\sigma(k+1)}[\tag{20.320}$$

If $i \in \{1, \ldots, k-1\}$ then $b_{\sigma(i)} \underset{\text{[eq: 20.312]}}{\leqslant} a_{\sigma(i+1)} \underset{\text{[eq: 20.310]}}{\leqslant} a_{\sigma(k)} < b_{\sigma(k)} < x$ so that $x \notin [a_{\sigma(i)}, b_{\sigma(i)}[$. Further if $i \in \{k+1, \ldots, n\}$ then $x < a_{\sigma(k+1)} \leqslant a_{\sigma(i)}$ so that $x \notin [a_{\sigma(i)}, b_{\sigma(i)}[$. From this we conclude that $\forall i \in \{1, \ldots, n\}$ $x \notin [a_{\sigma(i)}, b_{\sigma(i)}[$ or

$$x \notin \bigcup_{i \in \{1, \ldots, n\}} [a_{\sigma(i)}, b_{\sigma(i)}[= [a_{\sigma(1)}, b_{\sigma(n)}[\tag{20.321}$$

As $a_{\sigma(1)} \underset{\text{[eq: 20.310]}}{\leqslant} a_{\sigma(k)} < b_{\sigma(k)} < x$ and $x < a_{\sigma(k+1)} \underset{\text{[eq: 20.310]}}{\leqslant} a_{\sigma(n)} < b_{\sigma(n)}$ so that $x \in [a_{\sigma(1)}, b_{\sigma(n)}[$ which contradicts [eq: 20.321]. Hence the assumption is false and we must have

$$\forall i \in \{1, \ldots, n-1\} \text{ that } b_{\sigma(i)} = a_{\sigma(i)}$$

□

We are now ready to prove that len is a content on the semi-ring $\mathcal{S}_{[[}$.

Lemma 20.272. *The length function* $\text{len}: \mathcal{S}_{[[} \to [0, \infty]$ *defined by* $\text{len}(I) = \begin{cases} 0 \text{ if } I = \varnothing \\ \text{end}(I) - \text{begin}(I) \text{ if } I \in \mathcal{I}_{[[} \end{cases}$ *[see definition: 20.269] is a finite content on the semi-ring* $\mathcal{S}_{[[}$.

Proof. First by definition we have

$$\text{len}(\varnothing) = 0 \tag{20.322}$$

Second $\forall I \in \mathcal{S}_{[[}$ we have $\text{len}(I) = \begin{cases} 0 < \infty \text{ if } I = \varnothing \\ \text{end}(I) - \text{begin}(I) < \infty \text{ if } I \in \mathcal{I}_{[[} \end{cases}$ which proves that

$$\text{len is a finite} \tag{20.323}$$

Next we prove that len is additive on $\mathcal{I}_{[[}$. Let $\{I_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{I}_{[[}$, $n \in \mathbb{N}$ pairwise disjoint such that $\bigsqcup_{i \in \{1, \ldots, n\}} I_i \in \mathcal{I}_{[[}$ then we have for $n \in \mathbb{N}$ either:

$n = 1$. Then $\text{len}\left(\bigsqcup_{i \in \{1, \ldots, n\}} I_i\right) = \text{len}\left(\bigsqcup_{i \in \{1\}} I_i\right) = \text{len}(I_1) = \sum_{i=1}^{1} \text{len}(I_i) = \sum_{i=1}^{n} \text{len}(I_i)$

$1 < n$. Then $\forall i \in \{1, \ldots, n\}$ there exists a_i, $b_i \in \mathbb{R}$ with $a_i < b_i$ such that $I_i = [a_i, b_i[$. Using [theorem: 20.271] there exist a bijection $\sigma: \{1, \ldots, n\} \to \{1, \ldots, n\}$ such that

$$\bigsqcup_{i \in \{1, \ldots, n\}} I_i = \bigsqcup_{i \in \{1, \ldots, n\}} [a_i, b_i[= \bigsqcup_{i \in \{1, \ldots, n\}} [a_{\sigma(i)}, b_{\sigma(i)}[= [a_{\sigma(1)}, b_{\sigma(n)}[\tag{20.324}$$

such that

$$\forall i \in \{1, \ldots, n-1\} \; b_{\sigma(i)} = a_{\sigma(i+1)} \tag{20.325}$$

Then

$$\begin{aligned}
\sum_{i=1}^{n} \text{len}(I_i) &\underset{\text{[theorem: 11.31]}}{=} \sum_{i=1}^{n} \text{len}(I_{\sigma(i)}) \\
&= \sum_{i=1}^{n} \text{len}([a_{\sigma(i)}, b_{\sigma(i)}[) \\
&= \sum_{i=1}^{n} (b_{\sigma(i)} - a_{\sigma(i)}) \\
&\underset{1<n}{=} (b_{\sigma(n)} - a_{\sigma(n)}) + \sum_{i=1}^{n-1} (b_{\sigma(i)} - a_{\sigma(i)}) \\
&\underset{\text{[eq: 20.325]}}{=} (b_{\sigma(n)} - a_{\sigma(n)}) + \sum_{i=1}^{n-1} (a_{\sigma(i+1)} - a_{\sigma(i)}) \\
&\underset{\text{[theorem: 11.10]}}{=} b_{\sigma(n)} - a_{\sigma(n)} + a_{\sigma(n)} - a_{\sigma(1)} \\
&= b_{\sigma(n)} - a_{\sigma(1)} \\
&= \text{len}([a_{\sigma(1)}, b_{\sigma(n)}[) \\
&\underset{\text{[eq: 20.324]}}{=} \text{len}\left(\bigsqcup_{i \in \{1, \ldots, n\}} I_i\right)
\end{aligned}$$

To summarize

$$\forall \{I_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{I}_{[[} \text{ pairwise disjoint with } \bigsqcup_{i \in \{1, \ldots, n\}} I_i \in \mathcal{I}_{[[} \;\; \text{len}\left(\bigsqcup_{i \in \{1, \ldots, n\}} I_i\right) = \sum_{i=1}^{n} \text{len}(I_i) \tag{20.326}$$

Next we extend the above to $\mathcal{S}_{[[}$. Let $\{I_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{S}_{[[}$, $n \in \mathbb{N}$ such that $\bigsqcup_{i \in \{1, \ldots, n\}} I_i \in \mathcal{S}_{[[}$. Define $N = \{i \in \{1, \ldots, n\} | I_i \neq \varnothing\}$ then for N we have either:

$N = \varnothing$. Then

$$\text{len}\left(\bigsqcup_{i \in \{1, \ldots, n\}} I_i\right) = \text{len}(\varnothing) = 0 = \sum_{i=1}^{n} 0 = \sum_{i=1}^{n} \text{len}(I_i)$$

$N \neq \varnothing$. Then as $\varnothing \neq N$ is finite there exist a $m \in \{1, \ldots, n\}$ and a bijection $\beta: \{1, \ldots, m\} \to N$. Further we have

$$\begin{aligned}
\operatorname{len}\left(\bigsqcup_{i \in \{1, \ldots, n\}} I_i\right) &\underset{\text{[theorem: 2.134]}}{=} \operatorname{len}\left(\bigsqcup_{i \in N} I_i\right) \\
&\underset{\text{[theorem: 2.119]}}{=} \operatorname{len}\left(\bigsqcup_{i \in \{1, \ldots, m\}} I_{\sigma(i)}\right) \\
&\underset{\text{[eq: 20.326]}}{=} \sum_{i=1}^{m} \operatorname{len}(I_{\sigma(i)}) \\
&= \sum_{i \in \{1, \ldots, m\}} \operatorname{len}(I_{\sigma(i)}) \\
&\underset{\text{[theorem: 11.36]}}{=} \sum_{i \in N} \operatorname{len}(I_i) \\
&= \sum_{i \in N} \operatorname{len}(I_i) + \sum_{i \in \{1, \ldots, n\} \setminus N} 0 \\
&= \sum_{i \in N} \operatorname{len}(I_i) + \sum_{i \in \{1, \ldots, n\} \setminus N} \operatorname{len}(I_i) \\
&= \sum_{i \in \{1, \ldots, n\}} \operatorname{len}(I_i) \\
&= \sum_{i=1}^{n} \operatorname{len}(I_i)
\end{aligned}$$

So in all cases we have that

Let $\{I_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{S}_{[[}$, $n \in \mathbb{N}$ pairwise disjoint with $\bigsqcup_{i \in \{1, \ldots, n\}} I_i \in \mathcal{S}_{[[}$ then

$$\operatorname{len}\left(\bigsqcup_{i \in \{1, \ldots, n\}} I_i\right) = \sum_{i=1}^{n} \operatorname{len}(I_i) \tag{20.327}$$

So using [eqs: 20.322, 20.323 and 20.327] it follows that len is a finite content on the semi-ring $\mathcal{S}_{[[}$. □

Next we prove that len is a pre-measure on $\mathcal{S}_{[[}$.

Lemma 20.273. *The function* $\operatorname{len}: \mathcal{S}_{[[} \to [0, \infty]$ *[see definition: 20.269] is a pre-measure on the semi-ring* $\mathcal{S}_{[[}$

Proof. Consider the topological space $\langle \mathbb{R}, \mathcal{T}_{||} \rangle$. Let $A \in S_{[[}$ and $\varepsilon \in \mathbb{R}^+$ then for A we have either:

$A = \varnothing$. Take then $A_\varepsilon = \varnothing \in \mathcal{S}_{[[}$ and $K_\varepsilon = \varnothing$. Then K_ε is compact by [example: 14.227], $A_\varepsilon \subseteq K_\varepsilon \subseteq A$ and $\operatorname{len}(A) - \operatorname{len}(A_\varepsilon) = 0 - 0 = 0 < \varepsilon$.

$A \neq \varnothing$. Then there exists $a, b \in \mathbb{R}$ with $a < b$ such that $A = [a, b[$. Define then $A_\varepsilon = \left[a, b - \frac{\varepsilon}{2}\right[$ and $K_\varepsilon = \left[a, b - \frac{\varepsilon}{2}\right]$. Then by the Heine Borel theorem]theorem: 14.236] K_ε is compact. Further $A_\varepsilon \subseteq K_\varepsilon \subseteq A$ and $\operatorname{len}(A) - \operatorname{len}(A_\varepsilon) = \operatorname{len}([a, b[) - \operatorname{len}\left(\left[a, b - \frac{\varepsilon}{2}\right[\right) = b - a - \left(b - \frac{\varepsilon}{2} - a\right) = \frac{\varepsilon}{2} < \varepsilon$

Hence using [theorem: 20.259] it follows that

$$\overline{\operatorname{len}} \text{ is a pre-measure on } \mathcal{R}[\mathcal{S}]$$ □

Next we use a derivate of the Carathéodry theorem [theorem: 20.238] to extend len to the Lebesgue measure on Lebesgue measurable sets in $\mathbb{R}$.

Theorem 20.274. *If we define*

$$\lambda^*: \mathcal{P}[\mathbb{R}] \to [0, \infty] \text{ by } \lambda^*(A) = \begin{cases} \infty \text{ if } \mathcal{S}[A] = \varnothing \\ \inf\left(\left\{\sum_{i=1}^{\infty} \mu(A_i) \middle| \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[A]\right\}\right) \end{cases}$$

where

$$\mathcal{S}[A] = \left\{ \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}_{[[} \middle| A \subseteq \bigcup_{i \in \mathbb{N}} A_i \right\}$$

then

$$\lambda^* \text{ is a outer measure}$$

$$\mathcal{L}[\mathbb{R}] = \left\{A \in \mathcal{P}(\mathbb{R}) | \forall B \in \mathcal{P}(\mathbb{R}) \text{ we have } \lambda^*(B) = \lambda^*\left(B \bigcap A\right) + \lambda^*(B \setminus A)\right\}$$

is a σ-algebra on $\mathbb{R}$ such that

$$\sigma[\mathcal{S}_{[[}] \subseteq \mathcal{L}[\mathbb{R}]$$

and

$$\overline{\lambda} = (\lambda^*)_{|\mathcal{L}(\mathbb{R})} : \mathcal{L}[\mathbb{R}] \to [0, \infty] \text{ is a measure on } \mathcal{L}[\mathbb{R}]$$

and

$$\lambda = (\lambda^*)_{|\sigma[\mathcal{S}_{[[}]} : \sigma[\mathcal{S}_{[[}] \to [0, \infty] \text{ is a measure on } \sigma[\mathcal{S}_{[[}]$$

and

$$(\lambda^*)_{|\mathcal{S}_{[[}} = \text{len}$$

Further if $\mu : \sigma[\mathcal{S}_{[[}] \to [0, \infty]$ is another measure such that $\mu_{|S_{[[}} = \text{len}$ then

$$\mu = \lambda$$

We have then

$$\langle \mathbb{R}, \mathcal{L}[\mathbb{R}], \overline{\lambda} \rangle \text{ is a measure space called the Lebesgue measure space}$$

where

$$\mathcal{L}[\mathbb{R}] \text{ is called the set of Lebesgue measurable sets}$$

and

$$\overline{\lambda} \text{ the Lebesgue measure}$$

***Note* 20.275.** *As by [theorem: 20.263] $\mathcal{B}[\mathbb{R}] = \sigma[\mathcal{S}_{[[}]$ we have also that*

$$\mathcal{B}[\mathbb{R}] \subseteq \mathcal{L}[\mathbb{R}]$$

and

$$\lambda : \mathcal{B}[\mathbb{R}] \to [0, \infty] \text{ is a measure on } \mathcal{B}[\mathbb{R}]$$

So

$$\langle \mathbb{R}, \mathcal{B}[\mathbb{R}], \lambda \rangle \text{ is a measure space called the Borel measures space}$$

where

$$\mathcal{B}[\mathbb{R}] \text{ is called the set of Borel sets on } \mathbb{R}$$

and

$$\lambda \text{ is called the Borel measure}$$

Proof. Using [lemma: 20.273] we have that

$$\text{len is a pre-measure on the semi-ring } \mathcal{S}_{[[}$$

Define $\{[-i, i[\}_{i \in \mathbb{N}} \subseteq \mathcal{S}_{[[}$ then we have

$$\forall i \in \mathbb{N} \text{ that } [-i, i[\subseteq [-(i+1), i+1[\text{ and } \text{len}([-i, i[) = 2 \cdot i < \infty$$

If $x \in \mathbb{R}$ then by [theorem: 10.30] there exist $n, m \in \mathbb{N}$ such that $-n < x < m$. Let $i = \max(n, m)$ then $-i \leqslant -n < x < m < i$ so that $x \in [-i, i[$ from which it follows that $\mathbb{R} \subseteq \bigcup_{i \in \mathbb{N}} [-i, i[$. As $\forall i \in \mathbb{N}$ $[-i, i[\subseteq \mathbb{R}$ we have $\bigcup_{i \in \mathbb{N}} [-i, i[\subseteq \mathbb{R}$. Hence we have

$$\mathbb{R} = \bigcup_{i \in \mathbb{N}} [-i, i[$$

The proof follows then from applying [theorem: 20.238]. □

20.4.4.4 Product of semi-rings

If we want to use the Carathéodory theorem to create a measure on $\mathcal{B}[\mathbb{R}^n]$ we have to start with a semi-ring, as $\mathcal{B}[\mathbb{R}^n] = \sigma[\mathcal{R}^n]$ it seems sensible to prove that $\mathcal{R}^n \bigcup \{\varnothing\}$ is a semi-ring on $\mathbb{R}^n$. First note that $R \in \mathcal{R}^n \bigcup \{\varnothing\}$ can be written as $R = \prod_{i \in \{1, \ldots, n\}} I_i$ where $I_i \in \mathcal{T}_{[[}$ which suggest the following definition that extends this note to the more general cases of a product of a finite number of semi-rings.

Definition 20.276. *Let $n \in \{2,...,\infty\}$, $\{\langle X_i, \mathcal{S}_i\rangle\}_{i\in\{1,\ldots,n\}}$ a finite family such that $\forall i \in \{1,...,n\}$ $\mathcal{S}_i \subseteq \mathcal{P}(X_i)$ then $\bigodot_{i\in\{1,\ldots,n\}} \mathcal{S}_i$ is defined by*

$$\bigodot_{i\in\{1,\ldots,n\}} \mathcal{S}_i = \left\{ \prod_{i\in\{1,\ldots,n\}} A_i | \forall i \in \{1,\ldots,n\}\ A_i \in \mathcal{S}_i \right\}$$

***Note* 20.277.** *In the particular cases where $n=2$ we note $\bigodot_{i\in\{1,2\}} S_i$ as $\mathcal{S}_1 \odot \mathcal{S}_2$. In other words*

$$S_1 \odot \mathcal{S}_2 = \{A \cdot B | A \in \mathcal{S}_1 \wedge B \in \mathcal{S}_2\}$$

Next we will prove using mathematical induction that $\bigodot_{i\in\{1,\ldots,n\}} \mathcal{S}_i$ is a semi-ring on $\prod_{i\in\{1,\ldots,\}} X_i$. The next lemma will be used in the base case and the induction step.

Lemma 20.278. *Let X_1, X_2 be two sets and $\mathcal{S}_1 \subseteq \mathcal{P}(X_1)$, $\mathcal{S}_2 \subseteq \mathcal{P}(X_2)$ be semi-rings on X_1 and X_2 respectively then $\mathcal{S}_1 \odot S_2$ is a semi-ring on $X_1 \cdot X_2$.*

Proof. As $\mathcal{S}_1$, $\mathcal{S}_2$ are semi-rings we have that $\varnothing \in S_1 \wedge \varnothing \in S_2$ so that

$$\varnothing = \varnothing \cdot \varnothing \in \mathcal{S}_1 \odot \mathcal{S}_2 \tag{20.328}$$

Let $R, S \in \mathcal{S}_1 \odot \mathcal{S}_2$ then there exists $A, C \in \mathcal{S}_1$ and $B, D \in \mathcal{S}_2$ such that

$$R = A \cdot B \text{ and } S = C \cdot D$$

Then we have

$$\begin{aligned} R \bigcap S &= (A \cdot B) \bigcap (C \cdot D) \\ &\underset{\text{[theorem: 6.84]}}{=} \left(A \bigcap C\right) \cdot \left(B \bigcap D\right) \end{aligned}$$

given that $\mathcal{S}_1, \mathcal{S}_2$ are semi-rings it follows that $A \bigcap C \in \mathcal{S}_1 \wedge B \bigcap D \in \mathcal{S}_2$ so that

$$R \bigcap S \in \mathcal{S}_1 \odot \mathcal{S}_2 \tag{20.329}$$

Using [theorem: 20.109] we have that

$$\begin{aligned} R \setminus S &= (A \cdot B) \setminus (C \cdot D) \\ &= (A \setminus C) \cdot (B \setminus D) \bigcup (A \setminus C) \cdot \left(B \bigcap D\right) \bigcup \left(A \bigcap C\right) \cdot (B \setminus D) \end{aligned}$$

where

1. $((A \setminus C) \cdot (B \setminus D)) \bigcap ((A \setminus C) \cdot (B \bigcap D)) = \varnothing$
2. $((A \setminus C) \cdot (B \setminus D)) \bigcap ((A \bigcap C) \cdot (B \setminus D)) = \varnothing$
3. $((A \setminus C) \cdot (B \bigcap D)) \bigcap ((A \bigcap C) \cdot (B \setminus D)) = \varnothing$

So if we define $\{R_i\}_{i\in\{1,2,3\}}$ by

$$\begin{aligned} R_1 &= (A \setminus C) \cdot (B \setminus D) \\ R_2 &= (A \setminus C) \cdot \left(B \bigcap D\right) \\ R_3 &= \left(A \bigcap C\right) \cdot (B \setminus D) \end{aligned}$$

then we have

$$\{R_i\}_{i\in\{1,2,3\}} \text{ is a pairwise disjoint and } R \setminus S = \bigsqcup_{i\in\{1,2.3\}} R_i \tag{20.330}$$

Now for $i \in \{1, 2, 3\}$ we have either:

***i* = 1.** As $A, C \in \mathcal{S}_1$ a semi ring there exist a pairwise disjoint $\{A_i\}_{i\in\{1,\ldots,m_1\}} \subseteq \mathcal{S}_1$ such that

$$A \setminus C = \bigsqcup_{i\in\{1,\ldots,m_1\}} A_i \tag{20.331}$$

likewise as $B, D \in \mathcal{S}_1$ there exist a pairwise disjoint $\{B_i\}_{i\in\{1,\ldots,m_2\}} \subseteq \mathcal{S}_2$ such that

$$B \setminus D = \bigsqcup_{i\in\{1,\ldots,m_2\}} B_i \tag{20.332}$$

so that we have

$$\begin{aligned} R_1 &= (A\setminus C)\cdot(B\setminus D) \\ &= \left(\bigsqcup_{i\in\{1,\dots,m_1\}} A_i\right)\cdot\left(\bigsqcup_{j\in\{1,\dots,m_2\}} B_j\right) \\ &\underset{\text{[theorem: 6.85]}}{=} \bigcup_{i\in\{1,\dots,m_1\}\times\{1,\dots,m_2\}} (A_i\cdot B_j) \end{aligned}$$

By [theorem: 6.41] $\{1,\dots,m_1\}\times\{1,\dots,m_2\}$ is finite so there exist a bijection

$$\sigma\colon\{1,\dots,N_1\}\to\{1,\dots,m_1\}\times\{1,\dots,m_2\}$$

then we have

$$R_1 = \bigcup_{(i,j)\in\{1,\dots,m_1\}\times\{1,\dots,m_2\}} (A_i\cdot B_j) \underset{\text{[theorem: 2.119]}}{=} \bigcup_{i\in\{1,\dots,N_1\}} (A_{\sigma(i)_1}\cdot B_{\sigma(i)_2})$$

Define

$$\{R_{1,i}\}_{i\in\{1,\dots,N_1\}} \text{ by } R_{1,i} = A_{\sigma(i)_1}\cdot B_{\sigma(i)_2}$$

then we have $\forall i\in\{1,\dots,N_1\}$ that, as $A_{\sigma(i)_1}\in\mathcal{S}_1$, $B_{\sigma(i)_2}\in\mathcal{S}_2$ so that $R_{1,i} = A_{\sigma(i)_1}\cdot B_{\sigma(i)_2}\in S_1\odot\mathcal{S}_2$. Hence we have

$$\{R_{1,i}\}_{i\in\{1,\dots,N_1\}}\subseteq\mathcal{S}_1\odot\mathcal{S}_2 \text{ and } R_1 = \bigcup_{i\in\{1,\dots,N_1\}} R_{1,i}$$

Further if $i,j\in\{1,\dots,N_1\}$ with $i\neq j$ we have, as σ is a bijection, that $\sigma(i)\neq\sigma(j)$, for $\sigma(i)_1$, $\sigma(j)_1$ we have either

$\boldsymbol{\sigma(i)_1 = \sigma(j)_1}$. Then $\sigma(i)_2\neq\sigma(j)_2$ so that

$$\begin{aligned} R_{1,i}\bigcap R_{1,j} &= (A_{\sigma(i)_1}\cdot B_{\sigma(i)_2})\bigcap(A_{\sigma(j)_1}\cdot B_{\sigma(j)_2}) \\ &= \left(A_{\sigma(i)_1}\bigcap A_{\sigma(j)_1}\right)\cdot\left(B_{\sigma(i)_2}\bigcap B_{\sigma(j)_2}\right) \\ &= \left(A_{\sigma(i)_1}\bigcap A_{\sigma(j)_1}\right)\cdot\varnothing \\ &= \varnothing \end{aligned}$$

$\boldsymbol{\sigma(i)_1 \neq \sigma(j)_1}$. Then

$$\begin{aligned} R_{1,i}\bigcap R_{1,j} &= (A_{\sigma(i)_1}\cdot B_{\sigma(i)_2})\bigcap(A_{\sigma(j)_1}\cdot B_{\sigma(j)_2}) \\ &= \left(A_{\sigma(i)_1}\bigcap A_{\sigma(j)_1}\right)\cdot\left(B_{\sigma(i)_2}\bigcap B_{\sigma(j)_2}\right) \\ &= \varnothing\cdot\left(B_{\sigma(i)_2}\bigcap B_{\sigma(j)_2}\right) \\ &= \varnothing \end{aligned}$$

which proves that

$$\{R_{1,i}\}_{i\in\{1,\dots,N_1\}}\subseteq\mathcal{S}_1\odot\mathcal{S}_2 \text{ is pairwise disjoint and } R_1 = \bigsqcup_{i\in\{1,\dots,N_1\}} R_{1,i}$$

$\boldsymbol{i=2}$. Then

$$\begin{aligned} R_2 &= (A\setminus C)\cdot\left(B\bigcap D\right) \\ &\underset{\text{[eq: 20.331]}}{=} \left(\bigsqcup_{i\in\{1,\dots,m_1\}} A_i\right)\cdot\left(B\bigcap D\right) \\ &\underset{\text{[theorem: 6.85]}}{=} \bigcup_{i\in\{1,\dots,m_1\}} \left(A_i\cdot\left(B\bigcap D\right)\right) \\ &= \bigcup_{i\in\{1,\dots,N_2\}} R_{2,i} \end{aligned}$$

where

$$N_2 = m_1 \text{ and } \{R_{2,i}\}_{i\in\{1,\dots,N_2\}} \text{ is defined by } R_{2,i} = A_i\cdot\left(B\bigcap D\right)$$

Let $i\in\{1,\dots,N_2\}$ then, as $A_i\in\mathcal{S}_1$, $B,D\in\mathcal{S}_2\Rightarrow B\bigcap D\in\mathcal{S}_2$, $R_{2,i} = A_i\cdot(B\bigcap D)\in\mathcal{S}_1\odot\mathcal{S}_2$ so that

$$\{R_{2,i}\}_{i\in\{1,\dots,N_2\}}\subseteq S_1\odot S_2$$

Further if $i,j\in\{1,\ldots,N_2\}$ with $i\neq j$ then we have

$$R_{2,i}\bigcap R_{2,j}=\left(A_i\cdot\left(B\bigcap D\right)\right)\bigcap\left(A_j\cdot\left(B\bigcap D\right)\right)=\left(A_i\bigcap A_j\right)\cdot\left(B\bigcap D\right)=\varnothing\cdot\left(B\bigcap D\right)=\varnothing$$

So we have proved that

$$\{R_{2,i}\}_{i\in\{1,\ldots,N_2\}}\subseteq\mathcal{S}_1\odot\mathcal{S}_2 \text{ is pairwise disjoint and } R_2=\bigsqcup_{i\in\{1,\ldots,N_2\}}R_{2,i}$$

$\boldsymbol{i=3}$**.** Then

$$\begin{aligned}R_3 &= \left(A\bigcap C\right)\cdot(B\setminus D)\\ &\underset{\text{[eq: 20.332]}}{=} \left(A\bigcap C\right)\cdot\left(\bigsqcup_{i\in\{1,\ldots,m_2\}}B_i\right)\\ &\underset{\text{[theorem: 6.85]}}{=} \bigcup_{i\in\{1,\ldots,m_2\}}\left(\left(A\bigcap C\right)\cdot B_i\right)\\ &= \bigcup_{i\in\{1,\ldots,N_3\}}D_{3,i}\end{aligned}$$

where

$$N_3=m_2 \text{ and } \{R_{3,i}\}_{i\in\{1,\ldots,N_3\}} \text{ is defined by } R_{3,i}=\left(A\bigcap C\right)\cdot B_i$$

Let $i\in\{1,\ldots,N_3\}$ then, as $B_i\in\mathcal{S}_2$, $A,C\in\mathcal{S}_1\Rightarrow A\bigcap C\in\mathcal{S}_1$, $R_{3,i}=((A\bigcap C)\cdot B_i)\in\mathcal{S}_1\odot\mathcal{S}_2$ so that

$$\{R_{3,i}\}_{i\in\{1,\ldots,N_2\}}\subseteq S_1\odot S_2$$

Further if $i,j\in\{1,\ldots,N_2\}$ with $i\neq j$ then we have

$$R_{3,i}\bigcap R_{3,j}=\left(\left(A\bigcap C\right)\cdot B_i\right)\bigcap\left(\left(A\bigcap C\right)\cdot B_j\right)=\left(A\bigcap C\right)\cdot\left(B_i\bigcap B_j\right)=\left(A\bigcap C\right)\cdot\varnothing=\varnothing$$

So we have proved that

$$\{R_{3,i}\}_{i\in\{1,\ldots,N_3\}}\subseteq\mathcal{S}_1\odot\mathcal{S}_2 \text{ is pairwise disjoint and } R_3=\bigsqcup_{i\in\{1,\ldots,N_3\}}R_{3,i}$$

To summarize the above, we have a pairwise disjoint $\{R_i\}_{i\in\{1,2,3\}}$ such that

$$R\setminus S\underset{\text{[eq: 20.330[}}{=}\bigsqcup_{i\in\{1,2,3\}}R_i$$

and $\forall i\in\{1,2,3\}$ there exist a pairwised disjoint $\{R_{i,j}\}_{j\in\{1,\ldots,N_i\}}\subseteq\mathcal{S}_1\odot S_2$ such

$$R_i=\bigsqcup_{j\in\{1,\ldots,N_i\}}R_{i,j}$$

Further as $\bigcup_{i\in\{1,2,3\}}\{i\}\cdot\{1,\ldots,N_i\}$ is finite by [theorems: 6.41, 6.36] there exist a bijection

$$\sigma:\{1,\ldots,N\}\to\bigcup_{i\in\{1,2,3\}}\{i\}\cdot\{1,\ldots,N_i\}$$

Hence we can apply]corollary: 20.119] to get that

$$\{R_{\sigma(i)_1,\sigma(i)_2}\}_{i\in\{1,\ldots,N\}}\subseteq\mathcal{S}_1\odot\mathcal{S}_2 \text{ is pairwise disjoint and } R\setminus S=\bigsqcup_{i\in\{1,\ldots,N\}}R_{\sigma(i)_1,\sigma(i)_2}\tag{20.333}$$

Finally from [eqs: 20.328, 20.329 and the above eq: 20.333] it follows that

$$\mathcal{S}_1\odot\mathcal{S}_2 \text{ is a semi-ring on } X_1\cdot X_2$$

□

If we want to use the above lemma in the proof by mathematical induction that $\bigodot_{i\in\{1,\ldots,n\}}\mathcal{S}_i$ is a semi-ring we have a small problem: $\prod_{i\in\{1,\ldots,n+1\}}X_i$ is not equal to $\left(\prod_{i\in\{1,\ldots,n\}}X_i\right)\cdot X_{n+1}$. Luckely we can prove that $\left(\prod_{i\in\{1,\ldots,n\}}X_i\right)\cdot X_{n+1}$ is bijective to $\prod_{i\in\{1,\ldots,n+1\}}X_i$. So it makes sense to see how a bijection can be used to generate a semi-ring on the image of the bijection based on a semi-ring on the domain of the bijection.

Theorem 20.279. *Let X, Y be sets, $\beta: X \to Y$ a bijection and $\mathcal{S} \subseteq X$ a semi-ring on X then $\{\beta(A)|A \in \mathcal{S}\}$ is a semi-ring on Y.*

Proof. As $\beta(\varnothing) = \varnothing$ it follows that

$$\varnothing \in \{\beta(A)|A \in \mathcal{S}\} \tag{20.334}$$

Let $R, S \in \{\beta(A)|A \in \mathcal{S}\}$ there exist $A, B \in \mathcal{S}$ such that $R = \beta(A)$, $S = \beta(B)$. Using [theorem: 2.95(4)] and the fact that β is a bijection hence injective we have that

$$R \bigcap S = \beta(A) \bigcap \beta(B) \underset{\text{[theorem: 2.95(4)]}}{=} \beta\left(A \bigcap B\right)$$

As $\mathcal{S}$ is a semi-ring $A \bigcap B \in \mathcal{S}$ so that $\beta(A \bigcap B) \in \{\beta(A)|A \in \mathcal{S}\}$ which combined with the above proves that

$$\forall R, S \in \{\beta(A)|A \in \mathcal{S}\} \text{ we have } R \bigcap S \in \{\beta(A)|A \in \mathcal{S}\} \tag{20.335}$$

Using [theorem: 2.94(5)] and the fact that β is injective it follows that

$$R \setminus S = \beta(A) \setminus \beta(B) \underset{\text{[theorem: 2.94(5)]}}{=} \beta(A \setminus B) \tag{20.336}$$

As $A, B \in \mathcal{S}$ and $\mathcal{S}$ is a semi-ring there exist a pairwise disjoint $\{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that

$$A \setminus B = \bigsqcup_{i \in \{1, \ldots, n\}} A_i \tag{20.337}$$

Let $i, j \in \{1, \ldots, n\}$ with $i \neq j$ then $\beta(A_i) \bigcap \beta(A_j) \underset{\text{[theorem: 2.95(4)]}}{=} \beta(A_i \bigcap A_j) = \beta(\varnothing) = \varnothing$ so that

$$\beta(A_i)_{i \in \{1, \ldots, n\}} \subseteq \{\beta(A)|A \in \mathcal{S}\} \text{ is pairwise disjoint} \tag{20.338}$$

Further

$$\bigsqcup_{i \in \{1, \ldots, n\}} \beta(A_i) \underset{\text{[theorem: 2.136]}}{=} \beta\left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i\right) \underset{\text{[eq: 20.337]}}{=} \beta(A \setminus B) \underset{\text{[eq: 20.336]}}{=} R \setminus S \tag{20.339}$$

Define $\{R_i\}_{i \in \{1, \ldots, n\}} \subseteq \{\beta(A)|A \in \mathcal{S}\}$ by $R_i = \beta(A_i)$ then [eqs: 20.338, 20.339] can be summarized as

$$\forall R, S \in \{\beta(A)|A \in \mathcal{S}\} \ \exists \{R_i\}_{i \in \{1, \ldots, n\}} \subseteq \{\beta(A)|A \in \mathcal{S}\} \text{ such that } R \setminus S = \bigsqcup_{i \in \{1, \ldots, n\}} R_i \tag{20.340}$$

By [eqs: 20.334, 20.335 and 20.340] it follows that

$$\{\beta(A)|A \in \mathcal{S}\} \text{ is a semi-ring on } Y$$

□

Next we construct a bijection between $\left(\prod_{i \in \{1, \ldots, n\}} X_i\right) \cdot X_{n+1}$ and $\prod_{i \in \{1, \ldots, n+1\}} X_i$.

Lemma 20.280. *Let $n \in \mathbb{N}$, $\{\langle X_i, \mathcal{S}_i \rangle\}_{i \in \{1, \ldots, n+1\}}$ a finite family such that $\forall i \in \{1, \ldots, n\}$ $\mathcal{S}_i \subseteq \mathcal{P}(X_i)$ then*

1. $$\beta: \left(\prod_{i \in \{1, \ldots, n\}} X_i\right) \cdot X_{n+1} \to \prod_{i \in \{1, \ldots, n+1\}} X_i \text{ defined by } \beta(x, y)_i = \begin{cases} x_i & \text{if } i \in \{1, \ldots, n\} \\ y & \text{if } i = n+1 \end{cases}$$

   is a bijection

2. $\bigodot_{i \in \{1, \ldots, n+1\}} \mathcal{S}_i = \left\{\beta(B)|B \in \left(\bigodot_{i \in \{1, \ldots, n\}} \mathcal{S}_i\right) \odot S_{n+1}\right\}$

***Note* 20.281.** *Be carefull in the notation used in (2) $\beta(B)$ is the image of the set B in the domain $\left(\prod_{i \in \{1, \ldots, n\}} X_i\right) \cdot X_{n+1}$ of the bijection β. So $\bigodot_{i \in \{1, \ldots, n+1\}} \mathcal{S}_i$ is not equal to $\beta\left(\left(\bigodot_{i \in \{1, \ldots, n\}} \mathcal{S}_i\right) \odot S_{n+1}\right)$ which is by the way not well defined.*

Proof.

1. We have:

   injectivity. Assume that $\beta(x, y) = \beta(u, v)$ then $\forall i \in \{1, \ldots, n\}$ we have

   $$x_i = \beta(x, y)_i = \beta(u, v)_i = u_i$$

so that $x=u$ and $y=\beta(x,y)_{n+1}=\beta(u,v)_{n+1}=v$. So $(x,y)=(u,v)$ which proves injectivity.

surjectivity. Let $u\in\prod_{i\in[1,\ldots,n+1]}X_i$ and define $x\in\prod_{i\in\{1,\ldots,n\}}X_i$ by $x_i=u_i$ and $y\in X_{n+1}$ by $y=u_{n+1}$ then $\forall i\in\{1,\ldots,n+1\}$ we have

$$\beta(x,y)_i=\begin{cases} x_i=u_i \text{ if } i\in\{1,\ldots,n\} \\ u_{n+1} \text{ if } i=n+1 \end{cases}=u_i$$

proving that $\beta(x,y)=u$

2. Let $\{A_i\}_{i\in\{1,\ldots,n+1\}}$ be a family of sets such that $\forall i\in\{1,\ldots,n+1\}$ $A_i\in S_i\subseteq\mathcal{P}(X_i)$. Let $u\in\beta\left(\left(\prod_{i\in\{1,\ldots,n\}}A_i\right)\cdot A_{n+1}\right)$ then $u=\beta(x,y)$ where $x\in\prod_{i\in\{1,\ldots,n\}}A_i\Rightarrow\forall i\in\{1,\ldots,n\}$ $x_i\in A_i$ and $y\in A_{n+1}$. So

$$\forall i\in\{1,\ldots,n+1\}\ \beta(x,y)_i=\begin{cases} x_i\in A_i \text{ if } i\in\{1,\ldots,n\} \\ y\in A_i \text{ if } i=n+1 \end{cases}\in A$$

so that $u\in\prod_{i\in\{1,\ldots,n+1\}}A_i$, Hence

$$\beta\left(\left(\prod_{i\in\{1,\ldots,n\}}A_i\right)\cdot A_{n+1}\right)\subseteq\prod_{i\in\{1,\ldots,n+1\}}A_i \tag{20.341}$$

If $u\in\prod_{i\in\{1,\ldots,n+1\}}A_i$ then $\forall i\in\{1,...,n+1\}$ we have $u_i\in A_i$. Define $x\in\prod_{i\in\{1,\ldots,n\}}X_i$ by $x_i=u_i\in A_i$ and $y=u_{n+1}\in A_{n_1}$ then $(x,y)\in\left(\prod_{i\in\{1,\ldots,n\}}A_i\right)\cdot A_{n+1}$. further

$$\beta(x,y)=\begin{cases} x_i=u_i \text{ if } i\in\{1,\ldots,n\} \\ y=u_{n+1} \text{ if } i=n+1 \end{cases}=u_i$$

proving that $u=\beta(x,y)\in\beta\left(\left(\prod_{i\in\{1,\ldots,n\}}A_i\right)\cdot A_{n+1}\right)$. Hence

$$\prod_{i\in\{1,\ldots,n+1\}}A_i\subseteq\beta\left(\left(\prod_{i\in\{1,\ldots,n\}}A_i\right)\cdot A_{n+1}\right)$$

which combined with [eq: 20.341] proves that

$$\prod_{i\in\{1,\ldots,n+1\}}A_i=\beta\left(\left(\prod_{i\in\{1,\ldots,n\}}A_i\right)\cdot A_{n+1}\right) \tag{20.342}$$

Let now $A\in\bigodot_{i\in\{1,\ldots,n+1\}}S_i$ then $A=\prod_{i\in\{1,\ldots,n+1\}}A$ where $\forall i\in\{1,\ldots,n+1\}$ $A_i\in\mathcal{S}_i$. Then $\prod_{i\in\{1,\ldots,n\}}A_i\in\bigodot_{i\in\{1,\ldots,n\}}\mathcal{S}_i$ and $A_{n+1}\in S_{n+1}$ so that

$$\left(\prod_{i\in\{1,\ldots,n\}}A_i\right)\cdot A_{n+1}\in\left(\bigodot_{i\in\{1,\ldots,n\}}\mathcal{S}_i\right)\odot\mathcal{S}_{n+1}$$

Hence as

$$A=\prod_{i\in\{1,\ldots,n+1\}}A_i\underset{\text{[eq: 20.342]}}{=}\beta\left(\left(\left(\prod_{i\in\{1,\ldots,n\}}A_i\right)\cdot A_{n+1}\right)\right)$$

it follows that $A\in\left\{\beta(B)|B\in\left(\bigodot_{i\in\{1,\ldots,n\}}\mathcal{S}_i\right)\odot S_{n+1}\right\}$ which proves that

$$\bigodot_{i\in\{1,\ldots,n+1\}}S_i\subseteq\left\{\beta(B)|B\in\left(\bigodot_{i\in\{1,\ldots,n\}}\mathcal{S}_i\right)\odot S_{n+1}\right\} \tag{20.343}$$

On the other hand if $B\in\left\{\beta(B)|B\in\left(\bigodot_{i\in\{1,\ldots,n\}}\mathcal{S}_i\right)\odot S_{n+1}\right\}$ then there exists a $A\in\left(\bigodot_{i\in\{1,\ldots,n\}}\mathcal{S}_i\right)\odot S_{n+1}$ such that $B=\beta(A)$. As $A\in\left(\bigodot_{i\in\{1,\ldots,n\}}\mathcal{S}_i\right)\odot S$ there exist a $\{A_i\}_{i\in\{1,\ldots,n\}}$ with $\forall i\in\{1,\ldots,n\}$ $A_i\in\mathcal{S}_i$ and a $A_{n+1}\in\mathcal{S}_{n+1}$ such that

$$B=\beta(A)=\beta\left(\left(\prod_{i\in\{1,\ldots,n\}}A_i\right)\cdot A_{n+1}\right)$$

Using [eq: 20.342] on the above proves that that

$$B = \prod_{i\in\{1,\dots,n+1\}} A_i \in \bigodot_{i\in\{1,\dots,n+1\}} \mathcal{S}_i$$

hence $\left\{\beta(B)|B \in \left(\bigodot_{i\in\{1,\dots,n\}} \mathcal{S}_i\right) \odot S_{n+1}\right\} \subseteq \bigodot_{i\in\{1,\dots,n+1\}} \mathcal{S}_i$ which combined with [eq: 20.343] proves that

$$\bigodot_{i\in\{1,\dots,n+1\}} S_i = \left\{\beta(B)|B \in \left(\bigodot_{i\in\{1,\dots,n\}} \mathcal{S}_i\right) \odot S_{n+1}\right\}$$

□

We are now ready to use mathematical induction to prove that $\bigodot_{i\in\{1,\dots,n\}} S_i$ is a semi-ring on $\prod_{i\in\{1,\dots,n\}} X_i$.

Theorem 20.282. *Let $n \in \mathbb{N}$, $\{\langle X_i, \mathcal{S}_i\rangle\}_{i\in\{1,\dots,n\}}$ a finite family such that $\forall i \in \{1,\dots,n\}$ $\mathcal{S}_i$ is a semi-ring on X_i then for $\bigodot_{i\in\{1,\dots,n\}} \mathcal{S}_i$ defined by*

$$\bigodot_{i\in\{1,\dots,n\}} \mathcal{S}_i = \left\{\prod_{i\in\{1,\dots,n\}} A_i | \forall i \in \{1,\dots,n\}\ A_i \in \mathcal{S}_i\right\}$$

we have that

$$\bigodot_{i\in\{1,\dots,n\}} S_i \text{ is a semi-ring on } \prod_{i\in\{1,\dots,n\}} X_i$$

Proof. We prove this by mathematical induction, so define

$$\mathcal{S} = \left\{n \in \mathbb{N} | \text{If } \{\langle X_i, \mathcal{S}_i\rangle\}_{i\in\{1,\dots,n\}} \text{ is a family such that } \forall i \in \{1,\dots,n\}\ \mathcal{S}_i \text{ is a semi-ring on } X_i \text{ then } \bigodot_{i\in\{1,\dots,n\}} S_i \text{ is a semi-ring on } \prod_{i\in\{1,\dots,n\}} X_i\right\}$$

then we have:

$1 \in \mathcal{S}$. Let $\{\langle X_i, \mathcal{S}_i\rangle\}_{i\in\{1\}}$ be such that $\mathcal{S}_1$ is a semi-ring on X_1. Define

$$\beta: X_1 \to \prod_{i\in\{1\}} X_i \text{ where } \beta(x) \text{ is defined by } \beta(x)_1 = x \text{ [in other words } \beta(x) = (x)$$

then we have:

injectivity. If $\beta(x) = \beta(y)$ then $x = \beta(x)_1 = \beta(y)_1 = y$.

surjectivity. If $y \in \prod_{i\in\{1\}} X_i$ then for $x = y_1$ we have $\forall i \in \{1\}$ that $\beta(x)_1 = x = y_1$ so that $\beta(x) = y$.

so that

$$\beta \text{ is a bijection}$$

Let $A \in \bigodot_{i\in\{1\}} S_i = \left\{\prod_{i\in\{1\}} A_i | \forall i \in \{1\}\ A_i \in S_i\right\}$ then $A = \prod_{i\in\{1\}} A_i$ where $A_1 \in \mathcal{S}_1$. If $x \in A = \prod_{i\in\{1\}} A_i$ then $x_1 \in A_i$ so that $x = \beta(x_1) \in \beta(A_1)$ and if $x \in \beta(A_1)$ then there exist a $a \in A_1$ such that $x = \beta(a) = (a)$ hence $x_1 = \beta(a)_1 = a \in A_i$ so that $x \in \prod_{i\in\{1\}} A_i = A$, proving that $A = \beta(A_1) \in \{\beta(B)|B \in \mathcal{S}_1\}$. Hence we have

$$\bigodot_{i\in\{1\}} S_i \subseteq \{\beta(B)|B \in \mathcal{S}_1\} \tag{20.344}$$

For the opposite inclusion, let $A \in \{\beta(B)|B \in \mathcal{S}_1\}$ then there exist a $A_1 \in S_1$ such that $A = \beta(A_1)$. If $x \in A = \beta(A_1)$ then there exist a $a \in A_1$ such that $x = \beta(a)$ so that $x_1 = \beta(a)_1 = a \in A_1$ hence $x \in \prod_{i\in\{1\}} A_i$ and if $x \in \prod_{i\in\{1\}} A_i$ then $x_1 \in A_1$ so that $x = \beta(x_1) \in \beta(A_i)$, proving that $A = \prod_{i\in\{1\}} A_i \in \bigodot_{i\in\{1\}} S_i$. Hence we have that $\{\beta(B)|B \in \mathcal{S}_1\} \subseteq \bigodot_{i\in\{1\}} S_i$ which combined with [eq: 20.344] proves that

$$\bigodot_{i\in\{1\}} S_i = \{\beta(B)|B \in \mathcal{S}_1\}$$

Finally as $\mathcal{S}_1$ is a semi-ring it follows from [lemma: 20.279] that $\bigodot_{i\in\{1\}}\mathcal{S}_i$ is a semi-ring which proves that $1\in S$.

$2\in\mathcal{S}$. If $\{\langle X_i,\mathcal{S}_i\rangle\}_{i\in\{1,2\}}$ is such that $\mathcal{S}_1$ is a semi-ring on X_1 and $\mathcal{S}_2$ is a semi-ring on X_2 then by [theorem: 20.276] $\bigodot_{i\in\{1,2\}}\mathcal{S}_i=\mathcal{S}_1\odot\mathcal{S}_2$ is a semi-ring on $X_1\cdot X_2=\prod_{i\in\{1,2\}}X_i$. Hence $2\in\mathcal{S}$.

$n\in\mathcal{S}\Rightarrow n+1\in\mathcal{S}$. Let $\{\langle X_i,\mathcal{S}_i\rangle\}_{i\in\{1,\dots,n+1\}}$ be a finite family such that $\forall i\in\{1,\dots,n+1\}$ we have that $\mathcal{S}_i$ is a semi-ring on X_i. As $n\in\mathcal{S}$ it follows that $\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i$ is a semi-ring on $\prod_{i\in\{1,\dots,n\}}X_i$. As also $\mathcal{S}_{n+1}$ is a semi-ring on X_{n+1} it follows from [theorem: 20.276] that

$$\left(\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i\right)\odot S_{n+1}\text{ is a semi-ring on }\left(\prod_{i\in\{1,\dots,n\}}X_i\right)\cdot X_{n+1}$$

Using the previous lemma [lemma: 20.280] there exist a bijection

$$\beta:\left(\prod_{i\in\{1,\dots,n\}}X_i\right)\cdot X_{n+1}\to\prod_{i\in\{1,\dots,n+1\}}X_i$$

such that

$$\bigodot_{i\in\{1,\dots,n+1\}}\mathcal{S}_i=\left\{\beta(B)|B\in\left(\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i\right)\odot S_{n+1}\right\}$$

By [theorem: 20.279] it follows then that $\left\{\beta(B)|B\in\left(\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i\right)\odot S_{n+1}\right\}$ is a semi-ring on $\prod_{i\in\{1,\dots,n+1\}}X_i$. Hence $\bigodot_{i\in\{1,\dots,n+1\}}\mathcal{S}_i$ is a semi-ring on $\prod_{i\in\{1,\dots,n+1\}}X_i$ proving that $n+1\in\mathcal{S}$ □

Corollary 20.283. *Let $n\in\mathbb{N}$, X a set and $\mathcal{S}$ a semi-ring on X then*

$$\mathcal{S}^n=\left\{\prod_{i\in\{1,\dots,n\}}A_i|\forall i\in\{1,\dots,n\}\ A_i\in\mathcal{S}\right\}=\left\{\prod_{i\in\{1,\dots,m\}}A_i|\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}\right\}$$

is a semi-ring on X^n

Proof. Define $\{\langle X_i,\mathcal{S}_i\rangle\}_{i\in\{1,\dots,n\}}$ by $X_i=X$ and $\mathcal{S}_i=\mathcal{S}$. Then by the previous theorem [theorem: 20.282] we have that $\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i$ is a semi-ring on $\prod_{i\in\{1,\dots,n\}}X_i$. Now by definition we have that

$$X^n\underset{\text{definition}}{=}\prod_{i\in\{1,\dots,n\}}X_i$$

and

$$\begin{aligned}\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i&=\left\{\prod_{i\in\{1,\dots,n\}}A_i|\forall i\in\{1,\dots,n\}\ A_i\in\mathcal{S}_i\right\}\\&\underset{\mathcal{S}_i=\mathcal{S}}{=}\left\{\prod_{i\in\{1,\dots,n\}}A_i|\forall i\in\{1,\dots,n\}\ A_i\in\mathcal{S}\right\}\\&=\mathcal{S}^n\end{aligned}$$

so that $\mathcal{S}^n$ is a semi-ring on X^n. □

20.4.4.5 Semi-ring on $\mathbb{R}^n$

We are now ready to prove that $\mathcal{R}^n\bigcup\{\varnothing\}$ is a semi-ring.

Theorem 20.284. *Let $n\in\mathbb{N}$ then we have*

$$\mathcal{R}^n=\left\{\prod_{i\in\{1,\dots,n\}}I_i|\forall i\in\{1,\dots,n\}\ I_i\in\mathcal{I}_{[[}\right\}\underset{\text{def}}{=}\left\{\prod_{i\in\{1,\dots,n\}}I_i|\{I_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{I}_{[[}\right\}$$

$$\mathcal{R}^n\bigcap\{\varnothing\}=\varnothing$$

$$\mathcal{R}^n\bigcup\{\varnothing\}=\left\{\prod_{i\in\{1,\dots,n\}}I_i|\forall i\in\{1,\dots,n\}\ I_i\in\mathcal{S}_{[[}\right\}\underset{\text{def}}{=}\left\{\prod_{i\in\{1,\dots,n\}}I_i|\{I_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}_{[[}\right\}$$

Proof. If $R \in \mathcal{R}^n$ then by [definition: 20.170] there exists $a, b \in \mathbb{R}^n$ with $a < b \Rightarrow a_i < b_i$ such that

$$R = [a, b[\underset{\text{[definition: 20.167]}}{=} \prod_{i \in \{1, \ldots, n\}} [a_i, b_i[$$

As $\forall i \in \{1,...,n\}$ $a_i < b_i$ hence $[a_i, b_i[\in \mathcal{I}_{[[}$ it follows that $R \in \left\{\prod_{i \in \{1, \ldots, n\}} I_i | \forall i \in \{1,...,n\}\ I_i \in \mathcal{I}_{[[}\right\}$ proving that

$$\mathcal{R}^n \subseteq \left\{\prod_{i \in \{1, \ldots, n\}} I_i | \forall i \in \{1, \ldots, n\}\ I_i \in \mathcal{I}_{[[}\right\} \tag{20.345}$$

Further if $R \in \left\{\prod_{i \in \{1, \ldots, n\}} I_i | \forall i \in \{1, \ldots, n\}\ I_i \in \mathcal{I}_{[[}\right\}$ then there exists a $\{I_i\}_{i \in \{1, \ldots, n\}}$ with $\forall i \in \{1, \ldots, n\}$ $I_i \in \mathcal{I}_{[[}$ such that $R = \prod_{i \in \{1, \ldots, n\}} I_i$.. Hence $\forall i \in \{1, \ldots, n\}$ there exists $a_i, b_i \in \mathbb{R}$ with $a_i < b_i$ such that $I_i = [a_i, b_i[$. Define $a = (a_1, \ldots, a_n) \in \mathbb{R}^n$, $(b_1, \ldots, b_n) \in \mathbb{R}^n$ then $a < b$ and $[a, b[\underset{\text{[definition: 20.167]}}{=} \prod_{i \in \{1, \ldots, n\}} [a_i, b_i[= \prod_{i \in \{1, \ldots, n\}} I_i = R$ from which it follows that $R \in \mathcal{R}^n$. So $\left\{\prod_{i \in \{1, \ldots, n\}} I_i | \forall i \in \{1, \ldots, n\}\ I_i \in \mathcal{I}_{[[}\right\} \subseteq \mathcal{R}^n$, combining this with [eq: 20.345] gives

$$\mathcal{R}^n = \left\{\prod_{i \in \{1, \ldots, n\}} I_i | \forall i \in \{1, \ldots, n\}\ I_i \in \mathcal{I}_{[[}\right\} \tag{20.346}$$

Let $R \in \mathcal{R}^n$ then there exists $\{I_i\}_{i \in \{1, \ldots, n\}}$ with $I_i \in \mathcal{I}_{[[}$ [so that $I_i \neq \varnothing$] such that $R = \prod_{i \in \{1, \ldots, n\}} I_i$. Applying [theorem: 3.109] it follows that $R \neq \varnothing$ so that

$$\mathcal{R}^n \bigcap \{\varnothing\} = \varnothing \tag{20.347}$$

If $R \in \mathcal{R}^n \bigcup \{\varnothing\}$ then we have either:

- $\boldsymbol{R \in \mathcal{R}^n}$**.** Then by [eq: 20.346] $R = \prod_{i \in \{1, \ldots, n\}} I_i$ where $\forall i \in \{1, \ldots, n\}$ $I_i \in \mathcal{I}_{[[} \subseteq \mathcal{S}_{[[}$ so that $R \in \left\{\prod_{i \in \{1, \ldots, n\}} I_i | \forall i \in \{1, \ldots, n\}\ I_i \in \mathcal{S}_{[[}\right\}$.
- $\boldsymbol{R = \varnothing}$**.** Define $\{I_i\}_{i \in \{1, \ldots, n\}}$ by $I_i = \varnothing \in \mathcal{S}_{[[}$ then $\varnothing \underset{\text{[theorem: 2.138]}}{=} \prod_{i \in \{1, \ldots, n\}} I_i$ so that $R \in \left\{\prod_{i \in \{1, \ldots, n\}} I_i | \forall i \in \{1, \ldots, n\}\ I_i \in \mathcal{S}_{[[}\right\}$.

hence we have that

$$\mathcal{R}^n \bigcup \{\varnothing\} \subseteq \left\{\prod_{i \in \{1, \ldots, n\}} I_i | \forall i \in \{1, \ldots, n\}\ I_i \in \mathcal{S}_{[[}\right\} \tag{20.348}$$

Let $R \in \left\{\prod_{i \in \{1, \ldots, n\}} I_i | \forall i \in \{1, \ldots, n\}\ I_i \in \mathcal{S}_{[[}\right\}$ then $R = \prod_{i \in \{1, \ldots, n\}} I_i$ where $\forall i \in \{1, \ldots, n\}$ $I_i \in \mathcal{S}_{[[}$. Then we have either:

- $\boldsymbol{\forall i \in \{1, \ldots, n\}\ I_i \neq \varnothing}$**.** Then by [theorem: 20.261] it follows that $\forall i \in I$ $I_i \in \mathcal{I}_{[[}$ so that $I_i = [a_i, b_i[\neq \varnothing \Rightarrow a_i < b_i$, hence for $a = (a_1, \ldots, a_n), b = (b_1, \ldots, b_n) \in \mathbb{R}$ we have $a < b$ so that

$$R = \prod_{i \in \{1, \ldots, n\}} [a, b[\in \mathcal{R}^n \subseteq \mathcal{R}^n \bigcup \{\varnothing\}$$

- $\boldsymbol{\exists i \in \{1, \ldots, n\}}$ **such that** $\boldsymbol{I_i = \varnothing}$**.** Then

$$R = \prod_{i \in \{1, \ldots, n\}} A_i \underset{\text{[theorem: 2.138]}}{=} \varnothing \in \mathcal{R}^n \bigcap \{\varnothing\}$$

proving that $\left\{\prod_{i \in \{1, \ldots, n\}} I_i | \forall i \in \{1, \ldots, n\}\ I_i \in \mathcal{S}_{[[}\right\} \subseteq \mathcal{R}^n \bigcap \{\varnothing\}$. Combining this with [eq: 20.348] proves finally that

$$\mathcal{R}^n \bigcup \{\varnothing\} = \left\{\prod_{i \in \{1, \ldots, n\}} I_i | \forall i \in \{1, \ldots, n\}\ I_i \in \mathcal{S}_{[[}\right\}$$ □

A direct consequence of the above theorem is the following

Theorem 20.285. *Let $n \in \mathbb{N}$ then $\mathcal{R}^n \bigsqcup \{\varnothing\}$ is a semi-ring on $\mathbb{R}^n$*

Proof. First we have

$$\mathcal{R}^n \bigsqcup \{\varnothing\} \underset{[\text{theorem: } 20.284]}{=} \mathcal{R}^n \bigcup \{\varnothing\} = \left\{ \prod_{i \in \{1,\ldots,n\}} I_i | \forall i \in \{1,\ldots,n\}\ I_i \in \mathcal{S}_{[[} \right\} = (\mathcal{S}_{[[})^n$$

so that by [theorem: 20.283]

$$\mathcal{R}^n \bigsqcup \{\varnothing\} \text{ is a semi-ring}$$

□

Theorem 20.286. *Let $n \in \mathbb{N}$ then we have that*

$$\sigma[\{C \subseteq \mathbb{R}^n | C \text{ is closed in } \mathcal{T}_{\|\|^n}\}] = \beta[\mathbb{R}^n] = \sigma[\mathcal{R}^n] = \sigma\left[\mathcal{R}^n \bigcup \{\varnothing\}\right]$$

Proof. By [theorem: 20.183] we only have to prove that $\sigma[\mathcal{R}^n] = \sigma[\mathcal{R}^n \bigsqcup \{\varnothing\}]$. As $\mathcal{R}^n \subseteq \mathcal{R}^n \bigcup \{\varnothing\} \subseteq \sigma[\mathcal{R}^n \bigcup \{\varnothing\}]$ and $\sigma[\mathcal{R}^n \bigcup \{\varnothing\}]$ is a σ-algebra it follows from [theorem: 20.146] that

$$\sigma[\mathcal{R}^n] \subseteq \sigma\left[\mathcal{R}^n \bigsqcup \{\varnothing\}\right] \tag{20.349}$$

Let $A \in \mathcal{R}^n \bigsqcup \{\varnothing\}$ then either $A \in \mathcal{R}^n \subseteq \sigma[\mathcal{R}_n]$ or $A = \varnothing \in \sigma[\mathcal{R}_n]$ so that $\mathcal{R}^n \bigsqcup \{\varnothing\} \subseteq \sigma[\mathcal{R}^n]$, as $\sigma[\mathcal{R}^n]$ is a σ-algebra it follows from [theorem: 20.146] that $\sigma[\mathcal{R}^n \bigsqcup \{\varnothing\}] \subseteq \sigma[\mathcal{R}^n]$. Combining this with [eq: 20.349] proves

$$\sigma[\mathcal{R}^n] = \sigma\left[\mathcal{R}^n \bigsqcup \{\varnothing\}\right]$$

□

20.4.4.6 Content on the semi-ring $\mathcal{R}^n \bigcup \{\varnothing\}$

Definition 20.287. (Content of a rectangle) *Let $n \in \mathbb{N}$ then we define*

$$\text{vol}^n : \mathcal{R}^n \bigsqcup \{\varnothing\} \to [0, \infty] \text{ by } \text{vol}^n(R) = \begin{cases} 0 & \text{if } R = \varnothing \\ v^n(R) & \text{if } R \neq \varnothing \end{cases}$$

where $v^n(R) : \mathcal{R}^n \to [0, \infty]$ is defined by $v^n(R) = \prod_{i=1}^n (\text{begin}(R)_i - \text{end}(R)_i) \in \mathbb{R}^+$ [see definition: 20.174].

***Note* 20.288.** *Using the definition it follows that $\text{vol}^n(R)$ is finite and*

$$\forall R \in \mathcal{R}^n \bigcup \{\varnothing\} \text{ we have } \text{vol}^n(R) = 0 \Leftrightarrow R \in \mathcal{R}^n$$

Next it remains to prove that vol^n is actual a content on $\mathcal{R}^n \bigcup \{\varnothing\}$, the most difficult part is proving additivity of vol^n. To illustrate how to prove this consider the following 2-dimesional case [see figure:] where

$$R = \bigsqcup_{i \in \{1,\ldots,4\}} R_i$$

then we have to prove that

$$\text{vol}^2(R) = \sum_{i=1}^4 \text{vol}^2(R_i)$$

Figure 20.1.

To do this we divide R_1, R_2, R_3, R_4 and R_5 in sub-cubes by partitioning their sides in sub intervals.

Figure 20.2.

so that

$$\begin{aligned} R_1 &= R_{1,1}+R_{1,2}+R_{1,3}+R_{1,4} \\ R_2 &= R_{2,1}+R_{2,2} \\ R_3 &= R_{3,1} \\ R_4 &= R_{4,1} \\ R_5 &= R_{5,1} \end{aligned}$$

then we prove that

$$\begin{aligned} \mathrm{vol}^2(R) &= \mathrm{vol}^2(R_{1,1})+\mathrm{vol}^2(R_{1,2})+\mathrm{vol}^2(R_{1,3})+\mathrm{vol}^2(R_{1,4})+\mathrm{vol}^2(R_{2,1})+\mathrm{vol}^2(R_{2,2})+\mathrm{vol}^2(R_{3,1})+\mathrm{vol}^2(R_{3,1})+ \\ &\quad \mathrm{vol}^2(R_{4,1})+\mathrm{vol}^2(R_{5,1}) \end{aligned}$$

and apply associativity to get

$$\begin{aligned} \mathrm{vol}^2(R) &= (\mathrm{vol}^2(R_{1,1})+\mathrm{vol}^2(R_{1,2})+\mathrm{vol}^2(R_{1,3})+\mathrm{vol}^2(R_{1,4}))+(\mathrm{vol}^2(R_{2,1})+\mathrm{vol}^2(R_{2,2}))+(\mathrm{vol}^2(R_{3,1}))+ \\ &\quad (\mathrm{vol}^2(R_{3,1}))+(\mathrm{vol}^2(R_{4,1}))+(\mathrm{vol}^2(R_{5,1})) \\ &= \mathrm{vol}^2(R_1)+\mathrm{vol}^2(R_2)+\mathrm{vol}^2(R_3)+\mathrm{vol}^2(R_4)+\mathrm{vol}^2(R_5) \end{aligned}$$

which proves additivity. First we show that every increasing finite family of real numbers can be used to construct a pairwise disjoint union of half open intervals that is itself a half open interval. This will be used later to turn a union of half open intervals that is itself a half open interval in a disjoint union of half open intervals.

Lemma 20.289. *Let $n, m \in \mathbb{N}$ with $n \leqslant m$, $\{a_i\}_{i\in\{n,\dots,m\}} \subseteq \mathbb{R}$ such that $\forall i \in \{n,\dots,m-1\}$ we have $a_i \leqslant a_{i+1}$ then*

$$\{[a_i, a_{i+1}[\}_{i\in\{n,\dots,m-1\}} \text{ is pairwise disjoint}$$

and

$$\bigsqcup_{i\in\{n,\dots,m-1\}} [a_i, a_{i+1}[= [a_n, a_m[$$

Proof. Let $i, j \in \{n,\dots,m-1\}$ with $i \neq j$ then we may assume that $i < j$ [otherwise exchange i and j]. Assume that $x \in [a_i, a_{i+1}[\bigcap [a_j, a_{j+1}[$ then $a_i \leqslant x < a_{i+1} \underset{i<j \Rightarrow i+1 \leqslant j}{\leqslant} a_j \leqslant x < a_{j+1}$ leading to the contradiction $x < x$, hence the assumption is wrong proving that $[a_i, a_{i+1}[\bigcap [a_j, a_{j+1}[= \varnothing$. So

$$\{[a_i, a_{i+1}[\}_{i\in\{n,\dots,m-1\}} \text{ is pairwise disjoint}$$

Let $x \in [a_n, a_m[$ then $a_n \leqslant x < a_m$ so that $n \in \{i \in \{n, \ldots, m\} | a_i \leqslant x\}$ a finite set. Hence $M = \max(\{i \in \{n, \ldots, m\} | a_i \leqslant x\})$ exist. As $x < a_m \Rightarrow a_m \nleqslant x$ we have $M \neq m$ so that $M \in \{n, \ldots, m-1\} \Rightarrow M+1 \in \{n, \ldots, m\}$. As $M = \max(\{i \in \{n, \ldots, m\} | a_i \leqslant x\})$ it follows that $a_M \leqslant x < a_{M+1}$ so that $x \in [a_M, a_{M+1}[\subseteq \bigsqcup_{i \in \{n, \ldots, m-1\}} [a_i, a_{i+1}[$. Hence we have proved that

$$[a_n, a_m[\subseteq \bigsqcup_{i \in \{n, \ldots, m-1\}} [a_i, a_{i+1}[\tag{20.350}$$

Let $x \in \bigsqcup_{i \in \{n, \ldots, m-1\}} [a_i, a_{i+1}[$ then there exist a $i \in \{n, \ldots, m-1\}$ such that $a_i \leqslant x < a_{i+1}$. As $n \leqslant i$ and $i \leqslant m-1 < m$ we have by the hypothesis that $a_n \leqslant a_i \wedge a_{i+1} \leqslant a_m$ so that $a_n \leqslant x < a_m$ or $x \in [a_n, a_m[$. Hence $\bigsqcup_{i \in \{n, \ldots, m-1\}} [a_i, a_{i+1}[\subseteq [a_n, a_m[$ which combined with [eq: 20.350] gives

$$\bigsqcup_{i \in \{n, \ldots, m-1\}} [a_i, a_{i+1}[= [a_n, a_m[\qquad \square$$

Next we show that a half open interval that is a union of half open subintevals is the disjoint union of sub intervals that are based on the boundary points of the half open subintervalas. For example:

$$\begin{aligned} [-4, 2[&= [-3, 2[\bigsqcup [-1, 1[\bigsqcup [-4, 0[\bigsqcup [0, 2[\\ &= [-4, -3[\bigsqcup [-3, -1[\bigsqcup [-1, 0[\bigsqcup [0, 1[\bigsqcup [1, 2[\end{aligned}$$

to do thist we sort the boundary points $\{-3, 2, -1, 1, -4, 0, 2\}$ giving the sorted set

$$\{-4, -3, -1, 0, 1, 2\}$$

and use the the previous lemma to create the final list of intervals

$$[-4, -3[, [-3, -1[, [-1, 0[, [0, 1[, [1, 2[$$

Lemma 20.290. *Let $n \in \mathbb{N}$ and $\{[a_i, b_i[\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{I}_{[[}$ such that $\bigcup_{i \in \{1, \ldots, n\}} [a_i, b_i[= [a, b[$ then if we take*

$$A = \{\alpha_i | i \in \{1, \ldots, n\}\} \bigsqcup \{b_i | i \in \{1, \ldots, n\}\}$$

there exists a $m \in \mathbb{N} \setminus \{1\}$ and a bijection $\beta: \{1, \ldots, m\} \to A$ such that:

1. $\beta(1) = a \wedge \beta(m) = b$
2. $\forall i, j \in \{1, \ldots, m\}$ *with* $i < j$ *we have* $\beta(i) < \beta(j)$
3. $\forall x, y \in A$ *with* $x < y$ *we have* $\beta^{-1}(x) < \beta^{-1}(y)$
4. $\forall i \in \{1, \ldots, n\}$ *we have* $\beta^{-1}(a_i) < \beta^{-1}(b_i)$
5. $\forall i \in \{1, \ldots, n\}$ $\{[\beta(j), \beta(j+1)[\}_{j \in \{\beta^{-1}(a_i), \ldots, \beta^{-1}(b_i)-1\}}$ *is pairwise disjoint and* $[a_i, b_i[= \bigsqcup_{j \in \{\beta^{-1}(a_i), \ldots, \beta^{-1}(b_i)-1\}} [\beta(j), \beta(j+1)[$
6. $\{[\beta(i), \beta(i+1)[\}_{i \in \{1, \ldots, m-1\}}$ *is pairwise disjoint and* $\bigsqcup_{i \in \{1, \ldots, m-1\}} [\beta(i), \beta(i+1)[= [a, b[$

Proof. Define $A = \{a_i | i \in \{1, \ldots, n\}\} \bigsqcup \{b_i | i \in \{1, \ldots, n\}\}$. As $[a_1, b_1[\neq \varnothing$ we have that $[a, b[= \bigcup_{i \in \{1, \ldots, n\}} [a_i, b_i[\neq \varnothing$ so that

$$a < b \tag{20.351}$$

Assume that $a \notin A$. As $a \in [a, b[= \bigcup_{i \in \{1, \ldots, n\}} [a_i, b_i[$ there exist a $i \in \{1, \ldots, n\}$ such that $a \in [a_i, b_i[\Rightarrow a_i \leqslant a < b_i \underset{a \notin A \Rightarrow a \neq a_i}{\Rightarrow} a_i < a < b_i$. Using the density of the real numbers [theorem: 10.32] there exist a $t \in \mathbb{R}$ such that $a_i < t < a < b_i \Rightarrow t \notin [a, b[\wedge t \in [a_i, b_i[\subseteq [a, b[$ a contradiction. So the assumption is wrong and we have

$$a \in A \tag{20.352}$$

Assume that $b \notin A$. Given $i \in \{1, \ldots, n\}$ we have $[a_i, b_i[\subseteq \bigcup_{i \in \{1, \ldots, n\}} [a_i, b_i[\subseteq [a, b[$ so that by [theorem: 3.144] $b_i \leqslant b \underset{b \notin A \Rightarrow b \neq b_i}{\Rightarrow} b_i < b$. As also $a < b$ it follows that $\max(\{a\} \bigcup \{b_i | i \in \{1, \ldots, n\}\}) < b$. Hence using the density of the real numbers [theorem: 10.32] there exists a $t \in \mathbb{R}$ with $\max(\{a\} \bigcup \{b_i | i \in \{1, \ldots, n\}\}) < t < b$. Hence $\forall i \in \{1, \ldots, n\}$ $t \notin [a_i, b_i[\wedge a < t < b$. So $t \notin \bigcup_{i \in \{1, \ldots, n\}} [a_i, b_i[= [a, b[\wedge t \in [a, b[$ again a contradiction. Hence the assumption is wrong and we have

$$b \in A \tag{20.353}$$

As $\forall i \in \{1,\ldots,n\}$ we have $[a_i, b_i[\subseteq \bigcup_{i\in\{1,\ldots,n\}} [a_i, b_i[= [a, b[$ it follows from theorem: 3.144] that $a \leqslant a_i < b_i \leqslant b$ proving that

$$a = \min(A) \wedge b = \max(A)$$

Using [theorems: 6.34, 6.45] it follows that A is finite and as $a, b \in A$ $\operatorname{card}(A) \in \mathbb{N}$, hence using [theorem: 10.97] it follows that there exist a bijection

$$\beta\colon \{1,\ldots,m\} \to A \text{ where } m = \operatorname{card}(A) \text{ such that } \forall i \in \{1,\ldots,m-1\}\ \beta(i) < \beta(i+1) \tag{20.354}$$

As $\forall i \in \{1,\ldots,m\}$ we have $\beta(1) \leqslant \beta(i)$ and $\beta(i) \leqslant \beta(m)$ it follows that $\beta(1) = \min(A) = a \wedge \beta(m) = \max(A) = b$, hence

$$a = \beta(1) \wedge b = \beta(m) \tag{20.355}$$

Let $x, y \in A$ such that $x < y$. If $\beta^{-1}(y) \leqslant \beta^{-1}(x)$ it follows that $y = \beta(\beta^{-1}(y)) \leqslant \beta(\beta^{-1}(x)) = x$ contradicting $x \leqslant y$. Hence we have

$$\forall x, y \in A \text{ with } x < y \text{ we have } \beta^{-1}(x) < \beta^{-1}(y) \tag{20.356}$$

Let $i \in \{1,\ldots,n\}$ then $a_i, b_i \in A$ and $a_i < b_i$ [as $[a_i, b_i[\in \mathcal{I}_{[[}$ so that by the above $\beta^{-1}(a_i) < \beta^{-1}(b_i)$. In other words

$$\forall i \in \{1,\ldots,n\} \text{ we have } \beta^{-1}(a_i) < \beta^{-1}(b_i) \tag{20.357}$$

Let $i \in \{1,\ldots,n\}$ then for $j \in \{\beta^{-1}(a_i),\ldots,\beta^{-1}(b_i)-1\}$ we have $\beta(j) < \beta(j)$ so that by [lemma: 20.289] we have

$$\{[\beta(j), \beta(j+1)[\}_{j\in\{\beta^{-1}(a_i),\ldots,\beta^{-1}(b_i)-1\}} \text{ is pairwise disjoint} \tag{20.358}$$

and

$$\bigsqcup_{j\in\{\beta^{-1}(a_i),\ldots,\beta^{-1}(b_i)-1\}} [\beta(j), \beta(j+1)[= [\beta(\beta^{-1}(a_i)), \beta(\beta^{-1}(b_i))[= [a_i, b_i[\tag{20.359}$$

Using [lemma: 20.289] on [eq: 20.354] gives

$$\{[\beta(i), \beta(i-1)[\}_{i\in\{1,\ldots,m-1\}} \text{ is pairwise disjoint} \tag{20.360}$$

and

$$\bigsqcup_{i\in\{1,\ldots,m-1\}} [\beta(i), \beta(i+1)[= [\beta(1), \beta(n)[\underset{\text{[eq: 20.355]}}{=} [a, b[\tag{20.361}$$

So (1) is proved by [eq: 20.355], (2) is proved by [eq: 20.354], (3) is proved by [eq: 20.356], (4) is proved by [eq: 20.357], (5) by [eqs: 20.358, 20.359] and finally (6) by [eqs: 20.360, 20.361]. □

Next we show how the volume of a half open rectangle partioned by its sides can be calculated. Giving the follow example of a partioned rectangle R

Figure 20.3.

we have then

$$\begin{aligned}
\prod_{i\in\{1,\ldots,n\}}[a_i,b_i[&= [a_1,b_1[\cdot[a_2,b_2[\\
&= [a_{1,1},\ a_{1,2}[\ \cdot\ [a_{2,1},\ a_{2,2}[\bigsqcup\ [a_{1,1},\ a_{1,2}[\ \cdot\ [a_{2,2},\ a_{2,3}[\bigsqcup\ [a_{1,1},\ a_{1,2}[\ \cdot\ [a_{2,3},\ a_{2,4}[\bigsqcup \\
&\quad [a_{1,2},a_{1,3}[\cdot[a_{2,1},a_{2,2}[\bigsqcup[a_{1,2},a_{1,3}[\cdot[a_{2,2},a_{2,3}[\bigsqcup[a_{1,2},a_{1,3}[\cdot[a_{2,3},a_{2,4}[\\
&= \bigsqcup_{\rho\in\{(1,1),(1,2),(1,3),(2,1),(2,2),(2,3)\}}[a_{1,\rho_1},a_{1,\rho_1+1}[\cdot[a_{2,\rho_2},a_{2,\rho_2+1}[\\
&= \bigsqcup_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}}\left(\prod_{i\in\{1,\ldots,n\}}[a_{i,\rho_i},a_{i,\rho_i+1}[\right)
\end{aligned}$$

and

$$\begin{aligned}
\prod_{i\in\{1,\ldots,n\}}(b_i-a_i) &= (b_1-a_1)\cdot(b_2-a_2) \\
&= (a_{1,2}-a_{1,1})\cdot(a_{2,2}-a_{2,1})+(a_{1,2}-a_{1,1})\cdot(a_{2,3}-a_{2,2})+(a_{1,2}-a_{1,1})\cdot(a_{2,4}-a_{2,3})+ \\
&\quad (a_{1,3}-a_{1,2})\cdot(a_{2,2}-a_{2,1})+(a_{1,3}-a_{1,2})\cdot(a_{2,3}-a_{2,2})+(a_{1,3}-a_{1,2})\cdot(a_{2,4}-a_{2,3}) \\
&= \bigsqcup_{\rho\in\{(1,1),(1,2),(1,3),(2,1),(2,2),(2,3)\}}(a_{1,\rho_1+1}-a_{1,\rho_1})\cdot(a_{2,\rho_2+1}-a_{2,\rho_2}) \\
&= \bigsqcup_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}}\left(\prod_{i\in\{1,\ldots,n\}}(a_{i,\rho_i+1}-a_{i,\rho_i})\right)
\end{aligned}$$

Lemma 20.291. *Let $n\in\mathbb{N}$, $\{[a_i,b_i[\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{I}_{[[}$ such that $\forall i\in\{1,\ldots,n\}$ there exists $n_i,m_i\in\mathbb{N}$ with $n_i\leqslant m_i$ and a $\{a_{i,j}\}_{j\in\{n_i,\ldots,m_i\}}\subseteq\mathbb{R}$ such that $\forall j\in\{n_i,\ldots,m_i-1\}$ $a_{i,j}\leqslant a_{i,j+1}$ and $a_{i,n_i}=a_i\wedge a_{i,m_i}=b_i$ then*

$$\left\{\prod_{i\in\{1,\ldots,n\}}[a_{i,\rho_i},a_{i,\rho_i+1}[\right\}_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}}\quad\textit{is pairwise disjoint}$$

$$\prod_{i\in\{1,\ldots,n\}}[a_i,b_i[=\bigsqcup_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}}\left(\prod_{i\in\{1,\ldots,n\}}[a_{i,\rho_i},a_{i,\rho_i+1}[\right)$$

$$\prod_{i=1}^{n}(b_i-a_i)=\sum_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}}\left(\prod_{i\in\{1,\ldots,n\}}(a_{i,\rho_i+1}-a_{i,\rho_i})\right)$$

Proof. Assume that $\exists i\in\{1,\ldots,n\}$ such that $n_i=m_i$ then $a_i=a_{i,n_i}=a_{o,m_i}=b_i$ contradicting $a_i<b_i$ [because $[a_i,b_i[\neq\varnothing$], hence a assumption is false and we have

$$\forall i\in\{1,\ldots,n\}\text{ we have }n_i<m_i\text{ or }n_i\leqslant m_i-1 \tag{20.362}$$

Let $i\in\{1,\ldots,n\}$ then, as $\forall j\in\{n_i,\ldots,m_i-1\}$ $a_{i,j}\leqslant a_{i,j+1}$ it follows form [lemma: 20.289] that

$$\{[a_{i,j},a_{i,j+1}[\}_{j\in\{n_i\ldots,m_i-1\}}\text{ is pairwise disjoint} \tag{20.363}$$

and

$$[a_i,b_i[=[a_{i,n_i},a_{i,m_i}[=\bigsqcup_{j\in\{n_i,\ldots,m_i-1\}}[a_{i,j},a_{i,j+1}[\tag{20.364}$$

Let $x \in \prod_{i\in\{1,\dots,n\}} [a_i, b_i[$ then $\forall i \in \{1,\dots,n\}$ we have $x_i \in [a_i, b_i[$, hence by the above there exist a $\rho_i \in \{n_i,\dots, m_i - 1\}$ such that $x_i \in [a_{i,\rho_i}, a_{i,\rho_i+1}[$. So for $\rho = (\rho_1,\dots,\rho_n) \in \prod_{i\in\{1,\dots,n\}} \{n_i,\dots,m_i-1\}$ it follows that $\forall i \in \{1,\dots,n\}$ $x_i \in [a_{i,\rho_i}, a_{i,\rho_i+1}[$ proving that $x \in \prod_{i\in\{1,\dots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[$. Hence we have

$$\prod_{i\in\{1,\dots,n\}} [a_i, b_i[\subseteq \bigcup_{\rho\in\prod_{i\in\{1,\dots,n\}}\{n_i,\dots,m_i-1\}} \left(\prod_{i\in\{1,\dots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \tag{20.365}$$

If $x \in \bigcup_{\rho\in\prod_{i\in\{1,\dots,n\}}\{n_i,\dots,m_i-1\}} \left(\prod_{i\in\{1,\dots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right)$ then there exist a $\rho \in \prod_{i\in\{1,\dots,n\}} \{n_i,\dots,m_i-1\}$ such that $x \in \prod_{i\in\{1,\dots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[$. Hence $\forall i \in \{1,\dots,n\}$ we have $x_i \in [a_{i,\rho_i}, a_{i,\rho_i+1}[\underset{\text{[eq: 20.364]}}{\subseteq} [a_i, b_i[$ proving that $x \in \prod_{i\in\{1,\dots,n\}} [a_i, b_i[$. So it follows that $\bigcup_{\rho\in\prod_{i\in\{1,\dots,n\}}\{n_i,\dots,m_i-1\}} \left(\prod_{i\in\{1,\dots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \subseteq \prod_{i\in\{1,\dots,n\}} [a_i, b_i[$ which combined with [eq: 20.365] proves that

$$\prod_{i\in\{1,\dots,n\}} [a_i, b_i[= \bigcup_{\rho\in\prod_{i\in\{1,\dots,n\}}\{n_i,\dots,m_i-1\}} \left(\prod_{i\in\{1,\dots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \tag{20.366}$$

Let $\rho, \sigma \in \prod_{i\in\{1,\dots,n\}} \{n_i,\dots,m_i-1\}$ with $\rho = \sigma$ then there exist a $k \in \{1,\dots,n\}$ such that $\rho(l) \neq \sigma(k)$. Assume that that there exist a $x \in \left(\prod_{i\in\{1,\dots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \bigcap \left(\prod_{i\in\{1,\dots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right)$ then $x_k \in [a_{k,\rho_k}, a_{k,\rho_k+1}[\bigcap [a_{k,\sigma_k}, a_{k,\sigma_k+1}[\underset{\rho_k\neq\sigma_k}{=} \varnothing$ which is a contradiction, hence the assumption is wrong and we must have that $\left(\prod_{i\in\{1,\dots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \bigcap \left(\prod_{i\in\{1,\dots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) = \varnothing$. So we have

$$\left\{\prod_{i\in\{1,\dots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right\}_{\rho\in\prod_{i\in\{1,\dots,n\}}\{n_i,\dots,m_i-1\}} \text{ is pairwise disjoint} \tag{20.367}$$

Further we have

$$\begin{aligned}
\prod_{i=1}^{n} (b_i - a_i) &\underset{\text{[definition: 20.269]}}{=} \prod_{i=1}^{n} \operatorname{len}([a_i, b_i[) \\
&\underset{\text{[eq: 20.363, 20.364]}}{=} \prod_{i=1}^{n} \operatorname{len}\left(\bigsqcup_{j\in\{n_i,\dots,m_i\}} [a_{i,j}, a_{i,j+1}[\right) \\
&\underset{\text{[lemma: 20.272]}}{=} \prod_{i=1}^{n} \left(\sum_{j\in\{n_i,\dots,m_i\}} \operatorname{len}([a_{i,j}, a_{i,j+1}])\right) \\
&\underset{\text{[theorem: 11.49]}}{=} \sum_{\rho\in\prod_{i\in\{1,\dots,n\}}\{n_i,\dots,m_i\}} \left(\prod_{i\in\{1,\dots,n\}} \operatorname{len}([a_{i,\rho_i}, a_{i,\rho_i+1}[)\right) \\
&= \sum_{\rho\in\prod_{i\in\{1,\dots,n\}}\{n_i,\dots,m_i\}} \left(\prod_{i\in\{1,\dots,n\}} (a_{i,\rho_i+1} - a_{i,\rho_i})\right)
\end{aligned}$$

which proves the last part of the theorem. □

The following lemma shows that if the union of half open rectangles is a half open rectangle then each side of the of the open rectangle is a union of the corresponding sides of the subrectangles. For example in the following 2-dimesional we have that

$$\begin{aligned}
[a_1, b_1[&= [a_{1,1}, b_{1,1}[\bigcup [a_{2,1}, b_{2,1}[\bigcup [a_{3,1}, b_{3,1}[\bigcup [a_{4,1}, b_{5,1}[\bigcup [a_{5,1}, b_{5,1}[\\
&= \bigcup_{i\in\{1,\dots,5\}} [a_{i,1}, b_{i,1}[\\
[a_2, b_2[&= [a_{1,2}, b_{1,2}[\bigcup [a_{2,2}, b_{2,2}[\bigcup [a_{3,2}, b_{3,2}[\bigcup [a_{4,2}], b_{4,2}[\bigcup [a_{5,2}, b_{5,2}[\\
&= \bigcup_{i\in\{1,\dots,b\}} [a_{i,2}, b_{i,2}[
\end{aligned}$$

Figure 20.4.

Lemma 20.292. *Let $n, m \in \mathbb{N}$ and let $\left\{\prod_{j\in\{1,\ldots,n\}} [a_{i,j}, b_{i,j}[\right\}_{i\in\{1,\ldots,m\}} \subseteq \mathcal{R}^n$ such that*

$$\bigcup_{i\in\{1,\ldots,m\}} \left(\prod_{j\in\{1,\ldots n\}} [a_{i,j}, b_{i,j}[\right) = \prod_{j\in\{1,\ldots,n\}} [a_j, b_j[\in \mathcal{R}^n$$

then $\forall j \in \{1,\ldots,n\}$ we have

$$[a_j, b_j[= \bigcup_{i\in\{1,\ldots,m\}} [a_{i,j}, b_{i,j}[$$

Proof. Take $j \in \{1,\ldots,n\}$. If $t \in \bigcup_{i\in\{1,\ldots,m\}} [a_{i,j}, b_{i,j}[$ then there exist a $i \in \{1,\ldots,m\}$ such that $t \in [a_{i,j}, b_{i,j}[$. As $\prod_{j\in\{1,\ldots n\}} [a_{i,j}, b_{i,j}[\in \mathcal{R}^n$ $\prod_{j\in\{1,\ldots n\}} [a_{i,j}, b_{i,j}[\neq \varnothing$ it follows from [theorems: 3.109, 3.108] that the projection function $\pi_j \colon \prod_{j\in\{1,\ldots n\}} [a_{i,j}, b_{i,j}[\to [a_{i,j}, b_{i,j}[$ is a surjection hence there exists a $x \in \prod_{j\in\{1,\ldots n\}} [a_{i,j}, b_{i,j}[$ such that $x_j = \pi_j(x) = t$. As

$$\prod_{j\in\{1,\ldots n\}} [a_{i,j}, b_{i,j}[\subseteq \bigcup_{i\in\{1,\ldots,m\}} \left(\prod_{j\in\{1,\ldots n\}} [a_{i,j}, b_{i,j}[\right) = \prod_{j\in\{1,\ldots,n\}} [a_j, b_j[$$

we have that $x \in \prod_{j\in\{1,\ldots,n\}} [a_j, b_j[$ so that $t = \pi_j(x) \in [a_j, b_j[$. Hence we have

$$\bigcup_{i\in\{1,\ldots,m\}} [a_{i,j}, b_{i,j}[\subseteq [a_j, b_j[\tag{20.368}$$

Let $t \in [a_j, b_j[$. As $\prod_{j\in\{1,\ldots,n\}} [a_j, b_j[\in \mathcal{R}^n$ $\prod_{j\in\{1,\ldots,n\}} [a_j, b_j[\neq \varnothing$ so that by [theorems: 3.109, 3.108] the projection function $\pi_j \colon \prod_{j\in\{1,\ldots,n\}} [a_j, b_j[\to [a_j, b_j[$ is a surjection, hence there exist a $x \in \prod_{j\in\{1,\ldots,n\}} [a_j, b_j[= \bigsqcup_{i\in\{1,\ldots,m\}} \left(\prod_{j\in\{1,\ldots n\}} [a_{i,j}, b_{i,j}[\right)$ such that $t = \pi_j(x)$. Then there exists a $i \in \{1,\ldots,m\}$ such that $x \in \prod_{j\in\{1,\ldots n\}} [a_{m,j}, b_{m,j}[$. So it follows that $t = \pi_j(x) \in [a_{m,j}, b_{m,j}[\subseteq \bigcup_{i\in\{1,\ldots,m\}} [a_{i,j}, b_{i,j}[$ which proves that $[a_j, b_j[\subseteq \bigcup_{i\in\{1,\ldots,m\}} [a_{i,j}, b_{i,j}[$. Combining this with [eq: 20.368] proves that

$$[a_j, b_j[= \bigcup_{i\in\{1,\ldots,m\}} [a_{i,j}, b_{i,j}[$$

□

We show now that the volume of the pairwise distinct union of half open non empty rectangles is equal to the sum of the volumes of thise reactangles if this distinct union is also a half open rectangle.

Lemma 20.293. *Let $n,\ m \in \mathbb{N}$, $\left\{\prod_{j\in\{1,\ldots,n\}}[a_{i,j},b_{i,j}[\right\}_{i\in\{1,\ldots,m\}} \subseteq \mathcal{R}^n$ pairwise disjoint such that $\bigsqcup_{i\in\{1,\ldots,m\}}\left(\prod_{j\in\{1,\ldots n\}}[a_{i,j},b_{i,j}[\right) = \prod_{i\in\{1,\ldots,n\}}[a_i,b_i[\in\mathcal{R}^n$ then we have*

$$\prod_{i\in\{1,\ldots,n\}}(b_i-a_i) = \sum_{i=1}^{m}\left(\prod_{j=1}^{n}(b_{i,j}-a_{i,j})\right)$$

Proof. First using the previous lemma [lemma: 20.292] we have that

$$\forall j\in\{1,\ldots,n\}\ [a_j,b_j[= \bigcup_{i\in\{1,\ldots,m\}}[a_{i,j},b_{i,j}[\tag{20.369}$$

Let $j\in\{1,\ldots,n\}$. Using [lemma: 20.290] there exists a $n_j\in\mathbb{N}$ and a bijection

$$\beta_j\colon\{1,\ldots,n_j\}\to\{a_{i,j}|i\in\{1,\ldots,n_j\}\}\bigcup\{b_{i,j}|i\in\{1,\ldots,n_j\}\} \tag{20.370}$$

such that

$$\beta_j(1)=a_j\wedge\beta_j(n_j)=b_j \tag{20.371}$$

$$\forall k,l\in\{1,\ldots,n_j\}\text{ with }k<l\text{ we have }\beta_j(k)<\beta_j(l) \tag{20.372}$$

$$\forall x,y\in\{a_{i,j}|i\in\{1,\ldots,n_j\}\}\bigcup\{b_{i,j}|i\in\{1,\ldots,n_j\}\}\text{ with }x<y\text{ we have }(\beta_j)^{-1}(x)<(\beta_j)^{-1}(y) \tag{20.373}$$

$$\forall i\in\{1,\ldots,m\}\text{ we have }(\beta_j)^{-1}(a_{i,j})<(\beta_j)^{-1}(b_{i,j}) \tag{20.374}$$

$$\forall i\in\{1,\ldots,m\}\quad [a_{i,j},b_{i,j}[= \bigsqcup_{l\in\{(\beta_j)^{-1}(a_{i,j}),\ldots,(\beta_j)^{-1}(b_{i,j})-1\}}[\beta_j(l),\beta_j(l+1)[\tag{20.375}$$

$$[a_j,b_j[= \bigsqcup_{i\in\{1,\ldots,n_j\}}[\beta_i(i),\beta_j(i+1)[\tag{20.376}$$

Because of [eqs: 20.371 and 20.372] we can apply the previous lemma [lemma: 20.291] giving

$$\prod_{j\in\{1,\ldots,n\}}[a_j,b_j[= \bigsqcup_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{1,\ldots,n_j-1\}}\left(\prod_{j\in\{1,\ldots,n\}}[\beta_j(\rho_j)-\beta_j(\rho_j+1)[\right) \tag{20.377}$$

$$\prod_{j=1}^{n}(b_j-a_j) = \sum_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{1,\ldots,n_j-1\}}\left(\prod_{j\in\{1,\ldots,n\}}(\beta_j(\rho_j+1)-\beta_j(\rho_j))\right) \tag{20.378}$$

Let $i\in\{1,\ldots,m-1\}$. As $a_{i,j}=\beta_j((\beta_j)^{-1}(a_{i,j}))$ and $b_{i,j}=\beta_j((\beta_j)^{-1}(b_{i,j}))$ and $\forall i\in\{(\beta_j)^{-1}(a_{i,j}),\ldots,(\beta_j)^{-1}(b_{i,j})-1\}$ we have by [eq: 20.372] that $\beta_j(i)<\beta_j(i+1)$ we can use [[lemma: 20.291] again to get

$$\prod_{j\in\{1,\ldots,n\}}[a_{i,j},b_{i,j}[= \bigsqcup_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{(\beta_j)^{-1}(a_{i,j}),\ldots,(\beta_j)^{-1}(b_{i,j})-1\}}\left(\prod_{j=1}^{n}[\beta_j(\rho_j),\beta_j(\rho_j)+1[\right) \tag{20.379}$$

$$\prod_{j\in\{1,\ldots,n\}}(b_{i,j}-a_{i,j}) = \sum_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{(\beta_j)^{-1}(a_{i,j}),\ldots,(\beta_j)^{-1}(b_{i,j})-1\}}\left(\prod_{j=1}^{n}(\beta_j(\rho_j+1)-\beta_j(j))\right) \tag{20.380}$$

To relate [eq: 20.377] to [eq: 20.380] we prove now the following:

$$\bigsqcup_{i\in\{1,\ldots,m\}}\left(\prod_{j\in\{1,\ldots,n\}}\{(\beta_j)^{-1}(a_{i,j}),\ldots,(\beta_j)^{-1}(b_{i,j})-1\}\right) = \prod_{j\in\{1,\ldots,n\}}\{1,\ldots,n_j-1\} \tag{20.381}$$

Proof. Let $i \in \{1,\ldots,m\}$ and $j \in \{1,\ldots,n\}$. From [eq: 20.370] it follows that $(\beta_j)^{-1}(a_{i,j}), (\beta_j)^{-1}(b_{i,j}) \in \{1,\ldots, m_j\}$, further by [eq: 20.374] we have $(\beta_j)^{-1}(a_{i,j}) \leqslant (\beta_j)^{-1}(b_{i,j}) - 1$ so that $\{(\beta_j)^{-1}(a_{i,j}),\ldots,(\beta_j)^{-1}(b_{i,j}) - 1\} \subseteq \{1,\ldots,m_j - 1\}$. Applying [theorem: 2.141] gives us then $\prod_{j\in\{1,\ldots,n\}} \{(\beta_j)^{-1}(a_{i,j}),\ldots,(\beta_j)^{-1}(b_{i,j}) - 1\} \subseteq \prod_{j\in\{1,\ldots,m\}} \{1,\ldots,n_j - 1\}$ hence we have

$$\bigcup_{i\in\{1,\ldots,m\}} \left(\prod_{j\in\{1,\ldots,n\}} \{(\beta_j)^{-1}(a_{i,j}),\ldots,(\beta_j)^{-1}(b_{i,j}) - 1\} \right) \subseteq \prod_{j\in\{1,\ldots,n\}} \{1,\ldots,n_j - 1\} \tag{20.382}$$

For the opposite inclusion let $\rho \in \prod_{j\in\{1,\ldots,n\}} \{1,\ldots,n_j - 1\}$. For $j \in \{1,\ldots,n\}$ $\rho_j \in \{1,\ldots,n_j - 1\}$ we have by [eq: 20.372] that $\beta_j(\rho_j) < \beta_j(\rho_j + 1)$ so that $\beta_j(\rho_j) \in [\beta_j(\rho_j), \beta_j(\rho_j)[$. Hence

$$\begin{aligned}
(\beta_1(\rho_1),\ldots,\beta_n(\rho_n)) &\in \prod_{j\in\{1,\ldots,n\}} [\beta_j(\rho_j), \beta_j(\rho_j)[\\
&\subseteq \bigsqcup_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{1,\ldots,n_j-1\}} \left(\prod_{j\in\{1,\ldots,n\}} [\beta_j(\rho_j), \beta_j(\rho_j+1)[\right) \\
&\underset{\text{[eq: 20.377]}}{=} \prod_{j\in\{1,\ldots,n\}} [a_j, b_j[\\
&\underset{\text{hypothesis}}{=} \bigsqcup_{i\in\{1,\ldots,m\}} \left(\prod_{j\in\{1,\ldots n\}} [a_{i,j}, b_{i,j}[\right)
\end{aligned}$$

Hence

$$\exists k \in \{1,\ldots,m\} \text{ such that } (\beta_1(\rho_1),\ldots,\beta_n(\rho_n)) \in \prod_{j\in\{1,\ldots n\}} [a_{k,j}, b_{k,j}[\tag{20.383}$$

Assume now that $\exists j \in \{1,\ldots,n\}$ such that $b_{k,j} < \beta_j(\rho_j + 1)$ then $\beta_j(\rho_j) \underset{\text{[eq: 20.383]}}{<} b_{k,j} < \beta_j(\rho_j + 1)$ so that by [eq: 20.373] $(\beta_j)^{-1}(\beta_j(\rho_j)) < (\beta_j)^{-1}(b_{k,j}) < (\beta_j)^{-1}(\rho_j + 1)$, hence $\rho_j < (\beta_j)^{-1}(b_{k,j}) < \rho_j + 1$ from which it follows that $0 < (\beta_j)^{-1}(b_{k,j}) - 1 < 1$ which, as $(\beta_j)^{-1}(b_{k,j})$ is a whole number [because $(\beta_j)^{-1}(b_{k,j}) \in \{1,\ldots,n_j\}$], is impossible. Hence the assumption is wrong and we must have that

$$\forall j \in \{1,\ldots,n\} \;\; \beta_j(\rho_j + 1) \leqslant b_{k,j} \tag{20.384}$$

So given $j \in \{1,\ldots,n\}$ we hav $a_{k,j} \underset{\text{[eq: 20.383]}}{\leqslant} \beta_j(\rho_j) \underset{\text{[eq: 20.372]}}{<} \beta_j(\rho_j + 1) \underset{\text{[eq: 20.384}}{\leqslant} b_{k,j}$. applying then [eq: 20.373] proves that $(\beta_j)^{-1}(a_{k,j}) \leqslant \rho_j < \rho_j + 1 \leqslant (\beta_j)^{-1}(b_{k,j})$, hence $(\beta_j)^{-1}(a_{k,j}) \leqslant \rho_j \leqslant (\beta_j)^{-1}(b_{k,j}) - 1$ proving that $\rho_j \in \{(\beta_j)^{-1}(a_{k,j}), (\beta_j)^{-1}(b_{k,j}) - 1\}$ from which it follows that $\rho \in \prod_{j\in\{1,\ldots,n\}} \{(\beta_j)^{-1}(a_{k,j}), (\beta_j)^{-1}(b_{k,j}) - 1\}$. This prove that

$$\prod_{j\in\{1,\ldots,n\}} \{1,\ldots,n_j - 1\} \subseteq \bigcup_{i\in\{1,\ldots,m\}} \left(\prod_{j\in\{1,\ldots,n\}} \{(\beta_j)^{-1}(a_{i,j}),\ldots,(\beta_j)^{-1}(b_{i,j}) - 1\} \right)$$

which combined with [eq: 20.382] results in

$$\prod_{j\in\{1,\ldots,n\}} \{1,\ldots,n_j - 1\} = \bigcup_{i\in\{1,\ldots,m\}} \left(\prod_{j\in\{1,\ldots,n\}} \{(\beta_j)^{-1}(a_{i,j}),\ldots,(\beta_j)^{-1}(b_{i,j}) - 1\} \right) \tag{20.385}$$

To finish the prove for [eq: 20.381] we must prove that it is a pairwise disjoint union. So let $k, l \in \{1,\ldots,m\}$ with $k \neq l$ and assume that

$$\exists r \in \prod_{j\in\{1,\ldots,n\}} \{(\beta_j)^{-1}(a_{k,j}),\ldots,(\beta_j)^{-1}(b_{k,j}) - 1\} \bigcap \prod_{j\in\{1,\ldots,n\}} \{(\beta_j)^{-1}(a_{l,j}),\ldots,(\beta_j)^{-1}(b_{l,j}) - 1\}$$

then $\forall j \in \{1,\ldots,n\}$

$$(\beta_j)^{-1}(a_{k,j}) \leqslant r \leqslant (\beta_j)^{-1}(b_{k,j}) - 1 \wedge (\beta_j)^{-1}(a_{l,j}) \leqslant r \leqslant (\beta_j)^{-1}(b_{l,j}) - 1$$

or

$$(\beta_j)^{-1}(a_{k,j}) \leqslant r < (\beta_j)^{-1}(b_{k,j}) \wedge (\beta_j)^{-1}(a_{l,j}) \leqslant r < (\beta_j)^{-1}(b_{l,j})$$

applying then [eq: 20.372] gives

$$a_{k,j} \leqslant \beta_j(r) < b_{k,j} \wedge a_{l,j} \leqslant \beta_j(r) < b_{l,j} \text{ or } \beta_j(r) \in [a_{k,j}, b_{k,j}[\wedge \beta_j(r) \in [a_{l,j}, b_{l,j}[$$

proving that $(\beta_1(r),...,\beta_n(r)) \in \left(\prod_{i\in\{1,\dots,n\}} [a_{k,i}, b_{k,i}[\right) \bigcap \left(\prod_{i\in\{1,\dots,n\}} [a_{l,i}, b_{l,i}[\right)$ which as by the hypothesis $(\beta_1(r),\dots,\beta_n(r)) \in \left(\prod_{i\in\{1,\dots,n\}} [a_{k,i}, b_{k,i}[\right) \bigcap \left(\prod_{i\in\{1,\dots,n\}} [a_{l,i}, b_{l,i}[\right) = \varnothing$ is a contradiction hence we must have that

$$\prod_{j\in\{1,\dots,n\}} \{(\beta_j)^{-1}(a_{k,j}),\dots,(\beta_j)^{-1}(b_{k,j})-1\} \bigcap \prod_{j\in\{1,\dots,n\}} \{(\beta_j)^{-1}(a_{l,j}),\dots,(\beta_j)^{-1}(b_{l,j})-1\}$$

the above together with [eq: 20.385] proves finally [eq: 20.381]. □

Finally we are able to finish the prove of the lemma.

$$\begin{aligned}
\prod_{i=1}^{n} (b_i - a_i) &\underset{\text{[eq: 20.378]}}{=} \\
\sum_{\rho\in\prod_{i\in\{1,\dots,n\}}\{1,\dots,n_j-1\}} \left(\prod_{j\in\{1,\dots,n\}} (\beta_j(\rho_j+1) - \beta_j(\rho_j))\right) &\underset{\substack{\text{[eq: 20.381]}\\ \text{[theorem: 11.44]}}}{=} \\
\sum_{i\in\{1,\dots,m\}} \left(\sum_{\rho\in\prod_{j\in\{1,\dots,n\}}\{(\beta_j)^{-1}(a_{i,j}),\dots,(\beta_j)^{-1}(b_{i,j})-1\}} (\beta_j(\rho_j+1) - \beta_j(\rho_j))\right) &\underset{\text{[eq: 20.380]}}{=} \\
\sum_{i\in\{1,\dots,m\}} \left(\prod_{j\in\{1,\dots,n\}} (b_{i,j} - a_{i,j})\right)
\end{aligned}$$

□

Now we are finally ready to prove that $\mathrm{vol}^n \colon \mathcal{R}^n \bigcup \{\varnothing\} \to [0,\infty]$ is a finite content.

Theorem 20.294. *Let $n \in \mathbb{N}$ then $\mathrm{vol}^n \colon \mathcal{R}^n \bigcup \{\varnothing\} \to [0,\infty]$ [see definition: 20.287] is a finite content on the semi-ring $\mathcal{R}^n \bigcup \{\varnothing\}$ on $\mathbb{R}^n$ [see theorem: 20.285]*

Proof. First from the definition of vol^n [see definition: 20.287] it follows that

$$\mathrm{vol}^n \text{ is finite} \tag{20.386}$$

and

$$\mathrm{vol}^n(\varnothing) = \varnothing \tag{20.387}$$

Let $m \in \mathbb{N}$ and $\{R_i\}_{i\in\{1,\dots,m\}} \subseteq \mathcal{R}^n \bigcup \{\varnothing\}$ be pairwise disjoint such that $\bigsqcup_{i\in\{1,\dots,m\}} R_i \in \mathcal{R}^n \bigcup \{\varnothing\}$ then we have two possibilities for $\bigsqcup_{i\in\{1,\dots,m\}} R_i$

$\boldsymbol{\bigsqcup_{i\in\{1,\dots,m\}} R_i = \varnothing}$**.** Then we must have $\forall i \in \{1,\dots,m\}$ that $R_i = \varnothing$ so that

$$\mathrm{vol}^n\left(\bigsqcup_{i\in\{1,\dots,m\}} R_i\right) = \mathrm{vol}^n(\varnothing) = 0 = \sum_{i=1}^{n} 0 = \sum_{i=1}^{n} \mathrm{vol}^n(\varnothing) = \sum_{i=1}^{n} \mathrm{vol}^n(R_i)$$

$\boldsymbol{\bigsqcup_{i\in\{1,\dots,m\}} R_i \neq \varnothing}$**.** Then for $R = \bigsqcup_{i\in\{1,\dots,m\}} R_i$ there exist a $\{[a_i, b_i[\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{I}_{[[}$ such that

$$R = \prod_{i\in\{1,\dots,n\}} [a_i, b_i[\in \mathcal{R}^n \tag{20.388}$$

Then there exist a $i \in \{1,\dots,m\}$ such that $R_i \neq \varnothing$ so that $I = \{i \in \{1,\dots,m\} | R_i \neq \varnothing\} \neq \varnothing$ hence there exist a $k \in \mathbb{N}$ and a bijection

$$\beta \colon \{1,\dots,k\} \to I$$

Then $\forall i \in \{1,\ldots,k\}$ $R_{\beta(i)} \neq \varnothing$ and $\forall i,j \in \{1,\ldots,k\}$ with $i \neq j$ we have, as β is injective, that $\beta(i) \neq \beta(j)$ so that $R_{\beta(i)} \bigcap R_{\beta(j)} = \varnothing$. So that

$$\{R_{\beta(i)}\}_{i \in \{1,\ldots,k\}} \subseteq \mathcal{R}^n \text{ is pairwise disjoint} \tag{20.389}$$

Let $R = \bigsqcup_{i \in \{1,\ldots,m\}} R_i$ then we have

$$R = \bigsqcup_{i \in \{1,\ldots,m\}} R_i \underset{[\text{theorem: } 2.134]}{=} \bigsqcup_{i \in I} R_i \underset{[\text{theorem: } 2.119]}{=} \bigsqcup_{i \in \{1,\ldots k\}} R_{\beta(i)} \tag{20.390}$$

Further as $\{R_{\beta(i)}\}_{i \in \{1,\ldots,k\}} \subseteq \mathcal{R}^n$ we have $\forall i \in \{1,\ldots,k\}$ that

$$R_{\beta(i)} = \Pi_{j \in \{1,\ldots,n\}} [a_{i,j}, b_{i,j}[\subseteq \mathcal{R}n. \tag{20.391}$$

So that

$$\prod_{i \in \{1,\ldots,n\}} [a_i, b_i[\underset{[\text{eq: } 20.388]}{=} \bigsqcup_{i \in \{1,\ldots,k\}} \left(\prod_{j \in \{1,\ldots,n\}} [a_{i,j}, b_{i,j}[\right) \tag{20.392}$$

Then we have

$$\begin{aligned}
\mathrm{vol}^n(R) &= \prod_{i=1}^{n} (\mathrm{begin}(R)_i = \mathrm{end}(R)_i) \\
&= \prod_{i=1}^{n} (b_i - a_i) \\
&\underset{\substack{[\text{eq: } 20.392] \\ [\text{lemma: } 20.293]}}{=} \sum_{i=1}^{k} \left(\prod_{j=1}^{n} (b_{i,j} - a_{i,j}) \right) \\
&\underset{[\text{eq: } 20.391]}{=} \sum_{i=1}^{k} \left(\prod_{j=1}^{n} (\mathrm{begin}(R_{\beta(i)})_j - \mathrm{end}(R_{\beta(j)})_j) \right) \\
&= \sum_{i=1}^{k} \mathrm{vol}^n(R_{\beta(i)}) \\
&= \sum_{i \in \{1.,\ldots,k\}} \mathrm{vol}^n(R_{\beta(i)}) \\
&\underset{[\text{theorem: } 11.36]}{=} \sum_{i \in I} \mathrm{vol}^n(R_i) \\
&= \sum_{i \in I} \mathrm{vol}^n(R_i) + 0 \\
&\underset{i \notin I = R_i = \varnothing}{=} \sum_{i \in I} \mathrm{vol}^n(R_i) + \sum_{i \in \{1,\ldots,m\} \setminus I} \mathrm{vol}^n(R_i) \\
&= \sum_{i \in \{1,\ldots,m\}} \mathrm{vol}^n(R_i) \\
&= \sum_{i=1}^{m} \mathrm{vol}^n(R_i)
\end{aligned}$$

Hence

$$\mathrm{vol}^n\left(\bigsqcup_{i \in \{1,\ldots,m\}} R_i \right) = \sum_{i=1}^{n} \mathrm{vol}^n(R_i)$$

which finished the proof of the theorem. □

Next we use [theorem: 20.259] to prove that vol^n is actually a pre-measure on the semi-ring $\mathcal{R}^n \bigcup \{\varnothing\}$. To do this we need the following lemma that will allows us to 'aproximate' a half open rectangle by a compact set.

Lemma 20.295. *Let $n \in \mathbb{N}$, $\varepsilon \in \mathbb{R}^+$ and $\{x_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathbb{R}^+$ then $\exists \{\varepsilon_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathbb{R}^+$ with $0 < \varepsilon_i < x_i$ such that $\prod_{i=1}^{n} x_i < (\prod_{i=1}^{n} (x_i - \varepsilon_i)) + \varepsilon$*

Proof. We use induction on n. Let $\varepsilon \in \mathbb{R}^n$ and define

$$S_\varepsilon = \left\{ n \in \mathbb{N} | \text{If } \{x_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathbb{R}^+ \text{ then } \exists \{\varepsilon_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathbb{R}^+ \text{ with } \forall i \in \{1,\ldots,n\}\ 0 < \varepsilon_i < x_i \text{ such that } \prod_{i=1}^n x_i < \left(\prod_{i=1}^n (x_i - \varepsilon_i) \right) + \varepsilon \right\}$$

then we have:

- $\boldsymbol{1 \in S_\varepsilon}$**.** If $\{x_i\}_{i\in\{1,\ldots,1\}} \subseteq \mathbb{R}^+$ then $x_1 \in \mathbb{R}^+$, define $\varepsilon_1 = \min\left(\frac{x_1}{2}, \frac{\varepsilon}{2}\right) \in \mathbb{R}^+$ then $0 < \varepsilon_1 \leqslant \frac{x_1}{2} < x_1$ and $\prod_{i=1}^1 x_i - \prod_{i=1}^1 (x_i - \varepsilon_i) = x_1 - (x_1 - \varepsilon_1) = \varepsilon_1 \leqslant \frac{\varepsilon}{2} < \varepsilon$ so that $\prod_{i=1}^1 x_i < (\prod_{i=1}^1 (x_i - \varepsilon_i)) + \varepsilon$ proving that $1 \in \mathcal{S}$.
- $\boldsymbol{n \in S_\varepsilon \Rightarrow n+1 \in S_\varepsilon}$**.** Assume that $\{x_i\}_{i\in\{1,\ldots,n+1\}} \subseteq \mathbb{R}^+$ then as $n \in \mathcal{S}$ there exists $\{\varepsilon_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathbb{R}^+$ with $0 < \varepsilon_i < x_i$ and $\prod_{i=1}^n x_i < (\prod_{i=1}^n (x_i - \varepsilon_i)) + \frac{\varepsilon}{2 \cdot x_{n+1}}$ so that as $0 < x_{n+1}$ we have

$$x_{n+1} \cdot \prod_{i=1}^n x_i - x_{n+1} \cdot \prod_{i=1}^n (x_i - \varepsilon_i) < \frac{\varepsilon}{2} \tag{20.393}$$

Take now $\varepsilon_{n+1} = \min\left(\frac{\varepsilon}{4 \cdot \prod_{i=1}^n x_i}, \frac{x_{n+1}}{2}\right)$ then $0 < \varepsilon_{n+1} \leqslant \frac{x_{n+1}}{2} < x_{n+1}$ and $\varepsilon_{n+1} \cdot (\prod_{i=1}^n x_i) \leqslant \frac{\varepsilon}{4} < \frac{\varepsilon}{2}$. Now

$$\begin{aligned}
\prod_{i=1}^{n+1} x_i - \prod_{i=1}^{n+1} (x_i - \varepsilon_i) &= x_{n+1} \cdot \prod_{i=1}^n x_i - (x_{n+1} - \varepsilon_{n+1}) \cdot \prod_{i=1}^n (x_i - \varepsilon_i) \\
&= x_{n+1} \cdot \left(\prod_{i=1}^n x_i - \prod_{i=1}^n (x_i - \varepsilon_i) \right) + \varepsilon_{n+1} \cdot \prod_{i=1}^n (x_i - \varepsilon_i) \\
&\leqslant x_{n+1} \cdot \left(\prod_{i=1}^n x_i - \prod_{i=1}^n (x_i - \varepsilon_i) \right) + \frac{\varepsilon}{4} \\
&\underset{\text{[eq: 20.393]}}{<} \frac{\varepsilon}{2} + \frac{\varepsilon}{4} \\
&< \varepsilon
\end{aligned}$$

proving that $n+1 \in S_\varepsilon$. □

Now we can prove that the volume function is a pre-measure.

Theorem 20.296. *Let $n \in \mathbb{N}$ then the function $\mathrm{vol}^n : \mathcal{R}^n \bigcup \{\varnothing\} \to [0,\infty]$ is a finite pre-measure on the semi-ring $\mathcal{R}^n \bigcup \{\varnothing\}$.*

Proof. Consider the topological space $\langle \mathbb{R}^n, \|\|_n \rangle$ based on the canonical topology $\|\|_n$ [see theorem: 14.95]. Let $A \in \mathcal{R}^n \bigcup \{\varnothing\}$ then for A we have either:

- $\boldsymbol{A = \varnothing}$**.** Take then $A_\varepsilon = \varnothing$ and $K_\varepsilon = \varnothing$. Then K_ε is compact by [example: 14.227], $A_\varepsilon \subseteq K_\varepsilon \subseteq A$ and $\mathrm{vol}^n(A) - \mathrm{vol}^n(A_\varepsilon) = 0 - 0 = 0 < \varepsilon$.
- $\boldsymbol{A \neq \varnothing}$**.** Then there exiss $a, b \in \mathbb{R}^n$ with $a < b$ such that $A = [a, b[= \prod_{i\in\{1,\ldots,n\}} [a_i, b_i[$. As $\forall i \in \{1,\ldots,n\}$ $a_i < b_i \Rightarrow b_i - a_i \in \mathbb{R}^+$ we can use [lemma: 20.295] there exists a $\{\varepsilon_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathbb{R}^+$ such that

$$\forall i \in \{1,\ldots,n\}\ 0 < \varepsilon_i < b_i - a_i \text{ and } \prod_{i=1}^n (b_i - a_i) < \left(\prod_{i=1}^n ((b_i - a_i) - \varepsilon_i) \right) + \varepsilon \tag{20.394}$$

From the above it follows that $\forall i \in \{1,\ldots,n\}$ $a_i < b_i - \varepsilon_i$ so that

$$A_\varepsilon = \prod_{i\in\{1,\ldots,n\}} [a_i, b_i - \varepsilon_i[\in \mathcal{R}^n \subseteq \mathcal{R}^n \bigcup \{\varnothing\}$$

Further by [theorem: 14.276]

$$K_\varepsilon = \prod_{i\in\{1,\dots,n\}} [a, b_i - \varepsilon_i] \text{ is compact}$$

As $\forall i \in \{1,\dots,n\}$ $[a_i, b_i - \varepsilon_i[\subseteq [a_i, b_i - \varepsilon_i] \subseteq [a_i, b_i]$ it follows from [theorem: 2.141] that

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A$$

Further

$$\mathrm{vol}^n(A) - \mathrm{vol}^n(A_\varepsilon) = \prod_{i=1}^n (b_i - a_i) - \prod_{i=1}^n ((b_i - a_i) - \varepsilon_i) \underset{\text{[eq: 20.394]}}{<} \varepsilon$$

So in all cases we found a $A_\varepsilon \in \mathcal{R}^n \bigcup \{\varnothing\}$ and a compact set K_ε such that $A_\varepsilon \subseteq K_\varepsilon \subseteq A$ and $\mathrm{vol}^n(A) - \mathrm{vol}^n(A_\varepsilon) < \varepsilon$. Finally using [theorem: 20.259] it follows that

$$\mathrm{vol}^n : \mathcal{R}^n \bigcup \{\varnothing\} \to [0,\infty] \text{ is a pre-measure on } \mathcal{R}^n \bigcup \{\varnothing\}$$

which is finite by [theorem: 20.294]. □

Next we use a derivate of the Carathéodry theorem [theorem: 20.238] to extend vol^n to the Lebesgue measure on Lebesgue measurable sets in $\mathbb{R}^n$.

Theorem 20.297. *If we define*

$$(\lambda^n)^* : \mathcal{P}[\mathbb{R}^n] \to [0,\infty] \text{ by } (\lambda^n)^*(A) = \begin{cases} \infty \text{ if } \mathcal{S}[A] = \varnothing \\ \inf\left(\{\sum_{i=1}^\infty \mu(A_i) | \{A_i\}_{i\in\{1,\dots,n\}} \in \mathcal{S}[A]\right) \end{cases}$$

where

$$\mathcal{S}[A] = \left\{ \{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{R}^n \bigsqcup \{\varnothing\} | A \subseteq \bigcup_{i\in\mathbb{N}} A_i \right\}$$

then

$$(\lambda^n)^* \text{ is a outer measure}$$

$$\mathcal{L}[\mathbb{R}^n] = \left\{ A \in \mathcal{P}[\mathbb{R}^n] | \forall B \in \mathcal{P}(\mathbb{R}^n) \text{ we have } (\lambda^n)^*(B) = (\lambda^n)^*\left(B \bigcap A\right) + (\lambda^n)^*(B \setminus A) \right\}$$

is a σ-algebra on $\mathbb{R}^n$ such that

$$\sigma\left[\mathcal{R}^n \bigcup \{\varnothing\}\right] \subseteq \mathcal{L}[\mathbb{R}^n]$$

and

$$\overline{\lambda^n} = ((\lambda^n)^\star)_{|\mathcal{L}(\mathbb{R}^n)} : \mathcal{L}[\mathbb{R}^n] \to [0,\infty] \text{ is a measure on } \mathcal{L}[\mathbb{R}^n]$$

and

$$\lambda^n = ((\lambda^n)^\star)_{|\sigma[\mathcal{R}^n \bigsqcup \{\varnothing\}]} : \sigma\left[\mathcal{R}^n \bigsqcup \{\varnothing\}\right] \to [0,\infty] \text{ is a measure on } \sigma\left[\mathcal{R}^n \bigsqcup \{\varnothing\}\right]$$

and

$$((\lambda^n)^\star)_{|\mathcal{R}^n \bigsqcup \{\varnothing\}} = \mathrm{vol}^n$$

Further if $\mu : \sigma[\mathcal{R}^n \bigsqcup \{\varnothing\}] \to [0,\infty]$ is another measure such that $\mu_{|\mathcal{R}^n \bigsqcup \{\varnothing\}} = \mathrm{vol}^n$ then

$$\mu = \lambda^n$$

We have then

$$\langle \mathbb{R}^n, \mathcal{L}[\mathbb{R}^n], \overline{\lambda^n} \rangle \text{ is a measure space called the Lebesgue mesaure space on } \mathbb{R}^n$$

where

$$\mathcal{L}[\mathbb{R}^n] \text{ is called the set of Lebesgue measurable sets in } \mathbb{R}^n$$

and

$$\overline{\lambda^n} \text{ is called the Lebesgue mearuse on } \mathbb{R}^n$$

***Note* 20.298.** *As by [theorem: 20.286] $\mathcal{B}[\mathbb{R}^n] = \sigma[\mathcal{R}^n \bigsqcup \{\varnothing\}]$ we have also*

$$\mathcal{B}[\mathbb{R}^n] \subseteq \mathcal{L}[\mathbb{R}^n]$$

and

$$\lambda^n: \mathcal{B}[\mathbb{R}^n] \to [0,\infty] \text{ is a measure on } \mathcal{B}[\mathbb{R}^n]$$

so that

$$\langle \mathbb{R}^n, \mathcal{B}[\mathbb{R}^n], \lambda^n \rangle \text{ is a measure space called the Borel measure space on } \mathbb{R}^n$$

and

$$\lambda^n \text{ is called the Borel measure on } \mathbb{R}^n$$

Proof. Using [theorem: 20.296] we have that

$$\mathrm{vol}^n: \mathcal{R}^n \bigsqcup \{\varnothing\} \to [0,\infty] \text{ is a pre-measure on } \mathbb{R}^n \tag{20.395}$$

Define now $\{G_i\}_{i\in\mathbb{N}} \subseteq \mathcal{R}^n$ by $G_i = \prod_{j\in\{1,\ldots,n\}} [-i,i[$. Then as $\forall i \in \mathbb{N}$ $[-i,i[\subseteq [-(i+1),i+1[$ it follows from [theorem: 2.141] that $G_i \subseteq G_{i+1}$, hence we have

$$\forall i \in \mathbb{N} \text{ we have } G_i \subseteq G_{i+1} \text{ and as } \mathrm{vol}^n \text{ is finite that } \mathrm{vol}^n(G_i) < \infty \tag{20.396}$$

Let $x \in \mathbb{R}^n$ then $\forall i \in \{1,\ldots,n\}$ we have by [theorem: 10.30] that there exists $n_i, m_i \in \mathbb{N}$ such that $-n_i < x_i < m_i$. Take $k = \max(\{n_i | i \in \mathbb{N}\} \bigcup \{m_i | i \in \mathbb{N}\}) \in \mathbb{N}$ then $\forall i \in \mathbb{N}$ we have $-k < n_i < x_i < m_i < k$ so that $x \in G_k \subseteq \bigcup_{i\in\mathbb{N}} G_i \subseteq \mathbb{R}^n$. Hence we have

$$\mathbb{R}^n = \bigcup_{i\in\mathbb{N}} G_i \tag{20.397}$$

The proof follows then from [eqs: 20.395, 20.396, 20.397] and [theorem: 20.238]. □

20.4.5 Completeness of measures

Definition 20.299. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $B \in \mathcal{P}(X)$ is **μ-negligible** [sometimes also called μ-null] if there exist a $A \in \mathcal{S}$ with $\mu(A) = 0$ such that $B \subseteq A$. The set of all μ-negligible sets is noted as $\mathcal{N}_\mu$ hence*

$$\mathcal{N}_\mu = \{A \in \mathcal{P}(X) | \exists B \in \mathcal{A} \text{ with } \mu(B) = \varnothing \text{ such that } A \subseteq B\}$$

Lemma 20.300. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measurable space, I a countable set [i.e. finite or denumerable] and $\{A_i\}_{i\in I} \subseteq \mathcal{A}$ a countable family of sets such that $\forall i \in I$ $\mu(A_i)$ then $\mu(\bigcup_{i\in I} A_i) = 0$*

***Note* 20.301.** *[theorem: 20.143] ensures that $\bigcup_{i\in I} A_i \in \mathcal{A}$ so that $\mu(\bigcup_{i\in I} A_i)$ is well defined.*

Proof. As I is countable we have either:

***I* is finite.** Then there exist a $n \in \mathbb{N}$ and a bijection $\beta: \{1,\ldots,n\} \to I$. Define

$$\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \begin{cases} A_{\beta(i)} \text{ if } i \in \{1,\ldots,n\} \\ \varnothing \text{ if } i \in \mathbb{N} \setminus \{1,\ldots,n\} \end{cases}$$

then we have

$$\forall i \in \mathbb{N} \text{ that } \mu(B_i) = 0$$

Let $x \in \bigcup_{i\in I} A_i$ then there exist a $i \in I$ such that $x \in A_i$. As β is a bijection there exist a $j \in \{1,\ldots,n\}$ such that $i = \beta(j)$ hence $x \in A_{\beta(j)} = B_j \subseteq \bigcup_{j\in\mathbb{N}} B_j$ so that

$$\bigcup_{i\in I} A_i \subseteq \bigcup_{j\in\mathbb{N}} B_j$$

On the other hand if $x \in \bigcup_{j\in\mathbb{N}} B_j$ then $\exists j \in \mathbb{N}$ such that $x \in B_j$. We must have that $j \in \{1,\ldots,n\}$ for if $j \in \mathbb{N} \setminus \{1,\ldots,n\}$ then $B_j = \varnothing$, hence $x \in B_j = A_{\beta(j)} \subseteq \bigcup_{i\in I} A_i$ which proves that $\bigcup_{j\in\mathbb{N}} B_j \subseteq \bigcup_{i\in I} A_i$. Combining this result with the above gives

$$\bigcup_{i\in I} A_i = \bigcup_{i\in\mathbb{N}} B_i$$

Using the above we have

$$\begin{aligned}\mu\left(\bigcup_{i\in I} A_i\right) &= \mu\left(\bigcup_{i\in\mathbb{N}} B_i\right)\\ &\underset{\text{[theorem: 20.205]}}{\leqslant} \sum_{i=1}^{\infty}\mu(B_i)\\ &= \sum_{i=1}^{\infty} 0\\ &= 0\end{aligned}$$

which proves, as $0\leqslant\mu(\bigcup_{i\in I}A_i)$, that

$$\mu\left(\bigcup_{i\in I} A_i\right)=0$$

***I* is denumerable.** Then there exist a bijection $\beta:\mathbb{N}\to I$. Define

$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A} \text{ by } B_i=A_{\beta(i)}$$

then

$$\forall i\in\mathbb{N} \text{ we have } \mu(B_i)=0$$

Let $x\in\bigcup_{i\in I}A_i$ then there exist a $i\in I$ such that $x\in A_i$, as β is a bijection there exist a $j\in\mathbb{N}$ such that $i=\beta(j)$, hence $x\in A_{\beta(j)}=B_j\subseteq\bigcup_{j\in\mathbb{N}}B_j$ so that

$$\bigcup_{i\in I} A_i\subseteq\bigcup_{j\in\mathbb{N}} B_j$$

On the other hand if $x\in\bigcup_{j\in\mathbb{N}}B_j$ then there exist a $j\in\mathbb{N}$ such that $x\in B_j=A_{\beta(j)}\subseteq\bigcup_{j\in I}A_j$ which proves that $\bigcup_{j\in\mathbb{N}}B_j\subseteq\bigcup_{j\in I}A_j$. Combining this with the above proves that

$$\bigcup_{i\in I} A_i=\bigcup_{j\in\mathbb{N}} B_j$$

Using the above we have

$$\begin{aligned}\mu\left(\bigcup_{i\in I} A_i\right) &= \mu\left(\bigcup_{i\in\mathbb{N}} B_i\right)\\ &\underset{\text{[theorem: 20.205]}}{\leqslant} \sum_{i\in\mathbb{N}}\mu(B_i)\\ &= \sum_{i\in\mathbb{N}} 0\\ &= 0\end{aligned}$$

which proves, as $0\leqslant\mu(\bigcup_{i\in I}A_i)$, that

$$\mu\left(\bigcup_{i\in I} A_i\right)=0$$

□

We have the following properties for μ-negligible sets.

Theorem 20.302. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measurable space then we have*

1. $\varnothing\in\mathcal{N}_\mu$
2. *If $A\in\mathcal{N}_\mu$ then for every $B\subseteq A$ we have $B\in\mathcal{N}_\mu$*
3. *If I is countable, $\{A_i\}_{i\in I}\subseteq\mathcal{N}_\mu$ a countable family of μ-negligible sets then we have that*
   a. $\bigcup_{i\in\mathbb{N}}A_i\subseteq\mathcal{N}_\mu$
   b. *If $I\neq\varnothing$ then $\bigcap_{i\in\mathbb{N}}A_i\subseteq\mathcal{N}_\mu$*

Proof.

1. This is trivial as $\varnothing \subseteq \varnothing \in \mathcal{A}$ and $\mu(\varnothing) = 0$.
2. Let $A \in \mathcal{N}_\mu$ and $B \subseteq A$. As $A \in \mathcal{N}_\mu$ there exists a $C \in \mathcal{A}$ with $\mu(C) = 0$ such that $A \subseteq C$ which as $B \subseteq A$ proves that $B \subseteq C$ so that $B \in \mathcal{N}_\mu$.
3. Assume that $\{A_i\}_{i \in I} \subseteq \mathcal{N}_\mu$ then there exists a $\{B_i\}_{i \in I} \subseteq \mathcal{A}$ such that $\forall i \in I\ \mu(B_i) = 0$ and $A_i \subseteq B_i$. Hence $\bigcup_{i \in I} A_i \subseteq \bigcup_{i \in I} B_i$ and using [lemma: 20.300] we have that
$$\mu\left(\bigcup_{i \in I} B_i\right) = 0$$
which proves that
$$\bigcup_{i \in I} A_i \in \mathcal{N}_\mu$$
Finally if $I \neq \varnothing$ then there exist a $k \in I$ so that $\bigcap_{i \in I} A_i \subseteq A_k \in \mathcal{N}_\mu$ it follows from (2) that $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{N}_\mu$. □

Definition 20.303. (Complete Measures) *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then μ is **complete** if $\forall A \in \mathcal{A}$ with $\mu(A) = 0$ we have $\forall B \in \mathcal{P}(X)$ with $B \subseteq A$ that $B \in \mathcal{A}$. Every measure space with a complete measure is called a **complete measure space**.*

Theorem 20.304. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then*
$$\mu \text{ is complete} \Leftrightarrow \mathcal{N}_\mu \subseteq \mathcal{A}$$

Proof.

⇒. If $A \in \mathcal{N}_\mu$ then there exists a $B \in \mathcal{A}$ with $\mu(B) = 0$ such that $A \subseteq B$. As μ is complete, $B \in \mathcal{A}$, $\mu(B) = 0$ and $A \subseteq B$ it follows that $A \in \mathcal{A}$. Hence $\mathcal{N}_A \subseteq \mathcal{A}$

⇐. Let $A \in \mathcal{A}$ with $\mu(A) = 0$ then for $B \in \mathcal{P}(X)$ with $B \subseteq A$ we have by definition of $\mathcal{N}_\mu$ that $B \in \mathcal{N}_\mu$ hence, as $\mathcal{N}_\mu \subseteq \mathcal{A}$, it follows that $B \in \mathcal{A}$ which proves that μ is complete. □

We prove now that every measure space constructed via the Carathéodory is a complete measure space.

Theorem 20.305. *Let X be a set and $\mu^*: \mathcal{P}(X) \to [0, \infty]$ is a **outer measure** then the measure space*
$$\langle X, \mathcal{M}[\mu^*], (\mu^*)_{|\mathcal{M}[\mu^*]} \rangle \text{ [see theorem: 20.213]}$$
where
$$\mathcal{M}[\mu^*] \underset{\text{[definition: 20.210]}}{=} \left\{A \in \mathcal{P}(X) | \forall B \in P(X) \text{ we have } \mu^*(B) = \mu^*\left(B \bigcap A\right) + \mu^*(B \setminus A)\right\}$$
is a complete measure space.

Proof. If $A \in \mathcal{N}_{(\mu^*)_{|\mathcal{M}[\mu^*]}}$ then there exists a $B \in \mathcal{M}[\mu^*]$ with $\mu^*(B) = (\mu^*)_{|\mathcal{M}[\mu^*]}(B) = 0$ such that $A \subseteq B$. Hence by the definition of a outer measure [see definition: 20.208] we have that $\mu^*(A) \leqslant \mu^*(B) = 0$ which proves that $\mu^*(A) = 0$. Applying then [theorem: 20.212] proves that $A \in \mathcal{M}[\mu^*]$. Hence $\mathcal{N}_{(\mu^*)_{|\mathcal{M}[\mu^*]}} \subseteq \mathcal{M}[\mu^*]$ which by the previous theorem [theorem: 20.304] proves that $\langle X, \mathcal{M}[\mu^*], (\mu^*)_{|\mathcal{M}[\mu^*]} \rangle$ is a complete measure space. □

Corollary 20.306. *We have that*

1. $\left\langle \mathbb{R}, \mathcal{L}[\mathbb{R}], \overline{\lambda} \right\rangle$ *is a complete measure space.*
2. *Let $n \in \mathbb{N}$ then $\langle \mathbb{R}, \mathcal{L}[\mathbb{R}^n], \overline{\lambda^n} \rangle$ is a complete measure space*

Proof.

1. This follows from the previous theorem [theorem: 20.274] and the definition of $\langle \mathbb{R}, \mathcal{L}[\mathbb{R}], \overline{\lambda} \rangle$ [see theorem: 20.274].
2. This follows from the previous theorem [theorem: 20.274] and the definition of $\langle \mathbb{R}^n, \mathcal{L}[\mathbb{R}^n], \overline{\lambda^n} \rangle$ [see theorem: 20.297]. □

Sometimes we have to deal with arbitrary subsets of sets with measure zero, it is then desirable to that there exists a extension of measure space to a bigger measure space in which these sets are elements of the bigger σ-algebra. To do this we introduce the concept of the **completion** of a measure space.

Definition 20.307. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space then the **completion** of $\mathcal{A}$ noted as $\mathcal{A}_\mu$ is defined by*

$$\mathcal{A}_\mu = \{A \in \mathcal{P}(X) | \exists E, F \in \mathcal{A} \text{ such that } E \subseteq A \subseteq F \text{ and } \mu(F \setminus E) = 0\}$$

elements of $\mathcal{A}_\mu$ are called μ-measurable sets.

***Note* 20.308.** *As by [theorem: 20.140] a σ-algebra is a algebra if follows from [theorem: 20.135] that $\forall E$, $F \in \mathcal{A}$ $\mu \setminus F \in \mathcal{A}$ so the above is well defined.*

Next we define a set function of $\overline{\mu}: \mathcal{A}_\mu \to [0, \infty]$, first we need a little lemma needed for the existence of such a function.

Lemma 20.309. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space $A \in \mathcal{P}(X)$ and $E, F \in \mathcal{A}$ such that $E \subseteq A \subseteq F$ and $\mu(F \setminus E) = 0$ then*

$$\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\} \neq \varnothing \text{ [so that } \sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\}) \text{ exists]}$$

and

$$\mu(F) = \mu(E) = \sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\})$$

Proof. As $E \in \mathcal{A} \in \mathcal{A}$ and $E \subseteq A$ it follows that $\mu(E) \in \{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\}$ hence

$$\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\} \neq \varnothing \tag{20.398}$$

and

$$\mu(E) \leqslant \sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\}) \tag{20.399}$$

As $E \subseteq A \subseteq F$ we have $E \subseteq F$ so that by [theorem: 1.35] $F = (F \setminus E) \bigsqcup E$ hence $\mu(F) = \mu(F \setminus E) + \mu(E) = 0 + \mu(E) = \mu(E)$ proving that

$$\mu(E) = \mu(F) \tag{20.400}$$

If $B \in \mathcal{A}$ with $B \subseteq A$ then $B \subseteq F$ so that by [theorem: 20.201] $\mu(B) \leqslant \mu(F) = \mu(E)$ hence

$$\sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\}) \leqslant \mu(E)$$

which combining with [eq: 20.399] proves that

$$\sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\})$$ □

Theorem 20.310. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space then if we define*

$$\overline{\mu}: \mathcal{A}_\mu \to [0, \infty] \text{ by } \overline{\mu}(A) = \sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\})$$

then we have

$$\forall A \in \mathcal{A}_\mu \text{ we have if } E, F \in \mathcal{A} \text{ satsifies } E \subseteq A \subseteq F \text{ and } \mu(F \setminus E) = 0 \text{ then } \mu(E) = \mu(F) = \overline{\mu}(A)$$

and

$$\langle X, \mathcal{A}_\mu, \overline{\mu}\rangle \text{ is a measure space}$$

and

$$\mathcal{A} \subseteq \mathcal{A}_\mu$$

and

$$\mu = (\overline{\mu})_{|\mathcal{A}}$$

*In other words the measure space $\langle X, \mathcal{A}_\mu, \overline{\mu}\rangle$ is a extension of the measure space $\langle X, \mathcal{A}, \mu\rangle$. $\langle X, \mathcal{A}_\mu, \overline{\mu}\rangle$ is called the **completion of the measure space** $\langle X, \mathcal{A}, \mu\rangle$*

***Note* 20.311.** *$\overline{\mu}$ is welll defined because if $A \in \mathcal{A}_\mu$ then there exists $E, F \in \mathcal{A}$ with $E \subseteq A \subseteq F$ and $\mu(F \setminus E) = 0$ so that by [lemma: 20.309] $\{\mu(B) | B \in \mathcal{A}$ with $B \subseteq A\} \neq \varnothing$.*

Proof. Let $A \in \mathcal{A}_\mu$ then if $E, F \in \mathcal{A}$ is such that $E \subseteq A \subseteq F$ and $\mu(F \setminus E) = 0$ it follows from [lemma: 20.309] that

$$\mu(E) = \mu(F) = \sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\}) = \overline{\mu}(A) \tag{20.401}$$

Next we prove that $\mathcal{A}_\mu$ contains $\mathcal{A}$ and is a σ-algebra. Let $A \in \mathcal{A}$ and take $E = \varnothing \in \mathcal{A}$,, $F = A \in \mathcal{A}$ then $E = \varnothing \subseteq A \subseteq A = F$ and $\mu(F \setminus E) = \mu(\varnothing) = 0$ so that $A \in \mathcal{A}_\mu$. Hence we have

$$\mathcal{A} \subseteq \mathcal{A}_\mu \tag{20.402}$$

As $\mathcal{A}$ is a σ-algebra $\varnothing \in \mathcal{A}$ hence using the above it follows that

$$\varnothing \in \mathcal{A}_\mu \tag{20.403}$$

Let $A \in \mathcal{A}_\mu$ then there exists $E, F \in \mathcal{A}$ such that $E \subseteq A \subseteq F$ and $\mu(F \setminus E) = 0$. As $\mathcal{A}$ is a σ-algebra we have that

$$X \setminus E, X \setminus F \in \mathcal{A} \tag{20.404}$$

further applying [theorem: 1.33] gives

$$X \setminus F \subseteq X \setminus A \subseteq X \setminus E \tag{20.405}$$

Next

$$\begin{aligned}
x \in (X \setminus E) \setminus (X \setminus F) \quad &\Leftrightarrow \quad x \in X \setminus E \wedge x \notin X \setminus F \\
&\Leftrightarrow \quad (x \in X \wedge x \notin E) \wedge \neg(x \in X \wedge x \notin F) \\
&\Leftrightarrow \quad (x \in X \wedge x \notin E) \wedge (x \notin X \vee x \in F) \\
&\Leftrightarrow \quad (x \in X \wedge x \notin E \wedge x \notin X) \vee (x \in X \wedge x \notin E \wedge x \in F) \\
&\Leftrightarrow \quad x \in X \wedge x \notin E \wedge x \in F \\
&\underset{F \subseteq X}{\Leftrightarrow} \quad x \notin E \wedge x \in F \\
&\Leftrightarrow \quad F \setminus E
\end{aligned}$$

so that $(X \setminus E) \setminus (X \setminus F) = F \setminus E$ hence

$$\mu((X \setminus E) \setminus (X \setminus F)) = \mu(F \setminus E) = 0 \tag{20.406}$$

From [eqs: 20.404, 20.405 and 20.406] it follows that $X \setminus A \in \mathcal{A}_\mu$ so that

$$\forall A \in \mathcal{A}_\mu \text{ we have } X \setminus A \in \mathcal{A}_\mu \tag{20.407}$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_\mu$ then there exists $\{E_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$, $\{F_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ such that $\forall i \in \mathbb{N}$ $E_i \subseteq A_i \subseteq F_i$ and $\mu(F_i \setminus E_i) = 0$. Then we have

$$\bigcup_{i \in \mathbb{N}} E_i \subseteq \bigcup_{i \in \mathbb{N}} A_i \subseteq \bigcup_{i \in \mathbb{N}} F_i \text{ and, as } \mathcal{A} \text{ is a } \sigma\text{-algebra, } \bigcup_{i \in \mathbb{N}} E_i, \bigcup_{i \in \mathbb{N}} F_i \in \mathcal{A} \tag{20.408}$$

If $x \in (\bigcup_{i \in \mathbb{N}} F_i) \setminus (\bigcup_{i \in \mathbb{N}} E_i)$ then $x \in \bigcup_{i \in \mathbb{N}} F_i$ and $x \notin \bigcup_{i \in \mathbb{N}} E_i$, hence there exist a $i \in \mathbb{N}$ such that $x \in F_i$ and $\forall j \in \mathbb{N}$ $x \notin E_j$ in particular $x \notin E_i$, so $x \in F_i \setminus E_i$. So $(\bigcup_{i \in \mathbb{N}} F_i) \setminus (\bigcup_{i \in \mathbb{N}} E_i) \subseteq \bigcup_{i \in \mathbb{N}} (F_i \setminus E_i)$ where as $\mathcal{A}$ is a σ-algebra $F_i \setminus E_i \in \mathcal{A}$, hence

$$\mu\left(\left(\bigcup_{i \in \mathbb{N}} F_i\right) \setminus \left(\bigcup_{i \in \mathbb{N}} E_i\right)\right) \leqslant \mu\left(\bigcup_{i \in \mathbb{N}} (F_i \setminus E_i)\right) \underset{\text{[theorem: 20.205]}}{\leqslant} \sum_{i=1}^{\infty} \mu(F_i \setminus E_i) = 0 \tag{20.409}$$

From [eq: 20.408] and [eq: 20.409] it follows that $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}_\mu$ hence

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_\mu \text{ we have } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}_\mu \tag{20.410}$$

From [eqs: 20.403, 20.407 and 20.410] it follows that

$$\mathcal{A}_\mu \text{ is a } \sigma\text{-algebra} \tag{20.411}$$

Now as $\varnothing \in \mathcal{A}$, $\varnothing \subseteq \varnothing \subseteq \varnothing$ and $\mu(\varnothing \setminus \varnothing) = 0$ it follows from [eq: 20.401] that

$$\overline{\mu}(\varnothing) = \mu(\varnothing) = 0 \tag{20.412}$$

If additional $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_\mu$ is pairwise disjoint then $\forall i \in \mathbb{N}$ $E_i \subseteq A_i \subseteq F_i$ and $\mu(F_i \setminus E_i) = 0$. Let $i, j \in \mathbb{N}$ with $i \neq j$ then $E_i \bigcap E_j \subseteq A_i \bigcap A_j = \varnothing$ which proves that $\{E_i\}_{i \in \mathbb{N}}$ is pairwise disjoint. So

$$\begin{aligned}
\overline{\mu}\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &\underset{\text{[eq: 20.408, 20.409, 20.401]}}{=} \mu\left(\bigsqcup_{i \in \mathbb{N}} E_i\right) \\
&\underset{\mu \text{ is a measure}}{=} \sum_{i=1}^{\infty} \mu(E_i) \\
&\underset{\text{[eq: 20.401]}}{=} \sum_{i=1}^{\infty} \overline{\mu}(A_i)
\end{aligned}$$

The above together with [eq: 20.412] proves that

$$\overline{\mu} \text{ is a measure so that } \langle X, \mathcal{A}_\mu, \overline{\mu} \rangle \text{ is a measure space} \tag{20.413}$$

Let $A \in \mathcal{A}$ then as $A \subseteq A \subseteq A$ and $\mu(A \setminus A) = \mu(\varnothing) = 0$ we have by [eq: 20.401] that $\overline{\mu}(A) = \mu(A)$, hence

$$(\overline{\mu})_{|A} = \mu \tag{20.414}$$

Let $A \in \mathcal{N}_{\overline{\mu}}$ then there exist a $B \in \mathcal{A}_\mu$ with $\overline{\mu}(B) = 0$ such that $A \subseteq B$. As $B \in \mathcal{A}_\mu$ there exists $E, F \in \mathcal{A}$ with $E \subseteq B \subseteq F$ and $\mu(F \setminus E) = 0$, hence by [eq: 20.401] $\mu(F) = \overline{\mu}(B) = 0$. Next as $\varnothing \subseteq A \subseteq B \subseteq F$ and $\mu(F \setminus \varnothing) = \mu(F) = 0$ it follows that $A \in \mathcal{A}_\mu$. This proves that $\mathcal{N}_{\overline{\mu}} \subseteq \mathcal{A}_\mu$ so that by [theorem: 20.304]

$$\langle X, \mathcal{A}_\mu, \overline{\mu} \rangle \text{ is complete}$$

□

20.5 Measurable Functions

20.5.1 Measurable function definition

We define now the functions that can be integrated.

Definition 20.312. (Measurable Function) *Let $\langle X, \mathcal{A} \rangle$, $\langle Y, \mathcal{B} \rangle$ be two measurable spaces and $A \in \mathcal{A}$ then a function*

$$f: X \to Y$$

*is **$\mathcal{A}, \mathcal{B}$-measurable** if $\forall B \in \mathcal{B}$ we have that $f^{-1}(B) \in \mathcal{A}$. The set of $\mathcal{A}, \mathcal{B}$-measurable function graphs is noted as $\mathcal{M}[X, \mathcal{A}, Y, \mathcal{B}]$ hence*

$$\mathcal{M}[X, \mathcal{A}, Y, \mathcal{B}] = \{ f \in Y^X | f: X \to Y \text{ is } \mathcal{A}, \mathcal{B}\text{-measurable} \}$$

***Note* 20.313.** *A set can have many σ-algebras defined on it, so the same function can at the same time be measurable and not measurable, depending on the σ-algebras used.*

Example 20.314. Let $\langle X, \mathcal{A} \rangle$, $\langle Y, \mathcal{B} \rangle$ be measurable spaces then $C_y: X \to Y$ defined by $C_y(x) = y$ [the constant function] is $\mathcal{A}, \mathcal{B}$-measurable. In other words $C_y \in \mathcal{M}[X, \mathcal{A}, Y, \mathcal{B}]$.

Proof. Let $B \in \mathcal{B}$ then we have $C_y^{-1}(B) = X \in \mathcal{A}$ which proves that C_y is $\mathcal{A}, \mathcal{B}$-measurable. □

Theorem 20.315. *Let $\langle X, \mathcal{A} \rangle$, $\langle Y, \mathcal{B} \rangle$, $\langle Z, \mathcal{C} \rangle$ be measurable spaces, $f: X \to Y$ a $\mathcal{A}, \mathcal{B}$-measurable function and $g: Y \to Z$ a $\mathcal{B}, \mathcal{C}$-measurable function then*

$$g \circ f: X \to Z$$

is a $\mathcal{A}, \mathcal{C}$ measurable function.

Proof. Take $B \in \mathcal{C}$ then, as g is $\mathcal{B},\mathcal{C}$-measurable, $g^{-1}(B) \in \mathcal{B}$. As f is $\mathcal{A},\mathcal{B}$-measurable it follows that $f^{-1}(g^{-1}(B)) \in \mathcal{A}$. So, as $(g \circ f)^{-1}(B) \underset{\text{[theorem: 2.23]}}{=} f^{-1}(g^{-1}(B))$ it follows that $(g \circ f)^{-1}(B) \in \mathcal{A}$. Hence $g \circ f$ is $\mathcal{A},\mathcal{C}$-measurable. □

The following theorem shows that a restriction measurable function is measurable.

Theorem 20.316. *Let $\langle X,\mathcal{A}\rangle, \langle Y,\mathcal{B}\rangle$ be measurable spaces, $A \in \mathcal{A}$ and $f: X \to Y$ a $\mathcal{A},\mathcal{B}$-measurable function then $f_{|A}: A \to Y$ is $\mathcal{A}_{|A},\mathcal{B}$-measurable. In other words if $f \in \mathcal{M}[X,\mathcal{A},Y,\mathcal{B}]$ then $f_{|A} \in \mathcal{M}[A,\mathcal{A}_{|A},Y,\mathcal{B}]$.*

Proof. Let $B \in \mathcal{B}$ then, as f is $\mathcal{A},\mathcal{B}$-measurable, we have that $f^{-1}(B) \in \mathcal{A}$ so that $A \bigcap f^{-1}(B) \in \{A \bigcap B | B \in \mathcal{A}\} = \mathcal{A}_{|A}$. So $(f_{|A})^{-1}(B) \underset{\text{[theorem: 2.86]}}{=} A \bigcap f^{-1}(B) \in \mathcal{A}_{|A}$ which proves that f is $\mathcal{A}_{|A},\mathcal{B}$-measurable. □

Next we show the measurability of a extension of a function

Definition 20.317. *Let X,Y be sets, $A \subseteq X$, $y \in Y$ and $f: A \to Y$ a function then we define*

$$f_{A\uparrow^y X}: X \to Y \text{ by } f_{A\uparrow^0 X}(x) = \begin{cases} f(x) \text{ if } x \in A \\ y \text{ if } x \in X \setminus A \end{cases}$$

***Note* 20.318.** *Let $x \in X$ then $f_{X\uparrow^y X}(x) = f(x)$ so that $f_{X\uparrow^y X} = f$*

***Note* 20.319.** *Let $x \in A$ then $(f_{A\uparrow^y X})_{|A}(x) = f_{A\uparrow^y X}(x) \underset{x\in A}{=} f(x) \underset{x\in A}{=} f_{|A}(x)$ so that $(f_{A\uparrow^y X})_{|A} = f_{|A}$*

Theorem 20.320. *Let $\langle X,\mathcal{A}\rangle$, $\langle Y,\mathcal{B}\rangle$ be measurable spaces, $A \in \mathcal{A}$ and $f: A \to Y$ a function then*

$$f \text{ is } \mathcal{A}_{|A},\mathcal{B}\text{-measurable} \Leftrightarrow f_{A\uparrow^y X} \text{ is } \mathcal{A},\mathcal{B}\text{-measurable}$$

In other words we have

$$f \in \mathcal{M}[A,\mathcal{A}_{|A},Y,\mathcal{B}] \Leftrightarrow f_{A\uparrow^y X} \in \mathcal{M}[X,\mathcal{A},Y,\mathcal{B}]$$

Proof.

⇒. Let $B \in \mathcal{B}$ then we have either:

$y \in B$. Then for $t \in (f_{A\uparrow^y X})^{-1}(B)$ we have either:

$t \in A$. Then $f(t) = f_{A\uparrow^y X}(t) \in B$ so that $t \in f^{-1}(B)$ so that $t \in f^{-1}(B) \bigcup (X \setminus A)$

$t \in X \setminus A$. Then $t \in f^{-1}(B) \bigcup (X \setminus A)$

hence we have

$$(f_{A\uparrow^y X})^{-1}(B) \subseteq f^{-1}(B) \bigcup (X \setminus A) \tag{20.415}$$

Let $t \in f^{-1}(B) \bigcup (X \setminus A)$ then we have either:

$t \in A$. Then as $t \notin X \setminus A$ we have $t \in f^{-1}(B)$ so that $f_{A\uparrow^y X}(t) = f(t) \in B$ which proves that $t \in (f_{A\uparrow^y X})^{-1}(B)$

$t \in X \setminus A$. Then $f_{A\uparrow^y X}(t) = y \in B$ so that $t \in (f_{A\uparrow^y X})^{-1}(B)$

Hence we have $f^{-1}(B) \bigcup (X \setminus A) \subseteq (f_{A\uparrow^y X})^{-1}(B)$ which combined with [eq: 20.415] proves that

$$(f_{A\uparrow^y X})^{-1}(B) = f^{-1}(B) \bigcup (X \setminus A)$$

As f is $\mathcal{A}_{|A},\mathcal{B}$-measurable $f^{-1}(B) \in \mathcal{A}$ and as $A \in \mathcal{A}$ we have $X \setminus A \in \mathcal{A}$ so that $f^{-1}(B) \bigcup (X \setminus A) \in \mathcal{A}$ which proves that

$$(f_{A\uparrow^y X})^{-1}(B) \in \mathcal{A}$$

$y \in Y \setminus B$. Let $t \in (f_{A\uparrow^y X})^{-1}(B)$. If $t \in X \setminus A$ then we have $y = f_{A\uparrow^y X}(t) \in B$ contradicting $y \in Y \setminus B$ hence $t \in A$. Further $f(t) = f_{A\uparrow^y X}(t) \in B \Rightarrow t \in f^{-1}(B)$ which proves that

$$(f_{A\uparrow^y X})^{-1}(B) \subseteq A \bigcap f^{-1}(B) \tag{20.416}$$

Let $t \in A \bigcap f^{-1}(B)$ then $t \in A$ and $f(t) \in B$ so that $f_{A\uparrow^y X}(t) \underset{t\in A}{=} f(t) \in B$ which proves that $t \in (f_{A\uparrow^y X})^{-1}(B)$. Hence $A \bigcap f^{-1}(B) \subseteq (f_{A\uparrow^y X})^{-1}(B)$ which combined with [eq: 20.416] proves that

$$(f_{A\uparrow^y X})^{-1}(B) = A \bigcap f^{-1}(B)$$

As f is $\mathcal{A}_{|A}, \mathcal{B}$-measurable we have that $f^{-1}(B) \in \mathcal{A}$ so that $A \bigcap f^{-1}(B) \in \mathcal{A}$ which proves that

$$(f_{A\uparrow^y X})^{-1}(B) \in \mathcal{A}$$

Hence $\forall B \in \mathcal{B}$ we have $(f_{A\uparrow^y X})^{-1}(B) \in \mathcal{A}$ which proves that

$$f_{A\uparrow^y X} \text{ is } \mathcal{A}, \mathcal{B}\text{-measurable}$$

$\Leftarrow$. As $f_{A\uparrow^y X}$ is $\mathcal{A}, \mathcal{B}$-measurable it follows from using [theorem: 20.316] that $f \underset{\text{[definition: 20.317]}}{=} (f_{A\uparrow^y X})_{|A}$ is $\mathcal{A}_{|A}, \mathcal{B}$-measurable. □

We have the following more specialized cases of measurable functions.

Definition 20.321. *Let $\langle X, \mathcal{T}_X \rangle$, $\langle Y, \mathcal{T}_Y \rangle$ be two topological spaces then a $\mathcal{B}[X, \mathcal{T}_X], \mathcal{B}[Y, \mathcal{T}_Y]$-measurable $f: X \to Y$ function is called a **Borel measurable** function.*

Example 20.322. A $\mathcal{B}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$-measurable function $f: X \to \overline{\mathbb{R}}$ is a Borel measurable function.

Example 20.323. A a $\mathcal{B}[\mathbb{R}^n], \mathcal{B}[\overline{\mathbb{R}}]$-measurable funciton $f: X \to \overline{\mathbb{R}}$ is a Borel measurable function.

For integration we are only interested in functions to $\overline{\mathbb{R}}$ so we use some simplified notations for these functions.

Definition 20.324. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space then a*

$$\mathcal{A}, \mathcal{B}[\overline{\mathbb{R}}]\text{-measurable function } f: X \to \overline{\mathbb{R}}$$

*is called a **$\mathcal{A}$-measurable** function. Further we define*

$$\mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] = \{f \in \overline{\mathbb{R}}^X \,|\, f: X \to \overline{\mathbb{R}} \text{ is } \mathcal{A}\text{-measurable}\}$$

$$\mathcal{M}[X, \mathcal{A}, \mathbb{R}] = \{f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \,|\, f(X) \subseteq \mathbb{R}\} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

$$\overline{\mathcal{M}}^+[X, \mathcal{A}] = \{f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \,|\, f(X) \subseteq [0, \infty]\} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

$$\mathcal{M}^+[X, \mathcal{A}] = \{f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \,|\, f(X) \subseteq [0, \infty[\} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

***Note* 20.325.** *As $[0, \infty[\subseteq \mathbb{R} \subseteq \overline{\mathbb{R}}$ and $[0, \infty[\subseteq [0, \infty] \subseteq \overline{\mathbb{R}}$ we have also*

$$\mathcal{M}^+[X, \mathcal{A}] \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

and

$$\mathcal{M}^+[X, \mathcal{A}] \subseteq \overline{\mathcal{M}}^+[X, \mathcal{A}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Theorem 20.326. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space then we have:*

1. *If $f: X \to \mathbb{R}$ is $\mathcal{A}, \mathcal{B}[\mathbb{R}]$-measurable then $f: X \to \overline{\mathbb{R}}$ is $\mathcal{A}, \mathcal{B}[\overline{\mathbb{R}}]$-measurable [in other words $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.*
2. *If $f: X \to \overline{\mathbb{R}}$ is $\mathcal{A}, \mathcal{B}[\overline{\mathbb{R}}]$-measurable and $f(X) \subseteq \mathbb{R}$ then $f: X \to \mathbb{R}$ is $\mathcal{A}, \mathcal{B}[\mathbb{R}]$-measurable. In other words if $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $f: X \to \mathbb{R}$ is $\mathcal{A}, \mathcal{B}[\mathbb{R}]$-measurable.*

Proof.

1. Let $B \in \mathcal{B}[\overline{\mathbb{R}}]$ then by [theorem: 20.162] $B \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]$, hence, as f is $\mathcal{A}, \mathcal{B}[\mathbb{R}]$-measurable, $f^{-1}(B \bigcap \mathbb{R}) \in \mathcal{A}$. Further

$$f^{-1}\big(B \bigcap \mathbb{R}\big) \underset{\text{[theorem: 2.95]}}{=} f^{-1}(B) \bigcap f^{-1}(\mathbb{R}) = f^{-1}(B) \bigcap X = f^{-1}(B)$$

so that $f^{-1}(B) \in \mathcal{A}$, which proves that $f: X \to \overline{\mathbb{R}}$ is $\mathcal{A}, \mathcal{B}[\overline{\mathbb{R}}]$-measurable.

2. As $f(X) \subseteq \mathbb{R}$ it follows that $f: X \to \mathbb{R}$ is a well defined function. Let $B \in \mathcal{B}[\mathbb{R}] \Rightarrow B \subseteq \mathbb{R} \subseteq \overline{\mathbb{R}}$ then, as $B \bigcap \mathbb{R} = B$, we have by [theorem: 20.162] that $B \in \mathcal{B}[\overline{\mathbb{R}}]$, hence, as $f: X \to \overline{\mathbb{R}}$ is $\mathcal{A}, \mathcal{B}[\overline{\mathbb{R}}]$-measurable, $f^{-1}(B) \in \mathcal{A}$ which proves that $f: A \to \mathbb{R}$ is $\mathcal{A}, \mathcal{B}[\mathbb{R}]$-measurable. □

Next we define Lebesgue measurable functions.

Definition 20.327. *A $\mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$-measurable function $f: \mathbb{R} \to \overline{\mathbb{R}}$ is called a Lebesgue measurable function and the set of $\mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$-measurable function is noted as $\mathcal{L}$. So*

$$\mathcal{L} = \{ f \in \overline{\mathbb{R}}^{\mathbb{R}} | f: \mathbb{R} \to \overline{\mathbb{R}} \text{ is } \mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{R}]\text{-measurable} \}$$

Definition 20.328. *Let $n \in \mathbb{N}$ then a $\mathcal{L}[\mathbb{R}^n], \mathcal{B}[\overline{\mathbb{R}}]$-measurable function $f: \mathbb{R}^n \to \overline{\mathbb{R}}$ is called a Lebesgue measurable function and the set of $\mathcal{L}[\mathbb{R}^n], \mathcal{B}[\overline{\mathbb{R}}]$-measurable function is noted as $\mathcal{L}^n$. So*

$$\mathcal{L}^n = \{ f \in \overline{\mathbb{R}}^{\mathbb{R}^n} | f: \mathbb{R}^n \to \overline{\mathbb{R}} \text{ is } \mathcal{L}[\mathbb{R}^n], \mathcal{B}[\overline{R}]\text{-measurable} \}$$

We show now how we can extend a measurable extended real valued function to a measurable function.

Definition 20.329. *Let X, Y be sets, $A \subseteq X$ and $f: A \to Y$ a function then we define*

$$f_{A \uparrow X}: X \to \overline{\mathbb{R}} \text{ by } f_{A \uparrow X} = f_{A \uparrow^0 X} \text{ [see definition: 20.317]}$$

so that

$$\forall x \in X \text{ we have } f_{A \uparrow X}(x) = \begin{cases} f(x) & \text{if } x \in A \\ 0 & \text{if } x \in X \setminus A \end{cases}$$

***Note* 20.330.** *As $\forall x \in A$ we have $(f_{A \uparrow X})_{|A}(x) = f_{A \uparrow X}(x) \underset{x \in A}{=} f(x)$ it follows that $(f_{A \uparrow X})_{|A} = f$*

Theorem 20.331. *Let $\langle X, \mathcal{A} \rangle$ be a measurable spacea, $A \in \mathcal{A}$ and $f: A \to \overline{\mathbb{R}}$ a function then we have*

$$f_{A \uparrow X} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \Leftrightarrow f \in \mathcal{M}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$$

Proof.

⇒. If $f_{A \uparrow X} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows that $f_{A \uparrow^0 X} \underset{\text{def}}{=} f_{A \uparrow X}$ is $\mathcal{A}, \mathcal{B}[\overline{\mathbb{R}}]$-measurable so that by [theorem: 20.320] f is $\mathcal{A}_{|A}, \mathcal{B}[\overline{\mathbb{R}}]$-measurable, hence $f \in \mathcal{M}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$.

⇐. If $f \in \mathcal{M}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$ then f is $\mathcal{A}_{|A}, \mathcal{B}[\overline{\mathbb{R}}]$-measurable so that by [theorem: 20.320] $f_{A \uparrow X} = f_{A \uparrow^0 X}$ is $\mathcal{A}$, $\mathcal{B}[\overline{\mathbb{R}}]$-measurable, hence $f_{A \uparrow X} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. □

In the case of generated σ-algebras there is a easier way to check if a function is measurable.

Theorem 20.332. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, Y a set, $\mathcal{B} \subseteq \mathcal{P}(Y)$ so that $\langle Y, \sigma[\mathcal{B}] \rangle$ is a measurable space and $f: X \to Y$ a function then*

$$f \text{ is } \mathcal{A}, \sigma[\mathcal{B}]\text{-measurable} \Leftrightarrow \forall B \in \mathcal{B} \text{ we have } f^{-1}(B) \in \mathcal{A}$$

Proof.

⇒. Let $B \in \mathcal{B}$ then as $\mathcal{B} \subseteq \sigma[\mathcal{B}]$ we have that $B \in \sigma[\mathcal{B}]$. Hence, as f is $\mathcal{A}, \sigma[\mathcal{B}]$-measurable, it follows that $f^{-1}(B) \in \mathcal{A}$.

⇐. First we prove that $\mathcal{H} = \{ B \in \mathcal{P}(Y) | f^{-1}(B) \in \mathcal{A} \}$ is a σ-algebra containing $\mathcal{B}$. Let $B \in \mathcal{B}$ then by the hypothesis $f^{-1}(B) \in \mathcal{A}$ so that $\mathcal{B} \in \mathcal{H}$, hence

$$\mathcal{B} \subseteq \mathcal{H} \tag{20.417}$$

As $f^{-1}(Y) = X \in \mathcal{A}$ we have also

$$Y \in \mathcal{H} \tag{20.418}$$

Let $B \in \mathcal{H}$ then $f^{-1}(B) \in \mathcal{A}$ so that $f^{-1}(Y \setminus B) \underset{\text{[theorem: 2.94(4]}}{=} X \setminus f^{-1}(B) \in \mathcal{A}$. From this it follows that $Y \setminus B \in \mathcal{H}$. Hence

$$\forall B \in \mathcal{H} \text{ we have that } Y \setminus B \in \mathcal{H} \tag{20.419}$$

Let $\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{H}$ then $\forall i \in \mathbb{N}$ $f^{-1}(B_i) \in \mathcal{A}$. As $f^{-1}(\bigcup_{i \in \mathbb{N}} B_i) \underset{\text{[theorem: 2.136]}}{=} \bigcup_{i \in \mathbb{N}} f^{-1}(B_i)$ and $\mathcal{A}$ is a σ-algebra it follows that $f^{-1}(\bigcup_{i \in \mathbb{N}} B_i) \in \mathcal{A}$ so that $\bigcup_{i \in \mathbb{N}} B_i \in \mathcal{H}$. Hence

$$\forall \{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{H} \text{ we have that } \bigcup_{i \in \mathbb{N}} B_i \in \mathcal{H} \tag{20.420}$$

From [eqs: 20.417, 20.418, 20.419 and 20.420] it follows that $\mathcal{H}$ is a σ-algebra containing $\mathcal{B}$ hence, using [theorem: 20.146], it follows that $\sigma[\mathcal{B}] \subseteq \mathcal{H}$. So $\forall B \in \sigma[\mathcal{B}]$ we have $B \in \mathcal{H}$ meaning that $f^{-1}(B) \in \mathcal{A}$ which proves that f is $\mathcal{A}, \sigma[\mathcal{B}]$-measurable. □

Most books on mesure theory give a alternative definition for $\mathcal{A}$-measurable functions based on the following definitions.

Definition 20.333. *Let X be a set then we define*

1. *If $f: X \to \overline{\mathbb{R}}, g: X \to \overline{\mathbb{R}}$ then given $x \in \overline{\mathbb{R}}$ we define*

$$\begin{aligned}
\{f < x\} &\underset{\text{def}}{=} f^{-1}([-\infty, x[) = \{t \in X \,|\, f(t) < x\} \\
\{f \leqslant x\} &\underset{\text{def}}{=} f^{-1}([-\infty, x]) = \{t \in X \,|\, f(t) \leqslant x\} \\
\{f > x\} &\underset{\text{def}}{=} f^{-1}(]x, \infty]) = \{t \in X \,|\, x < f(t)\} \\
\{f \geqslant x\} &\underset{\text{def}}{=} f^{-1}([x, \infty]) = \{t \in X \,|\, x \leqslant f(t)\} \\
\{f = x\} &\underset{\text{def}}{=} f^{-1}(\{x\}) = \{t \in X \,|\, x = f(t)\} \\
\{f \leqslant g\} &\underset{\text{def}}{=} \{x \in X \,|\, f(x) \leqslant g(x)\} \\
\{f < g\} &\underset{\text{def}}{=} \{x \in X \,|\, f(x) < g(x)\} \\
\{f = g\} &\underset{\text{def}}{=} \{x \in X \,|\, f(x) = g(x)\}
\end{aligned}$$

2. *If $f: X \to \mathbb{R}$, $g: X \to \mathbb{R}$ then given $x \in \mathbb{R}$ we define*

$$\begin{aligned}
\{f < x\} &\underset{\text{def}}{=} f^{-1}(]-\infty, x[) = \{t \in X \,|\, f(t) < x\} \\
\{f \leqslant x\} &\underset{\text{def}}{=} f^{-1}(]-\infty, x]) = \{t \in X \,|\, f(t) \leqslant x\} \\
\{f > x\} &\underset{\text{def}}{=} f^{-1}(]x, \infty[) = \{t \in X \,|\, x < f(t)\} \\
\{f \geqslant x\} &\underset{\text{def}}{=} f^{-1}([x, \infty[) = \{t \in X \,|\, x \leqslant f(t)\} \\
\{f = x\} &\underset{\text{def}}{=} f^{-1}(\{x\}) = \{t \in X \,|\, x = f(t)\} \\
\{f \leqslant g\} &\underset{\text{def}}{=} \{x \in X \,|\, f(x) \leqslant g(x)\} \\
\{f < g\} &\underset{\text{def}}{=} \{x \in X \,|\, f(x) < g(x)\} \\
\{f = g\} &\underset{\text{def}}{=} \{x \in X \,|\, f(x) = g(x)\}
\end{aligned}$$

Lemma 20.334. *Let X be a set, $f: X \to \overline{\mathbb{R}}$ and $x \in \mathbb{R}$ then*

1. $\{f \geqslant x\} = \bigcap_{n \in \mathbb{N}} \left\{f > x - \frac{1}{n}\right\}$
2. $X \setminus \{f \geqslant x\} = \{f < x\}$
3. $\{f \leqslant x\} = \bigcap_{n \in \mathbb{N}} \left\{f < x + \frac{1}{n}\right\}$
4. $X \setminus \{f \leqslant x\} = \{f > x\}$

Proof.

1. Let $n \in \mathbb{N}$ then if $t \in \{f \geqslant x\}$ we have that $x \leqslant f(t) \underset{x \in \mathbb{R}}{\Rightarrow} x - \frac{1}{n} < f(t) \Rightarrow t \in \left\{x - \frac{1}{n} < f\right\}$ proving

$$\{f \geqslant x\} \subseteq \bigcap_{n \in \mathbb{N}} \left\{f > x - \frac{1}{n}\right\} \tag{20.421}$$

If $t \in \bigcap_{n \in \mathbb{N}} \left\{ f > x - \frac{1}{n} \right\}$ then $\forall n \in \mathbb{N}$ we have $x - \frac{1}{n} < f(t)$. Assume that $f(t) < x$ then by [theorem: 10.30] there exists a $n \in \mathbb{N}$ such that $f(t) + \frac{1}{n} < x \underset{x \in \mathbb{R}}{\Rightarrow} f(t) < x - \frac{1}{n}$ a contradiction, so we must have $x \leqslant f(t)$ or $t \in \{f \geqslant x\}$. So $\bigcap_{n \in \mathbb{N}} \left\{ f > x - \frac{1}{n} \right\} \subseteq \{f \geqslant x\}$. Combining this with [eq: 20.421] proves

$$\{f \geqslant x\} = \bigcap_{n \in \mathbb{N}} \left\{ f > x - \frac{1}{n} \right\}$$

2.

$$\begin{aligned} X \setminus \{f \geqslant x\} &= X \setminus f^{-1}([x, \infty]) \\ &= f^{-1}(\overline{\mathbb{R}}) \setminus f^{-1}(]x, \infty]) \\ &\underset{\text{[theorem: 2.94]}}{=} f^{-1}(\overline{\mathbb{R}} \setminus [x, \infty]) \\ &= f^{-1}([-\infty, x[) \\ &= \{f < x\} \end{aligned}$$

3. Let $n \in \mathbb{N}$ then if $t \in \{f \leqslant x\}$ we have that $f(t) \leqslant x \underset{x \in \mathbb{R}}{\Rightarrow} f(t) < x + \frac{1}{n}$ or $t \in \left\{ f < x + \frac{1}{n} \right\}$. So

$$\{f \leqslant x\} \subseteq \bigcap_{n \in \mathbb{N}} \left\{ f < x + \frac{1}{n} \right\} \tag{20.422}$$

Let $t \in \bigcap_{n \in \mathbb{N}} \left\{ f < x + \frac{1}{n} \right\}$ then $\forall n \in \mathbb{N}$ we have $f(t) < x + \frac{1}{n}$. Assume that $f(t) > x$ then by [theorem: 10.30] there exists a $n \in \mathbb{N}$ such that $x + \frac{1}{n} < f(t)$ a contradiction hence $f(t) \leqslant x$ or $t \in \{f \leqslant x\}$. Combining this with [eq: 20.422] proves that

$$\{f \leqslant x\} = \bigcap_{n \in \mathbb{N}} \left\{ f < x + \frac{1}{n} \right\}$$

4.

$$\begin{aligned} X \setminus \{f \leqslant x\} &= X \setminus f^{-1}([-\infty, x]) \\ &= f^{-1}(\overline{\mathbb{R}}) \setminus f^{-1}([-\infty, x]) \\ &\underset{\text{[theorem: 2.94]}}{=} f^{-1}(\overline{\mathbb{R}} \setminus [-\infty, x]) \\ &= f^{-1}(]x, \infty]) \\ &= \{x < f\} \end{aligned}$$

□

We are now ready to state the following equivalences for $\mathcal{A}$-measurability [which is used in many books about measure theory].

Theorem 20.335. *Let $\langle X, \mathcal{A} \rangle$ be a measurable set and $f: X \to \overline{\mathbb{R}}$ a function then we have the following equivalences:*

1. *f is $\mathcal{A}$-measurable [or equivalently $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$]*
2. *$\forall x \in \mathbb{R}$ we have $\{f > x\} \in \mathcal{A}$*
3. *$\forall x \in \mathbb{R}$ we have $\{f \geqslant x\} \in \mathcal{A}$*
4. *$\forall x \in \mathbb{R}$ we have $\{f < x\} \in \mathcal{A}$*
5. *$\forall x \in \mathbb{R}$ we have $\{f \leqslant x\} \in \mathcal{A}$*

Proof.

1 ⇒ 2. Take $x \in \mathbb{R}$ then $]x, \infty] \in \sigma[\{]a, \infty] | a \in \mathbb{R}\}] \underset{\text{[theorem: 20.162]}}{=} \mathcal{B}[\overline{\mathbb{R}}]$ and we have, as f is $\mathcal{A}$-measurable, that $\{f > x\} = f^{-1}(]x, \infty]) \in \mathcal{A}$

2 ⇒ 1. Let $B \in \{]a, \infty] | a \in \mathbb{R}\}$ then $B =]x, \infty]$ where $x \in \mathbb{R}$. hence

$$f^{-1}(B) = f^{-1}(]x, \infty]) = \{f > x\} \in \mathcal{A}.$$

So using [theorem: 20.332] together with $\sigma[\{]a,\infty]|a\in\mathbb{R}\}]\underset{\text{[theorem: 20.162]}}{=}\mathcal{B}[\overline{\mathbb{R}}]$ it follows that f is $\mathcal{A}$, $\mathcal{B}[\overline{\mathbb{R}}]$-measurable or in other words $\mathcal{A}$-measurable.

2 ⇒ 3. Let $x\in\mathbb{R}$ then using (2) we have $\forall n\in\mathbb{N}$ that $\left\{f>x-\frac{1}{n}\right\}\in\mathcal{A}$, hence by [theorem: 20.140] it follows that $\bigcap_{n\in\mathbb{N}}\left\{f>x-\frac{1}{n}\right\}\in\mathcal{A}$. Using [lemma: 20.334] $\{f\geqslant x\}=\bigcap_{n\in\mathbb{N}}\left\{f>x-\frac{1}{n}\right\}$ proving that $\{f\geqslant x\}\in\mathcal{A}$.

3 ⇒ 4. Let $x\in\mathbb{R}$ then $\{f<x\}\underset{\text{[lemma: 20.334]}}{=}X\setminus\{f\geqslant x\}\in\mathcal{A}$ [as $\{f\geqslant x\}\in\mathcal{A}$].

4 ⇒ 5. Let $x\in\mathbb{R}$ then by (4) we have that $\forall n\in\mathbb{N}$ that $\left\{f<x+\frac{1}{n}\right\}\in\mathcal{A}$, hence by [theorem: 20.140] it follows that $\bigcap_{n\in\mathbb{N}}\left\{f<x+\frac{1}{n}\right\}\in\mathcal{A}$. Using [lemma: 20.334] $\{f\leqslant x\}=\bigcap_{n\in\mathbb{N}_0}\left\{f<x+\frac{1}{n}\right\}$ proving that $\{f\leqslant x\}\in\mathcal{A}$.

5 ⇒ 2. Let $x\in\mathbb{R}$ then $\{f>x\}\underset{\text{[lemma: 20.334]}}{=}X\setminus\{f\leqslant x\}\in\mathcal{A}$. □

20.5.2 Measurable function properties

Theorem 20.336. *Let $\langle X,\mathcal{T}_X\rangle$, $\langle Y,\mathcal{T}_Y\rangle$ be topological spaces and $f:X\to Y$ a continuous function then f is $\mathcal{B}[X,\mathcal{T}_X],\mathcal{B}[Y,\mathcal{T}_Y]$-measurable. In other words continuous functions are Borel measurable.*

Proof. If $U\in\mathcal{T}_Y$ then as f is continuous we have $f^{-1}(U)\in\mathcal{T}_X\subseteq\mathcal{B}[X,\mathcal{T}_X]$ so that by [theorem: 20.332] we have that f is $\mathcal{B}[X,\mathcal{T}_X],\mathcal{B}[Y,\mathcal{T}_Y]$-measurable. □

Note that although the composition of measurable functions is measurable this is not the case for Lebesgue measurable functions. For example if $f:\mathbb{R}\to\overline{\mathbb{R}}$ and $g:\mathbb{R}\to\overline{\mathbb{R}}$ are Lebesgue measurable functions such that $f(\mathbb{R})\subseteq\mathbb{R}$ then by [theorem: 20.326] $f:\mathbb{R}\to\mathbb{R}$ is $\mathcal{L}[\mathbb{R}],\mathcal{B}[\overline{\mathbb{R}}]$-measurable and g is $\mathcal{L}[\mathbb{R}],\mathcal{B}[\overline{\mathbb{R}}]$–measurable but not $\mathcal{B}[\mathbb{R}],\mathcal{B}[\mathbb{R}]$-measurable, so we can not apply the composition theorem. If however g is $\mathcal{B}[\mathbb{R}],\mathcal{B}[\overline{\mathbb{R}}]$-measurable then $g\circ f$ is by the previous theorem $\mathcal{L}[\mathbb{R}],\mathcal{B}[\mathbb{R}]$-measurable hence Lebesgue measurable.

Theorem 20.337. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space and let $f:X\to\overline{\mathbb{R}}$ and $g:X\to\overline{\mathbb{R}}$ be $\mathcal{A}$-measurable functions then we have:*

1. $\{f<g\}\in\mathcal{A}$
2. $\{f\leqslant g\}\in\mathcal{A}$
3. $\{f=g\}\in\mathcal{A}$
4. $\{f\neq g\}\in\mathcal{A}$
5. *If $x\in\overline{\mathbb{R}}$ then $\{f=x\}\in\mathcal{A}$*

Proof.

1. Let $t\in\{f<g\}$ then $f(t)<g(t)$. Using the density of the rational numbers in the extended real numbers [see theorem: 20.12] there exist a $q\in\mathbb{Q}$ such that $f(t)<q<g(t)$, so that $t\in\{f<q\}$ and $t\in\{g>q\}$, proving $t\in\{f<q\}\bigcap\{g>q\}$ Hence we have

$$\{f<g\}\subseteq\bigcup_{q\in\mathbb{Q}}\left(\{f<q\}\bigcap\{g>q\}\right)\tag{20.423}$$

If $t\in\bigcup_{q\in\mathbb{Q}}(\{f<q\}\bigcap\{g>q\})$ then there exist a $q\in Q$ such that $t\in\{f<q\}\bigcap\{g>q\}$, hence $f(t)<q\wedge g(t)<q\Rightarrow f(t)<g(t)$ proving that $t\in\{f<g\}$. Hence $\bigcup_{q\in\mathbb{Q}}(\{f<q\}\bigcap\{g>q\})\subseteq\{f<g\}$ which combined with [eq: 20.423] proves that

$$\{f<g\}=\bigcup_{q\in\mathbb{Q}}\left(\{f<q\}\bigcap\{g>q\}\right)$$

Using [theorem: 20.335] we have that $\forall q\in Q\ \{f<q\},\{g>q\}\in\mathcal{A}\Rightarrow\{f<q\}\bigcap\{g>q\}\in\mathcal{A}$. As $\mathbb{Q}$ is denumerable [see theorem: 10.5] it follows from [theorem: 20.143] that $\bigcup_{q\in\mathbb{Q}}(\{f<q\}\bigcap\{g>q\})\in\mathcal{A}$ so that

$$\{f<g\}\in\mathcal{A}$$

2. We have

$$\begin{aligned} t \in (X \setminus \{g < f\}) &\Leftrightarrow t \in X \wedge \neg(g(t) < f(t)) \\ &\Leftrightarrow t \in X \wedge f(t) \leqslant g(t) \\ &\Leftrightarrow t \in \{f \leqslant g\} \end{aligned}$$

proving that $X \setminus \{g < f\} = \{f \leqslant g\}$. Using (1) we have $\{g < f\} \in \mathcal{A}$ hence $X \setminus \{g < f\} \in \mathcal{A}$ which proves that

$$\{f \leqslant g\} \in \mathcal{A}$$

3. We have

$$\begin{aligned} t \in (\{f \leqslant g\} \setminus \{f < g\}) &\Leftrightarrow t \in \{f \leqslant g\} \wedge t \notin \{f < g\} \\ &\Leftrightarrow t \in X \wedge f(t) \leqslant g(t) \wedge \neg(f(t) < g(t)) \\ &\Leftrightarrow t \in X \wedge f(t) \leqslant g(t) \wedge g(t) \leqslant f(t) \\ &\Leftrightarrow t \in X \wedge f(t) = g(t) \\ &\Leftrightarrow t \in \{f = g\} \end{aligned}$$

proving that $\{f = g\} = \{f \leqslant g\} \setminus \{f > g\} \in \mathcal{A}$ [using (1), (2) and [theorems: 20.136, 20.140]

4. We have

$$\begin{aligned} t \in X \setminus \{f = g\} &\Leftrightarrow t \in X \wedge \neg(f(t) = g(t)) \\ &\Leftrightarrow t \in X \wedge f(t) \neq g(t) \\ &\Leftrightarrow t \in \{f \neq g\} \end{aligned}$$

proving that $\{f \neq g\} = X \setminus \{f = g\} \in \mathcal{A}$ [using (3)]

5. Let $x \in \overline{\mathbb{R}}$ then as $\{x\}$ is closed [see theorem: 20.49], we have by 20.150] that $\{x\} \in \mathcal{B}[\overline{\mathbb{R}}]$ which as f is $\mathcal{A}$-measurable proves that $\{f = x\} = f^{-1}(\{x\}) \in \mathcal{A}$. □

For non neagtive functions we have that the sum of measurable non negative functions is a non negative measurable function.

Theorem 20.338. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $f, g \in \overline{\mathcal{M}}^+[X, \mathcal{A}]$ then $f + g \in \overline{\mathcal{M}}^+[X, \mathcal{A}]$ where $f + g$ is defined pointwise by*

$$f + g : X \to \overline{\mathbb{R}} \text{ where } (f + g)(x) = f(x) + g(x)$$

***Note* 20.339.** *The condition $f, g \in \overline{\mathcal{M}}^+[X, \mathcal{A}]$ is neccesary to ensure that $\forall x \in X$ $f(x) + g(x)$ is well defined and $0 \leqslant f(x) + g(x)$.*

Proof. Let $x \in \mathbb{R}$. If $t \in \{f + g < x\}$ then $f(t) + g(t) < x$. As $0 \leqslant f(t) + g(t) < x \in \mathbb{R}$ $f(t), g(t) \in \mathbb{R}$ so that $f(t) < x - g(t)$. Using the density of $\mathbb{Q}$ in $\mathbb{R}$ [see theorem: 10.32] there exists a $q \in \mathbb{Q}$ such that $f(t) < q < x - g(t)$ hence

$$f(t) < q \wedge g(t) < x - q \Rightarrow t \in \{f < q\} \bigcap \{g < x - q\} \subseteq \bigcup_{q \in \mathbb{Q}} \left(\{f < q\} \bigcap \{g < x - q\}\right)$$

which proves that

$$\{f + g < x\} \subseteq \bigcup_{q \in \mathbb{Q}} \left(\{f < q\} \bigcap \{g < x - q\}\right) \tag{20.424}$$

If $t \in \bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g < x - q\})$ then there exists a $q \in \mathbb{Q}$ such that $t \in \{f < q\} \bigcap \{g < x - q\}$ hence $f(t) < q \wedge g(t) < x - q \Rightarrow f(t) + g(t) < x - q + q = x$ or $t \in \{f + g < x\}$. So $\bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g < x - q\}) \subseteq \{f + g < x\}$ which combined with [eq: 20.424] results in

$$\{f + g < x\} = \bigcup_{q \in \mathbb{Q}} \left(\{f < q\} \bigcap \{g < x - q\}\right)$$

Let $q \in \mathbb{Q}$ then as f, g is $\mathcal{A}$-measurable $\{f < q\}, \{g < x - q\} \in \mathcal{A} \Rightarrow \{f < q\} \bigcap \{g < x - q\} \in \mathcal{A}$, using [theorem: 20.143] and the fact that $\mathbb{Q}$ is countable [see theorem: 10.5] it follows that $\bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g < x - q\}) \in \mathcal{A}$ hence we have

$$\{f + g < x\} \in \mathcal{A}$$

As $x \in \mathbb{R}$ was choosen arbitrary it follows from the above that $f + g$ is $\mathcal{A}$-measurable. □

The sum of real valued measurable functions is also

Theorem 20.340. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ where $f + g$ is defined pointwise by*

$$f + g: X \to \overline{\mathbb{R}} \text{ where } (f + g)(x) = f(x) + g(x)$$

Proof. Let $x \in \mathbb{R}$. If $t \in \{f + g < x\}$ then $f(t) + g(t) < x$. As $f(t), g(t) \in \mathbb{R}$ we have $f(t) < x - g(t)$. Using the density of $\mathbb{Q}$ in $\mathbb{R}$ [see theorem: 10.32] there exists a $q \in \mathbb{Q}$ such that $f(t) < q < x - g(t)$ hence

$$f(t) < q \wedge g(t) < x - q \Rightarrow t \in \{f < q\} \bigcap \{g < x - q\} \subseteq \bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g < x - q\})$$

which proves that

$$\{f + g < x\} \subseteq \bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g < x - q\}) \tag{20.425}$$

If $t \in \bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g < x - q\})$ then there exists a $q \in \mathbb{Q}$ such that $t \in \{f < q\} \bigcap \{g < x - q\}$ hence $f(t) < q \wedge g(t) < x - q \Rightarrow f(t) + g(t) < x - q + q = x$ or $t \in \{f + g < x\}$. So $\bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g < x - q\}) \subseteq \{f + g < x\}$ which combined with [eq: 20.425] results in

$$\{f + g < x\} = \bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g < x - q\})$$

Let $q \in \mathbb{Q}$ then as f, g is $\mathcal{A}$-measurable $\{f < q\}, \{g < x - q\} \in \mathcal{A} \Rightarrow \{f < q\} \bigcap \{g < x - q\} \in \mathcal{A}$, using [theorem: 20.143] and the fact that $\mathbb{Q}$ is countable [see theorem: 10.5] it follows that $\bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g < x - q\}) \in \mathcal{A}$ hence we have

$$\{f + g < x\} \in \mathcal{A}$$

As $x \in \mathbb{R}$ was choosen arbitrary it follows from the above that $f + g$ is $\mathcal{A}$-measurable. □

Next we extend the above two theorems to finite sums of $\mathcal{A}$-measurable functions.

Definition 20.341. *Let X be a set, $n \in \mathbb{N}$ and $\{f_i\}_{i \in \{1, \ldots, n\}} \subseteq \overline{\mathbb{R}}^X$ then we define*

$$\sum_{i=1}^{n} f_i: X \to \overline{\mathbb{R}} \text{ by } \left(\sum_{1=1}^{n} f_i \right)(x) = \sum_{i=1}^{n} f_i(x)$$

Theorem 20.342. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $n \in \mathbb{N}$ and $\{f_i\}_{i \in \{1, \ldots, n\}} \subseteq \overline{\mathcal{M}}^+[A, \mathcal{A}]$ then $\sum_{i=1}^{n} f_i \in \overline{\mathcal{M}}^+[A, \mathcal{A}]$*

Proof. We use induction to prove this, so define

$$S = \left\{ n \in \mathbb{N} | \text{If } \{f_i\}_{i \in \{1, \ldots, n\}} \subseteq \overline{\mathcal{M}}^+[X, \mathcal{A}] \text{ then } \sum_{i=1}^{n} f_i \in \overline{\mathcal{M}}^+[X, \mathcal{A}] \right\}$$

then we have:

- $\boldsymbol{1 \in S}$**.** If $\{f_i\}_{i \in \{1\}} \subseteq \overline{\mathcal{M}}^+[X, \mathcal{A}]$ then $\forall x \in X$ $(\sum_{i=1}^{1} f_i)(x) = \sum_{i=1}^{1} f_i(x) = f_1(x)$ which proves that $\sum_{i=1}^{1} f = f_1 \in \overline{\mathcal{M}}^+[X, \mathcal{A}]$, hence $1 \in S$.
- $\boldsymbol{n \in S \Rightarrow n + 1 \in \mathcal{S}}$**.** Let $\{f_i\}_{i \in \{1, \ldots, n\}} \subseteq \overline{\mathcal{M}}^+[X, \mathcal{A}]$ then $\forall x \in X$ we have

$$\left(\sum_{i=1}^{n+1} f_i \right)(x) = \sum_{i=1}^{n+1} f_i(x) = f_{n+1}(x) + \sum_{i=1}^{n} f_i(x) = \left(f_{n+1} + \sum_{i=1}^{n} f_i \right)(x)$$

so that

$$\sum_{i=1}^{n+1} f_i = f_{n+1} + \sum_{i=1}^{n} f_i \tag{20.426}$$

As $n \in S$ we have $\sum_{i=1}^{n} f_i \in \overline{\mathcal{M}}^+[X, \mathcal{A}]$ which, as $f_{n+1} \in \overline{\mathcal{M}}^+[X, \mathcal{A}]$, proves, using [theorem: 20.338], that

$$f_{n+1} + \sum_{i=1}^{n} f_i \in \overline{\mathcal{M}}^+[X, \mathcal{A}]$$

Combining this with [eq: 20.426] proves that $\sum_{i=1}^{n+1} f_i \in \overline{\mathcal{M}}^+[X, \mathcal{A}]$ so that $n+1 \in S$. □

Theorem 20.343. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $n \in \mathbb{N}$ and $\{f_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $\sum_{i=1}^{n} f_i \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$*

Proof. We use induction to prove this, so define

$$S = \left\{ n \in \mathbb{N} | \text{If } \{f_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \text{ then } \sum_{i=1}^{n} f_i \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \right\}$$

then we have:

$1 \in S$. If $\{f_i\}_{i \in \{1\}} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $\forall x \in X$ $(\sum_{i=1}^{1} f_i)(x) = \sum_{i=1}^{1} f_i(x) = f_1(x)$ which proves that $\sum_{i=1}^{1} f = f_1 \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$, hence $1 \in S$.

$n \in S \Rightarrow n+1 \in \mathcal{S}$. Let $\{f_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $\forall x \in X$ we have

$$\left(\sum_{i=1}^{n+1} f_i \right)(x) = \sum_{i=1}^{n+1} f_i(x) = f_{n+1}(x) + \sum_{i=1}^{n} f_i(x) = \left(f_{n+1} + \sum_{i=1}^{n} f_i \right)(x)$$

so that

$$\sum_{i=1}^{n+1} f_i = f_{n+1} + \sum_{i=1}^{n} f_i \tag{20.427}$$

As $n \in S$ we have $\sum_{i=1}^{n} f_i \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ which, as $f_{n+1} \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$. proves, using [theorem: 20.343], that

$$f_{n+1} + \sum_{i=1}^{n} f_i \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

Combining this with [eq: 20.427] proves that $\sum_{i=1}^{n+1} f_i \in \mathcal{M}[A, \mathcal{A}, \mathbb{R}]$ so that $n+1 \in S$. □

Having covered the case of sums of measurable functions we consider now the multiplication of a function by a scalar.

Theorem 20.344. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $\alpha \in \mathbb{R}$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ where $\alpha \cdot f$ is defined pointwise by $\alpha \cdot f : X \to \overline{\mathbb{R}}$ by $(\alpha \cdot f)(x) = \alpha \cdot f(x)$.*

Proof. For $\alpha \in \mathbb{R}$ we have 3 cases to consider.

$\alpha = 0$. Then $\forall x \in X$ $(\alpha \cdot f)(x) = 0 \cdot f(x) = 0$ so that $\alpha \cdot f = C_0$, hence using [theorem: 20.314] it follows that $\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

$0 < \alpha$. Let $x \in \mathbb{R}$ then

$$\begin{aligned} t \in \{\alpha \cdot f < x\} &\Leftrightarrow \alpha \cdot f(t) < x \\ &\Leftrightarrow f(t) < \frac{x}{\alpha} \\ &\Leftrightarrow t \in \left\{ f < \frac{x}{\alpha} \right\} \end{aligned}$$

proving that $\{\alpha \cdot f < x\} = \left\{f < \frac{x}{\alpha}\right\} \in \mathcal{A}$ [using theorem: 20.335]]. Using [theorem: 20.335] again we have then that $\alpha \cdot f$ is $\mathcal{A}$-measurable.

$\alpha < 0$. Let $x \in \mathbb{R}$ then

$$\begin{aligned} t \in \{\alpha \cdot f < x\} &\Leftrightarrow \alpha \cdot f(t) < x \\ &\Leftrightarrow f(t) > \frac{x}{\alpha} \\ &\Leftrightarrow t \in \left\{f > \frac{x}{\alpha}\right\} \end{aligned}$$

proving that $\{\alpha \cdot f < x\} = \left\{f > \frac{x}{\alpha}\right\} \in \mathcal{A}$ [using [theorem: 20.335]]. Using [theorem: 20.335] again we have then that $\alpha \cdot f$ is $\mathcal{A}$-measurable. □

Theorem 20.345. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space then we have*

1. *If $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $f - g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ where*
$$f - g : A \to \overline{\mathbb{R}} \text{ is defined by } (f - g)(x) = f(x) - g(x)$$
2. *If $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then*
$$f^2 : A \to \overline{\mathbb{R}} \text{ defined by } f^2(x) = (f(x))^2$$
is $\mathcal{A}$-measurable. In other words $f^2 \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$.
3. *If $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $f \cdot g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ where*
$$f \cdot g : X \to \overline{\mathbb{R}} \text{ defined by } (f \cdot g)(x) = f(x) \cdot g(x)$$
4. *If $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then we have that*
$$D = \{x \in X \,|\, g(x) \neq 0\} \in \mathcal{A}$$
and for
$$\frac{f}{g} : D \to \overline{\mathbb{R}} \text{ defined by } \frac{f}{g}(x) = \frac{f(x)}{g(x)}$$
we have that $\frac{f}{g} \in \mathcal{M}[D, \mathcal{A}_{|D}, \mathbb{R}]$.

Proof.

1. As $\forall x \in X$
$$(f + (-1) \cdot g)(x) = f(x) + ((-1) \cdot g)(x) = f(x) + (-1) \cdot g(x) = f(x) - g(x) = (f - g)(x)$$
we have that $f + (-1) \cdot g = f - g$. Using [theorem: 20.344]
$$(-1) \cdot g \in f \cdot g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \underset{(-1) \cdot g(X) \in \mathbb{R}}{\Rightarrow} \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$
Hence, using [theorem: 20.340] $f - g = g + (-1) \cdot g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$.
2. Let $x \in \mathbb{R}$ then we have either:

   $x \leqslant 0$. If $t \in \{f^2 < x\}$ we have $0 < (f(t))^2 = f^2(t) < x \leqslant 0$ leading to the contradiction $0 < 0$. Hence $\{f^2 < x\} = \varnothing \in \mathcal{A}$.

   $0 < x$. Then
$$\begin{aligned} t \in \{f^2 < x\} &\Leftrightarrow f^2(t) < x \\ &\underset{\text{[theorem: 10.72]}}{\Leftrightarrow} -\sqrt{x} < f(t) < \sqrt{x} \\ &\Leftrightarrow t \in \{f > -\sqrt{x}\} \wedge t \in \{f < \sqrt{x}\} \\ &\Leftrightarrow t \in \{f > -\sqrt{x}\} \bigcap \{f < \sqrt{x}\} \end{aligned}$$
   proving that $\{f^2 < x\} = \{f > -\sqrt{x}\} \bigcap \{f < \sqrt{x}\}$. As $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows from [theorem: 20.335] that $\{f > -\sqrt{x}\}, \{f < \sqrt{x}\} \in \mathcal{A} \Rightarrow \{f > -\sqrt{x}\} \bigcap \{f < \sqrt{x}\} \in \mathcal{A}$, hence $\{f^2 < x\} \in \mathcal{A}$.

   As in all cases $\{f^2 < x\} \in \mathcal{A}$ we have by [theorem: 20.335] that f^2 is $\mathcal{A}$-measurable.

3. As $f,g\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$ we have by [theorem: 20.340] that $f+g\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$. Applying (2) it follows that $f^2,g^2,(f+g)^2\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$. Using (1) twice we have that $((f+g)^2-f^2)-g^2\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$ so that by [theorem: 20.344]

$$\frac{1}{2}\cdot(((f+g)^2-f^2)-g^2)\in\mathcal{M}[X,\mathcal{A},\mathbb{R}] \tag{20.428}$$

Finally if $x\in X$ then

$$\begin{aligned}\left(\frac{1}{2}\cdot((f+g)^2-f^2-g^2)\right)(x) &= \frac{1}{2}\cdot(((f(x)+g(x))^2-f^2(x))-g^2(x))\\ &= \frac{1}{2}\cdot(f^2(x)+g^2(x)+2\cdot f(x)\cdot g(x)-f^2(x)-g^2(x))\\ &= f(x)\cdot g(x)\\ &= (f\cdot g)(x)\end{aligned}$$

which proves that that $f\cdot g=\frac{1}{2}\cdot(((f+g)^2-f^2)-g^2)$ and by [eq: 20.428] that

$$f\cdot g\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$$

4. Let $D=\{x\in X|g(x)\neq 0\}$ then

$$\begin{aligned}t\in D &\Leftrightarrow t\in\{x\in X|g(x)\neq 0\}\\ &\Leftrightarrow t\in X\wedge(g(t)<0\vee 0<g(t))\\ &\Leftrightarrow (t\in X\wedge g(t)<0)\vee(t\in\mathcal{A}\wedge 0<g(t))\\ &\Leftrightarrow t\in\{g<0\}\vee t\in\{g>0\}\\ &\Leftrightarrow t\in\{g<0\}\bigcup\{g>0\}\end{aligned}$$

so that $D=\{g<0\}\bigcup\{g>0\}$. As g is $\mathcal{A}$-measurable we have by [theorem: 20.335] that $\{g<0\}$, $\{g>0\}\in\mathcal{A}$ proving that

$$D=\{x\in A|g(x)\neq 0\}=\{g<0\}\bigcup\{g>0\}\in\mathcal{A} \tag{20.429}$$

Let $x\in\mathbb{R}$.

$$t\in\left(\{t\in X|g(t)>0\}\bigcap\{t\in X|f(t)<x\cdot g(t)\}\right)\bigcup\left(\{t\in X|g(t)<0\}\bigcap\{t\in X|f(t)>x\cdot g(t)\}\right)$$

then we have either:

$\{t\in X|g(t)>0\}\bigcap\{t\in X|f(t)<x\cdot g(t)\}$. Then $x\in X\wedge g(t)>0\wedge f(t)<x\cdot g(t)$, so that $t\in X\wedge\frac{f(t)}{g(t)}<x$, proving as $g(t)\neq 0$, that $t\in\left\{t\in D|\frac{f(t)}{g(t)}<x\right\}$.

$\{t\in X|g(t)<0\}\bigcap\{t\in X|f(t)>x\cdot g(t)\}$. then $t\in X\wedge g(t)<0\wedge f(t)>x\cdot g(t)$ so that $t\in X\wedge\frac{f(t)}{g(t)}<x$ proving as $g(t)\neq 0$, that $t\in\left\{t\in D|\frac{f(t)}{g(t)}<x\right\}$.

So we have

$$\left(\{t\in X|g(t)>0\}\bigcap\{t\in X|f(t)<x\cdot g(t)\}\right)\bigcup\left(\{t\in X|g(t)<0\}\bigcap\{t\in X|f(t)>x\cdot g(t)\}\right)\subseteq\left\{t\in D|\frac{f(t)}{g(t)}<x\right\} \tag{20.430}$$

For the opposite inclusion, let $t\in\left\{t\in D|\frac{f(t)}{g(t)}<x\right\}$ then $g(t)\neq 0$ and $\frac{f(t)}{g(t)}<x$ so we must consider the following cases for $g(t)\neq 0$:

$g(t)>0$. then $f(t)<x\cdot g(t)$ or $t\in\{t\in X|g(t)>0\}\bigcap\{t\in X|f(t)<x\cdot g(t)\}$

$g(t)<0$. then $f(t)>x\cdot g(t)$ or $t\in\{t\in X|g(t)<0\}\bigcap\{t\in X|f(t)>x\cdot g(t)\}$

proving that

$$\left\{t\in D|\frac{f(t)}{g(t)}<x\right\}\subseteq\left(\{t\in X|g(t)>0\}\bigcap\{t\in X|f(t)<x\cdot g(t)\}\right)\bigcup\left(\{t\in X|g(t)<0\}\bigcap\{t\in A|f(t)>x\cdot g(t)\}\right)$$

So combining this with 20.430 proves that

$$\left(\{t\in X\,|\,g(t)>0\}\bigcap\{t\in X\,|\,f(t)<x\cdot g(t)\}\right)\bigcup\left(\{t\in X\,|\,g(t)<0\}\bigcap\{t\in X\,|\,f(t)>x\cdot g(t)\}\right)=\left\{t\in D\,|\,\frac{f(t)}{g(t)}<x\right\} \tag{20.431}$$

Now as g is $\mathcal{A}$-measurable it follows from 20.335] that $\{g>0\}=\{t\in X\,|\,g(t)>0\}\in\mathcal{A}$ and

$$\{g<0\}=\{t\in X\,|\,g(t)<0\}\in\mathcal{A}.$$

As f,g are $\mathcal{A}$-measurable and $x\cdot g$ is $\mathcal{A}$-measurable [using theorem: 20.344] it follows from 20.337] that

$$\{f>x\cdot g\}=\{t\in X\,|\,f(t)>x\cdot g(t)\}\in\mathcal{A}$$
$$\{f<x\cdot g\}=\{t\in X\,|\,f(t)<x\cdot g(t)\}\in\mathcal{A}$$

Using the above in [eq: 20.431] proves then that $\left\{t\in D\,|\,\frac{f(t)}{g(t)}<x\right\}\in\mathcal{A}$ and as $\left\{t\in D\,|\,\frac{f(t)}{g(t)}<x\right\}\subseteq D$ it follows that $\left\{t\in D\,|\,\frac{f(t)}{g(t)}<x\right\}\in\mathcal{A}_{|D}$ Finally using [theorem: 20.335] we get finally that

$$\frac{f}{g}\in\mathcal{M}[D,\mathcal{A}_{|D},\overline{\mathbb{R}}]$$

□

Theorem 20.346. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space and $f,g\in\mathcal{M}[X,\mathcal{A},\overline{\mathbb{R}}]$ then*

1. *$f\vee g\colon X\to[0,\infty]$ defined by $(f\vee g)(x)=\max(f(x),g(x))$ is a $\mathcal{A}$-measurable function. In other words $f\vee g\in\mathcal{M}[X,\mathcal{A},\overline{\mathbb{R}}]$.*
2. *$f\wedge g\colon X\to[0,\infty]$ defined by $(f\wedge g)(x)=\min(f(x),g(x))$ is a $\mathcal{A}$-measurable function. In other words $f\wedge g\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$.*

Proof.

1. Let $x\in\mathbb{R}$ then

$$\begin{aligned}t\in\{(f\vee g)<x\}\ &\Leftrightarrow\ (f\vee g)(t)<x\\ &\Leftrightarrow\ \max(f(t),g(t))<x\\ &\Leftrightarrow\ f(t)<x\wedge g(t)<x\\ &\Leftrightarrow\ t\in\{f<x\}\wedge t\in\{g<x\}\\ &\Leftrightarrow\ t\in\{f<x\}\bigcap\{g<x\}\end{aligned}$$

which proves that

$$\{(f\vee g)<x\}=\{f<x\}\bigcap\{g<x\}$$

Using [theorem: 20.335] and the fact that f,g are $\mathcal{A}$-measurable it follows that $\{f<x\},\{g<x\}\in\mathcal{A}$ from which it follows, using the above, that $\{(f\vee g)<x\}\in\mathcal{A}$. Applying [theorem: 20.335] again proves that $f\vee g$ is $\mathcal{A}$-measurable.

2. Let $x\in\mathbb{R}$ then

$$\begin{aligned}t\in\{(f\wedge g)>x\}\ &\Leftrightarrow\ (f\wedge g)(t)>x\\ &\Leftrightarrow\ \min(f(t),g(t))>x\\ &\Leftrightarrow\ f(t)>x\wedge g(t)>x\\ &\Leftrightarrow\ t\in\{f>x\}\vee t\in\{g>x\}\\ &\Leftrightarrow\ t\in\{f>x\}\bigcap\{g>x\}\end{aligned}$$

which proves that

$$\{(f\vee g)>x\}=\{f>x\}\bigcap\{g>x\}$$

Using [theorem: 20.335] and the fact that f,g are $\mathcal{A}$-measurable it follows that $\{f>x\},\{g>x\}\in\mathcal{A}$ from which it follows, using the above, that $\{(f\vee g)>x\}\in\mathcal{A}$. Applying [theorem: 20.335] again proves that $f>g$ is $\mathcal{A}$-measurable. □

Using mathematical induction we can extend the above to a finite family of $\mathcal{A}$-measurable functions.

Corollary 20.347. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space, $n \in \mathbb{N}$ and $\{f_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then*

1. *$\bigvee_{i=1}^n f_i : A \to \overline{\mathbb{R}}$ defined by $(\bigvee_{i=1}^n f_i)(x) = \max(\{f_i(x) | i \in \{1,\ldots,n\}\})$ is $\mathcal{A}$-measurble. In other words $\bigvee_{i=1}^n f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.*
2. *$\bigwedge_{i=1}^n f_i : A \to \overline{\mathbb{R}}$ defined by $(\bigwedge_{i=1}^n f_i)(x) = \min(\{f_i(x) | i \in \{1,\ldots,n\}\})$ is $\mathcal{A}$-measurable. In other words $\bigwedge_{i=1}^n f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.*

Proof. We use recursion to prove this.

1. Let
$$S = \left\{ n \in \mathbb{N} | \text{If } \{f_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ then } \bigvee_{i=1}^n f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \right\}$$
then we have:

   $1 \in S$. If $\{f_i\}_{i\in\{1\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $(\bigvee_{i=1}^1 f)(x) = \max(\{f_1(x)\}) = f_1(x)$ so that $\bigvee_{i=1}^1 f_i = f_1 \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, hence $1 \in S$

   $n \in S \Rightarrow n+1 \in S$. Let $\{f_i\}_{i\in\{1,\ldots,n+1\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $\forall x \in X$ we have
$$\begin{aligned}
\left(\bigvee_{i=1}^{n+1} f_i\right)(x) &= \max(\{f_i(x) | i \in \{1,\ldots,n+1\}\}) \\
&\underset{\text{[corollary: 3.67]}}{=} \max(\max(\{f_i(x) | i \in \{1,\ldots,n+1\}\}), f_{n+1}(x)) \\
&= \max\left(\left(\bigvee_{i=1}^n f_i\right)(x), f_{n+1}(x)\right) \\
&= \left(\left(\bigvee_{i=1}^n f_i\right) \vee f_{n+1}\right)(x)
\end{aligned}$$
   so that
$$\bigvee_{i=1}^{n+1} f_i = \left(\bigvee_{i=1}^n f_i\right) \vee f_{n+1}$$
   As $n \in S$ we have that $\bigvee_{i=1}^n f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, hence, using [theorem: 20.346] it follows that $(\bigvee_{i=1}^{n+1} f_i) \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, proving $n+1 \in \mathcal{S}$.

2. Let
$$S = \left\{ n \in \mathbb{N} | \text{If } \{f_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ then } \bigwedge_{i=1}^n f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \right\}$$
then we have:

   $1 \in S$. If $\{f_i\}_{i\in\{1\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $(\bigwedge_{i=1}^1 f)(x) = \min(\{f_1(x)\}) = f_1(x)$ so that $\bigwedge_{i=1}^1 f_i = f_1 \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, hence $1 \in S$

   $n \in S \Rightarrow n+1 \in S$. Let $\{f_i\}_{i\in\{1,\ldots,n+1\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $\forall x \in X$ we have
$$\begin{aligned}
\left(\bigwedge_{i=1}^{n+1} f_i\right)(x) &= \min(\{f_i(x) | i \in \{1,\ldots,n+1\}\}) \\
&\underset{\text{[corollary: 3.67]}}{=} \min(\min(\{f_i(x) | i \in \{1,\ldots,n+1\}\}), f_{n+1}(x)) \\
&= \min\left(\left(\bigwedge_{i=1}^n f_i\right)(x), f_{n+1}(x)\right) \\
&= \left(\left(\bigwedge_{i=1}^n f_i\right) \wedge f_{n+1}\right)(x)
\end{aligned}$$

so that

$$\bigwedge_{i=1}^{n+1} f_i = \left(\bigwedge_{i=1}^{n} f_i\right) \wedge f_{n+1}$$

As $n \in S$ we have that $\bigwedge_{i=1}^{n} f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, hence, using [theorem: 20.346] it follows that $(\bigwedge_{i=1}^{n+1} f_i) \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, proving $n+1 \in \mathcal{S}$. □

We now look at the measurability of the sup, inf, $\lim_{n\to\infty}$ sup and $\lim_{n\to\infty}$ inf and limit of a sequence of measurable functions.

Theorem 20.348. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space, $k \in \mathbb{N}$ and $\{f_i\}_{i\in\{k,\ldots,\infty\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ a sequence of $\mathcal{A}$-measurable functions then we have:*

1. *The function*

$$\sup_{n\in\{k,\ldots,\infty\}} f_n : X \to \overline{\mathbb{R}} \text{ defined by } \left(\sup_{n\in\{k,\ldots,\infty\}} f_n\right)(x) = \sup\left(\{f_n(x) | n \in \{k,\ldots,\infty\}\}\right)$$

   is $\mathcal{A}$-measurable. In other words $\sup_{n\to\infty} f_n \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

2. *The function*

$$\inf_{n\in\{k,\ldots,\infty\}} f_n : X \to \overline{\mathbb{R}} \text{ defined by } \left(\inf_{n\in\{k,\ldots,\infty\}} f_n\right)(x) = \inf\left(\{f_n(x) | n \in \{k,\ldots,\infty\}\}\right)$$

   is $\mathcal{A}$-measurable. In other words $\inf_{n\in\{k,\ldots,\infty\}} f_n \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

3. *The function*

$$\liminf_{n\to\infty} f_n : X \to \overline{\mathbb{R}} \text{ defined by } \left(\liminf_{n\to\infty} f_n\right)(x) = \liminf_{n\to\infty} f_n(x)$$

   is $\mathcal{A}$-measurable. In other words $\liminf_{n\to\infty} f_n \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

4. *The function*

$$\limsup_{n\to\infty} f_n : X \to \overline{\mathbb{R}} \text{ defined by } \left(\limsup_{n\to\infty} f_n\right)(x) = \limsup_{n\to\infty} f_n(x)$$

   is $\mathcal{A}$-measurable. In other words $\limsup_{n\to\infty} f_n \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

5. *Let $D = \left\{x \in X | \left(\limsup_{n\to\infty} f_n\right)(x) = \left(\liminf_{n\to\infty} f_n\right)(x)\right\}$ [this is the set where by [definition: 20.69] $\operatorname{limit}_{n\to\infty} f_n(x)$ exist so $D = \left\{x \in X | \lim_{n\to\infty} f_n(x) \text{ exist}\right\}$] then*

$$D \in \mathcal{A}$$

   and for the function

$$\lim_{n\to\infty} f_n : D \to \overline{\mathbb{R}} \text{ defined by } \left(\lim_{n\to\infty} f_n\right)(x) = \lim_{n\to\infty} f_n(x)$$

   we have $\lim_{n\to\infty} f_n \in \mathcal{M}[D, \mathcal{A}_{|D}, \overline{\mathbb{R}}]$.

Proof.

1. Let $x \in \mathbb{R}$. If $t \in \left\{\left(\sup_{k\in\{n,\ldots,\infty\}} f_n\right) \leqslant x\right\}$ then $\sup\left(\{f_n(t) | n \in \{k,\ldots,\infty\}\}\right) \leqslant x$. So $\forall n \in \{k,\ldots,\infty\}$ we have $f_n(t) \leqslant x \Rightarrow t \in \{f_n \leqslant x\}$. Hence

$$\left\{\left(\sup_{k\in\{n,\ldots,\infty\}} f_n\right) \leqslant x\right\} \subseteq \bigcap_{n\in\{k,\ldots,\infty\}} \{f_n \leqslant x\} \tag{20.432}$$

If $t \in \bigcap_{n\in\{k,\ldots,\infty\}} \{f_n \leqslant x\}$ then we have $\forall n \in \{k,\ldots,\infty\}$ that $t \in \{f_n \leqslant x\} \Rightarrow f_n(t) \leqslant x$. So x is a upper bound for $\{f_n(t)|n \in \{k,\ldots,\infty\}\}$ from which it follows that $\sup(\{f_n(t)|n \in \{k,\ldots,\infty\}\}) \leqslant x$ or $t \in \left\{\left(\sup_{n\in\{k,\ldots,\infty\}} f_n\right) \leqslant x\right\}$ proving that $\bigcap_{n\in\{k,\ldots,\infty\}} \{f_n \leqslant x\} \subseteq \left\{\left(\sup_{n\in\{k,\ldots,\infty\}} f_n\right) \leqslant x\right\}$. Combining this with [eq: 20.432] gives

$$\left\{\left(\sup_{n\in\{k,\ldots,\infty\}} f_n\right) \leqslant x\right\} = \bigcap_{n\in\{k,\ldots,\infty\}} \{f_n \leqslant x\} \tag{20.433}$$

As $\forall n \in \{k,\ldots,n\}$ f_n is $\mathcal{A}$-measurable it follows from [theorem: 20.335] that $\{f_n \leqslant x\} \in \mathcal{A}$. Using [theorem: 20.140] we have that $\bigcap_{n\in\{k,\ldots,\infty\}} \{f_n \leqslant x\} \in \mathcal{A}$ or, using [eq: 20.433], that $\left\{\left(\sup_{n\in\{k,\ldots,\infty\}} f_n\right) \leqslant x\right\} \in \mathcal{A}$. Applying then [theorem: 20.335] proves that

$$\sup_{n\in\{k,\ldots,\infty\}} f_n \text{ is } \mathcal{A}\text{-measurable}$$

2. Let $x \in \mathbb{R}$. If $t \in \left\{\left(\inf_{n\in\{k,\ldots,\infty\}} f_n\right) < x\right\}$ then $\inf(\{f_n(t)|n \in \{k,\ldots,n\}\}) < x$. So $\exists n \in \{k,\ldots,\infty\}$ such that $f_n(t) < x \Rightarrow t \in \{f_n < x\}$. Hence

$$\left\{\left(\inf_{n\in\{k,\ldots,\infty\}} f_n\right) < x\right\} \subseteq \bigcup_{n\in\{k,\ldots,\infty\}} \{f_n < x\} \tag{20.434}$$

If $t \in \bigcup_{n\in\{k,\ldots,\infty\}} \{f_n < x\}$ then $\exists n \in \{k,\ldots,\infty\}$ such that $t \in \{f_n < x\} \Rightarrow f_n(t) < x$, hence $\inf(\{f_n(t)|n \in \{k,\ldots,n\}\}) \leqslant f_n(t) < x$, proving that $t \in \left\{\left(\inf_{n\in\{k,\ldots,\infty\}} f_n\right) < x\right\}$. So $\bigcup_{n\in\{k,\ldots,\infty\}} \{f_n < x\} \subseteq \left\{\left(\inf_{n\in\{k,\ldots,\infty\}} f_n\right) < x\right\}$ which by [eq: 20.434] gives

$$\left\{\left(\inf_{n\in\{k,\ldots,\infty\}} f_n\right) < x\right\} = \bigcup_{n\in\{k,\ldots,\infty\}} \{f_n < x\} \tag{20.435}$$

As $\forall n \in \{k,\ldots,n\}$ f_n is $\mathcal{A}$-measurable it follows from [theorem: 20.335] that $\{f_n < x\} \in \mathcal{A}$, applying then [definition: 20.137] proves that $\bigcup_{n\in\{k,\ldots,\infty\}} \{f_n < x\} \in \mathcal{A}$ or using [eq: 20.435] that $\left\{\left(\inf_{n\in\{k,\ldots,\infty\}} f_n\right) < x\right\} \in \mathcal{A}$. Using then [theorem: 20.335] it follows that

$$\inf_{n\in\{k,\ldots,\infty\}} f_n \text{ is } \mathcal{A}\text{-measurable}$$

3. Let $x \in A$ then

$$\begin{aligned}
\left(\liminf_{n\to\infty} f_n\right)(x) &= \liminf_{n\to\infty} f_n(x) \\
&\underset{\text{[definition: 20.55]}}{=} \sup(\{\inf(\{f_i|i \in \{l,\ldots,\infty\}\})|l \in \{k,\ldots,\infty\}\}) \\
&= \sup\left(\left\{\left(\inf_{i\in\{l,\ldots,\infty\}} f_i\right)(x)|l \in \{k,\ldots,\infty\}\right\}\right) \\
&= \sup_{l\in\{k,\ldots,\infty\}}\left(\left(\inf_{i\in\{l,\ldots,\infty\}} f_i\right)(x)\right) \\
&= \left(\sup_{l\in\{k,\ldots,\infty\}}\left(\inf_{i\in\{l,\ldots,\infty\}} f_i\right)\right)(x)
\end{aligned}$$

which proves that

$$\liminf_{n\to\infty} f_n = \sup_{l\in\{k,\ldots,\infty\}}\left(\inf_{i\in\{l,\ldots,\infty\}} f_i\right) \tag{20.436}$$

Now $\forall l \in \{k,\ldots,\infty\}$ we have by (2) that $\inf_{i\in\{l,\ldots,\infty\}} f_i$ is $\mathcal{A}$-measurable. So applying (1) it follows that $\sup_{l\in\{k,\ldots,\infty\}}\left(\inf_{i\in\{l,\ldots,\infty\}} f_i\right)$ is $\mathcal{A}$-measurable. Hence using [eq: 20.436] it follows that $\liminf_{n\to\infty} f_n$ is $\mathcal{A}$-measurable.

4. Let $x \in A$ then

$$\begin{aligned}
\left(\limsup_{n\to\infty} f_n\right)(x) &= \limsup_{n\to\infty} f_n(x) \\
&\underset{\text{[definition: 20.55]}}{=} \inf\left(\left\{\sup\left(\left\{f_i | i \in \{l,\ldots,\infty\}\right\}\right) | l \in \{k,\ldots,\infty\}\right\}\right) \\
&= \inf\left(\left\{\left(\sup_{i\in\{l,\ldots,\infty\}} f_i\right)(x) | l \in \{k,\ldots,\infty\}\right\}\right) \\
&= \inf_{l\in\{k,\ldots,\infty\}}\left(\left(\sup_{i\in\{l,\ldots,\infty\}} f_i\right)(x)\right) \\
&= \left(\inf_{l\in\{k,\ldots,\infty\}}\left(\sup_{i\in\{l,\ldots,\infty\}} f_i\right)\right)(x)
\end{aligned}$$

which proves that

$$\limsup_{n\to\infty} f_n = \inf_{l\in\{k,\ldots,\infty\}}\left(\sup_{i\in\{l,\ldots,\infty\}} f_i\right) \tag{20.437}$$

Now $\forall l \in \{k,\ldots,\infty\}$ we have by (1) that $\sup_{i\in\{l,\ldots,\infty\}} f_i$ is $\mathcal{A}$-measurable. So applying (2) it follows that $\inf_{l\in\{k,\ldots,\infty\}}\left(\sup_{i\in\{l,\ldots,\infty\}} f_i\right)$ is $\mathcal{A}$-measurable. Hence using [eq: 20.436] it follows that $\limsup_{n\to\infty} f_n$ is $\mathcal{A}$-measurable.

5. From (3),(4) it follows that $\liminf_{n\to\infty} f_n$ and $\limsup_{n\to\infty} f_n$ are $\mathcal{A}$-measurable, combining this fact with [theorem: 20.337], proves that $\left\{\limsup_{n\to\infty} f_n = \limsup_{n\to\infty} f_n\right\} \in \mathcal{A}$. As $D = \left\{x \in A | \left(\limsup_{n\to\infty} f_n\right)(x) = \left(\limsup_{n\to\infty} f_n\right)(x)\right\} = \left\{\limsup_{n\to\infty} f_n = \limsup_{n\to\infty} f_n\right\}$ it follows that

$$D \in \mathcal{A} \tag{20.438}$$

If $x \in D$ then by definition $\limsup_{n\to\infty} f_n(x) = \limsup_{n\to\infty} f_n(x)$ so that by [definition: 20.69] $\lim_{n\to\infty} f_n(x)$ exist and $\lim_{n\to\infty} f_n(x) = \limsup_{n\to\infty} f_n(x) = \limsup_{n\to\infty} f_n(x)$. This allows us to define the function

$$\lim_{n\to\infty} f_n : D \to [0,\infty] \text{ where } \left(\lim_{n\to\infty} f_n\right)(x) = \lim_{n\to\infty} f_n(x) = \limsup_{n\to\infty} f_n(x) = \limsup_{n\to\infty} f_n(x) \tag{20.439}$$

Let $x \in \overline{\mathbb{R}}$ then

$$\begin{aligned}
t \in D \bigcap \left\{\left(\limsup_{n\to\infty} f_n\right) \leqslant x\right\} &\Leftrightarrow t \in D \wedge \left(\limsup_{n\to\infty} f_n\right)(t) \leqslant x \\
&\underset{\text{[eq: 20.439]}}{\Leftrightarrow} t \in D \wedge \left(\lim_{n\to\infty} f_n\right)(t) \leqslant x \\
&\Leftrightarrow t \in \left\{\left(\lim_{n\to\infty} f_n\right) \leqslant x\right\}
\end{aligned}$$

which proves that $\left\{\left(\lim_{n\to\infty} f_n\right) \leqslant x\right\} = D \bigcap \left\{\left(\limsup_{n\to\infty} f_n\right) \leqslant x\right\} \in \mathcal{A}_{|D}$ [as $D \in \mathcal{A}$ and $\left\{\left(\limsup_{n\to\infty} f_n\right) \leqslant x\right\} \in \mathcal{A}$]. Finally using [theorem: 20.335] it follows that

$$\lim_{n\to\infty} f_n : D \to \overline{\mathbb{R}} \text{ is } \mathcal{A}_{|D}\text{-measurable}$$

□

Theorem 20.349. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space and $\{f_n\}_{n\in\mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ a sequence of $\mathcal{A}$-measurable functions then for*

$$f_\infty : X \to \overline{\mathbb{R}} \text{ definied by } f_\infty(x) = \begin{cases} \lim_{n\to\infty} f_n(x) & \text{if } x \in D \\ 0 & \text{if } x \in X \setminus D \end{cases}$$

where

$$D = \left\{x \in X | \lim_{n\to\infty} f_n(x) \text{ exist}\right\} = \left\{x \in X | \left(\limsup_{n\to\infty} f_n\right)(x) = \left(\liminf_{n\to\infty} f_n\right)(x)\right\}$$

we have that

$$f_\infty \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ or in other words } f_\infty \text{ is } \mathcal{A}\text{-measurable}$$

Proof. Using the previous theorem [theorem: 20.348] it follows that

$$D \in \mathcal{A} \text{ and for the function } \lim_{n\to\infty} f_n : D \to \overline{\mathbb{R}} \text{ defined by } \left(\lim_{n\to\infty} f_n\right)(x) = \lim_{n\to\infty} f_n(x)$$

we have $\lim_{n\to\infty} f_n \in \mathcal{M}[A, \mathcal{A}_{|D}, \overline{\mathbb{R}}]$. Further $\forall x \in X$ we have

$$\left(\lim_{n\to\infty} f_n\right)_{D\uparrow X}(x) = \begin{cases} \left(\lim_{n\to\infty} f_n\right)(x) \text{ if } x \in D \\ 0 \text{ if } x \in X \setminus D \end{cases} = \begin{cases} \lim_{n\to\infty} f_n(x) \text{ if } x \in D \\ 0 \text{ if } x \in X \setminus D \end{cases} = f_\infty(x)$$

which proves that $f_\infty = \left(\lim_{n\to\infty} f_n\right)_{D\uparrow X}$ so that by [theorem: 20.331]

$$f_\infty \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

□

A very usefull $\mathcal{A}$-measurable function is the Charasteristic function.

Definition 20.350. *Let X be a set, $A \in \mathcal{P}(X)$ then the Charasteristic function $\mathcal{X}_{X,A}$ is defined by*

$$\mathcal{X}_{X,A} : X \to \overline{\mathbb{R}} \text{ where } \mathcal{X}_{X,A}(x) = \begin{cases} 1 \text{ if } x \in A \\ 0 \text{ if } x \in X \setminus A \end{cases}$$

If X is understood from the context then we use the notation $\mathcal{X}_A$ instead of $\mathcal{X}_{X,A}$

Theorem 20.351. *Let X be a set and $A \subseteq X$, $B \subseteq X$ then*

1. $\mathcal{X}_{X,A} \cdot \mathcal{X}_{X,B} = \mathcal{X}_{X,A\bigcap B}$ *[where $\mathcal{X}_{X,A} \cdot \mathcal{X}_{X,B}$ is poinwise defined]*
2. *If $f : X \to \overline{\mathbb{R}}$ is a function then $(\mathcal{X}_{X,B} \cdot f)_{|B} = f_{|B}$ [where $\mathcal{X}_{X,A} \cdot f$ is poinwise defined]*
3. *If $f : X \to \overline{\mathbb{R}}$ is a function then $(\mathcal{X}_{X,B} \cdot f)_{|A} = \mathcal{X}_{A,B} \cdot f_{|A}$ [where $\mathcal{X}_{X,B} \cdot f$ is poinwise defined]*

Proof.

1. Let $x \in X$ then we have either:

   $\boldsymbol{x \in A \bigcap B}$**.** Then $x \in A \wedge x \in B$ so that

   $$(\mathcal{X}_{X,A} \cdot \mathcal{X}_{X,B})(x) = \mathcal{X}_{X,A}(x) \cdot \mathcal{X}_{X,B}(x) = 1 \cdot 1 = 1 = \mathcal{X}_{X,A\bigcap B}(x)$$

   $\boldsymbol{x \in X \setminus (A \bigcap B)}$**.** Then $x \notin A \vee x \in B$ so that

   $$(\mathcal{X}_{X,A} \cdot \mathcal{X}_{X,B})(x) = \mathcal{X}_{X,A}(x) \cdot \mathcal{X}_{X,B}(x) = 0 - \mathcal{X}_{X,A\bigcap B}(x)$$

   which proves that $\mathcal{X}_{X,A} \cdot \mathcal{X}_{X,B} = \mathcal{X}_{X,A\bigcap B}$
2. Let $x \in B$ then we have $(\mathcal{X}_{X,B} \cdot f)_{|B}(x) = (\mathcal{X}_{X,B} \cdot f)(x) = 1 \cdot f(x) = f(x) = f_{|B}(x)$ which proves that $(\mathcal{X}_{X,B} \cdot f)_{|B} = f_{|B}$.
3. Let $x \in A$ then we have for x either:

   $\boldsymbol{x \in B}$**.** Then

   $$(\mathcal{X}_{X,B} \cdot f)_{|A}(x) = (\mathcal{X}_{X,B} \cdot f)(x) = \mathcal{X}_{X,B}(x) \cdot f(x) = f(x) = f_{|A}(x) = \mathcal{X}_{A,B}(x) \cdot f_{|A}(x) = (\mathcal{X}_{A,B} \cdot f_{|A})(x)$$

   $\boldsymbol{x \notin B}$**.** Then

   $$(\mathcal{X}_{X,B} \cdot f)_{|A}(x) = (\mathcal{X}_{X,B} \cdot f)(x) = \mathcal{X}_{X,B}(x) \cdot f(x) = 0 = \mathcal{X}_{A,B}(x) \cdot f_{|A}(x) = (\mathcal{X}_{A,B} \cdot f_{|A})(x)$$

   so that

   $$(\mathcal{X}_{X,B} \cdot f)_{|A} = \mathcal{X}_{A,B} \cdot f_{|A}$$

□

Theorem 20.352. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space and $A \in \mathcal{A}$ then $\mathcal{X}_{X,A} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.*

Proof. Let $x \in X$ then we have two possibilities:

$1 \leqslant x$. If $t \in \{\mathcal{X}_{X,A} > x\}$ then $1 \leqslant x < \mathcal{X}_{X,A}(t) = \begin{cases} 1 \text{ if } t \in A \\ 0 \text{ if } t \in X \setminus A \end{cases} \leqslant 1$ leading to the contradiction $1 < 1$ hence we have $\{\mathcal{X}_{X,A} > x\} = \varnothing \in \mathcal{A}$

$0 \leqslant x < 1$. Let $t \in \{\mathcal{X}_{X,A} > x\}$ then $0 \leqslant x < \mathcal{X}_{X,A}(t)$. If $t \notin A$ then $0 \leqslant x < \mathcal{X}_{X,A}(t) = 0$ laeding to the contradiction $0 < 0$ hence we must have that $t \in A$ which proves that

$$\{\mathcal{X}_{X,A} > x\} \subseteq A$$

If $t \in A$ then $\mathcal{X}_{X,A}(t) = 1 > x$ so that $t \in \{\mathcal{X}_{X,A} > x\}$ which proves that $A \subseteq \{\mathcal{X}_{X,A} > x\}$. Combining this with the above gives $\{\mathcal{X}_{X,A} > x\} = A \in \mathcal{A}$.

$x < 0$. If $t \in X$ then we have $\mathcal{X}_{X,A}(t) = \begin{cases} 1 \text{ if } t \in A \\ 0 \text{ if } t \in X \setminus A \end{cases} \geqslant 0 > x$ so that $X \subseteq \{\mathcal{X}_{X,A} > x\} \subseteq X$, hence $\{\mathcal{X}_{X,A} > x\} = X \in \mathcal{A}$.

As in all cases $\{\mathcal{X}_{X,A} > x\} \in \mathcal{A}$ it follows from [theorem: 20.335] that $\mathcal{X}_{X,A} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. □

Corollary 20.353. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space, $A \in \mathcal{A}$ and $f: X \to \overline{\mathbb{R}}$ a $\mathcal{A}$-measurable function then $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.*

Proof. This follows from the previous theorem [theorem: 20.352] and [theorem: 20.345]. □

Lemma 20.354. *Let X, $A \subseteq X$ be a set and $f: X \to \overline{\mathbb{R}}$ a function then for $B \subseteq \overline{\mathbb{R}}$ we have*

1. *If $0 \notin B$ then $(\mathcal{X}_{X,A} \cdot f)^{-1}(B) = A \bigcap f^{-1}(B)$*
2. *If $0 \in B$ then $(\mathcal{X}_{X,A} \cdot f)^{-1}(B) = (X \setminus A) \bigcup f^{-1}(B)$*

Proof.

1. Let $x \in (\mathcal{X}_{X,A} \cdot f)^{-1}(B)$ then $(\mathcal{X}_{X,A} \cdot f)(x) \in B$. Assume that $x \in X \setminus A$ then we would have $0 = \mathcal{X}_{X,\mathcal{A}}(x) \cdot f(x) = (\mathcal{X}_{X,A} \cdot f)(x) \in B$ contradicting the hypothese $0 \notin B$ so we must have that $x \in A$. Then $f(x) = \mathcal{X}_{X,A}(x) \cdot f(x) = (\mathcal{X}_{X,A} \cdot f)(x) \in B$ proving that $x \in A \bigcap f^{-1}(B)$. Hence

$$(\mathcal{X}_{X,A} \cdot f)^{-1}(B) \subseteq A \bigcap f^{-1}(B) \tag{20.440}$$

If $x \in A \bigcap f^{-1}(B)$ then $x \in A$ and $f(x) \in B$ so that $(\mathcal{X}_{X,A} \cdot f)(x) = \mathcal{X}_{X,A}(x) \cdot f(x) = f(x) \in B$ proving that $x \in (\mathcal{X}_{X,A} \cdot f)^{-1}(B)$. So $A \bigcap f^{-1}(B) \subseteq (\mathcal{X}_{X,A} \cdot f)^{-1}(B)$ which by [eq: 20.440 proves that

$$(\mathcal{X}_{X,A} \cdot f)^{-1}(B) = A \bigcap f^{-1}(B)$$

2. Let $x \in (\mathcal{X}_{X,A} \cdot f)^{-1}(B)$ then $(\mathcal{X}_{X,A} \cdot f)(x) \in B$, consider the following possible cases for x:

$x \in A$. Then $f(x) = \mathcal{X}_{X,A}(x) \cdot f(x) = (\mathcal{X}_{X,A} \cdot f)(x) \in B$ proving that

$$x \in f^{-1}(B) \subseteq (X \setminus A) \bigcup f^{-}(B)$$

$x \in X \setminus A$. Then clearly $x \in (X \setminus A) \bigcup f^{-1}(B)$

Hence we have

$$(\mathcal{X}_{X,A} \cdot f)^{-1}(B) \subseteq (X \setminus A) \bigcup f^{-1}(B) \tag{20.441}$$

On the other hand if $x \in (X \setminus A) \bigcup f^{-1}(B)$ then we have either

$x \in X \setminus A$. Then $(\mathcal{X}_{X,A} \cdot f)(x) = \mathcal{X}_{X,A}(x) \cdot f(x) = 0 \in B$ proving $x \in (\mathcal{X}_{X,A} \cdot f)^{-1}(B)$

$x \in A$. Then $x \in f^{-1}(B)$ so that $(\mathcal{X}_{X,A} \cdot f)(x) = \mathcal{X}_{X,A}(x) \cdot f(x) = f(x) \in B$ proving that $x \in (\mathcal{X}_{X,A} \cdot f)^{-1}(B)$.

Hence $(X \setminus A) \bigcup f^{-}(B) \subseteq (\mathcal{X}_{X,A} \cdot f)^{-1}(B)$ which by [eq: 20.441] gives

$$(\mathcal{X}_{X,A} \cdot f)^{-}(B) = (X \setminus A) \bigcup f^{-1}(B)$$

□

Theorem 20.355. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $A\in\mathcal{A}$ and $\langle A,\mathcal{A}_{|A}\rangle$ the measurable space defined by $\mathcal{A}_{|A}=\{C\in\mathcal{A}|C\subseteq A\}$ [see theorem: 20.147] and $f:X\to\overline{\mathbb{R}}$ a function then we have*

$$\mathcal{X}_{X,A}\cdot f\in\mathcal{M}[X,\mathcal{A},\overline{\mathbb{R}}]\Leftrightarrow f_{|A}\in\mathcal{M}[A,\mathcal{A}_{|A},\overline{\mathbb{R}}]$$

Proof.

⇒. Let $B\in\mathcal{B}[\overline{\mathbb{R}}]$ then as $\mathcal{X}_{X,A}\cdot f\in\mathcal{M}[X,\mathcal{A},\overline{\mathbb{R}}]$ we have

$$(\mathcal{X}_{X,A}\cdot f)^{-1}(B)\in\mathcal{A} \tag{20.442}$$

For B we must consider the following cases:

$0\in B$. Then by [lemma: 20.354]

$$(X\setminus A)\bigcup f^{-1}(B)=(\mathcal{X}_{X,A}\cdot f)^{-1}(B)\underset{\text{[eq: 20.442]}}{\in}\mathcal{A} \tag{20.443}$$

Further

$$\begin{aligned}A\bigcap\big((X\setminus A)\bigcup f^{-1}(B)\big) &= \big(A\bigcap(X\setminus A)\big)\bigcup\big(A\bigcap f^{-1}(B)\big)\\ &= \varnothing\bigcup\big(A\bigcap f^{-1}(B)\big)\\ &= A\bigcap f^{-1}(B)\\ &\underset{\text{[theorem: 2.86]}}{=} (f_{|A})^{-1}(B)\end{aligned}$$

As $A\in\mathcal{A}$ and by [eq: 20.443] $(X\setminus A)\bigcup f^{-1}(B)\in\mathcal{A}$ it follows that $A\bigcap((X\setminus A)\bigcup f^{-1}(B))\in\mathcal{A}$ so that by the above $(f_{|A})^{-1}(B)\in\mathcal{A}$.

$0\notin B$. Then $(f_{|A})^{-1}(B)\underset{\text{[theorem: 2.86]}}{=}A\bigcap f^{-1}(B)\underset{\text{[lemma: 20.354]}}{=}(\mathcal{X}_{X,A}\cdot f)^{-1}(B)\underset{\text{[eq: 20.442]}}{\in}\mathcal{A}$ proving that $(f_{|A})^{-1}(B)\in\mathcal{A}$.

So $\forall B\in\mathcal{B}[\overline{\mathbb{R}}]$ $(f_{|A})^{-1}(B)\in\mathcal{A}$, hence as $(f_{|A})^{-1}(B)\underset{\text{[theorem: 2.86]}}{=}A\bigcap f^{-1}(B)\subseteq A$ it follows that $(f_{|A})^{-1}(B)\in\mathcal{A}_{|A}$. Which proves that

$$f_{|A}\in\mathcal{M}[A,\mathcal{A}_{|A},\overline{\mathbb{R}}]$$

⇐. Let $B\in\mathcal{B}[\overline{\mathbb{R}}]$ then, as by the hypothesis $f_{|A}\in\mathcal{M}[A,\mathcal{A}_{|A},\overline{\mathbb{R}}]$ we have that $(f_{|A})^{-1}(B)\in\mathcal{A}_{|A}$ so that

$$A\bigcap f^{-1}(B)\underset{\text{[theorem: 2.86]}}{=}(f_{|A})^{-1}(B)\in\mathcal{A}_{|A}=\{B\in\mathcal{A}|B\subseteq A\}\subseteq\mathcal{A} \tag{20.444}$$

Further

$$\begin{aligned}(X\setminus A)\bigcup\big(A\bigcap f^{-1}(B)\big) &= \big((X\setminus A)\bigcup A\big)\bigcap\big((X\setminus A)\bigcup f^{-1}(B)\big)\\ &= X\bigcap\big((X\setminus A)\bigcup f^{-1}(B)\big)\\ &= (X\setminus A)\bigcup f^{-1}(B)\end{aligned}$$

As $A\bigcap(A\bigcap f^{-1}(B))\in\mathcal{A}$ [see eq: 20.444[and $A\in\mathcal{A}\Rightarrow X\setminus A\in\mathcal{A}$ it follows that $(X\setminus A)\bigcup(A\bigcap f^{-1}(B))\in\mathcal{A}$ so that by the above

$$(X\setminus A)\bigcup f^{-1}(B)\in\mathcal{A} \tag{20.445}$$

Now for B we have either:

$0\in B$. Then by [lemma: 20.354] $(\mathcal{X}_A\cdot f)^{-1}(B)=(X\setminus A)\bigcup f^{-1}(B)\in\mathcal{A}$

$0\notin B$. Then by [lemma: 20.354] $(\mathcal{X}_A\cdot f)^{-1}(B)=A\bigcap f^{-1}(B)\underset{\text{[eq: 20.444]}}{\in}\mathcal{A}$

So $\forall B\in\mathcal{B}[\overline{\mathbb{R}}]$ we have $(\mathcal{X}_A\cdot f)^{-1}(B)\in\mathcal{A}$ which proves that

$$\mathcal{X}_A\cdot f\in\mathcal{M}[X,\mathcal{A},\overline{\mathbb{R}}]$$

□

Corollary 20.356. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $A\in\mathcal{A}$ and $f\in\mathcal{M}[X,\mathcal{A},\overline{\mathbb{R}}]$ then*

$$f_{|A}\in\mathcal{M}[A,\mathcal{A}_{|A},\overline{\mathbb{R}}]$$

Proof. As $A\in\mathcal{A}$ it follows from [theorem: 20.353] that $\mathcal{X}_A\cdot f\in\mathcal{M}[X,\mathcal{A},\overline{\mathbb{R}}]$ so that by the previous theorem [theorem: 20.355] $f_{|A}\in\mathcal{M}[A,\mathcal{A}_{|A},\overline{\mathbb{R}}]$. □

20.5.3 Almost everywhere properties

Using the concept of μ-negligible sets [see definition: 20.299] we can introduce the term **almost everywhere**. A statement about elements in a set is said to be almost everywhere true if it is true for every element in the set except for a μ-negligible subset. The idea is that we can ignore the μ-negligible part because because it will not influence the final result.

Definition 20.357. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space and $P(x)$ a predicat then $P(x)$ is* ***μ-a.e. true*** *if $\{x \in X \mid \neg P(x)\} \in \mathcal{N}_\mu$. In other words using the definition of $\mathcal{N}_\mu$ [see definition: 20.299]*

$$P(x) \text{ is } \mu\text{-a.e. true or } P(x) \text{ holds } \mu\text{-a.e.}$$

if there exists a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$\{x \in X \mid \neg P(x)\} \subseteq N$$

Using the above we have the following examples that will be used in this text.

Definition 20.358. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space then we define:*

1. *If $f: X \to \overline{\mathbb{R}}$ and $g: X \to \overline{\mathbb{R}}$ are functions then* ***$f = g$ μ-a.e.*** *if there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X \mid f(x) \neq g(x)\} \subseteq N$.*
2. *If $f: X \to \overline{\mathbb{R}}$ and $g: X \to \overline{\mathbb{R}}$ are functions then* ***$f \leqslant g$ μ-a.e.*** *if there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X \mid g(x) < f(x)\} \subseteq N$.*
3. *If $f: X \to \overline{\mathbb{R}}$ and $g: X \to \overline{\mathbb{R}}$ are functions then* ***$f < g$ μ-a.e.*** *if there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X \mid g(x) \leqslant f(x)\} \subseteq N$.*
4. *If $f: X \to \overline{\mathbb{R}}$ then* ***$f = 0$ μ-a.e.*** *if there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X \mid f(x) \neq 0\} \subseteq N$*
5. *Let $\{f_n\}_{n \in \mathbb{N}} \subseteq \overline{\mathbb{R}}^X$ be a sequence of functions and $f: X \to \overline{\mathbb{R}}$ then* $\boldsymbol{\lim_{n \to \infty} f_n = f}$ ***μ-a.e.*** *if there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that*

$$X \setminus \left\{x \in X \mid \lim_{n \to \infty} f_n(x) \text{ exist and } \lim_{n \to \infty} f_n(x) = f(x)\right\} \subseteq N$$

One way that almost everywhere equality is used is in masking undesirable points from the domain of a function using a charasteristic function. For this the following theorem is usefull.

Theorem 20.359. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space, $A \in \mathcal{N}_\mu$ [in other words there exist a $N \in \mathcal{S}$ with $\mu(N) = 0$ such that $A \subseteq N$] and $f: X \to \overline{\mathbb{R}}$ then for $\mathcal{X}_{X, X \setminus A} \cdot f: X \to \overline{\mathbb{R}}$ we have that*

$$\mathcal{X}_{X, X \setminus A} \cdot f = f \ \mu\text{-a.e.}$$

Proof. Let $x \in \{x \in X \mid (\mathcal{X}_{X, X \setminus A} \cdot f)(x) \neq f(x)\}$ then $x \in X$ and $\mathcal{X}_{X, X \setminus A}(x) \cdot f(x) \neq f(x)$. Assume that $x \notin A$ then $x \in X \setminus A$ so that $f(x) \neq \mathcal{X}_{X, X \setminus A}(x) \cdot f(x) = 1 \cdot f(x) = f(x)$ which is a contradiction. Hence the assumption is false and we must have that $x \in A$, which proves that

$$\{x \in X \mid (\mathcal{X}_{X, X \setminus A} \cdot f)(x) \neq f(x)\} \subseteq A \subseteq N$$

So by definition

$$\mathcal{X}_{X \setminus A} \cdot f = f \ \mu\text{-a.e.}$$

□

Theorem 20.360. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space together with functions*

$$f: X \to \overline{\mathbb{R}}$$
$$g: X \to \overline{\mathbb{R}}$$
$$h: X \to \overline{\mathbb{R}}$$
$$k: X \to \overline{\mathbb{R}}$$

then we have:

1. *If $f=g$ μ-a.e. and $g=h$ μ-a.e. then $f=h$ μ-a.e.*
2. *If $f\leqslant g$ μ-a.e. and $g\leqslant h$ μ-a.e. then $f\leqslant h$ μ-a.e.*
3. *If $f\leqslant g$ μ-a.e. and $g\leqslant f$ μ-a.e. then $f=g$ μ-a.e.*
4. *If $\alpha\in\mathbb{R}\setminus\{0\}$ then if $f=g$ μ-a.e. it follows that $\alpha\cdot f=\alpha\cdot g$ μ-a.e.*
5. *If $\forall x\in X$ $(f(x),g(x)),(h(x),k(x))\in\overline{\mathbb{R}}\setminus\{(\infty,-\infty),\{-\infty,\infty\}\}$ [in other words $\forall x\in X$ $f(x)+g(x)$ and $h(x)+k(x)$ is well defined], $f=h$ μ-a.e. and $g=k$ μ-a.e. then $f+g=h+k$ μ-a.e.*

Proof.

1. As $f=g$ μ-a.e. and $g=h$ μ-a.e. there exist $N_1,N_2\in\mathcal{A}$ with $\mu(N_1)=0=\mu(N_2)$ such that $\{x\in X\,|\,f(x)\neq g(x)\}\subseteq N_1$ and $\{x\in X\,|\,g(x)\neq h(x)\}\subseteq N_2$. Let $x\in\{x\in X\,|\,f(x)\neq h(x)\}$ then $f(x)\neq g(x)\vee g(x)\neq h(x)$ [for if $f(x)=g(x)\wedge g(x)=h(x)$ then $f(x)=h(x)$] so that $x\in\{x\in X\,|\,f(x)\neq g(x)\}\bigcup\{x\in X\,|\,g(x)\neq h(x)\}$ proving
$$\{x\in X\,|\,f(x)\neq h(x)\}\subseteq\{x\in X\,|\,f(x)\neq g(x)\}\bigcup\{x\in X\,|\,g(x)\neq h(x)\}\subseteq N_1\bigcup N_2\in\mathcal{A}$$
which, as $\mu(N_1\bigcup N_2)\leqslant\mu(N_1)+\mu(N_2)=0$, proves that
$$f=h\ \mu\text{-a.e.}$$
2. As $f\leqslant g$ μ-a.e. and $g\leqslant h$ μ-a.e. there exist $N_1,N_2\in\mathcal{A}$ with $\mu(N_1)=0=\mu(N_2)$ such that $\{x\in X\,|\,g(x)<f(x)\}\subseteq N_1$ and $\{x\in X\,|\,h(x)<g(x)\}\subseteq N_2$. Let $x\in\{x\in X\,|\,h(x)<f(x)\}$ then we have $g(x)<f(x)\vee h(x)<g(x)$ [for if $f(x)\leqslant g(x)\wedge g(x)\leqslant h(x)$ then we have $f(x)\leqslant h(x)$ contradicting $h(x)<f(x)$] so that $x\in\{x\in X\,|\,g(x)<f(x)\}\bigcup\{x\in X\,|\,h(x)<g(x)\}$ proving
$$\{x\in X\,|\,h(x)<f(x)\}\subseteq\{x\in X\,|\,g(x)<f(x)\}\bigcup\{x\in X\,|\,h(x)<g(x)\}\subseteq N_1\bigcup N_2\in\mathcal{A}$$
which, as $\mu(N_1\bigcup N_2)\leqslant\mu(N_1)+\mu(N_2)=0$, proves that
$$f\leqslant h\ \mu\text{-a.e.}$$
3. As $f\leqslant g$ μ-a.e. and $g\leqslant f$ μ-a.e. there exist $N_1,N_2\in\mathcal{A}$ with $\mu(N_1)=0=\mu(N_2)$ such that $\{x\in X\,|\,g(x)<f(x)\}\subseteq N_1$ and $\{x\in X\,|\,f(x)<g(x)\}\subseteq N_2$. Let $x\in\{x\in X\,|\,f(x)\neq g(x)\}$ then $f(x)\neq g(x)$ hence $f(x)<g(x)\vee g(x)<f(x)$ so that $x\in\{x\in X\,|\,g(x)<f(x)\}\bigcup\{x\in X\,|\,f(x)<g(x)\}$ proving that
$$\{x\in X\,|\,f(x)\neq g(x)\}\subseteq\{x\in X\,|\,g(x)<f(x)\}\bigcup\{x\in X\,|\,f(x)<g(x)\}\subseteq N_1\bigcup N_2\in\mathcal{A}$$
which as $\mu(N_1\bigcup N_2)\leqslant\mu(N_1)+\mu(N_2)=0$, proves that
$$f=g\ \mu\text{-a.e.}$$
4. As $f=g$ μ-a.e. there exists a $N\in\mathcal{A}$ with $\mu(N)=0$ such that $\{x\in X\,|\,f(x)\neq g(x)\}\subseteq N$. Let now $x\in\{x\in X\,|\,\alpha\cdot f(x)\neq\alpha\cdot g(x)\}$ then $\alpha\cdot f(x)\neq\alpha\cdot g(x)\underset{\alpha\neq 0}{\Rightarrow}f(x)\neq g(x)$ proving that $\{x\in X\,|\,\alpha\cdot f(x)\neq\alpha\cdot g(x)\}\subseteq\{x\in X\,|\,f(x)\neq g(x)\}\subseteq N$. So
$$\alpha\cdot f\neq\alpha\cdot g\ \mu\text{-a.e.}$$
5. As $f=h$ μ-a.e. and $g=k$ μ-a.e. there exists $N_1,N_2\in\mathcal{A}$ with $\mu(N_1)=0=\mu(N_2)$ such that $\{x\in X\,|\,f(x)\neq h(x)\}\subseteq N_1$ and $\{x\in X\,|\,g(x)\neq k(x)\}\subseteq N_2$. Let $x\in\{x\in X\,|\,f(x)+g(x)\neq h(x)+k(x)\}$ then $f(x)\neq h(x)\vee g(x)\neq k(x)$ [for if $f(x)=h(x)\wedge g(x)=k(x)\Rightarrow f(x)+g(x)=h(x)+k(x)$] so that $x\in\{x\in X\,|\,f(x)\neq h(x)\}\bigcup\{x\in X\,|\,g(x)\neq k(x)\}$. Hence
$$\{x\in X\,|\,f(x)+g(x)\neq h(x)+k(x)\}\subseteq N_1\bigcup N_2\in\mathcal{A}$$
As $\mu(N_1\bigcup N_2)\leqslant\mu(N_1)+\mu(N_2)=0$ it follows that $f+g=h+k$ μ-a.e. □

Theorem 20.361. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space and $f\colon X\to\overline{\mathbb{R}}$ $g\colon X\to\overline{\mathbb{R}}$ with $f(X),g(X)\subseteq\mathbb{R}$ then*
$$f=g\ \mu\text{-a.e.}\Leftrightarrow f-g=0\ \mu\text{-a.e.}$$

***Note* 20.362.** *$f(X), g(X) \subseteq \mathbb{R}$ is needed to ensure that $g - f$ is well defined.*

Proof. Note that

$$\begin{aligned} x \in \{x \in X \,|\, f(x) \neq g(x)\} &\Leftrightarrow x \in X \wedge f(x) \neq g(x) \\ &\Leftrightarrow x \in X \wedge (f-g)(x) \neq 0 \\ &\Leftrightarrow x \in \{x \in X \,|\, (f-g)(x) \neq 0\} \end{aligned}$$

proving that $\{x \in X \,|\, f(x) \neq g(x)\} = \{x \in X \,|\, (f-g)(x) \neq 0\}$, from which we have trivially that

$$f = g \ \mu\text{-a.e.} \Leftrightarrow f - g = 0 \ \mu\text{-a.e.}$$

□

The following theorem shows that for a complete measure space a function that is a.e. equal to a measurable function is also measurable.

Theorem 20.363. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a **complete** measure space [see theorem: 20.303], $f: X \to \overline{\mathbb{R}}$ a $\mathcal{A}$-measurable function and $g: X \to \overline{\mathbb{R}}$ satisfies $f = g$ μ-a.e. then g is $\mathcal{A}$-measurable.*

Proof. As $f = g$ μ-a.e. there exists a $N \in \mathcal{A}$ with $\mu(N) = 0$ and $\{x \in X \,|\, f(x) \neq g(x)\} \subseteq N$. So

$$x \in X \setminus N \Rightarrow f(x) = g(x) \tag{20.446}$$

. Let $t \in \mathbb{R}$ then

$$\begin{aligned} x \in \{g \leqslant t\} &\Leftrightarrow x \in X \wedge g(x) \leqslant t \\ &\Leftrightarrow (x \in X \setminus N \vee x \in N) \wedge g(x) \leqslant t \\ &\Leftrightarrow (x \in X \setminus N \wedge g(x) \leqslant t) \vee (x \in N \wedge g(x) \leqslant t) \\ &\underset{\text{[eq: 20.446]}}{\Leftrightarrow} (x \in X \setminus N \wedge f(x) \leqslant t) \vee (x \in N \wedge g(x) \leqslant t) \\ &\Leftrightarrow x \in \left((X \setminus N) \bigcap \{f \leqslant t\}\right) \vee x \in \left(N \bigcap \{g \leqslant t\}\right) \\ &\Leftrightarrow x \in \left((X \setminus N) \bigcap \{f \leqslant t\}\right) \bigcup \left(N \bigcap \{g \leqslant t\}\right) \end{aligned}$$

which proves that

$$\{g \leqslant t\} = \left((X \setminus N) \bigcap \{f \leqslant t\}\right) \bigcup \left(N \bigcap \{g \leqslant t\}\right) \tag{20.447}$$

Given that f is $\mathcal{A}$-measurable we have by [theorem: 20.335] that $\{f \leqslant t\} \in \mathcal{A}$, further as $N \in \mathcal{A}$ we have also $X \setminus N \in \mathcal{A}$. Finally as $N \bigcap \{g \leqslant t\} \subseteq N$ and $\mu(N) = 0$ it follows from the fact μ is complete that $N \bigcap \{g \leqslant t\} \in \mathcal{A}$. So $(X \setminus N \bigcap \{f \leqslant t\}) \bigcup (N \bigcap \{g \leqslant t\}) \in \mathcal{A}$ which by [eq: 20.447] proves that $\{g \leqslant t\} \in \mathcal{A}$. Applying then [theorem: 20.335] results in

$$g \text{ is } \mathcal{A}\text{-measurable}$$

□

Theorem 20.364. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a **complete measure space** and $\{f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ a sequence of $\mathcal{A}$-measurable functions and $f: X \to \overline{\mathbb{R}}$ a function such that $\lim_{n \to \infty} f_n = f$ μ-a.e. then $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.*

Proof. Let $D = \left\{x \in X \,|\, \lim_{n \to \infty} f_n(x) \text{ exist}\right\}$ then we have by [theorem: 20.349] that

$$f_\infty: X \to \overline{\mathbb{R}} \text{ where } f_\infty(x) = \begin{cases} \lim_{n \to \infty} f_n(x) \text{ if } x \in D \\ 0 \text{ if } x \in X \setminus D \end{cases} \text{ is } \mathcal{A}\text{-measurable}$$

As $\lim_{n \to \infty} f_n = f$ μ-a.e. there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$X \setminus \left\{x \in X \,|\, \lim_{n \to \infty} f_n(x) \text{ exist and } \lim_{n \to \infty} f_n(x) = f(x)\right\} \subseteq N$$

If $x \in \left\{x \in X \,|\, \lim_{n \to \infty} f_n(x) \text{ exist and } \lim_{n \to \infty} f_n(x) = f(x)\right\}$ then $\lim_{n \to \infty} f_n(x)$ exists and $\lim_{n \to \infty} f_n(x) = f(x)$ so that $x \in D$ and $f(x) = \lim_{n \to \infty} f_n(x) = f_\infty(x)$ which proves that $x \in \{x \in X \,|\, f(x) = f_\infty(x)\}$. Hence

$$\left\{x \in X \,|\, \lim_{n \to \infty} f_n(x) \text{ exist and } \lim_{n \to \infty} f_n(x) = f(x)\right\} \subseteq \{x \in X \,|\, f(x) = f_\infty(x)\}$$

so that

$$X \setminus \{x \in X \,|\, f(x) = f_\infty(x)\} \subseteq X \setminus \left\{x \in X \,|\, \lim_{n\to\infty} f_n(x) \text{ exist and } \lim_{n\to\infty} f_n(x) = f(x)\right\} \subseteq N$$

from which it follows that $f = f_\infty$ μ-a.e.. Using then the previous theorem [theorem: 20.363] we must conclude that

$$f \text{ is } \mathcal{A}\text{-measurable.}$$

□

20.6 The measure integral

We will build up the definition of the measure integral in fases:

1. We define a integral over measurable functions whose image is finite the so called **simple functions**.
2. Extend this integral to non negative measurable functions.
3. Extend the integral of non negative measurable function to general measurable functions.
4. Finally extend the integral to complex valued functions.

20.6.1 Integral of simple functions

Definition 20.365. *Let X be a non empty set then a function $f: X \to \overline{\mathbb{R}}$ is a **simple function** if $f(X)$ is a **finite set** and $\boldsymbol{f(X) \subseteq \mathbb{R}}$. The set of all simple function graphs is noted as $\mathcal{S}[X]$ so*

$$\mathcal{S}[X] = \{f \in \overline{\mathbb{R}}^X \,|\, f(X) \subseteq \mathbb{R} \text{ and } f(X) \text{ is a finite set}\}$$

We have the following alternative definition of a simple function.

Theorem 20.366. *Let X be a non empty set then for a function $f: X \to \overline{\mathbb{R}}$ with $f(X) \subseteq \mathbb{R}$ we have the following equivalences:*

1. *f is a simple function [in other words $f \in \mathcal{S}[X]$]*
2. *There exist a $n \in \mathbb{N}$ and a bijection $\beta: \{1, \ldots, n\} \to f(X)$ such that for $\{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{P}(X)$ defined by $A_i = f^{-1}(\{\beta(i)\})$ we have:*
   a. *$\{A_i\}_{i\in\{1,\ldots,n\}}$ is pairwise disjoint*
   b. *$X = \bigsqcup_{i\in\{1,\ldots,n\}} A_i$*
   c. *$f = \sum_{i=1}^n \beta(i) \cdot \mathcal{X}_{A_i}$*
3. *There exist a $n \in \mathbb{N}$ and a pairwise disjoint $\{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{P}(X)$ and $\{f_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathbb{R}$ such that*

$$f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{A_i}$$

Proof.

1 ⇒ 2. As f is a simple function $f(X)$ is finite, further as $X \neq \varnothing$ $f(X) \neq \varnothing$, hence there exists a $n \in \mathbb{N}$ and a bijection

$$\beta: \{1, \ldots, n\} \to f(X)$$

Define $\{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{P}(X)$ by $A_i = f^{-1}(\{\beta(i)\})$. Let $i, j \in \{1, \ldots, n\}$ with $i \neq j$ then

$$\begin{aligned}
A_j \bigcap A_j &= f^{-1}(\{\beta(i)\}) \bigcap f^{-1}(\{\beta(j)\}) \\
&\underset{\text{[theorem: 2.95]}}{=} f^{-1}\big(\{\beta(i)\} \bigcap \{\beta(j)\}\big) \\
&\underset{i\neq j \Rightarrow \beta(i)\neq\beta(j) \Rightarrow \{\beta(i)\}\bigcap\{\beta(j)\}=\varnothing}{=} f^{-1}(\varnothing) \\
&= \varnothing
\end{aligned}$$

which proves that

$$\{A_i\}_{i\in\{1,\ldots,n\}} \text{ is pairwise disjoint} \tag{20.448}$$

Let $x\in X$ then $f(x)\in f(X)$ so, using the surjectivity of β, there exist a $i\in\{1,\ldots,n\}$ such that $f(x)=\beta(i)$. Hence $x\in f^{-1}(\{\beta(i)\})=A_i\subseteq\bigsqcup_{i\in\{1,\ldots,n\}}A_i$ which proves that $X\subseteq\bigsqcup_{i\in\{1,\ldots,n\}}A_i\subseteq X$ or that

$$X=\bigsqcup_{i\in\{1,\ldots,n\}}A_i \tag{20.449}$$

Let $x\in X$ then by [eqs: 20.448, 20.449] there exists a $i\in\{1,\ldots,n\}$ such that $x\in A_i$ and $\forall j\in\{1,\ldots,n\}$ $x\notin A_j$. Hence

$$\begin{aligned}\left(\sum_{k=1}^{n} f(\beta(k))\cdot\mathcal{X}_{X,A_k}\right)(x) &= \sum_{k\in\{1,\ldots,n\}} f(\beta(k))\cdot\mathcal{X}_{X,A_k}(x)\\ &= \sum_{k\in\{i\}} f(\beta(k))\cdot\mathcal{X}_{X,A_k}(x)+\sum_{k\in\{1,\ldots,n\}\setminus\{i\}} f(\beta(k))\cdot\mathcal{X}_{X,A_k}(x)\\ &= f(\beta(i))\cdot\mathcal{X}_{X,A_i}(x)+\sum_{k\in\{1,\ldots,n\}\setminus\{i\}} f(\beta(k))\cdot 0\\ &= f(\beta(i))\\ &= f(x)\end{aligned}$$

proving that

$$f=\sum_{k=1}^{n} f(\beta(k))\cdot\mathcal{X}_{X,A_k} \tag{20.450}$$

2 ⇒ 3. By (2) there exists a $n\in\mathbb{N}$ and a bijection $\beta:\{1,\ldots,n\}\to f(X)\subseteq\mathbb{R}$ such that for $\{A_i\}_{i\in\{1,\ldots,n\}}$ defined by $A_i=\beta^{-1}(\{\beta(i)\})$ we have

$$\{A_i\}_{i\in\{1,\ldots,n\}} \text{ is pairwise disjoint, } X=\bigsqcup_{i\in\{1,\ldots,n\}}A_i \text{ and } f=\sum_{i=1}^{n} f(\beta(i))\cdot\mathcal{X}_{X,A_i}$$

Define $\{f_i\}_{i\in\{1,\ldots,n\}}\subseteq f(X)\subseteq\mathbb{R}$ by $f_i=f(\beta(i))\in\mathbb{R}$ then we have by the above also

$$f=\sum_{i=1}^{n} f_i\cdot\mathcal{X}_{X,A_i}$$

which finish the proof of (3).

3 ⇒ 1. By (3) there exists a $n\in\mathbb{N}$, $\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{P}(X)$, $\{f_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{R}$ such that

$$\{A_i\}_{i\in\{1,\ldots,n\}} \text{ is pairwise disjoint and } f=\sum_{i=1}^{n} f_i\cdot\mathcal{X}_{X,A_i}$$

Let $y\in f(X)$ then there exists a $x\in X$ such that $y=f(x)$. Using the above there exist a $i\in\{1,\ldots,n\}$ such that $x\in A_i$ and $\forall j\in\{1,\ldots,n\}\setminus\{i\}$ $x\notin A_j$ hence

$$\begin{aligned}y &= f(x)\\ &= \left(\sum_{k=1}^{n} f_k\cdot\mathcal{X}_{A_k}\right)(x)\\ &= \sum_{k\in\{1,\ldots,n\}} f_k\cdot\mathcal{X}_{A_k}(x)\\ &= \sum_{k\in\{i\}} f_k\cdot\mathcal{X}_{A_k}(x)+\sum_{k\in\{1,\ldots,n\}\setminus\{i\}} f_k\cdot\mathcal{X}_{A_k}(x)\\ &= f_i\cdot\mathcal{X}_{A_i}(x)+\sum_{k\in\{1,\ldots,n\}\setminus\{i\}} f_k\cdot 0\\ &= f_i\\ &\in \{f_i|i\in\{1,\ldots,n\}\}\end{aligned}$$

from which it follows that $f(X) \subseteq \{f_i | i \in \{1, \ldots, n\}\}$ a finite set. As the subset of a finite set is finite [see theorem: 6.43] it follows that $f(X)$ is a finite set, hence f is a simple function by definition. □

We have the following important result for functions of the form $f = \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{A_i}$ like simple functions.

Theorem 20.367. *Let X be a non empty set, $n \in \mathbb{N}$, I finite, $\{A_i\}_{i \in I} \subseteq \mathcal{P}(X)$ pairwise disjoint and $\{f_i\}_{i \in I} \subseteq \mathbb{R}$ then for*

$$f = \sum_{i \in I} f_i \cdot \mathcal{X}_{X, A_i} : X \to \overline{\mathbb{R}}$$

we have that:

1. *$\forall i \in I$ we have $\forall x \in A_i$ that $f(x) = f_i$*
2. *$\forall x \in X \setminus (\bigsqcup_{i \in I} A_i)$ we have $f(x) = 0$*

Proof.

1. Let $i \in I$ then for $x \in A_i$ we have, as $\{A_i\}_{i \in I}$ is pairwise disjoint, that $\forall j \in I \setminus \{i\}$ $x \notin A_j$. So

$$\begin{aligned} f(x) &= \sum_{k \in I} f_k \cdot \mathcal{X}_{X, A_k}(x) \\ &= \sum_{k \in \{i\}} f_k \cdot \mathcal{X}_{X, A_k}(x) + \sum_{k \in I \setminus \{i\}} f_k \cdot \mathcal{X}_{X, A_k}(x) \\ &= f_i \cdot \mathcal{X}_{X, A_i}(x) + \sum_{k \in I \setminus \{i\}} f_k \cdot 0 \\ &= f_i \end{aligned}$$

2. If $x \in X \setminus (\bigsqcup_{i \in I} A_i)$ then $\forall i \in I$ we have $x \notin A_i$ so that

$$f(x) = \sum_{i \in I} f_i \cdot \mathcal{X}_{X, A_i}(x) = \sum_{i \in I} f_i \cdot 0 = 0$$

□

The set of simple functions is stable under pointwise sum and scalar product.

Theorem 20.368. *Let X be a set then we have*

1. *$\forall f \in \mathcal{S}[X]$ and $\forall \alpha \in \mathbb{R}$ we have $\alpha \cdot f \in \mathcal{S}[X]$*
2. *$\forall f, g \in \mathcal{S}[X]$ we have $f + g \in \mathcal{S}[X]$*

Proof.

1. We have to consider two cases for α

   $\alpha = 0$. Then $(\alpha \cdot f)(X) = \{0\}$ which is finite and non empty

   $\alpha \neq 0$. As f is a simple function there exists a $n \in \mathbb{N}$ and a bijection $\beta : \{1, \ldots, n\} \to f(X)$. Define now

   $$\alpha_f : \{1, \ldots, n\} \to (\alpha \cdot f)(X) \text{ by } \alpha_f(i) = \alpha \cdot \beta(i)$$

   If $y \in (\alpha \cdot f)(X)$ then there exists a $x \in X$ such that

   $$y = (\alpha \cdot f)(x) = \alpha \cdot f(x) \underset{\alpha \neq 0}{\Rightarrow} f(x) = \frac{y}{\alpha}$$

   As $f(x) \in f(X)$ there exists a $i \in \{1, \ldots, n\}$ such that

   $$\beta(i) = f(x) = \frac{y}{\alpha} \Rightarrow y = \alpha \cdot \beta(i) = \alpha_f(i)$$

   proving that α_f is *a* surjection. So using [theorem: 6.44] we have that $(\alpha \cdot f)(X)$ is finite.

so in all cases $(\alpha \cdot f)(X)$ is finite proving that $\alpha \cdot f$ is a simple function.

2. As f and g are simple functions we have that $f(X)$ and $g(X)$ are finite. As the product of finite sets is finite [see theroem: 6.41] we have that

$$f(X) \times g(X) \text{ is finite}$$

Define now

$$s: f(X) \times g(Y) \to \{x+y|(x,y) \in f(X) \times g(Y)\} \text{ by } s(x,y) = x+y$$

Then if $z \in \{x+y|(x,y) \in f(X) \times g(Y)\}$ there exists a $x \in f(X)$ and a $y \in f(Y)$ such that $z = x+y = s(x,y)$ which proves that s is surjective. Applying then [theorem: 6.44] proves that

$$\{x+y|(x,y) \in f(X) \times g(X)\} \text{ is finite}$$

Let $y \in (f+g)(X)$ then there exists a $x \in X$ such that

$$y = f(x) + g(x) \in \{x+y|(x,y) \in f(X) \times g(X)\}.$$

Hence $(f+g)(X) \subseteq \{x+y|(x,y) \in f(X) \times g(X)\}$ which, as we have proved that $\{x+y|(x,y) \in f(X) \times g(X)\}$ is finite, proves using [theorem: 6.43] that $(f+g)(X)$ is finite.. This proves that $f+g$ is a simple function. □

A example of a simple function $f: \mathbb{R} \to \overline{\mathbb{R}}$ of the form

$$f = f_1 \cdot \mathcal{X}_{A_1} + f_2 \cdot \mathcal{X}_{A_2} + f_3 \cdot \mathcal{X}_{A_3} + f_4 \cdot \mathcal{X}_{A_4} \text{ where } f(X) = \{f_1, f_2, f_3, f_4\}$$

is shown in the following figure:

Figure 20.5.

The area below the above function and the X-axis is intuitively equal to the sum

$$f_1 \cdot \text{size}(A_1) + f_2 \cdot \text{size}(A_2) + f_3 \cdot \text{size}(A_3) + f_4 \cdot \text{size}(A_4)$$

so the integral of f which calculates this size should be of the form

$$\int f = f_1 \cdot \text{size}(A_1) + f_2 \cdot \text{size}(A_2) + f_3 \cdot \text{size}(A_3) + f_4 \cdot \text{size}(A_4)$$

hence we need a way to calculate the sizes of A_1, A_2, A_3 and A_4, in other words A_1, A_2, A_3 and A_4 must be measurable so that we can use the measure function to calculate the sizes. The integral becomes then

$$\int f = f_1 \cdot \mu(A_1) + f_2 \cdot \mu(A_2) + f_3 \cdot \mu(A_3) + f_4 \cdot \mu(A_4)$$

For this to work we must have $A_1, A_2, A_3, A_4 \in \mathcal{A}$ and as $\mu(A_i)$ can be ∞ f_1, f_2, f_3, f_4 must be non negative. This motivates the following defintion.

Definition 20.369. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space then the set of $\mathcal{A}$-measurable real valued simple functions is noted as $\mathcal{S}[X, \mathcal{A}]$. Hence*

$$\mathcal{S}[X, \mathcal{A}] = \{f \in \mathcal{S}[X] | f: X \to \overline{\mathbb{R}} \text{ is } \mathcal{A}\text{-measurable}\} \subseteq S[X]$$

***Note* 20.370.** *If $f \in \mathcal{S}[X, \mathcal{A}]$ then $f \in \mathcal{S}[X]$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. Hence we have that*

$$\mathcal{S}[X, \mathcal{A}] = \mathcal{S}[X] \bigcap \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

We have a simpler alternative definition for $\mathcal{S}[X, \mathcal{A}]$
TODO subspace

Theorem 20.371. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space then we have the following equivalences:*

1. *$f \in \mathcal{S}[X, \mathcal{A}]$ [in other words $f \in \mathcal{S}[X]$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$*
2. *$f \in \mathcal{S}[X]$ and $\forall y \in f(X)$ $f^{-1}(\{y\}) \in \mathcal{A}$*
3. *There exists a $n \in \mathbb{N}$, a pairwise disjoint family $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ of measurable sets and a family $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}$ of real numbers so that*

$$f = \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{X, A_i}$$

Proof.

1 ⇒ 2. As $f \in \mathcal{S}[X, \mathcal{A}]$ $f \in S[X] \Rightarrow f(X) \subseteq \mathbb{R}$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. Let $y \in f(X)$ then, as $f(X) \subseteq \mathbb{R}$ it follows that $y \in \mathbb{R}$. Applying then [theorem: 20.337] it follows from the fact that f is $\mathcal{A}$-measurable that $f^{-1}(\{y\}) \underset{\text{[definition: 20.333]}}{=} \{f = y\} \in \mathcal{A}$.

2 ⇒ 3. As $f \in S[X] \Rightarrow f(X) \subseteq \mathbb{R}$ we can use [theorem: 20.366] to get a $n \in \mathbb{N}$ and a bijection $\beta: \{1, \dots, n\} \to f(X)$ such that for $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{P}(X)$ defined by $A_i = f^{-1}(\beta(i))$ we have

$$f = \sum_{i=1}^{n} \beta(i) \cdot \mathcal{X}_{X, A_i} \text{ and } \{A_i\}_{i \in \{1, \dots, n\}} \text{ is pairwise disjoint}$$

Using (2) we have $\forall i \in \{1, \dots, n\}$ $A_i = f^{-1}(\beta(i)) \in \mathcal{A}$ so that

$$\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$$

Finally, define $\{f_i\}_{i \in \{1, \dots, n\}}$ by $f_i = \beta(i) \in f(X) \subseteq \mathbb{R}$ then

$$\{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R} \text{ and } f = \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{A_i}$$

3 ⇒ 1. As $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ we have that $A_{n+1} \underset{\text{def}}{=} X \setminus \left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) \in \mathcal{A}$, take $f_{n+1} = 0$ then

$$\{f_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathbb{R},\ \{A_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{A} \text{ is pairwise disjoint, } \bigsqcup_{i=1}^{n+1} A_i = X \tag{20.451}$$

and $\forall x \in X$ we have $\sum_{i=1}^{n+1} f_i \cdot \mathcal{X}_{A_i}(x) = f_{n+1} \cdot \mathcal{X}_{A_{n+1}} + \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{A_i}(x) = 0 + f(x) = f(x)$ so that

$$f = \sum_{i=1}^{n+1} f_i \cdot \mathcal{X}_{A_i} \tag{20.452}$$

Let $x \in X$ then there exist a $i \in \{1, \dots, n+1\}$ such that $x \in A_i$ hence $f(x) \underset{\text{[theorem: 20.367]}}{=} f_i \in \mathbb{R}$ which proves that

$$f(X) \subseteq \mathbb{R}$$

So by [theorem: 20.366] we have

$$f \in \mathcal{S}[X]$$

Define $\{I_i\}_{i\in\{1,\dots,n+1\}}\subseteq\mathcal{P}(\{1,\dots,n+1\})$ by

$$I_i=\{j\in\{1,\dots,n+1\}|f(A_j)=\{f_i\}\}\subseteq\{1,\dots,n+1\}$$

then we prove that

$$\forall i\in\{1,\dots,n+1\}\text{ we have }f^{-1}(\{f_i\})=\bigsqcup_{j\in I_i}A_j\underset{\text{[theorem: 20.143]}}{\in}\mathcal{A}\tag{20.453}$$

Proof. Given $i\in\{1,\dots,n+1\}$. Let $x\in f^{-1}(\{f_i\})$ then $f(x)=f_i$. As $x\in X=\bigsqcup_{k\in\{1,\dots,n\}}A_i$ there exist a $k\in\{1,\dots,n\}$ such that $x\in A_k$. Using [theorem: 20.367] it follows that $f(A_k)=\{f_k\}$ which, as $x\in A_k\wedge f(x)=f_i$, proves that $f_i=f_k$, hence $f(A_k)=\{f_i\}$ or $k\in I_i$. In other words $x\in A_k\subseteq\bigcup_{j\in I_i}A_j$, so that

$$f^{-1}(\{f_i\})\subseteq\bigcup_{j\in I_i}A_j\tag{20.454}$$

Let $x\in\bigcup_{j\in I_i}A_j$ then there exist a $k\in I_i$ such that $x\in A_k$, as $k\in I_i$ $f(A_k)=\{f_i\}$, so that $f(x)=f_i$ or $x\in f^{-1}(\{f_i\})$. Hence $\bigcup_{j\in I_i}A_j\subseteq f^{-1}(\{f_i\})$ which combined with [eq: 20.454] proves $f^{-1}(\{f_i\})=\bigcup_{j\in I_i}A_j$ and thus [eq: 20.453]. □

Let $x\in X=\bigsqcup_{i\in\{1,\dots,n+1\}}A_i$ then there exist a $i\in\{1,\dots,n+1\}$ such that $x\in A_i$. Using [theorem: 20.367] again it follows that $f(x)\in f_i$ so that $x\in f^{-1}(\{f_i\})\subseteq\bigcup_{i\in\{1,\dots,n+1\}}f^{-1}(\{f_i\})$. Hence we have $X\subseteq\bigcup_{i\in\{1,\dots,n+1\}}f^{-1}(\{f_i\})$ and as trivially $\bigcup_{i\in\{1,\dots,n+1\}}f^{-1}(\{f_i\})\subseteq X$ it follows that

$$X=\bigcup_{i\in\{1,\dots,n+1\}}f^{-1}(\{f_i\})\tag{20.455}$$

We are now ready to prove that f is $\mathcal{A}$-measurable. Let $B\in\mathcal{B}[\overline{\mathbb{R}}]$ then as $f^{-1}(B)\subseteq X$ we have

$$\begin{aligned}f^{-1}(B)&=f^{-1}(B)\bigcap X\\&\underset{\text{[eq: 20.455]}}{=}f^{-1}(B)\bigcap\left(\bigcup_{i\in\{1,\dots,n+1\}}f^{-1}(\{f_i\})\right)\\&=\bigcup_{i\in\{1,\dots,n+1\}}\left(f^{-1}(B)\bigcap f^{-1}(\{f_i\})\right)\\&\underset{\text{[theorem: 2.95]}}{=}\bigcup_{i\in\{1,\dots,n+1\}}f^{-1}\left(B\bigcap\{f_i\}\right)\end{aligned}\tag{20.456}$$

Let $i\in\{1,\dots,n+1\}$ then for f_i we have either :

$f_i\in B$. Then $B\bigcap\{f_i\}=\{f_i\}$ so that $f^{-1}(B)=f^{-1}(\{f_i\})\in\mathcal{A}$ [see eq: 20.453]

$f_i\notin B$. Then $f^{-1}(B\bigcap\{f_i\})=f^{-1}(\varnothing)=\varnothing\in\mathcal{A}$

Hence $\forall i\in\{1,\dots,n+1\}$ $f^{-1}(B\bigcap\{f_i\})\in\mathcal{A}$ so that $\bigcup_{i\in\{1,\dots,n+1\}}f^{-1}(B\bigcap\{f_i\})\in\mathcal{A}$ which by [eq: 20.456] proves that $f^{-1}(B)\in\mathcal{A}$. As $B\in\mathcal{B}[\overline{\mathbb{R}}]$ was choosen arbitrary it follows by definition that

$$f\text{ is }\mathcal{A}\text{-measurable}$$ □

We show now that $\mathcal{S}[X,\mathcal{A}]$ is stable under the pointwise sum and product.

Theorem 20.372. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space then we have*

1. *$\forall f\in\mathcal{S}[X,\mathcal{A}]$ and $\forall\alpha\in\mathbb{R}$ we have $\alpha\cdot f\in\mathcal{S}[X,\mathcal{A}]$*
2. *$\forall f,g\in\mathcal{S}[X,\mathcal{A}]$ we have $f+g\in\mathcal{S}[X,\mathcal{A}]$*

Proof.

1. As $f\in\mathcal{S}[X,\mathcal{A}]$ we have that $f\in\mathcal{S}[X]$ and f is $\mathcal{A}$-measurable. By [theorem: 20.368] we have $\alpha\cdot f\in\mathcal{S}[X]$ and by [theorem: 20.344] that $\alpha\cdot f$ is $\mathcal{A}$-measurable. Hence $\alpha\cdot f\in\mathcal{S}[X,\mathcal{A}]$.

2. As $f, g \in \mathcal{S}[X, \mathcal{A}]$ we have that $f, g \in \mathcal{S}[X]$ and f, g are $\mathcal{A}$-measurable. By [theorem: 20.368] we have $f + g \in \mathcal{S}[X]$. Further using [theorem: 20.340] it follows that $f + g$ is $\mathcal{A}$-measurable. Hence $f + g \in \mathcal{S}[X, \mathcal{A}]$. □

When defining integral we are only interested in non negative measurable simple functions hence the following definition.

Definition 20.373. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space then the set of non negative $\mathcal{A}$-measurable real valued simple functions is noted as $\mathcal{S}^+[X, \mathcal{A}]$ hence*

$$\mathcal{S}^+[X, \mathcal{A}] = \{f \in \mathcal{S}[X, \mathcal{A}] | f(X) \subseteq [0, \infty[\}$$

***Note* 20.374.** *As by [definition: 20.369] $\mathcal{S}[X, \mathcal{A}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows that $\mathcal{S}^+[X, \mathcal{A}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$*

A trivial example of a non negative measurable simple function is the constant function.

Example 20.375. Let $\langle X, A\rangle$ be a measurable space, $a \in [0, \infty[$ then $C_a \in \mathcal{S}^+[X, \mathcal{A}]$ where

$$C_a : X \to \overline{\mathbb{R}} \text{ is defined by } C_a(x) = a$$

Proof. As $C_a(X) = \{a\}$ we have that $C_a \in \mathcal{S}[X]$ and $C_a(X) \subseteq [0, \infty[$. Let $B \in \mathcal{B}[\overline{\mathbb{R}}]$ then for a we have either:

***a* ∈ *B*.** Then $(C_a)^{-1}(B) = \{x \in X | a = C_a(x) \in B\} = X \in \mathcal{A}$

***a* ∉ *B*.** Then $(C_a)^{-1}(B) = \{x \in X | a = C_a(x) \in B\} = \varnothing \in \mathcal{A}$

so that C_a is $\mathcal{A}$-measurable. Hence it follows that $C_a \in \mathcal{S}^+[X, \mathcal{A}]$. □

We have a simpler alternative definition for $\mathcal{S}^+[X, \mathcal{A}]$

Theorem 20.376. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space then we have the following equivalences:*

1. *$f \in \mathcal{S}^+[X, \mathcal{A}]$ [in other words $f \in \mathcal{S}[X]$, $f(X) \subseteq [0, \infty[$ and f is $\mathcal{A}$-measurable.*
2. *$f \in \mathcal{S}[X]$, $f(X) \subseteq [0, \infty[$ and $\forall y \in f(X)$ $f^{-1}(\{y\}) \in \mathcal{A}$*
3. *There exists a $n \in \mathbb{N}$, a pairwise disjoint family $\{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A}$ of measurable sets and a family $\{f_i\}_{i \in \{1, \ldots, n\}} \subseteq [0, \infty[$ of real non negative numbers so that*

$$f = \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{A_i}$$

Proof.

1 ⇒ 2. As $f \in \mathcal{S}^+[X, \mathcal{A}]$ we have that $f \in \mathcal{S}[X, \mathcal{A}]$ and $f(X) \subseteq [0, \infty[$. Using [theorem: 20.371] that $f \in \mathcal{S}[X]$ and $\forall y \in f(X)$ $f^{-1}(\{y\}) \in \mathcal{A}$.

2 ⇒ 3. As $f \in \mathcal{S}[X]$ and $\forall y \in f(X)$ $f^{-1}(\{y\}) \in \mathcal{A}$ it follows from [theorem: 20.371] that there exist a $n \in \mathbb{N}$, a pairwise disjoint family $\{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A}$ and a $\{f'_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R}$ such that

$$f = \sum_{i=1}^{n} f'_i \cdot \mathcal{X}_{A_i}$$

Define

$$\{f_i\}_{i \in \{1, \ldots, n\}} \subseteq [0, \infty[\text{ by } f_i = \max(0, f'_i)$$

Consider now

$$g = \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{A_i}$$

Let $x \in X$ then we have either:

***x* ∈ $\bigcup_{i \in \{1, \ldots n\}}$ *A*$_i$.** Then there exist a $i \in \{1, \ldots, n\}$ such that $x \in A_i$. Using [theorem: 20.367] we have that

$$f'_i = f(x) \wedge f_i = g(x)$$

Further as $f_i' = f(x) \subseteq f(X) \underset{\text{hypothesis}}{\subseteq} [0,\infty[$ it follows that $f_i' = \max(f_i', 0) = f_i$ so that $f(x) = g(x)$.

$\boldsymbol{x \in X \setminus \left(\bigcup_{i\in\{1,\dots,n\}} A_i\right)}$**.** Then using [theorem: 20.367] we have that $f(x) = 0 = g(x) = 0$

As in all cases we have $f(x) = g(x)$ it follows that $f = g$ hence we have that

$$f = \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{A_i} \text{ where } \{f_i\}_{i\in\{1,\dots,n\}} \subseteq [0,\infty[\text{ and } \{A_i\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{A} \text{ is pairwise disjoint}$$

3 ⇒ 1. Using [theorem: 20.371] it follows that $f \in \mathcal{S}[X,\mathcal{A}]$. Let $x \in X$ then we have

$$f(x) \underset{\text{[theorem: 20.371]}}{=} \begin{cases} f_i \in [0,\infty[\text{ if } x \in \bigcup_{i\in\{1,\dots,n\}} A_i \\ 0 \in [0,\infty[\text{ if } x \in X \setminus \bigcup_{i\in\{1,\dots,n\}} A_i \end{cases} \in [0,\infty[$$

so that we have additional $f(X) \subseteq [0,\infty[$. Hence we have

$$f \in \mathcal{S}^+[X,\mathcal{A}]$$

□

Example 20.377. Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $A \in \mathcal{A}$, $a,b \in [0,\infty[$ then for the function

$$f: X \to \overline{\mathbb{R}} \text{ where } f(x) = \begin{cases} a \text{ if } x \in A \\ b \text{ if } x \in X \setminus A \end{cases}$$

we have that

$$f \in \mathcal{S}^+[X,\mathcal{A}]$$

Proof. As $f(X) = \{a,b\}$ a finite set it follows that $f \in \mathcal{S}[X]$ and $f(X) \subseteq [0,\infty[$. Further for a,b we have either:

$\boldsymbol{a = b}$**.** Then $f^{-1}(\{a\}) = f^{-1}(\{b\}) = X \in \mathcal{A}$

$\boldsymbol{a \neq b}$**.** Then as $\forall x \in A$ we have $f(x) = a \in \{a\}$ so that $A \subseteq f^{-1}(\{a\})$. If $x \in f^{-1}(\{a\})$ then $f(x) = a$ and we must have that $x \in A$ [if $x \in X \setminus A$ then $f(x) = b \neq a$] so that $f^{-1}(\{a\}) \subseteq A$. Hence we have

$$f^{-1}(\{a\}) = A \in \mathcal{A}$$

Likewise we have $\forall x \in X \setminus A$ that $f(x) = b \in \{b\}$ proving that $X \setminus A \subseteq f^{-1}(\{b\})$. If $x \in f^{-1}(\{b\})$ then $f(x) = b$ and we must have that $x \in X \setminus A$ [if $x \in A$ then $f(x) = a \neq b$] so that $f^{-1}(\{b\}) \subseteq X \setminus A$. Hence we have

$$f^{-1}(\{b\}) = X \setminus A \in \mathcal{A}$$

So in all cases we have that $f^{-1}(\{a\}), f^{-1}(\{b\}) \in \mathcal{A}$ which by [theorem: 20.376] proves that

$$f \in \mathcal{S}^+[X,\mathcal{A}]$$

□

Given a non negative measurable simple function $f = \sum_{i=1}^{n} \alpha_i \cdot \mathcal{X}_{A_i}$ we want to define the integral of f as $\int f = \sum_{i=1}^{n} f_i \cdot \mu(A_i)$. However the same function f can have another representation $f = \sum_{i=1}^{m} \beta_i \cdot \mathcal{X}_{B_i}$, so we must show that the integral is independent of the choosen representation.

Theorem 20.378. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space and $f \in \mathcal{S}^+[X,\mathcal{A}]$ then if $n,m \in \mathbb{N}$, $\{A_i\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{A}$, $\{B_i\}_{i\in\{1,\dots,m\}} \subseteq \mathcal{A}$, $\{a_i\}_{i\in\{1,\dots,n\}} \subseteq [0,\infty[$ and $\{b_i\}_{i\in\{1,\dots,m\}} \subseteq [0,\infty[$ satisfies*

$$\sum_{i=1}^{n} a_i \cdot \mathcal{X}_{A_i} = f = \sum_{i=1}^{m} b_i \cdot \mathcal{X}_{B_i}$$

then we have

$$\sum_{i=1}^{n} a_i \cdot \mu(A_i) = \sum_{i=1}^{m} b_i \cdot \mu(B_i)$$

***Note* 20.379.** *The condition that $f \in S^+[X,\mathcal{A}]$ is needed because this ensures that $\{a_i\}_{i\in\{1,\dots,n\}}$, $\{b_i\}_{i\in\{1,\dots,m\}}$ are non negative so that $\sum_{i=1}^{n} a_i \cdot \mu(A_i)$ and $\sum_{i=1}^{m} b_i \cdot \mu(B_i)$ are well defined [as $\mu(A_i)$, $\mu(B_i)$ can be ∞].*

Proof. First we remove all the terms where $a_i \cdot \mu(A_i) = 0$ and $b_i \cdot \mu(B_i) = 0$, this will not change the sum. Defiine $I = \{i \in \{1, \ldots, n\} | A_i \neq \varnothing \wedge a_i \neq \varnothing\}$ and $J = \{i \in \{1, \ldots, m\} | B_i \neq 0 \wedge b_i \neq \varnothing\}$. Then $\forall i \in \{1, \ldots, n\} \setminus I$ we have $a_i \cdot \mu(A_i) \underset{a_i = 0 \vee A_i \neq \varnothing}{=} 0$ and $\forall i \in \{1, \ldots, m\} \setminus J \underset{b_i = 0 \vee B_i = \varnothing}{=} 0$ so that

$$\begin{aligned}
\left(\sum_{i=1}^{n} a_i \cdot \mathcal{X}_{A_i}\right)(x) &= \sum_{i=1}^{n} a_i \cdot \mathcal{X}_{A_i}(x) \\
&= \sum_{i \in I} a_i \cdot \mathcal{X}_{A_i}(x) + \sum_{i \in \{1, \ldots, n\} \setminus I} a_i \cdot \mathcal{X}_{A_i}(x) \\
&= \sum_{i \in I} a_i \cdot \mathcal{X}_{A_i}(x) + 0 \\
&= \sum_{i \in I} a_i \cdot \mathcal{X}_{A_i}(x)
\end{aligned}$$

and

$$\begin{aligned}
\left(\sum_{i=1}^{m} b_i \cdot \mathcal{X}_{B_i}\right)(x) &= \sum_{i=1}^{m} b_i \cdot \mathcal{X}_{B_i}(x) \\
&= \sum_{i \in J} b_i \cdot \mathcal{X}_{B_i}(x) + \sum_{i \in \{1, \ldots, m\} \setminus J} b_i \cdot \mathcal{X}_{B_i}(x) \\
&= \sum_{i \in J} b_i \cdot \mathcal{X}_{B_i}(x) + 0 \\
&= \sum_{i \in J} b_i \cdot \mathcal{X}_{B_i}(x)
\end{aligned}$$

proving that

$$\sum_{i \in I} a_i \cdot \mathcal{X}_{A_i} = f = \sum_{i \in J} b_i \cdot \mathcal{X}_{B_i} \tag{20.457}$$

As $\{A_i\}_{i \in \{1, \ldots, n\}}$ and $\{B_i\}_{i \in \{1, \ldots, m\}}$ are pairwise disjoint we have

$$\{A_i\}_{i \in I} \subseteq \mathcal{A} \text{ and } \{B_i\}_{i \in J} \subseteq \mathcal{A} \text{ are pairwise disjoint} \tag{20.458}$$

Further if $x \in \bigsqcup_{i \in I} A_i$ then there exist a $i \in I$ such that $x \in A_i$ so that by [theorem: 20.367] $f(x) = a_i \neq 0$. Assume that $x \notin \bigsqcup_{i \in J} B_i$ then $f(x) = \sum_{i \in J} b_i \cdot \mathcal{X}_{B_i}(x) = \sum_{i \in J} b_i \cdot 0 = 0$ contradicting $f(x) \neq 0$. Hence the assumption is wrong and we must have that $x \in \bigsqcup_{i \in J} B_i$. So

$$\bigsqcup_{i \in I} A_i \subseteq \bigsqcup_{i \in J} B_i \tag{20.459}$$

Likewise if $x \in \bigsqcup_{i \in J} B_i$ then there exist a $i \in J$ such that $x \in B_i$ so that by [theorem: 20.367] $f(x) = b_i \neq 0$. Assume that $x \notin \bigsqcup_{i \in I} A_i$ then $f(x) = \sum_{i \in I} a_i \cdot \mathcal{X}_{A_i}(x) = \sum_{i \in I} a_i \cdot 0 = 0$ contradicting $f(x) \neq 0$. Hence the assumption is wrong and we must have that $x \in \bigsqcup_{i \in I} A_i$. So $\bigsqcup_{i \in J} B_i \subseteq \bigsqcup_{i \in J} A_i$, combining this with [eq: 20.459] gives

$$\bigsqcup_{i \in I} A_i = \bigsqcup_{i \in J} B_i \tag{20.460}$$

Let $i \in \{1, \ldots, n\}$ then, as $\{B_j\}_{j \in J}$ are pairwise disjoint, $\{A_i \bigcap B_j\}_{j \in J}$ are pairwise disjoint and

$$A_i = A_i \bigcap \left(\bigsqcup_{j \in I} A_j\right) \underset{\text{[eq: 20.460]}}{=} A_i \bigcap \left(\bigsqcup_{j \in J} B_j\right) = \bigsqcup_{j \in J} \left(A_i \bigcap B_j\right) \tag{20.461}$$

Let $i \in \{1, \ldots, m\}$ then, as $\{A_j\}_{j \in I}$ are pairwise disjoint $\{A_j \bigcap B_i\}_{j \in J}$ are pairwise disjoint and

$$B_i = B_i \bigcap \left(\bigsqcup_{j \in I} B_j\right) \underset{\text{[eq: 20.460]}}{=} B_i \bigcap \left(\bigsqcup_{j \in I} A_j\right) = \bigsqcup_{j \in I} \left(A_j \bigcap B_i\right) \tag{20.462}$$

Define $K = \{(i, j) \in \{1, \ldots, n\} \times \{1, \ldots, m\} | A_i \bigcap B_j \neq \varnothing\}$ then if $(i, j) \in K$ we have $A_i \bigcap B_j \neq \varnothing$ so there exist a $x \in A_i \bigcap B_j$ and

$$a_i \underset{x \in A_i \wedge \text{[theorem: 20.367]}}{=} f(x) \underset{x \in B_i \wedge \text{[theorem: 20.367]}}{=} b_j$$

In other words

$$\forall (i,j) \in K \text{ we have } a_i = b_j \tag{20.463}$$

Now

$$\begin{aligned}
\sum_{i=1}^{n} a_i \cdot \mu(A_i) &= \sum_{i \in I} a_i \cdot \mu(A_i) + \sum_{i \in \{1,\ldots,n\} \setminus I} \alpha_i \cdot \mu(A_i) \\
&= \sum_{i \in I} a_i \cdot \mu(A_i) \\
&\underset{\text{[eq: 20.461]}}{=} \sum_{i \in I} a_i \cdot \mu\left(\bigsqcup_{j \in J} \left(A_i \bigcap B_j\right)\right) \\
&= \sum_{i \in I} \left(a_i \cdot \sum_{j \in J} \mu\left(A_i \bigcap B_j\right)\right) \\
&= \sum_{i \in I} \left(\sum_{j \in J} a_i \cdot \mu\left(A_i \bigcap B_j\right)\right) \\
&\underset{\text{[theorem: 11.45]}}{=} \sum_{(i,j) \in I \times J} a_i \cdot \mu\left(A_i \bigcap B_j\right) \\
&= \sum_{(i,j) \in K} a_i \cdot \mu\left(A_i \bigcap B_j\right) + \sum_{(i,j) \in \mathrm{K} \setminus (I \times J)} a_i \cdot \mu\left(A_i \bigcap B_j\right) \\
&= \sum_{(i,j) \in K} a_i \cdot \mu\left(A_i \bigcap B_j\right) + \sum_{(i,j) \in \mathrm{K} \setminus (I \times J)} a_i \cdot 0 \\
&= \sum_{(i,j) \in K} a_i \cdot \mu\left(A_i \bigcap B_j\right) \\
&\underset{\text{[eq: 20.463]}}{=} \sum_{(i,j) \in K} b_j \cdot \mu\left(A_i \bigcap B_j\right) \\
&= \sum_{(i,j) \in K} b_j \cdot \mu\left(A_i \bigcap B_j\right) + \sum_{(i,j) \in \mathrm{K} \setminus (I \times J)} b_j \cdot 0 \\
&= \sum_{(i,j) \in K} b_j \cdot \mu\left(A_i \bigcap B_j\right) + \sum_{(i,j) \in \mathrm{K} \setminus (I \times J)} b_j \cdot \mu\left(A_i \bigcap B_j\right) \\
&= \sum_{(i,j) \in I \times J} b_j \cdot \mu\left(A_i \bigcap B_j\right) \\
&\underset{\text{[theorem: 11.45]}}{=} \sum_{j \in J} \left(\sum_{i \in I} \left(b_j \cdot \mu\left(A_i \bigcap B_j\right)\right)\right) \\
&= \sum_{j \in J} \left(b_j \cdot \sum_{i \in I} \mu\left(A_i \bigcap B_j\right)\right) \\
&= \sum_{j \in J} b_j \cdot \mu\left(\bigsqcup_{i \in I} \left(A_i \bigcap B_j\right)\right) \\
&\underset{\text{[eq: 20.462]}}{=} \sum_{j \in J} b_j \cdot \mu(B_j) \\
&= \sum_{j \in J} b_j \cdot \mu(B_j) + \sum_{j \in \{1,\ldots,m\} \setminus J} b_j \cdot \mu(B_j) \\
&= \sum_{j=1}^{m} b_j \cdot \mu(B_j)
\end{aligned}$$

□

Thanks to the two previous theorems [theorems: 20.376, 20.378] the following definition is well defined [existence and uniqueness].

Definition 20.380. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space and $f \in \mathcal{S}^+[X, \mathcal{A}]$ then we define $\int^S f d\mu$ by*

$$\int^S f d\mu = \sum_{i=1}^n a_i \cdot \mu(A_i) \in [0, \infty[$$

where $n \in \mathbb{N}$, $\{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{A}$ is pairwise disjoint, $\{a_i\}_{i\in\{1,\ldots,n\}} \subseteq [0, \infty[$ satisfies

$$f = \sum_{i=1}^n a_i \cdot \mathcal{X}_{A_i}$$

***Note* 20.381.** *For the moment we use the special symbol $\int^s f d\mu$ to differentiate the integral of a simple function from the more general integral $\int f d\mu$ that will be based on the integral of simple functions.*

Example 20.382. Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space and $a \in [0, \infty[$ and $C_a: X \to \overline{\mathbb{R}}$ defined by $C_a(x) = a$ then $C_a \in \mathcal{S}[X, \mathcal{A}]$ and $\int^S C_a \, d\mu = a \cdot \mu(X)$.

Proof. Define $\{A_i\}_{i\in\{1\}} \subseteq \mathcal{A}$ by $A_1 = X$ and $\{a_i\}_{i\in\{1\}} \subseteq [0, \infty[$ by $a_1 = a$ then $\forall x \in X$ we have $(\sum_{i=1}^1 a_i \cdot \mathcal{X}_{\mathrm{Ai}})(x) = \sum_{i=1}^1 a_i \cdot \mathcal{X}_{A_i}(x) = a \cdot \mathcal{X}_X(x) = a = C_a(x)$ so that $C_a = \sum_{i=1}^1 a_i \cdot \mathcal{X}_{A_i}$. Hence by [theorem: 20.376]

$$C_a \in \mathcal{S}^+[X, \mathcal{A}]$$

and using [definition: 20.380]

$$\int^C C_a \, d\mu = \sum_{i=1}^1 a_i \cdot \mu(A_i) = a_1 \cdot \mu(A_1) = a \cdot \mu(X)$$ □

The following lemma will be usefull if we have to compare or add simple functions.

Lemma 20.383. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space, $f, g \in \mathcal{S}^+[X, \mathcal{A}]$ then there exist a $n \in \mathbb{N}$, a pairwise disjoint family $\{C_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{A}$ of sets in $\mathcal{A}$, a family $\{f_i\}_{i\in\{1,\ldots,n\}} \subseteq [0, \infty[$ and a family $\{g_i\}_{i\in\{1,\ldots,n\}}$ such that*

$$X = \bigsqcup_{i\in\{1,\ldots,n\}} C_i$$

$$f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{C_i} \text{ and } g = \sum_{i=1}^n g_i \cdot \mathcal{X}_{C_i}$$

Proof. As $f, g \in S^+[X, \mathcal{A}]$ we have by [theorem: 20.376] that there exists $n', m' \in \mathbb{N}$, $\{A'_i\}_{i\in\{1,\ldots,n'\}} \subseteq \mathcal{A}$ pairwise disjoint, $\{B'_i\}_{i\in\{1,\ldots,m'\}} \subseteq \mathcal{A}$ pairwise disjoint, $\{a'_i\}_{i\in\{1,\ldots,n'\}} \subseteq [0, \infty[$ and $\{b'_i\}_{i\in\{1,\ldots,m'\}}$ so that

$$f = \sum_{i=1}^n a'_i \cdot \mathcal{X}_{A'_i} \text{ and } g = \sum_{i=1}^m b'_i \cdot \mathcal{X}_{B'_i} \tag{20.464}$$

Define now

$$\{A_i\}_{i\in\{1,\ldots,n'+1\}} \subseteq \mathcal{A} \text{ by } A_i = \begin{cases} X \setminus \bigcup_{i\in\{1,\ldots,n'\}} A'_i \text{ if } i = n'+1 \\ A'_i \text{ if } i \in \{1,\ldots,n'\} \end{cases}$$

$$\{B_i\}_{i\in\{1,\ldots,m'+1\}} \subseteq \mathcal{A} \text{ by } B_i = \begin{cases} X \setminus \bigcup_{i\in\{1,\ldots,m'\}} B'_i \text{ if } i = m'+1 \\ B'_i \text{ if } i \in \{1,\ldots,m'\} \end{cases}$$

$$\{a_i\}_{i\in\{1,\ldots,n'+1\}} \text{ by } a_i = \begin{cases} 0 \text{ if } i = n'+1 \\ a'_i \text{ if } i \in \{1,\ldots,n'\} \end{cases}$$

$$\{b_i\}_{i\in\{1,\ldots,m'+1\}} \text{ by } b_i = \begin{cases} 0 \text{ if } i = m'+1 \\ b'_i \text{ if } i \in \{1,\ldots,m'\} \end{cases}$$

then clearly $\{A_i\}_{i\in\{1,\ldots,n'+1}$, $\{B_i\}_{i\in\{1\ldots,m'+1\}}$ are pairwise disjoint and

$$X=\bigsqcup_{i\in\{1,\ldots,n'+1\}}A_i=\bigsqcup_{i\in\{1,\ldots,m'+1\}}B_i \tag{20.465}$$

Hence

$$\forall i\in\{1,\ldots,n'+1\}\ A_i=A_i\bigcap X=A_i\bigcap\left(\bigsqcup_{j\in\{1,\ldots,m'+1\}}B_j\right)=\bigsqcup_{j\in\{1,\ldots,m'+1\}}\left(A_i\bigcap B_j\right) \tag{20.466}$$

and

$$\forall i\in\{1,\ldots,m'+1\}\ B_i=B_i\bigcap X=B_i\bigcap\left(\bigsqcup_{j\in\{1,\ldots,n'+1\}}A_j\right)=\bigsqcup_{j\in\{1,\ldots,n'+1\}}\left(A_j\bigcap B_i\right) \tag{20.467}$$

so that

$$X=\bigsqcup_{i=1}^{n'+1}\left(\bigsqcup_{j=1}^{m'+1}\left(A_i\bigcap B_j\right)\right)=\bigsqcup_{i=1}^{m'+1}\left(\bigsqcup_{j=1}^{n'+1}\left(A_j\bigcap B_i\right)\right) \tag{20.468}$$

Using [theorem: 6.41] $\{1,\ldots,n'+1\}\times\{1,\ldots,m'+1\}$ is finite and there exists a bijection

$$\beta\colon\{1,\ldots,n\}\to\{1,\ldots,n'+1\}\times\{1,\ldots,m'+1\}\text{ where }n=(n'+1)\cdot(m'+1)$$

Define now

$$\begin{aligned}\{C_i\}_{i\in\{1,\ldots,n\}}\subseteq A\ &\text{ by }\ C_i=A_{\beta(i)_1}\bigcap B_{\beta(i)_2}\\ \{f_i\}_{i\in\{1,\ldots,n\}}\ &\text{ by }\ f_i=a_{\beta(i)_1}\\ \{g_i\}_{i\in\{1,\ldots,n\}}\ &\text{ by }\ g_i=b_{\beta(i)_2}\end{aligned}$$

Let $x\in X$ then by [eq: 20.468] there exists a $i\in\{1,\ldots,n'+1\}$ such that $x\in\bigsqcup_{j\in\{1,\ldots,m'+1\}}(A_i\bigcap B_j)$, hence there exist a $j\in\{1,\ldots,m'+1\}$ such that $x\in A_i\bigcap B_j$. As β is a bijection there exist a $k\in\{1,\ldots,n\}$ such that $\beta(k)=(i,j)$ hence $x\in A_{\beta(k)_1}\bigcap B_{\beta(k)_2}=C_k\subseteq\bigcup_{k\in\{1,\ldots,n\}}C_k$. Hence $X\subseteq\bigcup_{k\in\{1,\ldots,n\}}C_k$ and as trivially $\bigcup_{k\in\{1,\ldots,n\}}C_k\subseteq X$ it follows that

$$X=\bigcup_{i\in\{1,\ldots,n\}}C_i \tag{20.469}$$

Next we prove that $\{C_i\}_{i\in\{1,\ldots,n\}}$ is pairwise disjoint. So let $i,j\in\{1,\ldots,n\}$ with $i\neq j$ then as β is a bijection we have that $\beta(i)\neq\beta(j)$, for $\beta(i)_1$, $\beta(j)_1$ we have then either:

$\boldsymbol{\beta(i)_1=\beta(j)_1}$**.** Then we must have that $\beta(i)_2\neq\beta(j)_2$ so that

$$C_i\bigcap C_j=\left(A_{\beta(i)_1}\bigcap B_{\beta(i)_2}\right)\bigcap\left(A_{\beta(j)_1}\bigcap B_{\beta(j)_2}\right)\subseteq B_{\beta(i)_2}\bigcap B_{\beta(j)_2}=\varnothing$$

$\boldsymbol{\beta(i)_1\neq\beta(j)_1}$**.** Then we have that

$$C_i\bigcap C_j=\left(A_{\beta(i)_1}\bigcap B_{\beta(i)_2}\right)\bigcap\left(A_{\beta(j)_1}\bigcap B_{\beta(j)_2}\right)\subseteq A_{\beta(i)_1}\bigcap B_{\beta(j)_1}=\varnothing$$

which proves that

$$\{C_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}\text{ is pairwise disjoint and }X=\bigsqcup_{i\in\{1,\ldots,n\}}C_i \tag{20.470}$$

Let $x\in X$ then by [eq: 20.470] there exist a $i\in\{1,\ldots,n\}$ such that $x\in C_i=A_{\beta(i)_1}\bigcap B_{\beta(i)_2}$ hence $x\in A_{\beta(i)_1}$. For $\beta(i)_1$ we have the following possibilities:

$\boldsymbol{\beta(i)_1=n'+1}$**.** Then $x\in A_{n'+1}=X\setminus\left(\bigsqcup_{i\in\{1,\ldots,n'\}}A_i\right)$ so that by [theorem: 20.367] and [eq: 20.464] $f(x)=0$. Further using [theorem: 20.367] and [eq: 20.470] it follows also that

$$\left(\sum_{i=1}^{n}f_i\cdot\mathcal{X}_{C_i}\right)(x)=f_i=a_{\beta(i)_1}=a_{n'+1}=0=f(x)$$

which proves that $f(x)=(\sum_{i=1}^{n}f_i\cdot\mathcal{X}_{C_i})(x)$.

$\boldsymbol{\beta(i)_1 \in \{1,\ldots,n'\}}$. Then $x \in A_{\beta(i)_1} = A'_{\beta(i)_1}$ so that by [theorem: 20.367] and [eq: 20.464] $f(x) = a'_{\beta(i)_1}$. Further using [theorem: 20.367] and [eq: 20.470] we have that

$$\left(\sum_{i=1}^{n} f_i \cdot \mathcal{X}_{C_i}\right)(x) = f_i = a_{\beta(i)_1} = a'_{\beta(i)} = f(x)$$

so that in this cases we have also that $f(x) = (\sum_{i=1}^{n} f_i \cdot \mathcal{X}_{C_i})(x)$.

To summarize we have proved that

$$f = \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{C_i}$$

We use now the same technic for g. Let $x \in X$ then by [eq: 20.470] there exist a $i \in \{1,\ldots,n\}$ such that $x \in C_i = A_{\beta(i)_1} \bigcap B_{\beta(i)_2}$ hence $x \in B_{\beta(i)_2}$. For $\beta(i)_2$ we have the following possibilities:

$\boldsymbol{\beta(i)_2 = m'+1}$. Then $x \in B_{n'+1} = X \setminus \left(\bigsqcup_{i \in \{1,\ldots,n'\}} B_i\right)$ so that by [theorem: 20.367] and [eq: 20.464] $g(x) = 0$. Further using [theorem: 20.367] and [eq: 20.470] it follows also that

$$\left(\sum_{i=1}^{n} g_i \cdot \mathcal{X}_{C_i}\right)(x) = g_i = b_{\beta(i)_2} = b_{m'+1} = 0 = g(x)$$

which proves that $g(x) = (\sum_{i=1}^{n} g_i \cdot \mathcal{X}_{C_i})(x)$.

$\boldsymbol{\beta(i)_2 \in \{1,\ldots,m'\}}$. Then $x \in B_{\beta(i)_2} = B'_{\beta(i)_2}$ so that by [theorem: 20.367] and [eq: 20.464] $g(x) = b'_{\beta(i)_2}$. Further using [theorem: 20.367] and [eq: 20.470] we have that

$$\left(\sum_{i=1}^{n} g_i \cdot \mathcal{X}_{C_i}\right)(x) = g_i = b_{\beta(i)_2} = b'_{\beta(i)} = g(x)$$

so that in this cases we have also that $g(x) = (\sum_{i=1}^{n} g_i \cdot \mathcal{X}_{C_i})(x)$.

To summarize we have proved that

$$g = \sum_{i=1}^{n} g_i \cdot \mathcal{X}_{C_i}$$

□

We prove now that the integral of non negative measurable simple functions has the usual properties of integration.

Theorem 20.384. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then we have*

1. *If $\alpha \in [0,\infty[$ and $f \in \mathcal{S}^+[X,\mathcal{A}]$ then $\alpha \cdot f \in \mathcal{S}^+[X,\mathcal{A}]$ and $\int^S (\alpha \cdot f)\, d\mu = \alpha \cdot \int^S f d\mu$.*
2. *If $f, g \in \boldsymbol{S}^+[X,\mathcal{A}]$ then*
   a. *$f+g \in \mathcal{S}^+[X,\mathcal{A}]$ and $\int^S (f+g)\, d\mu = \int^S f d\mu + \int^S g d\mu$.*
   b. *If $\forall x \in X\ f(x) \leqslant g(x)$ then $\int^S f d\mu \leqslant \int^S g d\mu$*
   c. *$f \wedge g \in \mathcal{S}^+[X,\mathcal{A}]$, $\int^S (f \wedge g)\, d\mu \leqslant \int^S f d\mu$ and $\int^S (f \wedge g)\, d\mu \leqslant \int^S g d\mu$*
   d. *$f \vee g \in \mathcal{S}^+[X,\mathcal{A}]$, $\int^S f d\mu \leqslant \int^S (f \wedge g)\, d\mu$ and $\int^S g d\mu \leqslant \int^S (f \wedge g)\, d\mu \leqslant \int^S g d\mu$*
3. *If $f \in \mathcal{S}^+[X,\mathcal{A}]$ satisfies $f = 0$ μ-a.e. then $\int^S f d\mu = 0$*

Proof.

1. As $f \in \mathcal{S}^+[X,\mathcal{A}]$ there exists by [theorem: 20.376] a pairwise disjoint $\{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A}$ and a $\{f_i\}_{i \in \{1,\ldots,n\}} \subseteq [0,\infty[$ such that $f = \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{A_i}$. Further we have by definition that

$$\int^S f d\mu = \sum_{i=1}^{n} f_i \cdot \mu(A_i)$$

Then $\{\alpha \cdot a_i\}_{i \in \{1,\ldots,n\}} \subseteq [0,\infty[$ and $\forall x \in X$ we have

$$\begin{aligned}(\alpha \cdot f)(x) &= \alpha \cdot f(x) \\ &= \alpha \cdot \sum_{i=1}^{n} a_i \cdot \mathcal{X}_{A_i}(x) \\ &= \sum_{i=1}^{n} (\alpha \cdot a_i) \cdot \mathcal{X}_{A_i}(x) \\ &= \left(\sum_{i=1}^{n} (\alpha \cdot a_i) \cdot \mathcal{X}_{A_i}\right)(x)\end{aligned}$$

proving that

$$\alpha \cdot f = \sum_{i=1}^{n} (\alpha \cdot a_i) \cdot \mathcal{X}_{A_i}$$

Using [theorem: 20.376] it follows that

$$\alpha \cdot f \in \mathcal{S}^+[X, \mathcal{A}]$$

Further we have

$$\begin{aligned}\int^S \alpha \cdot f d\mu &= \sum_{i=1}^{n} (\alpha \cdot f_i) \cdot \mu(A_i) \\ &= \alpha \cdot \sum_{i=1}^{n} f_i \cdot \mu(A_i) \\ &= \alpha \cdot \int^S f d\mu\end{aligned}$$

2. As $f, g \in \mathcal{S}^+[X, \mathcal{A}]$ there exists by [lemma: 20.383] $\{C_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A}$ pairwise disjoint, $\{f_i\}_{i \in \{1,\ldots,n\}} \subseteq [0,\infty[$ and $\{g_i\}_{i \in \{1,\ldots,n\}} \subseteq [0,\infty[$ such that

$$X = \bigsqcup_{i \in \{1,\ldots,n\}} A_i,\ f = \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{C_i} \text{ and } g = \sum_{i=1}^{n} g_i \cdot \mathcal{X}_{C_i} \tag{20.471}$$

By the definition of $\int^S$ we have also

$$\int^S f d\mu = \sum_{i=1}^{n} f_i \cdot \mu(C_i) \text{ and } \int^S g d\mu = \sum_{i=1}^{n} g_i \cdot \mu(C_i) \tag{20.472}$$

Next we have:

a. Now $\{f_i + g_i\}_{i \in \{1,\ldots,n\}} \subseteq [0,\infty[$ and

$$\begin{aligned}(f+g)(x) &= f(x) + g(x) \\ &= \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{C_i}(x) + \sum_{i=1}^{n} g_i \cdot \mathcal{X}_{C_i}(x) \\ &= \sum_{i=1}^{n} (f_i \cdot \mathcal{X}_{C_i}(x) + g_i \cdot \mathcal{X}_{C_i}(x)) \\ &= \sum_{i=1}^{n} (f_i + g_i) \cdot \mathcal{X}_{C_i}(x) \\ &= \left(\sum_{i=1}^{n} (f_i + g_i)\right)(x)\end{aligned}$$

whic proves that

$$f + g = \sum_{i=1}^{n} (f_i + g_i)$$

So using [theorem: 20.376] it follows that

$$f+g\in\mathcal{S}^{+}[X,\mathcal{A}]$$

and using the definition of the integral

$$\begin{aligned}\int^{S}(f+g)\,d\mu &= \sum_{i=1}^{n}(f_i+g_i)\cdot\mu(C_i)\\ &= \sum_{i=1}^{n}f_i\cdot\mu(C_i)+\sum_{i=1}^{n}g_i\cdot\mu(C_i)\\ &\underset{\text{[eq: 20.472]}}{=} \int^{S}fd\mu+\int^{S}gd\mu\end{aligned}$$

b. Assume that $\forall x\in X\ f(x)\leqslant g(x)$. Define $I=\{i\in\{1,\ldots,n\}|C_i\neq\varnothing\}$ then $\forall i\in I$ there exist a $C_i\neq\varnothing\Rightarrow\exists x\in C_i$ so that $f_i\underset{\text{[theorem: 20.367]}}{=}f(x)\leqslant g(x)\underset{\text{[theorem: 20.367]}}{=}g_i$. Hence we have

$$\forall i\in I\ f_i\leqslant g_i \tag{20.473}$$

Next

$$\begin{aligned}\int^{S}fd\mu &= \sum_{i=1}^{n}f_i\cdot\mu(C_i)\\ &= \sum_{i\in I}f_i\cdot\mu(C_i)+\sum_{i\in\{1,\ldots,n\}\setminus I}f_i\cdot\mu(C_i)\\ &= \sum_{i\in I}f_i\cdot\mu(C_i)\\ &\underset{\text{[eq: 20.473]}}{\leqslant} \sum_{i\in I}g_i\cdot\mu(C_i)\\ &= \sum_{i\in I}g_i\cdot\mu(C_i)+\sum_{i\in\{1,\ldots,n\}\setminus I}g_i\cdot\mu(C_i)\\ &= \sum_{i=1}^{n}g_i\cdot\mu(C_i)\\ &= \int^{S}gd\mu\end{aligned}$$

c. Let $x\in X$ then as $X\underset{\text{[eq: 20.471]}}{=}\bigsqcup_{i\in\{1,\ldots,n\}}C_i$ there exis a $i\in\{1,\ldots,n\}$ such that $x\in A_i$. Using [eq: 20.471] together with [theorem: 20.367] gives then $f(x)=f_i$ and $g(x)=g_i$. So

$$\begin{aligned}(f\wedge g)(x) &= \min(f(x),g(x))\\ &= \min(f_i,g_i)\\ &\underset{\text{[theorem: 20.367]}}{=} \left(\sum_{i=1}^{n}\min(f_i,g_i)\cdot\mathcal{X}_{C_i}\right)(x)\end{aligned}$$

which proves that

$$(f\wedge g)=\sum_{i=1}^{n}\min(f_i,g_i)\cdot\mathcal{X}_{C_i}$$

and, as $\{\min(f_i,g_i)\}_{i\in\{1,\ldots,n\}}\subseteq[0,\infty[$ it follows from [theorem: 20.376] that

$$f\wedge g\in\mathcal{S}^{+}[X,\mathcal{A}]$$

Further as $\forall x\in X\ (f\wedge g)(x)=\min(f(x),g(x))\leqslant f(x),g(x)$ it folllows from (b) that

$$\int^{S}(f\wedge g)\,d\mu\leqslant\int^{S}fd\mu\text{ and }\int^{S}(f\wedge g)\,d\mu\leqslant\int^{S}gd\mu$$

d. Let $x \in X$ then as $X \underset{\text{[eq: 20.471]}}{=} \bigsqcup_{i \in \{1,\ldots,n\}} C_i$ there exis a $i \in \{1,\ldots,n\}$ such that $x \in A_i$. Using [eq: 20.471] together with [theorem: 20.367] gives then $f(x) = f_i$ and $g(x) = g_i$. So

$$\begin{aligned}(f \vee g)(x) &= \max(f(x), g(x)) \\ &= \max(f_i, g_i) \\ &\underset{\text{[theorem: 20.367]}}{=} \left(\sum_{i=1}^{n} \max(f_i, g_i) \cdot \mathcal{X}_{C_i}\right)(x)\end{aligned}$$

which proves that

$$(f \vee g) = \sum_{i=1}^{n} \min(f_i, g_i) \cdot \mathcal{X}_{C_i}$$

and, as $\{\max(f_i, g_i)\}_{i \in \{1,\ldots,n\}} \subseteq [0, \infty[$ it follows from [theorem: 20.376] that

$$f \vee g \in \mathcal{S}^+[X, \mathcal{A}]$$

Further as $\forall x \in X\, f(x), g(x) \leqslant \max(f(x), g(x)) = f \vee g$ it folllows from (b) that

$$\int^S f d\mu \leqslant \int^S (f \vee g)\, d\mu \text{ and } \int^S g d\mu \int^S (f \vee g)\, d\mu$$

3. As $f = 0$ μ-a.e. there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$\{x \in X | 0 \neq f(x)\} \subseteq N \tag{20.474}$$

As $f \in \mathcal{S}^+[X, \mathcal{A}]$ there exists by [theorem: 20.376] a $n \in \mathbb{N}$, a pairwise disjoint family $\{A_i)_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A}$ and a $\{f_i\}_{i \in \{1,\ldots,n\}} \subseteq [0, \infty[$ such that $f = \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{A_i}$. Let $i \in \{1,\ldots,n\}$ then for f_i we have either:

$f_i = 0$. Then $f_i \cdot \mu(A_i) = 0$

$0 < f_i$. Then $\forall x \in A_i$ we have $f(x) \underset{\text{[theorem: 20.367]}}{=} a_i \neq 0$ so that $x \in \{x \in X | 0 \neq f(x)\}$. Hence $A_i \subseteq \{x \in X | 0 \neq f(x)\} \underset{\text{[eq: 20.474]}}{\subseteq} N$. So $\mu(A_i) \underset{\text{[theorem: 20.201]}}{\leqslant} \mu(N) = 0$ from which it follows that $f \cdot \mu(A_i) = 0$

So $\forall i \in \{1,\ldots,n\}$ we have that $f_i \cdot \mu(A_i) = 0$ proving that

$$\int^S f d\mu = \sum_{i=1}^{n} f_i \cdot \mu(A_i) = 0$$

□

Using mathematical induction we have the following extension of the above theorem.

Corollary 20.385. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $n \in \mathbb{N}$ and $\{f_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ then we have that*

1. $\bigwedge_{i \in \{1,\ldots,n\}} f_i \in \mathcal{S}^+[X, \mathcal{A}]$
2. $\bigvee_{i \in \{1,\ldots,n\}} f_i \in \mathcal{S}^+[X, \mathcal{A}]$

Proof.

1. Let

$$S = \left\{ n \in \mathbb{N} | \text{If } \{f_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{S}^+[X, \mathcal{A}] \text{ then } \bigwedge_{i=1}^{n} f_i \in \mathcal{S}^+[X, \mathcal{A}] \right\}$$

then we have:

$1 \in S$. If $\{f_i\}_{i \in \{1\}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ then $(\bigwedge_{i=1}^{1} f)(x) = \min(\{f_1(x)\}) = f_1(x)$ so that $\bigwedge_{i=1}^{1} f_i = f_1 \in \mathcal{S}^+[X, \mathcal{A}]$, hence $1 \in S$

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$. Let $\{f_i\}_{i\in\{1,\ldots,n+1\}} \subseteq \mathcal{S}^+[X,\mathcal{A}]$ then $\forall x \in A$ we have

$$\begin{aligned}
\left(\bigwedge_{i=1}^{n+1} f_i\right)(x) &= \min\left(\{f_i(x) | i \in \{1,\ldots,n+1\}\}\right) \\
&\underset{\text{[corollary: 3.67]}}{=} \min\left(\min\left(\{f_i(x) | i \in \{1,\ldots,n+1\}\}\right), f_{n+1}(x)\right) \\
&= \min\left(\left(\bigwedge_{i=1}^{n} f_i\right)(x), f_{n+1}(x)\right) \\
&= \left(\left(\bigwedge_{i=1}^{n} f_i\right) \wedge f_{n+1}\right)(x)
\end{aligned}$$

so that

$$\bigwedge_{i=1}^{n+1} f_i = \left(\bigwedge_{i=1}^{n} f_i\right) \wedge f_{n+1}$$

As $n \in S$ we have that $\bigwedge_{i=1}^{n} f_i \in \mathcal{S}^+[X,\mathcal{A}]$, hence, using [theorem: 20.384] it follows that $(\bigwedge_{i=1}^{n+1} f_i) \in \mathcal{S}^+[X,\mathcal{A}]$, proving $n+1 \in \mathcal{S}$.

2. Let

$$S = \left\{ n \in \mathbb{N} | \text{If } \{f_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{S}^+[X,\mathcal{A}] \text{ then } \bigvee_{i=1}^{n} f_i \in \mathcal{S}^+[X,\mathcal{A}] \right\}$$

then we have:

$\boldsymbol{1 \in S}$. If $\{f_i\}_{i\in\{1\}} \subseteq \mathcal{S}^+[X,\mathcal{A}]$ then $(\bigvee_{i=1}^{1} f)(x) = \max\left(\{f_1(x)\}\right) = f_1(x)$ so that $\bigvee_{i=1}^{1} f_i = f_1 \in \mathcal{S}^+[X,\mathcal{A}]$, hence $1 \in S$

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$. Let $\{f_i\}_{i\in\{1,\ldots,n+1\}} \subseteq \mathcal{S}^+[X,\mathcal{A}]$ then $\forall x \in A$ we have

$$\begin{aligned}
\left(\bigvee_{i=1}^{n+1} f_i\right)(x) &= \max\left(\{f_i(x) | i \in \{1,\ldots,n+1\}\}\right) \\
&\underset{\text{[corollary: 3.67]}}{=} \max\left(\max\left(\{f_i(x) | i \in \{1,\ldots,n+1\}\}\right), f_{n+1}(x)\right) \\
&= \max\left(\left(\bigvee_{i=1}^{n} f_i\right)(x), f_{n+1}(x)\right) \\
&= \left(\left(\bigvee_{i=1}^{n} f_i\right) \vee f_{n+1}\right)(x)
\end{aligned}$$

so that

$$\bigvee_{i=1}^{n+1} f_i = \left(\bigvee_{i=1}^{n} f_i\right) \vee f_{n+1}$$

As $n \in S$ we have that $\bigvee_{i=1}^{n} f_i \in \mathcal{S}^+[X,\mathcal{A}]$, hence, using [theorem: 20.384] it follows that $(\bigvee_{i=1}^{n+1} f_i) \in \mathcal{S}^+[X,\mathcal{A}]$, proving $n+1 \in \mathcal{S}$. □

The following theorem is the simple function variant of the monotone convergence theorem that is one of the central convergence theorems that sets the measure integral appart from the Riemann integral.

Theorem 20.386. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space, $\{f_i\}_{i\in\mathbb{N}} \subseteq \mathcal{S}^+[X,\mathcal{A}]$ such that*

$$\forall x \in X \text{ we have } \forall k \in \mathbb{N} \text{ that } f_k(x) \leqslant f_{k+1}(x)$$

and for $\lim_{k\to\infty} f_k : X \to \overline{\mathbb{R}}$ defined by $\left(\lim_{k\to\infty} f_n\right)(x) = \lim_{k\to\infty} f_k(x)$ we have $\lim_{k\to\infty} f_k \in \mathcal{S}^+[X,\mathcal{A}]$ then

$$\lim_{k\to\infty} \int^S f_k \, d\mu \text{ exists}$$

and

$$\int^S \left(\lim_{k\to\infty} f_k\right) d\mu = \lim_{k\to\infty} \int^S f_n \, d\mu$$

***Note* 20.387.** *As $\forall x \in X$ we have $\forall k \in \mathbb{N}$ $f_k(x) \leqslant f_{k+1}(x)$ we have by [theorem: 20.89] that $\lim_{k\to\infty} f_k(x)$ exist, as is needed for the requirements of this theorem.*

Proof. As $\forall x \in X$ we have $\forall k \in \mathbb{N}$ that $f_k(x) \leqslant f_{k+1}(x)$ it follows from [theorem: 20.384] that

$$\forall k \in \mathbb{N} \text{ we have } \int^S f_k \, d\mu \leqslant \int^S f_{k+1} \, d\mu \tag{20.475}$$

So using [theorem: 20.89] it follows that

$$\lim_{k\to\infty} \int^S f_k \, d\mu \text{ exists and } \lim_{k\to\infty} \int^S f_k \, d\mu = \sup\left(\left\{\int^S f_k \, d\mu | k \in \mathbb{N}\right\}\right) \geqslant 0 \tag{20.476}$$

Further as $\forall x \in X$ we have $\forall k \in \mathbb{N}$ that $f_k(x) \leqslant f_{k+1}(x)$ we have by [theorem: 20.89] again that

$$\lim_{k\to\infty} f_k(x) \text{ exists and } \lim_{k\to\infty} f_k(x) = \sup\left(\{f_k(x) | k \in \mathbb{N}\}\right) \tag{20.477}$$

so that

$$x \in X \text{ we have } \forall k \in \mathbb{N} \text{ that } f_k(x) \leqslant \lim_{k\to\infty} f_k(x) \tag{20.478}$$

As $\lim_{k\to\infty} f_k \in \mathcal{S}^+[X, \mathcal{A}]$ $\int^S \left(\lim_{k\to\infty} f_k\right) d\mu$ exist and using [theorem: 20.384] it follows then that $\forall k \in \mathbb{N}$ $\int^S f_k \, d\mu \leqslant \int^S \left(\lim_{i\to\infty} f_i\right) d\mu$ so that using [theorem: 20.82]

$$0 \underset{\text{[eq: 20.476]}}{\leqslant} \lim_{k\to\infty} \int^{\mathcal{S}} f_k \, d\mu \leqslant \int^{\mathcal{S}} \left(\lim_{i\to\infty} f_i\right) d\mu \tag{20.479}$$

Next we prove the opposite inequality. As $\lim_{k\to\infty} f_k \in \mathcal{S}^+[X, \mathcal{A}]$ there exists by [theorem: 20.376] a $n \in \mathbb{N}$, a pairwise disjoint family $\{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{A}$ and a family $\{a_i\}_{i\in\{1,\ldots,n\}} \subseteq [0, \infty[$ such that

$$\lim_{k\to\infty} f_k = \sum_{i=1}^n a_i \cdot \mathcal{X}_{A_i} \tag{20.480}$$

For $\{a_i\}_{i\in\{1,\ldots,n\}}$ we have two possible cases:

$\forall i \in \{1, \ldots, n\}$ $a_i = 0$. Then $\int^S \lim_{k\to\infty} f_k \underset{\text{[eq: 20.480]}}{=} \sum_{i=1}^n a_i \cdot \mu(A_i) = \sum_{i=1}^n 0 \cdot \mu(A_i) = 0$ so that we have [using eq: 20.479]

$$0 \leqslant \lim_{i\to\infty} \int^{\mathcal{S}} f_i \, d\mu \underset{\text{[eq: 20.477]}}{\leqslant} \int^{\mathcal{S}} \left(\lim_{k\to\infty} f_k\right) d\mu = 0$$

which proves that in this case

$$\lim_{k\to\infty} \int^{\mathcal{S}} f_k \, d\mu = \int^{\mathcal{S}} \left(\lim_{k\to\infty} f_k\right) d\mu$$

$\exists i \in \{1, \ldots, n\}$ $a_i \neq 0$. Then $I = \{i \in \{1, \ldots, n\} | a_i \neq 0\} \neq \varnothing$ so that there exists a $m \in \mathbb{N}$ and a bijection $\beta: \{1, \ldots, m\} \to I$. Let $x \in X$ then

$$\begin{aligned}
\left(\lim_{k\to\infty} f_k\right)(x) &\underset{\text{[eq: 20.480]}}{=} \sum_{i\in\{1,\ldots,n\}} a_i \cdot \mathcal{X}_{A_i}(x) \\
&= \sum_{i\in\{1,\ldots,n\}\setminus I} a_i \cdot \mathcal{X}_{A_i}(x) + \sum_{i\in I} a_i \cdot \mathcal{X}_{A_i}(x) \\
&= \sum_{i\in I} a_i \cdot \mathcal{X}_{A_i}(x) \\
&\underset{\text{[theorem: 11.36]}}{=} \sum_{i\in\{1,\ldots,m\}} a_{\beta(i)} \cdot \mathcal{X}_{A_{\beta(i)}}(x) \\
&= \sum_{i=1}^m a_{\beta(i)} \cdot \mathcal{X}_{A_{\beta(i)}}(x)
\end{aligned}$$

proving, if we define $\{b_i\}_{i\in\{1,\ldots,m\}}$ by $b_i = a_{\beta(i)}$ and $\{B_i\}_{i\in\{1,\ldots,n\}}$ by $B_i = A_{\beta(i)} \in \mathcal{A}$, that

$$\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ and } \lim_{k\to\infty} f_k = \sum_{i=1}^{m} b_i \cdot \mathcal{X}_{B_i} \text{ and } \forall i \in \{1,\ldots,m\}\ b_i \in \mathbb{R}^+ \tag{20.481}$$

Further, if $i, j \in \{1,\ldots,m\}$ with $i \neq j$ then $\beta(i) \neq \beta(j)$ so that $B_i \bigcap B_j = A_{\beta(i)} \bigcap A_{\beta(j)} = \varnothing$ which proves that

$$\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ is pairwise disjoint} \tag{20.482}$$

Let $\varepsilon \in \mathbb{R}^+$ with $\varepsilon < 1$ then $0 < 1-\varepsilon$. Let $i \in \{1,\ldots,m\}$ and define

$$\{B_{i,j}\}_{j\in\mathbb{N}} \text{ by } B_{i,j} = \{x \in B_i | f_j(x) \geqslant (1-\varepsilon)\cdot b_i\} \subseteq B_i \tag{20.483}$$

then as

$$\{x \in B_i | f_j(x) \geqslant (1-\varepsilon)\} = B_i \bigcap \{x \in X | f_j(x) \geqslant (1-\varepsilon)\cdot b_i\} \underset{\text{[def: 20.333]}}{=} B_i \bigcap \{f_j \geqslant (1-\varepsilon)\cdot b_i\}$$

and $B_i, \{f_j \geqslant (1-\varepsilon)\cdot b_i\} \in \mathcal{A}$ [see: [theorem: 20.335] it follows that

$$\forall i \in \{1,\ldots,m\} \text{ we have } \{B_{i,j}\}_{j\in\mathbb{N}} \subseteq \mathcal{A} \tag{20.484}$$

If $x \in B_i$ then by [theorem: 20.367] and [eqs: 20.481, 20.482] we have $\left(\lim_{k\to\infty} f_k\right)(x) = b_i$ so that $(1-\varepsilon)\cdot b_i < b_i = \left(\lim_{k\to\infty} f_k\right)(x) \underset{\text{[eq: 20.477]}}{=} \sup(\{f_i(x) | i \in \mathbb{N}\})$. Hence there exist a $k \in \mathbb{N}$ such that $(1-\varepsilon)\cdot b_i < f_k(x)$ which proves that $x \in B_{i,k} \subseteq \bigcup_{j\in\mathbb{N}} B_{i,j}$ which proves that $B_i \subseteq \bigcup_{j\in\mathbb{N}} B_{i,j}$. As $\forall j \in \mathbb{N}$ we have $B_{i,j} \subseteq B_i \Rightarrow \bigcup_{j\in\mathbb{N}} B_{i,j} \subseteq B_i$ it follows that

$$\forall i \in \{1,\ldots,m\}\ B_i = \bigcup_{j\in\mathbb{N}} B_{i,j} \tag{20.485}$$

Let $k \in \mathbb{N}$ then $\forall i, j \in \{1,\ldots,m\}$ with $i \neq j$ we have $B_{i,k} \bigcap B_{j,k} \subseteq B_i \bigcap B_j = \varnothing$ which proves that

$$\forall k \in \mathbb{N} \text{ we have that } \{B_{i,k}\}_{i\in\{1,\ldots,m\}} \text{ is pairwise disjoint} \tag{20.486}$$

Let $i \in \{1,\ldots,m\}$ and $k \in \mathbb{N}$ then if $x \in B_{i,k}$ we have that $(1-\varepsilon)\cdot b_i \leqslant f_k(x) \leqslant f_{k+1}(x)$, so $x \in B_{i,k+1}$, hence

$$\forall i \in \{1,\ldots,m\} \text{ we have } \forall k \in \mathbb{N} \text{ that } B_{i,k} \subseteq B_{i,k+1} \tag{20.487}$$

Using now [theorem: 20.206 (1)] it follows that

$$\forall i \in \{1,\ldots,m\}\ \mu(B_i) \underset{\text{[eq: 20.485]}}{=} \mu\left(\bigcup_{j\in\mathbb{N}} B_{i,j}\right) = \lim_{j\to\infty} \mu(B_{i,j}) = \sup(\{\mu(B_{i,j}) | j \in \mathbb{N}\}) \tag{20.488}$$

Define now

$$\{g_k\}_{k\in\mathbb{N}} \text{ by } g_k = \sum_{i=1}^{m} (1-\varepsilon)\cdot b_i \cdot \mathcal{X}_{B_{i,k}} \tag{20.489}$$

then by [theorem: 20.376] together with [eqs: 20.489, 20.484, 20.486] we have that

$$\{g_k\}_{k\in\mathbb{N}} \subseteq \mathcal{S}^+[X.\mathcal{A}] \tag{20.490}$$

Let $x \in X$ and $k \in \mathbb{N}$ then for x we have either:

$\boldsymbol{x \in \bigcup_{i\in\{1,\ldots,m\}} B_{i,k}}$. Then there exist a $i \in \{1,\ldots,m\}$ such that $x \in B_{i,k}$ so that $(1-\varepsilon)\cdot b_i \leqslant f_k(x)$ which as $g_k(x) \underset{\text{[theorem: 20.367]}}{=} (1-\varepsilon)\cdot b_i \leqslant f_k(x)$ so that

$$g_k(x) \leqslant f_k(x)$$

Further as $B_{i,k} \underset{\text{[eq: 20.487]}}{\subseteq} B_{i,k+1}$ we have that $x \in B_{i,k+1}$ so that

$$g_k(x) \underset{\text{[theorem: 20.367]}}{=} (1-\varepsilon)\cdot b_{k+1} \underset{\text{[theorem: 20.367]}}{=} g_{k+1}(x)$$

proving that

$$g_k(x) \leqslant g_{k+1}(x)$$

$\boldsymbol{x \notin \bigcup_{i \in \{1,\ldots,m\}} B_{i,k}}$**.** Then $g_k(x) = \sum_{i=1}^m (1-\varepsilon) \cdot b_i \cdot \mathcal{X}_{B_{i,k}} = \sum_{i=1}^m (1-\varepsilon) \cdot b_i \cdot 0 = 0$ so that

$$g_k(x) = 0 \leqslant f_k(x)$$

and

$$g_k(x) = 0 \leqslant g_{k+1}(x)$$

Hence we have that

$$\forall x \in X \text{ we have } \forall k \in \mathbb{N} \text{ that } g_k(x) \leqslant g_{k+1}(x) \text{ and } g_k(x) \leqslant f_k(x) \tag{20.491}$$

From the above we have using [theorem: 20.384] that $\forall k \in \mathbb{N}$ $\int^S g_k \, d\mu \leqslant \int^S g_{k+1} \, d\mu$. So using [theorem: 20.89] $\lim\limits_{k \to \infty} \int^S g_k \, d\mu$ exists. Lets calculate this limit. By [theorem: 20.82] and [eq: 20.488] we have that $\forall i \in \{1, \ldots, m\}$ $\lim\limits_{k \to \infty} ((1-\varepsilon) \cdot b_i \cdot \mu(B_{i,k}))$ exists and

$$\lim_{k \to \infty} ((1-\varepsilon) \cdot b_i \cdot \mu(B_{i,k})) = (1-\varepsilon) \cdot \beta_i \cdot \lim_{k \to \infty} \mu(B_{i,k}) = (1-\varepsilon) \cdot b_i \cdot \mu(B_i)$$

Hence using [theorem: 20.85] it follows that $\lim\limits_{k \to \infty} (\sum_{i=1}^m (1-\varepsilon) \cdot b_i \cdot \mu(B_{i,k}))$ exists and

$$\lim_{k \to \infty} \left(\sum_{i=1}^m (1-\varepsilon) \cdot b_i \cdot \mu(B_{i,k}) \right) = (1-\varepsilon) \cdot \sum_{i=1}^m b_i \cdot \mu(B_i) \tag{20.492}$$

so

$$\begin{aligned} \lim_{k \to \infty} \int^S g_k \, d\mu &\underset{\text{[eq: 20.489]}}{=} \lim_{k \to \infty} \left(\sum_{i=1}^m (1-\varepsilon) \cdot b_i \cdot \mu(B_{i,k}) \right) \\ &\underset{\text{[eq: 20.492]}}{=} (1-\varepsilon) \cdot \sum_{i=1}^m b_i \cdot \mu(B_i) \\ &\underset{\text{[eq: 20.481]}}{=} (1-\varepsilon) \cdot \int^S \left(\lim_{k \to \infty} f_k \right) d\mu \end{aligned}$$

Hence

$$\lim_{k \to \infty} \int^S g_k \, d\mu = (1-\varepsilon) \cdot \int^S \left(\lim_{k \to \infty} f_k \right) d\mu \tag{20.493}$$

As by [eq: 20.491] $\forall x \in X$ we have $\forall k \in \mathbb{N}$ that $g_k(x) \leqslant f_k(x)$ it follows from [theorem: 20.384] that $\int^S g_k \, d\mu \leqslant \int^S f_k \, d\mu$. Using then [theorem: 20.82] we have that

$$\lim_{k \to \infty} \int^S g_k \, d\mu \leqslant \lim_{k \to \infty} \int^S f_k d\mu$$

If we combine this with [eq: 20.493] we get

$$(1-\varepsilon) \cdot \int^S \left(\lim_{k \to \infty} f_k \right) d\mu \leqslant \lim_{k \to \infty} \int^S f_k d\mu \leqslant \infty \tag{20.494}$$

Now for $\int^S \left(\lim\limits_{k \to \infty} f_k \right) d\mu$ we have either:

$\boldsymbol{\int^S \left(\lim\limits_{k \to \infty} f_k \right) d\mu = \infty}$**.** Then as $0 < (1-\varepsilon)$ we have $(1-\varepsilon) \cdot \int^S \left(\lim\limits_{k \to \infty} f_k \right) d\mu = \infty$ so that by [eq: 20.494] $\lim\limits_{k \to \infty} \int^S f_k d\mu = \infty = \int^S \left(\lim\limits_{k \to \infty} f_k \right) d\mu$ so that

$$\int^S \left(\lim_{k \to \infty} f_k \right) d\mu \leqslant \lim_{k \to \infty} \int^S f_k d\mu$$

$\boldsymbol{\int^S \left(\lim\limits_{k \to \infty} f_k \right) d\mu < \infty}$**.** By [eq: 20.479] we have $0 \leqslant \lim\limits_{k \to \infty} \int^S f_k \, d\mu \leqslant \int^S \left(\lim\limits_{k \to \infty} f_k \right) d\mu < \infty$ so that $\lim\limits_{k \to \infty} \int^S f_k \, d\mu \in \mathbb{R}$. Hence by [eq: 20.494] we have that

$$\int^S \left(\lim_{k \to \infty} f_k \right) d\mu \leqslant \lim_{k \to \infty} \int^S f_k d\mu + \varepsilon \cdot \int^S \left(\lim_{k \to \infty} f_k \right) d\mu$$

As $\varepsilon \in \mathbb{R}^+$ with $\varepsilon < 1$ was choosen arbitrary it follows from [theorem: 10.31] that

$$\int^S \left(\lim_{k\to\infty} f_k\right) d\mu \leqslant \lim_{k\to\infty} \int^S f_k d\mu$$

which proves that in all cases

$$\int^S \left(\lim_{k\to\infty} f_k\right) d\mu \leqslant \lim_{k\to\infty} \int^S f_k d\mu$$

Combining this with [eq: 20.479] proves that

$$\int^S \left(\lim_{k\to\infty} f_k\right) d\mu = \lim_{k\to\infty} \int^S f_k \, d\mu$$

So in all possible cases we have

$$\int^S \left(\lim_{k\to\infty} f_k\right) d\mu = \lim_{k\to\infty} \int^S f_k \, d\mu$$

□

20.6.2 Integral of non negative functions

We extend now the integral $\int^S$ of measurable non negative simple functions to non negative measurable functions.

Definition 20.388. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space then we define*

$$\mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] = \{f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] | f(X) \subseteq [0, \infty]\}$$

$$\mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] = \{f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] | f(X) \subseteq [0, \infty[\} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

where $\mathcal{M}[X, \mathcal{A}, \mathbb{R}]$, $\mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ is defined in [definition: 20.324]

***Note* 20.389.** *In contrast with the definition of $\mathcal{S}^+[X, \mathcal{A}]$ $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ can in principle attain the value ∞.*

Definition 20.390. *Let $\langle X, \mathcal{A}, \mu\rangle$ and $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then we define $\int^+ f d\mu$ by*

$$\int^+ f d\mu = \sup\left(\left\{\int^{\mathcal{S}} g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leqslant f(x)\right\}\right)$$

***Note* 20.391.** *As by [example: 20.314] $C_0 : X \to \overline{\mathbb{R}}$ is $\mathcal{A}$-measurable and $\forall x \in X$ $C_0(x) = 0 \leqslant f(x)$ it follows that $\left\{\int^{\mathcal{S}} g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leqslant f(x)\right\} \neq \varnothing$ so that*

$$\sup\left(\left\{\int^{\mathcal{S}} g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leqslant f(x)\right\}\right)$$

exists. Hence the definition is well defined.

***Note* 20.392.** *In the definition of the integral $\int^+ f d\mu$ we don't use the $\mathcal{A}$-measurability of f, $\sup\left(\left\{\int^{\mathcal{S}} g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leqslant f(x)\right\}\right)$ is also well defined for a non negative function. However the requirement that f is $\mathcal{A}$ will be usefull later to construct a alternative definition based on a limiting process of simple functions.*

Next we define the integral on a measurable subset.

Definition 20.393. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space, $A \in \mathcal{A}$ and $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then*

$$\int_A^+ f d\mu = \int^+ (\mathcal{X}_A \cdot f) \, d\mu$$

***Note* 20.394.** *Using [theorem: 20.353] $\mathcal{X}_A \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ as is needed in this definition.*

We show now that $\int^+$ is actually a extension of $\int^S$.

Theorem 20.395. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measurable space and $f \in \mathcal{S}^+[X, \mathcal{A}]$ then $f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ and*

$$\int^S f d\mu = \int^+ f d\mu$$

Proof. As $f \in \mathcal{S}^+[X, \mathcal{A}]$ we have by [definition: 20.373] that f is $\mathcal{A}$-measurable, hence $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $f(X) \subseteq [0, \infty[\subseteq [0, \infty]$ so that

$$f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$$

Further as trivially $\forall x \in X \; f(x) \leqslant f(x)$ and $f \in \mathcal{S}^+[X, \mathcal{A}]$ it follows that

$$\int^S f d\mu \in \left\{ \int^{\mathcal{S}} g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leqslant f(x) \right\}$$

so that

$$\int^S f d\mu \leqslant \sup \left(\left\{ \int^{\mathcal{S}} g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leqslant f(x) \right\} \right) = \int^+ f d\mu \tag{20.495}$$

Let $g \in \mathcal{S}^+[X, \mathcal{A}]$ such that $\forall x \in X$ we have $g(x) \leqslant f(x)$ then by [theorem: 20.384] we have $\int^S g d\mu \leqslant \int^S f d\mu$. So it follows that $\int^S f$ is a upper bound of $\left\{ \int^{\mathcal{S}} g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leqslant f(x) \right\}$ proving that

$$\sup \left(\left\{ \int^{\mathcal{S}} g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leqslant f(x) \right\} \right) \leqslant \int^S f d\mu$$

which combined with [eq: 20.495] gives

$$\int^S f d\mu = \int^+ f d\mu$$

□

Example 20.396. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $a \in \mathbb{R}$ then $C_a \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ and

$$\int^+ C_a \, d\mu = a \cdot \mu(X)$$

Proof. Using [theorem: 20.375] $C_a \in \mathcal{S}^+[X, \mathcal{A}]$, hence using [theorem: 20.395] $C_a \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ and

$$\int^+ C_a \, d\mu = \int^S C_a \, d\mu \underset{\text{[theorem: 20.382]}}{=} a \cdot \mu(X)$$

□

Example 20.397. $\langle X, \mathcal{A}, \mu \rangle$ be a measurable space, $A \in \mathcal{A}$ and $\alpha \in [0, \infty[$ then $\alpha \cdot \mathcal{X}_A \in S^+[X, \mathcal{A}]$ and $\int^+ \alpha \cdot \mathcal{X}_A d\mu = \alpha \cdot \mu(A)$.

Proof. Take $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{A}$ by $A_1 = A$ and $\{a_i\}_{i \in \{1\}} = \alpha$ then $\forall x \in X \; (\alpha \cdot \mathcal{X}_A)(x) = \alpha \cdot \mathcal{X}_A(x) = \sum_{i=1}^1 a_i \cdot \mathcal{X}_{A_I}$ proving that $\alpha \cdot \mathcal{X}_A = \sum_{i=1}^1 a_i \cdot \mathcal{X}_{A_i}$. From [theorem: 20.376] it follows then that

$$\alpha \cdot \mathcal{X}_A \in \mathcal{S}^+[X, \mathcal{A}]$$

Using [definition: 20.380] it follows then that

$$\int^S (\alpha \cdot \mathcal{X}_A) \, d\mu = \sum_{i=1}^1 a_i \cdot \mu(A_i) = \alpha \cdot \mu(A)$$

Hence using [theorem: 20.395] $\alpha \cdot \mathcal{X}_A \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ and $\int^+ (\alpha \cdot \mathcal{X}_A) \, d\mu = \mu(A_i)$. □

Every non negative measurable function can be written as a limit of increasing simple measurable functions. We will use this fact to write $\int^+$ in terms of a limit of $\int^S$ of simple functions.

Theorem 20.398. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space and $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then there exists a sequence $\{f_k\}_{k\in\mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}[$ such that $\forall x \in X$ we have*

$$\forall n \in \mathbb{N} \text{ we have } f_n(x) \leqslant f_{n+1}(x)$$

and

$$\lim_{n\to\infty} f_n(x) \text{ exists and } f(x) = \lim_{n\to\infty} f_n(x) = \sup\left(\{f_n(x) | n \in \mathbb{N}\}\right)$$

In other words we have that

$$f = \lim_{n\to\infty} f_n$$

Proof. The strategy of the proof is to divide $f(X)\bigcap[0, n[$ in $n \cdot 2^n$ intervals of the form $\left[\frac{k-1}{2^n}, \frac{k}{2^n}\right[$ and aproximate f by f_n where $f_n(x) = \begin{cases} \frac{k-1}{2^n} \text{ if } x \in f(X)\bigcap[0, n[\text{ where } k \text{ satisfies } x \in f^{-1}\left(\left[\frac{k-1}{2^n}, \frac{k}{2^n}\right[\right) \\ n \text{ if } x \in X \setminus (\bigcup_{k\in I_n} A_{n,k}) \end{cases}$ and prove that $f = \lim_{n\to\infty} f_n$ The following illustrates this for $n = 2$ and $X = \mathbb{R}$ here

x	$\in$	$f^{-1}([0, 1/4[)$	$\Rightarrow$	$f_2(x) = 0/4$
x	$\in$	$f^{-1}([1/4, 2/4[)$	$\Rightarrow$	$f_2(x) = 1/4$
x	$\in$	$f^{-1}([2/4, 3/4[)$	$\Rightarrow$	$f_2(x) = 2/4$
x	$\in$	$f^{-1}([3/4, 4/4[)$	$\Rightarrow$	$f_2(x) = 3/4$
x	$\in$	$f^{-1}([4/4, 5/4[)$	$\Rightarrow$	$f_2(x) = 4/4$
x	$\in$	$f^{-1}([5/4, 6/4[)$	$\Rightarrow$	$f_2(x) = 5/4$
x	$\in$	$f^{-1}([6/4, 7/4[)$	$\Rightarrow$	$f_2(x) = 6/4$
x	$\in$	$f^{-1}([7/4, 8/4[)$	$\Rightarrow$	$f_2(x) = 7/4$
x	$\in$	$f^{-1}([8/4, \infty[)$	$\Rightarrow$	$f_2(x) = 2$

so that

$$\begin{aligned} f_2 = {} & \mathcal{X}_{f^{-1}\left(\left[0,\frac{1}{4}\right[\right)} \cdot \frac{0}{4} + \mathcal{X}_{f^{-1}\left(\left[\frac{1}{4},\frac{2}{4}\right[\right)} \cdot \frac{1}{4} + \mathcal{X}_{f^{-1}\left(\left[\frac{2}{4},\frac{3}{4}\right[\right)} \cdot \frac{2}{4} + \mathcal{X}_{f^{-1}\left(\left[\frac{3}{4},\frac{4}{4}\right[\right)} \cdot \frac{3}{4} + \mathcal{X}_{f^{-1}\left(\left[\frac{4}{4},\frac{5}{4}\right[\right)} \cdot \frac{4}{4} + \mathcal{X}_{f^{-1}\left(\left[\frac{5}{4},\frac{6}{4}\right[\right)} \cdot \frac{5}{4} + \\ & \mathcal{X}_{f^{-1}\left(\left[\frac{6}{4},\frac{7}{4}\right[\right)} \cdot \frac{7}{4} + \mathcal{X}_{f^{-1}\left(\left[\frac{7}{4},\frac{8}{4}\right[\right)} \cdot \frac{7}{4} + \mathcal{X}_{f^{-1}\left(\left[\frac{8}{4},\infty\right[\right)} \cdot \frac{8}{4} \end{aligned} \tag{20.496}$$

Figure 20.6. f apprimated by f_2

Now for the details of the proof. Define

$$\{I_n\}_{n\in\mathbb{N}}\subseteq\mathcal{P}(\mathbb{N})\text{ by }I_n=\{i\in\mathbb{N}|i\leqslant n\cdot 2^n\}=\{1,\ldots,n\cdot 2^n\}\tag{20.497}$$

Let $n\in\mathbb{N}$. Define for $k\in I_n$

$$A_{n,k}=\left\{x\in X|\frac{k-1}{2^n}\leqslant f(x)<\frac{k}{n}\right\}=f^{-1}\left(\left[\frac{k-1}{2^n},\frac{k}{2^n}\right[\right)\tag{20.498}$$

Then we have

$$\begin{aligned}x\in A_{n,k}\;&\Leftrightarrow\;\frac{k-1}{2^n}\leqslant x\wedge x<\frac{k}{2^n}\\&\Leftrightarrow\;x\in\left\{f\geqslant\frac{k-1}{2^n}\right\}\wedge x\in\left\{f<\frac{k}{2^n}\right\}\\&\Leftrightarrow\;x\in\left\{f\geqslant\frac{k-1}{2^n}\right\}\bigcap\left\{f<\frac{k}{2^n}\right\}\end{aligned}$$

which proves that

$$A_{n,k}=\left\{f\geqslant\frac{k-1}{2^n}\right\}\bigcap\left\{f<\frac{k}{2^n}\right\}\tag{20.499}$$

As f is $\mathcal{A}$-measurable it follows from [theorem: 20.335] that $\left\{f\geqslant\frac{k-1}{2^n}\right\},\left\{f<\frac{k}{2^n}\right\}\in\mathcal{A}$ so that

$$\forall k\in I_n\text{ we have }A_{n,k}\in\mathcal{A}\tag{20.500}$$

As $I_n=\{1,\ldots,n\cdot 2^n\}$ is finite hence countable it follows from [theorem: 20.143] that

$$\bigcup_{k\in I_n}A_{n,k}\in\mathcal{A}\tag{20.501}$$

Let $l,k\in I_n$ with $l\neq k$ then we may assume that $l<k\Rightarrow l\leqslant k-1$ [otherwise interchange l and k]. Assume that $x\in A_{n,k}\bigcap A_{n,l}$ then $\frac{l-1}{2^n}\leqslant f(x)<\frac{l}{2^n}\leqslant\frac{k-1}{2^n}\leqslant f(x)<\frac{k}{2^n}$ leading to the contradiction $f(x)<f(x)$, hence the assumption is wrong and we have that $A_{n,k}\bigcap A_{n,l}=\varnothing$. Hence we have proved that

$$\{A_{n,k}\}_{k\in I_n}\text{ is pairwise disjoint}\tag{20.502}$$

If $x\in\bigcup_{k\in I_n}A_{n,k}$ there exist a $k\in I_n$ [which is **unique** by [eq: 20.502]] so that $x\in A_{n,k}$

$$f_n\colon X\to\overline{\mathbb{R}}\text{ where }f_n(x)=\begin{cases}\frac{k-1}{2^n}\text{ if }x\in\bigcup_{k\in I_n}A_{n,k}\text{ where }k\text{ satisfies }x\in A_{n,k}\\ n\text{ if }x\in X\setminus(\bigcup_{k\in I_n}A_{n,k})\end{cases}\in[0,\infty[\tag{20.503}$$

is a well defined function. Further using [example: 20.377] we have that $f_n\in\mathcal{S}^+[X,\mathcal{A}]$ so that

$$\{f_n\}_{n\in\mathbb{N}}\subseteq\mathcal{S}^+[X,\mathcal{A}]\tag{20.504}$$

Let $n\in\mathbb{N}$ and take $x\in f^{-1}([0,n[)$ then $0\leqslant f(x)<n$. Define $B_x=\left\{k\in I_n|f(x)<\frac{k}{2^n}\right\}\subseteq I_n$ a finite set. As $n\cdot 2^n\in I_n$ and $f(x)<n=\frac{n\cdot 2^n}{2^n}$ we have that $n\cdot 2^n\in B_x$ so that $B_x\neq\varnothing$. Hence $l=\min(B_x)$ exist. There are two possible cases for l

- $\boldsymbol{l=1}$. Then $\frac{1-1}{2^n}=0\leqslant f(x)<\frac{1}{2^n}$ so that $x\in A_{n,1}\subseteq\bigcup_{k\in I_n}A_{n,k}$
- $\boldsymbol{1<l}$. Then $1\leqslant l-1<l\leqslant n\cdot 2^n$ so that $l-1\in I_n$. As $l-1<l=\min(B_x)$ we must have that $\frac{l-1}{2^n}\leqslant f(x)<\frac{l}{2^n}$ so that $x\in A_{n,l}\subseteq\bigcup_{k\in I_n}A_{n,k}$

So we have proved that $f^{-1}([0,n[)\subseteq\bigcup_{k\in I_n}A_{n,k}$. For the opposite inclusion, we have for $k\in I_n$ that $A_{n,k}=f^{-1}\left(\left[\frac{k-1}{2^n},\frac{k}{2^n}\right[\right)\underset{\frac{k}{2^n}\leqslant\frac{n\cdot 2^n}{2^n}}{\subseteq}f^{-1}([0,1[)$. So it follows that $\bigcup_{k\in I_n}A_{n,k}=f^{-1}([0,1[)$. Summarized we have

$$\forall n\in\mathbb{N}\text{ we have }f^{-1}([0,n[)=\bigcup_{k\in I_n}A_{n,k}\tag{20.505}$$

Let $x \in X$ and $n \in \mathbb{N}$ then we have to check the following possible cases

$f(x) < n$. Then $x \in f^{-1}([0,n[) \underset{\text{[eq: 20.505]}}{=} \bigcup_{k \in I_n} A_{n,k}$ hence there exist a $k \in I_n$ [which is unique by [eq: 20.502]] such that $x \in A_{n,k}$, hence using the definition of f_n [see eq: 20.503] it follows that $f_n(x) = \frac{k-1}{2^n}$. As $x \in A_{n,k}$ we have also $\frac{k-1}{2^n} \leqslant f(x) < \frac{k}{2^n}$ so that

$$f_n(x) \leqslant f(x) \text{ and } f_n(x) = \frac{k-1}{2^n} \leqslant f(x) < \frac{k}{2^n}$$

$n \leqslant f(x)$. Then $x \notin f^{-1}([0,n[) \underset{\text{[eq: 20.505]}}{=} \bigcup_{k \in I_n} A_{n,k}$ so that $x \in X \setminus \bigcup_{k \in I_n} A_{n,k}$ and from [eq: 20.503] we have that

$$f_n(x) = n \text{ and } f_n(x) \leqslant f(x)$$

Summarizing the above we have three results

$$\forall x \in X \text{ we have } f_n(x) \leqslant f(x) \tag{20.506}$$

$$\forall x \in X, \forall n \in \mathbb{N} \text{ with } f(x) < n \text{ there exist a } k \in I_n \text{ with } f_n(x) = \frac{k-1}{2^n} \leqslant f(x) < \frac{k}{2} \tag{20.507}$$

$$\forall x \in X, \forall n \in \mathbb{N} \text{ with } n \leqslant f(x) \text{ we have } f_n(x) = n \tag{20.508}$$

Next we show that $\{f_n\}_{n \in \mathbb{N}}$ is increasing. Let $x \in X$ then we have for $n \in \mathbb{N}$ either:

$f(x) < n$. Then $f(x) < n, n+1$ so using [eq: 20.507] there exists $k \in I_n, l \in I_{n+1}$ such that

$$f_n(x) = \frac{k-1}{2^n} \leqslant f(x) < \frac{k}{2^n} \wedge f_{n+1}(x) = \frac{l-1}{2^{n+1}} \leqslant f(x) < \frac{l}{2^{n+1}}$$

From this it follows that

$$\begin{aligned}
\frac{k-1}{2^n} < \frac{l-1}{2^{n+1}} &\Rightarrow \frac{2 \cdot k - 2}{2^{n+1}} < \frac{l}{2^{n+1}} \\
&\Rightarrow 2 \cdot k - 2 < l \\
&\Rightarrow 2 \cdot k - 2 \leqslant l - 1 \\
&\Rightarrow \frac{2 \cdot k - 2}{2^{n+1}} \leqslant \frac{l-1}{2^{n+1}} \\
&\Rightarrow \frac{k-1}{2^n} \leqslant \frac{l-1}{2^{n+1}} \\
&\Rightarrow f_n(x) \leqslant f_{n+1}(x)
\end{aligned}$$

proving

$$f_n(x) \leqslant f_{n+1}(x)$$

$n \leqslant f(x) < n+1$. Then by [eq: 20.506] $f_n(x) = n$ and by [eq: 20.507] there exist a $k \in I_{n+1}$ such that $f_{n+1}(x) = \frac{k-1}{2^{n+1}} \leqslant f(x) < \frac{k}{2^{n+1}}$. As $n \leqslant f(x)$ it follows that

$$\begin{aligned}
n < \frac{k}{2^{n+1}} &\Rightarrow n \cdot 2^{n+1} < k \\
&\Rightarrow n \cdot 2^{n+1} \leqslant k - 1 \\
&\Rightarrow n \leqslant \frac{k-1}{2^{n+1}} \\
&\Rightarrow f_n(x) \leqslant f_{n+1}(x)
\end{aligned}$$

proving

$$f_n(x) \leqslant f_{n+1}(x)$$

$n+1 \leqslant f(x)$. Then $n, n+1 \leqslant f(x)$ so that by [eq: 20.506] $f_n(x) = n < n+1 = f_{n+1}(x)$ so that we have again

$$f_n(x) \leqslant f_{n+1}(x)$$

So we have proved that

$$\forall x \in X \text{ we have } \forall n \in \mathbb{N} \text{ that } f_n(x) \leqslant f_{n+1}(x) \tag{20.509}$$

Using then [theorem: 20.89] on the above it follows that

$$\forall x \in X \ \lim_{n\to\infty} f_n(x) \text{ exists and } \lim_{n\to\infty} f_n(x) = \sup(\{f_n(x)|n \in \mathbb{N}\}) \tag{20.510}$$

Let $x \in X$. Using [eq: 20.506] we have that $\forall n \in \mathbb{N}$ $f_n(x) \leqslant f(x)$ so that

$$\sup(\{f_n(x)|n \in \mathbb{N}\}) \leqslant f(x) \tag{20.511}$$

For the opposite inclusion. Assume that $\sup(\{f_n(x)|n \in \mathbb{N}_0\}) < f(x)$ then

$$\sup(\{f_n(x)|n \in \mathbb{N}_0\}) \in \mathbb{R}$$

and for $f(x)$ we have either:

$f(x) = \infty$. By [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $\sup(\{f_n(x)|n \in \mathbb{N}_0\}) < n < \infty = f(x)$. Using then [eq: 20.508] we have $f_n(x) = n$ so that $n = f_n(x) \leqslant \sup(\{f_n(x)|n \in \mathbb{N}_0\}) < n$ leading to the contradiction $n < n$.

$f(x) < \infty$. As $f(x) - \sup(\{f_n(x)|n \in \mathbb{N}\}) > 0$. there exist by [theorem: 10.64] a $n_1 \in \mathbb{N}$ such that

$$\frac{1}{2^{n_1}} < f(x) - \sup(\{f_n(x)|n \in \mathbb{N}\})$$

Further using [theorem: 10.30] there exist a $n_2 \in \mathbb{N}$ such that $f(x) < n_2$. Let $n = \max(n_1, n_2)$ then $f(x) < n$ so that by [eq: 20.507] there exist a $k \in I_n$ such that $f_n(x) = \frac{k-1}{2^n} \leqslant f(x) < \frac{k}{2^n}$. Then $f(x) - f_n(x) < \frac{k}{2^n} - \frac{k-1}{2^n} = \frac{1}{2^n} < \frac{1}{2^{n_1}} < f(x) - \sup(\{f_n(x)|n \in \mathbb{N}\})$ so that $\sup(\{f_n(x)|n \in \mathbb{N}\}) < f_n(x)$ which as $f_n(x) \leqslant \sup(\{f_n(x)|n \in \mathbb{N}\})$ is a contradiction.

As in all cases we reach a contradiction the assumption is invalid and we must have that $f(x) \leqslant \sup(\{f_n(x)|n \in \mathbb{N}\})$ which combined with [eq: 20.511] proves that $f(x) = \sup(\{f_n(x)|n \in \mathbb{N}\})$, hence using [eq: 20.510] we have

$$\forall x \in X \text{ we have } \lim_{n\to\infty} f_n(x) \text{ exist and } f(x) = \lim_{n\to\infty} f_n(x) = \sup(\{f_n(x)|n \in \mathbb{N}\}) \qquad \square$$

We set out now to provide a alternative definition of $\int^+$. As we can approximate f by a sequence of simple functions $\{f_n\}_{n\in\mathbb{N}}$ we will approximate $\int^+ f d\mu$ by $\int^S f_n d\mu$. The following illustrates this for $n = 2$ and $X = \mathbb{R}$ here

x	$\in$	$f^{-1}([0,1/4[)$	$\Rightarrow$	$f_2(x) = 0/4$
x	$\in$	$f^{-1}([1/4,2/4[)$	$\Rightarrow$	$f_2(x) = 1/4$
x	$\in$	$f^{-1}([2/4,3/4[)$	$\Rightarrow$	$f_2(x) = 2/4$
x	$\in$	$f^{-1}([3/4,4/4[)$	$\Rightarrow$	$f_2(x) = 3/4$
x	$\in$	$f^{-1}([4/4,5/4[)$	$\Rightarrow$	$f_2(x) = 4/4$
x	$\in$	$f^{-1}([5/4,6/4[)$	$\Rightarrow$	$f_2(x) = 5/4$
x	$\in$	$f^{-1}([6/4,7/4[)$	$\Rightarrow$	$f_2(x) = 6/4$
x	$\in$	$f^{-1}([7/4,8/4[)$	$\Rightarrow$	$f_2(x) = 7/4$
x	$\in$	$f^{-1}([8/4,\infty[)$	$\Rightarrow$	$f_2(x) = 2$

so that

$$\begin{aligned} f_2 &= \mathcal{X}_{f^{-1}\left(\left[0,\frac{1}{4}\right[\right)} \cdot \frac{0}{4} + \mathcal{X}_{f^{-1}\left(\left[\frac{1}{4},\frac{2}{4}\right[\right)} \cdot \frac{1}{4} + \mathcal{X}_{f^{-1}\left(\left[\frac{2}{4},\frac{3}{4}\right[\right)} \cdot \frac{2}{4} + \mathcal{X}_{f^{-1}\left(\left[\frac{3}{4},\frac{4}{4}\right[\right)} \cdot \frac{3}{4} + \mathcal{X}_{f^{-1}\left(\left[\frac{4}{4},\frac{5}{4}\right[\right)} \cdot \frac{4}{4} + \mathcal{X}_{f^{-1}\left(\left[\frac{5}{4},\frac{6}{4}\right[\right)} \cdot \frac{5}{4} + \\ &\quad \mathcal{X}_{f^{-1}\left(\left[\frac{6}{4},\frac{7}{4}\right[\right)} \cdot \frac{7}{4} + \mathcal{X}_{f^{-1}\left(\left[\frac{7}{4},\frac{8}{4}\right[\right)} \cdot \frac{7}{4} + \mathcal{X}_{f^{-1}\left(\left[\frac{8}{4},\infty\right[\right)} \cdot \frac{8}{4} \end{aligned}$$

and the simple integral becomes

$$\begin{aligned} \int^S f_2 d\mu &= \frac{0}{4} \cdot \mu\left(f^{-1}\left(\left[0,\frac{1}{4}\right[\right)\right) + \frac{1}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{1}{4},\frac{2}{4}\right[\right)\right) + \frac{2}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{2}{4},\frac{3}{4}\right[\right)\right) + \frac{3}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{3}{4},\frac{4}{4}\right[\right)\right) + \\ &\quad \frac{4}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{4}{4},\frac{5}{4}\right[\right)\right) + \frac{5}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{5}{4},\frac{6}{4}\right[\right)\right) + \frac{6}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{6}{4},\frac{7}{4}\right[\right)\right) + \frac{7}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{7}{4},\frac{8}{4}\right[\right)\right) + \\ &\quad \frac{8}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{8}{4},\infty\right[\right)\right) \end{aligned}$$

which is illustrated in the below figure

Figure 20.7. f apprimated by f_2

Note 20.399. For the integral $\int^S f_2 d\mu$ to make sense the sets $f^{-1}\left[\frac{k-1}{2^n}, \frac{k}{2^n}\right[$ must be measurable, which is the reason why we must require that f is measurable. The above figure suggest that the surface beneath f is aproximated from below by a increasing sequence $\int^S f_n d\mu$ this will provides us with a alternative definition for $\int^+ \mathrm{f} d\mu$.

Theorem 20.400. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space and $\{f_k\}_{k\in\mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ such that*

$$\forall x \in X \text{ we have } f_k(x) \leqslant f_{k+1}(x)$$

and

$$\lim_{k\to\infty} f_k \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

then

$$\lim_{k\to\infty} \int^S f_k \, d\mu \text{ exist}$$

and

$$\int^+ \left(\lim_{k\to\infty} f_k\right) d\mu = \sup\left(\left\{\int^{\mathcal{S}} f_k \, d\mu | k \in \mathbb{N}\right\}\right) = \lim_{k\to\infty} \int^S f_k \, d\mu \underset{\text{[theorem: 20.395]}}{=} \lim_{n\to\infty} \int^+ f_n \, d\mu$$

***Note* 20.401.** *As $\forall x \in X$ we have $\forall k \in \mathbb{N}$ $f_k(x) \leqslant f_{k+1}(x)$ we have by [theorem: 20.89] that $\lim_{k\to\infty} f_k(x)$ exist, as is needed for the requirements of this theorem.*

Proof. As $\forall x \in X$ we have $\forall k \in \mathbb{N}$ $f_k(x) \leqslant f_{k+1}(x)$ we have by [theorem: 20.89] that

$$\forall x \in X \text{ we have } \lim_{k\to\infty} f_k(x) \text{ exists and } \lim_{k\to\infty} f_k(x) = \sup\left(\{f_k(x) | k \in \mathbb{N}\}\right) \tag{20.512}$$

so that

$$\forall x \in X \text{ we have } \forall k \in \mathbb{N} \text{ that } f_k(x) \leqslant \lim_{k\to\infty} f_k(x) \tag{20.513}$$

Further using [theorem: 20.384] we have that $\forall k \in \mathbb{N}$ $\int^S f_k \, d\mu \leqslant \int^S f_{k+1} \, d\mu$ which by [theorem: 20.89] proves that

$$\lim_{k\to\infty} \int^S f_k \, d\mu \text{ exists and } \lim_{k\to\infty} \int^S f_k \, d\mu = \sup\left(\left\{\int^S f_k \, d\mu | k \in \mathbb{N}\right\}\right) \tag{20.514}$$

So that

$$\forall k \in \mathbb{N} \text{ we have } \int^S f_k \, d\mu \leqslant \lim_{k\to\infty} \int^S f_k d\mu \tag{20.515}$$

Let $k \in \mathbb{N}$. As by [eq: 20.513] $\forall x \in X\ f_k(x) \leqslant \lim_{k\to\infty} f_k(x) = \left(\lim_{k\to\infty} f_k\right)(x)$ and $f_k \in S^+[X, \mathcal{A}]$ we have that $\int^S f_k\, d\mu \in \left\{\int^S g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X\ g(x) \leqslant \left(\lim_{k\to\infty} f_k\right)(x)\right\}$ so that

$$\int^S f_k\, d\mu \leqslant \sup\left(\left\{\int^S g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X\ g(x) \leqslant \left(\lim_{k\to\infty} f_k\right)(x)\right\}\right)$$

hence we have by [definition: 20.390] that

$$\forall k \in \mathbb{N} \int^S f_k\, d\mu \leqslant \int^+ \left(\lim_{k\to\infty} f_k\right) d\mu \tag{20.516}$$

So $\sup\left(\left\{\int^S f_k\, d\mu | k \in \mathbb{N}\right\}\right) \leqslant \int^+ \left(\lim_{k\to\infty} f_k\right) d\mu$ which by [eq: 20.514] proves that

$$\lim_{k\to\infty} \int^S f_k\, d\mu \leqslant \int^+ \left(\lim_{k\to\infty} f_k\right) d\mu \tag{20.517}$$

For the opposite inequality let $g \in \mathcal{S}^+[X, \mathcal{A}]$ be such that $\forall x \in X\ g(x) \leqslant \left(\lim_{k\to\infty} f_k\right)(x) = \lim_{k\to\infty} f_k(x)$. Using [theorem: 20.384] it follows then that

$$\forall k \in \mathbb{N}\ g \wedge f_k \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \int^S (g \wedge f_k)\, d\mu \leqslant \int^S f_k\, d\mu \tag{20.518}$$

Let $x \in X$ then given $k \in \mathbb{N}$ we have

$$(g \wedge f_k)(x) = \min(g(x), f_k(x)) \leqslant \min(g(x), f_{k+1}(x)) = (g \wedge f_{k+1})(x) \tag{20.519}$$

so that by [theorem: 20.89]

$$\lim_{k\to\infty} (g \wedge f_k)(x) \text{ exists and } \lim_{k\to\infty} (g \wedge f_k)(x) = \sup(\{(g \wedge f_k)(x) | k \in \mathbb{N}\}) \tag{20.520}$$

As $\forall k \in \mathbb{N}\ (g \wedge f_k)(x) = \min(g(x), f_k(x)) g(x)$ we have that

$$\sup(\{(g \wedge f_k)(x) | k \in \mathbb{N}\}) \leqslant g(x) \tag{20.521}$$

As $g(x) \leqslant \left(\lim_{k\to\infty} f_k\right)(x)$ we have for $g(x)$ either:

$g(x) = \left(\lim_{k\to\infty} f_k\right)(x)$. Then $g(x) \underset{\text{[eq: 20.512]}}{=} \sup(\{f_k(x) | k \in \mathbb{N}\})$ so that $\forall k \in \mathbb{N}$ we have $f_k(x) \leqslant g(x)$ hence $(g \wedge f_k)(x) = \min(g(x), f_k(x)) = f_k(x)$ which proves that

$$\sup(\{(g \wedge f_n)(x) | k \in \mathbb{N}\}) = \sup(\{f_k(x) | k \in \mathbb{N}\}) \underset{\text{[eq: 20.512]}}{=} g(x) = \left(\lim_{k\to\infty} f_k\right)(x) = g(x)$$

$g(x) < \left(\lim_{k\to\infty} f_k\right)(x)$. Then by [eq: 20.512] $g(x) < \sup(\{f_k(x) | k \in \mathbb{N}\})$ so that there exist a $k \in \mathbb{N}$ such that $g(x) < f_k(x)$ hence $(g \wedge f_k)(x) = \min(g(x), f_k(k)) = g(x)$. Hence $g(x) \in \{(g \wedge f_n)(x) | k \in \mathbb{N}\}$ so that $g(x) \leqslant \sup(\{(g \wedge f_n)(x) | k \in \mathbb{N}\})$ which by [eq: 20.521] proves that

$$g(x) = \sup(\{(g \wedge f_k)(x) | k \in \mathbb{N}\})$$

So in all cases $g(x) = \sup(\{(g \wedge f_k)(x) | k \in \mathbb{N}\})$ which by [eq: 20.520] proves $\lim_{k\to\infty} (g \wedge f_k)(x) = g(x)$ hence

$$\lim_{k\to\infty} (g \wedge f_k) = g \in \mathcal{S}^+[X, \mathcal{A}[\tag{20.522}$$

The above and [eq: 20.519] allows us to apply [theorem: 20.386] to get that

$$\lim_{k\to\infty} \int^S (g \wedge f_k)\, d\mu \text{ exists and } \lim_{k\to!} \int^S (g \wedge f_k)\, d\mu = \int^S \left(\lim_{k\to\infty} (g \wedge f_k)\right) d\mu = \int^S g d\mu \tag{20.523}$$

By [eq: 20.518] $\int^S (g \wedge f_k)\, d\mu \leqslant \int^S f_k\, d\mu$ so that by [theorem: 20.82] we have

$$\lim_{k\to\infty} \int^S (g \wedge f_k)\, d\mu \leqslant \lim_{k\to\infty} \int^S f_k\, d\mu$$

Combining this with [eq: 20.523] gives $\int^S g d\mu \leqslant \int^S f_k \, d\mu$ hence

$$\int^S g d\mu \leqslant \lim_{k\to\infty} \int^S f_k \, d\mu$$

So $\int^S f_k \, d\mu$ is a upper bound for $\left\{\int^S g d\mu | g \in \mathcal{S}^+[X,\mathcal{A}] \text{ with } g(x) \leqslant \left(\lim_{k\to\infty} f_k\right)(x)\right\}$ proving that

$$\sup\left(\left\{\int^S g d\mu | g \in \mathcal{S}^+[X,\mathcal{A}] \text{ with } g(x) \leqslant \left(\lim_{k\to\infty} f_k\right)(x)\right\}\right) \leqslant \lim_{k\to\circ} \int^S f_k \, d\mu$$

As $\int^+ \left(\lim_{k\to\infty} f_k\right) d\mu = \sup\left(\left\{\int^S g d\mu | g \in \mathcal{S}^+[X,\mathcal{A}] \text{ with } g(x) \leqslant \left(\lim_{k\to\infty} f_k\right)(x)\right\}\right)$ we have that

$$\int^+ \left(\lim_{k\to\infty} f_k\right) d\mu \leqslant \lim_{k\to\circ} \int^S f_k \, d\mu$$

Combining this with [eq: 20.517] proves that

$$\int^+ \left(\lim_{k\to\infty} f_k\right) d\mu = \lim_{k\to\infty} \int^S f_k \, d\mu \underset{\text{[eq: 20.514]}}{=} \sup\left(\left\{\int^S f_k \, d\mu | k \in \mathbb{N}\right\}\right) \qquad \square$$

Next we state a alternative way to define the integral $\int^+$. The benefit of this alternative definition is that it is based on a limiting process making it easier to lift properties of $\int^S$ to $\int^+$. In this theorem the measurability of f is a requirement.

Theorem 20.402. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space and $f: X \to \overline{\mathbb{R}}$ such that $f \in \mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}]$ then there exist a sequence $\{f_n\}_{n\in\mathbb{N}} \subseteq \mathcal{S}^+[X,\mathcal{A}]$ such that*

$$\forall x \in X \text{ we have } \forall n \in \mathbb{N} \text{ that } f_n(x) \leqslant f_{n+1}(x)$$

and

$$\forall x \in X \text{ we have } \lim_{n\to\infty} f_n(x) \text{ exists and } f(x) = \lim_{n\to\infty} f_n(x) = \sup\left(\{f_n(x) | n \in \mathbb{N}\}\right)$$

and

$$\lim_{n\to\infty} \int^S f_n \, d\mu \text{ exist and } \int^+ f d\mu = \lim_{n\to\infty} \int^S f_n \, d\mu = \sup\left(\left\{\int^S f_n \, d\mu | n \in \mathbb{N}\right\}\right)$$

Proof. Using [theorem: 20.398] there exists a $\{f_n\}_{n\in\mathbb{N}} \subseteq \mathcal{S}^+[X,\mathcal{A}]$ such that $\forall x \in X$ we have $\forall n \in \mathbb{N}$ $f_n(x) \leqslant f_{n+1}(x)$ and $\lim_{n\to\infty} f_n(x) = f(x) = \sup\left(\{f_n(x) | n \in \mathbb{N}\}\right) \Rightarrow f = \lim_{n\to\infty} f_n$. Using this result together with the previous theorem [theorem: 20.400] proves that $\lim_{n\to\infty} \int^S f_n \, d\mu$ exists and

$$\int^+ f d\mu = \int^+ \left(\lim_{n\to\infty} f_n\right) d\mu = \lim_{n\to\infty} \int^S f_n \, d\mu \qquad \square$$

We prove now that $\int^+$ has similar properties as $\int^S$.

Theorem 20.403. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space and $f \in \mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}]$ such that $f = 0$ μ-a.e. then $\int^+ f d\mu = 0$.*

Proof. As $f = 0$ μ-a.e. there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$\{x \in X | 0 < f(x)\} \underset{f(X)\overline{\subseteq}[0,\infty]}{=} \{x \in X | 0 \neq f(x)\} \subseteq N$$

Let $g \in \mathcal{S}^+[X,\mathcal{A}]$ be such that $\forall x \in X$ $g(x) \leqslant f(x)$. Then for

$$x \in \{x \in X | g(x) \neq 0\} \underset{g(X)\overline{\subseteq}[0,\infty[}{=} \{x \in X | 0 < g(x)\}$$

we have $0 < g(x) \leqslant f(x)$ so that $x \in \{x \in X | 0 < f(x)\} \subseteq N$. Hence $\{x \in X | g(x) \neq 0\} \subseteq N$ which proves that $g = 0$ μ-a.e., applying then [theorem: 20.384 (5)] results in $\int^S g d\mu = 0$. So we have proved that

$$\left\{\int^S g d\mu | g \in \mathcal{S}^+[X,\mathcal{A}] \text{ with } \forall x \in X g(x) \leqslant f(x)\right\} = \{0\}$$

Hence

$$\int^{+} f d\mu = \sup\left(\int g d\mu | g \in \mathcal{S}^{+}[X, \mathcal{A}] \text{ with } \forall x \in X g(x) \leqslant f(x)\right) = 0 \qquad \square$$

Theorem 20.404. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space and let $f, g \in \mathcal{M}^{+}[X, \mathcal{A}, \overline{\mathbb{R}}]$ such that $f = g$ μ-a.e. then*

$$\int^{+} f d\mu = \int^{+} g d\mu$$

Proof. Define

$$H = \{x \in X | f(x) \neq g(x)\} = \{f \neq g\}$$

As f, g are $\mathcal{A}$-measurable we have by [theorem: 20.337] that $H \in \mathcal{A}$. Further as $f = g$ μ=a.e. there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $H \subseteq N$ hence $\mu(H) \leqslant \mu(N) = 0$. Summarized we have

$$H \in \mathcal{A} \text{ and } \mu(H) = 0 \tag{20.524}$$

Define

$$h: X \to [0, \infty] \text{ by } h(x) = \begin{cases} \infty \text{ if } x \in H \\ 0 \text{ if } x \in X \setminus H \end{cases}$$

Let $x \in \mathbb{R}$ then we have either:

$0 \leqslant x$. Then if $t \in \{h > x\}$ we have $h(t) > x \geqslant 0$ so that $x \in H$ [otherwise $h(t) = 0 \not> 0$] so that $\{h > x\} \subseteq H$. If $t \in H$ then $h(t) = \infty > x$ so that $H \subseteq \{h > x\}$. Summarized we have

$$\{h > x\} = H \in \mathcal{A}$$

$x < 0$. Then if $t \in X$ we have either $t \in H$ so that $h(t) = \infty > x$ or $t \in X \setminus H$ giving $h(t) = 0 > x$, hence $X \subseteq \{h > x\} \subseteq X$ proving

$$\{h > x\} = X \in \mathcal{A}$$

As in all cases we have $\{h > x\} \in \mathcal{A}$ and $x \in \mathbb{R}$ was choosen arbitrary it follows that

$$h \text{ is } \mathcal{A}\text{-measurable or } h \in \mathcal{M}^{+}[X, \mathcal{A}, \overline{\mathbb{R}}] \tag{20.525}$$

Let $n \in \mathbb{N}$ and define $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{A}$ by $H_1 = H \underset{\text{[eq: 20.524]}}{\in} \mathcal{A}$ and $\{a_i\}_{i \in \{1\}}$ where $a_1 = n$ so that by [theorem: 20.376]

$$h_n = n \cdot \mathcal{X}_H = \sum_{i=1}^{1} a_i \cdot \mathcal{X}_{A_i} \in \mathcal{S}^{+}[X, \mathcal{A}] \text{ and } \int^{S} h_n d\mu = n \cdot \mu(H) \underset{\text{[eq: 20.524]}}{=} 0 \tag{20.526}$$

Further we have

$$\forall n \in \mathbb{N}, \forall x \in X \text{ that } h_n(x) = \begin{cases} n \text{ if } x \in H \\ 0 \text{ if } x \in X \setminus H \end{cases} \leqslant \begin{cases} n+1 \text{ if } x \in H \\ 0 \text{ if } x \in X \setminus H \end{cases} = h_{n+1}(x) \tag{20.527}$$

Let $x \in X$ then we have either:

$x \in H$. Then $\lim_{n \to \infty} h_n(x) = \lim_{n \to \infty} n \underset{\text{[theorem: 20.79]}}{=} \infty = h(x)$.

$x \in X \setminus H$. Then $\lim_{n \to \infty} h_n(x) = \lim_{n \to \infty} 0 = 0 = h(x)$

proving that $\lim_{n \to \infty} h_n(x) = h(x)$. This fact together with [eqs: 20.526 and 20.527] allows us to use [theorem: 20.400] giving

$$\lim_{n \to \infty} \int^{S} h_n \, d\mu \text{ exist and } \int^{+} h d\mu = \lim_{n \to \infty} \int^{S} h_n d\mu \underset{\text{[eq: 20.526]}}{=} \lim_{n \to \infty} 0 = 0 \tag{20.528}$$

Further if we look again at the possibilities of $x \in X$ we have

$x \in H$. Then $h(x) = \infty$ so that $g(x) + h(x) = g(x) + \infty = \infty \geqslant f(x)$ and $g(x) \leqslant \infty = f(x) + \infty = f(x) + h(x)$ so that $f(x) \leqslant g(x) + h(x)$ and $g(x) \leqslant f(x) + h(x)$.

$x \in X \setminus H$. Then $f(x) = g(x) = g(x) + 0 = g(x) + f(x)$ and $g(x) = f(x) = f(x) + 0 = f(x) + h(x)$

So in all cases we have $f(x) \leqslant g(x) + h(x) \wedge g(x) \leqslant f(x) + h(x)$. Using [theorem: 20.405] we have that

$$\int^+ f d\mu \leqslant \int^+ g d\mu + \int^+ h d\mu \underset{\text{[eq: 20.528]}}{=} \int^+ g d\mu$$

and

$$\int^+ g d\mu \leqslant \int^+ f d\mu + \int^+ h d\mu \underset{\text{[eq: 20.528]}}{=} \int^+ f d\mu$$

which proves that

$$\int^+ f d\mu = \int^+ f d\mu$$

□

Theorem 20.405. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f, g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then we have*

1. *$\forall \alpha \in [0, \infty[$ we have $\alpha \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $\int^+ (\alpha \cdot f) d\mu = \alpha \cdot \int^+ f d\mu$.*
2. *$f + g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $\int^+ (f + g) d\mu = \int^+ f d\mu + \int^+ g d\mu$.*
3. *If $\forall x \in X$ we have $f(x) \leqslant g(x)$ then $\int^+ f d\mu \leqslant \int^+ g d\mu$*

Proof. First using [theorem: 20.402] there exists $\{f_n\}_{n \in \mathbb{N}}, \{g_n\}_{n \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ such that $\forall x \in X$ we have $\forall n \in \mathbb{N}$ that $f_n(x) \leqslant f_{n+1}(x)$, $g_n(x) \leqslant g_{n+1}(x)$ and

$$f = \lim_{n \to \infty} f_n,\ g = \lim_{n \to \infty} g_n,\ \int^+ f d\mu = \lim_{n \to \infty} \int^S f_n \, d\mu \text{ and } \int^+ g d\mu = \lim_{n \to \infty} \int^S g_n \, d\mu \tag{20.529}$$

then we have:

1. Using [theorems: 20.344, 20.384] and the fact that $0 < \alpha$ it follows that

$$\alpha \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \{\alpha \cdot f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$$

Given $x \in X$ we have

$$\forall n \in \mathbb{N} \text{ we have } (\alpha \cdot f_n)(x) = \alpha \cdot f_n(x) \underset{0 < \alpha}{\leqslant} \alpha \cdot f_n(x) = (\alpha \cdot f_{n+1})(x)$$

and

$$\begin{aligned}
(\alpha \cdot f)(x) &= \alpha \cdot f(x) \\
&\underset{\text{[eq: 20.529]}}{=} \alpha \cdot \lim_{n \to \infty} f_n(x) \\
&\underset{\text{[theorem: 20.82]}}{=} \lim_{n \to \infty} (\alpha \cdot f_n(x)) \\
&= \lim_{n \to \infty} (\alpha \cdot f_n)(x)
\end{aligned}$$

Hence using [theorem: 20.400] we have that $\lim_{n \to \infty} \int^S (\alpha \cdot f_n) \, d\mu$ exists and

$$\begin{aligned}
\int^+ (\alpha \cdot f) \, d\mu &= \lim_{n \to \infty} \int^S (\alpha \cdot f_n) \, d\mu \\
&\underset{\text{[theorem: 20.384]}}{=} \lim_{n \to \infty} \left(\alpha \cdot \int^S f_n \, d\mu \right) \\
&\underset{\text{[theorem: 20.82]}}{=} \alpha \cdot \lim_{n \to \infty} \int^S f_n \, d\mu \\
&\underset{\text{[eq: 20.529]}}{=} \alpha \cdot \int^+ f_n \, d\mu
\end{aligned}$$

2. Using [theorems: 20.338, 20.384] it follows that

$$f + g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \{f_n + g_n\}_{n \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$$

Given $x \in X$ we have

$$\forall n \in \mathbb{N} \text{ we have } (f_n + g_n)(x) = f_n(x) + g_n(x) \leqslant f_{n+1}(x) + g_{n+1}(x) = (f_{n+1} + g_{n+1})(x)$$

and

$$\begin{aligned}(f+g)(x) &= f(x)+g(x)\\ &\underset{\text{[eq: 20.529]}}{=} \lim_{n\to\infty} f_n(x)+\lim_{n\to\infty} g_n(x)\\ &\underset{\text{[theorem: 20.82]}}{=} \lim_{n\to\infty}(f_n(x)+g_n(x))\\ &= \lim_{n\to\infty}(f_n+g_n)(x)\end{aligned}$$

Hence using [theorem: 20.400] we have that $\lim_{n\to\infty}\int^S (f_n+g_n)\,d\mu$ exists and

$$\begin{aligned}\int^+ (f+g)\,d\mu &= \lim_{n\to\infty}\int^S (f_n+g_n)\,d\mu\\ &\underset{\text{[theorem: 20.384]}}{=} \lim_{n\to\infty}\left(\int^S f_n\,d\mu+\int^S g_n\,d\mu\right)\\ &\underset{\text{[theorem: 20.82]}}{=} \lim_{n\to\infty}\int^S f_n\,d\mu+\lim_{n\to\infty}\int^S g_n\,d\mu\\ &\underset{\text{[eq: 20.529]}}{=} \int^+ f_n\,d\mu+\int^+ g_n\,d\mu\end{aligned}$$

3. Assume that $\forall x\in X$ we have $f(x)\leqslant g(x)$. Let

$$h\in\left\{\int^S h\quad d\mu | h\in\mathcal{S}^+[X,\mathcal{A}]\wedge\forall x\in X \text{ we have } h(x)\leqslant f(x)\right\}$$

then $h\in\mathcal{S}^+[X,\mathcal{A}]$ and $\forall x\in X$ we have $h(x)\leqslant f(x)\leqslant g(x)$ so that

$$h\in\left\{\int^S h\quad d\mu | h\in\mathcal{S}^+[X,\mathcal{A}]\wedge\forall x\in X \text{ we have } h(x)\leqslant g(x)\right\}$$

Hence

$$\left\{\int^S h\quad d\mu | h\in\mathcal{S}^+[X,\mathcal{A}]\wedge\forall x\in X \text{ we have } h(x)\leqslant f(x)\right\}\subseteq$$
$$\left\{\int^S h\quad d\mu | h\in\mathcal{S}^+[X,\mathcal{A}]\wedge\forall x\in X \text{ we have } h(x)\leqslant g(x)\right\}$$

So

$$\begin{aligned}\int^+ f d\mu &\underset{\text{def}}{=} \sup\left(\left\{\int^S h\quad d\mu | h\in\mathcal{S}^+[X,\mathcal{A}]\wedge\forall x\in X \text{ we have } h(x)\leqslant g(x)\right\}\right)\\ &\underset{\text{[theorem: 3.77]}}{\leqslant} \sup\left(\left\{\int^S h\quad d\mu | h\in\mathcal{S}^+[X,\mathcal{A}]\wedge\forall x\in X \text{ we have } h(x)\leqslant g(x)\right\}\right)\\ &= \int^+ g d\mu\end{aligned}$$

□

Next we use induction to extend the last part of the previous theorem to a finite sum of measurable functions.

Theorem 20.406. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space, $n\in\mathbb{N}$ and $\{f_i\}_{\in\{1,\ldots,n\}}\subseteq\mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}]$ then*

$$\sum_{i=1}^n f_i\in\mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}]$$

and

$$\int^+\left(\sum_{i=1}^n f_i\right)d\mu=\sum_{i=1}^n\int^+ f_i\,d\mu$$

Proof. We use induction to prove this, so let

$$\mathcal{S}=\left\{n\in\mathbb{N}_0 | \text{If } \{f_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}] \text{ then } \sum_{i=1}^n f_i\in\mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}] \text{ and } \int^+\left(\sum_{i=1}^n f_i\right)d\mu=\sum_{i=1}^n\int^+ f_i\,d\mu\right\}$$

then we have:

$1 \in S$. Let $\{f_i\}_{i\in\{1,\dots,1\}} \subseteq \mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}]$ then $\sum_{i=1}^1 f_i = f_1 \in \mathcal{M}^+[X,\mathcal{A}]$ and $\int^+ (\sum_{i=1}^n f_i)\, d\mu = \int^+ f_1\, d\mu = \sum_{i=1}^1 \int^+ f_i\, d\mu$ proving that $1 \in \mathcal{S}$.

$n \in S \Rightarrow n+1 \in S$. Let $\{f_i\}_{i\in\{1,\dots,1\}} \subseteq \mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}]$ then as $n \in \mathcal{S}$ we have that $\sum_{i=1}^n f_i \in \mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}]$ hence

$$\sum_{i=1}^{n+1} f_i = \left(\sum_{i=1}^{n} f_i\right) + f_{n+1} \in \mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}] \quad \text{[using [theorem: 20.405 (2)]}$$

Further we have

$$\begin{aligned}
\int^+ \left(\sum_{i=1}^{n+1} f_i\right) d\mu &= \int^+ \left(\left(\sum_{i=1}^{n} f_i\right) + f_{n+1}\right) d\mu \\
&\underset{\text{[theorem: 20.405(2)]}}{=} \int^+ \left(\sum_{i=1}^{n} f_i\right) d\mu + \int^+ f_{n+1}\, d\mu \\
&\underset{n\in\mathcal{S}}{=} \left(\sum_{i=1}^{n} \int^+ f_i\, d\mu\right) + \int^+ f_{n+1}\, d\mu \\
&= \sum_{i=1}^{n+1} \int^+ f_i d\mu
\end{aligned}$$

proving that $n+1 \in \mathcal{S}$. □

Next we prove that every non negative function with a finite integral is μ-a.e. finite. First we need a lemma.

Lemma 20.407. *Let $\langle C,\mathcal{A},\mu\rangle$ be a measurable space, $t \in \mathbb{R}^+$ and $f \in \mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}]$ then for*

$$A_t = \{f \geqslant t\} \underset{\text{def}}{=} \{x \in X \,|\, f(x) \geqslant t\}$$

we have

$$\mu(A_t) \leqslant \frac{1}{t} \cdot \int_{A_t}^+ f d\mu \leqslant \frac{1}{t} \cdot \int^+ f d\mu$$

Proof. Consider the function $t \cdot \mathcal{X}_{A_i} = \sum_{i=1}^1 a_i \cdot \mathcal{X}_{A_i}$ where $a_1 = t \in \mathbb{R}^+$ and $A_1 = A_t$ then as $A_t = \{f \geqslant t\} \in \mathcal{A}$ [as f is $\mathcal{A}$-measurable] we have that

$$t \cdot \mathcal{X}_{A_t} \underset{\text{[theorem: 20.376]}}{\in} \mathcal{S}^+[X,\mathcal{A}] \text{ and } \int^+ (t \cdot \mathcal{X}_{A_i}) d\mu \underset{\text{def}}{=} \sum_{i=1}^{1} a_i \mu(A_i) = t \cdot \mu(A_t) < \infty \tag{20.530}$$

Let $x \in X$ then either

$x \in A_t$. then $0 < t \leqslant f(x)$ and as $\mathcal{X}_{A_t}(x) = 1$ we have $0 \leqslant t \cdot \mathcal{X}_{\mathrm{At}} \leqslant f(x) \cdot \mathcal{X}_{A_t} \leqslant f(x)$

$x \in X \setminus A_t$. then $\mathcal{X}_{A_t}(x) = 0$ so that trivially $0 \leqslant t \cdot \mathcal{X}_{A_t}(x) \leqslant f(x) \cdot \mathcal{X}_{A_t}(x) \leqslant f(x)$

hence in all cases we have $0 \leqslant t \cdot \mathcal{X}_{A_t} \leqslant f(x) \cdot \mathcal{X}_{A_t} \leqslant f(x)$ so that by [theorem: 20.405]

$$t \cdot \mu(A_i) \underset{\text{[eq: 20.530]}}{=} \int^+ (t \cdot \mathcal{X}_{A_t})\, d\mu \leqslant \int^+ \mathcal{X}_{A_t} \cdot f d\mu \leqslant \int^+ f d\mu$$

proving that

$$\mu(A_i) \leqslant \frac{1}{t} \cdot \int_{A_t}^+ f d\mu \leqslant \frac{1}{t} \cdot \int^+ f d\mu$$ □

Theorem 20.408. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space and $f \in \mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}]$ such that $\int^+ f d\mu < \infty$ then*

$$\mu(\{x \in X : f(x) = \infty\}) = 0$$

proving that

$$f \neq \infty \ \mu\text{-a.e.}$$

***Note* 20.409.** *Using [theorem: 20.337] we have that $\{x \in X \,|\, f(x) = \infty\} = \{f = \infty\} \in \mathcal{A}$ so that $\mu(\{x \in X \,|\, f(x) = \infty\})$ is well defined.*

Proof. Let $n \in \mathbb{N}_0$ then $\frac{1}{n} \in]0, \infty[$ so using the above lemma [see lemma: 20.407] we have that

$$\mu(\{x \in X \mid f(x) \geqslant n\}) \leqslant \frac{1}{n} \cdot \int^+ f d\mu$$

Now if $x \in \{x \in X \mid f(x) = \infty\}$ we have $n \leqslant \infty = f(x)$ so that $x \in \{x \in X \mid f(x) \geqslant n\}$ proving that

$$\{f = \infty\} = \{x \in X \mid f(x) = \infty\} \subseteq \{x \in X \mid f(x) \geqslant n\}$$

As $\{f = \infty\} \in \mathcal{A}$ [see theorem: 20.337] we have

$$\mu(\{x \in X \mid f(x) = \infty\}) \leqslant \{x \in X \mid f(x) \geqslant n\} \leqslant \frac{1}{n} \cdot \int^+ f d\mu$$

As n is chosen arbitrary and $0 \leqslant \int^+ f d\mu < \infty \Rightarrow$ we have by [theorem: 10.31] that

$$\mu(\{x \in X \mid f(x) = \infty\}) = 0$$

proving that

$$f \neq \infty \ \mu\text{-a.e.}$$

□

20.6.3 Measure integral

20.6.3.1 Definition of the measure integral

We extend now the integral $\int^+$ of non negative measurable functions to the measure integral $\int$ of measurable functions. To do this we write a measurable ffunction f as the difference of two non negative measurable functions f^+ and f^-, so $f = f^+ - f^-$ and define $\int f d\mu$ as $\int f d\mu = \int^+ f^+ \, d\mu - \int^+ f^- \, d\mu$. Of course this only works as $\int^+ f^+ \, d\mu - \int^+ f^- \, d\mu$ makes sense so we require that $\int^+ f^+ \, d\mu$, $\int^+ f^- \, d\mu$ are finite.

Definition 20.410. *Let X be a set and $f: X \to \overline{\mathbb{R}}$ a function then we define:*

1. $f^+: X \to \overline{\mathbb{R}}$ *by* $f^+(x) = \max(f(x), 0) \in [0, \infty]$
2. $f^-: X \to \overline{\mathbb{R}}$ *by* $f^-(x) = -\min(-f(x), 0) \in [0, \infty]$
3. $|f|: X \to \overline{\mathbb{R}}$ *by* $|f|(x) = |f(x)|$

***Note* 20.411.** *From the definition it follows that $f^+(X) \subseteq [0, \infty]$, $f^-(X) \subseteq [0, \infty]$ an $|f|(X) \subseteq [0, \infty]$.*

We have a alternative defintion for f^+, f^- and $|f|$.

Theorem 20.412. *Let X be a set and $f: X \to \overline{\mathbb{R}}$ a function then we have*

1. $f^+ = f \vee C_0$
2. $f^- = -(f \wedge C_0)$
3. $|f| = f^+ + f^-$
4. $\forall x \in X \ (f^+(x), f^-(x)) \in = \overline{\mathbb{R}} \times \overline{\mathbb{R}} \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ *so that $f^+ - f^-$ is well defined and*

$$f = f^+ - f^-$$

Proof.

1. Let $x \in X$ then $f^+(x) = \max(f(x), 0) = \max(f(x), C_0(x)) = (f \vee C_0)(x)$. proving that

$$f^+ = f \vee C_0$$

2. Let $x \in X$ then $f^-(x) = -\min(f(x), 0) = -\min(f(x), C_0(x)) = -(f \wedge C_0)(x) = (-(f \wedge C_0))(x)$ proving that

$$f^- = -(f \wedge C_0)$$

3. Let $x \in X$ then for $f(x)$ we have either:

   $\boldsymbol{0 \leqslant f(x)}$**.** Then

$$\begin{aligned}(f^+ + f^-)(x) &= f^+(x) + f^-(x) \\ &= \max(f(x), 0) + (-\min(f(x), 0)) \\ &= f(x) + (-0) \\ &= f(x) \\ &= |f(x)| \\ &= |f|(x)\end{aligned}$$

   $\boldsymbol{f(x) < 0}$**.** Then

$$\begin{aligned}(f^+ + f^-)(x) &= f^+(x) + f^-(x) \\ &= \max(f(x), 0) + (-\min(f(x), 0)) \\ &= 0 + (-f(x)) \\ &= -f(x) \\ &= |f(x)| \\ &= |f|(x)\end{aligned}$$

   which proves that

$$|f| = f^+ + f^-$$

4. Let $x \in X$ then we have the following cases for $f(x)$

   $\boldsymbol{f(x) = \infty}$**.** Then

$$f^+(x) = \max(f(x), 0) = \max(\infty, 0) = \infty = f(x)$$

   and

$$f^{-1}(x) = -\min(f(x), 0) = -\min(\infty, 0) = 0$$

   so that $(f^+(x), f^{-1}(x)) = (\infty, 0) \in \overline{\mathbb{R}} \times \overline{\mathbb{R}} \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ and

$$(f^+ - f^-)(x) = f^+(x) - f^-(x) = f(x) - 0 = f(x)$$

   $\boldsymbol{f(x) = -\infty}$**.** Then

$$f^+(x) = \max(f(x), 0) = \max(-\infty, 0) = 0$$

   and

$$f^{-1}(x) = -\min(f(x), 0) = -\min(-\infty, 0) = \infty$$

   so that $(f^+(x), f^{-1}(x)) = (0, \circ) \in \overline{\mathbb{R}} \times \overline{\mathbb{R}} \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ and

$$(f^+ - f^-)(x) = f^+(x) - f^-(x) = 0 - \infty = -\infty = f(x)$$

   $\boldsymbol{f(x) \in \mathbb{R}}$**.** Then for $f(x)$ we have either:

      $\boldsymbol{f(x) < 0}$**.** Then we have

$$f^+(x) = \max(f(x), 0) = 0$$

      and

$$f^-(x) = -\min(f(x), 0) = -f(x)$$

      so that $(f^+(x), f^-(x)) = (0, -f(x)) \in \overline{\mathbb{R}} \times \overline{\mathbb{R}} \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ and

$$(f^+ - f^-)(x) = f^+(x) - f^{-1}(x) = 0 - (-f(x)) = f(x)$$

      $\boldsymbol{0 \leqslant f(x)}$**.** Then we have

$$f^+(x) = \max(f(x), 0) = f(x)$$

and

$$f^-(x) = -\min(f(x), 0) = -0 = 0$$

so that $(f^+(x), f^-(x)) = (f(x), 0) \in \overline{\mathbb{R}} \times \overline{\mathbb{R}} \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ and

$$(f^+ - f^-)(x) = f^+(x) - f^{-1}(x) = f(x) - 0 = f(x)$$

So in all cases we have have $(f^+(x), f^-(x)) = (f(x), 0) \in \overline{\mathbb{R}} \times \overline{\mathbb{R}} \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ and $(f^+ - f^-)(x) = f(x)$. Hence

$$f = f^+ - f^-$$

□

Theorem 20.413. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then we have*

$$f^+ \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}],\ f^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } |f| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Proof. As $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $C_0 \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ [see example: 20.314] it follows from [theorems: 20.346, 20.344 and 20.412] that

$$f^+ = f \vee C_0 \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } f^- = -(f \wedge C_0) \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

By [theorem: 20.338] and the above that

$$|f| = f^+ + f^- \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

As also $f^+(X), f^-(X), |f|(X) \subseteq [0, \infty]$ it follows that

$$f^+ \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}],\ f^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } |f| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

□

Theorem 20.414. *Let X be a set and $f: X \to \overline{\mathbb{R}}$, $g: X \to \overline{\mathbb{R}}$ be functions then we have:*

1. *If $\alpha \in [0, \infty[$ then $(\alpha \cdot f)^+ = \alpha \cdot f^+$ and $(\alpha \cdot f)^- = \alpha \cdot f^{-1}$*
2. *If $\alpha \in]-\infty, 0]$ then $(\alpha \cdot f)^+ = -\alpha \cdot f^-$ and $(\alpha \cdot f)^- = -\alpha \cdot f^+$*
3. *If $f(x) \subseteq \mathbb{R} \wedge g(x) \subseteq \mathbb{R}$ then we have $\forall x \in X$ that*
   a. $(f+g)^+(x) \leqslant f^+(x) + g^+(x) \leqslant (f^+ + g^+)(x)$
   b. $(f+g)^-(x) \leqslant f^-(x) + g^-(x) \leqslant (f^- + g^-)(x)$
4. *$\forall x \in X$ we have $f^+(x) \leqslant |f(x)|$ and $f^-(x) \leqslant |f(x)|$*
5. *If $A \subseteq X$ then $(f_{|A})^+ = (f^+)_{|A}$ and $(f_{|A})^- = (f^{-1})_{|A}$*
6. *If $X \subseteq Y$ then $(f_{X \uparrow Y})^+ = (f^+)_{|X \uparrow Y}$ and $(f_{X \uparrow Y})^- = (f^-)_{X \uparrow Y}$ [see definition: 20.329]*
7. *If $f(X) \subseteq [0, \infty]$ then $f = f^+$ and $f^- = C_0$*
8. *If $f(X) \subseteq [0, \infty]$ then $(f \cdot g)^+ = f \cdot g^+$ and $(f \cdot g)^- = f \cdot g^-$*
9. *If $A \subseteq X$ then $(f_{|A})^+ = (f^+)_{|A}$ and $(f_{|A})^- = (f^-)_{|A}$*

Proof.

1. Let $x \in X$ then we have either

   $\boldsymbol{f(x) \leqslant 0}$. then $\alpha \cdot f(x) \leqslant 0$

$$\begin{aligned}
(\alpha \cdot f)^+(x) &= (\alpha \cdot f)^+(x) \\
&= \max(\alpha \cdot f(x), 0) \\
&= 0 \\
&= \alpha \cdot 0 \\
&= \alpha \cdot \max(f(x), 0) \\
&= \alpha \cdot f^+(x)
\end{aligned}$$

and

$$\begin{aligned}(\alpha\cdot f)^{-1}(x) &= -\min(\alpha\cdot f(x),0)\\ &= -\alpha\cdot f(x)\\ &= \alpha\cdot(-f(x))\\ &= \alpha\cdot(-\min(f(x),0))\\ &= \alpha\cdot f^{-}(x)\end{aligned}$$

$\boldsymbol{0<f(x)}$**.** then $0<\alpha\cdot f(x)$

$$\begin{aligned}(\alpha\cdot f)^{+}(x) &= \max(\alpha\cdot f(x),0)\\ &= \alpha\cdot f(x)\\ &= \alpha\cdot\max(f(x),0)\\ &= \alpha\cdot f^{+}(x)\end{aligned}$$

and

$$\begin{aligned}(\alpha\cdot f)^{-}(x) &= -\min(\alpha\cdot f(x),0)\\ &= 0\\ &= \alpha\cdot 0\\ &= a\cdot(-\min(f(x),0))\\ &= \alpha\cdot f^{-}(x)\end{aligned}$$

2. Let $x\in X$ then for x we have either

$\boldsymbol{f(x)\leqslant 0}$**.** then $0\leqslant\alpha\cdot f(x)$

$$\begin{aligned}(\alpha\cdot f)^{+}(x) &= \max(\alpha\cdot f(x),0)\\ &= \alpha\cdot f(x)\\ &= \alpha\cdot\min(f(x),0)\\ &= -\alpha\cdot f^{-}(x)\end{aligned}$$

and

$$\begin{aligned}(\alpha\cdot f)^{-}(x) &= -\min(\alpha\cdot f(x),0)\\ &= 0\\ &= -\alpha\cdot 0\\ &= -\alpha\cdot\max(f(x),0)\\ &= -\alpha\cdot f^{+}(x)\end{aligned}$$

$\boldsymbol{0<f(x)}$**.** then $\alpha\cdot f(x)<0$

$$\begin{aligned}(a\cdot f)^{+}(x) &= \max(\alpha\cdot f(x),0)\\ &= 0\\ &= \alpha\cdot 0\\ &= \alpha\cdot(\min(f(x),0))\\ &= -\alpha\cdot f^{-}(x)\end{aligned}$$

and

$$\begin{aligned}(\alpha\cdot f)^{-}(x) &= -\min(\alpha\cdot f(x),0)\\ &= -\alpha\cdot f(x)\\ &= -\alpha\cdot\max(f(x),0)\\ &= -\alpha\cdot f^{+}(x)\end{aligned}$$

3. Let $x\in X$ then

a. As $f(x)\leqslant\max(f(x),0)=f^{+}(x)$ and $g(x)\leqslant\max(g(x),0)=g^{+}(x)$ we have

$$\begin{aligned}(f+g)(x) &= f(x)+g(x)\\ &\leqslant f^{+}(x)+g^{+}(x)\end{aligned}$$

which as $0 \leqslant f^+(x) + g^+(x)$ proves that $\max((f+g)(x), 0) \leqslant f^+(x) + g^+(x)$ so that

$$\begin{aligned}(f+g)^+(x) &= \max((f+g)(x), 0)\\ &\leqslant f^+(x) + g^+(x)\end{aligned}$$

b. Then $-f^-(x) = \min(f(x), 0) \leqslant f(x)$ and $-g^-(x) = \min(g(x), 0) \leqslant g(x)$ so that

$$\begin{aligned}-f^-(x) - g^-(x) &\leqslant f(x) + g(x)\\ &\leqslant (f+g)(x)\end{aligned}$$

which as $-f^-(x) - g^-(x) \leqslant 0$ proves that $-f^-(x) - g^-(x) \leqslant \min((f+g)(x), 0)$ so that

$$\begin{aligned}(f+g)^-(x) &= -\min((f+g)(x), 0)\\ &\leqslant f^-(x) + g^-(x)\end{aligned}$$

4. Let $x \in X$ then $f(x) \leqslant |f(x)|$ and $0 \leqslant |f(x)|$ so that $f^+(x) = \max(f(x), 0) \leqslant |f(x)|$. Further $-f(x) \leqslant |f(x)| \Rightarrow -|f(x)| \leqslant f(x)$ and $-|f(x)| \leqslant 0$ so that $\min(f(x), 0) \geqslant -|f(x)|$, hence $f^-(x) = -\min(f(x), 0) \leqslant |f(x)|$

5. Let $x \in A \subseteq X$ then $(f_{|A})^+(x) = \max(f_{|A}(x), 0) \underset{x \in A}{=} \max(f(x), 0) = f^+(x) \underset{x \in A}{=} (f^+)_{|B}(x)$ and $(f_{|A})^-(x) = -\min(f_{|A}(x), 0) \underset{x \in A}{=} -\min(f(x), 0) = f^-(x) \underset{x \in A}{=} (f^-)_{|A}(x)$ proving that

$$(f_{|A})^+ = (f^+)_{|A} \text{ and } (f_{|A})^- = (f^-)_{|A}$$

6. Let $x \in X \subseteq Y$ then we must consider two cases:

   $\boldsymbol{x \in X}$. then

$$\begin{aligned}(f_{X\uparrow Y})^+(x) &= \max((f_{X\uparrow Y})(x), 0)\\ &= \max(f(x), 0)\\ &= f^+(x)\\ &= (f^+(x))_{X\uparrow Y}\\ (f_{X\uparrow Y})^-(x) &= -\min((f_{X\uparrow Y})(x), 0)\\ &= -\min(f(x), 0)\\ &= f^-(x)\\ &= (f^-(x))_{X\uparrow Y}\end{aligned}$$

   $\boldsymbol{x \in X \setminus Y}$. then

$$\begin{aligned}(f_{X\uparrow Y})^+(x) &= \max(f_{X\uparrow Y}(x), 0)\\ &= \max(0, 0)\\ &= 0\\ &= (f^+(x))_{X\uparrow Y}\\ (f_{X\uparrow Y})^- &= -\min(f_{X\uparrow Y}(x), 0)\\ &= -\min(0, 0)\\ &= 0\\ &= (f^-(x))_{X\uparrow Y}\end{aligned}$$

   proing that in all cases $(f_{X\uparrow Y})^+(x) = (f^+(x))_{X\uparrow Y}$ and $(f_{X\uparrow Y})^-(x) = (f^-(x))_{X\uparrow Y}$. Hence

$$(f_{X\uparrow Y})^+ = (f^+)_{|X\uparrow Y} \text{ and } (f_{X\uparrow Y})^- = (f^-)_{|X\uparrow Y}$$

7. Let $x \in X$ then we have, as $f(X) \subseteq [0, \infty]$, that $0 \leqslant f(x)$ hence

$$f^+(x) = \max(f(x), 0) = f(x) \text{ and } f^-(x) = -\min(f(x), 0) = 0 = C_0(x)$$

   which proves that

$$f = f^+ \text{ and } f^- = C_0$$

8. Let $x \in X$ then for $g(x)$ we have either:

   $0 \leqslant g(x)$. Then as $0 \leqslant f(x)$ we have $0 \leqslant f(x) \cdot g(x) = (f \cdot g)(x)$ so that

$$\begin{aligned}
(f \cdot g)^+(x) &= \max((f \cdot g)(x), 0) \\
&= (f \cdot g)(x) \\
&= f(x) \cdot g(x) \\
&= f(x) \cdot \max(g(x), 0) \\
&= f(x) \cdot g^+(x) \\
&= (f \cdot g^+)(x) \\
(f \cdot g)^-(x) &= -\min((f \cdot g)(x), 0) \\
&= 0 \\
&= f(x) \cdot 0 \\
&= f(x) \cdot (-\min(g(x), 0)) \\
&= f(x) \cdot g^-(x) \\
&= (f \cdot g^-)(x)
\end{aligned}$$

   $g(x) < 0$. Then as $0 \leqslant f(x)$ we have $(f \cdot g)(x) = f(x) \cdot g(x) < 0$ so that

$$\begin{aligned}
(f \cdot g)^+(x) &= \max((f \cdot g)(x), 0) \\
&= 0 \\
&= f(x) \cdot 0 \\
&= f(x) \cdot \max(g(x), 0) \\
&= f(x) \cdot g^+(x) \\
&= (f \cdot g^+)(x) \\
(f \cdot g)^-(x) &= -\min((f \cdot g)(x), 0) \\
&= -(f \cdot g)(x) \\
&= f(x) \cdot (-g(x)) \\
&= f(x) \cdot (-\min(g(x), 0)) \\
&= f(x) \cdot g^-(x) \\
&= (f \cdot g^-)(x)
\end{aligned}$$

   Hence in all cases we have $(f \cdot g)^+ = f \cdot g^+$ and $(f \cdot g)^- = f \cdot g^-$

9. Let $x \in A \subseteq X$ then

$$(f_{|A})^+(x) = \max(f_{|A}(x), 0) \underset{x \in A}{=} \max(f(x), 0) = f^+(x) \underset{x \in A}{=} (f^+)_{|A}(x)$$

   and

$$(f_{|A})^-(x) = -\min(f_{|A}(x), 0) \underset{x \in A}{=} -\min(f(x), 0) = f^-(x) \underset{x \in A}{=} (f^-)_{|A}(x)$$

   proving that

$$(f_{|B})^+ = (f^+)_{|B} \text{ and } (f_{|B})^- = (f^-)_{|B}$$

□

We are ready now to the define the μ-measure integral and μ-integrable functions [the functions for which the μ-measure integral is defined].

Definition 20.415. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $f: X \to \overline{\mathbb{R}}$ is **μ-integrable** if*

$$f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ f^+ \, d\mu \in [0, \infty[, \ \int^+ f^- \, d\mu \in [0, \infty[$$

The set of all μ-integrable function graphs is noted as $\mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ hence

$$\mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] = \left\{ f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge \int^+ f^+ \, d\mu \in [0, \infty[\wedge \int^- f^- d\mu \in [0, \infty[\right\} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

and the set if all real valued μ-integrable function graphs is noted as $\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$ hence

$$\begin{aligned}\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}] &= \left\{f\in\mathcal{M}[X,\mathcal{A},\mu,\mathbb{R}]\wedge\int^{+}f^{+}d\mu\in[0,\infty[\wedge\int^{-}f^{-}d\mu\in[0,\infty[\right\}\\ &= \{f\in\mathcal{L}[X,\mathcal{A},\mu,\overline{\mathbb{R}}]|f(X)\subseteq\mathbb{R}\}\\ &\subseteq \mathcal{L}[X,\mathcal{A},\mu,\overline{\mathbb{R}}]\end{aligned}$$

If $f\in\mathcal{L}[X,\mathcal{A},\mu,\overline{\mathbb{R}}]$ then the measure integral $\int fd\mu$ is defined by

$$\int fd\mu=\int^{+}f^{+}d\mu-\int^{+}f^{-}d\mu\in[0,\infty[$$

***Note* 20.416.** *As $f\in\mathcal{M}[X,\mathcal{A},\overline{\mathbb{R}}]$ it follows from [theorem: 20.413] that $f^{+},f^{-}\in\mathcal{M}^{+}[X,\mathcal{A},\overline{\mathbb{R}}]$. Hence $\int^{+}f^{+}d\mu,\int^{-}f^{-}d\mu$ are well defined. Finally the condition $\int^{+}f^{+}d\mu,\int^{+}f^{-}d\mu\in[0,\infty[$ ensures that $\int^{+}f^{+}d\mu-\int^{+}f^{-}d\mu$ is well defined.*

***Note* 20.417.** *For the measure space $\langle\mathbb{R},\mathcal{L},\lambda\rangle$ and $\langle\mathbb{R}^{n},\mathcal{L}^{n},\lambda^{n}\rangle$ the measure integral is named the Lebesgue integral.*

Example 20.418. Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space then $C_0\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$ and $\int C_0d\mu=0$

Proof. Let $x\in X$ then $(C_0)^{+}(x)=\max(C_0(x),0)=0=C_0(x)$ and $(C_0)^{-}(x)=-\min(C_0(x),0)=0=C_0(x)$ so that

$$(C_0)^{+}=C_0=(C_0)^{-}$$

Hence we have $\int^{+}(C_0)^{+}d\mu=\int^{+}C_0d\mu\underset{\text{[example: 20.403]}}{=}0\underset{\text{[example: 20.403]}}{=}\int^{+}C_0d\mu=\int^{+}(C_0)^{-}d\mu=0$. As further $C_0\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$ [see theorem: 20.314] it follows that

$$C_0\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]\text{ and }\int C_0d\mu=0$$

□

We show now that $\int$ is a extension of $\int^{S}$ and almost a extension of $\int^{+}$ [we need a extra condition]

Theorem 20.419. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space then we have:*

1. *If $f\in\mathcal{S}^{+}[X,\mathcal{A}]$ then*
$$f\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]\text{ and }\int fd\mu=\int^{S}fd\mu$$
2. *If $f\in\mathcal{M}^{+}[X,\mathcal{A},\overline{\mathbb{R}}]$ such that $\int^{+}fd\mu<\infty$ then*
$$f\in\mathcal{L}[X,\mathcal{A},\mu,\overline{\mathbb{R}}]\text{ and }\int fd\mu=\int^{+}fd\mu$$
3. *If $f\in\mathcal{L}[X,\mathcal{A},\mu,\overline{\mathbb{R}}]$ and $f(X)\subseteq[0,\infty]$ then $f\in\mathcal{M}^{+}[X,\mathcal{A},\overline{\mathbb{R}}]$, $\int^{+}fd\mu<\infty$ and $\int fd\mu=\int^{+}fd\mu$*

Proof.

1. As $f\in\mathcal{S}^{+}[X,\mathcal{A}]$ we have that $f(X)\subseteq[0,\infty[$ and f is $\mathcal{A}$-measurable, hence $f\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$ further by [definition: 20.380]
$$\int^{S}fd\mu\in[0,\infty[$$
Further using [theorem: 20.414] we have
$$f^{+}=f\in\mathcal{S}^{+}[X,\mathcal{A}]\underset{\text{[theorem: 20.395]}}{\subseteq}\mathcal{M}^{+}[X,\mathcal{A},\mathbb{R}]\text{ and }f^{-}=C_0$$
then $\int^{+}f^{+}d\mu\underset{\text{[theorem: 20.395]}}{=}\int^{S}f^{+}d\mu\in[0,\infty[$ and $\int^{+}f^{-}d\mu\underset{\text{[theorem: 20.396]}}{=}0\cdot\mu(X)=0\in[0,\infty[$. So we have proved that
$$f\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]\text{ and }\int fd\mu=\int^{+}f^{+}d\mu-\int^{+}f^{-}d\mu=\int^{S}f^{+}d\mu-0\underset{f^{+}=f}{=}\int^{S}fd\mu$$

2. As $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have $f(X) \subset [0, \infty]$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. Further by [theorem: 20.414]
$$f^+ = f \text{ and } f^- = C_0$$
As $\int^+ f d\mu \in [0, \infty[$ and $\int^+ f^- d\mu = \int^+ C_0 d\mu \underset{\text{[theorem: 20.396]}}{=} 0 \cdot \mu(X) = 0 \in [0, \infty[$ it follows that
$$f \in \mathcal{L}[X, \mathcal{A}, \mu] \text{ and } \int f d\mu = \int^+ f^+ d\mu - \int^+ f^- d\mu = \int^+ f d\mu - 0 = \int^+ f d\mu$$
3. As $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $f(X) \subseteq [0, \infty]$ we have by definition that $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$, further from $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ we have also that $\int^+ f^+ d\mu < \infty$. So the conditions for (2) are satisfied so that $\int f d\mu = \int^+ f d\mu$. □

Definition 20.420. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $A \in \mathcal{A}$ then $f: X \to \overline{\mathbb{R}}$ is **μ-integrable over A** if*
$$f \cdot \mathcal{X}_A \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ (f^+ \cdot \mathcal{X}_A)\, d\mu \in [0, \infty[, \int^+ (f^- \cdot \mathcal{X}_A)\, d\mu \in [0, \infty[$$
The set of all μ-integrable function graphs is noted as $\mathcal{L}[A, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ hence
$$\mathcal{L}[A, \mathcal{A}, \mu, \overline{\mathbb{R}}] = \left\{ \mathcal{X}_A \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge \int^+ (\mathcal{X}_A \cdot f^+)\, d\mu \in [0, \infty[\wedge \int^- (\mathcal{X}_A \cdot f^-)\, d\mu \in [0, \infty[\right\}$$
If $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then the measure integral $\int_A f d\mu$ is defined by
$$\int_A f d\mu = \int^+ (\mathcal{X}_A \cdot f^+) d\mu - \int^+ (\mathcal{X}_A \cdot f^-) d\mu$$
*In other words **f is μ-integrable over A** if **$\mathcal{X}_A \cdot f$ is μ-integrable**.*

***Note* 20.421.** *As $\forall x \in X$ $(\mathcal{X}_X \cdot f)(x) = \mathcal{X}_X(x) \cdot f(x) = 1 \cdot f(x) = f(x)$ so that $\mathcal{X}_X \cdot f = f$, hence we have for $A = X$ that*
$$\begin{aligned} \mathcal{L}[A, \mathcal{A}, \mu, \overline{\mathbb{R}}] &= \\ \left\{ \mathcal{X}_A \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge \int^+ (\mathcal{X}_A \cdot f^+)\, d\mu \in [0, \infty[\wedge \int^- (\mathcal{X}_A \cdot f^-)\, d\mu \in [0, \infty[\right\} &= \\ \left\{ f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge \int^+ f^+ d\mu \in [0, \infty[\wedge \int^- f^-\, d\mu \in [0, \infty[\right\} &= \\ \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \end{aligned}$$
which is the reason why we use the notation $\mathcal{L}[A, \mathcal{A}, \mu, \overline{\mathbb{R}}]$.

Theorem 20.422. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $A \in \mathcal{A}$ then*
$$\mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \subseteq \mathcal{L}[A, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$
and for $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ we have that
$$\int_A f d\mu = \int (f \cdot \mathcal{X}_A) \cdot d\mu$$

Proof. Let $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $\int^+ f^+ d\mu, \int^+ f^- d\mu \in [0, \infty[$. As $A \in \mathcal{A}$ we have by [theorem: 20.353] that
$$\mathcal{X}_A \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \tag{20.531}$$
Let $x \in X$ then we have either:

$x \in A$. Then
$$(\mathcal{X}_A \cdot f^+)(x) = \mathcal{X}_A(x) \cdot f^+(x) = 1 \cdot f^+(x) = f^+(x)$$
$$(\mathcal{X}_A \cdot f^-)(x) = \mathcal{X}_A(x) \cdot f^-(x) = 1 \cdot f^-(x) = f^-(x)$$
so that
$$(\mathcal{X}_A \cdot f^+)(x) \leqslant f^+(x) \wedge (\mathcal{X}_A \cdot f^-)(x) \leqslant f^-(x)$$

$\boldsymbol{x \in X \setminus A}$. Then

$$(\mathcal{X}_A \cdot f^+)(x) = \mathcal{X}_A(x) \cdot f^+(x) = 0 \cdot f^+(x) = 0 \leqslant f^+(x)$$
$$(\mathcal{X}_A \cdot f^-)(x) = \mathcal{X}_A(x) \cdot f^-(x) = 0 \cdot f^-(x) = 0 \leqslant f^-(x)$$

so that

$$(\mathcal{X}_A \cdot f^+)(x) \leqslant f^+(x) \wedge (\mathcal{X}_A \cdot f^-)(x) \leqslant f^-(x)$$

hence in all cases we have

$$(\mathcal{X}_A \cdot f^+)(x) \leqslant f^+(x) \wedge (\mathcal{X}_A \cdot f^-)(x) \leqslant f^-(x)$$

Applying then [theorem: 20.405] we have that

$$0 \leqslant \int^+ (\mathcal{X}_A \cdot f^+) d\mu \leqslant \int^+ f^+ d\mu < \infty \text{ and } 0 \leqslant \int^+ (\mathcal{X}_A \cdot f^-) d\mu \leqslant \int^+ f^- d\mu < \infty \tag{20.532}$$

By [eq: 20.531, 20.532] it follows then that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

Let $x \in X$ then we have either:

$\boldsymbol{x \in A}$. Then

$$\begin{aligned}
(\mathcal{X}_A \cdot f)^+(x) &= \max((\mathcal{X}_A \cdot f)(x), 0) \\
&= \max(\mathcal{X}_A(x) \cdot f(x), 0) \\
&= \max(f(x), 0) \\
&= f^+(x) \\
&= \mathcal{X}_A(x) \cdot f^+(x) \\
&= (\mathcal{X}_A \cdot f^+)(x) \\
(\mathcal{X}_A \cdot f)^-(x) &= -\min((\mathcal{X}_A \cdot f)(x), 0) \\
&= -\min(\mathcal{X}_A(x) \cdot f(x), 0) \\
&= -\min(f(x), 0) \\
&= f^-(x) \\
&= \mathcal{X}_A(x) \cdot f^-(x) \\
&= (\mathcal{X}_A \cdot f^-)(x)
\end{aligned}$$

$\boldsymbol{x \in X \setminus A}$. Then

$$\begin{aligned}
(\mathcal{X}_A \cdot f)^+(x) &= \max((\mathcal{X}_A \cdot f)(x), 0) \\
&= \max(\mathcal{X}_A(x) \cdot f(x), 0) \\
&= \max(0, 0) \\
&= 0 \\
&= \mathcal{X}_A(x) \cdot f^+(x) \\
&= (\mathcal{X}_A \cdot f^+)(x) \\
(\mathcal{X}_A \cdot f)^-(x) &= -\min((\mathcal{X}_A \cdot f)(x), 0) \\
&= -\min(\mathcal{X}_A(x) \cdot f(x), 0) \\
&= -\min(0, 0) \\
&= 0 \\
&= \mathcal{X}_A(x) \cdot f^-(x) \\
&= (\mathcal{X}_A \cdot f^-)(x)
\end{aligned}$$

So we have

$$(\mathcal{X}_A \cdot f)^+ = \mathcal{X}_A \cdot f^+ \text{ and } (\mathcal{X}_A \cdot f)^- = \mathcal{X}_A \cdot f^-$$

hence

$$\int (\mathcal{X}_A \cdot f) d\mu = \int^+ (\mathcal{X}_A \cdot f)^+ d\mu + \int^+ (\mathcal{X}_A \cdot f)^- d\mu = \int^+ (\mathcal{X}_A \cdot f^+) d\mu + \int^+ (\mathcal{X}_A \cdot f^-) d\mu = \int_A f d\mu \qquad \square$$

20.6.3.2 Properties of the measure integral

Theorem 20.423. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ such that $f = 0$ μ-a.e. then $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ and $\int f d\mu = 0$*

Proof. As $f = 0$ μ-a.e. there exist a $N \in \boldsymbol{A}$ with $\mu(N) = 0$ such that

$$\{x \in X \,|\, f(x) \neq 0\} \subseteq N$$

Let $x \in \{x \in X \,|\, f^+(x) \neq 0\}$ then $\max(f(x), 0) \neq 0$ so tha $f(x) \neq 0$ or $x \in \{x \in X \,|\, f(x) \neq 0\} \subseteq \mathbb{N}$, hence $\{x \in X \,|\, f^+(x) \neq 0\} \subseteq N$ which proves that $f^+ = 0$ is μ-a.e.. Applying then [theorem: 20.403] proves that

$$\int^+ f^+ \, d\mu = 0 < \infty$$

If $x \in \{x \in X \,|\, f^-(x) \neq 0\}$ then $-\min(f(x), 0) \neq 0$ so that $f(x) \neq 0$ or $x \in \{x \in X \,|\, f(x) \neq 0\} \subseteq \mathbb{N}$, hence $\{x \in X \,|\, f^-(x) \neq 0\} \subseteq N$ which proves that f^- is μ-a.e.. Applying then [theorem: 20.403] proves that

$$\int^+ f^- \, d\mu = 0 < \infty$$

As $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $\int^+ f^+ d\mu, \int^+ f^- d\mu \subseteq [0, \infty[$ it follows that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

and

$$\int f d\mu \underset{\text{def}}{=} \int^+ f^+ \, d\mu - \int^+ f^- d\mu = 0 - 0 = 0$$

□

Theorem 20.424. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space and $f_1, g_1, f_2, g_2 \subseteq \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ such that $f_1(X)$, $g_1(X), f_2(X), g_2(X) \subseteq [0, \infty[$ and $f_1 - f_2 = g_1 - g_2$ then*

$$\int^+ f_1 d\mu - \int^+ f_2 d\mu = \int f_1 \, d\mu - \int f_2 d\mu = \int g_1 \, d\mu - \int g_2 \, d\mu = \int^+ g_1 \, d\mu - \int^+ g_2 \, d\mu$$

Proof. Let $x \in X$ then from $f_1 - f_2 = g_1 - g_2$ we have

$$\begin{aligned}
(f_1 - f_2)(x) = (g_1 - g_2)(x) \quad &\Rightarrow \quad f_1(x) - f_2(x) = g_1(x) - g_2(x) \\
&\underset{f_1(x), f_2(x), g_1(x), g_2(x) \in \mathbb{R}}{\Rightarrow} \quad f_1(x) + g_2(x) = f_2(x) + g_1(x) \\
&\Rightarrow \quad (f_1 + g_2)(x) = (f_2 + g_1)(x)
\end{aligned}$$

proving that

$$f_1 + g_2 = f_2 + g_1 \tag{20.533}$$

As $f_1, f_2, g_1, g_1 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ and $f_1(X), g_1(X), f_2(X), g_2(X) \subseteq [0, \infty[$ we have by [theorem: 20.419 (3)] that

$$\begin{aligned}
f_1, g_1, f_2, g_2 \quad &\in \quad \mathcal{M}^+[X, \mathcal{A}] \\
\int f_1 \, d\mu \quad &= \quad \int^+ f_1 \, d\mu < \infty && (20.534) \\
\int f_2 \, d\mu \quad &= \quad \int^+ f_2 \, d\mu < \infty && (20.535) \\
\int g_1 \, d\mu \quad &= \quad \int^+ g_1 \, d\mu < \infty && (20.536) \\
\int g_2 \, d\mu \quad &= \quad \int^+ g_2 \, d\mu < \infty && (20.537)
\end{aligned}$$

Using [theorem: 20.405] we have that

$$\int^+ f_1 d\mu + \int^+ g_2 \, d\mu = \int^+ (f_1 + g_2) \, d\mu \underset{\text{[eq: 20.533}}{=} \int^+ (f_2 + g_1) \, d\mu = \int^+ f_2 d\mu + \int^+ g_1 d\mu$$

So we have as the integrals are finite that

$$\int^+ f_1 \, d\mu - \int^+ f_2 \, d\mu \quad = \quad \int^+ g_1 d\mu - \int^+ g_2 \, d\mu$$

which combined with [eqs: 20.534, 20.275, 20.536 and 20.537] proves that

$$\int f_1\,d\mu - \int f_2\,d\mu \;=\; \int g_1 d\mu - \int g_2\,d\mu \qquad \square$$

Theorem 20.425. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space, $f,g\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$ then we have:*

1. $\forall\alpha\in\mathbb{R}\;\alpha\cdot f\in\mathcal{L}[X,\mathcal{A}.,\mu,\mathbb{R}]$ *and* $\int(\alpha\cdot f)d\mu=\alpha\cdot\int f d\mu$.
2. $f+g\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$ *and* $\int(f+g)d\mu=\int f d\mu+\int g d\mu$
3. $\forall x\in X\;f(x)\leqslant g(x)$ *then* $\int f d\mu\leqslant\int g d\mu$

Proof.

1. As $f\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$ we have that $f\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$ and $\int^+ f^+\,d\mu,\int^+ f^- d\mu\in[0,\infty[$. Using [theorem: 20.344] we have that

$$\alpha\cdot f\in\mathcal{M}[X,\mathcal{A},\mathbb{R}] \tag{20.538}$$

Consider the following cases for α

$\alpha=0$. Then $\alpha\cdot f=C_0$ so that by [note: 20.418] $\int(\alpha\cdot f)d\mu=0=\alpha\cdot\int f d\mu$.

$0<\alpha$. Then we have that

$$(\alpha\cdot f)^+ \underset{\text{[theorem: 20.414]}}{=} \alpha\cdot f^+ \text{ and } (\alpha\cdot f)^- \underset{\text{[theorem: 20.414]}}{=} \alpha\cdot f^- \tag{20.539}$$

so

$$\begin{aligned}\int^+(\alpha\cdot f)^+\,d\mu &= \int^+(\alpha\cdot f^+)\,d\mu\\ &\underset{\text{[theorem: 20.405]}}{=} \alpha\cdot\int^+ f^+\,d\mu<\infty \qquad (20.540)\\ \int^+(\alpha\cdot f)^-\,d\mu &= \int^+(\alpha\cdot f^-)\,d\mu\\ &\underset{\text{[theorem: 20.405]}}{=} \alpha\cdot\int^+ f^-\,d\mu<\infty \qquad (20.541)\end{aligned}$$

Using [eqs: 20.538, 20.540 and 20.541] it follows that

$$\alpha\cdot f \text{ is } \mu\text{-integrable}$$

and

$$\begin{aligned}\int(\alpha\cdot f)\,d\mu &= \int^+(\alpha\cdot f)^+\,d\mu-\int^+(\alpha\cdot f)^-\,d\mu\\ &\underset{\text{[eqs: 20.540, 20.541]}}{=} \alpha\cdot\int^+ f^+\,d\mu-\alpha\cdot\int^+ f^-\,d\mu\\ &= \alpha\cdot\left(\int^+ f^+ d\mu-\int^+ f^-\,d\mu\right)\\ &= \alpha\cdot\int f d\mu\end{aligned}$$

$\alpha<0$. Then we have that $-\alpha\in[0,\infty[$ and

$$(\alpha\cdot f)^- \underset{\text{[theorem: 20.414]}}{=} -\alpha\cdot f^- \text{ and } (\alpha\cdot f)^- \underset{\text{[theorem: 20.414]}}{=} -\alpha\cdot f^+ \tag{20.542}$$

so

$$\begin{aligned}\int^+(\alpha\cdot f)^+\,d\mu &= \int^+(-\alpha\cdot f^-)\,d\mu\\ &\underset{\text{[theorem: 20.405]}}{=} (-\alpha)\cdot\int^+ f^-\,d\mu<\infty \qquad (20.543)\\ \int^+(\alpha\cdot f)^-\,d\mu &= \int^+(-\alpha\cdot f^+)\,d\mu\\ &\underset{\text{[theorem: 20.405]}}{=} (-\alpha)\cdot\int^+ f^+\,d\mu<\infty \qquad (20.544)\end{aligned}$$

Using [eqs: 20.538, 20.543 and 20.544] it follows that

$$\alpha \cdot f \text{ is } \mu\text{-integrable}$$

and

$$\begin{aligned}
\int (\alpha \cdot f)\, d\mu &= \int^+ (\alpha \cdot f)^+ \, d\mu - \int^+ (\alpha \cdot f)^- \, d\mu \\
&\underset{\text{[eqs: 20.543, 20.544]}}{=} (-\alpha) \cdot \int^+ f^- \, d\mu - (-\alpha) \cdot \int^+ f^+ \, d\mu \\
&= \alpha \cdot \left(\int^+ f^+ d\mu - \int^+ f^- \, d\mu \right) \\
&= \alpha \cdot \int f d\mu
\end{aligned}$$

2. As $f, g \in \mathcal{L}[X, \mathcal{A}.\mu, \mathbb{R}]$ $f(X), g(X) \subseteq \mathbb{R}$ we have that

$$f + g \text{ is well defined, } f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \text{ and} \int^+ f^+ d\mu, \int^+ f^- d\mu, \int^+ g^+ d\mu, \int^+ g^{-1} d\mu$$

Using [theorem: 20.340] it follows that

$$f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

Further we have by [theorem: 20.414] that

$$\forall x \in X \ (f+g)^+(x) \leqslant f^+(x) + g^+(x) \text{ and } (f+g)^-(x) \leqslant f^-(x) + g^-(x)$$

so that we can apply [theorem: 20.405] giving

$$\int^+ (f+g)^+ d\mu \leqslant \int^+ (f^+ + g^+) d\mu \underset{\text{[theorem: 20.405]}}{=} \int^+ f^+ d\mu + \int^+ g^+ d\mu < \infty$$

$$\int^+ (f+g)^- d\mu \leqslant \int^+ (f^- + g^-) d\mu \underset{\text{[theorem: 20.405]}}{=} \int^+ f^- d\mu + \int^+ g^- d\mu < \infty$$

which proves that

$$f + g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

Next we have that

$$\begin{aligned}
(f+g)^+ - (f+g)^- &\underset{\text{[theorem: 20.412]}}{=} f + g \\
&\underset{\text{[theorem: 20.412]}}{=} (f^+ - f^-) + (g^+ - g^-) \\
&= (f^+ + g^+) - (f^- + g^-)
\end{aligned} \tag{20.545}$$

Finally

$$\begin{aligned}
\int (f+g) d\mu &\underset{\text{def}}{=} \int^+ (f+g)^+ d\mu - \int^+ (f+g)^- d\mu \\
&\underset{\text{[theorem: 20.424],[eq: 20.545]}}{=} \int^+ (f^+ + g^+) d\mu - \int^+ (f^- + g^-) d\mu \\
&\underset{\text{[theorem: 20.405]}}{=} \int^+ f^+ d\mu + \int^+ g^+ d\mu - \left(\int^+ f^- d\mu + \int^+ g^- d\mu \right) \\
&= \left(\int^+ f^+ d\mu - \int^+ f^- d\mu \right) + \left(\int^+ g^+ d\mu - \int^+ g^- d\mu \right) \\
&= \int f d\mu + \int g d\mu
\end{aligned}$$

3. As $f, g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$, $f(X), g(X) \subseteq \mathbb{R}$ and $-1 \in \mathbb{R}$ we have by (1) that $(-1) \cdot g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$, hence by (1) it follows that

$$f - g = f + (-1) \cdot g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \tag{20.546}$$

As $\forall x \in X\ f(x) \leqslant g(x) \Rightarrow (g-f)(x) = g(x) - f(x) \in [0,\infty]$ it follows from [theorem: 20.419] that

$$\int (g-f)d\mu = \int^{+} (g-f) \geqslant 0 \tag{20.547}$$

Further we have

$$\begin{aligned}
\int g d\mu - \int f d\mu &= \int g d\mu + (-1)\cdot \int f d\mu \\
&\underset{(1)}{=} \int g d\mu + \int ((-1)\cdot f) d\mu \\
&\underset{(2)}{=} \int (g + (-1)\cdot f) d\mu \\
&= \int (g-f) d\mu \\
&\underset{\text{[theorem 20.547]}}{\geqslant} 0
\end{aligned}$$

which proves that

$$\int f d\mu \leqslant \int g d\mu$$

□

We have now the following alternative definition for integrability.

Theorem 20.426. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space and $f: X \to \overline{\mathbb{R}}$ a function then*

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \Rightarrow |f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

$$f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^{+} |f| d\mu < \infty \Rightarrow f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

$$f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } |f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \text{ then } f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

Further if f is μ-integrable then

$$\left| \int f d\mu \right| \leqslant \int |f| d\mu$$

Proof. We prove this in 4 steps:

1. Assume that $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then by definition

$$f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^{+} f^{+} d\mu < \infty \wedge \int^{+} f^{-} d\mu < \infty \tag{20.548}$$

Using [theorem: 20.413] it follows then that

$$f^{+}, f^{-} \in \mathcal{M}^{+}[X, \mathcal{A}, \overline{\mathbb{R}}] \tag{20.549}$$

So using [theorem: 20.419] on [eqs: 20.548, 20.549] f^{+} and f^{-} are μ-integrable with $\int^{+} f^{+} d\mu = \int f^{+} d\mu$ and $\int^{+} f^{-} d\mu = \int f^{-} d\mu$. As $|f| = f^{+} + f^{-}$ it follows from [theorem: 20.425] that that

$$|f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

To summarize

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \Rightarrow |f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

2. Assume that $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $\int^{+} |f| d\mu < \infty$ then using [theorem: 20.413] it follows that $|f| \in \mathcal{M}^{+}[X, \mathcal{A}, \overline{\mathbb{R}}]$. Let $x \in X$ then by [theorem: 20.414] $f^{+}(x) \leqslant |f(x)| = |f|(x)$ and $f^{-}(x) \leqslant |f(x)| = |f|(x)$ so that by [theorem: 20.405] we have that $\int^{+} f^{+} d\mu \leqslant \int^{+} |f| d\mu < \infty$ and $\int^{+} f^{-} d\mu \leqslant \int^{+} |f| d\mu < \infty$. Hence as we assumed that $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have by definition that $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$. Summarized we have

$$f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^{+} |f| d\mu < \infty \Rightarrow f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

3. Let $f \in \mathcal{M}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ and $|f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then by definition we have that

$$\int^+ |f| d\mu \underset{\text{[theorem: 20.414]}}{=} \int^+ |f|^+ d\mu \underset{|f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]}{<} \infty$$

which by (2) proves that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

4. Finally

$$\begin{aligned}
\left| \int f d\mu \right| &= \left| \int^+ f^+ d\mu - \int^+ f^- d\mu \right| \\
&\leqslant \left| \int^+ f^+ d\mu \right| + \left| \int^+ f^- d\mu \right| \\
&= \int^+ f^+ d\mu + \int^+ f^- d\mu \\
&\underset{\text{[theorem: 20.405]}}{=} \int^+ (f^+ + g^-) d\mu \\
&\underset{\text{[theorem: 20.412]}}{=} \int^+ |f| d\mu \\
&\underset{\text{[theorem: 20.419]}}{=} \int |f| d\mu
\end{aligned}$$

□

Theorem 20.427. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and let $f, g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ such that $f = g$ μ-a.e.. If f is μ-integrable then g is μ-integrable and $\int f d\mu = \int g d\mu$.*

Proof. Define

$$H = \{x \in X | f(x) \neq g(x)\} = \{f \neq g\}$$

As f, g are $\mathcal{A}$-measurable we have by [theorem: 20.337 that $H \in \mathcal{A}$. Further as $f = g$ μ-a.e. there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $H \subseteq N$, hence $\mu(H) \leqslant \mu(N) = 0$. To summarize

$$H \in \mathcal{A} \text{ and } \mu(H) = 0 \tag{20.550}$$

As $f, g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have by [theorem: 20.413] it follows that $f^+, f^-, g^+, g^- \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. Let $x \in X$ then

$$\text{If } f^+(x) \neq g^+(x) \Rightarrow \max(f(x, 0)) \neq \max(g(x), 0) \Rightarrow f(x) \neq g(x)$$

$$\text{If } f^-(x) \neq g^-(x) \Rightarrow -\min(f(x, 0)) \neq -\min(g(x), 0) \Rightarrow f(x) \neq g(x)$$

which proves that

$$\{x \in A | f^+(x) \neq g^+(x)\} \subseteq H \text{ and } \{x \in A | f^-(x) \neq g^-(x)\} \subseteq H$$

As $\mu(H) \underset{\text{[eq: 20.550]}}{=} 0$ we have by definition that

$$f^+ = g^+ \ \mu\text{-a.e. and } f^- = g^- \ \mu\text{-a.e.}$$

Using [theorem: 20.404] we have then

$$\int^+ g^+ d\mu = \int^+ f^+ d\mu \underset{f \text{ is } \mu\text{-integrable}}{<} \infty \text{ and } \int^+ g^- d\mu = \int^+ f^- d\mu \underset{f \text{ is } \mu\text{-integrable}}{<} \infty$$

which proves that

$$g \text{ is } \mu\text{-integrable and } \int f d\mu = \int^+ f^+ d\mu - \int^+ f^- d\mu = \int^+ g^+ d\mu - \int^+ g^- d\mu = \int g d\mu$$

□

Theorem 20.428. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ [so that $g(X) \subseteq \mathbb{R}$] and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ such that $|f| \leqslant g$ μ-a.e. then $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ and $\int f d\mu \leqslant \int g d\mu$.*

Proof. We prove this theorem in two stages:

1. Assume that $\forall x \in X$ we have $|f(x)| \leqslant g(x)$. As $g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ so that $g(X) \subseteq [0, \infty]$ it follows from [theorem: 20.419(3)] that
$$g \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \text{ and } \int g d\mu = \int^+ g d\mu < \infty$$
As $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows from [theorem: 20.413] that
$$f^+, f^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$
Let $x \in X$ then $f^+(x) \underset{\text{[theorem: 20.414}}{\leqslant} |f(x)| \leqslant g(x)$ and $f^-(x) \underset{\text{[theorem: 20.414}}{\leqslant} |f(x)| \leqslant g(x)$ so that by [theorem: 20.405]
$$\int^+ f^+ d\mu \leqslant \int^+ g d\mu < \infty \text{ and } \int^+ f^- d\mu \leqslant \int^+ g d\mu < \infty$$
This proved that
$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$
As $\forall x \in X$ $f(x) \leqslant |f(x)| \leqslant g(x) \underset{g(X) \subseteq \mathbb{R}}{<} \infty$ we have $f(X) \subseteq \mathbb{R}$ and using [theorem: 20.425] that
$$\int f d\mu \leqslant \int g d\mu$$

2. Assume that $|f| \leqslant g$ μ-a.e. Then there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that
$$\{x \in X | \neg(|f(x)| \leqslant g(x))\} \subseteq N$$
so that
$$\forall x \in X \setminus N \text{ we have } |f(x)| \leqslant g(x)$$
Let $x \in X$ then we have either:

   ***x* ∈ *N*.** Then $|(\mathcal{X}_{X \setminus N} \cdot f)|(x) = |\mathcal{X}_{X \setminus N}(x) \cdot f(x)| = |0 \cdot f(x)| = 0 \leqslant g(x)$

   ***x* ∈ *X* \ *N*.** Then $|(\mathcal{X}_{X \setminus N} \cdot f)|(x) = |\mathcal{X}_{X \setminus N}(x) \cdot f(x)| = |1 \cdot f(x)| = |f(x)| \leqslant g(x)$

   hence we have that
$$\forall x \in X \text{ that } |\mathcal{X}_{X \setminus N} \cdot f| \leqslant g(x)$$
Further as $N \in \mathcal{A} \Rightarrow X \setminus N \in \mathcal{A}$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows from [theorem: 20.353] that
$$\mathcal{X}_{X \setminus N} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$
So all the conditions for (1) are satisfied and we have that
$$\mathcal{X}_{X \setminus A} \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \text{ and } \int (\mathcal{X}_{X \setminus N} \cdot f) d\mu \leqslant \int g d\mu$$
Now as $\mu(N) = 0$ it follows from [theorem: 20.359] that $\mathcal{X}_{X \setminus A} \cdot f = f$ μ-a.e., using then [theorem: 20.427] it follows that
$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \text{ and } \int f d\mu = \int (\mathcal{X}_{X \setminus N} \cdot f) d\mu \leqslant \int g d\mu$$
□

Theorem 20.429. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then $\{x \in X | f(x) \neq 0\}$ is **μ-finite under μ**. [see definition: 20.194].*

Proof. Let $n \in \mathbb{N}$ and define
$$A_n = \left\{x \in X \,\middle|\, |f|(x) \geqslant \frac{1}{n}\right\} = \left\{|f| \geqslant \frac{1}{n}\right\}$$
As $f \in \mathcal{L}[X, \mathcal{A}, \mu]$ we have by [theorem: 20.426] that $|f| \in \mathcal{L}[X, \mathcal{A}, \mu]$ hence $|f| \in \mathcal{M}^+[X, \mathcal{A}]$ so that by [theorem: 20.335]
$$A_n = \left\{|f| \geqslant \frac{1}{n}\right\} \in \mathcal{A}$$

As $|f| \in \mathcal{L}[X, \mathcal{A}, \mu]$ we have that

$$\int^+ |f| d\mu \underset{\text{[theorem: 20.414]}}{=} \int^+ |f|^+ d\mu < \infty$$

Using [lemma: 20.407] we have then that

$$\mu(A_n) = \mu\left(\left\{|f| \geqslant \frac{1}{n}\right\}\right) \leqslant \frac{1}{\frac{1}{n}} \cdot \int^+ |f| d\mu = n \cdot \int^+ |f| \, d\mu < \infty$$

To summarize

$$\{A_n\}_{n \in \mathbb{N}} \subseteq \mathcal{A} \text{ and } \forall n \in \mathbb{N} \text{ we have } \mu(A_n) < \infty \tag{20.551}$$

Let $x \in \{x \in X | f(x) \neq 0\}$ then $0 < |f(x)|$ so that by [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $0 < \frac{1}{n} < |f(x)|$, hence $x \in A_n$. This proves that

$$\{x \in X | f(x) \neq 0\} \subseteq A_n \subseteq \bigcup_{n \in \mathbb{N}} A_n \tag{20.552}$$

Further if $x \in A_n$ then $0 < \frac{1}{n} < |f(x)| \Rightarrow f(x/0$ so that $x \in \{x \in X | f(x) \neq 0\}$, hence $\bigcup_{n \in \mathbb{N}} A_n \subseteq \{x \in X | f(x) \neq 0\}$ which combined with [eq: 20.552]

$$\{x \in X | f(x) \neq 0\} = \bigcup_{n \in \mathbb{N}} A_n$$

□

Theorem 20.430. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ [so that by [theorem: 20.413] $|f| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$] then we have:*

1. *If $\int^+ |f| d\mu = 0$ then $f = 0$ μ-a.e.*
2. *If $f \in \mathcal{L}[X, \mathcal{A}, \mu]$ with $\int |f| \, d\mu = 0$ then $f = 0$ μ-a.e.*

Proof.

1. For the first part. Let $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ with $\int^+ |f| \, d\mu = 0$ then by [theorem: 20.413] $|f| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$. Hence using [lemma: 20.407] we have for $n \in \mathbb{N}$ that

$$\mu\left(\left\{x \in X \,||f(x)| \geqslant \frac{1}{n}\right\}\right) \leqslant n \cdot \int^+ |f| d\mu = 0 \tag{20.553}$$

Let $x \in \{x \in X | f(x) \neq 0\}$ then $0 < |f(x)|$ so that by [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $0 < \frac{1}{n} < f(x) \Rightarrow x \in \left\{x \in X \,||f(x)| \geqslant \frac{1}{n}\right\} \subseteq \bigcup_{n \in \mathbb{N}} \left\{x \in X \,||f(x)| \geqslant \frac{1}{n}\right\}$. Likewise if $x \in \bigcup_{n \in \mathbb{N}} \left\{x \in X \,||f(x)| \geqslant \frac{1}{n}\right\}$ then there exist a $n \in \mathbb{N}$ such that $x \in \left\{x \in X \,||f(x)| \geqslant \frac{1}{n}\right\} \Rightarrow |f(x)| \geqslant \frac{1}{n} > 0 \Rightarrow f(x) \neq 0$ proving that $x \in \{x \in X | f(x) \neq 0\}$. So we have proved that

$$\bigcup_{n \in \mathbb{N}} \left\{x \in X \,||f(x)| \geqslant \frac{1}{n}\right\} = \{x \in X | f(x) \neq 0\} \tag{20.554}$$

As $|f| \in \mathcal{M}^+[X, \mathcal{A}]$ we have by [theorem: 20.335] that

$$\left\{x \in X \,||f(x)| \geqslant \frac{1}{n}\right\}_{n \in \mathbb{N}} \subseteq \mathcal{A} \text{ so that } \bigcup_{n \in \mathbb{N}} \left\{x \in X \,||f(x)| \geqslant \frac{1}{n}\right\} \in \mathcal{A} \tag{20.555}$$

Hence

$$\begin{aligned}
\mu(\{x \in X | f(x) \neq 0\}) &\underset{\text{[eq: 20.554]}}{=} \mu\left(\bigcup_{n \in \mathbb{N}} \left\{x \in X \,||f(x)| \geqslant \frac{1}{n}\right\}\right) \\
&\underset{\text{[eq: 20.555]}\wedge\text{[theorem: 20.205]}}{\leqslant} \sum_{n=1}^{\infty} \mu\left(\left\{x \in X \,||f(x)| \geqslant \frac{1}{n}\right\}\right) \\
&\underset{\text{[eq: 20.553]}}{=} 0
\end{aligned}$$

which proves that

$$f = 0 \ \mu\text{-a.e.}$$

2. As $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows from [theorem: 20.426] that $|f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ hence $\int |f|^+ d\mu < \infty$ and we have from [theorem: 20.419] that $\int^+ |f| d\mu = \int |f| d\mu = 0$. Hence by (1) $f = 0$ μ=a.e. □

Theorem 20.431. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ such that $\forall A \in \mathcal{A}$ we have $0 \leqslant \int_A f d\mu$ then $f \geqslant 0$ μ-a.e.*

***Note* 20.432.** *Using [theorem: 20.422] we have that $\mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \subseteq \mathcal{L}[A, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ so that $\int_A f d\mu$ is well defined].*

Proof. Let $A = \{x \in X | 0 \nleqslant f(x)\} = \{x \in X | f(x) < 0\} = \{f < 0\}$. As $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have by [theorem: 20.335] that

$$A \in \mathcal{A}$$

If $x \in X$ then we have either:

$\boldsymbol{x \in A}$**.** Then $f(x) < 0$ and $\mathcal{X}_A(x) = 1$ so that $(\mathcal{X}_A \cdot f)(x) = f(x) < 0$ hence

$$(\mathcal{X}_A \cdot f)^+(x) = \max((\mathcal{X}_A \cdot f)(x), 0) = 0$$

$\boldsymbol{x \in X \setminus A}$**.** Then $\mathcal{X}_A(x) = 0$ so that $(\mathcal{X}_A \cdot f)(x) = 0$ hence

$$(\mathcal{X}_A \cdot f)^+(x) = \max((\mathcal{X}_A \cdot f)(x), 0) = \max(0, 0) = 0$$

so we have proved that $(\mathcal{X}_A \cdot f)^+ = C_0$ so that by [example: 20.396] that

$$\int^+ (\mathcal{X}_A \cdot f)^+ d\mu = 0 \tag{20.556}$$

So we have

$$0 \leqslant \int_A f d\mu = \int (\mathcal{X}_A \cdot f) d\mu = \int^+ (\mathcal{X}_A \cdot f)^+ d\mu - \int^+ (\mathcal{X}_A \cdot f)^- d\mu = -\int^+ (\mathcal{X}_A \cdot f) d\mu \leqslant 0$$

which proves that

$$\int^+ (\mathcal{X}_A \cdot f)^- d\mu = 0 \tag{20.557}$$

Combining [eqs: 20.556, 20.557] with [theorem: 20.419] gives

$$\int (\mathcal{X}_A \cdot f)^+ d\mu = \int (\mathcal{X}_A \cdot f)^- d\mu = 0$$

Hence

$$\begin{aligned} \int |\mathcal{X}_A \cdot f| d\mu &\underset{\text{[theorem: 20.412]}}{=} \int ((\mathcal{X}_A \cdot f)^+ + (\mathcal{X}_A \cdot f)^-) d\mu \\ &\underset{\text{[theorem: 20.425]}}{=} \int (\mathcal{X}_A \cdot f)^+ d\mu + \int (\mathcal{X}_A \cdot f)^- d\mu \\ &= 0 \end{aligned}$$

Using [theorem: 20.430] on the above it follows that $\mathcal{X}_A \cdot f = 0$ μ-a.e.. Hence there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X | (\mathcal{X}_A \cdot f) \neq 0\} \subseteq N$. If $x \in A = \{f < 0\}$ then $f(x) < 0$ and $\mathcal{X}_A(x) = 1$ proving that $(\mathcal{X}_A \cdot f)(x) < 0 \Rightarrow (\mathcal{X}_A \cdot f)(x) \neq 0$, hence $x \in \{x \in X | (\mathcal{X}_A \cdot f) \neq 0\} \subseteq N$. Hence as $A = \{x \in X | f(x) \ngeqslant 0\}$ it follows that

$$f \geqslant 0 \ \mu\text{-a.e.}$$

□

Theorem 20.433. *Let $\langle X, \mathcal{A}, \mu \rangle$ and $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then*

$$\{x \in X | |f(x)| = \infty\} \in \mathcal{A} \text{ and } \mu(\{x \in X | |f(x)| = \infty\}) = 0$$

In other words $|f| < \infty$ μ-a.e..

Proof. As $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ we have by [theorem: 20.426] that $|f| \in \mathcal{L}[X, \mathcal{A}, \mu]$. Hence $\int^+ |f| d\mu \underset{\text{[theorem: 20.414]}}{=} \int^+ |f|^+ d\mu < \infty$ so that by [theorem: 20.408] $\{x \in X | |f(x)| = \infty\} \in \mathcal{A}$ and $\mu(\{x \in X | |f(x)| = \infty\}) = 0$. □

We have now a weaker version of μ-integrable functions.

Theorem 20.434. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then*

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \Leftrightarrow \exists g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \text{ with } g(X) \subseteq \mathbb{R} \text{ such that } f = g \ \mu\text{-a.e.}$$

Proof. We have

$\Rightarrow$. As $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then we must create a function $g: X \to \overline{\mathbb{R}}$ with $g(X) \subseteq \mathbb{R}$ such that $f = g$ μ-a.e.. To do this define the set A of all elements of X where $f(x)$ is either $+\infty$ or $-\infty$.

$$A = \{x \in X \,|\, |f(x)| = \infty\} = \{|f| = \infty\}$$

By [theorem: 20.426] $|f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ so that using [theorem: 20.337] $A \in \mathcal{A}$ and thus also $X \setminus A \in \mathcal{A}$, further by [theorem: 20.433] $\mu(A) = 0$. Summarized we have

$$A \in \mathcal{A},\ X \setminus A \in \mathcal{A} \text{ and } \mu(A) = 0 \tag{20.558}$$

Define now

$$g = \mathcal{X}_{X \setminus A} \cdot f: X \to \overline{\mathbb{R}}$$

then using [theorem: 20.353] we have that

$$g = \mathcal{X}_{X \setminus A} \cdot f \in \mathcal{M}[X, \mathcal{A}]$$

Further if $x \in X$ then either $x \in A$ giving $g(x) \underset{x \notin X \setminus A}{=} 0 \in \mathbb{R}$ or $x \in X \setminus A$ then $|g(x)| = |f(x)| \neq \infty$ so that $g(x) \in \mathbb{R}$ hence

$$g(X) \subseteq \mathbb{R}$$

As $\mu(A) = 0$ it follows from [theorem: 20.359] that $\mathcal{X}_{X \setminus A} \cdot f = f$ μ-a.e. hence

$$g = f \ \mu\text{-a.e.}$$

Using [theorem: 20.427] together with the above proves that

$$g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

$\Leftarrow$. Let $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. As that there a function $g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ such that $f = g$ μ-a.e. then by [theorem: 20.427] $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$. □

20.6.4 Limit theorems

One benefit that the measure integral has over the Riemann integral are the limit theorems which are the prime reason for the power of the measure integral.

Theorem 20.435. (Monotone Convergence Theorem (1)) *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space, $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $\{f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ such that $\forall x \in X$*

$$\forall n \in \mathbb{N}\ f_n(x) \leqslant f_{n+1}(x) \text{ and } f(x) = \lim_{n \to \infty} f_n(x)$$

then

$$\lim_{n \to \infty} \int^+ f_n \, d\mu \text{ exists and } \int^+ f d\mu = \lim_{n \to \infty} \int^+ f_n d\mu$$

Note 20.436. As $\forall n \in \mathbb{N}\ f_n(x) \leqslant f_{n+1}(x)$ it follows from [theorem: 20.89] that $\lim_{n \to \infty} f_n(x) = \sup(\{f_n(x) | n \in \mathbb{N}\})$

Note 20.437. We do not requery that f is μ-integrable hence $\int^+ f d\mu = \infty$ is possible. This also the reason why we use $\int^+$ instead of $\int$.

Proof. Let $x \in X$ then as $\forall n \in \mathbb{N}\ f_n(x) \leqslant f_{n+1}(x)$ we have by [theorem: 20.405] that $\int^+ f_n d\mu \leqslant \int^+ f_{n+1} d\mu$ so that by [theorem: 20.89]

$$\lim_{n \to \infty} \int^+ f_n d\mu \text{ exist and } \lim_{n \to \infty} \int^+ f_n d\mu = \sup\left(\left\{\int^+ f_n d\mu | n \in \mathbb{N}\right\}\right) \tag{20.559}$$

As $\forall n \in \mathbb{N}$ we have $f_n(x) \leqslant \sup(\{f_n(x)|n \in \mathbb{N}\}) = \lim_{n\to\infty} f_n(x) = f(x)$ we have by [theorem: 20.405] that $\int^+ f_n d\mu \leqslant \int^+ f d\mu$ hence we have

$$\lim_{n\to\infty} \int^+ f_n d\mu = \sup\left(\left\{\int^+ f_n d\mu | n \in \mathbb{N}\right\}\right) \leqslant \int^+ f d\mu \tag{20.560}$$

So it remains to prove that $\int^+ f d\mu \leqslant \lim_{n\to\infty} \int^+ f_n d\mu$. Let $x \in X$ and $n \in \mathbb{N}$ then as $f_n \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have by [theorem: 20.402] that there exist a $\{g_{n,i}\}_{i\in\mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ such that

$$\forall i \in \mathbb{N} \text{ we have } g_{n,i}(x) \leqslant g_{n,i+1}(x) \tag{20.561}$$

$$f_n(x) = \lim_{i\to\infty} g_{n,i} = \sup(\{g_{n,i}(x)|i \in \mathbb{N}\}) \tag{20.562}$$

$$\lim_{i\to\infty} \int^S g_{n,i} d\mu \text{ exist and } \int^+ f_n d\mu = \lim_{i\to\infty} \int^S g_{n,i} d\mu \tag{20.563}$$

Define now

$$\{h_n\}_{n\in\mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}] \text{ by } h_n = \left(\bigvee_{i\in\{1,\ldots,n\}} g_{i,n}\right) \underset{\text{[theorem: 20.385]}}{\in} \mathcal{S}^+[X, \mathcal{A}] \tag{20.564}$$

Let $x \in X$ and $n \in \mathbb{N}$ then $\forall i \in \{1, \ldots, n\}$ we have

$$\begin{aligned} g_{i,n}(x) &\leqslant g_{i,n+1}(x) \\ &\leqslant \max(\{g_{i,n+1}(x)|i \in \{1, \ldots, n+1\}\}) \\ &= \left(\bigvee_{i\in\{1,\ldots,n+1\}} g_{i,n+1}\right)(x) \\ &= h_{n+1}(x) \end{aligned} \tag{20.565}$$

hence $h_n(x) = \left(\bigvee_{i\in\{1,\ldots,n\}} g_{i,n}\right)(x) = \max(\{g_{i,n}(x)|i \in \{1, \ldots, n\}\}) \underset{\text{[eq: 20.565]}}{\leqslant} h_{n+1}(x)$. So we have that

$$\forall x \in X \text{ we have } \forall n \in \mathbb{N} \text{ that } h_n(x) \leqslant h_{n+1}(x) \tag{20.566}$$

Further as $\forall i \in \{1, \ldots, n\}$ $g_{i,n}(x) \leqslant \sup(\{g_{i,j}(x)|j \in \mathbb{N}\}) \underset{\text{[eq: 20.562]}}{=} f_n(x)$ we have that

$$\forall n \in \mathbb{N} \; h_n(x) = \left(\bigvee_{i\in\{1,\ldots,n\}} g_{i,n}\right)(x) = \max(\{g_{i,n}(x)|i \in \{1, \ldots, n\}\}) \leqslant f_n(x) \tag{20.567}$$

As $\forall n \in \mathbb{N}$ we have $f_n(x) \leqslant \sup(\{f_n(x)|n \in \mathbb{N}\}) = \lim_{n\to\infty} f_n(x) = f(x)$ it follows that

$$\forall n \in \mathbb{N} \text{ we have } h_n(x) \leqslant f(x) \tag{20.568}$$

Using [eq: 20.567] together with [theorem: 20.89] proves that

$$\lim_{n\to\infty} h_n(x) \text{ exist and } \lim_{n\to\infty} h_n(x) = \sup(\{h_n(x)|n \in \mathbb{N}\}) \leqslant f(x) \tag{20.569}$$

We prove now by contradiction that $f(x) \leqslant \sup(\{h_n(x)|n \in \mathbb{N}\})$. So assume that $\sup(\{h_n(x)|n \in \mathbb{N}\}) < f(x)$. Then as $f(x) = \sup(\{f_n(x)|n \in \mathbb{N}\})$ there exist a $n \in \mathbb{N}$ such that

$$\sup(\{h_n(x)|n \in \mathbb{N}\}) < f_n(x)$$

As by [eq: 20.562] $f_n(x) = \sup(\{g_{n,i}(x)|i \in \mathbb{N}\})$ there exist a $k \in \mathbb{N}$ such that

$$\sup(\{h_n(x)|n \in \mathbb{N}\}) < g_{n,k}(x) \underset{k\in\max(h,k)}{\leqslant} g_{n,\max(n,k)}(x)$$

now

$$\begin{aligned} g_{n,\max(n,k)}(x) &\underset{n\in\{1,\ldots,\max(n,k)\}}{\leqslant} \max(\{g_{i,\max(n,k)}|i \in \{1, \ldots, \max(n,k)\}\}) \\ &= \left(\bigvee_{i\in\{1,\ldots,\max(n,k)\}} g_{\text{imax}(n,k)}\right)(x) \\ &= h_{\text{msx}(n,k)} \end{aligned}$$

which leads to the contradiction $\sup(\{h_n(x)|n\in\mathbb{N}\})<h_{\max(,\mathrm{nk})}$. So the assumption is wrong and we have that $f(x)\leqslant\sup(\{h_n(x)|n\in\mathbb{N}\})$ which combined with [eq: 20.569] gives

$$\forall x\in X \text{ we have } f(x)=\sup(\{h_n(x)|n\in\mathbb{N}\})=\lim_{n\to\infty}h_n(x)$$

or

$$\lim_{n\to\infty}h_n=f\in\mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}] \tag{20.570}$$

Next

$$\begin{aligned}\int^+ f d\mu &\underset{\text{[eq: 20.570]}}{=} \int^+\Big(\lim_{n\to\infty}h_n(x)\Big)d\mu\\ &\underset{\text{[theorem: 20.400]}}{=} \lim_{n\to\infty}\int^S h_n\,d\mu\\ &\underset{\text{[theorem: 20.395]}}{=} \lim_{n\to\infty}\int^+ h_n d\mu\\ &\underset{\text{[eq: 20.567]}\wedge\text{[theorems: 20.82,20.405]}}{\leqslant} \lim_{n\to\infty}\int^+ f_n d\mu\end{aligned}$$

which together with [eq: 20.560] proves that

$$\int^+ f d\mu=\lim_{n\to\infty}\int^+ f_n d\mu$$

□

If we weaken the requirements $\forall n\in\mathbb{N}\ f_n(x)\leqslant f_{n+1}(x)$ and $f(x)=\lim_{n\to\infty}f_n(x)$ to be hold almost everywhere we get the Monotone Convergence Theorem.

Theorem 20.438. (Monotone Convergence Theorem (2)) *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space, $f\in\mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}]$ and $\{f_i\}_{i\in\mathbb{N}}\subseteq\mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}]$ such that there exist a $N\in\mathcal{A}$ with $\mu(N)=0$ such that*

$$\Big\{x\in X|\neg\Big(\forall n\in\mathbb{N}\ f_n(x)\leqslant f_{n+1}(x)\wedge\lim_{n\to\infty}f_n(x)=f(x)\Big)\Big\}\subseteq N$$

[In other words we have $\forall n\in\mathbb{N}\ f_n\leqslant f_{n+1}\wedge\lim_{n\to\infty}f_n$ μ-a.e.] then we have

$$\int^+ f d\mu=\lim_{n\to\infty}\int^+ f_n d\mu$$

Proof. Let

$$A=\Big\{x\in X|\neg\Big(\forall n\in\mathbb{N}\ f_n(x)\leqslant f_{n+1}(x)\wedge\lim_{n\to\infty}f_n(x)=f(x)\Big)\Big\}$$

then by the hypothesis there exist a $N\in\mathcal{A}$ with $\mu(N)=0$ such that

$$A\subseteq N\Rightarrow X\setminus N\subseteq X\setminus A$$

then we have for x either:

***x* ∈ *N*.** Then

$$\forall n\in\mathbb{N}\,(\mathcal{X}_{X\setminus N}\cdot f_n)(x)=0\cdot f(x)=0=0\cdot f_{n+1}(x)=\mathcal{X}_{X\setminus N}(x)\cdot f_{n+1}(x)=(\mathcal{X}_{X\setminus N}\cdot f_{n+1})(x)$$

and

$$\begin{aligned}(\mathcal{X}_{X\setminus N}\cdot f)(x) &= 0\cdot f(x)\\ &= 0\\ &= \lim_{n\to\infty}(0\cdot f_n(x))\\ &= \lim_{n\to\infty}(\mathcal{X}_{X\setminus N}(x)\cdot f_n(x))\\ &= \lim_{n\to\infty}(\mathcal{X}_{X\setminus N}\cdot f_n)(x)\end{aligned}$$

$\boldsymbol{x \in X \setminus N}$**.** Then

$$\forall n \in \mathbb{N}\ (\mathcal{X}_{X\setminus N} \cdot f_n)(x) = 1 \cdot f_n(x) \underset{x \in X \setminus N \Rightarrow x \notin A}{\leqslant} f_{n+1}(x) = 1 \cdot f_{n+1}(x) = (\mathcal{X}_{X\setminus N} \cdot f_{n+1})(x)$$

and

$$\begin{aligned}(\mathcal{X}_{X\setminus N} \cdot f)(x) &= \mathcal{X}_{X\setminus N}(x) \cdot f(x) \\ &= f(x) \\ &\underset{x \in X \setminus N \Rightarrow x \notin A}{=} \lim_{n\to\infty} f_n(x) \\ &= \lim_{n\to\infty} (\mathcal{X}_{X\setminus N}(x) \cdot f_n(x)) \\ &= \lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot f_n)(x)\end{aligned}$$

So we have $\forall x \in X$ that

$$\forall n \in \mathbb{N} \text{ we have } (\mathcal{X}_{X\setminus N} \cdot f_n)(x) \leqslant (\mathcal{X}_{X\setminus N} \cdot f_{n+1})(x) \text{ and } (\mathcal{X}_N \cdot f)(x) = \lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot f)(x)$$

As $N \in \mathcal{A} \Rightarrow X \setminus N \in A$ it follows from the hypothesis by [theorem: 20.353] that $\mathcal{X}_{X\setminus N} \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $\{\mathcal{X}_{X\setminus A} \cdot f_n\}_{n\in\mathbb{N}} \subseteq \mathcal{A}$. So the conditions for [theorem: 20.435] are satisfied and we have that

$$\lim_{n\to\infty} \int^+ (\mathcal{X}_{X\setminus N} \cdot f_n) d\mu \text{ exist and } \lim_{n\to\infty} \int^+ (\mathcal{X}_{X\setminus N} \cdot f_n) d\mu = \int^+ (\mathcal{X}_{X\setminus N} \cdot f) d\mu \tag{20.571}$$

Further using [theorem: 20.359] we have that

$$f = (\mathcal{X}_{X\setminus N} \cdot f)\ \mu\text{-a.e. and } \forall n \in \mathbb{N} \text{ we have } f_n = (\mathcal{X}_{X\setminus N} \cdot f_n)\ \mu\text{-a.e.}$$

Hence using [theorem: 20.404] we have that

$$\int^+ f d\mu \underset{\text{[theorem: 20.404]}}{=} \int^+ (\mathcal{X}_{X\setminus N} \cdot f) d\mu \underset{\text{[eq: 20.571]}}{=} \lim_{n\to\infty} \int^+ (\mathcal{X}_{X\setminus N} \cdot f_n) d\mu \underset{\text{[theorem: 20.404]}}{=} \lim_{n\to\infty} \int^+ f_n d\mu$$

proving that

$$\int^+ f d\mu = \lim_{n\to\infty} \int^+ f_n d\mu$$

□

A consequence of the above theorem is the Beppo Levi's theorem.

Theorem 20.439. (Beppo Levi's Theorem) *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space and $\{f_i\}_{i\in\mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then we have that*

$$\sum_{i=1}^{\infty} f_i \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ \left(\sum_{i=1}^{\infty} f_i\right) d\mu = \sum_{i=1}^{\infty} \int^+ f_i d\mu$$

where

$$\sum_{i=1}^{\infty} f_i : X \to \overline{\mathbb{R}} \text{ is defined by } \left(\sum_{i=1}^{\infty} f_i\right)(x) = \sum_{i=1}^{\infty} f_i(x)$$

***Note* 20.440.** *As $\{f_i\}_{i\in\mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}]$ we have $\{f_i(x)\}_{i\in\mathbb{N}} \subseteq [0, \infty]$ so that by [definition: 20.92] $\sum_{i=1}^{\infty} f_i(x)$ is well defined, similar as $\{\int^+ f_i\}_{i\in\mathbb{N}} \subseteq [0, \infty]$ we have that $\sum_{i=1}^{\infty} \int^+ f_i d\mu$.*

Proof. Let $n \in \mathbb{N}$ then by [theorem: 20.406]

$$\sum_{i=1}^{n} f_i \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ \left(\sum_{i=1}^{n} f_i\right) d\mu = \sum_{i=1}^{n} \left(\int^+ f_i d\mu\right) \tag{20.572}$$

so that

$$\left\{\sum_{i=1}^{n} f_i\right\}_{i\in\mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Let $x \in X$ then by [definition: 20.92] $\lim_{n\to\infty} \sum_{i=1}^{\infty} f_i(x)$ exist and $\lim_{n\to\infty} \sum_{i=1}^{n} f_i(x) = \sum_{i=1}^{\infty} f_i(x) \in [0,\infty]$. Hence using [theorem: 20.348] we have that

$$\lim_{n\to\infty}\left(\sum_{i=1}^{n} f_i\right) \in \mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}]$$

Using now the Monotone Convergence Theorem [theorem: 20.435] we have that

$$\lim_{n\to\infty}\int^+\left(\sum_{i=1}^{n} f_i\right)d\mu \text{ exists and } \int^+\left(\lim_{n\to\infty}\left(\sum_{i=1}^{n} f_i\right)\right) = \lim_{n\to\infty}\int^+\left(\sum_{i=1}^{n} f_i\right)d\mu \tag{20.573}$$

As $\left(\lim_{n\to\infty}(\sum_{i=1}^{n} f_i)\right)(x) = \lim_{n\to\infty}((\sum_{i=1}^{n} f_i)(x)) = \lim_{n\to\infty}(\sum_{i=1}^{n} f_i(x)) \underset{\text{def}}{=} \sum_{i=1}^{\infty} f_i(x) \underset{\text{def}}{=} (\sum_{i=1}^{\infty} f_i)(x)$ we have

$$\lim_{n\to\infty}\left(\sum_{i=1}^{n} f_i\right) = \sum_{i=1}^{\infty} f_i$$

Substituting this in [eq: 20.573] gives finally

$$\int^+\left(\sum_{i=1}^{\infty} f_i\right)d\mu = \lim_{n\to\infty}\int^+\left(\sum_{i=1}^{n} f_i\right)d\mu \underset{\text{[eq: 20.572]}}{=} \lim_{n\to\infty}\left(\sum_{i=1}^{n}\left(\int^+ f_i d\mu\right)\right) \underset{\text{def}}{=} \sum_{i=1}^{\infty}\left(\int^+ f_i d\mu\right) \qquad \square$$

A application of the Beppo Levi's Theorem is a way of defining a new measure on a measure space based on a non negative measurable function.

Theorem 20.441. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space, $f \in \mathcal{M}^+[X,\mathcal{A},\mu,\overline{\mathbb{R}}]$ then if we define*

$$\nu: \mathcal{A} \to [0,\infty] \text{ by } \nu(A) = \int_A^+ f d\mu$$

we have that ν is a measure on $\langle X,\mathcal{A}\rangle$. Further we have

$$\nu \text{ is finite} \Leftrightarrow f \text{ is } \mu\text{-integrable}$$

Proof. Let $x \in X$ then $(f\cdot\mathcal{X}_\varnothing)(x) = f(x)\cdot\mathcal{X}_\varnothing(x) = f(x)\cdot 0 = C_0$ which proves that

$$\nu(\varnothing) = \int_\varnothing^+ (\mathcal{X}_\varnothing\cdot f)d\mu = \int_A^+ C_0 d\mu \underset{\text{[example: 20.396]}}{=} 0 \tag{20.574}$$

Let $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ be pairwise disjoint family. Define

$$\{f_i\}_{i\in\mathbb{N}_0} \subseteq \mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}] \text{ by } f_i = \mathcal{X}_{A_i}\cdot f \underset{\text{[theorem: 20.353]}}{\in} \mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}]$$

Let $A = \bigsqcup_{i<'\mathbb{N}_0} A_i$. Take $x \in X$ then for $f(x)$ we have the following cases to consider:

$f(x) = \infty$. then for x and $n \in \mathbb{N}$ we have either:

$x \in X \setminus A$. then $(\mathcal{X}_A\cdot f)(x) = 0$ and $(\sum_{i=1}^{n} f_i)(x) = \sum_{i=1}^{n}(\mathcal{X}_{A_i}(x)\cdot f(x)) = \sum_{i=1}^{n} 0 = 0$ so that

$$\lim_{n\to\infty}\sum_{i=1}^{n} f_i(x) = 0 = (\mathcal{X}_A\cdot f)(x)$$

$x \in A$. then $(f\cdot\mathcal{X}_A)(x) = \infty$ and $(\sum_{i=1}^{n} f_i)(x) = \sum_{i=1}^{n}(\mathcal{X}_{A_i}(x)\cdot f(x)) = \sum_{i=1}^{n}\infty = \infty$ proving that

$$\lim_{n\to\infty}\sum_{i=1}^{n} f_i(x) = (\mathcal{X}_A\cdot f)(x)$$

$f(x) < \infty$. then for x and $n \in \mathbb{N}$ we have either:

$x \in X \setminus A$. then $(\mathcal{X}_A\cdot f)(x) = 0$ and $(\sum_{i=1}^{n} f_i)(x) = \sum_{i=1}^{n}(\mathcal{X}_{A_i}(x)\cdot f(x)) = \sum_{i=1}^{n} 0 = 0$ so that

$$\lim_{n\to\infty}\sum_{i=1}^{n} f_i(x) = (X_A\cdot f)(x)$$

$\boldsymbol{x \in A}$**.** Let $\varepsilon > 0$, as $x \in A = \bigsqcup_{i \in \mathbb{N}} A_i$ there exists a unique $M \in \mathbb{N}_0$ such that $x \in A_M$ and $\forall i \in \mathbb{N} \backslash \{M\}$ that $x \notin A_i$. If $n \in \{M, \ldots, \infty\}$ then we have

$$\begin{aligned}
\left|(f \cdot \mathcal{X}_A)(x) - \sum_{i=1}^{n} f_i(x)\right| &= \left|f(x) - \sum_{i=1}^{n} (\mathcal{X}_{A_i}(x) \cdot f(x))\right| \\
&= \left|f(x) - \sum_{i \in \{M\}} (\mathcal{X}_{A_i}(x) \cdot f(x)) - \sum_{i \in \mathbb{N} \backslash \{M\}} (\mathcal{X}_{A_i}(x) \cdot f(x))\right| \\
&= |f(x) - \mathcal{X}_{A_N}(x) \cdot f(x)| \\
&= |f(x - f(x))| \\
&= 0
\end{aligned}$$

proving that

$$\lim_{n \to \infty} \sum_{i=1}^{n} f_i(x) = (\mathcal{X}_A \cdot f)(x)$$

this proves that in all cases

$$\sum_{i=1}^{\infty} f_i(x) = (\mathcal{X}_A \cdot f)(x)$$

Applying then Beppo Levi [see 20.439] gives

$$\begin{aligned}
\nu\left(\bigsqcup_{i \in \mathbb{N}_0} A_i\right) &= \nu(A) \\
&= \int^{+} (\mathcal{X}_A \cdot f) d\mu \\
&= \int^{+} \left(\sum_{i=1}^{\infty} f_i\right) d\mu \\
&\underset{20.439}{=} \sum_{i=1}^{\infty} \int^{+} f_i \, d\mu \\
&= \sum_{i=1}^{\infty} \int^{+} (\mathcal{X}_{A_i} \cdot f) d\mu \\
&= \sum_{i=1}^{\infty} v(A_i)
\end{aligned}$$

which together with [eq: 20.574] proves that

$$\nu \text{ is a measure on the measurable space } \langle X, \mathcal{A} \rangle$$

For the last part of the theorem:

$\Rightarrow$**.** If ν is finite then as $f = \mathcal{X}_X \cdot f$ we have that $\int^{+} f d\mu = \int^{+} (\mathcal{X}_X \cdot f) d\mu = \nu(X) < \infty$ which proves using [theorem: 20.419] that f is μ-integrable.

$\Leftarrow$**.** Let $A \in \mathcal{A}$ and $x \in X$ then $(f \cdot \mathcal{X}_A)(x) = f(x) \cdot \mathcal{X}_A(x) = \begin{cases} f(x) \text{ if } x \in A \\ 0 \leqslant f(x) \text{ if } x \in X \setminus A \end{cases} \leqslant f(x)$. Hence using [theorem: 20.405] we have that $\nu(A) = \int_A^{+} f d\mu = \int^{+} (\mathcal{X}_A \cdot f) d\mu \leqslant \int^{+} f d\mu < \infty$ which proves that ν is a finite measure. □

Lemma 20.442. (Fatou's lemma) *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $\{f_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}^{+}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then*

$$\int^{+} \left(\liminf_{n \to \infty} f\right) d\mu \leqslant \liminf_{n \to \infty} \int^{+} f_n \, d\mu$$

***Note* 20.443.** *Using [theorem: 20.348] we have that $\liminf_{n \to \infty} f \in \mathcal{M}^{+}[X, \mathcal{A}, \overline{\mathbb{R}}]$ so that $\int^{+} \left(\liminf_{n \to \infty} f\right)$ is well defined.*

***Note* 20.444.** *We can not assume that $\lim_{n \to \infty} \int^{+} f_i \, d\mu$ exists which is the reason $\liminf_{n \to \infty} \int^{+} f_i \, d\mu$ is used.*

Proof. Define

$$\{g_n\}_{n\in\mathbb{N}_0}\subseteq\mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}] \text{ by } g_n(x)=\inf(\{f_i(x)|i\in\{n,\ldots,\infty\}\})\underset{\text{[theor.: 20.348]}}{\in}\mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}] \tag{20.575}$$

Let $x\in X$ and $n\in\mathbb{N}N$ then $\{f_i(x)|i\in\{n+1,\ldots,\infty\}\}\subseteq\{f_i(x)|i\in\{n,\ldots\infty\}\}$ so that by [theorem: 3.77] we have

$$\inf(\{f_i(x)|i\in\{n,\ldots\infty\}\})\leqslant\inf(\{f_i(x)|i\in\{n+1,\ldots\infty\}\})$$

which as also

$$\inf(\{f_i(x)|i\in\{n,\ldots\infty\}\})\leqslant f_n(x)$$

proves that

$$\forall n\in\mathbb{N}\ g_n(x)\leqslant f_n(x) \text{ and } g_n(x)\leqslant g_{n+1}(x) \tag{20.576}$$

So we have

$$\begin{aligned}\lim_{n\to\infty}g_n(x) &\underset{\text{[theorem: 20.89]}}{=} \sup(\{g_n(x)|n\in\mathbb{N}\})\\ &= \sup(\{\inf(\{f_i(x)|i\in\{n,\ldots,\infty\}\})|n\in\mathbb{N}\})\\ &\underset{\text{def}}{=} \liminf_{n\to\infty}f_i(x)\end{aligned}$$

We can no apply the Monotone Convergence Theorem [see theorem: 20.435] giving

$$\begin{aligned}\int^+\left(\liminf_{n\to\infty}f_i\right)d\mu &= \int^+\left(\lim_{n\to\infty}g_n\right)d\mu\\ &\underset{\text{[theorem: 20.435]}}{=} \lim_{n\to\infty}\int^+g_n\,d\mu\\ &\underset{\text{def}}{=} \liminf_{n\to\infty}\int^+g_n\,d\mu\end{aligned} \tag{20.577}$$

Using [eq: 20.576] with [theorem: 20.405] we have $\forall n\in\mathbb{N}_0$ that $\int^+g_n\,d\mu\leqslant\int^+f_n\,d\mu$. So we have using [theorem: 20.59] that $\liminf_{n\to\infty}\int^+g_n\,d\mu\leqslant\liminf_{n\to\infty}\int^+f_n\,d\mu$. Substituting thid in [eq: 20.577] gives finally

$$\int^+\left(\liminf_{n\to\infty}f_i\right)d\mu\leqslant\liminf_{n\to\infty}\int^+f_n\,d\mu$$

□

Theorem 20.445. (Lebesgue's Dominated Convergence Theorem) *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space, $g\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$ [so $g(X)\subseteq[0,\infty]$], $\{f_i\}_{i\in\mathbb{N}}\subseteq\mathcal{M}[X,\mathcal{A},\overline{\mathbb{R}}]$ and $f\in\mathcal{M}[X,\mathcal{A},\overline{\mathbb{R}}]$ such that*

$$(f=\lim_{n\to\infty}f_n \text{ and } \forall n\in\mathbb{N} \text{ we have } |f_n|\leqslant g) \text{ holds } \mu.a.e.$$

In other words there exist a $N\in\mathcal{A}$ with $\mu(N)=0$ such that

$$\left\{x\in X\,|\neg\left(\lim_{n\to\infty}f_n(x) \text{ exists with } f(x)=\lim_{n\to\infty}f_n(x) \text{ and } \forall n\in\mathbb{N} \text{ we have } |f_n(x)|\leqslant g(x)\right)\right\}$$

then we have:

1. $f\in\mathcal{L}[X,\mathcal{A},\mu,\overline{\mathbb{R}}]$
2. $\{f_n\}_{n\in\mathbb{N}}\subseteq\mathcal{L}[X,\mathcal{A},\mu,\overline{\mathbb{R}}]$
3. $\int f d\mu=\lim_{n\to\infty}\int f_n\,d\mu$

Proof. As $g\in\mathcal{L}[X,\mathcal{A},\mu]$ it follows from [theorem: 20.433] that

$$N_1=\{x\in X\,|g(x)=\infty\}\in\mathcal{A} \text{ and } \mu(N_1)=0 \tag{20.578}$$

By the hypothesis there exist a $N_2\in\mathcal{A}$ with $\mu(N_2)=0$ such that

$$\left\{x\in X\,|\neg\left(\lim_{n\to\infty}f_n(x) \text{ exists with } f(x)=\lim_{n\to\infty}f_n(x) \text{ and } \forall n\in\mathbb{N}\ \ |f_n(x)|\leqslant g(x)\right)\right\}\subseteq N_2$$

Take $N = N_1 \bigcup N_2$ then we have $\forall x \in X \setminus N$ that

$$g(x) \neq 0 \wedge \lim_{n\to\infty} f_n(x) \text{ exists with } f(x) = \lim_{n\to\infty} f_n(x) \text{ and } \forall n \in \mathbb{N} \ \ |f_n(x)| \leqslant g(x) \tag{20.579}$$

and

$$N \in \mathcal{A} \text{ and } \mu(N) \leqslant \mu(N_1) + \mu(N_2) = 0 \Rightarrow \mu(N) \tag{20.580}$$

So using [theorems: 20.353, 20.413] we have that

$$\mathcal{X}_{X\setminus N} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge |\mathcal{X}_{X|N} \cdot f| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge \mathcal{X}_{X\setminus N} \cdot g \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \tag{20.581}$$

$$\forall n \in \mathbb{N} \text{ we have } \mathcal{X}_{X\setminus A} \cdot f_n \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge |\mathcal{X}_{X\setminus N} \cdot f_n| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \tag{20.582}$$

Let $x \in X$ then we have either:

$\boldsymbol{x \in N}$. Then we have

$$(\mathcal{X}_{X\setminus N} \cdot g)(x) = 0 \Rightarrow 0 \leqslant (\mathcal{X}_{X\setminus N} \cdot g)(x) < \infty$$

$$\forall n \in \mathbb{N} \ |\mathcal{X}_{X\setminus N} \cdot f_n|(x) = 0 = (\mathcal{X}_{X\setminus N} \cdot g) \Rightarrow \ |\mathcal{X}_{X\setminus N} \cdot f_n|(x) \leqslant (\mathcal{X}_{X\setminus N} \cdot g)(x)$$

$$\lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot f_n)(x) = \lim_{n\to\infty} 0 \text{ exist and } \lim_{n\to\infty} 0 = 0 = (\mathcal{X}_{X\setminus N} \cdot f)(x)$$

so that

$$\lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot f_n)(x) \text{ exist and } \lim_{n\to\infty} |\mathcal{X}_{X\setminus N} \cdot f_n|(x) = (\mathcal{X}_{X\setminus N} \cdot f)(x)$$

$\boldsymbol{x \in X \setminus N}$. Then

$$(\mathcal{X}_{X\setminus N} \cdot g)(x) = g(x) \underset{\text{[eq: 20.579]}}{\neq} \infty \Rightarrow 0 \leqslant (\mathcal{X}_{X\setminus N} \cdot g)(x) < \infty$$

$$\forall n \in \mathbb{N} \ |\mathcal{X}_{X\setminus N} \cdot f_n|(x) = |f_n(x)| \underset{\text{[eq: 20.579]}}{\leqslant} g_n(x) = (\mathcal{X}_{X\setminus N} \cdot g) \Rightarrow \ |\mathcal{X}_{X\setminus N} \cdot f_n|(x) \leqslant (\mathcal{X}_{X\setminus N} \cdot g)(x)$$

$$\lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot f_n)(x) = \lim_{n\to\infty} f_n(x) \text{ exist and } \lim_{n\to\infty} f_n(x) \underset{\text{[eq: 20.579]}}{=} f(x) = (\mathcal{X}_{X\setminus N} \cdot f)(x)$$

so that

$$\lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot f_n)(x) \text{ exist and } \lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot f_n)(x) = (\mathcal{X}_{X\setminus N} \cdot f)(x)$$

Hence we have

$$\forall x \in X \text{ we have } 0 \leqslant (\mathcal{X}_{X\setminus N} \cdot g)(x) < \infty \tag{20.583}$$

$$\forall x \in X \text{ we have } \forall n \in \mathbb{N} \text{ that } |\mathcal{X}_{X\setminus N} \cdot f_n|(x) \leqslant (\mathcal{X}_{X\setminus N} \cdot g)(x) < \infty \tag{20.584}$$

$$\forall x \in X \ \lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot f_n)(x) \text{ exists and } \lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot f_n)(x) = (\mathcal{X}_{X\setminus N} \cdot f)(x) \tag{20.585}$$

Applying [corollary: 20.78] on the above we have also

$$\forall x \in X \ \lim_{n\to\infty} |\mathcal{X}_{X\setminus N} \cdot f_n|(x) \text{ exist and } \lim_{n\to\infty} |\mathcal{X}_{X|N} \cdot f_n|(x) = |\mathcal{X}_{X\setminus N} \cdot f|(x) \tag{20.586}$$

Using [theorem: 20.359] together with [eq: 20.578] proves also

$$g = \mathcal{X}_{X\setminus N} \cdot g \ \mu\text{-a.e.}, \ f = \mathcal{X}_{X\setminus N} \cdot f \ \mu\text{-a.e. and } \forall n \in \mathbb{N} \text{ we have } f_n = \mathcal{X}_{X\setminus N} \cdot f_n \ \mu\text{-a.e.} \tag{20.587}$$

So that using [theorem: 20.427] we have, as g is μ-integrable, we have that

$$\mathcal{X}_{X\setminus N} \cdot g \in \mathcal{L}[X, \mathcal{A}, \mu] \text{ and } \int (\mathcal{X}_{X\setminus N} \cdot g) d\mu = \int g d\mu < \infty \tag{20.588}$$

Next we prove that every $f_n \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ and $\int f_n d\mu = \int (\mathcal{X}_{X\setminus N} \cdot f_n)$. Let $n \in \mathbb{N}$. Using [eqs: 20.581, 20.582] and [eq: 20.584] allows us to use [theorem: 20.405] to get

$$\int^+ |\mathcal{X}_{X\setminus N} \cdot f_n| d\mu \leqslant \int^+ (\mathcal{X}_{X\setminus N} \cdot g) d\mu \underset{\text{[theorem: 20.419]}}{=} \int (\mathcal{X}_{X\setminus N} \cdot g) d\mu \underset{\text{[eq: 20.588]}}{<} \infty$$

So using [eq: 20.582] and [theorem: 20.419] it follows that $|\mathcal{X}_{X\setminus N} \cdot f_n| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$. Applying then [theorem: 20.426] it follows that $\mathcal{X}_{X\setminus N} \cdot f_n \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$. Using then [theorem: 20.427] together with [eq: 20.587] proves that

$$\forall n \in \mathbb{N} \text{ we have } f_n \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \text{ and } \int f_n d\mu = \int (\mathcal{X}_{X\setminus N} \cdot f_n) d\mu \tag{20.589}$$

Next we prove that $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$. Let $x \in X$ then we have

$$\begin{aligned}
|\mathcal{X}_{X\setminus N} \cdot f(x)|(x) &\underset{\text{[eq: 20.586]}}{=} \lim_{n\to\infty} |\mathcal{X}_{X\setminus N} \cdot f_n|(x) \\
&\underset{\text{[theorem: 20.82]}\wedge\text{[eq: 20.584]}}{\leqslant} (\mathcal{X}_{X\setminus N} \cdot g)(x) \\
&\underset{\text{[eq: 20.583]}}{<} \infty
\end{aligned}$$

which proves that

$$|\mathcal{X}_{X\setminus N} \cdot f(x)|(x) < (\mathcal{X}_{X\setminus N} \cdot g)(x) < \infty \tag{20.590}$$

Using the above and [eq: 20.581] allows us to use [theorem: 20.405] to get

$$\int^+ |\mathcal{X}_{X\setminus N} \cdot f| d\mu \leqslant \int^+ (\mathcal{X}_{X\setminus N} \cdot g) d\mu \underset{\mathcal{X}_{X\setminus N} \cdot g \in \mathcal{L}[X, \mathcal{A}, \mu]}{<} \infty$$

Hence using]eq: 20.581 and [theorem: 20.419] it follows that $|\mathcal{X}_{X\setminus N} \cdot f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$. Using then [theorem: 20.427] together with [eq: 20.587] proves that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \text{ and } \int f d\mu = \int (\mathcal{X}_{X\setminus N} \cdot f) d\mu \tag{20.591}$$

Further using [eq: 20.584] and [eq: 20.590] it follows that

$$(\mathcal{X}_{X\setminus N} \cdot f)(X) \subseteq \mathbb{R},\ (\mathcal{X}_{X\setminus N} \cdot g)(X) \subseteq \mathbb{R} \text{ and } \forall n \in \mathbb{N}\ (\mathcal{X}_{X\setminus N} \cdot f_n)(X) \subseteq \mathbb{R} \tag{20.592}$$

Given $x \in X$ and $n \in \mathbb{N}$ then as $|\mathcal{X}_{X\setminus N} \cdot f_n(x)|(x) \leqslant (\mathcal{X}_{X\setminus N} \cdot g)(x)$ [see eq: 20.584] we have

$$\begin{aligned}
(\mathcal{X}_{X\setminus N} \cdot f_n(x))(x) &\leqslant (\mathcal{X}_{X\setminus N} \cdot g)(x) \\
-(\mathcal{X}_{X\setminus N} \cdot f_n(x))(x) &\leqslant (\mathcal{X}_{X\setminus N} \cdot g)(x)
\end{aligned}$$

so taking in account [eq: 20.592] we have that

$$\begin{aligned}
0 &\leqslant (\mathcal{X}_{X\setminus N} \cdot g)(x) - (\mathcal{X}_{X\setminus N} \cdot f_n)(x) \\
0 &\leqslant (\mathcal{X}_{X\setminus N} \cdot g)(x) + (\mathcal{X}_{X\setminus N} \cdot f_n)(x)
\end{aligned}$$

Using the above, [eq: 20.581, 20.582] and [theorem: 20.340, 20.345] we have

$$\{\mathcal{X}_{X\setminus N} \cdot g - \mathcal{X}_{X\setminus N} \cdot f_n\}_{n\in\mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \tag{20.593}$$

$$\{\mathcal{X}_{X\setminus N} \cdot g + \mathcal{X}_{X\setminus N} \cdot f_n\}_{n\in\mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \tag{20.594}$$

Using the above we have

$$\begin{aligned}
(\mathcal{X}_{X\setminus N} \cdot g)(x) + (\mathcal{X}_{X\setminus N} \cdot f)(x) &\underset{\text{[eq: 20.585]}}{=} (\mathcal{X}_{X\setminus N} \cdot g)(x) + \lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot f_n) \\
&\underset{\text{[example: 20.71]}}{=} \lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot g)(x) + \lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot f_n) \\
&\underset{\text{[theorem: 20.82]}}{=} \lim_{i\to\infty} (\mathcal{X}_{X\setminus N} \cdot g + \mathcal{X}_{X\setminus N} \cdot f_n)(x) \\
&\underset{\text{def}}{=} \liminf_{i\to\infty} (\mathcal{X}_{X\setminus N} \cdot g + \mathcal{X}_{X\setminus N} \cdot f_n)(x) \\
(\mathcal{X}_{X\setminus N} \cdot g)(x) - (\mathcal{X}_{X\setminus N} \cdot f)(X) &\underset{\text{[eq: 20.585]}}{=} (\mathcal{X}_{X\setminus N} \cdot g)(x) - \lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot f_n) \\
&\underset{\text{[example: 20.71]}}{=} \lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot g)(x) - \lim_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot f_n) \\
&\underset{\text{[theorem: 20.82]}}{=} \lim_{i\to\infty} (\mathcal{X}_{X\setminus N} \cdot g - \mathcal{X}_{X\setminus N} \cdot f_n)(x) \\
&\underset{\text{def}}{=} \liminf_{i\to\infty} (\mathcal{X}_{X\setminus N} \cdot g + \mathcal{X}_{X\setminus N} \cdot f_n)(x)
\end{aligned}$$

so that

$$(\mathcal{X}_{X\setminus N} \cdot g) + (\mathcal{X}_{X\setminus N} \cdot f) = \liminf_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot g + \mathcal{X}_{X\setminus N} \cdot f_n) \tag{20.595}$$

$$(\mathcal{X}_{X\setminus N} \cdot g) - (\mathcal{X}_{X\setminus N} \cdot f) = \liminf_{n\to\infty} (\mathcal{X}_{X\setminus N} \cdot g - \mathcal{X}_{X\setminus N} \cdot f_n) \tag{20.596}$$

Next we have taking in account [eq: 20.592]

$$\begin{aligned}
\int(\mathcal{X}_{X\setminus N}\cdot g)d\mu+\int(\mathcal{X}_{X\setminus N}\cdot f)d\mu &\underset{\text{[theorem: 20.425]}}{=}\\
\int(\mathcal{X}_{X\setminus N}\cdot g+\mathcal{X}_{X\setminus N}\cdot f)d\mu &\underset{\text{[eq: 20.595]}}{=}\\
\int\liminf_{n\to\infty}(\mathcal{X}_{X\setminus N}\cdot g+\mathcal{X}_{X\setminus N}\cdot f_n)d\mu &\underset{\text{[theorem: 20.442]}\wedge\text{[eq: 20.594]}}{\leqslant}\\
\liminf_{n\to\infty}\left(\int(\mathcal{X}_{X\setminus N}\cdot g+\mathcal{X}_{X\setminus N}\cdot f_n)d\mu\right) &\underset{\text{[theorem: 20.425]}}{=}\\
\liminf_{n\to\infty}\left(\int(\mathcal{X}_{X\setminus N}\cdot g)d\mu+\int(\mathcal{X}_{X\setminus N}\cdot f_n)d\mu\right) &\underset{\text{[theorem: 20.62]}}{=}\\
\int(\mathcal{X}_{X\setminus N}\cdot g)d\mu+\liminf_{n\to\infty}\int(\mathcal{X}_{X\setminus N}\cdot f_n)d\mu &
\end{aligned}$$

hence as the integrals are real numbers we have that

$$\int(\mathcal{X}_{X\setminus N}\cdot f)d\mu\leqslant\liminf_{n\to\infty}\int(\mathcal{X}_{X\setminus N}\cdot f_n)d\mu \tag{20.597}$$

Similar we have

$$\begin{aligned}
\int(\mathcal{X}_{X\setminus N}\cdot g)d\mu-\int(\mathcal{X}_{X\setminus N}\cdot f)d\mu &\underset{\text{[theorem: 20.425]}}{=}\\
\int(\mathcal{X}_{X\setminus N}\cdot g-\mathcal{X}_{X\setminus N}\cdot f)d\mu &\underset{\text{[eq: 20.595]}}{=}\\
\int\liminf_{n\to\infty}(\mathcal{X}_{X\setminus N}\cdot g-\mathcal{X}_{X\setminus N}\cdot f_n)d\mu &\underset{\text{[theorem: 20.442]}\wedge\text{[eq: 20.593]}}{\leqslant}\\
\liminf_{n\to\infty}\left(\int(\mathcal{X}_{X\setminus N}\cdot g+\mathcal{X}_{X\setminus N}\cdot f_n)d\mu\right) &\underset{\text{[theorem: 20.425]}}{=}\\
\liminf_{n\to\infty}\left(\int(\mathcal{X}_{X\setminus N}\cdot g)d\mu+\left(-\int(\mathcal{X}_{X\setminus N}\cdot f_n)d\mu\right)\right) &\underset{\text{[theorem: 20.62]}}{=}\\
\int(\mathcal{X}_{X\setminus N}\cdot g)d\mu+\liminf_{n\to\infty}\left(-\int(\mathcal{X}_{X\setminus N}\cdot f_n)d\mu\right) &\underset{\text{[theorem: 20.64]}}{=}\\
\int(\mathcal{X}_{X\setminus N}\cdot g)d\mu-\limsup_{n\to\infty}\int(\mathcal{X}_{X\setminus N}\cdot f_n)d\mu &
\end{aligned}$$

which as the integrals are real numbers gives

$$\limsup_{n\to\infty}\int(\mathcal{X}_{X\setminus N}\cdot f_n)d\mu\leqslant\int(\mathcal{X}_{X\setminus N}\cdot f)d\mu$$

which combined with [eq: 20.597] proves that

$$\int(\mathcal{X}_{X\setminus N}\cdot f)d\mu\leqslant\liminf_{n\to\infty}\int(\mathcal{X}_{X\setminus N}\cdot f_n)d\mu\underset{\text{[theorem: 20.67]}}{\leqslant}\limsup_{n\to\infty}\int(\mathcal{X}_{X\setminus N}\cdot f)d\mu\leqslant\int(\mathcal{X}_{X\setminus N}\cdot f)d\mu$$

This proves that $\lim_{n\to\infty}\int(\mathcal{X}_{X\setminus N}\cdot f_n)d\mu$ exist and $\int(\mathcal{X}_{X\setminus N}\cdot f)d\mu=\lim_{n\to\infty}\int(\mathcal{X}_{X\setminus N}\cdot f_n)d\mu$. Using then [eq: 20.589] and [eq: 20.591] gives

$$\lim_{n\to\infty}\int f_n d\mu \text{ exist and } \int f d\mu=\lim_{n\to\infty}\int f_n d\mu$$ □

TODO

20.6.5 Integration on sub measure spaces

If $\langle X,\mathcal{A},\mu\rangle$ is a measure space and $A\in\mathcal{A}$ then by [theorem: 20.147] then we have for $\mathcal{A}_{|A}=\{B\in\mathcal{A}|B\subseteq A\}$ and $\mu_{|\mathcal{A}_{|A}}:\mathcal{A}_{|A}\to[0,\infty]$ that $\langle A,\mathcal{A}_{|A},\mu_{|\mathcal{A}_{|A}}\rangle$ is a measure space. the question that we will answer in this section is the following: If $f:X\to\overline{\mathbb{R}}$ is integrable in $\langle X,\mathcal{A},\mu\rangle$ what can we say about the integrability of $f_{|A}:A\to\overline{\mathbb{R}}$ and what is the realation between the integrals $\int f d\mu$ and $\int f_{|A}d\mu_{|\mathcal{A}_{|A}}$ [if the integrals exist]. We first answer the question for integration of non negative functions.

Theorem 20.446. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space, $A \in \mathcal{A}$ and $\mathcal{X}_A \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then*

$$f_{|A} \in \mathcal{M}^+[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$$

and

$$\int_A^+ f d\mu \underset{\text{[see definition: 20.393]}}{=} \int^+ (\mathcal{X}_A \cdot f) d\mu = \int^+ f_{|A} d\mu_{|\mathcal{A}_{|A}}$$

Proof. In this proof we have to work with characteristics functions define on X and A so we use the following naming convention [see definition: 20.350]. More specifically

$$\text{If } C \subseteq X \text{ then } \mathcal{X}_C : X \to \overline{\mathbb{R}} \text{ is defined by } \mathcal{X}_C(x) = \begin{cases} 1 \text{ if } x \in C \\ 0 \text{ if } x \in X \setminus C \end{cases}$$

$$\text{If } C \subseteq A \text{ then } \mathcal{X}_{A,C} : A \to \overline{\mathbb{R}} \text{ is defined by } \mathcal{X}_{A,C}(x) = \begin{cases} 1 \text{ if } x \in C \\ 0 \text{ if } x \in A \setminus C \end{cases}$$

As $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows from [theorem: 20.355] it follows that

$$f_{|A} \in \mathcal{M}^+[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$$

Now using [definition: 20.390] we have that

$$\int^+ f_{|A} d\mu_{|\mathcal{A}_{|A}} = \sup\left(\left\{\int^S g d\mu_{|\mathcal{A}_{|A}} | g \in \mathcal{S}^+[A, \mathcal{A}_{|A}] \wedge \forall x \in A \text{ we have } g(x) \leqslant f_{|A}(x)\right\}\right) \tag{20.598}$$

$$\int^+ (\mathcal{X}_A \cdot f) d\mu = \sup\left(\left\{\int^S g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in A \text{ we have } g(x) \leqslant (\mathcal{X}_A \cdot f)(x)\right\}\right) \tag{20.599}$$

So to prove the theorem we have to prove that the above supremums are the same. Let $I \in \left\{\int^S g d\mu_{|\mathcal{A}_{|A}} | g \in \mathcal{S}^+[A, \mathcal{A}_{|A}] \wedge \forall x \in A \text{ we have } g(x) \leqslant f_{|A}(x)\right\}$ then there exist a $g \in \boldsymbol{S}^+[A, \mathcal{A}_A]$ with $\forall x \in A$ $g(x) \leqslant f_{|A}(x) = f(x)$ such that $I = \int^S g d\mu_{|\mathcal{A}_{|A}}$. Using the alternate definition of simple functions [see theorem: 20.376] there exist a $n \in \mathbb{N}$, a $\{C_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A}_{|A} = \{B \in \mathcal{A} | B \subseteq A\} \subseteq \mathcal{A}$ pairwise disjoint and $\{\alpha_i\}_{i \in \{1,\ldots,n\}} \subseteq [0, \infty[$ such that

$$g = \sum_{i=1}^n \alpha_i \cdot \mathcal{X}_{A,C_i}$$

Define now

$$h = \sum_{i=1}^n \alpha_i \cdot \mathcal{X}_{C_i}$$

then by [theorem: 20.376] it follows that

$$h \in \mathcal{S}^+[X, \mathcal{A}] \tag{20.600}$$

Further if $x \in X$ then we have either:

$\boldsymbol{x \in \bigsqcup_{i \in \{1,\ldots,n\}} C_i}$. Then $\exists i \in \{1, \ldots, n\}$ such that $x \in C_i \subseteq A$ so that

$$\begin{aligned} h(x) &= \left(\sum_{i=1}^n \alpha_i \cdot \mathcal{X}_{C_i}\right)(x) \\ &\underset{\text{[theorem: 20.367]}}{=} \alpha_i \\ &\underset{\text{[theorem: 20.367]}}{=} \left(\sum_{i=1}^n \alpha_i \cdot \mathcal{X}_{A,C_i}\right)(x) \\ &\leqslant f_{|A}(x) \\ &= f(x) \\ &= \mathcal{X}_A(x) \cdot f(x) \\ &= (X_A \cdot f)(x) \end{aligned}$$

$\boldsymbol{x \in X \setminus \bigsqcup_{i \in \{1,\ldots,n\}} C_i}$. Then by [theorem: 20.367] $h(x) = 0 \leqslant (\mathcal{X}_A \cdot f)(x)$ [as f is non negative].

which proves that

$$\forall x \in X \text{ we have } h(x) \leqslant (\mathcal{X}_A \cdot f)(x) \tag{20.601}$$

Further we have

$$I = \int^S g d\mu_{|\mathcal{A}_{|A}} \underset{\text{[definition: 20.380]}}{=} \sum_{i=1}^n \alpha_i \cdot \mu_{|\mathcal{A}_{|A}}(C_i) \underset{C \in \mathcal{A}}{=} \sum_{i=1}^n \alpha_i \cdot \mu(C_i) \underset{\text{[definition: 20.380]}}{=} \int^C h d\mu$$

The above together with [eqs: 20.600 and 20.601] proves that

$$I \in \left\{ \int^S g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in A \text{ we have } g(x) \leqslant (\mathcal{X}_A \cdot f)(x) \right\}.$$

So we have proved that

$$\left\{ \int^S g d\mu_{|\mathcal{A}_{|A}} | g \in \mathcal{S}^+[A, \mathcal{A}_{|A}] \wedge \forall x \in A \text{ we have } g(x) \leqslant f_{|A}(x) \right\} \subseteq$$
$$\left\{ \int^S g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in A \text{ we have } g(x) \leqslant (\mathcal{X}_A \cdot f)(x) \right\} \tag{20.602}$$

For the opposite inequality. Let $I \in \left\{ \int^S g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in A \text{ we have } g(x) \leqslant (\mathcal{X}_A \cdot f)(x) \right\}$ then there exist a $k \in \mathcal{S}^+[X, \mathcal{A}]$ with $\forall x \in X\ k(x) \leqslant (\mathcal{X}_A \cdot f)(x)$ such that $I = \int^S k d\mu$. Now for $x \in X$ we have either:

$x \in A$. Then $k(x) = \mathcal{X}_A(x) \cdot k(x) = (\mathcal{X}_A \cdot k)(x)$

$x \in X \setminus A$. As $0 \leqslant k(x) \leqslant (\mathcal{X}_A \cdot f)(x) = \mathcal{X}_A(x) \cdot f(x) = 0$ so that

$$k(x) = 0 = \mathcal{X}_A(x) \cdot k(x) = (\mathcal{X}_A \cdot k)(x)$$

hence we have proved that

$$k = \mathcal{X}_A \cdot k \tag{20.603}$$

As $g \in \mathcal{S}^+[X, \mathcal{A}]$ there exist by [theorem: 20.376] a $m \in \mathbb{N}$, a $\{B_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A}$ pairwise disjoint and a $\{\beta_i\}_{i \in \{1, \ldots, m\}} \subseteq [0, \infty[$ such that

$$k = \sum_{i=1}^m \beta_i \cdot \mathcal{X}_{B_i}$$

Then we have

$$k \underset{\text{[eq: 20.603]}}{=} \mathcal{X}_A \cdot \sum_{i=1}^m \beta_i \cdot \mathcal{X}_{B_i} = \sum_{i=1}^m \beta_i \cdot \mathcal{X}_A \cdot \mathcal{X}_{B_i} \underset{\text{[theorem: 20.351]}}{=} \sum_{i=1}^m \beta_i \cdot \mathcal{X}_{A \bigcap B_i} \tag{20.604}$$

Define now

$$l = \sum_{i=1}^m \beta_i \cdot \mathcal{X}_{A, A \bigcap B_i}$$

As $\forall i \in \{1, \ldots, m\}\ B_i \in \mathcal{A} \Rightarrow A \bigcap B_i \in \mathcal{A}$ and $A \bigcap B_i \subseteq A$ it follows that $\{A \bigcap B_i\}_{i \in \{1, \ldots, m\}} \subseteq \mathcal{A}_{|A}$ [pairwise disjoint]. So using [theorem: 20.376] we have that

$$l \in \mathcal{S}^+[A, \mathcal{A}_{|A}] \tag{20.605}$$

Further if $x \in A$ then we have either:

$x \in \bigsqcup_{i \in \{1, \ldots, m\}} (A \bigcap B_i)$. Then $\exists i \in \{1, \ldots, m\}$ such that $x \in A \bigcap B_i \subseteq B_i, A$ so that

$$\begin{aligned}
l(x) &= \left(\sum_{i=1}^m \beta_i \cdot \mathcal{X}_{A, A \bigcap B_i} \right)(x) \\
&\underset{\text{[theorem: 20.367]}}{=} \beta_i \\
&\underset{\text{[theorem: 20.367]}}{=} \left(\sum_{i=1}^m \beta_i \cdot \mathcal{X}_{B_i} \right)(x) \\
&= k(x) \\
&\leqslant (\mathcal{X}_A \cdot f)(x) \\
&\leqslant f(x) \\
&= f_{|A}(x)
\end{aligned}$$

$\boldsymbol{x \notin A \setminus \bigsqcup_{i \in \{1,\ldots,m\}} (A \bigcap B_i)}$**.** Then $l(x) = 0 \leqslant f_{|A}(x)$ [as f is non negative] which proves that

$$\forall x \in A \text{ we have } l(x) \leqslant f_{|A}(x) \tag{20.606}$$

Further

$$I = \int^S k d\mu \underset{\text{[definition: 20.380]}}{=} \sum_{i=1}^m \beta_i \cdot \mu(A \bigcap B_i) \underset{A \bigcap B_i \in \mathcal{A}_{|A}}{=} \sum_{i=1}^m \beta_i \cdot \mu_{|\mathcal{A}_{|A}}(A \bigcap B_i) = \int^S l d\mu_{|\mathcal{A}_{|A}}$$

Combining the above with [eqs: 20.605 and 20.606] proves that

$$I \in \left\{ \int^S g d\mu_{|\mathcal{A}_{|A}} | g \in \mathcal{S}^+[A, \mathcal{A}_{|A}] \wedge \forall x \in A \text{ we have } g(x) \leqslant f_{|A}(x) \right\}$$

hence

$$\left\{ \int^S g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in A \text{ we have } g(x) \leqslant (\mathcal{X}_A \cdot f)(x) \right\} \subseteq$$
$$\left\{ \int^S g d\mu_{|\mathcal{A}_{|A}} | g \in \mathcal{S}^+[A, \mathcal{A}_{|A}] \wedge \forall x \in A \text{ we have } g(x) \leqslant f_{|A}(x) \right\}$$

which combined with [eq: 20.602] gives

$$\left\{ \int^S g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in A \text{ we have } g(x) \leqslant (\mathcal{X}_A \cdot f)(x) \right\} =$$
$$\left\{ \int^S g d\mu_{|\mathcal{A}_{|A}} | g \in \mathcal{S}^+[A, \mathcal{A}_{|A}] \wedge \forall x \in A \text{ we have } g(x) \leqslant f_{|A}(x) \right\}$$

Finally using [eqs: 20.598 and 20.599] it follows that

$$\int^+ (\mathcal{X}_A \cdot f) d\mu = \int^+ f_{|A} d\mu_{|\mathcal{A}_{|A}}$$

□

In the above we went from the integral of $(\mathcal{X}_A \cdot f)$ where f has domain X to the integral of $f_{|A}$ with domain A. The next lemma goes in the opposite way we start with the integral of a function with domain B and go the integral of $f_{A \uparrow X}$ with domain X.

Theorem 20.447. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $A \in \mathcal{A}$ and $f \in \mathcal{M}^+[A, \mathcal{A}_A, \overline{\mathbb{R}}]$ then $f_{A \uparrow X} \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ and*

$$\int^+ f d\mu_{|\mathcal{A}_{|A}} = \int^+ f_{A \uparrow X} d\mu$$

where

$$\mathcal{A}_{|A} = \{B \in \mathcal{A} | B \subseteq A\} \text{ see [definition: 20.147]}$$
$$\mu_{|\mathcal{A}_{|A}} \text{ is the restriction of } \mu \text{ to } \mathcal{A}_{|A}$$
$$f_{A \uparrow X} : X \to \overline{\mathbb{R}} \text{ is defined by } f_{A \uparrow X}(x) = \begin{cases} f(x) & \text{if } x \in A \\ 0 & \text{if } x \in X \setminus A \end{cases} \text{ [see definition: 20.329]}$$

Proof. As $f \in \mathcal{M}^+[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$ it follows from [theorem: 20.331] that

$$f_{A \uparrow X} \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

which proves the first part of the lemma. Now for the second part note that

$$\begin{aligned} \int^+ f_{A \uparrow X} d\mu &\underset{\text{[note: 20.329]}}{=} \int^+ (\mathcal{X}_A \cdot f_{A \uparrow X}) d\mu \\ &\underset{\text{[theorem: 20.446]}}{=} \int^+ (f_{A \uparrow X})_{|A} d\mu_{|\mathcal{A}_{|A}} \\ &\underset{\text{[note: 20.329]}}{=} \int^+ f d\mu_{|\mathcal{A}_{|A}} \end{aligned}$$

□

We extend now the above two results to general integration.
TODO

Theorem 20.448. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space, $A \in \mathcal{A}$ and $\langle A, \mathcal{A}_{|A}, \mu_{|\mathcal{A}_{|A}}\rangle$ [see theorem: 20.199] then we have:*

1. *The following are equivalent*
   a. *f is μ-integrable over A [meaning that $\mathcal{X}_A \cdot f$ is μ-integrable [see definition: 20.420]*
   b. *$f_{|A}$ is $\mu_{|\mathcal{A}_{|A}}$ integrable*

   Further in case of (a) [and thus also of (b)] we have $\int_A f d\mu = \int f_{|A} d\mu_{|\mathcal{A}_{|A}}$
2. *The following are equivalent*
   a. *f is $\mu_{|\mathcal{A}_{|A}}$-integrable.*
   b. *$f_{A\uparrow X}$ is μ-integrable*

   Further in case of (a) [and thus also of (b)] we have $\int f_{A\uparrow X} d\mu = \int f\, d\mu_{/\mathcal{A}_{/A}}$

Proof.

1.

a ⇒ b. As f is μ-integrable on A we have that $\mathcal{X}_A \cdot f$ is μ-integrable, which by definition means that

$$\mathcal{X}_A \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \underset{\text{[theorem: 20.413]}}{\Rightarrow} (\mathcal{X}_A \cdot f)^+, (\mathcal{X}_A \cdot f)^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \tag{20.607}$$

and

$$\int^+ (\mathcal{X}_A \cdot f)^+ d\mu < \infty \wedge \int^+ (\mathcal{X}_A \cdot f)^- d\mu < \infty \tag{20.608}$$

Applying [theorem: 20.446] on [eq: 20.607] gives

$$((\mathcal{X}_A \cdot f)^+)_{|A} \in \mathcal{M}^+[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}] \text{ and } ((\mathcal{X}_A \cdot f)^-)_{|A} \in \mathcal{M}^-[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}] \tag{20.609}$$

$$\mathcal{X}_A \cdot (\mathcal{X}_A \cdot f)^+ \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \mathcal{X}_A \cdot (\mathcal{X}_A \cdot f)^- \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \tag{20.610}$$

$$\int^+ (\mathcal{X}_A \cdot (\mathcal{X}_A \cdot f)^+) d\mu = \int^+ ((\mathcal{X}_A \cdot f)^+)_{|A} d\mu_{|\mathcal{A}_{|A}} \tag{20.611}$$

$$\int^+ (\mathcal{X}_A \cdot (\mathcal{X}_A \cdot f)^-) d\mu = \int^+ ((\mathcal{X}_A \cdot f)^-)_{|A} d\mu_{|\mathcal{A}_{|A}} \tag{20.612}$$

Now

$$((\mathcal{X}_A \cdot f)^+)_{|A} \underset{\text{[theorem: 20.414]}}{=} ((\mathcal{X}_A \cdot f)_{|A})^+ \underset{\text{[theorem: 20.351]}}{=} (f_{|A})^+ \tag{20.613}$$

$$((\mathcal{X}_A \cdot f)^-)_{|A} \underset{\text{[theorem: 20.414]}}{=} ((\mathcal{X}_A \cdot f)_{|A})^- \underset{\text{[theorem: 20.351]}}{=} (f_{|A})^- \tag{20.614}$$

$$\mathcal{X}_A \cdot (\mathcal{X}_A \cdot f)^+ \underset{\text{[theor: 20.414(8)]}}{=} (\mathcal{X}_A \cdot \mathcal{X}_A \cdot f)^+ \underset{\text{[theor: 20.351]}}{=} (\mathcal{X}_{A \bigcap A} \cdot f)^+ = (\mathcal{X}_A \cdot f)^+ \tag{20.615}$$

$$\mathcal{X}_A \cdot (\mathcal{X}_A \cdot f)^- \underset{\text{[theor: 20.414(8)]}}{=} (\mathcal{X}_A \cdot \mathcal{X}_A \cdot f)^- \underset{\text{[20.351]}}{=} (\mathcal{X}_{A \bigcap A} \cdot f)^- = (\mathcal{X}_A \cdot f)^- \tag{20.616}$$

Substituting [eqs: 20.613, 20.615,20.614, 20.616] in [eqs: 20.609, 20.611,20.610, 20.612] we get

$$(f_{|A})^+ \in \mathcal{M}^+[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}] \text{ and } (f_{|A})^- \in \mathcal{M}^+[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$$

$$(\mathcal{X}_A \cdot f)^+ \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } (\mathcal{X}_A \cdot f)^- \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

$$\int^+ (f_{|A})^+ d\mu_{|\mathcal{A}_{|A}} = \int^+ (\mathcal{X}_A \cdot f)^+ d\mu \underset{\text{[eq: 20.608]}}{<} \infty$$

$$\int^+ (f_{|A})^- d\mu_{|\mathcal{A}_{|A}} = \int^+ (\mathcal{X}_A \cdot f)^- d\mu \underset{\text{[eq: 20.608]}}{<} \infty$$

From the above it follows that $f_{|A}$ is $\mu_{|\mathcal{A}_{|A}}$-integrable and

$$\begin{aligned}\int f_{|A} d\mu_{|\mathcal{A}_{|A|}} &\underset{\text{def}}{=} \int^{+} (f_{|A})^{+} d\mu_{|\mathcal{A}_{|A}} - \int^{+} (f_{|A})^{-} d\mu_{|\mathcal{A}_{|A}} \\ &= \int^{+} (\mathcal{X}_A \cdot f)^{+} d\mu - \int^{+} (\mathcal{X}_A \cdot f)^{-} d\mu \\ &\underset{\text{def}}{=} \int (\mathcal{X}_A \cdot f) d\mu \\ &\underset{\text{def}}{=} \int_A f d\mu\end{aligned}$$

***b* ⇒ *a*.** Because $f_{|A}$ is $\mu_{|\mathcal{A}_{|A}}$-integrable we have by definition that

$$f_{|A} \in \mathcal{M}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}] \underset{[\text{theorem: } 20.413]}{\Rightarrow} (f_{|A})^{+}, (f_{|A})^{-} \in \mathcal{M}^{+}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}] \tag{20.617}$$

$$\int^{+} (f_{|A})^{+} d\mu_{|\mathcal{A}_{|A}} < \infty \text{ and } \int^{+} (f_{|A})^{-} d\mu_{|\mathcal{A}_{|A}} < \infty \tag{20.618}$$

Using [theorem: 20.414(9)] it follows that $(f_{|A})^{+} = (f^{+})_{|A}$ and $(f_{|A})^{+} = (f^{+})_{|A}$ which after substituting this result in [eq: 20.617] gives

$$f_{|A}, (f^{+})_{|A}, (f^{-})_{|A} \in \mathcal{M}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$$

Using then [theorem: 20.355] on the above results in

$$\mathcal{X}_A \cdot f, \mathcal{X}_A \cdot f^{+}, \mathcal{X}_A \cdot f^{-} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \tag{20.619}$$

Using [theorem: 20.446] ont the above it follows that

$$\int^{+} (\mathcal{X}_A \cdot f^{+}) d\mu = \int^{+} (f^{+})_{|A} d\mu_{|\mathcal{A}_{|A}} \underset{[\text{theorem: } 20.414(8)]}{=} \int^{+} (f_{|A})^{+} d\mu_{|\mathcal{A}_{|A}} \underset{[\text{eq: } 20.618]}{<} \infty$$

$$\int^{+} (\mathcal{X}_A \cdot f^{+}) d\mu = \int^{+} (f^{+})_{|A} d\mu_{|\mathcal{A}_{|A}} \underset{[\text{theorem: } 20.414(8)]}{=} \int^{+} (f_{|A})^{+} d\mu_{|\mathcal{A}_{|A}} \underset{[\text{eq: } 20.618]}{<} \infty$$

Finally as by [theorem: 20.414(8)] $\mathcal{X}_A \cdot f^{+} = (\mathcal{X}_A \cdot f)^{+} \wedge \mathcal{X}_A \cdot f^{-} = (\mathcal{X}_A \cdot f)^{-}$ it follows that

$$\int^{+} (\mathcal{X}_A \cdot f)^{+} d\mu < \infty \wedge \int^{+} (\mathcal{X}_A \cdot f)^{-} d\mu < \infty$$

which together with $\mathcal{X}_A \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ [see eq: 20.619] proves $\mathcal{X}_A \cdot f$ is μ-integrable. Hence by [definition: 20.420] f is μ-integrable over A.

2.

***a* ⇒ *b*.** As f is $\mu_{|\mathcal{A}_{|A}}$-integrable we have that

$$f \in \mathcal{M}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}] \underset{[\text{theorem: } 20.413]}{\Rightarrow} f^{+}, f^{-} \in \mathcal{M}^{+}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}] \tag{20.620}$$

$$\int^{+} f^{+} d\mu_{|\mathcal{A}_{|A}} < \infty \text{ and } \int^{+} f^{-} d\mu_{|\mathcal{A}_{|A}} < \infty \tag{20.621}$$

Using [theorem: 20.447] it follows that

$$(f^{+})_{A \uparrow X} \in \mathcal{M}^{+}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^{+} (f^{+})_{A \uparrow X} d\mu = \int^{+} f^{+} d\mu_{|\mathcal{A}_{|A}} < \infty$$

$$(f^{-})_{A \uparrow X} \in \mathcal{M}^{+}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^{+} (f^{-})_{A \uparrow X} d\mu = \int^{+} f^{-} d\mu_{|\mathcal{A}_{|A}} < \infty$$

As by [theorem: 20.414(6)] $(f^+)_{A\uparrow X} = (f_{A\uparrow X})^+$ and $(f^-)_{A\uparrow X} = (f_{A\uparrow X})^-$ the above becomes:

$$(f_{A\uparrow X})^+ \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ (f_{A\uparrow X})^+ d\mu = \int^+ f^+ d\mu_{|\mathcal{A}_{|A}} < \infty \tag{20.622}$$

$$(f_{A\uparrow X})^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ (f_{A\uparrow X})^- d\mu = \int^+ f^- d\mu_{|\mathcal{A}_{|A}} < \infty \tag{20.623}$$

Using the above and the fact that $f \in \mathcal{M}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}] \underset{\text{[theorem: 20.447]}}{\Rightarrow} f_{A\uparrow X} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ proves that

$$f_{A\uparrow X} \text{ is } \mu\text{-integrable}$$

Further we have that

$$\begin{aligned} \int f_{A\uparrow X} d\mu &\underset{\text{def}}{=} \int^+ (f_{A\uparrow X})^+ d\mu - \int^+ (f_{A\uparrow X})^- d\mu \\ &\underset{\text{[eqs: 20.622.20.623]}}{=} \int^+ f^+ d\mu_{|\mathcal{A}_{|A}} - \int^+ f^- d\mu_{|\mathcal{A}_{|A}} \\ &= \int f d\mu_{|\mathcal{A}_{|A}} \end{aligned}$$

***b* ⇒ *a*.** As $f_{A\uparrow X}$ is μ-integrable we have by definition that

$$f_{A\uparrow X} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \underset{\text{[theorem: 20.413]}}{\Rightarrow} (f_{A\uparrow X})^+, (f_{A\uparrow X})^- \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

$$\int^+ (f_{A\uparrow X})^+ d\mu < \infty \wedge \int^+ (f_{A\uparrow X})^- d\mu < \infty$$

Inserting $(f_{A\uparrow X})^+ \underset{\text{[theorem: 20.414(5)]}}{=} (f^+)_{A\uparrow X}$ and $(f_{A\uparrow X})^- \underset{\text{[theorem: 20.414(5)]}}{=} (f^-)_{A\uparrow X}$ in the above gives

$$f_{A\uparrow X}, (f^+)_{A\uparrow X}, (f^-)_{A\uparrow X} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \tag{20.624}$$

$$\int^+ (f^+)_{A\uparrow X} d\mu < \infty \wedge \int^+ (f^-)_{A\uparrow X} d\mu < \infty \tag{20.625}$$

Uisng [theorem: 20.331] on [eq: 20.624] gives

$$f, f^+, f^- \in \mathcal{M}[]$$

□

20.6.6 Complex integration

20.6.6.1 Measurability of complex valued functions

If we want to develop a theory of integration of complex valued functions we need first to replace the measure space $\langle \overline{\mathbb{R}}, \mathcal{B}[\overline{\mathbb{R}}], \lambda \rangle$ with a measure space based on $\mathbb{C}$ instead of $\overline{\mathbb{R}}$. To do this we make use of the fact that $\mathbb{C}$ is actually defined as $\mathbb{C} = \mathbb{R}^2$ [see definition: 10.1] where $z = x + i \cdot y$ is actually equivalent with $(x, y) = x + i \cdot y$ [see theorem: 10.77]. Further the topology on $\mathbb{C} = \mathbb{R}^2$ based on the absolute value $||$: $\mathbb{C} \to [0, \infty[$ where $|(x, y)| = \sqrt{x^2 + y^2}$ is by [theorem: 14.117] is equivalent with the norm $||_2 : \mathbb{C} \to [0, \infty[$ defined by $|(x, y)|_2 = \max(|x|, |y|)$ so that by [theprem: 14.113] the topology $\mathcal{T}_{||}$ [the canonical topology on $\mathbb{C}$] is equal to the topology $\mathcal{T}_{||\|_2}$. Hence the following definition makes sence.

Definition 20.449. *The measurable space for the complex numbers noted as $\langle \mathbb{C}, \mathcal{B}[\mathbb{C}] \rangle$ is defined by*

$$\mathbb{C} = \mathbb{R}^2 \text{ and } \mathcal{B}[\mathbb{C}] = \mathcal{B}[\mathbb{C}, \mathcal{T}_{||}] = \mathcal{B}[\mathbb{R}^2, \mathcal{T}_{||_2}] = \sigma[\mathcal{T}_{||\|_2}] \underset{\text{[theorem: 20.163]}}{=} \mathcal{B}[\mathbb{R}^2]$$

In other words

$$\langle \mathbb{C}, \mathcal{B}[\mathbb{C}] \rangle = \langle \mathbb{R}^2, \mathcal{B}[\mathbb{R}^2] \rangle$$

Once we have defined the measurable space we can define the set of all measurable functions to $\mathbb{C}$.

Definition 20.450. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space, $A \in \mathcal{A}$ then the set of all $\mathcal{A}, \mathcal{B}[\mathbb{C}]$-measurable functions is noted as $\mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ so*

$$\mathcal{M}[A, \mathcal{A}, \mathbb{C}] = \{f \in \mathbb{C}^A | f: X \to \mathbb{C} \text{ is } \mathcal{A}, \mathcal{B}[\mathbb{C}]\text{-measurable}\}$$

***Note* 20.451.** *Sometimes we want to talk about $\mathcal{M}[A, \mathcal{A}, \mathbb{R}]$ and $\mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ at the same time. In this case we use the notation $\mathcal{M}[A, \mathcal{A}, \mathbb{K}]$ where $\mathcal{M}[A, \mathcal{A}, \mathbb{K}]$ stands for either $\mathcal{M}[A, \mathcal{A}, \mathbb{R}]$ or $\mathcal{M}[A, \mathcal{A}, \mathbb{C}]$. Just like $\mathbb{K}$ stands for either $\mathbb{R}$ or $\mathbb{C}$.*

The following general theorem will be usefull for a alternative definition of $\mathcal{M}[X, \mathcal{A}, \mathbb{C}]$.

Theorem 20.452. *Let $n \in \mathbb{N}$, $\langle X, \mathcal{A}\rangle$, $A \in \mathcal{A}$ be a measurable space and $f: A \to \mathbb{R}^n$ a function then*

$$f \text{ is } \mathcal{A}, \mathcal{B}[\mathbb{R}^n]\text{-measurable} \Leftrightarrow \forall i \in \{1, \ldots, n\} \ f_i = \pi_i \circ f: A \to \mathbb{R} \text{ is } \mathcal{A}\text{-measurable}$$

Proof.

- **$\Rightarrow$.** Given $i \in \{1, \ldots, n\}$ we have by [theorems: 14.94, 14.141] that $\pi_i: \mathbb{R}^n \to \mathbb{R}$ is continuous using the topologies $\mathcal{T}, \mathcal{T}_{||_n}$. So using [theorem: 20.336] it follows that π_i is $\mathcal{B}[\mathbb{R}^n], \mathcal{B}[\mathbb{R}]$-measurable. As f is $\mathcal{A}$, $\mathcal{B}[\mathbb{R}^n]$-measurable it follows from [theorem: 20.315] that $f_i = \pi_i \circ f$ is $\mathcal{A}, \mathcal{B}[\mathbb{R}]$-measurable, hence by definition we have that f is $\mathcal{A}$-measurable.
- **$\Leftarrow$.** Using [theorem: 20.187] we have that

  $$\mathcal{B}[\mathbb{R}^n] = \sigma(\mathcal{H}^n) \text{ where } \mathcal{H}^n = \{]-\infty, a[_i | i \in \{1, \ldots, n\} \wedge a \in \mathbb{R}\} \text{ and }]-\infty, a[_i = \{x \in \mathbb{R}^n | x_i < a|\}$$

  Let $A \in \mathcal{H}^n$ then there exists a $i \in \{1, \ldots, n\}$ and a $x \in \mathbb{R}$ such that $A =]-\infty, x[_i$ then we have

  $$\begin{aligned} y \in f^{-1}(A) &\Leftrightarrow f(y) \in]-\infty, x[_i \\ &\Leftrightarrow (f(y))_i < x \\ &\Leftrightarrow \pi_i(f(y)) < x \\ &\Leftrightarrow (\pi_i \circ f)_i(y) < x \\ &\Leftrightarrow f_i(y) < x \\ &\Leftrightarrow y \in \{f_i < x\} \end{aligned}$$

  which proves that

  $$f^{-1}(A) = \{f_i < x\} \underset{f_i \text{ is } \mathcal{A}\text{-measurable}}{\in} \mathcal{A}$$

  Hence we have by [theorem: 20.332] that f is $\mathcal{A}, \mathcal{B}[\mathbb{R}^n]$-measurable. □

Applying the above theorem to $\mathbb{R}^2$ yields a simple way to checkif $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$.

Definition 20.453. *Let X be a set and $f: X \to \mathbb{C}$ then we define*

$$\mathrm{Re}(f): X \to \mathbb{R} \text{ by } \mathrm{Re}(f)(x) = \mathrm{Re}(f(x))$$

$$\mathrm{Img}(f): X \to \mathbb{R} \text{ by } \mathrm{Img}(f)(x) = \mathrm{Img}(f(x))$$

Theorem 20.454. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space, $A \in \mathcal{A}$ and $f: A \to \mathbb{C}$ a function then we have*

$$f \text{ is } \mathcal{A}, \mathcal{B}[\mathbb{C}]\text{-measurable} \Leftrightarrow \mathrm{Re}(f) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \text{ and } \mathrm{Img}(f) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

Proof. This follows from the previous theorem [see theorem: 20.452], $\mathrm{Re}(f), \mathrm{Img}(f) \subseteq \mathbb{R}$ and the fact that $\mathbb{C} = \mathbb{R}^2$, $\mathrm{Re}(f) = \pi_i \circ f$ and $\mathrm{Img}(f) = \pi_2 \circ f$. □

We have now similar properties for $\mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ as for $\mathcal{M}[X, \mathcal{A}]$. First we define some pointwise definitions:

Definition 20.455. *Let X be a set then we define*

1. *If $\alpha \in \mathbb{C}$ and $f: X \to \mathbb{C}$ a function then $\alpha \cdot f: X \to \mathbb{C}$ is defined by $(\alpha \cdot f)(x) = \alpha \cdot f(x)$*
2. *If $f: X \to \mathbb{C}$ is a function then $|f|: X \to \mathbb{R}$ is defined by $|f|(x) = |f(x)|$.*
3. *If $f: X \to \mathbb{C}$ and $g: X \to \mathbb{C}$ are functions then we define:*
   a. *$f + g: X \to \mathbb{C}$ by $(f+g)(x) = f(x) + g(x)$*
   b. *$f \cdot g: X \to \mathbb{C}$ by $(f \cdot g)(x) = f(x) \cdot g(x)$*
4. *If $n \in \mathbb{N}$, $\{f_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathbb{C}^X$ then $\sum_{i=1}^n f_i: X \to \mathbb{C}$ is defined by $(\sum_{i=1}^n f_i)(x) = \sum_{i=1}^n f_i(x)$*
5. *If $\{f_i\}_{i \in \mathbb{N}} \subseteq \mathbb{C}^X$ then*
$$\lim_{i \to \infty} f_i: \left\{x \in X \,|\, \lim_{i \to \infty} f_i(x) \text{ exist}\right\} \to \mathbb{C} \text{ is defined by } \left(\lim_{i \to \infty} f_i\right)(x) = \lim_{i \to \infty} f_i(x)$$

TODO a reference in proof of (6) must be updated

Theorem 20.456. *Let $\langle X, \mathcal{A} \rangle$, $A \in \mathcal{A}$ be a measurable space then we have*

1. *$\forall f, g \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ we have that $f + g \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$.*
2. *If $n \in \mathbb{N}$, $\{f_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ then $\sum_{i=1}^n f_i \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$.*
3. *$\forall \alpha \in \mathbb{C}$ and $f \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$we have that $\alpha \cdot f \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$.*
4. *$\forall f, g \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ we have $f \cdot g \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$.*
5. *If $A \in A$ and $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ then $\mathcal{X}_A \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$.*
6. *If $\{f_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ and $D = \left\{x \in X \,|\, \lim_{i \to \infty} f_i(x) \text{ exist}\right\}$ then $D \in \mathcal{A}$ and $\lim_{i \to \infty} f_i \in \mathcal{M}[D, \mathcal{A}, \mathbb{C}]$.*

Proof.

1. As $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ we have by the previous theorem [theorem: 20.454] that
$$\mathrm{Re}(f), \mathrm{Img}(f), \mathrm{Re}(g), \mathrm{Img}(f) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \tag{20.626}$$
Let $x \in X$ then
$$\begin{aligned}(f+g)(x) &= f(x) + g(x) \\ &= \mathrm{Re}(f(x)) + i \cdot \mathrm{Img}(f(x)) + \mathrm{Re}(g(x)) + i \cdot \mathrm{Img}(g(x)) \\ &= (\mathrm{Re}(f(x)) + \mathrm{Re}(g(x))) + i \cdot (\mathrm{Img}(f(x)) + \mathrm{Img}(g(x))) \\ &= (\mathrm{Re}(f) + \mathrm{Re}(g))(x) + i \cdot (\mathrm{Img}(f) + \mathrm{Img}(g))(x)\end{aligned}$$
proving that
$$\mathrm{Re}(f+g) = \mathrm{Re}(f) + \mathrm{Re}(g) \text{ and } \mathrm{Img}(f+g) = \mathrm{Img}(f) + \mathrm{Img}(g)$$
Using the above, [eq: 20.626] and [theorem: 20.340] we have that $\mathrm{Re}(f+g), \mathrm{Img}(f+g) \in \mathcal{M}[A, \mathcal{A}]$ so that by the previous theorem [see theorem: 20.454] we have that
$$f + g \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$$
2. This is easily proved by induction. So let
$$\mathcal{S} = \left\{n \in \mathbb{N}_0 | \text{If } \{f_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{M}[A, \mathcal{A}, \mathbb{C}] \text{ then } \sum_{i=1}^n f_i \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]\right\}$$
then we have:

   $1 \in \mathcal{S}$. If $\{f_i\}_{i \in \{1\}} \subseteq \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ then $\sum_{i=1}^1 f_i = f_1 \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ which proves that $1 \in \mathcal{S}$.

   $n \in \mathcal{S} \Rightarrow n + 1 \in \mathcal{S}$. then if $\{f_i\}_{i \in \{1,\ldots,n+1\}} \subseteq \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ we have as $\sum_{i=1}^{n+1} f_i = f_{n+1} + \sum_{i=1}^n f_i \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ [as $f_{n+1} \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$, $n \in \mathcal{S}$ and (1)]. So $n + 1 \in \mathcal{S}$

   induction proves then (2).

3. As $f \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ we have by the previous theorem [theorem: 20.454] that

$$\mathrm{Re}(f), \mathrm{Img}(f) \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}] \tag{20.627}$$

Let $x \in X$ then

$$\begin{aligned}
(\alpha \cdot f)(x) &= \\
\alpha \cdot f(x) &= \\
(\mathrm{Re}(\alpha) + i \cdot \mathrm{Img}(\alpha)) \cdot (\mathrm{Re}(f(x)) + i \cdot \mathrm{Img}(f(x))) &= \\
(\mathrm{Re}(\alpha) \cdot \mathrm{Re}(f(x)) - \mathrm{Img}(\alpha) \cdot \mathrm{Img}(f(x))) + i \cdot (\mathrm{Re}(\alpha) \cdot \mathrm{Img}(f(x)) + \mathrm{Img}(\alpha) \cdot \mathrm{Re}(fx)) &= \\
(\mathrm{Re}(\alpha) \cdot \mathrm{Re}(f) - \mathrm{Img}(\alpha) \cdot \mathrm{Img}(f))(x) + i \cdot (\mathrm{Re}(\alpha) \cdot \mathrm{Img}(f) + \mathrm{Img}(\alpha) \cdot \mathrm{Re}(f))(x) &
\end{aligned}$$

proving that

$$\mathrm{Re}(\alpha \cdot f) = \mathrm{Re}(\alpha) \cdot \mathrm{Re}(f) - \mathrm{Img}(\alpha) \cdot \mathrm{Img}(f) \wedge \mathrm{Img}(\alpha \cdot f) = \mathrm{Re}(\alpha) \cdot \mathrm{Img}(f) + \mathrm{Img}(\alpha) \cdot \mathrm{Re}(f)$$

Using the above, [eq: 20.627 and [theorem: 20.344] we have that

$$\mathrm{Re}(\alpha \cdot f), \mathrm{Img}(\alpha \cdot f) \in \mathcal{M}[A, \mathcal{A}, \mathbb{R}]$$

which by [theorem: 20.454] proves

$$\alpha \cdot f \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$$

4. As $f, g \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ we have by [theorem: 20.454] that $\mathrm{Ref}(f), \mathrm{Ref}(g), \mathrm{Img}(f), \mathrm{Img}(g) \in \mathcal{M}[A, \mathcal{A}, \mathbb{R}]$. Further

$$\begin{aligned}
f \cdot g &= (\mathrm{Re}(f) + i \cdot \mathrm{Img}(f)) \cdot (\mathrm{Re}(g) + i \cdot \mathrm{Img}(g)) \\
&= \mathrm{Re}(f) \cdot \mathrm{Re}(g) - \mathrm{Img}(f) \cdot \mathrm{Img}(g) + i \cdot (\mathrm{Re}(f) \cdot \mathrm{Img}(g) + \mathrm{Img}(f) \cdot \mathrm{Re}(g))
\end{aligned}$$

proving that

$$\begin{aligned}
\mathrm{Re}(f \cdot g) &= \mathrm{Re}(f) \cdot \mathrm{Re}(g) - \mathrm{Img}(f) \cdot \mathrm{Img}(g) \\
\mathrm{Img}(f \cdot g) &= \mathrm{Re}(f) \cdot \mathrm{Img}(g) + \mathrm{Img}(f) \cdot \mathrm{Re}(g)
\end{aligned}$$

Using then [theorem: 20.345] it follows that

$$\mathrm{Re}(f \cdot g), \mathrm{Img}(f \cdot g) \in \mathcal{M}[A, \mathcal{A}, \mathbb{R}]$$

which by [theorem: 20.454] proves that $f \cdot g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$

5. As $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ we have by [theorem: 20.454] that

$$\mathrm{Re}(f), \mathrm{Img}(f) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

Further we have for $x \in X$

$$\mathrm{Re}(\mathcal{X}_A \cdot f)(x) = \mathrm{Re}(\mathcal{X}_A(x) \cdot f(x)) \underset{\mathcal{X}_A(x) \in \mathbb{R}}{=} \mathcal{X}_A(x) \cdot \mathrm{Re}(f(x)) = (\mathcal{X}_A \cdot \mathrm{Re}(f))(x)$$

$$\mathrm{Img}(\mathcal{X}_A \cdot f)(x) = \mathrm{Img}(\mathcal{X}_A(x) \cdot f(x)) \underset{\mathcal{X}_A(x) \in \mathbb{R}}{=} \mathcal{X}_A(x) \cdot \mathrm{Img}(f(x)) = (\mathcal{X}_A \cdot \mathrm{Img}(f))(x)$$

so that by [theorem: 20.353]

$$\mathrm{Re}(\mathcal{X}_A \cdot f), \mathrm{Img}(\mathcal{X}_A \cdot f) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

hence using [theorem: 20.454] we have that $\mathcal{X}_A \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$.

6. As $\{f_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ we have by [theorem: 20.454] that

$$\forall i \in \mathbb{N}\ \mathrm{Re}(f_i), \mathrm{Img}(f_i) \in \mathcal{M}[A, \mathcal{A}, \mathbb{R}]$$

Further using [theorem: 14.304] we have that $\lim_{i \to \infty} f_i(x)$ exists if and only if $\lim_{i \to \infty} \mathrm{Re}(f_i(x))$ and $\lim_{i \to \infty} \mathrm{Img}(f_i(x))$ exists. So if $D_1 = \left\{ x \in A | \lim_{i \to \infty} \mathrm{Re}(f_i(x)) \text{ exists} \right\}$ and $D_2 = \left\{ x \in A | \lim_{i \to \infty} \mathrm{Img}(f_i(x)) \text{ exists} \right\}$ then we have

$$D = \left\{ x \in A | \lim_{i \to \infty} f_i(x) \text{ exists} \right\} = D_1 \bigcap D_2$$

From [theorem: 20.348] we have that $D_1 \in \mathcal{A}, D_2 \in \mathcal{A}$ proving that

$$D = D_1 \bigcap D_2 \in \mathcal{A}$$

Further using [theorem: 20.348] again we have that $\lim_{i\to\infty} \mathrm{Re}(f_i) \in \mathcal{M}[D_1, \mathcal{A}, \mathbb{R}]$ and $\lim_{i\to\infty} \mathrm{Img}(f_i) \in \mathcal{M}[D]$ which as $D \subseteq D_1, D_2$ proves by [theorem: TODO find reference to use] that

$$\left(\lim_{i\to\infty} \mathrm{Re}(f_i)\right)_{|D}, \left(\lim_{i\to\infty} \mathrm{Img}(f_i)\right)_{|D} \in \mathcal{M}[D, \mathcal{A}, \mathbb{C}].$$

Further $\forall x \in D$ we have by [theorem: 14.304]

$$\begin{aligned}
\left(\left(\lim_{n\to\infty} \mathrm{Re}(f_n)\right)_{|D} + i \cdot \left(\lim_{n\to\infty} \mathrm{Img}(f_n)\right)_{|D}\right)(x) &= \\
\left(\lim_{n\to\infty} \mathrm{Re}(f_n)\right)_{|D}(x) + i \cdot \left(\lim_{n\to\infty} \mathrm{Img}(f_n)\right)_{|D}(x) &= \\
\left(\lim_{n\to\infty} \mathrm{Re}(f_n)\right)(x) + i \cdot \left(\lim_{n\to\infty} \mathrm{Img}(f_n)\right)(x) & \\
\lim_{n\to\infty} \mathrm{Re}(f_n(x)) + i \cdot \lim_{n\to\infty} \mathrm{Img}(f_n(x)) &\underset{\text{[theorem: 14.304]}}{=} \\
\lim_{n\to\infty} (\mathrm{Re}(f_n(x)) + i \cdot \mathrm{Img}(f_n(x))) &= \\
\lim_{n\to\infty} f_n(x) &
\end{aligned}$$

proving that $\lim_{n\to\infty} f_n = \left(\lim_{n\to\infty} \mathrm{Re}(F_n)\right)_{|D} + i \cdot \left(\lim_{n\to\infty} \mathrm{Img}(f_n)\right)_{|D}$. Using (1) and (3) we finally have that

$$\lim_{n\to\infty} f_n \in \mathcal{M}[D, \mathcal{A}, \mathbb{C}]$$

□

Theorem 20.457. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space, $A \in \mathrm{A}$ and $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ then*

$$|f| \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$$

Proof. As $||: \mathbb{C} \to \mathbb{R}$ is continuous [see theorem: 14.157] we have by [theorem: 20.336] that the function $||$ is $\mathcal{B}[\mathbb{C}], \mathcal{B}[\mathbb{R}]$-measurable. As $\forall x \in A$ we have $(|| \circ f)(x = ||(f(x))) = |f(x)| = |f|(x)$ it follows that $|f| = || \circ f$. So using [theorem: 20.315] it follows that $|f|$ is $\mathcal{A}, \mathcal{B}[\mathbb{R}]$-measurable or as $\mathrm{Re}(f)(X), \mathrm{Img}(f)(X) \subseteq \mathbb{R}$

$$|f| \in \mathcal{M}^+[X, \mathcal{A}]$$

□

20.6.6.2 Complex Measure Integral

We can now define the integral of complex valued functions based on the integrals of its real and imaginair components of these functions.

Definition 20.458. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space and $f: X \to \mathbb{C}$ a function then*

$$f \text{ is } \mu\text{-complex integrable if } \mathrm{Re}(f) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \wedge \mathrm{Img}(f) \in \mathcal{L}[X, \mathcal{A}.\mu, \mathbb{R}]$$

and the complex integral of f noted as $\int^{\mathbb{C}} f d\mu$ is defined by

$$\int^{\mathbb{C}} f d\mu = \int \mathrm{Re}(f) d\mu + i \cdot \int \mathrm{Img}(f) d\mu$$

The set of all complex integrable functions is noted as $\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ hence

$$\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}] = \{f \in \mathbb{C}^X \,|\, f: X \to \mathbb{C} \text{ is } \mu\text{-complex integrable}\}$$

Example 20.459. Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure spacen then $C_0 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ and $\int^C C_0 d\mu = 0$ where C_0: $X \to \mathbb{C}$ is defined by $C_0(x)$.

Proof. Let $x \in X$ then $\mathrm{Re}(C_0)(x) = \mathrm{Re}(C_0(x)) = \mathrm{Re}(0) = 0 = C_0(x)$ and $\mathrm{Img}(C_0)(x) = \mathrm{Img}(C_0(x)) = \mathrm{Img}(0) = 0 = C_0(x)$. This proves that $\mathrm{Re}(C_0) = C_0 \underset{\text{[note: 20.418]}}{\in} \mathcal{L}(X, \mathcal{A}, \mu, \mathbb{R})$ and $\mathrm{Img}(C_0) = C_0 \underset{\text{[note: 20.418]}}{\in} \mathcal{L}(X, \mathcal{A}, \mu, \mathbb{R})$. Hence we have by definition that $C_0 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$. Further we have

$$\int^{\mathbb{C}} C_0 d\mu = \int \mathrm{Re}(C_0) d\mu + i \cdot \int \mathrm{Img}(C_0) d\mu = \int C_0 d\mu + i \cdot \int C_0 d\mu \underset{\text{[note: 20.418]}}{=} 0$$

□

The following shows that the complex integral is a extension of the measure integral.

Theorem 20.460. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then*

$$\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \subseteq \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$$

and

$$\forall f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ we have that } \int^{\mathbb{C}} f d\mu = \int f d\mu$$

Proof. Let $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ then $f(X) \subseteq \mathbb{R}$. Now for the function $f: X \to \mathbb{C}$ we have as $f(X) \subseteq \mathbb{R}$ that $\forall x \in X$ $\mathrm{Re}(f)(x) = \mathrm{Re}(f(x)) = f(x)$ and $\mathrm{Img}(f)(x) = \mathrm{Img}(f(x)) = 0 = C_0(x)$. Hence we have

$$\mathrm{Re}(f) = f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ and } \mathrm{Img}(f) = C_0 \underset{\text{[theorem: 20.423]}}{\in} \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \tag{20.628}$$

which proves that $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$. So

$$\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \subseteq \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$$

Further

$$\int^{\mathbb{C}} f d\mu = \int \mathrm{Re}(f) d\mu + \int \mathrm{Img}(f) d\mu \underset{\text{[eq: 20.628]}}{=} \int f d\mu + \int C_0 d\mu \underset{\text{[theorem: 20.423]}}{=} \int f d\mu$$

□

Theorem 20.461. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then we have*

1. *$\forall f, g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that $f + g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ and*

$$\int^{\mathbb{C}} (f + g) d\mu = \int^{\mathbb{C}} f d\mu + \int^{\mathbb{C}} g d\mu$$

2. *$\forall \alpha \in \mathbb{C}$ and $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that $\alpha \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ and*

$$\int^{\mathbb{C}} (\alpha \cdot f) d\mu = \alpha \cdot \int^{\mathbb{C}} f d\mu$$

Proof.

1. As $f, g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ we have by definition that

$$\mathrm{Re}(f), \mathrm{Re}(g), \mathrm{Img}(f), \mathrm{Img}(g) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

further as $f(X), g(X) \subseteq \mathbb{C}$ we have

$$\mathrm{Re}(f)(X), \mathrm{Re}(g)(X), \mathrm{Img}(f), \mathrm{Img}(g) \subseteq \mathbb{R}$$

Let $x \in X$ then

$$\mathrm{Re}(f + g)(x) = \mathrm{Re}(f(x) + g(X)) = \mathrm{Re}(f(x)) + \mathrm{Re}(g(x)) = (\mathrm{Re}(f) + \mathrm{Re}(g))(x)$$

$$\mathrm{Img}(f + g)(x) = \mathrm{Img}(f(x) + g(X)) = \mathrm{Img}(f(x)) + \mathrm{Img}(g(x)) = (\mathrm{Img}(f) + \mathrm{Img}(g))(x)$$

so that

$$\mathrm{Re}(f + g) = \mathrm{Re}(f) + \mathrm{Re}(g) \text{ and } \mathrm{Img}(f + g) = \mathrm{Img}(f) + \mathrm{Img}(g)$$

Hence using now [theorem: 20.425] it follows that

$$\mathrm{Re}(f + g), \mathrm{Img}(f + g) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

which proves that

$$f+g\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{C}]$$

Further

$$\begin{aligned}\int^{\mathbb{C}}(f+g)d\mu &= \int \mathrm{Re}(f+g)d\mu+i\cdot\int \mathrm{Img}(f+g)d\mu\\ &= \int(\mathrm{Re}(f)+\mathrm{Re}(g))d\mu+i\cdot\int(\mathrm{Img}(f)+\mathrm{Img}(g))d\mu\\ &\underset{\text{[theorem: 20.425]}}{=} \int \mathrm{Re}(f)d\mu+\int \mathrm{Re}(g)d\mu+i\cdot\int \mathrm{Img}(f)d\mu+i\cdot\int \mathrm{Img}(g)d\mu\\ &= \int^{\mathbb{C}}fd\mu+\int^{\mathbb{C}}gd\mu\end{aligned}$$

2. As $f\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{C}]$ we have by definition that

$$\mathrm{Re}(f),\mathrm{Img}(f)\in\mathcal{L}(X,\mathcal{A},\mu,\mathbb{R}) \text{ and } \int^{\mathbb{C}}fd\mu=\int \mathrm{Re}(f)d\mu+i\cdot\int \mathrm{Img}(f)d\mu$$

Let $x\in X$ then

$$\begin{aligned}(\alpha\cdot f)(x) &=\\ \alpha\cdot f(x) &=\\ (\mathrm{Re}(\alpha)+i\cdot\mathrm{Img}(\alpha))\cdot(\mathrm{Re}(f(x))+\mathrm{Img}(f(x))) &=\\ \mathrm{Re}(\alpha)\cdot\mathrm{Img}(f(x))-\mathrm{Img}(\alpha)\cdot\mathrm{Re}(f(x))+i\cdot(\mathrm{Re}(\alpha)\cdot\mathrm{Re}(f(x))+\mathrm{Img}(\alpha)\cdot\mathrm{Img}(f(x))) &=\\ ((\mathrm{Re}(\alpha)\cdot\mathrm{Re}(f)-\mathrm{Img}(\alpha)\cdot\mathrm{Img}(f))+i\cdot(\mathrm{Re}(\alpha)\cdot\mathrm{Img}(f)+\mathrm{Img}(\alpha)\cdot\mathrm{Re}(f)))(x)\end{aligned}$$

which proves that

$$\mathrm{Re}(\alpha\cdot f)=\mathrm{Re}(\alpha)\cdot\mathrm{Re}(f)-\mathrm{Img}(\alpha)\cdot\mathrm{Img}(f)\wedge\mathrm{Img}(\alpha\cdot f)=\mathrm{Re}(\alpha)\cdot\mathrm{Img}(f)+\mathrm{Img}(a)\cdot\mathrm{Re}(f)$$

Using [theorem: 20.425] on the above we have that $\mathrm{Re}(\alpha\cdot f)$, $\mathrm{Img}(\alpha\cdot f)\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$ so that by definition

$$\alpha\cdot f\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{C}]$$

Further

$$\begin{aligned}\int^{\mathbb{C}}(\alpha\cdot f)d\mu &=\\ \int(\mathrm{Re}(\alpha)\cdot\mathrm{Re}(f)-\mathrm{Img}(\alpha)\cdot\mathrm{Img}(f))d\mu+i\cdot\int(\mathrm{Re}(\alpha)\cdot\mathrm{Img}(f)+\mathrm{Img}(a)\cdot\mathrm{Re}(f))d\mu &=\\ \mathrm{Re}(\alpha)\cdot\int \mathrm{Re}(f)d\mu-\mathrm{Img}(\alpha)\cdot\int \mathrm{Img}(f)d\mu+i\cdot\mathrm{Re}(\alpha)\cdot\int \mathrm{Img}(f)d\mu+i\cdot\mathrm{Img}(\alpha)\cdot\int \mathrm{Re}(f)d\mu &=\\ \mathrm{Re}(\alpha)\cdot\left(\int \mathrm{Re}(f)d\mu+i\cdot\int \mathrm{Img}(f)d\mu\right)+i\cdot\mathrm{Img}(\alpha)\cdot\left(\int \mathrm{Re}(f)d\mu+\int \mathrm{Img}(f)d\mu\right) &=\\ \mathrm{Re}(\alpha)\cdot\int^{\mathbb{C}}fd\mu+i\cdot\mathrm{Img}(\alpha)\cdot\int^{\mathbb{C}}fd\mu &=\\ (\mathrm{Re}(\alpha)+i\cdot\mathrm{Img}(\alpha))\cdot\int^{\mathbb{C}}fd\mu &=\\ \alpha\cdot\int^{\mathbb{C}}fd\mu\end{aligned}$$

□

We have the following equivalent definition of μ-complex integrable functions:

Theorem 20.462. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space and $f:X\to\mathbb{C}$ a complex valued function then*

$$f\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{C}]\Leftrightarrow f\in\mathcal{M}[X,\mathcal{A},\mu,\mathbb{C}] \text{ and } |f|\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$$

Further if $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ then we have

$$\left| \int^{\mathbb{C}} f d\mu \right| \leqslant \int |f| d\mu$$

Proof.

⇒. As $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that $\mathrm{Re}(f), \mathrm{Img}(f) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ so that $\mathrm{Re}(f), \mathrm{Img}(f) \in \mathcal{M}[X, \mathcal{A}]$. Using then [theorem: 20.454] it follows that

$$f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}] \tag{20.629}$$

and using [theorem: 20.457]

$$|f| \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \tag{20.630}$$

Further as $\mathrm{Re}(f), \mathrm{Img}(g) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ we have by [theorem: 20.426] that

$$|\mathrm{Re}(f)|, |\mathrm{Img}(f)| \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

so that

$$\int^+ |\mathrm{Re}(f)| d\mu \underset{\text{[theorem: 20.414]}}{=} \int^+ |\mathrm{Re}(f)|^+ d\mu < \infty$$

$$\int^+ |\mathrm{Img}(f)| d\mu \underset{\text{[theorem: 20.414]}}{=} \int^+ |\mathrm{Img}(f)|^+ d\mu < \infty$$

Let $x \in X$ then

$$|f|(x) = |f(x)| \underset{\text{[theorem: 10.85(8)}}{\leqslant} |\mathrm{Re}(f(x))| + |\mathrm{Img}(f(x))| = (|\mathrm{Re}(f)| + |\mathrm{Img}(f)|)(x)$$

So that by [theorem: 20.405]

$$\int^+ |f| d\mu \leqslant \int^+ (|\mathrm{Re}(f)| + |\mathrm{Img}(f)|) d\mu \underset{\text{[theorem: 20.405]}}{=} \int^+ |\mathrm{Re}(f)| d\mu + \int^+ |\mathrm{Img}(f)| d\mu < \infty$$

which together with [eq: 20.630] proves by [theorem: 20.419] that

$$|f| \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

⇐. As $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ we have using [theorem: 20.454] that

$$\mathrm{Re}(f), \mathrm{Img}(f) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

Let $x \in X$ then

$$|\mathrm{Re}(f)|(x) = |\mathrm{Re}(f(x))| \underset{\text{[theorem: 10.85(3)]}}{\leqslant} |f(x)| = |f|(x)$$

$$|\mathrm{Img}(f)|(x) = |\mathrm{Img}(f(x))| \underset{\text{[theorem: 10.85(3)]}}{\leqslant} |f(x)| = |f|(x)$$

Using then [theorem: 20.428] it follows that $\mathrm{Re}(f), \mathrm{Img}(f) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ hence we have by definition that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$$

For the last part define

$$w(f) = \begin{cases} 1 \text{ if } \left| \int^{\mathbb{C}} f d\mu \right| = 0 \\ \frac{f^{\mathbb{C}} d\mu}{|\int^{\mathbb{C}} f d\mu|} \text{ if } \left| \int^{\mathbb{C}} f d\mu / 0 \right. \end{cases} \text{ so that } |w(f)| = 1$$

then for $\int^{\mathbb{C}} f d\mu$ we have either:

$\int f^{\mathbb{C}} d\mu = 0$. Then $|\int f d\mu| = 0$ and $w(f) = 1$ so that $w \cdot \left| \int^{\mathbb{C}} f d\mu \right| = \int^{\mathbb{C}} f d\mu$

$\int f^{\mathbb{C}} d\mu \neq 0$. Then $\left| \int^{\mathbb{C}} f d\mu \right| \neq 0$ and $w = \frac{\int^{\mathbb{C}} f d\mu}{|\int^{\mathbb{C}} f d\mu|}$ so that $w \cdot \left| \int^{\mathbb{C}} f d\mu \right| = \int^{\mathbb{C}} f d\mu$

Summarized we have

$$\int^{\mathbb{C}} f d\mu = w(f) \cdot \left| \int^{\mathbb{C}} f d\mu \right| \text{ and } |w(f)| = 1$$

Then we have

$$\begin{aligned}
\left|\int^{\mathbb{C}} f d\mu\right| &= \frac{1}{w(f)}\cdot\int^{\mathbb{C}} f d\mu \\
&\underset{\text{[theorem: 20.461]}}{=} \int^{\mathbb{C}}\left(\frac{1}{w(f)}\cdot f\right)d\mu \\
&\underset{\text{def}}{=} \int \mathrm{Re}\left(\frac{1}{w(f)}\cdot f\right)d\mu + i\cdot\int \mathrm{Img}\left(\frac{1}{w(f)}\cdot f\right)d\mu \\
&\underset{\int \mathrm{Img}\left(\frac{1}{w(f)}\cdot f\right)d\mu,\left|\int f d\mu\right|\in\mathbb{R}}{=} \int \mathrm{Re}\left(\frac{1}{w(f)}\cdot f\right)d\mu
\end{aligned} \tag{20.631}$$

Let $x\in X$ then using [theorem: 10.85] we have that

$$\mathrm{Re}\left(\frac{1}{w(f)}\cdot f(x)\right)\leqslant\left|\frac{1}{w(f)}\cdot f(x)\right|=\left|\frac{1}{w(f)}\right|\cdot|f(x)|\underset{|w(f)|=1}{=}|f(x)|=|f|(x)$$

Hence using [theorem: 20.425] we have that $\int \mathrm{Re}\left(\frac{1}{w(f)}\cdot f(x)\right)d\mu\leqslant\int|f|d\mu$ which combined with [eq: 20.631] proves that

$$\left|\int^{\mathbb{C}} f d\mu\right|\leqslant\int|f|d\mu$$

□

20.6.7 The spaces $\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ and $L^p[X,\mathcal{A},\mu,\mathbb{K}]$

20.6.7.1 Definition of $\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ and $L^p[X,\mathcal{A},\mu,\mathbb{K}]$

In this section we introduce infinite Banach spaces that play a very important role in physics and functional analyses. Be carefull in the following we use the same symbol $||$ for the norm on $\mathbb{R}$ and on $\mathbb{C}$ [see examples: 14.97,14.96], context will indicate which norm is used.

Definition 20.463. *Let $p\in[1,\infty[$ then we define*

$$||^p=(*)^p\circ||:\mathbb{R}\to\overline{\mathbb{R}} \text{ so that } (||^p)(x)=|x|^p$$

$$||^p=(*)^p\circ||:\mathbb{C}\to\overline{\mathbb{R}} \text{ so that } (||^p)(x)=|x|^p$$

If X is a set and $f:X\to\mathbb{R}$ then we define

$$|f|^p=||^p\circ f:X\to\overline{\mathbb{R}} \text{ so that } |f|^p(x)=|f(x)|^p$$

If X is a set and $f:X\to\mathbb{C}$ then we define

$$|f|^p=||^p\circ f:X\to\overline{\mathbb{R}} \text{ so that } |f|^p(x)=|f(x)|^p$$

***Note* 20.464.** *Using [theorem: 19.42 (2)] we have that $\forall x\in[0,\infty[$ we have that $x^p\in[0,\infty[$ so that*

$$||(X)\subseteq[0,\infty[\wedge||^p(X)\subseteq[0,\infty[\wedge|f|^p(X)\subseteq[0,\infty[$$

Definition 20.465. *Let $p\in[1,\infty[$ and $\langle X,\mathcal{A},\mu\rangle$ a measures space, $\mathbb{K}=\mathbb{C}$ or $\mathbb{R}$ then we define $\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ as follows*

1. *If $\mathbb{K}=\mathbb{R}$ then $\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{R}]=\{f\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]|f(X)\subseteq\mathbb{R}\wedge|f|^p\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]\}$*
2. *If $\mathbb{K}=\mathbb{C}$ then $\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{C}]=\{f\in\mathcal{M}[X,\mathcal{A},\mathbb{C}]||f|^p\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]\}$*

We prove now that $\mathcal{L}[X,\mathcal{A},\mu,\mathbb{K}]$ is a special case of $\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ where $p=1$.

Theorem 20.466. *Let $p\in[1,\infty[$ and $\langle X,\mathcal{A},\mu\rangle$ a measure space then*

$$\mathcal{L}[X,\mathcal{A},\mu,\mathbb{K}]=\mathcal{L}^1[X,\mathcal{A},\mu,\mathbb{K}]$$

in other words we have

1. $\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]=\mathcal{L}^1[X,\mathcal{A},\mu,\mathbb{R}]$
2. $\mathcal{L}[X,\mathcal{A},\mu,\mathbb{C}]=\mathcal{L}^1[X,\mathcal{A},\mu,\mathbb{C}]$

Proof. First as $\forall x\in X$ we have $|f|^1(x)=|f(x)|^1 \underset{\text{[theorem: 19.42(4)]}}{=} |f(x)|=|f|(x)$ we have that

$$|f|_{\mathbb{R}}=|f|^1_{\mathbb{R}}$$

1. Let $f\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$ then $f\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$ and by [theorem: 20.426] $|f|^1=|f|\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$ so that
$$\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]\subseteq\mathcal{L}^1[X,\mathcal{A},\mu,\mathbb{R}] \tag{20.632}$$
Further if $f\in\mathcal{L}^1[X,\mathcal{A},\mu,\mathbb{R}]$ then $f\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$ and $|f|=|f|^1\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$. Hence $\int^+|f|d\mu=\int^+|f|^+d\mu<\infty$ so that by [theorem: 20.426] $f\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$ which proves that $\mathcal{L}^1[X,\mathcal{A},\mu,\mathbb{R}]\subseteq\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$, combining this with [eq: 20.632] gives
$$\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]=\mathcal{L}^1[X,\mathcal{A},\mu,\mathbb{R}]$$
2. Let $f\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{C}]$ then we have by definition that $\mathrm{Re}(f),\mathrm{Img}(f)\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$, hence $\mathrm{Re}(f)$, $\mathrm{Img}(f)\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$. Using [theorem: 20.454] it follows then that $f\in\mathcal{M}[X,\mathcal{A},\mathbb{C}]$ and using [theorem: 20.462] it follows that $|f|^1=|f|\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$, hence $f\in\mathcal{L}^1[X,\mathcal{A},\mu,\mathbb{C}]$ which proves that
$$\mathcal{L}[X,\mathcal{A},\mu,\mathbb{C}]\subseteq\mathcal{L}^1[X,\mathcal{A},\mu,\mathbb{C}] \tag{20.633}$$
If $f\in\mathcal{L}^1[X,\mathcal{A},\mu,\mathbb{C}]$ then $f\in\mathcal{M}[X,\mathcal{A},\mu,\mathbb{C}]$ and $|f|=|f|^1\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$ which by [theorem: 20.462] proves that $f\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{C}]$, hence $\mathcal{L}^1[X,\mathcal{A},\mu,\mathbb{C}]\subseteq\mathcal{L}[X,\mathcal{A},\mu,\mathbb{C}]$. Combining this result with [eq: 20.633] proves that
$$\mathcal{L}[X,\mathcal{A},\mu,\mathbb{C}]=\mathcal{L}^1[X,\mathcal{A},\mu,\mathbb{C}]$$ □

Example 20.467. Let $p\in[1,\infty[$ then for $C_0:\mathbb{K}\to\overline{\mathbb{R}}$ defined by $C_0(x)=0$ we have that
$$C_0\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$$

Proof. First using [theorem: 20.314] it follows that
$$C_0\in\mathcal{M}[X,\mathcal{A},\mathbb{K}]$$
Further we have $\forall x\in X$ that $|C_0|^p(x)=|C_0(x)|^p=|0|^p \underset{\text{[definition: 19.39]}\wedge p\neq 0}{=} 0=C_0(x)$ which proves that $|C_0|^p=C_0$. As by [example: 20.418] $C_0\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$ it follows that
$$C_0\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$$ □

Next we want to prove that $\langle\mathcal{L}[X,\mathcal{A},\mu,\mathbb{C}],+,\cdot\rangle$ is a vector space over $\mathbb{R}$ and that $\langle\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}],+,\cdot\rangle$ is a vector space over $\mathbb{C}$. To do this we need the following three lemma's.

Lemma 20.468. *Let $p\in[1,\infty[$ then we have that:*

1. $||^p\in\mathcal{M}^+[\mathbb{R},\mathcal{A},\mathbb{R}]$.
2. *If $f\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$ then $|f|^p\in\mathcal{M}^+[X,\mathcal{A},\mathbb{R}]$.*
3. $||^p\in\mathcal{M}^+[\mathbb{C},\mathcal{A},\overline{\mathbb{R}}]$.
4. *If $f\in\mathcal{M}[X,\mathcal{A},\mathbb{C}]$ then $|f|^p\in\mathcal{M}^+[X,\mathcal{A},\mathbb{R}]$.*

Proof.

1. Using [theorem: 14.157] $||:\mathbb{R}\to\mathbb{R}$ is a continuous function [using the canonical topologies on $\mathbb{R}$. By [theorem: 14.134] it follows then that
$$||:\mathbb{R}\to[0,\infty[\text{ is continuous using the topologies } \mathcal{T}_{||},\ (\mathcal{T}_{||})_{|[0,\infty[}$$

Further using [theorem: 19.51] we have that

$$(*)^p\colon [0,\infty[\to\mathbb{R} \text{ is continuous}$$

Hence as $||^p=(*)^p\circ||$ we have bu [theorem: 14.140] that

$$||^p\colon \mathbb{R}\to\mathbb{R} \text{ is continuous using the topologies } \mathcal{T}_{||},\mathcal{T}_{||}$$

Hence $||^p$ is $\mathcal{B}[\mathbb{R}],\mathcal{B}[\mathbb{R}]$-measurable [see theorem: 20.336], using then [theorem: 20.326] it follows that $||^p\colon\mathbb{R}\to\overline{\mathbb{R}}$ is $\mathcal{B}[\mathbb{R}],\mathcal{B}[\overline{\mathbb{R}}]$-measurable. Finally as $||^p(X)\subseteq[0,\infty[$ it follows that

$$||^p\in\mathcal{M}^+[\mathbb{R},\mathcal{A},\mathbb{R}]$$

2. Let $x\in X$ then $|f|^p=||^p\circ f$. Hence using [theorem: 20.315] (1) and the fact that f is $\mathcal{A},\mathcal{B}[\mathbb{R}]$-measurable it follows that $|f|^p$ is $\mathcal{A},\mathcal{B}[\overline{\mathbb{R}}]$-measurable. Finally as $||^p(f(X))\subseteq[0,\infty[$ we have that

$$|f|^p\in\mathcal{M}^+[X,\mathcal{A},\mathbb{R}]$$

3. Using [theorem: 14.157] $||\colon\mathbb{C}\to\mathbb{R}$ is a continuous function [using the canonical topologies on $\mathbb{C}$ and $\mathbb{R}$. By [theorem: 14.134] it follows then that

$$||\colon\mathbb{R}\to[0,\infty[\text{ is continuous using the topologies } \mathcal{T}_{||},\ (\mathcal{T}_{||})_{|[0,\infty[}$$

Further using [theorem: 19.51] we have that

$$(*)^p\colon [0,\infty[\to\mathbb{R} \text{ is continuous}$$

Hence as $||^p=(*)^p\circ||$ we have by [theorem: 14.140] that

$$||^p\colon\mathbb{C}\to\mathbb{R} \text{ is continuous using the topologies } \mathcal{T}_{||},\mathcal{T}_{||}$$

Hence $||^p$ is $\mathcal{B}[\mathbb{C}],\mathcal{B}[\mathbb{R}]$-measurable [see theorem: 20.336], using then [theorem: 20.326] it follows that $||^p\colon\mathbb{C}\to\overline{\mathbb{R}}$ is $\mathcal{B}[\mathbb{C}],\mathcal{B}[\overline{\mathbb{R}}]$-measurable. Finally as $||^p(X)\subseteq[0,\infty[$ it follows that

$$||^p\in\mathcal{M}^+[\mathbb{C},\mathcal{A},\mathbb{R}]$$

4. Let $x\in X$ then $|f|^p=||^p\circ f$. Hence using [theorem: 20.315] (3) and the fact that f is $\mathcal{A},\mathcal{B}[\mathbb{R}]$-measurable it follows that $|f|^p$ is $\mathcal{A},\mathcal{B}[\overline{\mathbb{R}}]$-measurable. Finally as $||^p(f(X))\subseteq[0,\infty[$ we have that

$$|f|^p\in\mathcal{M}^+[X,\mathcal{A},\mathbb{R}]$$

□

Lemma 20.469. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space, $p\in[1,\infty[$, $g\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ and $f\in\mathcal{M}[X,\mathcal{A},\mathbb{K}]$ such that $\forall x\in X$ we have $|f(x)|\leqslant|g(x)|$ then $f\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$.*

Proof. As $f\in\mathcal{M}[X,\mathcal{A},\mathbb{K}]$ we have by [lemma: 20.468] that

$$|f|^p\in\mathcal{M}[X,\mathcal{A},\mathbb{K}]$$

Let $x\in X$ then by the hypothesis $|f(x)|\leqslant|g(x)|$ so that by the fact that the power function is monotone [see theorem: 19.42(15)] we have $|f(x)|^p\leqslant|g(x)|^p$, summarized

$$\forall x\in X \text{ we have } ||f(x)|^p|\leqslant|g(x)|^p$$

Further as $g\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ we have that

$$|g|^p\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}] \text{ and } |g|^p(X)\subseteq\mathbb{R}$$

Hence the conditions for [theorem: 20.428] are satisfied so that

$$|f(x)|^p\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$$

which as $f\in\mathcal{M}[X,\mathcal{A},\mathbb{K}]$ proves that

$$f\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$$

□

Lemma 20.470. *Let $p\in]0,\infty[$ and $z_1,z_2\in\mathbb{K}$ then $|z_1+z_2|^p\leqslant 2^p\cdot(|z_1|^p+|z_2|^p)$*

Proof. For $|z_1|$, $|z_2|$ we have the following possible cases:

$|z_1| \leqslant |z_2|$. Then

$$|z_1 + z_2| \leqslant |z_1| + |z_2| \leqslant 2 \cdot |z_2|$$

So that

$$\begin{aligned} |z_1 + z_2|^p &\underset{\text{[theorem: 19.42(15)]}}{\leqslant} (2 \cdot |z_2|)^p \\ &\underset{\text{[theorem: 19.42(15)]}}{=} 2^p \cdot |z_2|^p \\ &\leqslant 2^p \cdot |z_1|^p + 2^p \cdot |z_2|^p \\ &\leqslant 2^p \cdot (|z_1|^p + |z_2|^p) \end{aligned}$$

$|z_2| < |z_1|$. Then

$$|z_1 + z_2| < |z_1| + |z_2| \leqslant 2 \cdot |z_1|$$

So that

$$\begin{aligned} |z_1 + z_2|^p &\underset{\text{[theorem: 19.42(15)]}}{<} (2 \cdot |z_1|)^p \\ &\underset{\text{[theorem: 19.42(15)]}}{=} 2^p \cdot |z_1|^p \\ &\leqslant 2^p \cdot |z_1|^p + 2^p \cdot |z_2|^p \\ &\leqslant 2^p \cdot (|z_1|^p + |z_2|^p) \end{aligned}$$

So in all cases we have

$$|z_1 + z_2|^p \leqslant 2^p \cdot (|z_1|^p + |z_2|^p)$$

□

Theorem 20.471. *Let $p \in [1, \infty[$ and $\langle X, \mathcal{A}, \mu \rangle$ a measure space then we have:*

1. *$\forall f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ we have $f + g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$.*
2. *$\forall \alpha \in \mathbb{R}$ and $\forall f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ we have that $\alpha \cdot f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$.*
3. *$\forall f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}]$ we have $f + g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}]$.*
4. *$\forall \alpha \in \mathbb{R}$ and $\forall f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that $\alpha \cdot f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}]$.*

***Note* 20.472.** *If we use the convention then $\mathbb{K} = \mathbb{R}$ or $\mathbb{C}$ then we can rephrase the theorem as follows*

$$\forall f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ we have } f + g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

$$\forall f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ and } \alpha \in \mathbb{C} \text{ we have } \alpha \cdot f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

Proof.

1. As $f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ we have that

$$f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \text{ and } |f|^p, |g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \underset{\text{[theorem: 20.419]}}{\Rightarrow} |f|^p, |g|^p \in \mathcal{M}^+[X, \mathcal{A}, \mu]$$

From [theorem: 20.338] it follows that

$$f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \tag{20.634}$$

so that using [lemma: 20.468]

$$|f + g|^p \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \tag{20.635}$$

Let $x \in X$ then

$$|f + g|^p(x) = |f(x) + g(x)|^p \underset{\text{[lemma: 20.470]}}{\leqslant} 2^p \cdot (|f(x)|^p + |g(x)|^p) = (2^p \cdot (|f|^p + |g|^p))(x)$$

applying then [theorem: 20.405] we have

$$\int^+ |f + g|^p d\mu \leqslant 2^p \cdot \left(\int^+ |f|^p d\mu + \int^+ |g|^p d\mu \right) \tag{20.636}$$

As $|f|^p, |g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ we have by [theorem: 20.419] that $\int^+ |f|^p d\mu < \infty, \int^+ |g|^p d\mu < \infty$. So from the above [eq: 20.635] we have that $\int^+ |f+g|^p d\mu < \infty$. Combining this with [eq: 20.635] allows us to use [theorem: 20.419] to prove that $|f+g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. As $f+g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ [see eq: 20.634] we have that

$$f+g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$$

2. As $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ we have that

$$f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \text{ and } |f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

From [theorem: 20.344] it follows then that

$$\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

Further for $x \in X$ we have

$$|\alpha \cdot f|^p(x) = |\alpha \cdot f(x)|^p = (|\alpha| \cdot |f(x)|) \underset{\text{[theorem: 19.42]}}{=} |\alpha|^p| \cdot |f(x)|^p = (|\alpha|^p \cdot |f|^p)(x)$$

which proves that

$$|\alpha \cdot f|^p = |\alpha| \cdot |f|^p$$

As $|f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ it follows from [theorem: 20.425] that $|\alpha|^p \cdot |f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ so that $|\alpha \cdot f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$, which combined with $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ proves that

$$\alpha \cdot f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$$

3. As $f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that

$$f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}] \text{ and } |f|^p, |g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \underset{\text{[theorem: 20.419]}}{\Rightarrow} |f|^p, |g|^p \in \mathcal{M}^+[X, \mathcal{A}, \mu]$$

From [theorem: 20.456] it follows that

$$f+g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}] \tag{20.637}$$

so that using [lemma: 20.468]

$$|f+g|^p \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{C}] \tag{20.638}$$

Let $x \in X$ then

$$|f+g|^p(x) = |f(x)+g(x)|^p \underset{\text{[lemma: 20.470]}}{\leqslant} 2^p \cdot (|f(x)|^p + |g(x)|^p) = (2^p \cdot (|f|^p + |g|^p))(x)$$

applying then [theorem: 20.405] we have

$$\int^+ |f+g|^p d\mu \leqslant 2^p \cdot \left(\int^+ |f|^p d\mu + \int^+ |g|^p d\mu \right) \tag{20.639}$$

As $|f|^p, |g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ we have by [theorem: 20.425] that $\int^+ |f|^p d\mu < \infty, \int^+ |g|^p d\mu < \infty$. So from the above [eq: 20.639] we have that $\int^+ |f+g|^p d\mu < \infty$. Combining this with [eq: 20.638] allows us to use [theorem: 20.419] to prove that $|f+g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. As $f+g \in \mathcal{M}[X.\mathcal{A}, \mathbb{C}]$ [see eq: 20.637] we have that

$$|f+g|^p \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$$

4. As $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that

$$f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}] \text{ and } |f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

From [theorem: 20.344] it follows then that

$$\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$$

Further for $x \in X$ we have

$$|\alpha \cdot f|^p(x) = |\alpha \cdot f(x)|^p = (|\alpha| \cdot |f(x)|) \underset{\text{[theorem: 19.42]}}{=} |\alpha|^p| \cdot |f(x)|^p = (|\alpha|^p \cdot |f|^p)(x)$$

which proves that

$$|\alpha \cdot f|^p = |\alpha| \cdot |f|^p$$

As $|f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ it follows from [theorem: 20.425] that $|\alpha|^p \cdot |f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ so that $|\alpha \cdot f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$, which combined with $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ proves that

$$\alpha \cdot f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}]$$

□

We extend now $\mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ where $p \in [1, \infty[$ to the case where $p = \infty$.

Definition 20.473. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $\mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ where $\mathbb{K} = \mathbb{R}$ or $\mathbb{C}$ is defined by*

1. *If $\mathbb{K} = \mathbb{R}$ then $\mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}] = \{f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] | \exists M \in \mathbb{R}^+$ such that $\forall x \in X \ |f(x)| \leqslant M\}$*
2. *If $\mathbb{K} = \mathbb{C}$ then $\mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}] = \{f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}] | \exists M \in \mathbb{R}^+$ such that $\forall x \in X \ |f(x)| \leqslant M\}$*

Theorem 20.474. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then*

1. *$\forall f, g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ we have $f + g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$*
2. *$\forall f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ and $\alpha \in \mathbb{R}$ we have that $\alpha \cdot f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$*
3. *$\forall f, g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}]$ we have $f + g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}]$*
4. *$\forall f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}]$ and $\alpha \in \mathbb{C}$ we have that $\alpha \cdot f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}]$*

In other words using the notation $\mathbb{K} = \mathbb{R}$ or $\mathbb{C}$ we have that

$$\forall f, g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \text{ we have } f + g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$$

$$\forall f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \text{ we have } \forall \alpha \in \mathbb{K} \text{ that } \alpha \cdot f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$$

Proof.

1. As $f, g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ we have that $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$, hence by [theorem: 20.338] $f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$. Further there exists $M_1, M_2 \in \mathbb{R}^+$ such that $\forall x \in X$ we have $|f(x)| \leqslant M_1$, $|g(x)| \leqslant M_2$. If $M = M_1 + M_2$ then $\forall x \in X$ we have
$$|(f + g)(x)| = |f(x) + g(x)| \leqslant |f(x)| + |g(x)| \leqslant M_1 + M_2 = M$$
So we have that
$$f + g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$$
2. As $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ we have that $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$, hence by [theorem: 20.344] $\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$. Further there exists a $M' \in \mathbb{R}^+$ such that $\forall x \in X \ |f(x)| \leqslant M'$. Take $M = |\alpha| \cdot |M' + 1 \in \mathbb{R}^+$ then given $x \in X$ we have
$$|(\alpha \cdot f)(x)| = |\alpha \cdot f(x)| = |\alpha| \cdot |f(x)| \leqslant |\alpha| \cdot M' < |\alpha| \cdot M' + 1 = M$$
So we have
$$\alpha \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$
3. As $f, g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$, hence by [theorem: 20.461] $f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$, and a M_1, M_2 such that $\forall x \in X$ we have $|f(x)| \leqslant M_1$, $|g(x)| \leqslant M_2$. If $M = M_1 + M_2$ then $\forall x \in X$ we have
$$|(f + g)(x)| = |f(x) + g(x)| \leqslant |f(x)| + |g(x)| \leqslant M_1 + M_2 = M.$$
So we have that
$$f + g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}]$$
4. As $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$, hence by [theorem: 20.461] $\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ and there exists a $M' \in \mathbb{R}$ such that $\forall x \in X \ |f(x)| \leqslant M'$. Take $M = |\alpha| \cdot |M'| + 1 \in \mathbb{R}^+$ then given $x \in X$ we have
$$|(\alpha \cdot f)(x)| = |\alpha \cdot f(x)| = |\alpha| \cdot |f(x)| \leqslant |\alpha| \cdot M' < |\alpha| \cdot M' + 1 = M.$$
So we have
$$\alpha \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$$

□

We are now ready to prove that $\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ is a vector space.

Theorem 20.475. *Let $p\in[1,\infty]$, $\mathbb{K}=\mathbb{R}$ or $\mathbb{C}$ and $\langle X,\mathcal{A},\mu\rangle$ a measure space then if we define*

$$f+g\colon X\to\mathbb{K} \text{ by } (f+g)(x)=f(x)+g(x) \text{ and } (\alpha\cdot f)\colon X\to\mathbb{K} \text{ by } (\alpha\cdot f)(x)=\alpha\cdot f(x)$$

we have that

$$\langle\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}],+,\cdot\rangle \text{ is a vector space over the field } \mathbb{K} \text{ with neutral element } C_0$$

Proof. By [example: 20.467] $C_0\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{K}]$ so that

$$\mathcal{L}[X,\mathcal{A},\mu,\mathbb{K}]\neq\varnothing$$

As further $\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]\subseteq\mathcal{M}[X,\mathcal{A},\mathbb{K}]\subseteq\mathbb{K}^X$ it follows from [theorem: 11.67] and [theorem: 11.60] together with [theorems: 20.471, 20.474] that

$$\langle\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}],+,\cdot\rangle \text{ is a vector space over the field } \mathbb{K} \text{ with neutral element } C_0$$ □

Theorem 20.476. *Let $p\in[1,\infty]$ and $f\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ then $|f|\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{R}]$*

Proof. For $p\in[1,\infty]$ we have two possible cases to consider:

$p=\infty$. As $f\in\mathcal{L}^\infty[X,\mathcal{A},\mu,\mathbb{K}]$ we have by definition that

$$f\in\mathcal{M}[X,\mathcal{A},\mu,\mathbb{K}]\ \exists M\in\mathbb{R}^+ \text{ such that } \forall x\in X \text{ we have } |f(x)|\leqslant M$$

Using [theorems: 20.413, 20.457] it follows that $|f|\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$, further $\forall x\in X$ we have $|(|f(x)|)|=|f(x)|\leqslant M$. Hence we have by definition that

$$|f|\in\mathcal{L}^\infty[X,\mathcal{A},\mu,\mathbb{R}]$$

$p\in[1,\infty[$. As $f\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ we have by definition that

$$f\in\mathcal{M}[X,\mathcal{A},\mathbb{K}] \text{ and } |f|^p\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$$

Using [theorems: 20.413, 20.457] it follows that $|f|\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$, further as $|(|f|)|^p=|f|^p$ it follows that $|(|f|)|^p\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$. Hence

$$|f|\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{R}]$$ □

Next we we define what later will become a pseudo norm on $\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$. We start with the case where $p\in[1,\infty[$.

Definition 20.477. *Let $p\in[1,\infty[$ and $\langle X,\mathcal{A},\mu\rangle$ a measure space then we define*

$$\|\|_p\colon\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]\to[0,\infty[\text{ by } \|f\|_p=\left(\int|f|^p d\mu\right)^{\frac{1}{p}}$$

Theorem 20.478. *Let $p\in[1,\infty[$, $\langle X,\mathcal{A},\mu\rangle$ a measure space and $f\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ such that $\|f\|_p=0$ then we have that $|f|^p=0$ μ-a.e. and $f=0$ μ-a.e.*

Proof. Let $x\in X$ then as $|f(x)|\in[0,\infty[$ we have by [definition: 19.39] that $|f(x)|^p\in[0,\infty[$, hence we have $||f|^p|(x)=||f|^p(x)|=|f|^p(x)$ so that $||f|^p|=|f|^p$. As $\|f\|_p=0$ we have that $(\int|f|^p d\mu)^{\frac{1}{p}}=0$ so that by [theorem: 19.42] $\int||f|^p|d\mu=\int|f|^p d\mu=0$. Using then [theorem: 20.430] it follows that $|f|^p=0$ μ-a.e. So there exist a $N\in\mathcal{A}$ with $\mu(A)=0$ such that $\{x\in X\,||f(x)|^p\neq0\}\subseteq N$. Let $x\in\{x\in X\,|f(x)\neq0\}$ then $f(x)\neq0\Rightarrow|f(x)|\neq0\underset{\text{[theorem: 19.42]}}{\Rightarrow}|f(x)|^p\neq0$ so that $x\in\{x\in X\,||f(x)|^p\neq0\}\subseteq N$, hence $\{x\in X\,|f(x)\neq0\}\subseteq N$ which proves that

$$f=0 \ \mu\text{-a.e.}$$ □

To define $\|\|_\infty$ we need first to first introduce the concept of locally μ-null sets.

Definition 20.479. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space then N* ***is locally μ-null*** *if $\forall A \in \mathcal{A}$ with $\mu(A) < \infty$ we have that $A \bigcap N \in \mathcal{N}_\mu$ [see definition: 20.299].*

A trivial example is of a locally μ-null set is the exmpty set.

Example 20.480. Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space then $\varnothing$ is locally μ-null.

Proof. Let $A \in \mathcal{A}$ $A \bigcap \emptyset = \emptyset \in \mathcal{A}$ with $\mu(\emptyset) = 0$ proving that $\emptyset$ is locally μ-null. □

We have the following properties for μ-null sets.

Theorem 20.481. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measurable space then*

1. *Every negligible set is locally μ-null. In otherwords $\forall A \in \mathcal{N}_\mu$ we have that A is locally μ-null.*
2. *If B is locally μ-null and $A \subseteq B$ then A is locally μ-null.*
3. *If I is a countable set [finite or denumerable] and $\{A_i\}_{i \in I} \subseteq \mathcal{P}(X)$ a countable family of locally μ-null sets then $\bigcup_{i \in I} A_i$ is locally μ-null.*

Proof.

1. Let $N \in \mathcal{N}_\mu$ then there exist a $B \in \mathcal{A}$ with $\mu(B) = 0$ such that $A \subseteq B$. Let $A \in \mathcal{A}$ with $\mu(A) < \infty$ then $N \bigcap A \subseteq N \subseteq B$ so that $N \bigcap A \in \mathcal{N}_\mu$. So we have by definition that N is locally μ-null.
2. Let $D \in \mathcal{A}$ with $\mu(D) < \infty$ then as B is locally μ-null we have that $B \bigcap D \in \mathcal{N}_\mu$. Hence there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $B \bigcap D \subseteq N$. As $A \subseteq B$ we have that $A \bigcap D \subseteq B \bigcap D \subseteq N$ which proves that $A \bigcap D \in \mathcal{N}_\mu$.
3. Let $\{A\}_{i \in I} \subseteq \mathcal{P}(X)$ be a countable family of locally μ-null sets. Let $A \in \mathcal{A}$ with $\mu(A) < \infty$. Let $i \in I$ then as A_i is locally μ-null we have that $A \bigcap A_i \in \mathcal{N}_\mu$., so by [theorem: 20.302] we have that $\bigcup_{i \in I} (A \bigcap A_i) \in \mathcal{N}_\mu$. So that
$$A \bigcap \left(\bigcup_{i \in I} A_i \right) = \bigcup_{i \in I} (A \bigcap A_i) \in \mathcal{N}_\mu$$
which proves that
$$\bigcup_{i \in I} A_i \text{ is locally } \mu\text{-null}$$
□

We are now ready to define $\|\|_\infty$

Definition 20.482. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space then we define*

$$\|\|_\infty : \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \to [0, \infty[\text{ by } \|f\|_\infty = \inf(\{M \in [0, \infty[| \{x \in X | |f(x)| > M\} \text{ is locally } \mu\text{-null}\})$$

Proof. Of course for this definition to make sense the inf must exist and be finite. Let $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ then $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ and there exist a $M \in \mathbb{R}^+$ such that $\forall x \in X$ we have $|f(x)| \leqslant M$ so that $\{x \in X | |f(x)| > M\} = \varnothing$ which is locally μ-null [see example: 20.480]. So we have proved that

$$M \in \{M \in [0, \infty[| \{x \in X | |f(x)| > M\} \text{ is locally } \mu\text{-null}\}$$

so that

$$\inf(\{M \in [0, \infty[| \{x \in X | |f(x)| > M\} \text{ is locally } \mu\text{-null}\}) \text{ exist}$$

and

$$0 \leqslant \inf(\{M \in [0, \infty[| \{x \in X | |f(x)| > M\} \text{ is locally } \mu\text{-null}\}) \leqslant M$$

which proves that

$$\inf(\{M \in [0, \infty[| \{x \in X | |f(x)| > M\} \text{ is locally } \mu\text{-null}\}) \text{ is finite}$$
□

We set out now to prove that $\|\|_p$ is a norm on the vector space $\langle \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot\rangle$.

Lemma 20.483. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measurable space and $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ then*

$$\{x \in X | |f(x)| > \|f\|_\infty\} \text{ is locally } \mu\text{-null}$$

Proof. Let $n \in \mathbb{N}$ then as

$$\inf(\{M \in [0,\infty[| \{x \in X | |f(x)| > M\}\} \text{ is locally } \mu\text{-null}) = \|f\|_\infty < \|f\|_\infty + \frac{1}{n}$$

there exist a M_n such that $\{x \in X | |f(x)| > M_n\}$ is locally μ-null and $\|f\|_\infty \leqslant M_n < \|f\|_\infty + \frac{1}{n}$. So we have by [theorem: 3.107] a $\{M_n\}_{n\in\mathbb{N}} \subseteq [0,\infty[$ that

$$\forall n \in \mathbb{N}\ \{x \in X | |f(x)| > M_n\} \text{ is local } \mu\text{-null and } \|f\|_\infty \leqslant M_n < \|f\|_\infty + \frac{1}{n} \tag{20.640}$$

If $x \in \{x \in X | |f(x)| > \|f\|_\infty\}$ then $\|f\|_\infty < |f(x)|$ so that using [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $\|f\|_\infty < \|f\|_\infty + \frac{1}{n} < |f(x)|$, so $M_n \underset{\text{[eq: 20.640]}}{<} \|f\|_\infty + \frac{1}{n} < |f(x)|$ from which we deduce that $x \in \{x \in X | |f(x)| > M_n\} \subseteq \bigcup_{n\in\mathbb{N}} \{x \in X | |f(x)| > M_n\}$. Hence we have

$$\{x \in X | |f(x)| > \|f\|_\infty\} \subseteq \bigcup_{n\in\mathbb{N}} \{x \in X | |f(x)| > M_n\} \tag{20.641}$$

If $x \in \bigcup_{n\in\mathbb{N}} \{x \in X | |f(x)| > M_n\}$ then there exist a $n \in \mathbb{N}$ such that $x \in \{x \in X | |f(x)| > M_n\} \Rightarrow M_n < |f(x)|$ hence by [eq: 20.640] $\|f\|_\infty \leqslant M_n < |f(x)|$ so that $x \in \{x \in X | |f(x)| > \|f\|_\infty\}$ which proves that $\bigcup_{n\in\mathbb{N}} \{x \in X | |f(x)| > M_n\} \subseteq \{x \in X | |f(x)| > \|f\|_\infty\}$. Combining this with [eq: 20.641] proves

$$\{x \in X | |f(x)| > \|f\|_\infty\} = \bigcup_{n\in\mathbb{N}} \{x \in X | |f(x)| > M_n\}$$

As by [eq: 20.640] we have $\forall n \in \mathbb{N}$ that $\{x \in X | |f(x)| > M_n\}$ is locally μ-finite it follows from [theorem: 20.481] that $\bigcup_{n\in\mathbb{N}} \{x \in X | |f(x)| > M_n\}$ is locally μ-finite, hence we have that

$$\{x \in X | |f(x)| > \|f\|_\infty\} \text{ is locally } \mu\text{-finite}$$

□

The following theorem will be crucial for the properties of $\|\|_p$.

Theorem 20.484. (Holder's Inequality) *Let $p, q \in [1,\infty]$ be such that $\frac{1}{p} + \frac{1}{q} = 1$, $\langle X, \mathcal{A}, \mu\rangle$ a measure space and $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$, $g \in \mathcal{L}^q[X, \mathcal{A}, \mu, \mathbb{K}]$ then $f \cdot g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$ and*

$$\int |f \cdot g| d\mu \leqslant \|f\|_p \cdot \|g\|_q$$

Proof. For p, q we must consider the following cases:

$p = \infty$. Then as $1 = \frac{1}{p} + \frac{1}{q} \underset{\text{[definition: 20.21]}}{=} 0 + \frac{1}{q} = \frac{1}{q}$ we have that $q = 1$ [if $q = -\infty, \infty$ then $\frac{1}{q} = 0 \neq 1$ so we must have that $q = (1)^{-1} = 1$], so $g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$. By [theorem: 20.429] it follows that $\{x \in X | |g(x)| \neq 0\}$ is μ-finite, so there exist a $\{A\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N}\ \mu(A_i) < \infty$ such that

$$A = \{x \in X | |g(x)| \neq 0\} \subseteq \bigcup_{i\in\mathbb{N}} A_i \tag{20.642}$$

Further as $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ we have by [lemma: 20.483] that

$$B = \{x \in X | |f(x)| > \|f\|_\infty\} \text{ is locally } \mu\text{-null} \tag{20.643}$$

Using the definitions of A and B we have

$$\begin{aligned} A \bigcap B &\underset{\text{[eq: 20.642]}}{\subseteq} \left(\bigcup_{i\in\mathbb{N}} A_i\right) \bigcap B \\ &= \bigcup_{i\in\mathbb{N}} (A_i \bigcap B) \\ &= \bigcup_{i\in\mathbb{N}} (A_i \bigcap \{x \in X | |f(x)| > \|f\|_\infty\}) \end{aligned} \tag{20.644}$$

As $B = \{x \in X \,|\, |f(x)| > \|f\|_\infty\}$ is locally μ-null and $\mu(A_i) < \infty$ we have that $A_i \bigcap \{x \in X \,|\, |f(x)| > \|f\|_\infty\} \in \mathcal{N}_\mu$. So there exist a $N_i \in \mathcal{A}$ with $\mu(N_i) = 0$ such that $A_i \bigcap \{x \in X \,|\, |f(x)| > \|f\|_\infty\} \subseteq N_i$. Substituting this in [eq: 20.644] gives

$$\{x \in X \,|\, |g(x)| \neq 0\} \bigcap \{x \in X \,|\, |f(x)| > \|f\|_\infty\} \subseteq \bigcup_{i \in \mathbb{N}} N_i \tag{20.645}$$

and

$$\mu\left(\bigcup_{i \in \mathbb{N}} N_i\right) \underset{\text{[theorem: 20.300]}}{=} 0 \tag{20.646}$$

If $x \in \{x \in X \,|\, |f \cdot g|(x) > \|f\|_\infty \cdot |g(x)|\}$ then $|f(x)| \cdot |g(x)| > \|f\|_\infty \cdot |g(x)|$ and we must have that $|g(x)| \neq 0$ [otherwise we have $0 = |f(x)| \cdot |g(x)| > \|f\|_\infty \cdot |g(x)| = 0$ leading to the contradiction $0 > 0$], hence dividing by $|g(x)|$ we have $|f(x)| > \|f\|_\infty$. Hence $x \in \{x \in X \,|\, |g(x)| \neq 0\} \bigcap \{x \in X \,|\, |f(x)| > \|f\|_\infty\}$ proving that

$$\{x \in X \,|\, |f \cdot g|(x) > \|f\|_\infty \cdot |g(x)|\} \subseteq \{x \in X \,|\, |g(x)| \neq 0\} \bigcap \{x \in X \,|\, |f(x)| > \|f\|_\infty\}$$

So using [eq: 20.645] it follows that

$$\{x \in X \,|\, |f \cdot g|(x) > \|f\|_\infty \cdot |g(x)|\} \subseteq \bigcup_{i \in \mathbb{N}} N_i$$

which as $\mu(\bigcup_{i \in \mathbb{N}} N_i) = 0$ proves that

$$|f \cdot g| \leqslant \|f\|_\infty \cdot |g| \;\; \mu\text{-a.e.} \tag{20.647}$$

As $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ and $g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$ we have that $f, g \in \mathcal{M}[X, \mathcal{A}, \mu, \mathbb{K}]$, using then [theorems: 20.345, 20.456] and [lemma: 20.468] we have that $|f \cdot g| \in \mathcal{M}[X, \mathcal{A}, \mu, \mathbb{R}]$. Further from $g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$ it follows that $|g| = |g|^1 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ so that by [theorem: 20.461] $\|f\|_\infty \cdot |g| \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. Using then [eq: 20.647] together with [theorem: 20.428] proves that

$$|f \cdot g| \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ and } \int |f \cdot g| d\mu \leqslant \int \|f\|_\infty \cdot |g| d\mu = \|f\|_\infty \cdot \int |g| d\mu \tag{20.648}$$

Hence we have by definition that

$$f \cdot g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$$

As $\|g\|_q \underset{q=1}{=} \|g\|_1 = (\int |g|^1)^{\frac{1}{1}} = \int |g| d\mu$ it follows from [eq: 20.648] that

$$\int |f \cdot g| d\mu \leqslant \|f\|_\infty \cdot \|g\|_q = \|f\|_p \cdot \|g\|_q$$

$q = \infty$. This reduces to the case $p = \infty$ if we switch p with q and f with g.

$p \neq \infty \wedge q \neq \infty$. Let $x \in X$ then we have either:

$f(x) = 0 \vee g(x) = 0$. Then $|f(x) \cdot g(x)| = 0 \leqslant \frac{|f(x)|^p}{p} + \frac{|g(x)|^q}{q}$

$f(x) \neq 0 \wedge g(x) \neq 0$. Using Young's inequality [see 19.53] we have that

$$|f(x) \cdot g(x)| = |f(x)| \cdot |g(x)| \leqslant \frac{|f(x)|^p}{p} + \frac{|g(x)|^q}{q}$$

Hence we have

$$\forall x \in X \text{ we have } |f(x) \cdot g(x)| \leqslant \frac{|f(x)|^p}{p} + \frac{|g(x)|^q}{q} \tag{20.649}$$

As $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$, $g \in \mathcal{L}^q[X, \mathcal{A}, \mu, \mathbb{K}]$ it follows that $|f|^p, |g|^q \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. Hence using [theorem: 20.425] we have that $\frac{|f|^p}{p} + \frac{|g|^q}{q} \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. Further as $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ [see definition: 20.465] we have by [theorems: 20.345,20.413,20.456,20.457] that $|f \cdot g| \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{K}]$. Using then [eq: 20.649] together with [theorem: 20.428] proves that

$$|f \cdot g| \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ so that by definition } f \cdot g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}] \tag{20.650}$$

and

$$\int |f \cdot g| d\mu \leqslant \int \left(\frac{|f|^p}{p} + \frac{|g|^q}{q}\right) d\mu = \frac{1}{p} \cdot \int |f|^p d\mu + \frac{1}{q} \cdot \int |g|^q d\mu \tag{20.651}$$

We examine now the case where $\|f\|_p = 1 = \|g\|_q$. In this case we we have that

$$1 \underset{\text{[theorem: 19.42]}}{=} 1^p = (\|f\|_p) = \left(\left(\int |f|^p d\mu\right)^{\frac{1}{p}}\right)^p \underset{\text{[theorem: 19.42]}}{=} \int |f|^p d\mu$$

$$1 \underset{\text{[theorem: 19.42]}}{=} 1^q = (\|g\|_q) = \left(\left(\int |f|^q d\mu\right)^{\frac{1}{q}}\right)^q \underset{\text{[theorem: 19.42]}}{=} \int |f|^q d\mu$$

Substituting this in [eq: 20.651] gives

$$\int |f \cdot g| d\mu \leqslant \frac{1}{p} + \frac{1}{q} = 1$$

To summarize we have

If $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$, $g \in \mathcal{L}^q[X, \mathcal{A}, \mu, \mathbb{K}]$ with $\|f\|_p = 1 = \|g\|_q$ then $f \cdot g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}]$ and $\int |f \cdot g| d\mu \leqslant 1 = \|f\|_p \cdot \|g\|_q$ (20.652)

proving the theorem in this special case. Now for the general case we have for $\|f\|_p$, $\|g\|_q$ the following possible cases:

$\boldsymbol{\|f\|_p \neq 0 \wedge \|g\|_q \neq 0}$**.** Take then $f' = \frac{f}{\|f\|_p}$ and $g' = \frac{g}{\|g\|_q}$ so that by [theorem: 20.471] $f' \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$, $g' \in L[X, \mathcal{A}, \mu, \mathbb{K}]$. Further we have $\forall x \in X$ that

$$\left|\frac{f}{\|f\|_p}\right|^p (x) = \left(\frac{|f(x)|}{\|f\|_p}\right)^p \underset{\text{[theorem: 19.42}}{=} \left(\frac{|f(x)|^p}{(\|f\|_p)^p}\right) = \left(\frac{|f|^p}{(\|f\|_p)^p}\right)(x)$$

$$\left|\frac{g}{\|g\|_q}\right|^q (x) = \left(\frac{|g(x)|}{\|g\|_q}\right)^q \underset{\text{[theorem: 19.42}}{=} \left(\frac{|g(x)|^q}{(\|g\|_q)^q}\right) = \left(\frac{|g|^q}{(\|g\|_q)^q}\right)(x)$$

which proves that

$$\left|\frac{f}{\|f\|_p}\right|^p = \frac{|f|^p}{(\|f\|_p)^p} \wedge \left|\frac{g}{\|g\|_q}\right|^q = \frac{|g|^q}{(\|g\|_q)^q}$$

so that

$$\begin{aligned}
\|f'\|_p &= \left(\int \left|\frac{f}{\|f\|_p}\right|^p d\mu\right)^{\frac{1}{p}} \\
&= \left(\int \frac{|f|^p}{(\|f\|_p)^p} d\mu\right)^{\frac{1}{p}} \\
&= \left(\left(\frac{1}{\|f\|_p}\right)^p \cdot \int |f|^p d\mu\right)^{\frac{1}{p}} \\
&\underset{\text{[theorem: 19.42}}{=} \frac{1}{\|f\|_p} \cdot \left(\int |f|^p d\mu\right)^{\frac{1}{p}} \\
&= \frac{1}{\|f\|_p} \cdot \|f\|_p \\
&= 1 \\
\|g'\|_q &= \left(\int \left|\frac{g}{\|g\|_q}\right|^q d\mu\right)^{\frac{1}{q}} \\
&= \left(\int \frac{|g|^q}{(\|g\|_q)^q} d\mu\right)^{\frac{1}{q}} \\
&= \left(\left(\frac{1}{\|g\|_q}\right)^q \cdot \int |g|^q d\mu\right)^{\frac{1}{q}} \\
&\underset{\text{[theorem: 19.42}}{=} \frac{1}{\|g\|_q} \cdot \left(\int |g|^q d\mu\right)^{\frac{1}{q}} \\
&= \frac{1}{\|g\|_q} \cdot \|g\|_q \\
&= 1
\end{aligned}$$

So we can apply [eq: 20.652] giving

$$f' \cdot g' \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}] \text{ and } \int |f' \cdot g'| d\mu \leqslant 1 \tag{20.653}$$

Using [theorem: 20.471] we have $f \cdot g = (\|f\|_p \cdot \|g\|_q) \cdot (f' \cdot g') \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$ and

$$\int (f \cdot g) d\mu = \|f\|_p \cdot \|g\|_q \cdot \int (f' \cdot g') d\mu \underset{\text{[eq: 20.653]}}{\leqslant} \|f\|_p \cdot \|g\|_q \cdot 1$$

in other words

$$f \cdot g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}] \text{ and } \int (f \cdot g) d\mu \leqslant \|f\|_p \cdot \|g\|_q$$

$\|f\|_p = 0$. Then by [theorem: 20.478] we have $f = 0$ μ-a.e so there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X | f(x) \neq 0\} \subseteq N$. If $x \in \{x \in X | |f \cdot g|(x) \neq 0\}$ then $f(x) \neq 0$ [otherwise $|f \cdot g|(x) = |f(x) \cdot g(x)| = |0| = 0$] so that $x \in \{x \in X | f(x) \neq 0\} \subseteq N$. Hence $\{x \in X | |f \cdot g|(x) \neq 0\} \subseteq N$ which proves that $|f \cdot g| = 0$ μ-a.e.. Using [theorem: 20.423 it follows that

$$\int |f \cdot g| d\mu = 0 \leqslant \|f\|_p \cdot \|g\|_q$$

$\|g\|_q = 0$. Then by [theorem: 20.478] we have $g = 0$ μ-a.e so there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X | g(x) \neq 0\} \subseteq N$. If $x \in \{x \in X | |f \cdot g|(x) \neq 0\}$ then $g(x) \neq 0$ [otherwise $|f \cdot g|(x) = |f(x) \cdot g(x)| = |0| = 0$] so that $x \in \{x \in X | g(x) \neq 0\} \subseteq N$. Hence $\{x \in X | |f \cdot g|(x) \neq 0\} \subseteq N$ which proves that $|f \cdot g| = 0$ μ-a.e.. Using [theorem: 20.423 it follows that

$$\int |f \cdot g| d\mu = 0 \leqslant \|f\|_p \cdot \|g\|_q$$

So in all cases we have that

$$\int |f \cdot g| d\mu \leqslant \|f\|_p \cdot \|g\|_q \text{ and by [eq: 20.650] } f \cdot g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$$

proving the theorem for the case where $p, q \in [1, \infty[$. □

Theorem 20.485. (Minkowski's Inequality) *Let $p \in [1, \infty]$, $\langle X, \mathcal{A}, \mu \rangle$ a measure space then we have $\forall f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then $\|f + g\|_p \leqslant \|f\|_p + \|g\|_p$*

***Note* 20.486.** *Using [theorem: 20.475] $f + g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ so that $\|f + g\|_p$ is well defined.*

Proof. As $f + g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ we have by definition that

$$f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \text{ and } |f + g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}] \tag{20.654}$$

For $p \in [1, \infty]$ we have the following possible cases:

$p = \infty$. Define $F = \{x \in X | |f(x)| > \|f\|_p\}$ and $G = \{x \in X | |g(x)| \geqslant \|g\|_\infty\}$ then using [lemma: 20.483] we have that F is locally μ-null and G is locally μ-null so that by]theorem: 20.481]

$$F \bigcup G \text{ is locally } \mu\text{-null} \tag{20.655}$$

Let $x \in \{x \in X | |(f + g)(x)| > \|f\|_\infty + \|g\|_\infty\}$ then

$$\|f\|_\infty + \|g\|_\infty < |(f + g)(x)| \leqslant |f(x)| + |g(x)|.$$

Assume that $|f(x)| \leqslant \|f\|_\infty \wedge |g(x)| \leqslant \|g\|_\infty$ then we would have $\|f\|_\infty + \|g\|_\infty < \|f\|_\infty + \|g\|_\infty$ a contradiction, hence the assumption is wrong and we must have $\|f\|_\infty < |f(x)| \vee \|g\|_\infty < |g(x)|$ or $x \in F \bigcup G$. So we have proved that

$$\{x \in X | |(f + g)(x)| > \|f\|_\infty + \|g\|_\infty\} \subseteq X \setminus \left(X \setminus \left(F \bigcup G\right)\right) = F \bigcup G$$

so that using [eq: 20.655] on]theorem: 20.481] it follows that

$$\{x \in X \,|\, |(f+g)(x)| > \|f\|_\infty + \|g\|_\infty\} \text{ is locally } \mu\text{-null}$$

As by [definition: 20.482] $\|f\|_\infty + \|g\|_\infty \in [0,\infty[$ it follows that

$$\|f\|_\infty + \|g\|_\infty \in \{M \in [0,\infty[\,|\, \{x \in X \,|\, |(f+g)(x)| > M\}\}$$

so that $\|f+g\|_\infty \underset{\text{[definition: 20.482]}}{=} \inf(\{M \in [0,\infty[\,|\, \{x \in X \,|\, |(f+g)(x)| > M\}\}) \leqslant \|f\|_\infty + \|g\|_\infty$. Hence we have proved that

$$\|f+g\|_p \leqslant \|f\|_p + \|g\|_p$$

$\boldsymbol{p=1}$. Given $x \in X$ we have that $|f+g|(x) = |f(x)+g(x)| \leqslant |f(x)| + |g(x)|$ so that by [theorem: 20.425] we have $\int |f+g| d\mu \leqslant \int |f| d\mu + \int |g| d\mu$. Hence we have

$$\begin{aligned}
\|f+g\|_1 &= \left(\int |f+g|^1 d\mu\right)^{\frac{1}{1}} \\
&= \int |f+g| d\mu \\
&\leqslant \int |f| d\mu + \int |g| d\mu \\
&= \left(\int |f|^1 d\mu\right)^{\frac{1}{1}} + \left(\int |g|^1 d\mu\right)^{\frac{1}{1}} \\
&= \|f\|_1 + \|g\|_1
\end{aligned}$$

proving that

$$\|f+g\|_p \leqslant \|f\|_p$$

$\boldsymbol{p \in]1,\infty[}$. Let $q = \frac{p}{p-1}$ then $\frac{1}{p} + \frac{1}{q} = \frac{1}{p} + \frac{p-1}{p} = \frac{p}{p} = 1$ and $(p-1) \cdot q = p$. So if follows that $(|f+g|^{p-1})^q \underset{\text{[theorem: 19.42]}}{=} |f+g|^{(p-1)\cdot q} = |f+g|^p$. So using [eq: 20.654] it follows that $(|f+g|^{p-1})^q \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}]$ so that

$$|f+g|^{p-1} \in \mathcal{L}^q[X, \mathcal{A}, \mu, \mathbb{K}] \tag{20.656}$$

Now as $f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$, $\frac{1}{p} + \frac{1}{q}$ we have using the Holder's inequality [see theorem: 20.484] together with the above that

$$f \cdot |f+g|^{p-1} \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}] \wedge g \cdot |f+g|^{q-1} \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}] \tag{20.657}$$

$$\int |f \cdot |f+g|^{p-1}| d\mu \leqslant \|f\|_p \cdot \||f+g|^{p-1}\|_q \tag{20.658}$$

$$\int |g \cdot |f+g|^{p-1}| d\mu \leqslant \|g\|_p \cdot \||f+g|^{p-1}\|_q \tag{20.659}$$

Further we have $\forall x \in X$ that

$$\begin{aligned}
|f+g|^p(x) &= |f(x)+g(x)|^p \\
&\underset{\text{[theorem: 19.42]}}{=} |f(x)+g(x)| \cdot |f(x)+g(x)|^{p-1} \\
&\leqslant (|f(x)| + |g(x)|) \cdot |f(x)+g(x)|^{p-1} \\
&= |f(x)| \cdot |f(x)+g(x)|^{p-1} + |g(x)| \cdot |f(x)+g(x)|^{p-1} \\
&= (|f| \cdot |f+g|^{p-1} + |g| \cdot |f+g|^{p-1})(x)
\end{aligned}$$

Using [theorem: 20.425] we have then

$$\begin{aligned}
\int |f+g|^p d\mu &\leqslant \int (|f|\cdot|f+g|^{p-1}+|g|\cdot|f+g|^{p-1})d\mu \\
&\underset{\text{[theorem: 20.425]}}{=} \int (|f|\cdot|f+g|^{p-1})d\mu + \int (|g|\cdot|f+g|^{p-1})d\mu \\
&\underset{\text{[eqs: 20.658, 20.659]}}{\leqslant} \|f\|_p \cdot \||f+g|^{p-1}\|_q + \|g\|_p \cdot \||f+g|^{p-1}\|_q \\
&= (\|f\|_p + \|g\|_p)\cdot \||f+g|^{p-1}\|_q \\
&= (\|f\|_p + \|g\|_p)\cdot \left(\int (|f+g|^{p-1})^q d\mu\right)^{\frac{1}{q}} \\
&\underset{\text{[theorem: 19.42]}}{=} (\|f\|_p + \|g\|_p)\cdot \left(\int |f+g|^{(p-1)\cdot q} d\mu\right)^{\frac{1}{q}} \\
&= (\|f\|_p + \|g\|_p)\cdot \left(\int |f+g|^{p} d\mu\right)^{\frac{1}{q}}
\end{aligned}$$

so that

$$\int |f+g|^p d\mu \leqslant (\|f\|_p + \|g\|_p)\cdot \left(\int |f+g|^p d\mu\right)^{\frac{1}{q}} \tag{20.660}$$

For $\int |f+g|^p d\mu$ we have either:

$\int |f+g|^p d\mu = 0$. Then we have

$$\|f+g\|_p = \left(\int |f+g|^p d\mu\right)^{\frac{1}{p}} = 0^{\frac{1}{p}} \underset{\text{[eq: 19.42]}}{=} 0 \leqslant \|f\|_p + \|g\|_p$$

so that

$$\|f+g\|_p \leqslant \|f\|_p + \|g\|_p$$

$\int |f+g|^p d\mu \neq 0$. Then by [theorem: 19.39] we have $(\int |f+g|^p d\mu)^{\frac{1}{q}} \neq 0$ so that using using [eq: 20.660] we have

$$\begin{aligned}
\|f\|_p + \|g\|_p &\geqslant \frac{\int |f+g|^p d\mu}{(\int |f+g|^p d\mu)^{\frac{1}{q}}} \\
&\underset{\text{[eq: 19.42]}}{=} \left(\int |f+g|^p d\mu\right)^{1-\frac{1}{q}} \\
&= \left(\int |f+g|^p d\mu\right)^{\frac{1}{p}} \\
&= \|f+g\|_p
\end{aligned}$$

hence

$$\|f+g\|_p \leqslant \|f\|_p + \|g\|_p$$

So in all cases we have proved that

$$\|f+g\|_p \leqslant \|f\|_p + \|g\|_p$$

□

Theorem 20.487. *Let $p \in [1,\infty]$, $n \in \mathbb{N}$ and $\{f_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ then $\sum_{i=1}^n f_i \in \mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ and $\|\sum_{i=1}^n f_i\|_p \leqslant \sum_{i=1}^n \|f_i\|_p$'*

Proof. This is easily proved by mathematical induction. So let

$$\mathcal{S} = \left\{ n \in \mathbb{N} | \text{If } \{f_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}] \text{ then } \sum_{i=1}^n f_i \in \mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}] \text{ and } \left\|\sum_{i=1}^\infty f_i\right\|_p \leqslant \sum_{i=1}^n \|f_i\|_p \right\}$$

then we have:

$1 \in \mathcal{S}$. If $\{f_i\}_{i\in\{1,\dots,1\}} \subseteq \mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ then $\sum_{i=1}^{1} f_i = f_1 \in \mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ and

$$\left\|\sum_{i=1}^{1} f_i\right\|_p = \|f_1\|_p = \sum_{i=1}^{1} \|f_i\|_p$$

proving that $1 \in \mathcal{S}$.

$n \in \mathcal{S} \Rightarrow n+1 \in \mathcal{S}$. Let $\{f_i\}_{i\in\{1,\dots,n+1\}} \subseteq \mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ then we have as $n \in \mathcal{S}$ that $\sum_{i=1}^{n} f_i \in \mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ that by [theorem: 20.475] $\sum_{i=1}^{n+1} f_i = \sum_{i=1}^{n} f_i + f_{n+1} \in \mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ and

$$\begin{aligned}
\left\|\sum_{i=1}^{n+1} f_i\right\|_p &= \left\|\sum_{i=1}^{n} f_i + f_{n+1}\right\|_p \\
&\underset{\text{[theorem: 20.485]}}{\leqslant} \left\|\sum_{i=1}^{n} f_i\right\|_p + \|f_{n+1}\|_p \\
&\leqslant_{n\in\mathcal{S}} \sum_{i=1}^{n} \|f_i\|_p + \|f_{n+1}\|_p \\
&= \sum_{i=1}^{n+1} \|f_i\|_p
\end{aligned}$$

proving that $n+1 \in \mathcal{S}$. □

We are now ready to proves that $\langle \mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}], \|\|_p\rangle$ is a pseudo normed space.

Theorem 20.488. *Let $p \in [1,\dots,\infty]$ and $\langle X,\mathcal{A},\mu\rangle$ be a measure space then $\langle \mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}], \|\|_p\rangle$ is a pseudo normed vectorspace over $\mathbb{K}$.*

***Note* 20.489.** *Using [theorem: 20.475] we have that $\langle \mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}],+,\cdot\rangle$ is a vector space.*

***Note* 20.490.** *If $A \in \mathrm{A}$ such that $A \neq \varnothing \Rightarrow \exists a \in A$ and $\mu(A)=0$ then as $\mathcal{X}_{X,A}(a)=1$ we have that $\mathcal{X}_{X,A} \neq C_0$. Further we have using [example: 20.397] $0=\mu(A)=\int^+ \mathcal{X}_A d\mu = \int \mathcal{X}_A d\mu = (\int (\mathcal{X}_A)^1 d\mu)^{\frac{1}{1}} = \|\mathcal{X}_A\|_1$. So $\|\|_1$ is only a pseudo norm not a norm.*

Proof. By [definitions: 20.477, 20.482] we have that

$$\|\|_p : \mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}] \to [0,\infty[\tag{20.661}$$

Further we have using the Minkowski's Inequality [see theorem: 20.485] that

$$\forall f,g \in \mathcal{L}[X,\mathcal{A},\mu,\mathbb{K}] \text{ we have } \|f+g\|_p \leqslant \|f\|_p + \|g\|_p \tag{20.662}$$

Let $f \in \mathcal{L}[X,\mathcal{A},\mu,\mathbb{K}]$ and $\alpha \in \mathbb{K}$. For $p \in [1,\infty]$ we have either:

$p \in [1,\infty[$. Then

$$\begin{aligned}
\|\alpha\cdot f\|_p &= \left(\int |\alpha\cdot f|^p d\mu\right)^{\frac{1}{p}} \\
&= \left(\int (|\alpha|\cdot|f|)^p d\mu\right)^{\frac{1}{p}} \\
&\underset{\text{[theorem: 19.42]}}{=} \left(\int (|\alpha|^p\cdot|f|^p) d\mu\right)^{\frac{1}{p}} \\
&\underset{\text{[theorem: 20.425]}}{=} \left(|\alpha|^p\cdot\int |f|^p d\mu\right)^{\frac{1}{p}} \\
&\underset{\text{[theorem: 19.42]}}{=} (|\alpha|^p)^{\frac{1}{p}}\cdot\left(\int |f|^p d\mu\right)^{\frac{1}{p}} \\
&\underset{\text{[theorem: 19.42]}}{=} |\alpha|\cdot\left(\int |f|^p d\mu\right)^{\frac{1}{p}} \\
&= |\alpha|\cdot\|f\|_p
\end{aligned}$$

proving that

$$\|\alpha\cdot f\|_p=|\alpha|\cdot\|f\|_p$$

$p=\infty$. For $\alpha\in\mathbb{K}$ we have either:

$\alpha=0$. As $\{x\in X\,|\,|\alpha\cdot f|(x)>0\}=\varnothing$ [for if $|\alpha\cdot f|(x)>M$ then we have $0=|\alpha\cdot f(x)|=|\alpha\cdot f|(x)>M\geqslant 0$ a contradicton] and by [example: 20.480]

$$\{x\in X\,|\,|\alpha\cdot f|(x)>0\}\text{ is locally }\mu\text{-null}$$

So that $0\in\{M\in[0,\infty[\,|\{x\in X\,|\,|\alpha\cdot f|(x)>0\}\text{ is locally }\mu\text{-null}\}$ hence

$$0\leqslant\|\alpha\cdot f\|_\infty=\inf(\{M\in[0,\infty[\,|\{x\in X\,|\,|\alpha\cdot f|(x)>0\}\text{ is locally }\mu\text{-null}\})\leqslant 0$$

hence

$$\|\alpha\cdot f\|_\infty=0=|\alpha|\cdot\|f\|_\infty$$

$\alpha\neq 0$. Let $M\in[0,\infty[$ then we have

$$\begin{aligned}x\in\{x\in X\,|\,|(\alpha\cdot f)(x)|>M\}\quad&\Leftrightarrow\quad|\alpha\cdot f(x)|>M\\&\Leftrightarrow\quad|\alpha|\cdot|f(x)|>M\\&\underset{|\alpha|\neq 0}{\Leftrightarrow}\quad|f(x)|>\frac{M}{|\alpha|}\\&\Leftrightarrow\quad x\in\left\{x\in X\,|\,|f(x)|>\frac{M}{\alpha}\right\}\end{aligned}$$

proving that

$$\{x\in X\,|\,|(\alpha\cdot f)(x)|>M\}=\left\{x\in X\,|\,|f(x)|>\frac{M}{\alpha}\right\}\tag{20.663}$$

Define

$$\begin{aligned}A&=\{M\in[0,\infty[\,|\{x\in X\,|\,|\alpha\cdot f(x)|>M\}\text{ is locally }\mu\text{-null}\}\\B&=\{M\in[0,\infty[\,|\{x\in X\,|\,|f(x)|>M\}\text{ is locally }\mu\text{-null}\}\end{aligned}$$

If $M\in A$ then $\{x\in X\,|\,|\alpha\cdot f(x)|>M\}$ is locally μ-null so using [eq: 20.663] we have that $\left\{x\in X\,|\,|f(x)|>\frac{M}{|\alpha|}\right\}$ is locally μ-null hence $M'=\frac{M}{|\alpha|}\in B$ or $M\in\{|\alpha|\cdot M'|M'\in B\}$ giving

$$A\subseteq\{|\alpha|\cdot M'|M'\in B\}\tag{20.664}$$

On the other side, if $M\in\{|\alpha|\cdot M'|M'\in B\}$ there exists a $M'\in B$ such that $M=|\alpha|\cdot M'$ or $\frac{M}{|\alpha|}=M'\in B$ hence $\left\{x\in X\,|\,|f(x)|>\frac{M}{|\alpha|}\right\}$ is locally μ-null. Using [eq: 20.663] we have then that $\{x\in X\,|\,|(\alpha\cdot f)(x)|>M\}$ is locally μ-null or $M\in A$, proving that $\{|\alpha|\cdot M'|M'\in B\}\subseteq A$. Using [eq: 20.664 we have then that

$$A=\{|a|\cdot M'|M'\in B\}\tag{20.665}$$

As $\|\alpha\cdot f\|_\infty\underset{\text{def}}{=}\inf(A)$ we have by [eq: 20.665] that $\forall M\in B\ \|\alpha\cdot f\|_\infty\leqslant|\alpha|\cdot M$ so that $\frac{\|\alpha\cdot f\|_\infty}{|\alpha|}\leqslant M$ hence $\frac{\|\alpha\cdot f\|_\infty}{|\alpha|}\leqslant\inf(B)=\|f\|_\infty$ or

$$\|\alpha\cdot f\|_\infty\leqslant|\alpha|\cdot\|f\|_\infty\tag{20.666}$$

Further if $M\in\{|\alpha|\cdot M'|M'\in B\}$ then $M=|\alpha|\cdot M'$ where $M'\in B$ so that $\frac{M}{|\alpha|}=M'\in B$ hence $\|f\|_\infty=\inf(B)\leqslant\frac{M}{|\alpha|}$ or $|\alpha|\cdot\|f\|_\infty\leqslant M$ so that

$$|\alpha|\cdot\|f\|_\infty\leqslant\inf(\{|\alpha|\cdot M'|M'\in B\})\underset{\text{[eq: 20.665]}}{=}\inf(A)=\|\alpha\cdot f\|_\infty$$

which combined with [eq: 20.666] proves that

$$\|\alpha\cdot f\|_p=\|\alpha\cdot f\|_\infty=|\alpha|\cdot\|f\|_\infty=|\alpha|\cdot\|f\|_p$$

□

It would be nice that $\|\|p$ is actually a norm. To do this we consider first the sub space of $\mathcal{L}[X,\mathcal{A},\mu,\mathbb{K}]$ consisted of functions f with $\|\|_p$ and construct then factor space [see theorem: 11.76].

Definition 20.491. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space, $p \in [1, \infty]$ then we define the* ***p-null set*** *$\mathcal{N}^p$ by*

$$\mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}] = \{f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] | \|f\|_p = 0\}$$

We have the following equivalences of p-null sets.

Theorem 20.492. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space then we have*

1. *If $p \in [1, \infty[$ then*

$$f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}] \Leftrightarrow f \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \text{ and } f = 0 \ \mu\text{-a.e.}$$

2. *If $p = \infty$ then*

$$f \in \mathcal{N}^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \Leftrightarrow f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \text{ and } \{x \in X | f(x) \neq 0\} \text{ is locally } \mu\text{-null}$$

Proof.

1. First if $p \in [1, \infty[$ then

$$\begin{aligned} x \in \{x \in X | f(x) \neq 0\} &\Leftrightarrow f(x) \neq 0 \\ &\underset{\|\ \text{is a norm}}{\Leftrightarrow} |f(x)| \neq 0 \\ &\underset{[\text{theorem: } 19.42]}{\Leftrightarrow} |f(x)|^p \neq 0 \\ &\Leftrightarrow x \in \{x \in X | |f(x)|^p \neq 0\} \end{aligned}$$

which proves that

$$\forall p \in [1, \infty[\text{ we have } \{x \in X | f(x) \neq 0\} = \{x \in X | |f(x)|^p \neq 0\} \tag{20.667}$$

⇒. As $f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ we have that $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ and $\|f\|_p = 0$. Hence $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ and by [theorem: 20.478] $f = 0$ μ-a.e..

⇐. If $f = 0$ μ-a.e. then there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X | f(x) \neq 0\} \subseteq N$, using [eq: 20.667] we have $\{x \in X | |f(x)|^p \neq 0\} \subseteq N$ so that

$$|f|^p = 0 \ \mu\text{-a.e.}$$

As $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ we have by the above and [theorem: 20.423] that

$$|f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ and } \int |f|^p d\mu = 0 \Rightarrow \|f\|_p = \left(\int |f|^p d\mu\right)^{\frac{1}{p}} \underset{[\text{theorem: } 19.42]}{=} 0$$

so that $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ and $\|f\|_p = 0$ which proves that

$$f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

2.

⇒. As $f \in \mathcal{N}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ we have that

$$f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$$

and $\|f\|_\infty = 0$. Using [lemma: 20.483] it follows that $\{x \in X | |f(x)| > \|f\|_\infty\}$ is locally μ-null. As $\|f\|_\infty = 0$ it follows that $\{x \in X | |f(x)| > 0\}$ is locally μ-null or as $\{x \in X | |f(x)| \neq 0\} = \{x \in X | |f(x)| > 0\}$ it follows that

$$\{x \in X | |f(x)| > 0\} \text{ is locally } \mu\text{-null}$$

⇐. First we have

$$\begin{aligned} x \in \{x \in X | |f(z)| \neq 0\} &\Leftrightarrow |f(x)| \neq 0 \\ &\underset{0 \leqslant |f(x)|}{\Leftrightarrow} |f(x)| > 0 \\ &\Leftrightarrow \{x \in X | |f(x)| > 0\} \end{aligned}$$

we have that $\{x \in X \,|\, |f(z)| \neq 0\} = \{x \in X \,|\, |f(x)| > 0\}$ which, as $\{x \in X \,|\, f(x) \neq 0\}$ is locally μ-null, proves that $\{x \in X \,|\, |f(x)| > 0\}$ is locally μ-null. Hence

$$0 \in \{M \in [0, \infty[\,|\, \{x \in X \,|\, |f(x)| > M\} \text{ is locally } \mu\text{-null}\}$$

so that $0 \leqslant \|f\|_\infty = \inf(\{M \in [0, \infty[\,|\, \{x \in X \,|\, |f(x)| > M\} \text{ is locally } \mu\text{-null}\}) \leqslant 0$ which proves that

$$\|f\|_\infty = 0$$

As by the hypothesis $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ it follows from the above that

$$f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

□

We prove now that $\mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ is a sub-space of $\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}]$.

Theorem 20.493. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $p \in [0, \infty]$ then $\langle \mathcal{N}[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot \rangle$ is a sub-space of $\langle \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot \rangle$*

Proof. As $C_0 \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$, C_0 is the neutral element [see theorem: 20.475] and by [theorem: 20.488] $\|\|_p$ is a pseudo norm it follows that $\|C_o\|_p = 0$ hence

$$C_0 \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}] \Rightarrow \mathcal{N}[X, \mathcal{A}, \mu, \mathbb{K}] \neq 0$$

If $f, g \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then $\|f\|_p = 0 = \|g\|_p$ so that $\|f + g\|_p \leqslant \|f\|_p + \|g\|_p = 0$ hence $\|f + g\| = 0$.

$$\forall f, g \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ we have } f + g \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

Further if $\alpha \in \mathbb{K}$, $f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then $\|f\|_p = 0$ so that $\|\alpha \cdot f\|_p = |\alpha| \cdot \|f\|_p = 0$ proving that

$$\forall f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}], \forall \alpha \in \mathbb{K} \text{ we have } \alpha \cdot f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

So we have that $\langle \mathcal{N}[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot \rangle$ is a sub-space of $\langle \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot \rangle$. □

We use now [theorem: 11.76] to define $L^p[X, \mathcal{A}, \mu, \mathbb{K}]$

Definition 20.494. *Let $p \in [1, \infty]$ and $\langle X, \mathcal{A}, \mu \rangle$ a measure space then by [theorems: 20.493 and 11.75]*

$$\sim_p \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \times \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ where } f \sim_p g \text{ if } f - g \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

is a equivalence relation. For every $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ we can then define the equivalence class $[f]_p$ by

$$[f]_p = \{g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] | g \sim_p f\} = \{g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] | f - g \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]\}$$

The set $L^p[X, \mathcal{A}, \mu, \mathbb{K}]$ is then defined as the factor space $\mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] / \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ so that by [theorem: 11.76] we have

$$L^p[X, \mathcal{A}, \mu, \mathbb{K}] = \{[x]_p | x \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]\}$$

Using [theorem: 11.76] the following operators are well defined

$$+ : L^p[X, \mathcal{A}, \mu, \mathbb{K}] \times L^p[X, \mathcal{A}, \mu, \mathbb{K}] \to L^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ by } [f]_p + [g]_p = [f + g]_p$$

$$\cdot : \mathbb{K} \times L^p[X, \mathcal{A}, \mu, \mathbb{K}] \to L^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ by } \alpha \cdot [f]_p = [\alpha \cdot f]_p$$

and

$$\langle L^p[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot \rangle \text{ forms a vector space with neutral element } [C_0]_p$$

Next we show that we can define a norm on $L^p[X, \mathcal{A}, \mu, \mathbb{K}]$.

Theorem 20.495. *Let $p \in [0, \infty]$ and $\langle X, \boldsymbol{A}, \mu \rangle$ a measure space then*

$$\|\|_{\mathrm{Lp}} : L(X, \mathcal{A}, \mu, \mathbb{K}) \to [0, \infty[\text{ defined by } \|x\|_{\mathrm{Lp}} = \|f\| \text{ where } x = [f]_p$$

is a well defined function that defines a norm on $L(X, \mathcal{A}, \mu, \mathbb{K})$ making

$$\langle L^p(X, \mathcal{A}, \mu, \mathbb{K}), \|\|_{\mathrm{Lp}} \rangle \text{ a normed space}$$

Proof. First we must prove that $\|\|_{L_p}$ is well defined. Let $f \in L^p(X, \mathcal{A}, \mu, \mathbb{K})$ then there exist a $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ such that $x = [f]_p$. Assume that there exist another $g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}]$ such that $x = [g]_p$ then $[f]_p = [g]_p$ so that $f - g \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$. Hence we have that $\|f - g\|_p = 0$ so that

$$|\|f\|_p - \|g\|_p| \underset{[\text{theorem: } 14.87]}{\leqslant} \|f - g\|_p = 0$$

so that $\|f\|_p = \|g\|_p$. Hence it follows that

$$\|\|_{\mathrm{Lp}}: L(X, \mathcal{A}, \mu, \mathbb{K}) \to [0, \infty[\text{ defined by } \|x\|_{\mathrm{Lp}} = \|f\| \text{ where } x = [f]_p \text{ is well defined} \tag{20.668}$$

Next let $x, y \in L^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then there exist $f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ such that $x = [f]_p$ and $y = [g]_p$ then

$$\begin{aligned}
\|x + y\|_{\mathrm{Lp}} &= \|[f]_p + [g]_p\|_{\mathrm{Lp}} \\
&= \|[f + g]_p\|_{\mathrm{Lp}} \\
&= \|f + g\|_p \\
&\leqslant \|f\|_p + \|g\|_p \\
&= \|[f]_p\|_{L_p} + \|[g]_p\|_{\mathrm{Lp}} \\
&= \|x\|_{\mathrm{Lp}} + \|y\|_{\mathrm{Lp}}
\end{aligned}$$

So we have proved that

$$\forall x, y \in L^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ we have } \|x + y\|_{\mathrm{Lp}} \leqslant \|x\|_{\mathrm{Lp}} + \|y\|_{\mathrm{Lp}} \tag{20.669}$$

Further if $\alpha \in \mathbb{K}$ and $x \in L^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then there exist a $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ such that $x = [f]_p$ so that

$$\begin{aligned}
\|\alpha \cdot x\|_{\mathrm{Lp}} &= \|\alpha \cdot [f]_p\|_{\mathrm{Lp}} \\
&= \|[\alpha \cdot f]_p\|_{\mathrm{Lp}} \\
&= \|\alpha \cdot f\|_p \\
&= |\alpha| \cdot \|f\|_p \\
&= |\alpha| \cdot \|[f]_p\|_{\mathrm{Lp}} \\
&= |\alpha| \cdot \|x\|_{\mathrm{Lp}}
\end{aligned}$$

hence we have

$$\forall \alpha \in \mathbb{K}, \forall x \in L^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ we have } \|\alpha \cdot x\|_{\mathrm{Lp}} = |\alpha| \cdot \|x\|_{\mathrm{Lp}} \tag{20.670}$$

Finally if $x \in L[X, \mathcal{A}, \mu, \mathbb{K}]$ is such that $\|x\|_{\mathrm{Lp}} = 0$ then there exist a $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ such that $x = [f]_p$. As $\|f\|_p = \|[f]_p\|_{\mathrm{Lp}} = \|x\|_{\mathrm{Lp}} = 0$ it follows that $f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$. As $C_0 \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ we have that $f - C_0 \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ it follows that $x = [f]_p = [C_0]_p$ the neutral element in $L^p[X, \mathcal{A}, \mu, \mathbb{K}]$. In other words we have

$$\forall x \in L^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ with } \|x\|_{\mathrm{Lp}} = 0 \text{ we have } x = [C_0]_p \tag{20.671}$$

So by [eqs: 20.668, 20.669, 20.670 and 20.671] it follows that $\|\|_{\mathrm{Lp}}$ is a norm. □

20.6.7.2 The Banach space $\langle L^p[X, \mathcal{A}, \mu, \mathbb{K}], \|\|_{\mathrm{Lp}} \rangle$

We will prove now that the norm $\|\|_p$ is complete. First we need some lemmas.

Lemma 20.496. *Let $p \in [0, \infty[$ and $\{x_i\}_{i \in \mathbb{N}} \subseteq [0, \infty[$ such that $\lim_{i \to \infty} x_i$ exist and $\lim_{i \to \infty} x_i \in \mathbb{R}$ then*

$$\lim_{i \to \infty} (x_i)^p \text{ exists and } \lim_{i \to \infty} (x_i)^p = \left(\lim_{i \to \infty} x_i\right)^p$$

$$\lim_{i \to \infty} |x_i|^p = \left|\lim_{i \to \infty} x_i\right|^p$$

Proof. As $[*]^p: [0, \infty[\to \mathbb{R}$ defined by $[*]^p(x) = x^p$ is continuous on $[0, \infty[$ [see theorem: 19.51] we have by [theorem: 14.313[that $\lim_{i \to \infty} (x_i)^p = \lim_{i \to \infty} (*)^p(x)$ exist and $\lim_{i \to \infty} (x_i)^p = \lim_{i \to \infty} (*)^p(x) = (*)^p\left(\lim_{i \to \infty} x_i\right) = \left(\lim_{i \to \infty} x_i\right)^p$. In other words

$$\forall \{x_i\}_{i \in \mathbb{N}} \subseteq [0, \infty[\text{ we have } \lim_{i \to \infty} (x_i)^p \text{ exists and } \lim_{i \to \infty} (x_i)^p = \left(\lim_{i \to \infty} x_i\right)^p \tag{20.672}$$

Further as $\lim_{i\to\infty} x_i$ exist and $\lim_{i\to\infty} x_i \in \mathbb{R}$ it follows from [theorem: 14.316] we have that for $\{|x_i|\}_{i\in\mathbb{N}} \subseteq [0,\infty[$ $\lim_{i\to\infty} |x_i|$ exist and $\lim_{i\to\infty} |x_i| = \left|\lim_{i\to\infty} x_i\right|$. Using then [eq: 20.672] it follows that

$$\lim_{i\to\infty} |x_i|^p \text{ exist and } \lim_{i\to\infty} |x_i|^p = \left(\left|\lim_{i\to\infty} x_i\right|\right)^p = \left|\lim_{i\to\infty} x_i\right|^p \qquad \square$$

We extend now the above lemma to limits that can be finite or infinite.

Lemma 20.497. *Let $p \in [1,\infty[$ and $\{x_i\}_{i\in\mathbb{N}} \subseteq \mathbb{N}$ be such that $\forall i \in \mathbb{N}$ we have $x_i \leqslant x_{i+1}$ then we have if we define*

$$\forall x \in [0,\infty]\ x^p = \begin{cases} x^p \text{ where } x \in [0,\infty[\text{ [here } x^p \text{ is defined in [definition: 19.39]} \\ \infty \text{ if } x = \infty \end{cases}$$

that

$$\lim_{i\to\infty} x_i \text{ and } \lim_{i\to\infty} (x_i)^p \text{ where } \lim_{i\to\infty} x_i, \lim_{i\to\infty} (x_i)^p \in [0,\infty]$$

and

$$\sup(\{(x_i)^p | i \in \mathbb{N}_0\}) = \lim_{i\to\infty} (x_i)^p = \left(\lim_{i\to\infty} x_i\right)^p = (\sup(\{x_i | i \in \mathbb{N}_0\}))^p$$

Proof. As $\forall i \in \mathbb{N}$ we have $0 \leqslant x_i \leqslant x_{i+1}$ it follows by [theorem: 19.42] that $0 \leqslant (x_i)^p \leqslant (x_{i+1})^p$ so that by [theorems: 20.89,20.82] it follows that

$$\lim_{i\to\infty} x_i \text{ exist, } \lim_{i\to\infty} (x_i)^p \text{ exist, } 0 \leqslant \lim_{i\to\infty} x_i = \sup(\{x_i | i \in \mathbb{N}\}) \text{ and } 0 \leqslant \lim_{i\to\infty} (x_i)^p = \sup(\{(x_i)^p | i \in \mathbb{N}\})$$

Let $i \in \mathbb{N}$ then for $\lim_{i\to\infty} x_i$ we have either:

$\lim_{i\to\infty} x_i = \infty$. Then $(x_i)^p \leqslant \infty = \infty^p = \left(\lim_{i\to\infty} x_i\right)^p$

$\lim_{i\to\infty} x_i \neq \infty$. Then $x_i \leqslant \sup(\{x_i | i \in \mathbb{N}\})$ so that by [theorem: 19.42] $(x_i)^p \leqslant \left(\lim_{i\to\infty} x_i\right)^p$

which proves that $\forall i \in \mathbb{N}$ $(x_i)^p \leqslant \left(\lim_{i\to\infty} x_i\right)^p$ so that

$$\lim_{i\to\infty} (x_i)^p = \sup(\{(x_i)^p | i \in \mathbb{N}\}) \leqslant \left(\lim_{i\to\infty} x_i\right)^p \tag{20.673}$$

For $\lim_{i\to\infty} (x_i)^p$ we have the following cases to examine:

$\lim_{i\to\infty} (x_i)^p = \infty$. Then $\lim_{i\to\infty} (x_i)^p = \infty \leqslant \left(\lim_{i\to\infty} x_i\right)^p \leqslant \infty$ so that

$$\lim_{i\to\infty} (x_i)^p = \left(\lim_{i\to\infty} x_i\right)^p$$

$\lim_{i\to\infty} (x_i)^p \neq \infty$. Then $\forall i \in \mathbb{N}$ we have $(x_i)^p \leqslant \sup(\{(x_i)^p | i \in \mathbb{N}\}) = \lim_{i\to\infty} (x_i)^p < \infty$ so that by [theorem: 19.39] $x_i \leqslant \left(\lim_{i\to\infty} (x_i)^p\right)^{\frac{1}{p}}$ hence $\lim_{i\to\infty} x_i = \sup(\{x_i | i \in \mathbb{N}\}) \leqslant \left(\lim_{i\to\infty} (x_i)^p\right)^{\frac{1}{p}} < \infty$. Hence using [lemma: 20.496] it follows that

$$\lim_{i\to\infty} (x_i)^p = \left(\lim_{i\to\infty} x_i\right)^p$$

So in all cases we have

$$\lim_{i\to\infty} (x_i)^p = \left(\lim_{i\to\infty} x_i\right)^p \qquad \square$$

Lemma 20.498. *Let $p \in [1,\infty]$, $\langle X, \mathcal{A}, \mu\rangle$ be measure space and $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then we have $\|f\|_p = \||f|\|_p$*

***Note* 20.499.** *Using [theorem: 20.476] $|f| \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ as is required in this lemma.*

Proof. For p we have either

$p = \infty$. then as $|f| = |(|f|)|$ we have that

$$\begin{aligned} \|f\|_\infty &= \inf(\{M \in [0,\infty[| \{x \in X | |f(x)| > M\} \text{ is locally } \mu\text{-null}\}) \\ &= \inf(\{M \in [0,\infty[| \{x \in X | |f|(x)| > M\} \text{ is locally } \mu\text{-null}\}) \\ &= \|(|f|)\|_\infty \end{aligned}$$

$\boldsymbol{p \in]1, \infty[}$. then as $|f| = |(|f|)|$ we have that

$$\begin{aligned} \|f\|_p &= \left(\int |f|^p\right)^{\frac{1}{p}} \\ &= \left(\int |(|f|)|^p\right)^{\frac{1}{p}} \\ &= \|(|f|)\|_p \end{aligned}$$

□

Lemma 20.500. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space then $\langle L^\infty[X, \mathcal{A}, \mu, \mathbb{K}], \|\|_{L\infty}\rangle$ is a Banach space*

Proof. Using [theorem: 20.495] it follows that

$$\langle L^\infty[X, \mathcal{A}, \mu, \mathbb{K}], \|\|_{L\infty}\rangle$$

So the only thing left to prove is that this space is complete. Let $\{f_i\}_{i\in\mathbb{N}} \subseteq L^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ be a Cauchy sequence then we have there exist a $\{F_i\}_{i\in\mathbb{N}} \subset \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ such that $\forall i \in \mathbb{N}\ f_i = [F_i]_p$. Let $\varepsilon \in \mathbb{R}^+$ then as $\{f_i\}_{i\in\mathbb{N}}$ is Cauchy there exist a $N_\varepsilon \in \mathbb{N}$ such that $\forall n, m \in \{N_\varepsilon, \ldots, \infty\}$ we have $\|f_n - f_m\|_{L\infty} < \varepsilon$. So $\|F_n - F_m\|_\infty = \|[F_n - F_m]_\infty\|_{L\infty} = \|[F_n]_\infty - [F_m]_\infty\|_{L\infty} = \|f_n - f_m\|_{L\infty} < \varepsilon$ hence we have proved that

$$\forall \varepsilon \in \mathbb{R}^+\ \exists N_\varepsilon \in \mathbb{N} \text{ such that } \forall n, m \in \{N_\varepsilon, \ldots, \infty\} \text{ we have } \|F_n - F_m\|_\infty < \varepsilon \tag{20.674}$$

Let $n, m \in \mathbb{N}$ then as $F_n, F_m \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ a vector space we have that $F_n - F_m \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ so that by [lemma: 20.483] that

$$A_{n,m} = \{x \in X \,|\, |F_n(x) - F_m(x)| > \|F_n - F_m\|_\infty\} \text{ is locally } \mu\text{-null} \tag{20.675}$$

Using [theorem: 20.481] it follow that

$$A = \bigcup_{(i,j)\in\mathbb{N}} A_{i,j} \text{ is locally } \mu\text{-null} \tag{20.676}$$

As $F_n - F_m \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ we have by [defnition: 20.473] that $F_n - F_m \in \mathcal{M}[X, \mathcal{A}, \mu, \mathbb{K}]$ so that by [theorem: 20.468] $|F_n - F_m| \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ hence $|F_n - F_m|$ is $\mathcal{A}$-measurable so that by [theorem: 20.335] $A_{n,m} = \{|F_n - F_m| > \|F_n - F_m\|\} \in \mathcal{A}$. As $\mathcal{A}$ is a σ-algebra it follows then that

$$\forall n, m \in \mathbb{N}\ A_{n,m} \in \mathcal{A} \wedge A = \bigcup_{(i,j)\in\mathbb{N}\times\mathbb{N}} A_{i,j} \in \mathcal{A} \wedge X \setminus A \in \mathcal{A} \tag{20.677}$$

Now

$$\begin{aligned} x \in X \setminus A &\Leftrightarrow \forall n, m \in \mathbb{N}\, x \notin A_{n,m} = \{x \in X \,|\, |F_n(x) - F_m(x)| > \|F_n - F_m\|_\infty\} \\ &\Leftrightarrow \forall n, m \in \mathbb{N}\ |F_n(x) - F_m(x)| \leqslant \|F_n - F_m\|_\infty \\ &\Leftrightarrow x \in \{x \in X \,|\, \forall n, m \in \mathbb{N} \text{ we have} |F_n(x) - F_m(x)| \leqslant \|F_n - F_m\|_\infty) \end{aligned}$$

so that

$$X \setminus A = \{x \in X \,|\, \forall n, m \in \mathbb{N} \text{ we have } |F_n(x) - F_m(x)| \leqslant \|F_n - F_m\|_\infty) \tag{20.678}$$

Let $x \in X \setminus A$ and take $\varepsilon \in \mathbb{R}^+$ then by [eq: 20.674] there exist a $N_\varepsilon \in \mathbb{N}$ such that $\forall n, m \in \{N_\varepsilon, \ldots, \infty\}$ we have $|F_n(x) - F_m(x)| \leqslant \|F_n - F_m\|_\infty < \varepsilon$ which proves that

$$\forall x \in X \setminus A\ \{F_n(x)\}_{n\in\mathbb{N}} \subseteq \mathbb{K} \text{ is a Cauchy sequence}$$

As $\langle \mathbb{K}, \|\rangle$ is complete [see examples: 14.336, 14.339] it follows that

$$\forall x \in X \setminus A\ \lim_{i\to\infty} F_i(x) \text{ exist} \tag{20.679}$$

Define

$$F: X \to \mathbb{K} \text{ by } F(x) = \begin{cases} \lim\limits_{i\to\infty} F_i(x) \text{ if } x \in X \setminus A \\ 0 \text{ if } x \in A \end{cases} \tag{20.680}$$

As $\forall i \in \mathbb{N}\ F_i \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}]$ it follows that $F_i \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$, hence using [theorems: 20.353, 20.456] it follows that $\{\mathcal{X}_{X \setminus A} \cdot F_i\}_{i \in \mathbb{N}} \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ hence

$$\{\mathcal{X}_{X \setminus A} \cdot F_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \tag{20.681}$$

Let $x \in X$ then we either:

$x \in A$. Then $\lim_{i \to \infty} (\mathcal{X}_{X \setminus A} \cdot f_i)(x) = \lim_{i \to \infty} 0 = 0 = F(x)$

$x \in X \setminus A$. Then $\lim_{i \to \infty} (\mathcal{X}_{X \setminus A} \cdot f_i)(x) = \lim_{i \to \infty} f_i(x) = F(x)$

hence $\forall x \in X$ we have that $\lim_{i \to \infty} (\mathcal{X}_{X \setminus A} \cdot f)(x)$ exist and $\lim_{i \to \infty} (\mathcal{X}_{X \setminus A} \cdot f)(x) = F(x)$. Using then [theorems: 20.348, 20.456] together with [eq: 20.681] proves that

$$F \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \tag{20.682}$$

Let $x \in X \setminus A$ and take $\varepsilon \in \mathbb{R}^+$. Let $n \in \left\{N_{\frac{\varepsilon}{2}}, \ldots \infty\right\}$ [see eq: 20.674 for the definition of $N_{\frac{\varepsilon}{2}}$] then by [eq: 20.680] there exist a $N_x \in \mathbb{N}$ such that $\forall m \in [N_x, \ldots, \infty]$ we have $|F(x) - F_m(x)| < \frac{\varepsilon}{2}$. Take $N = \max\left(N_{\frac{\varepsilon}{2}}, N_x\right)$ then we have

$$\begin{aligned} |F(x) - F_n(x)| &= |F(x) - F_N(x) + F_N(x) - F_n(x)| \\ &\leqslant |F(x) - F_N(x)| + |F_N(x) - F_n(x)| \\ &< \frac{\varepsilon}{2} + |F_N(x) - F_n(x)| \\ &\underset{\text{[eq: 20.674]}}{<} \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \end{aligned}$$

which proves if we take $M_\varepsilon = N_{\frac{\varepsilon}{2}}$ that

$$\forall \varepsilon \in \mathbb{R}^+\ \exists M_\varepsilon \in \mathbb{N} \text{ such that } \forall n \in \{M_\varepsilon, \ldots, \infty\} \text{ we have } \forall x \in X \setminus A \text{ that } |F(x) - F_n(x)| < \varepsilon \tag{20.683}$$

As $1 \in \mathbb{R}^+$ we have by the above that $\exists M_1 \in \mathbb{N}$ such that $\forall x \in X \setminus A$ we have $|F(x) - F_{M_1}(x)| < 1$. As $F_{M_1} \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ it follows from [definition: 20.473] that there exist a $M \in [0, \infty[$ such that $\forall x \in X$ $|F_{M_1}(x)| \leqslant M$. Let $x \in X$ then we have either:

$x \in X \setminus A$. Then $|F(x)| = |F(x) - F_{M_1}(x) + F_{M_1}(x)| \leqslant |F(x) - F_{M_1}(x)| + |F_{M_1}(x)| < 1 + M$.

$x \in A$. Then $|F(x)| = 0 \leqslant 1 + M$

Hence F is bounded so that by [definition: 20.473] and [eq: 20.682] it follows that

$$F \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \text{ so that } f = [F]_\infty \in L^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \tag{20.684}$$

Let $\varepsilon \in \mathbb{R}^+$. If $n \in \{M_{\varepsilon/2}, \ldots, \infty\}$ then $\left\{x \in X \,|\, |F(x) - F_n(x)| > \frac{\varepsilon}{2}\right\} \subseteq A$ [for if $x \in X \setminus A$ we have by [eq: 20.683] that $|F(x) - F_n(x)| < \frac{\varepsilon}{\varepsilon}$. As A is locally μ-null [see eq: 20.676] it follows from [theorem: 20.481] that $\left\{x \in X \,|\, |F(x) - F_n(x)| > \frac{\varepsilon}{2}\right\}$ is locally μ-null. So $\frac{\varepsilon}{2} \in \{M \in [0, \infty[\,|\, \{F(x) - F_n(x) > M\}$ is locally μ-null$\}$. Hence

$$\|F - F_n\|_\infty = \inf\left(\{M \in [0, \infty[\,|\, \{F(x) - F_n(x) > M\} \text{ is locally } \mu\text{-null}\}\right) \leqslant \frac{\varepsilon}{2} < \varepsilon$$

Hence we have proved that

$$\forall \varepsilon \in \mathbb{R}^+ \text{ there exist a } N \in \mathbb{N} \text{ such that } \forall n \in \{N, \ldots, \infty\} \text{ we have } \|F - F_n\|_\infty < \varepsilon \tag{20.685}$$

Let $n \in \mathbb{N}$ then we have

$$\begin{aligned} \|f - f_n\|_{L\infty} &\underset{\text{[eq: 20.684]}}{=} \|[F]_\infty - [F_n]_\infty\|_{L\infty} \\ &= \|[F - F_n]_\infty\|_{L\infty} \\ &= \|F = F_n\|_\infty \end{aligned}$$

which combinded with [eq: 20.685] proves that

$$\forall \varepsilon \in \mathbb{R}^+\ \exists N \in \mathbb{N} \text{ we have } \forall n \in \{N, \ldots, \infty\} \text{ we have } \|f - f_n\|_{L\infty} < \varepsilon$$

which proves that

$$\lim_{i \to \infty} f_i \text{ converges in } \langle L^\infty[X, \mathcal{A}, \mu, \mathbb{K}], \|\|_{L\infty}\rangle$$

so that

$$\langle L^\infty[X,\mathcal{A},\mu,\mathbb{K}],\|\|_{L\infty}\rangle \text{ is complete} \qquad \square$$

Lemma 20.501. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space, $p\in[1,\infty[$ then $\langle L^p[X,\mathcal{A},\mu,\mathbb{K}],\|\|_{\mathrm{Lp}}\rangle$ is a Banach space.*

Proof. Using [theorem: 20.495] it follows that

$$\langle L^p[X,\mathcal{A},\mu,\mathbb{K}],\|\|_{\mathrm{Lp}}\rangle \text{ is a normed space}$$

So it remains to prove that $\langle L^p[X,\mathcal{A},\mu,\mathbb{K}],\|\|_{\mathrm{Lp}}\rangle$ is a Banach space. We use [theorem: 14.382] stating that a normed space is complete if and only if every absolute convergent series is convergent. So let $\{f_i\}_{i\in\mathbb{N}}\subseteq L^p[X,\mathcal{A},\mu,\mathbb{K}]$ be a absolute convergent series. Then by definition

$$\sum_{i=1}^{\infty}\|f\|_i \text{ converges to a element in } [0,\infty[\subseteq\mathbb{R} \tag{20.686}$$

As $\{f_i\}_{i\in\mathbb{N}}\subseteq L^p[X,\mathcal{A},\mu,\mathbb{K}]$ there exist a $\{F_i\}_{i\in\mathbb{N}}\subseteq\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ such that

$$\forall f_i=[F_i]_p \tag{20.687}$$

As $\{F_i\}_{i\in\mathbb{N}}\subseteq\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ we have using [theorem: 20.476] $\{|F_i|\}_{i\in\mathbb{N}}\subseteq\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$, hence using [theorem: 20.487] that

$$\left\{\sum_{i=1}^{n}|F_i|\right\}_{n\in\mathbb{N}}\subseteq\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}] \tag{20.688}$$

So using the definition of $\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ [see definition: 20.465] we have that

$$\forall n\in\mathbb{N}\left(\sum_{i=1}^{n}|F_i|\right)^p=\left|\sum_{i=1}^{n}|F_i|\right|^p\subseteq\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}] \tag{20.689}$$

Using [theorem: 20.419] we have that

$$\forall n\in\mathbb{N}\left(\sum_{i=1}^{n}|F_i|\right)^p\in\mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}]\wedge\int\left(\sum_{i=1}^{n}|F_i|\right)^p d\mu=\int^+\left(\sum_{i=1}^{n}|F_i|\right)^p d\mu<\infty \tag{20.690}$$

Given $n\in\mathbb{N}$ and $x\in X$ we have that $\sum_{i=1}^{n}|F_i(x)|\leqslant\sum_{i=1}^{n}|F_i(x)|+|F_{n+1}(x)|=\sum_{i=1}^{n+1}|F_i(x)|$ which together with the monotonity of the power function [see theorem: 19.42] proves that

$$\forall x\in X \text{ we have } \forall n\in\mathbb{N}\sum_{i=1}^{n}|F^i(x)|\leqslant\sum_{i=1}^{n+1}|F_i(x)|\wedge\left(\sum_{i=1}^{n}|F^i(x)|\right)^p\leqslant\left(\sum_{i=1}^{n+1}|F^i(x)|\right)^p \tag{20.691}$$

Hence using [theorem: 20.497] it follows that $g(x)\underset{\mathrm{def}}{=}\left(\lim_{n\to\infty}\sum_{i=1}^{n}|F_i(x)|\right)^p=(\sum_{i=1}^{\infty}|F_i(x)|)^p$ is well defined and

$$g(x)=\left(\sum_{i=1}^{\infty}|F_i(x)|\right)^p=\left(\lim_{n\to\infty}\sum_{i=1}^{n}|F_i(x)|\right)^p\underset{\text{[eq: 20.496]}}{=}\lim_{n\to\infty}\left(\sum_{i=1}^{n}|F_i(x)|\right)^p \tag{20.692}$$

Using the above together with [eq: 20.690] allows us to use [theorem: 20.348] giving

$$g=\lim_{n\to\infty}\left(\sum_{i=1}^{n}|F_i|\right)^p\in\mathcal{M}^+[X,\mathcal{A},\overline{\mathbb{R}}] \tag{20.693}$$

The conditions for the Monotone Convergence Theorem [see theorem: 20.435] are now satisfied by [eq: 20.690, 20.691, 20.693], hence we have that

$$\lim_{n\to\infty}\int^+\left(\sum_{i=1}^{n}|F_i|\right)^p d\mu \text{ exist and } \int^+ g\,d\mu=\lim_{n\to\infty}\int^+\left(\sum_{i=1}^{n}|F_i|\right)^p d\mu \tag{20.694}$$

Further, using the monotonicity of the integral [see theorem: 20.405] on [eq: 20.691] we have

$$\forall n \in \mathbb{N} \int^{+} \left(\sum_{i=1}^{n} |F^i| \right)^p d\mu \leqslant \int^{+} \left(\sum_{i=1}^{n+1} |F^i| \right)^p d\mu \tag{20.695}$$

so that by [theorem: 20.89]

$$\lim_{n \to \infty} \int^{+} \left(\sum_{i=1}^{n} |F_i| \right)^p d\mu = \sup \left(\left\{ \left(\sum_{i=1}^{n} |F_i| \right)^p | n \in \mathbb{N} \right\} \right) \tag{20.696}$$

Next

$$\begin{aligned}
\int^{+} \left(\sum_{i=1}^{n} |F_i| \right)^p d\mu & \underset{\text{[eq: 20.690]}}{=} \int \left(\sum_{i=1}^{n} |F^i| \right)^p d\mu \\
& = \left(\left\| \sum_{i=1}^{n} |F_i| \right\|_p \right)^p \\
& \underset{\text{[theorem: 19.42]},\|\|_p \text{is a norm}}{\leqslant} \left(\sum_{i=1}^{n} \| |F_i| \|_p \right)^p \\
& \underset{\text{[lemma: 20.498]}}{=} \left(\sum_{i=1}^{n} \|F_i\|_p \right)^p \\
& \underset{\text{[theorem: 19.42]}}{\leqslant} \left(\sup \left(\left\{ \sum_{i=1}^{n} \|F_i\|_p | n \in \mathbb{N} \right\} \right) \right)^p \\
& \underset{\text{[definition: 20.92]}}{=} \left(\sum_{i=1}^{\infty} \|F_i\|_p \right)^p
\end{aligned}$$

hence

$$\int^{+} \left(\sum_{i=1}^{n} |F_i| \right)^p d\mu \leqslant \left(\sum_{i=1}^{\infty} \|F_i\|_p \right)^p \tag{20.697}$$

Next

$$\begin{aligned}
\int^{+} g d\mu & \underset{\text{[eq: 20.694]}}{=} \lim_{n \to \infty} \int^{+} \left(\sum_{i=1}^{n} |F_i| \right)^p d\mu \\
& \underset{\text{[eq: 20.696]}}{=} \sup \left(\left\{ \int^{+} \left(\sum_{i=1}^{n} |F_i| \right)^p | n \in \mathbb{N} \right\} \right) \\
& \underset{\text{[eq: 20.697]}}{\leqslant} \left(\sum_{i=1}^{\infty} \|F_i\|_p \right)^p \\
& \underset{\text{[eq: 20.686]}}{<} \infty
\end{aligned}$$

which, as also $g \in \mathcal{M}^{+}[X, \mathcal{A}.\overline{\mathbb{R}}]$, proves by [theorem: 20.419] that

$$g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \tag{20.698}$$

Using [theorem: 20.433] it follows from the above that

$$N = \{x \in X | |g(x)| = \infty\} \in \mathcal{A} \text{ and } \mu(N) = \mu(\{x \in X | |g(x)| = \infty\}) = 0 \tag{20.699}$$

As $g \in \mathcal{M}^{+}[X, \mathcal{A}, \overline{\mathbb{R}}]$ [see eq: 20.693] it follows from [theorem: 20.353] that $\mathcal{X}_{X \setminus N} \cdot g \in \mathcal{M}^{+}[X, \mathcal{A}, \overline{\mathbb{R}}]$, from the above we have by [theorem: 20.359 that $\mathcal{X}_{X \setminus N} \cdot g = g$ μ-a.e. Finally, as by [eq: 20.698] $g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$, it follows from [theorem: 20.427] that

$$\mathcal{X}_{X \setminus N} \cdot g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

Further if $x \in X$ then $(\mathcal{X}_{X \setminus N} \cdot g)(x) = \begin{cases} g(x) \in \mathbb{R} \text{ if } x \in X \setminus N \\ 0 \in \mathbb{R} \text{ if } x \in N \end{cases} \in \mathbb{R}$ so that

$$\mathcal{X}_{X \setminus N} \cdot g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] = \{f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] | f(X) \subseteq \mathbb{R}\} \tag{20.700}$$

Let $x \in X \setminus N$ then $(\sum_{i=1}^{\infty} |F_i(x)|)^p \underset{\text{[eq: 20.692]}}{=} g(x) \underset{\text{[eq: 20.699]}}{<} \infty$, hence $\sum_{i=1}^{\infty} |F_i(x)| < \infty$ [otherwise we have $(\sum_{i=1}^{\infty} |F_i(x)|)^p = \infty^p \underset{\text{def}}{=} \infty$]. To summarize we have proved that

$$\forall x \in X \setminus N \text{ we have} \sum_{i=1}^{\infty} |F_i(x)| < \infty$$

Using Dominant Convergence [see theorem: 14.378] on the above for the Banach space $\langle \mathbb{C}, \|\rangle$ proves that

$$\forall x \in X \setminus N \sum_{i=1}^{\infty} F_i(x) = \lim_{n \to \infty} \sum_{i=1}^{n} F_i(x) \in \mathbb{K} \text{ exist} \tag{20.701}$$

Define now

$$F: X \to \mathbb{K} \text{ by } F(x) = \begin{cases} \lim\limits_{n \to \infty} \sum_{i=1}^{n} F_i(x) \text{ if } x \in X \setminus N \\ 0 \text{ if } x \in N \end{cases} \tag{20.702}$$

As $\{F_i\}_{i \in \mathbb{N}} \subseteq \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \underset{\text{[definition: 20.465]}}{\Rightarrow} \{F_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$, further, using [theorems: 20.353,20.456], it follows that $\{\mathcal{X}_{X \setminus N} \cdot F_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$. Hence using [theorems: 20.343,20.456] it follows that

$$\left\{\sum_{i=1}^{n} F_i\right\}_{n \in \mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \text{ and } \left\{\sum_{i=1}^{n} (\mathcal{X}_{X \setminus A} \cdot F_i)\right\} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \tag{20.703}$$

If $x \in X$ then

$$\lim_{n \to \infty} \left(\sum_{i=1}^{n} (\mathcal{X}_{X \setminus N} \cdot F_i)(x)\right) = \begin{cases} \lim\limits_{n \to \infty} \sum_{i=1}^{n} F_i(x) \text{ if } x \in X \setminus N \\ \lim\limits_{i \to} 0 \text{ if } x \in N \end{cases} = F(x) \tag{20.704}$$

So using [theorems: 20.348, 20.456] it follows that

$$F \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \text{ and by [lemma: 20.468] that } |F|^p \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \tag{20.705}$$

Let $n \in \mathbb{N}$ then for $x \in X$ we have either:

$\boldsymbol{x \in X \setminus N}$**.** Then

$$\begin{aligned} \left|\sum_{i=1}^{n} (\mathcal{X}_{X \setminus N} \cdot F_i)\right|^p &= \left|\sum_{i=1}^{n} F_i(x)\right|^p \\ &\underset{\text{[theorem: 19.42]}}{\leqslant} \left(\sum_{i=1}^{n} |F_i(x)|\right)^p \\ &\underset{\text{[theorem: 19.42]}}{\leqslant} \left(\sup\left(\left\{\sum_{i=1}^{n} |F_i(x)| | n \in \mathbb{N}\right\}\right)\right)^p \\ &\underset{\text{[definition: 20.92]}}{=} \left(\sum_{i=1}^{\infty} |F_i(x)|\right)^p \\ &\underset{\text{[eq: 20.692]}}{=} g(x) \end{aligned}$$

Next

$$\begin{aligned} |F(x)|^p &\underset{\text{[eq: 20.704]}}{=} \left|\lim_{n \to \infty} \sum_{i=1}^{n} F_i(x)\right|^p \\ &\underset{\text{[lemma: 20.496]}}{=} \lim_{n \to \infty} \left|\sum_{i=1}^{n} F_i(x)\right|^p \\ &\underset{\text{[theorem: 14.306]}}{\leqslant} g(x) \\ &= (\mathcal{X}_{X \setminus N} \cdot g)(x) \end{aligned}$$

$\boldsymbol{x \in N}$. Then $|F(x)|^p \underset{\text{[eq: 20.702]}}{=} 0 \leqslant (\mathcal{X}_{X\setminus N} \cdot g)(x)$

So we have that

$$\forall x \in X \text{ we have } |F(x)|^p \leqslant (\mathcal{X}_{X\setminus N} \cdot g)(x) \tag{20.706}$$

As $(\mathcal{X}_{X\setminus N} \cdot g)(x) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ [see eq: 20.700], $|F(x)|^p \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ [see eq: 20.705] it follows from the above and [theorem: 20.428[that

$$|F(x)|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \tag{20.707}$$

which as $F \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ [see eq: 20.705] proves that

$$F \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \tag{20.708}$$

Let $x \in X \setminus N$ then given $\varepsilon \in \mathbb{R}^+$ we have, as $F(x) \underset{\text{[eq: 20.702]}}{=} \lim_{n\to\infty} \sum_{i=1}^n F_i(x)$ so that by [theorem: 14.295] $\lim_{n\to\infty} |F(x) - \sum_1^n F_i(x)| = 0$ which using [lemma: 20.496] $\lim_{n\to\infty} |F(x) - \sum_1^n F_i(x)|^p = 0^p \underset{p\neq 1}{=} 0$. As $\mu(N) = 0$ it follows

$$\lim_{n\to\infty} \left| F - \sum_{i=1}^n F_i \right|^p = C_0 \ \mu\text{-a.e.} \tag{20.709}$$

Further, as $F, \sum_{i=1}^n F_i \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ [see eqs: 20.703, 20.705] it follows from [theorems: 20.345, 20.456] that $\{F - \sum_{i=1}^n F_i\}_{n\in\mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$, applying then [theorem: 20.468] gives

$$\left\{ \left| F - \sum_{i=1}^n F_i \right|^p \right\}_{i\in\mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \tag{20.710}$$

If $x \in X \setminus N$ then given $n \in \mathbb{N}$ we have

$$\begin{aligned}
\left| F(x) - \sum_{i=1}^n F_i(x) \right| &\underset{\text{[eq: 20.702]}}{=} \left| \sum_{i=1}^\infty F_i(x) - \sum_{i=1}^n F_i(x) \right| \\
&\underset{\text{[theorem: 14.358]}}{=} \left| \sum_{i=n+1}^\infty F_i(x) \right| \\
&\underset{\text{[theorem: 14.381]}}{\leqslant} \sum_{i=n+1}^\infty |F_i(x)| \\
&\leqslant \sum_{i=1}^\infty |F_i(x)|
\end{aligned}$$

which using [theorem: 19.42] $|F(x) - \sum_{i=1}^n F_i(x)|^p \leqslant (\sum_{i=1}^\infty |F_i(x)|)^p \underset{\text{[eq: 20.692]}}{=} g(x)$. As $\mu(N) = 0$ it follows that

$$\forall n \in \mathbb{N} \text{ we have } \left| F - \sum_{i=1}^n F_i \right|^p \leqslant g \ \mu\text{-a.e.} \tag{20.711}$$

So all the conditions for the Lebesgue Dominant Convergence Theorem [see theorem: 20.445] are satisfied [see eqs: 20.698, 20.710, 20.709 and 20.711], hence we have that

$$\lim_{n\to\infty} \int \left| F - \sum_{I=1}^n F_i \right|^p d\mu = \int \left(\lim_{n\to\infty} \left| F - \sum_{i=1}^n F_i \right|^p \right) d\mu \underset{\text{[eq: 20.709]}}{=} \int C_0 d\mu \underset{\text{[example: 20.418]}}{=} 0$$

proving

$$\lim_{n\to\infty} \left(\left\| F - \sum_{i=1}^n F_i \right\|_p \right)^p = 0$$

Using [lemma: 20.496] it follows then that

$$\lim_{n\to\infty} \left(\left(\left\| F - \sum_{i=1}^n F_i \right\|_p \right)^p \right)^{1/p} \text{ exist and } \lim_{n\to\infty} \left(\left(\left\| F - \sum_{i=1}^n F_i \right\|_p \right)^p \right)^{1/p} = 0^{1/p} = 0$$

which proves that

$$\lim_{n\to\infty}\left\|F-\sum_{i=1}^{n}F_i\right\|_p=0 \tag{20.712}$$

As $F\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{K}]$ [see 20.708] we have $[F]_p\in L^p[X,\mathcal{A},\mu,\mathbb{K}]$. Let $n\in\mathbb{N}$ then we have

$$\begin{aligned}\left\|[F]_p-\sum_{i=1}^{n}f_i\right\|_{\mathrm{Lp}} &= \left\|[F]_p-\sum_{i=1}^{n}[F_i]_p\right\|_{\mathrm{Lp}}\\ &= \left\|\left[F-\sum_{i=1}^{n}F_i\right]_p\right\|_{\mathrm{Lp}}\\ &= \left\|F-\sum_{i=1}^{n}F_i\right\|_p\end{aligned}$$

so that by [eq: 20.712] we have that $\lim_{n\to\infty}\|[F]_p-\sum_{i=1}^{n}f_i\|_{\mathrm{Lp}}=0$. Hence using [theorem: 14.295] it follows that

$$\sum_{i=1}^{\infty}f_i \text{ converges and } \sum_{i=1}^{n}f_i=[F]_p\in L^p[X,\mathcal{A},\mu,\mathbb{K}]$$

In other words we have proved that every absolute convergent series converges which by [theorem: 14.382] proves that

$$\langle L^p[X,\mathcal{A},\mu,\mathbb{K}],\|\|_p\rangle \text{ is a Banach space}$$ □

Summarizing the previous lemma's we have

Theorem 20.502. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space and $p\in[1,\infty]$ then $\langle L^p[X,\mathcal{A},\mu,\mathbb{K}],\|\|_{\mathrm{Lp}}\rangle$ is a Banach space.*

Proof. This follows from [lemma: 20.500] and [lemma: 20.501]. □

20.6.7.3 Density

We show now that $\mathcal{S}[X,\mathcal{A}]$ is dense in $\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{R}]$ [see theorem: 14.111]. First we prove this for the case where $p\in[1,\infty[$.

Theorem 20.503. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space, $p\in[1,\infty[$ and $f\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{R}]$ then $\forall\varepsilon\in\mathbb{R}^+$ there exist a $g\in\mathcal{S}[X,\mathcal{A}]\bigcap\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{R}]$ such that $\|f-g\|_p<\varepsilon$.*

Proof. If $f\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{R}]$ then $f\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$ so that using [theorem: 20.413] we have $f^+,f^{-1}\in\mathcal{M}^+[X,\mathcal{A},\mathbb{R}]$. Using [theorem: 20.398] there exists $\{h_n\}_{n\in\mathbb{N}},\{g_n\}_{n\in\mathbb{N}}\subseteq\mathcal{S}^+[X,\mathcal{A}]$ with

$$\forall x\in X \text{ we have } \forall n\in\mathbb{N} \text{ that } h_n(x)\leqslant h_{n+1}(x)\wedge g_n(x)\leqslant g_{n+1}(x) \tag{20.713}$$

such that

$$f^+=\lim_{n\to\infty}h_n\underset{\text{[theorem: 20.89]}}{=}\sup(\{h_n|n\in\mathbb{N}\})\wedge f^-=\lim_{n\to\infty}g_n\underset{\text{[theorem: 20.89]}}{=}\sup(\{g_n|n\in\mathbb{N}\}) \tag{20.714}$$

Define now

$$\{f_n\}_{n\in\mathbb{N}}\subseteq\mathcal{S}[X,\mathcal{A}]\underset{\text{[definition: 20.369]}}{\subseteq}\mathcal{M}[X,\mathcal{A},\overline{\mathbb{R}}] \text{ by } f_n=h_n-g_n\underset{\text{[theorem: 20.372]}}{\in}\mathcal{S}[X,\mathcal{A}]$$

Given $x\in X$ we have $\forall n\in\mathbb{N}$

$$\begin{aligned}|f_n(x)| &\leqslant |(h_n-g_n)(x)|\\ &\leqslant |h_n(x)|+|g_n(x)|\\ &\underset{0\leqslant h_n(x),g_n(x)}{=} h_n(x)+g_n(x)\\ &\underset{\text{[eq: 20.714]}}{\leqslant} f^+(x)+f^-(x)\\ &\underset{\text{[theorem: 20.412]}}{=} |f(x)|\end{aligned}$$

So we can use [lemma: 20.469] giving

$$f_n \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}] \underset{f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]}{\Rightarrow} f_n - f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}] \tag{20.715}$$

Hence we have by definition

$$\forall n \in \mathbb{N} \; |f_n - f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \Rightarrow |f_n - f|^p \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \tag{20.716}$$

Further we have

$$\begin{aligned}
|f_n(x) - f(x)| &= |h_n(x) - g_n(x) - f(x)| \\
&\underset{\text{[eq: 20.412]}}{=} |h_n(x) - g_n(x) - (f^+(x) - f^-(x))| \\
&\leqslant |h_n(x) - f^+(x)| + |g_n(x) - f^-(X)| \\
&\underset{\text{[eq: 20.714]}}{=} f^+(x) - h_n(x) + f^-(x) - g_n(x) \\
&\underset{0 \leqslant h_n(x), g_n(x)}{\leqslant} f^+(x) + f^-(x) \\
&\underset{\text{[theorem: 20.412]}}{=} |f(x)|
\end{aligned}$$

which, as the power function is monotone [see theorem: 19.42], results in

$$\forall x \in X \text{ we have } \forall n \in \mathbb{N} \text{ that } |(f_n - f)(x)|^p \leqslant |f(x)|^p \tag{20.717}$$

Let $x \in X$ then as $f(x) \in \mathbb{R}$ we have that $f^+(x), f^-(x) \in \mathbb{R}$ so that by [eq: 20.714] $\lim_{n \to \infty} h_n(x) \in \mathbb{R}$ and $\lim_{n \to \infty} g_n(x) \in \mathbb{R}$ so that

$$\begin{aligned}
\lim_{n \to \infty} f_n(x) &= \lim_{n \to \infty} (h_n(x) - g_n(x)) \\
&\underset{\text{[theorems: 14.303,14.302]}}{=} \lim_{n \to \infty} h_n(x) - \lim_{n \to \infty} g_n(x) \\
&\underset{\text{[eq: 20.714]}}{=} f^+(x) - f^-(x) \\
&= f(x)
\end{aligned}$$

which, using [theorem: 14.295] proves that $\lim_{n \to \infty} |f_n(x) - f(x)| = 0$. Using [lemma: 20.496] we have

$$\lim_{n \to \infty} |(f_n - f)(x)|^p = 0 \text{ or } \lim_{n \to \infty} |f_n - f|^p = C_0 \tag{20.718}$$

As $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ we have by definition that

$$|f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \tag{20.719}$$

The conditions for the Lebesgue Dominant Convergence Theorem [theorem: 20.445] are now satisfied by the fact that $C_0 \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ [see example: 20.314] and [eqs: 20.716, 20.717, 20.719]. Hence by applying this theorem we get

$$\lim_{n \to \infty} \int |f_n - f|^p d\mu = \int \left(\lim_{n \to \infty} |f_n - f|^p \right) d\mu \underset{\text{[eq: 20.718]}}{=} \int C_0 d\mu = 0$$

proving

$$\lim_{n \to \infty} (\|f_n - f\|_p)^p = 0$$

So given $\varepsilon \in \mathbb{R}^+$ there exist a $N \in \mathbb{N}$ such that $(\|f_N - f\|_p)^p < \varepsilon^p$. Hence using [theorem: 19.42] we have that $\|f_N - f\|_p = ((\|f_N - f\|_p)^p)^{1/p} < (\varepsilon^p)^{1/p} = \varepsilon$. Further we have $f_N \in \mathcal{S}[X, \mathcal{A}]$ and by [eq: 20.715] $f_N \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. Hence we have proved that

$$\forall \varepsilon \in \mathcal{S}[X, \mathcal{A}] \text{ there exist a } g \in \mathcal{S}[X, \mathcal{A}] \bigcap \mathcal{L}^p(X, \mathcal{A}, \mu, \mathbb{R}) \text{ such that } \|g - f\|_p < \varepsilon \qquad \square$$

We have a similar theorem for $p = \infty$, first we need a little lemma.

Lemma 20.504. *Let $a, b \in \mathbb{R}$ with $a \leqslant b$ then given $\varepsilon \in \mathbb{R}^+$ there exists a $n \in \{2, \ldots, \infty\}$ and $\{a_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R}$ such that $[a, b] \subseteq \bigcup_{i \in \{1, \ldots, n-1\}} [a_i, a_{i+1}[$ and $\forall i \in \{1, \ldots, n-1\}$ $a_i < a_{i+1}$ and $a_{i+1} - a_i < \varepsilon$.*

Proof. Take $l = b - a$. As $\varepsilon > 0$ we have by [theorem: 10.30] that there exists a $N \in \mathbb{N}_0$ such that $\frac{2 \cdot l}{\varepsilon} < N$ or $l < N \cdot \frac{\varepsilon}{2}$. Define now $n = N + 1$, so that $n \in \{2, \ldots, \infty\}$ and $\forall i \in \{1, \ldots, n\}$ $a_i = a + (i-1) \cdot \frac{\varepsilon}{2}$. Then $\forall i \in \{1, \ldots, n-1\}$ we have

$$a_i = a + (i-1) \cdot \frac{\varepsilon}{2} < a + i \cdot \frac{\varepsilon}{2} = a_{i+1}$$

and

$$a_{i+1} - a_i = a + i \cdot \frac{\varepsilon}{2} - a - (i-1) \cdot \frac{\varepsilon}{2} = \frac{\varepsilon}{2} < \varepsilon.$$

Further $a_1 = a$ and $a_n = a + (n-1) \cdot \frac{\varepsilon}{2} = a + N \cdot \frac{\varepsilon}{2} > a + l = b$ so that

$$b < a_n$$

Given $x \in [a, b]$ then $a \leqslant x \leqslant b$, define $I_x = \{i \in \{1, \ldots, n-1\} | a_i \leqslant x\}$. Then as $a_1 = a$ we have that the finite set I_x is not empty so that $m = \max(I_x)$ is well defined. We have now two cases to consider:

$m = n - 1$. Then $a_{n-1} \leqslant x$ and as $x \leqslant b < a_n$ it follows that $x \in [a_{n-1}, a_n[= [a_m, a_{m+1}[$

$m < n - 1$. Then $a_m \leqslant x$ and as $m + 1 \leqslant n - 1$ we must have $x < a_{m+1}$ proving that $x \in [a_m, a_{m+1}[$

So we conclude that $x \in \bigcup_{i \in \{1, \ldots, n-1\}} [a_i, a_{i+1}[$ or that

$$[a, b] \subseteq \bigcup_{i \in \{1, \ldots, n-1\}} [a_i, a_{i+1}[$$

□

Theorem 20.505. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ then $\forall \varepsilon \in \mathbb{R}^+$ there exist a $g \in \mathcal{S}[X, \mathcal{A}]$ such that $\|f - g\| < \varepsilon$.*

Proof. Let $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ and take $\varepsilon \in \mathbb{R}^+$. Using [lemma: 20.504] there exists a $n \in \{2, \ldots, \infty\}$ and a family $\{a_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R}$ with

$$]-\|f\|_\infty, \|f\|_\infty] \subseteq \bigcup_{i \in \{1, \ldots, n-1\}} [a_i, a_{i+1}[\text{ and } \forall i \in \{1, \ldots, n-1\}\ a_i < a_{i+1} \wedge a_{i+1} - a_i < \frac{\varepsilon}{2} \tag{20.720}$$

Let $i \in \{1, \ldots, n-1\}$ then $[a_i, a_{i+1}[\in \mathcal{I}_{[[} \subseteq \sigma[\mathcal{I}_{[[}] \underset{\text{[theorem: 20.156]}}{=} \mathcal{B}[\mathbb{R}] \underset{\text{[theorem: 20.162]}}{\subseteq} \mathcal{B}[\overline{\mathbb{R}}]$. As $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ hence $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ it follows that f is $\mathcal{A}$-measurable so that $f^{-1}([a_i, a_{i-1}[) \in \boldsymbol{A}$. Hence we have that we can define

$$\{A_i\}_{i \in \{1, \ldots, n-1\}} \subseteq \mathcal{A} \text{ by } A_i = f^{-1}([a_i, a_{i-1}[) \tag{20.721}$$

Next

$$\begin{aligned} f^{-1}(]-\|f\|_\infty, \|f\|_\infty]) &\underset{\text{[eq: 20.720]}}{\subseteq} f^{-1}\left(\bigcup_{i \in \{1, \ldots, n-1\}} [a_i, a_{i+1}[\right) \\ &= \bigcup_{i \in \{1, \ldots, n-1\}} f^{-1}([a_i, a_{i+1}[) \\ &\underset{\text{[eq: 20.721]}}{=} \bigcup_{i \in \{1, \ldots, n-1\}} A_i \end{aligned}$$

proving that

$$f^{-1}([-\|f\|_\infty, \|f\|_\infty]) \subseteq \bigcup_{i \in \{1, \ldots, n-1\}} A_i \in \mathcal{A} \tag{20.722}$$

Let $i, j \in \{1, \ldots, n-1\}$ with $i \neq j$ then we may assume without loss of generality that $i < j$ [otherwise switch i and j]. Assume that $x \in A_i \bigcap A_j$ then $f(x) \in [a_i, a_{i+1}[\bigcap [a_j, a_{j+1}[$ so that $a_i \leqslant f(x) < a_{i+1} \leqslant a_j \leqslant f(x) < a_{j+1}$ leading to the contradiction $f(x) < f(x)$. Hence the assumption is wrong and we must have that $A_i \bigcap A_j = \varnothing$. So its provesd that

$$\{A_i\}_{i \in \{1, \ldots, n-1\}} \text{ is pairwise disjoint} \tag{20.723}$$

Using then [theorem: 20.371] we have that

$$g=\sum_{i=1}^{n-1} a_i\cdot\mathcal{X}_{A_i}\in\mathcal{S}[X,\mathcal{A}] \tag{20.724}$$

If $x\in\bigcup_{i\in\{1,\dots,n-1\}}A_i$ then by [eq: 20.723] there exist a unique $i\in\{1,\dots,n-1\}$ such that $x\in A_i$ from which it follows that $f(x)\in[a_i,a_{i+1}[\Rightarrow a_i\leqslant f(x)<a_{i+1}$ so that $0\leqslant f(x)-a_i\leqslant a_{i+1}-a_i=\frac{\varepsilon}{2}$. As $g(x)\underset{\text{[theorem: 20.367]}}{=}a_i$ it follows that $|f(x)-g(x)|<\frac{\varepsilon}{2}$. Hence

$$\forall x\in\bigcup_{i\in\{1,\dots,n-1\}}A_i \text{ we have } |f(x)-g(x)|<\frac{\varepsilon}{2} \tag{20.725}$$

If $x\in\left\{x\in X\,|\,|f(x)-g(x)|>\frac{\varepsilon}{2}\right\}$ then using the above we must have that $x\in X\setminus\bigcup_{i\in\{1,\dots,n-1\}}A_i$. Using [eq: 20.722] it follows that $x\notin f^{-1}([-\|f\|_\infty,\|f\|_\infty])$ so that $f(x)\notin[-\|f\|_\infty,\|f\|_\infty]$ hence $f(x)<-\|f\|_\infty\vee\|f\|_\infty<f(x)$ from which we conclude that $\|f\|_\infty<|f(x)|$. So that

$$\left\{x\in X\,|\,|f(x)-g(x)|>\frac{\varepsilon}{2}\right\}\subseteq\{x\in X\,|\,\|f\|_\infty<|f(x)|\} \tag{20.726}$$

As $f\in\mathcal{L}^\infty[X,\mathcal{A},\mu,\mathbb{R}]$ we have by [lemma: 20.483] that $\{x\in X\,|\,\|f\|_\infty<|f(x)|\}$ is locally μ-null so that by [theorem: 20.481] $\left\{x\in X\,|\,|f(x)-g(x)|>\frac{\varepsilon}{2}\right\}$ is locally μ-null. So we have that $\frac{\varepsilon}{2}\in\{M\in[0,\infty[\,|\{x\in X\,|\,|(f-g)(x)>M|\}$ is locally μ-null$\}$ so that

$$\|f-g\|_\infty=\inf(\{M\in[0,\infty[\,|\{x\in X\,|\,|(f-g)(x)>M|\}\text{ is locally }\mu\text{-null}\})\leqslant\frac{\varepsilon}{2}<\varepsilon$$

In other words

$$\forall\varepsilon\in\mathbb{R}^+\text{ there exist a }g\in\mathcal{S}[X,\mathcal{A}]\text{ such that }\|f-g\|_\infty<\varepsilon$$ □

The two previous theorem motivates the following definition

Definition 20.506. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space and $p\in[1,\infty]$ then we define*

$$\mathcal{S}^p[X,\mathcal{A},\mu,\mathbb{R}]=\begin{cases}\{[f]_\infty|f\in\mathcal{S}[X,\mathcal{A}]\text{ if }p=\infty\}\\ \{[f]_p|f\in\mathcal{S}[X,\mathcal{A}]\bigcap\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{R}]\}\text{ if }p\in[1,\infty[\end{cases}\subseteq L^p[X,\mathcal{A},\mu,\mathbb{R}]$$

***Note* 20.507.** *If $f\in\mathcal{S}[X,\mathcal{A}]$ then f is $\mathcal{A}$-measurable and $f(X)$ is a finite set. Hence f is bounded above by $M=\{|y||y\in f(X)\}$ proving that $\mathcal{S}[X,\mathcal{A}]\subseteq\mathcal{L}^\infty[X,\mathcal{A},\mu,\mathbb{R}]$*

Using this definition we can summarize the two previous theorems

Theorem 20.508. *Let $\langle X,\mathcal{A},\mu\rangle$ be ameasure space, $p\in[1,\infty]$ and $f\in L^p[X,\mathcal{A},\mu,\mathbb{R}]$ then $\forall\varepsilon\in\mathbb{R}^+$ there exist a $g\in\mathcal{S}^p[X,\mathcal{A},\mu,\mathbb{R}]$ such that $\|f-g\|_{\mathrm{Lp}}<\varepsilon$*

***Note* 20.509.** *Using the topological space $\langle L^p[X,\mathcal{A},\mu,\mathbb{R}],\|\|_{\mathrm{Lp}}\rangle$ we have by [theorem: 14.111] that $\mathcal{S}^p[X,\mathcal{A},\mu,\mathbb{R}]$ is dense in $L^p[X,\mathcal{A},\mu,\mathbb{R}]$. So that by definition of dense subsets [see definition: 14.49] we have*

$$\overline{S^p[X,\mathcal{A},\mu,\mathbb{R}]}=L^p[X,\mathcal{A},\mu,\mathbb{R}]$$

Proof. Let $p\in[1,\dots,\infty]$ then we have either:

- $\boldsymbol{p=\infty}$**.** As $f\in L^\infty[X,\mathcal{A},\mu,\mathbb{R}]$ there exists a $F\in\mathcal{L}^\infty[X,\mathcal{A},\mu,\mathbb{R}]$ such that $f=[F]_\infty$. Using [theorem: 20.505] there exists a $G\in S[X,\mathcal{A}]$ such that $\|F-G\|_\infty<\varepsilon$. Take $g=[G]_\varepsilon\in\mathcal{S}^p[X,\mathcal{A},\mu,\mathbb{R}]$ then we have
$$\|f-g\|_{L\infty}=\|[F]_\infty-[G]_\infty\|_{L\infty}=\|[F-G]_\infty\|_{L\infty}=\|F-G\|_\infty<\varepsilon$$
- $\boldsymbol{p\in[1,\infty[}$**.** As $f\in L^p[X,\mathcal{A},\mu,\mathbb{R}]$ there exists a $F\in\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{R}]$ such that $f=[F]_p$. Using [theorem: 20.503] there exists a $G\in\mathcal{S}[X,\mathcal{A}]\bigcap\mathcal{L}^p[X,\mathcal{A},\mu,\mathbb{R}]$ such that $\|F-G\|_p<\infty$. Take $g=[G]_p\in\mathcal{S}^p[X,\mathcal{A},\mu,\mathbb{R}]$ then we have
$$\|f-g\|_{\mathrm{Lp}}=\|[F]_p-[G]_p\|_{\mathrm{Lp}}=\|[F-G]_p\|_{L^p}=\|F-G\|_p<\varepsilon$$ □

20.7 Signed and complex measures

Up to now a measure μ is defined to be non negative real valued function. In this section we extend this to measures that are real or complex.

20.7.1 Signed measures

20.7.1.1 Definition and properities

First we must extend the concept of finite sums in $\overline{\mathbb{R}}$ and ensure that they are always well defined. The problem is that $-\infty+\infty$ and $\infty+(-\infty)$ is not defined in $\overline{\mathbb{R}}$. To avoid this we restrict ourselve to the subsets $\mathbb{R}\bigcup\{\infty\}$ or $\mathbb{R}\bigcup\{-\infty\}$.

Definition 20.510. *We define*

$$\mathbb{R}_{\infty}=\mathbb{R}\bigcup\{\infty\}$$

$$\mathbb{R}_{-\infty}=\mathbb{R}\bigcup\{\infty\}$$

Theorem 20.511. *Using the definition of $+$ in $\bar{\mathbb{R}}$ restricted to $\mathbb{R}_{\infty}$, $\mathbb{R}_{-\infty}$we have the following*

1. $\langle\mathbb{R}_{\infty},+\rangle$ *is a Abelian semigroup*
2. $\langle\mathbb{R}_{-\infty},+\rangle$ *is a Abelian semigroup*

Proof.

1. We must prove the axioms of a Abelian semi group:

   associativity. Let $x,y,z\in\mathbb{R}_{\infty}$ then we have for $x,y,z\in\mathbb{R}_{\infty}$ either:

   $\boldsymbol{x\in\mathbb{R}\wedge y\in\mathbb{R}\wedge z\in\mathbb{R}}$**.** then using the properties of $+$ in $\mathbb{R}$ we have

   $$(x+y)+z=x+(y+z)$$

   $\boldsymbol{x\in\mathbb{R}\wedge y\in\mathbb{R}\wedge z=\infty}$**.** Then

   $$\begin{aligned}(x+y)+z &= (x+y)+\infty\\ &= \infty\\ &= x+\infty\\ &= x+(y+\infty)\\ &= x+(y+z)\end{aligned}$$

   $\boldsymbol{x\in\mathbb{R}\wedge y=\infty\wedge z\in\mathbb{R}}$**.** Then

   $$\begin{aligned}(x+y)+z &= (x+\infty)+z\\ &= \infty+z\\ &= \infty\\ &= x+\infty\\ &= x+(y+\infty)\\ &= x+(y+z)\end{aligned}$$

   $\boldsymbol{x\in\mathbb{R}\wedge y=\infty\wedge z=\infty}$**.** Then

   $$\begin{aligned}(x+y)+z &= (x+\infty)+\infty\\ &= \infty\\ &= x+\infty\\ &= x+(\infty+\infty)\\ &= x+(y+z)\end{aligned}$$

$\boldsymbol{x=\infty \wedge y\in\mathbb{R}\wedge z\in\mathbb{R}}$**.** Then

$$\begin{aligned}(x+y)+z &= (\infty+y)+z\\ &= \infty+z\\ &= \infty\\ &= \infty+(y+z)\\ &= x+(y+z)\end{aligned}$$

$\boldsymbol{x=\infty \wedge y\in\mathbb{R}\wedge z=\infty}$**.** Then

$$\begin{aligned}(x+y)+z &= (\infty+y)+\infty\\ &= \infty\\ &= \infty+(y+z)\\ &= x+(y+z)\end{aligned}$$

$\boldsymbol{x=\infty \wedge y=\infty\wedge z\in\mathbb{R}}$**.** Then

$$\begin{aligned}(x+y)+z &= (\infty+\infty)+z\\ &= \infty+z\\ &= \infty\\ &= \infty+(y+z)\\ &= x+(y+z)\end{aligned}$$

$\boldsymbol{x=\infty \wedge y=\infty\wedge z=\infty}$**.** Then

$$\begin{aligned}(x+y)+z &= (\infty+\infty)+\infty\\ &= \infty\\ &= \infty+(y+z)\\ &= x+(y+z)\end{aligned}$$

neutral element. Then we have for $x\in\mathbb{R}_\infty$ either

$\boldsymbol{x\in\mathbb{R}}$**.** then using the properties of $+$ in the real numbers we have

$$x+0=x=0+x$$

$\boldsymbol{x=\infty}$**.** then

$$x+0=\infty+0=\infty=0=0+\infty=0+x$$

commutativity. Then we have for $x,y\in\mathbb{R}_\infty$ either

$\boldsymbol{x\in\mathbb{R}\wedge y\in\mathbb{R}}$**.** Then using the properties of $+$ in $\mathbb{R}$ we have

$$x+y=y+x$$

$\boldsymbol{x\in\mathbb{R}\wedge y=\infty}$**.** Then

$$x+y=x+\infty=\infty=\infty+x=y+x$$

$\boldsymbol{x=\infty\wedge y\in\mathbb{R}}$**.** Then

$$x+y=\infty+y=\infty=y+\infty=y+x$$

$\boldsymbol{x=\infty\wedge y=\infty}$**.** Then

$$x+y=\infty+\infty=\infty=\infty+\infty=y+x$$

2. We must prove the axioms of a Abelian semi group:

associativity. Let $x,y,z\in\mathbb{R}_{-\infty}$ then we have vor $x,y,z\in\mathbb{R}_{-\infty}$ either:

$\boldsymbol{x\in\mathbb{R}\wedge y\in\mathbb{R}\wedge z\in\mathbb{R}}$**.** Then using the properties of $+$ in $\mathbb{R}$ we have

$$(x+y)+z=x+(y+z)$$

$\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R} \wedge z = -\infty}$**.** Then

$$\begin{aligned}(x+y)+z &= (x+y)+(-\infty)\\ &= -\infty\\ &= x+(-\infty)\\ &= x+(y+(-\infty))\\ &= x+(y+z)\end{aligned}$$

$\boldsymbol{x \in \mathbb{R} \wedge y = -\infty \wedge z \in \mathbb{R}}$**.** Then

$$\begin{aligned}(x+y)+z &= (x+(-\infty))+z\\ &= -\infty+z\\ &= -\infty\\ &= x+(-\infty)\\ &= x+(y+(-\infty))\\ &= x+(y+z)\end{aligned}$$

$\boldsymbol{x \in \mathbb{R} \wedge y = -\infty \wedge z = -\infty}$**.** Then

$$\begin{aligned}(x+y)+z &= (x+(-\infty))+(-\infty)\\ &= -\infty\\ &= x+(-\infty)\\ &= x+(-\infty+(-\infty))\\ &= x+(y+z)\end{aligned}$$

$\boldsymbol{x = -\infty \wedge y \in \mathbb{R} \wedge z \in \mathbb{R}}$**.** Then

$$\begin{aligned}(x+y)+z &= (-\infty+y)+z\\ &= -\infty+z\\ &= -\infty\\ &= -\infty+(y+z)\\ &= x+(y+z)\end{aligned}$$

$\boldsymbol{x = -\infty \wedge y \in \mathbb{R} \wedge z = -\infty}$**.** Then

$$\begin{aligned}(x+y)+z &= (-\infty+y)+(-\infty)\\ &= -\infty\\ &= -\infty+(y+z)\\ &= x+(y+z)\end{aligned}$$

$\boldsymbol{x = -\infty \wedge y = -\infty \wedge z \in \mathbb{R}}$**.** Then

$$\begin{aligned}(x+y)+z &= (-\infty+(-\infty))+z\\ &= -\infty+z\\ &= -\infty\\ &= -\infty+(y+z)\\ &= x+(y+z)\end{aligned}$$

$\boldsymbol{x = -\infty \wedge y = -\infty \wedge z = -\infty}$**.** Then

$$\begin{aligned}(x+y)+z &= (-\infty+(-\infty))+(-\infty)\\ &= -\infty\\ &= -\infty+(y+z)\\ &= x+(y+z)\end{aligned}$$

netural element. Then we have for $x \in \mathbb{R}_{-\infty}$ either

$\boldsymbol{x \in \mathbb{R}}$**.** Then using the properties of $+$ in the real numbers we have

$$x+0 = x = 0+x$$

$x=-\infty$. Then

$$x+0=-\infty+0=-\infty=0=0+(-\infty)=0+x$$

commutativity. Then we have for $x,y\in\mathbb{R}_\infty$ either

$x\in\mathbb{R}\wedge y\in\mathbb{R}$. Then using the properties of $+$ in $\mathbb{R}$ we have

$$x+y=y+x$$

$x\in\mathbb{R}\wedge y=-\infty$. Then

$$x+y=x+(-\infty)=-\infty=-\infty+x=y+x$$

$x=-\infty\wedge y\in\mathbb{R}$. Then

$$x+y=-\infty+y=-\infty=y+(-\infty)=y+x$$

$x=-\infty\wedge y=-\infty$. Then

$$x+y=-\infty+(-\infty)=-\infty=-\infty+(-\infty)=y+x$$

□

As $\langle\mathbb{R}_\infty,+\rangle$ and $\langle\mathbb{R}_\infty,+\rangle$ are semi groups we can now use [section: 11.1] to work with finite sums in these semi-groups.

Theorem 20.512. *Let $n\in\mathbb{N}$, $\alpha\in\mathbb{R}$ then we have $\forall\{x_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{R}_\infty$ [or $\mathbb{R}_{-\infty}$]*

1. *$\forall\{x_i\}_{i\in\mathbb{N}}\subseteq\mathbb{R}_\infty$ we have $\alpha\cdot\sum_{i=1}^n x_i=\sum_{i=1}^n(\alpha\cdot x_i)$*
2. *$\forall\{x_i\}_{i\in\mathbb{N}}\subseteq\mathbb{R}_{-\infty}$ we have $\alpha\cdot\sum_{i=1}^n x_i=\sum_{i=1}^n(\alpha\cdot x_i)$*

***Note* 20.513.** *$\langle\mathbb{R}_\infty,+,\cdot\rangle$ is not a ring so we can not use [theorem: 11.8] in this proof]*

Proof. We use induction to prove this, so define

$$S=\left\{n\in\mathbb{N}|\text{If }\{x_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{R}_\infty[\text{or }\mathbb{R}_{-\infty}]\text{ then }\alpha\cdot\sum_{i=1}^n x_i=\sum_{i=1}^n(\alpha\cdot x_i)\right\}$$

then we have:

$1\in S$. Let $\{x_i\}_{i\in\{1\}}\subseteq\mathbb{R}_\infty$ [or $\mathbb{R}_{-\infty}$] then $\alpha\cdot\sum_{i=1}^1 x_i=\alpha\cdot x_1=\sum_{i=1}^1(\alpha\cdot x_i)$ which proves that $1\in S$.

$n\in S\Rightarrow n+1\in S$. Let $\{x_i\}_{i\in\{1,\ldots,n+1\}}\subseteq\mathbb{R}_+$ [or $\mathbb{R}_{-\infty}$] then we have that

$$\begin{aligned}\sum_{i=1}^{n+1}(\alpha\cdot x_i) &= (\alpha\cdot x_{n+1})+\sum_{i=1}^n(\alpha\cdot x_i)\\ &\underset{n\in S}{=} (\alpha\cdot x_{n+1})+\alpha\cdot\sum_{i=1}^n x_i\\ &\underset{\text{[theorem: 20.39]}}{=} \alpha\cdot\left(x_{n+1}+\sum_{i=1}^n x_i\right)\\ &= \alpha\cdot\sum_{i=1}^{n+1}x_i\end{aligned}$$

which proves that $n+1\in S$. □

Next we extend the definition of infinite sums of non negative numbers in $\overline{\mathbb{R}}$ [see definition: 20.92] to infinite sums of elements in $\mathbb{R}_\infty$ or $\mathbb{R}_-$. Unfortunately this comes at a cost, in contrast to the sum of non negative extended real numbers the infinite sum of elements in $\mathbb{R}_\infty$ or $\mathbb{R}_\infty$ is not guaranteed to exist.

Definition 20.514. *Let $\{x_i\}_{i\in\mathbb{N}}\subseteq\mathbb{R}_\infty\subseteq\overline{\mathbb{R}}$ then we say that $\sum_{i=1}^\infty x_i$ exist if $\lim_{n\to\infty}\sum_{i=1}^n x_i$ exist and in this case we define $\sum_{i=1}^\infty x_i$ by $\sum_{i=1}^\infty x_i=\lim_{n\to\infty}\sum_{i=1}^n x_i$. Likewise if $\{x_i\}_{i\in\mathbb{N}}\subseteq\mathbb{R}_{-\infty}\subseteq\overline{\mathbb{R}}$ then $\sum_{i=1}^\infty x_i$ exist if $\lim_{n\to\infty}x_i$ exist and $\sum_{i=1}^\infty x_i$ is defined by $\sum_{i=1}^\infty x_i=\lim_{n\to\infty}\sum_{i=1}^n x_i$.*

***Note* 20.515.** *$\lim_{n\to\infty} x_i$ is defined in [definition: 20.69]*

We are now ready to define a signed measure on a measurable space.

Definition 20.516. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space then $\mu: \mathcal{A} \to \overline{\mathbb{R}}$ is a* ***signed measure on $\mathcal{A}$*** *if*

1. $\mu(\varnothing) = 0$
2. $\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$ *or* $\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$
3. $\forall \{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ *pairwise disjoint we have that* $\sum_{i=1}^\infty \mu(A_i)$ *exist and*

$$\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right) = \sum_{i=1}^\infty \mu(A_i)$$

***Note* 20.517.** *One difference between signed measures and measures is that for measures $\sum_{i=1}^\infty \mu(A_i)$ is always defined and equal to $\sup\left(\{\sum_{i=1}^k \mu(A_i) | k \in \mathbb{N}_0\}\right)$. For signed measures it is not guarenteed that $\sum_{i=1}^\infty \mu(A_i) = \lim_{n\to\infty} \sum_{i=1}^n \mu(A_i)$ exists. So the existence must either be stated in a definition [as above] or proved.*

Definition 20.518. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space then a signed measure $\mu: \mathcal{A} \to \overline{\mathbb{R}}$ is finite if*

$$\forall A \in \mathcal{A} \text{ we have } \mu(A) \in \mathbb{R}$$

Given two measures where one is finite we can create a sgined measure as the difference of these measures.

Theorem 20.519. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space and $\mu_1: \mathcal{A} \to [0, \infty]$, $\mu_2: \mathcal{A} \to [0, \infty]$ two measures on $\mathcal{A}$ where μ_2 is finite or μ_1 is finite so that*

$$\mu_1 - \mu_2: \mathcal{A} \to \overline{\mathbb{R}} \text{ defined by } (\mu_1 - \mu_2)(A)$$

is well defined then we have that

1. *$\mu_1 - \mu_2: \mathcal{A} \to \overline{\mathbb{R}}$ is a signed measure on $\mathcal{A}$*
2. *If $\forall A \in \mathcal{A}$ we have $\mu_2(A) \leqslant \mu_1(A)$ then $\mu_1 - \mu_2: \mathcal{A} \to \overline{\mathbb{R}}$ is a measure on $\mathcal{A}$*

Proof.

1. We have

$$\forall A \in \mathcal{A} \text{ that } (\mu_1 - \mu_2)(A) = \mu_1(A) - \mu_2(A) = 0 - 0 = 0 \tag{20.727}$$

For finiteness we have two possible cases:

μ_1 is finite. Then for $A \in \mathcal{A}$ we have either:

$\mu_2(A) = \infty$. Then $(\mu_1 - \mu_2)(A) = \mu_1(A) - \mu_2(A) = \mu_1(A) - \infty = -\infty$

$\mu_2(A) \in \mathbb{R}$. Then $(\mu_1 - \mu_2)(A) = \mu_1(A) - \mu_2(A) \in \mathbb{R}$

Hence we have

$$\{(\mu_1 - \mu_2)(A) | A \in \mathcal{A}\} \in \mathbb{R}_{-\infty}$$

μ_2 is finite. Then for $A \in \mathcal{A}$ we have either:

$\mu_1(A) = \infty$. Then $(\mu_1 - \mu_2)(A) = \mu_1(A) - \mu_2(A) = \infty - \mu_2(A) = \infty$

$\mu_1(A) \in \mathbb{R}$. Then $(\mu_1 - \mu_2)(A) = \mu_1(A) - \mu_2(A) \in \mathbb{R}$

Hence we have

$$\{(\mu_1 - \mu_2)(A) | A \in \mathcal{A}\} \in \mathbb{R}_\infty$$

So it follows that

$$\{(\mu_1 - \mu_2)(A) | A \in \mathcal{A}\} \in \mathbb{R}_\infty \text{ or } \{(\mu_1 - \mu_2)(A) | A \in \mathcal{A}\} \in \mathbb{R}_{-\infty} \tag{20.728}$$

Next we use induction to prove

$$\forall n \in \mathbb{N} \sum_{i=1}^{n} (\mu_1 - \mu_2)(A_i) = \sum_{i=1}^{n} \mu_1(A_i) - \sum_{i=1}^{n} \mu_2(A_i) \tag{20.729}$$

Proof. Let

$$S = \left\{ n \in \mathbb{N} | \sum_{i=1}^{n} (\mu_1 - \mu_2)(A_i) = \sum_{i=1}^{n} \mu_1(A_i) - \sum_{i=1}^{n} \mu_2(A_i) \right\}$$

then we have:

$1 \in S$. Then $\sum_{i=1}^{1} (\mu_1 - \mu_2)(A_i) = \mu_1(A_1) - \mu_2(A_1) = \sum_{i=1}^{1} \mu_1(A_i) - \sum_{i=1}^{1} \mu_2(A_i)$ which proves that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. We have

$$\begin{aligned}
\sum_{i=1}^{n+1} (\mu_1 - \mu_2)(A_i) &= (\mu_1 - \mu_2)(A_{n+1}) + \sum_{i=1}^{n} (\mu_1 - \mu_2)(A_i) \\
&\underset{n \in S}{=} (\mu_1 - \mu_2)(A_{n+1}) + \sum_{i=1}^{n} \mu_1(A_i) - \sum_{i=1}^{n} \mu_2(A_i) \\
&= \mu_1(A_{n+1}) + \sum_{i=1}^{n} \mu_1(A_i) - \mu_2(A_{n+1}) - \sum_{i=1}^{n} \mu_2(A_i) \\
&= \sum_{i=1}^{n+1} \mu_1(A_i) - \sum_{i=1}^{n+1} \mu_2(A_i)
\end{aligned}$$

which proves that $n+1 \in S$.

Mathematical induction proves [eq: 20.729] □

As $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ is pairwise disjoint we have that

$$\mu_1\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \mu_1(A_i) = \lim_{n \to \infty} \sum_{i=1}^{n} \mu(A_i) \text{ and } \mu_2\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \mu_2(A_i) = \lim_{n \to \infty} \sum_{i=1}^{n} \mu_2(A_i)$$

Then using [theorem: 20.82(3,5)] we have that $\lim_{n \to \infty} (\sum_{i=1}^{n} \mu_1(A_i) - \sum_{i=1}^{n} \mu_2(A_i))$ exist and

$$\lim_{n \to \infty} \left(\sum_{i=1}^{n} \mu_1(A_i) - \sum_{i=1}^{n} \mu_2(A_i) \right) = \lim_{n \to \infty} \sum_{i=1}^{n} \mu_1(A_i) - \lim_{n \to \infty} \sum_{i=1}^{n} \mu_2(A_i) \tag{20.730}$$

Hence

$$\begin{aligned}
\lim_{n \to \infty} \sum_{i=1}^{n} (\mu_1 - \mu_2)(A_i) &\underset{\text{[eq: 20.729]}}{=} \lim_{n \to \infty} \left(\sum_{i=1}^{n} \mu_1(A_i) - \sum_{i=1}^{n} \mu_2(A_i) \right) \\
&\underset{\text{]eq: 20.730]}}{=} \lim_{n \to \infty} \sum_{i=1}^{n} \mu_1(A_i) - \lim_{n \to \infty} \sum_{i=1}^{n} \mu_2(A_i) \\
&= \mu_1\left(\bigcup_{i \in \mathbb{N}} A_i\right) - \mu_2\left(\bigcup_{i \in \mathbb{N}} A_i\right) \\
&= (\mu_1 - \mu_2)\left(\bigcup_{i \in \mathbb{N}} A_i\right)
\end{aligned}$$

As $\sum_{i=1}^{\infty} (\mu_1 - \mu_2)(A_i) = \lim_{n \to \infty} \sum_{i=1}^{n} (\mu_1 - \mu_2)(A_i)$ it follows that

$$\sum_{i=1}^{\infty} (\mu_1 - \mu_2)(A_i) \text{ exist and } \sum_{i=1}^{\infty} (\mu_1 - \mu_2)(A_i) = (\mu_1 - \mu_2)\left(\bigcup_{i \in \mathbb{N}} A_i\right) \tag{20.731}$$

From [eqs: 20.727. 20.728 and 20.731] it follows that $\mu_1 - \mu_2$ is a signed measure on $\mathcal{A}$.

2. Assume that $\forall A \in \mathcal{A}$ we have $\mu_1(A) \leqslant \mu_2(A)$. For μ_1, μ_2 we have either:

   μ_1 is finite. Then as $\mu_1(A) \leqslant \mu_2(A)$ we have for $\mu_2(A)$ either:

   $\mu_2(A) \in \mathbb{R}$. Then $0 \leqslant \mu_2(A) - \mu_1(A)$ so that $(\mu_2 - \mu_1)(A) \in [0, \infty]$

   $\mu_2(A) = \infty$. Then $\mu_2(A) - \mu_1(A) = \infty - \mu_1(A) = \infty$ so that $(\mu_2 - \mu_1)(A) \in [0, \infty]$

   μ_2 is finite. Then $0 \leqslant \mu_1(A) \leqslant \mu_2(A) < \infty$ so that $\mu_1(A), \mu_2(A) \in \mathbb{R}$ hence $0 \leqslant \mu_2(A) - \mu_1(A)$ which proves that $(\mu_2 - \mu_1)(A) \in [0, \infty]$.

   From the above we conclude that

$$\mu_2 - \mu_1 : \mathcal{A} \to [0, \infty]$$

   is a well defined function which together with [eqs: 20.727 and 20.731] proves that

$$\mu_2 - \mu_1 : \mathcal{A} \to [0, \infty] \text{ is a measure on } \mathcal{A}$$

□

Theorem 20.520. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $\mu : \mathcal{A} \to \overline{\mathbb{R}}$ a signed mesure on $\mathcal{A}$ and $\alpha \in \mathbb{R}$ then $\alpha \cdot \mu : \mathcal{A} \to \overline{\mathbb{R}}$ defined by $(\alpha \cdot \mu)(A) = \alpha \cdot \mu(A)$ is a signed measure.*

Proof. We have

$$(\alpha \cdot \mu)(\varnothing) \underset{\mu \text{ is a signed measure}}{=} \alpha \cdot \mu(\varnothing) = \alpha \cdot 0 = 0 \tag{20.732}$$

As μ is a signed measure we have either:

$\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$. For $\alpha \in \mathbb{R}$ we have either:

$0 \leqslant \alpha$. Then if $x \in \{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\}$ there exist a $A \in \mathcal{A}$ such that $x = (\alpha \cdot \mu)(A) = \alpha \cdot \mu(A)$. For $\mu(A) \in \mathbb{R}_\infty$ we have either:

$\mu(A) \in \mathbb{R}$. Then $x = \alpha \cdot \mu(A) \in \mathbb{R}$ so that $x \in \mathbb{R}_\infty$

$\mu(A) = \infty$. Then $x = \alpha \cdot \infty = \infty$ so that $x \in \mathbb{R}_\infty$

So that

$$\{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$$

$\alpha < 0$. Then if $x \in \{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\}$ there exist a $A \in \mathcal{A}$ such that $x = (\alpha \cdot \mu)(A) = \alpha \cdot \mu(A)$. For $\mu(A) \in \mathbb{R}_\infty$ we have either:

$\mu(A) \in \mathbb{R}$. Then $x = \alpha \cdot \mu(A) \in \mathbb{R}$ so that $x \in \mathbb{R}_{-\infty}$

$\mu(A) = \infty$. Then $x = \alpha \cdot \infty = -\infty$ so that $x \in \mathbb{R}_{-\infty}$

So that

$$\{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$$

$\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$. For $\alpha \in \mathbb{R}$ we have either:

$0 \leqslant \alpha$. Then if $x \in \{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\}$ there exist a $A \in \mathcal{A}$ such that $x = (\alpha \cdot \mu)(A) = \alpha \cdot \mu(A)$. For $\mu(A) \in \mathbb{R}_{-\infty}$ we have either:

$\mu(A) \in \mathbb{R}$. Then $x = \alpha \cdot \mu(A) \in \mathbb{R}$ so that $x \in \mathbb{R}_{-\infty}$

$\mu(A) = -\infty$. Then $x = \alpha \cdot (-\infty) = -\infty$ so that $x \in \mathbb{R}_{-\infty}$

So that

$$\{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$$

$\alpha < 0$. Then if $x \in \{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\}$ there exist a $A \in \mathcal{A}$ such that $x = (\alpha \cdot \mu)(A) = \alpha \cdot \mu(A)$. For $\mu(A) \in \mathbb{R}_{-\infty}$ we have either:

$\mu(A) \in \mathbb{R}$. Then $x = \alpha \cdot \mu(A) \in \mathbb{R}$ so that $x \in \mathbb{R}_\infty$

$\mu(A) = -\infty$. Then $x = \alpha \cdot (-\infty) = \infty$ so that $x \in \mathbb{R}_\infty$

So that

$$\{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$$

Hence we have proved that

$$\{(\alpha\cdot\mu)(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_+ \text{ or } \{(\alpha\cdot\mu)(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_{-\infty} \tag{20.733}$$

Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ be a pairwise family of measurable sets. Then as μ is a signed measure there exist we have that

$$\sum_{i=1}^{\infty}\mu(A_i)=\lim_{n\to\infty}\sum_{i=1}^{n}\mu(A_i) \text{ exist and } \mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)=\sum_{i=1}^{\infty}\mu(A_i) \tag{20.734}$$

Using [theorem: 20.82(3)] we have that

$$\lim_{n\to\infty}\left(\alpha\cdot\sum_{i=1}^{n}\mu(A_i)\right) \text{ exist and } \lim_{n\to\infty}\left(\alpha\cdot\sum_{i=1}^{n}\mu(A_i)\right)=\alpha\cdot\lim_{n\to\infty}\sum_{i=1}^{n}\mu(A_i) \tag{20.735}$$

As $\forall n\in\mathbb{N}$ we have $\alpha\cdot\sum_{i=1}^{n}\mu(A_i)\underset{\text{[theorem: 20.512]}}{=}\sum_{i=1}^{n}(\alpha\cdot\mu(A_i))=\sum_{i=1}^{n}(\alpha\cdot\mu)(A_i)$ it follows that

$$\begin{aligned}\sum_{i=1}^{\infty}(\alpha\cdot\mu)(A_i) &= \lim_{n\to\infty}\sum_{i=1}^{n}(\alpha\cdot\mu(A_i))\\ &= \lim_{n\to\infty}\left(\alpha\cdot\sum_{i=1}^{n}\mu(A_i)\right)\\ &\underset{\text{[eq: 20.735]}}{=} \alpha\cdot\lim_{n\to\infty}\sum_{i=1}^{n}\mu(A_i)\\ &\underset{\text{[eq: 20.733]}}{=} \alpha\cdot\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)\\ &= (\alpha\cdot\mu)\left(\bigcup_{i\in\mathbb{N}}A_i\right)\end{aligned}$$

In other words

$$\sum_{i=1}^{\infty}(\alpha\cdot\mu)(A_i) \text{ exist and } \sum_{i=1}^{\infty}(\alpha\cdot\mu)(A_i)=(\alpha\cdot\mu)\left(\bigcup_{i\in\mathbb{N}}A_i\right)$$ □

Theorem 20.521. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $n\in\mathbb{N}$ and $\mu:\mathcal{A}\to\overline{\mathbb{R}}$ be a signed measure on $\mathcal{A}$ then $\forall\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}$ pairwise disjoint we have that*

$$\mu\left(\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)=\sum_{i=1}^{n}\mu(A_i)$$

In other words μ is finite additive.

Proof. Let $n\in\mathbb{N}$, $\{A_i\}_{i\in\{1\ldots,n\}}\subseteq\mathcal{A}$ be pairwise disjoint. Define now

$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A} \text{ by } B_i=\begin{cases}A_i \text{ if } i\in\{1,\ldots,n\}\\ \emptyset \text{ if } i\in\mathbb{N}\setminus\{1,\ldots,n\}\end{cases}$$

If $k,l\in\mathbb{N}$ with $k\neq l$ then we have either

$k,l\in\{1,\ldots,n\}$. then $B_k\bigcap B_l=A_k\bigcap A_l=\emptyset$

$k\notin\{1,\ldots,n\}$. then $B_k\bigcap B_l=\emptyset\bigcap B_l=\emptyset$

$l\notin\{1,\ldots,n\}$. then $B_k\bigcap B_l=B_k\bigcap\emptyset=\emptyset$

which proves that

$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A} \text{ is pairwise disjoint}$$

So we have by the definition of a signed measure that $\sum_{i=1}^{\infty}\mu(B_i)=\lim_{k\to\infty}\sum_{i=1}^{k}\mu(B_i)$ exists and

$$\mu\left(\bigcup_{i\in\mathbb{N}}B_i\right)=\sum_{i=1}^{\infty}\mu(B_i)=\lim_{k\to\infty}\sum_{i=1}^{k}\mu(B_i) \tag{20.736}$$

Now if $n<k$ we have that

$$\begin{aligned}\sum_{i=1}^{k}\mu(B_i) &= \sum_{i\in\{1,\ldots,k\}}\mu(B_i)\\ &\underset{\text{[theorem: 11.44]}}{=} \sum_{i\in\{1,\ldots,n\}}\mu(B_i)+\sum_{i\in\{n+1,\ldots,k\}}\mu(B_i)\\ &= \sum_{i\in\{1,\ldots,n\}}\mu(B_i)+\sum_{i\in\{n+1,\ldots,k\}}\mu(\emptyset)\\ &= \sum_{i\in\{1,\ldots,n\}}\mu(B_i)\\ &= \sum_{i\in\{1,\ldots,n\}}\mu(A_i)\\ &= \sum_{i=1}^{n}\mu(A_i)\end{aligned}\tag{20.737}$$

Further

$$\begin{aligned}\lim_{k\to\infty}\sum_{i=1}^{k}\mu(B_i) &\underset{\text{[theorem: 20.81]}}{=} \lim_{k\to\infty}\sum_{i=1}^{n+k+1}\mu(B_i)\\ &\underset{\text{[eq: 20.737]}}{=} \lim_{k\to\infty}\sum_{i=1}^{n}\mu(A_i)\\ &= \sum_{i=1}^{n}\mu(A_i)\end{aligned}\tag{20.738}$$

As

$$\bigcup_{i\in\mathbb{N}}B_i=\left(\bigcup_{i\in\{1,\ldots,n\}}B_i\right)\bigcup\left(\bigcup_{i\in\{n+1,\ldots,\infty\}}B_i\right)=\bigcup_{i\in\{1,\ldots,n\}}A_i$$

we have using the above and [eqs: 20.736 and 20.738] that

$$\mu\left(\bigcup_{i\in\{1,\ldots,n\}}A_i\right)=\sum_{i=1}^{n}\mu(A_i)$$ □

Signed measures have many of the same properties as normal measures.

Theorem 20.522. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space and $\mu:\mathcal{A}\to\overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$ then we have:*

1. *If $A\in\mathcal{A}$ satisfies $\mu(A)\in\mathbb{R}$ then we have $\forall B\in\mathcal{A}$ with $B\subseteq A$ that $\mu(B)\in\mathbb{R}$*
2. *If $A,B\in\mathcal{A}$ with $B\subseteq A$ and $\mu(B)\in\mathbb{R}$ then $\mu(A\setminus B)=\mu(A)-\mu(B)$*

Proof. If $B\subseteq A$ then $A=(A\setminus B)\bigcup B$ and $(A\setminus B)\bigcap B=\varnothing$ so that by [theorem: 20.521] we have

$$\mu(A)=\mu(A\setminus B)+\mu(B)\tag{20.739}$$

1. Assume that $\mu(A)\in\mathbb{R}$ and $B\subseteq A$. For μ we have either:
   - $\boldsymbol{\{\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_\infty}$**.** If $\mu(B)=\infty$ then $\mu(A)\underset{\text{[eq: 20.739]}}{=}\mu(A\setminus B)+\infty=\infty$ contradicting $\mu(A)\in\mathbb{R}$ hence we must have that $\mu(B)\in\mathbb{R}$.
   - $\boldsymbol{\{\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_{-\infty}}$**.** If $\mu(B)=-\infty$ then $\mu(A)\underset{\text{[eq: 20.739]}}{=}\mu(A\setminus B)+(-\infty)=\infty$ contradicting $\mu(A)\in\mathbb{R}$ hence we must have that $\mu(B)\in\mathbb{R}$.
2. If $B\subseteq A$ and $\mu(B)\in\mathbb{R}$ then for μ we have either:
   - $\boldsymbol{\{\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_\infty}$**.** Then for $\mu(A)$ we have either:
     - $\boldsymbol{\mu(A)\in\mathbb{R}}$**.** If $\mu(A\setminus B)=\infty$ then from [eq: 20.739] we have that $\mu(A)=\infty+\mu(B)=\infty$ contradicting $\mu(A)\in\mathbb{R}$. Hence we have $\mu(B),\mu(A),\mu(A\setminus B)\in\mathbb{R}$ so that from [eq: 20.739] it follows that $\mu(A\setminus B)=\mu(A)-\mu(B)$.

$\mu(A)=\infty$. If $\mu(A\setminus B)\in\mathbb{R}$ then by [eq: 20.739] $\mu(A)=\mu(A\setminus B)+\mu(B)\in\mathbb{R}$ contradicting $\mu(A)=\infty$. Hence we must have that $\mu(A\setminus B)=\infty$ so that $\mu(A\setminus B)=\infty=\infty-\mu(B)=\mu(A)-\mu(B)$.

$\{\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_{-\infty}$. Then for $\mu(A)$ we have either:

$\mu(A)\in\mathbb{R}$. If $\mu(A\setminus B)=-\infty$ then from [eq: 20.739] we have that $\mu(A)=-\infty+\mu(B)=-\infty$ contradicting $\mu(A)\in\mathbb{R}$. Hence we have $\mu(B),\mu(A),\mu(A\setminus B)\in\mathbb{R}$ so that from [eq: 20.739] it follows that $\mu(A\setminus B)=\mu(A)-\mu(B)$.

$\mu(A)=-\infty$. If $\mu(A\setminus B)\in\mathbb{R}$ then by [eq: 20.739] $\mu(A)=\mu(A\setminus B)+\mu(B)\in\mathbb{R}$ contradicting $\mu(A)=-\infty$. Hence we must have that $\mu(A\setminus B)=-\infty$ so that $\mu(A\setminus B)=-\infty=-\infty-\mu(B)=\mu(A)-\mu(B)$. □

Theorem 20.523. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space and let $\mu:\mathcal{A}\to\mathbb{R}$ be a signed measure on $\langle X,\mathcal{A}\rangle$. Then we have*

1. *$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ with $\forall i\in\mathbb{N}$ $A_i\subseteq A_{i+1}$ we have that $\lim_{i\to\infty}\mu(A_i)$ exists and*
$$\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)=\lim_{i\to\infty}\mu(A_i)$$
2. *$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ with $\forall i\in\mathbb{N}$ $A_{i+1}\subseteq A_i$ and such that $\exists k\in\mathbb{N}$ with $\mu(A_k)\in\mathbb{R}$ we have that $\lim_{i\to\infty}A_i$ exists and*
$$\mu\left(\bigcap_{i\in\mathbb{N}}A_i\right)=\lim_{i\to\infty}\mu(A_i)$$

Proof.

1. Define
$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}\text{ by }B_i=\begin{cases}A_i\text{ if }i=1\\A_i\setminus A_{i-1}\text{ if }i\in\{2,\ldots,\infty\}\end{cases}\in\mathcal{A}$$
Let $i,j\in\mathbb{N}$ with $i\neq j$ then we may always assume that $i<j$ [otherwise exchange i and j] then for i we have either:

$i=1$. Then $1<j$ so that $1\leqslant j-1$ from which it follows that $A_1\subseteq A_{j-1}\Rightarrow A_j\setminus A_{j-1}\subseteq A_j\setminus A_1$ hence $B_i\bigcap B_j=A_1\bigcap(A_j\setminus A_{j-1})\subseteq A_1\bigcap(A_j\setminus A_1)=\varnothing$ so that $B_i\bigcap B_j=\varnothing$

$i\in\{2,\ldots,\infty\}$. Then as $i<j$ we have $i\leqslant j-1$ so that $A_i\subseteq A_{j-1}$ from which it follows that $A_j\setminus A_{j-1}\subseteq A_j\setminus A_i$. So
$$B_i\bigcap B_j=(A_i\setminus A_{i-1})\bigcap(A_j\setminus A_{j-1})\subseteq(A_i\setminus A_{j-1})\bigcap(A_j\setminus A_i)=\varnothing$$
or $B_i\bigcap B_j=\varnothing$.

Hence
$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}\text{ is pairwise disjoint}\tag{20.740}$$
Let $n\in\mathbb{N}$ then $\forall i\in\{1,\ldots,n\}$ we have that $B_i=\begin{cases}A_1\subseteq A_i\text{ if }i=1\\A_i\setminus A_{i-1}\subseteq A_i\text{ if }i\in\{2,\ldots,\infty\}\end{cases}\subseteq A_i\underset{i\leqslant n}{\subseteq}A_n$ so that $\bigcup_{i\in\{1,\ldots,n\}}B_i\subseteq A_n$ and $B_n\subseteq A_n\Rightarrow\bigcup_{n\in\mathbb{N}}B_n\subseteq\bigcup_{n\in\mathbb{N}}A_n$. Summarized we have
$$\forall n\in\mathbb{N}\text{ we have }\bigcup_{i\in\{1,\ldots,n\}}B_i\subseteq A_n\text{ and }\bigcup_{i\in\mathbb{N}}B_i\subseteq\bigcup_{i\in\mathbb{N}}A_i\tag{20.741}$$
Let $n\in\mathbb{N}$ then for $x\in A_n$ we have that $n\in\{i\in\{1,\ldots,n\}|x\in A_i\}$ a finite set so that $m=\min(\{i\in\{1,\ldots,n\}|x\in A_i\})$ exist. For m we then either:

$m=1$. Then $x\in A_1=B_1\subseteq\bigcup_{i\in\{1,\ldots,n\}}B_i$

$1<m$. Then $x\notin A_{m-1}$ and $x\in A_m$ so that $x\in A_m\setminus A_{m-1}=B_m\subseteq\bigcup_{i\in\{1,\ldots,n\}}B_i$

So we have that $A_n \subseteq \bigcup_{i\in\{1,\ldots,n\}} B_i \subseteq \bigcup_{i\in\mathbb{N}} B_i$ which combined with [eq: 20.741] gives

$$\forall n \in \mathbb{N} \text{ we have } A_n = \bigcup_{i\in\{1,\ldots,n\}} B_i \text{ and } \bigcup_{i\in\mathbb{N}} B_i = \bigcup_{i\in\mathbb{N}} A_i \tag{20.742}$$

By the definition of a signed measure we have that

$$\sum_{i=1}^{\infty} \mu(B_i) = \lim_{n\to\infty} \sum_{i=1}^{n} \mu(B_i) \text{ exist and } \mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) = \sum_{i=1}^{\infty} \mu(B_i) \tag{20.743}$$

Finally

$$\begin{aligned}
\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right) &\underset{\text{[eq: 20.742]}}{=} \mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) \\
&\underset{\text{[eq: 20.743]}}{=} \lim_{n\to\infty} \sum_{i=1}^{n} \mu(B_i) \\
&\underset{\text{[theorem: 20.521]}}{=} \lim_{n\to\infty} \mu\left(\bigcup_{i\in\{1,\ldots,n\}} B_i\right) \\
&\underset{\text{[eq: 20.742]}}{=} \lim_{n\to\infty} \mu(A_n)
\end{aligned}$$

hence

$$\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right) = \lim_{n\to\infty} \mu(A_n)$$

2. First we consider the case where $k=1$. So let $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ such that $\mu(A_1) \in \mathbb{R}$ and $\forall i \in \mathbb{N}$ we have $A_{i+1} \subseteq A_i$. Then $\forall i \in \mathbb{N}$ we have $A_i \subseteq A_1$ so that by [theorem: 20.522] we have

$$\forall i \in \mathbb{N} \text{ we have } \mu(A_i) \in \mathbb{R} \tag{20.744}$$

Define now

$$\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = A_1 \setminus A_i \in \mathcal{A}$$

If $i \in \mathbb{N}$ then we have $B_i = A_1 \setminus A_i \underset{A_{i+1}\subseteq A_i}{\subseteq} A_1 \setminus A_{i+1} = B_{i+1}$ so that

$$\forall i \in \mathbb{N} \text{ we hae } B_i \subseteq B_{i+1}$$

Using (1) it follows that

$$\lim_{i\to\infty} \mu(B_i) \text{ exist and } \mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) = \lim_{i\to\infty} \mu(B_i) \tag{20.745}$$

Now

$$\begin{aligned}
A_1 \setminus \left(\bigcup_{i\in\mathbb{N}} B_i\right) &\underset{\text{[theorem: 2.132]}}{=} \bigcap_{i\in\mathbb{N}} (A_1 \setminus B_i) \\
&= \bigcap_{i\in\mathbb{N}} (A_1 \setminus (A_1 \setminus A_i)) \\
&\underset{\text{[theorem: 1.33}\}\wedge A_i\subseteq A_1}{=} \bigcap_{i\in\mathbb{N}} \text{Ai}
\end{aligned}$$

so that

$$A_1 \setminus \left(\bigcup_{i\in\mathbb{N}} B_i\right) = \bigcap_{i\in\mathbb{N}} A_i \tag{20.746}$$

As $\forall i \in \mathbb{N}$ $B_i = A_1 \setminus A_i \subseteq A_1$ we have $\bigcup_{i\in\mathbb{N}} B_i \subseteq A_1$ hence as $\mu(A_1) \in \mathbb{R}$ it follows from [theorem: 20.522] that

$$\mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) \in \mathbb{R} \text{ and } \forall i \in \mathbb{N}\ \mu(B_i) \in \mathbb{R} \tag{20.747}$$

Next

$$\begin{aligned}
\mu\left(\bigcap_{i\in\mathbb{N}} A_i\right) &\underset{\text{[eq: 20.746]}}{=} \mu\left(A_1\setminus\left(\bigcup_{i\in\mathbb{N}} B_i\right)\right)\\
&\underset{\text{[eq: 20.747]}\wedge\text{[theorem: 20.522]}}{=} \mu(A_1)-\mu\left(\bigcup_{i\in\mathbb{N}} B_i\right)\\
&\underset{\text{[eq: 20.745]}}{=} \mu(A_1)-\lim_{i\to\infty}\mu(B_i)\\
&\underset{B_i=A_1\setminus A_i,\ \text{[theorem: 20.522]},\ \text{[eq: 20.747]}}{=} \mu(A_1)-\lim_{i\to\infty}(\mu(A_1)-\mu(A_i))\\
&\underset{\text{[theorem: 20.82]}}{=} \mu(A_1)-\mu(A_1)+\lim_{i\to\infty}\mu(A_i)\\
&= \lim_{i\to\infty}\mu(A_i)
\end{aligned}$$

To summarize we have

$$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A} \text{ with } \mu(A_1)\in\mathbb{R} \text{ and } \forall i\in\mathbb{N} \text{ we have } A_{i+1}\subseteq A_i \text{ we have } \mu\left(\bigcap_{i\in\mathbb{N}} A_i\right)=\lim_{i\to\infty}\mu(A_i) \tag{20.748}$$

We consider now the general cases where $1\leqslant k$. So let $\{C_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ such that $\forall i\in\mathbb{N}\ C_{i+1}\subseteq C_i$ and $\exists k\in\mathbb{N}$ with $\mu(C_k)\in\mathbb{R}$. Define

$$\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A} \text{ by } A_i=C_{i+(k-1)}\in\mathcal{A}$$

Then $\mu(A_1)=C_{1+(k-1)}=C_k\in\mathbb{R}$ and $\forall i\in\mathbb{N}$ we have $A_{i+1}=C_{(i+1)+(k-1)}\subseteq C_{i+(k-1)}=A_i$. So we can apply [eq: 20.748] giving

$$\mu\left(\bigcap_{i\in\mathbb{N}} A_i\right)=\lim_{i\to\infty}\mu(A_i)=\lim_{i\to\infty}\mu(C_{i+(k-1)})\underset{\text{[theorem: 20.81]}}{=}\lim_{i\to\infty}\mu(C_i) \tag{20.749}$$

If $x\in\bigcap_{i\in\mathbb{N}}C_i$ then $\forall i\in\mathbb{N}$ we have, as $i+(k-1)\in\mathbb{N}$, that $x\in C_{i+(k-1)}=A_i\subseteq\bigcup_{i\in\mathbb{N}}A_i$ proving that

$$\bigcap_{i\in\mathbb{N}} C_i\subseteq\bigcap_{i\in\mathbb{N}} A_i \tag{20.750}$$

If $x\in\bigcap_{i\in\mathbb{N}}A_i$ then $\forall i\in\mathbb{N}$ we have $x\in A_i$. Let $j\in\mathbb{N}$ then we hae either:

$j\in\{k,\ldots,\infty\}$. Then $j-(k-1)\in\mathbb{N}$ so that $x\in A_{j-(k-1)}=C_{(j-(k-1)+(k-1))}=C_j$

$j\in\{1,\ldots,k-1\}$. Then $j<k$ so that $C_k\subseteq C_j$, as $x\in A_1=C_{1+(k-1)}=C_k$ we have $x\in C_j$.

From the above it follows that $\forall j\in\mathbb{N}$ we hae $x\in C_j$ so that $x\in\bigcap_{j\in\mathbb{N}}C_j$ which proves that $\bigcap_{i\in\mathbb{N}}A_i\subseteq\bigcap_{i\in\mathbb{N}}C_i$. Combining this with [eq: 20.750] we have

$$\bigcap_{i\in\mathbb{N}} C_i=\bigcap_{i\in\mathbb{N}} A_i$$

Substituting this in [eq: 20.749] gives finally

$$\mu\left(\bigcap_{i\in\mathbb{N}} C_i\right)=\lim_{i\to\infty}\mu(C_i)$$

□

For the opposite of the previous theorem we have:

Theorem 20.524. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space and $\mu:\mathcal{A}\to\overline{\mathbb{R}}$ a extended real function such that*

a) $\mu(\varnothing)=0$

b) $\{\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_\infty$ *or* $\{\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_{-\infty}$

c) If $n\in\mathbb{N}$ and $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ is pairwise disjoint we have $\mu\left(\bigcup_{i\in\{1,\ldots,n\}}A_i\right)=\sum_{i=1}^n\mu(A_i)$

then

1. *If $\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ with $\forall i\in\mathbb{N}\ A_i\subseteq A_{i+1}$ we have that $\lim_{i\to\infty}\mu(A_i)$ exists and $\mu(\bigcup_{i\in\mathbb{N}_0}A_i)=\lim_{n\to\infty}\mu(A_n)$ then μ is a signed measure on $\mathcal{A}$.*

2. *If* $\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ *with* $\forall i\in\mathbb{N}\ \mathcal{A}_{i+1}\subseteq A_i$ *and* $\bigcap_{i\in\mathbb{N}}A_i=\emptyset$ *we have that* $\lim_{i\to\infty}\mu(A_i)$ *exists and* $\lim_{i\to\infty}\mu(A_i)=0$ *then* μ *is a signed measure on* $\mathcal{A}$.

Proof.

1. Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ be pairwise disjoint. Define

$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}\text{ by }B_i=\bigsqcup_{j\in\{1,\ldots,i\}}A_j\in\mathcal{A}$$

Then using [lemma: 20.114] we have that

$$\bigsqcup_{i\in\mathbb{N}}A_i=\bigcup_{i\in\mathbb{N}}B_i\text{ and }\forall i\in\mathbb{N}\ B_i\subseteq B_{i+1}\tag{20.751}$$

Next

$$\begin{aligned}\mu\left(\bigsqcup_{i\in\mathbb{N}}A_i\right)&=\mu\left(\bigcup_{i\in\mathbb{N}}B_i\right)\\&\underset{\text{assumption}}{=}\lim_{i\to\infty}\mu(B_i)\\&=\lim_{i\to\infty}\mu\left(\bigsqcup_{j\in\{1,\ldots,i\}}A_j\right)\\&\underset{(c)}{=}\lim_{i\to\infty}\sum_{j=1}^{i}\mu(A_i)\end{aligned}$$

which together with (a) and (b) proves that μ is a signed measure on $\mathcal{A}$.

2. Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ be pairwise disjoint. Define

$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}\text{ by }B_i=\bigcup_{j\in\{i,\ldots,\infty\}}A_j\in\mathcal{A}$$

Let $i\in\mathbb{N}$ then $B_{i+1}=\bigcup_{j\in\{i+1,\ldots,\infty\}}A_j\subseteq\bigcup_{j\in\{i,\ldots,\infty\}}A_j=B_i$ so that

$$\forall i\in\mathbb{N}\text{ we have }B_{i+1}\subseteq B_i\tag{20.752}$$

Assume that $x\in\bigcap_{i\in\mathbb{N}}B_i$ then $x\in B_1=\bigcup_{j\in\mathbb{N}}A_j$ so that there exist a $j\in\mathbb{N}$ such that $x\in A_j$. Now $\forall k\in\{j+1,\ldots,\infty\}$ we have as $j\neq k$ that $A_j\bigcap A_k\neq\varnothing$ so that it follows that $x\notin A_k$ so that $x\notin\bigcup_{j\in\{j+1,\ldots,\infty\}}A_j=B_{j+1}$ which contradicts $x\in\bigcap_{i\in\mathbb{N}}B_i$. Hence the assumption is wrong and we must have

$$\bigcap_{i\in\mathbb{N}}B_i=\varnothing\tag{20.753}$$

Using the hypothesis we have that $\lim_{i\to\infty}\mu(B_i)$ exist and $\lim_{i\to\infty}\mu(B_i)=0$. Using [theorem: 20.81] it follows then that

$$\lim_{i\to\infty}\mu(B_{i+1})\text{ exist and }\lim_{i\to\infty}\mu(B_{i+1})=0\tag{20.754}$$

Let $k\in\mathbb{N}$. If $x\in\left(\bigcup_{i\in\{1,\ldots,k\}}A_i\right)\bigcap\left(\bigcup_{i\in\{k+1,\ldots,\infty\}}A_i\right)$ then there exist a $i\in\{1,\ldots,k\}$ and a $j\in\{k+1,\ldots,\infty\}$ such that $x\in A_i\wedge x\in A_j\Rightarrow x\in A_i\bigcap A_j$. However as $i\in\{1,\ldots,k\}\wedge j\in\{k+1,\ldots,\infty\}$ we have $i\leqslant k<k+1<j\Rightarrow i\neq j$ so that $A_i\bigcap A_j=\varnothing$ and we reach a contradiction. Hence we have

$$\forall k\in\mathbb{N}\ \left(\bigcup_{i\in\{1,\ldots,k\}}A_i\right)\bigcap\left(\bigcup_{i\in\{k+1,\ldots,\infty\}}A_i\right)=\varnothing$$

and using [theorem: 2.128]

$$\bigcup_{i\in\mathbb{N}}A_i=\left(\bigcup_{i\in\{1,\ldots,k\}}A_i\right)\bigcup\left(\bigcup_{i\in\{k+1,\ldots,\infty\}}A_i\right)$$

By (c) [finite additivity] we have

$$\begin{aligned}
\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right) &= \mu\left(\left(\bigcup_{i\in\{1,\ldots,k\}} A_i\right)\bigcup\left(\bigcup_{i\in\{k+1,\ldots,\infty\}} A_i\right)\right)\\
&= \mu\left(\bigcup_{i\in\{1,\ldots,k\}} A_i\right)+\mu\left(\bigcup_{i\in\{k+1,\ldots,\infty\}} A_i\right)\\
&= \mu\left(\bigcup_{i\in\{1,\ldots,k\}} A_i\right)+\mu(B_{k+1})\\
&\underset{(c)}{=} \left(\sum_{i=1}^{k}\mu(A_i)\right)+\mu(B_{k+1})
\end{aligned}$$

which proves that

$$\forall k\in\mathbb{N} \text{ we have } \mu\left(\bigcup_{i\in\mathbb{N}} A_i\right)=\left(\sum_{i=1}^{k}\mu(A_i)\right)+\mu(B_{k+1}) \tag{20.755}$$

For μ we have now either:

$\boldsymbol{\{\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_\infty}$**.** For $\mu(\bigcup_{i\in\mathbb{N}} A_i)$ we have either:

$\boldsymbol{\mu(\bigcup_{i\in\mathbb{N}} A_i)\in\mathbb{R}}$**.** Then from [eq: 20.755] it follows that $\sum_{i=1}^{k}\mu(A_i),\mu(B_{k+1})\in\mathbb{R}$ so that

$$\forall k\in\mathbb{N} \text{ we have } \left|\sum_{i=1}^{k}\mu(A_i)-\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right)\right|=|\mu(B_{k+1})|$$

Let $\varepsilon\in\mathbb{R}^+$ then as $\lim_{i\to\infty}\mu(B_{k+1})\underset{\text{[eq: 20.754]}}{=}0$ there exist a $N\in\mathbb{N}$ such that $\forall k\in\{N,\ldots,\infty\}$ $|\mu(B_{k+1})|<\varepsilon\Rightarrow|\sum_{i=1}^{k}\mu(A_i)-\mu(\bigcup_{i\in\mathbb{N}} A_i)|<\varepsilon$. This proves that

$$\lim_{k\to\infty}\sum_{i=1}^{k}\mu(A_i) \text{ exist and } \sum_{i=1}^{\infty}\mu(A_i)=\lim_{k\to\infty}\sum_{i=1}^{k}\mu(A_i)=\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right)$$

$\boldsymbol{\mu(\bigcup_{i\in\mathbb{N}} A_i)=\infty}$**.** As $\lim_{i\to\infty}\mu(B_{k+1})\underset{\text{[eq: 20.754]}}{=}0$ there exist a $N\in\mathbb{N}$ such that $\forall n\in\{N,\ldots,\infty\}$ $|\mu(B_{n+1})|<1$. So we have $\forall n\in\{N,\ldots,\infty\}$ that $\mu(B_{n+1})\in\mathbb{R}$ which combined with [eq: 20.755] proves that $\forall n\in\{N,\ldots,\infty\}$ $\sum_{i=1}^{n}\mu(A_i)=\infty$. Hence if $C\in\mathbb{R}^+$ we have that $\forall n\in\{N,\ldots,\infty\}$ $C<\sum_{i=1}^{n}\mu(A_i)$ which proves by [theorem: 20.76] that $\lim_{n\to\infty}\sum_{i=1}^{n}\mu(A_i)$ exist and $\lim_{n\to\infty}\sum_{i=1}^{n}\mu(A_i)=\infty$. So that

$$\sum_{i=1}^{\infty}\mu(A_i)=\lim_{n\to\infty}\sum_{i=1}^{n}\mu(A_i)=\infty=\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right)$$

$\boldsymbol{\{\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_{-\infty}}$**.** For $\mu(\bigcup_{i\in\mathbb{N}} A_i)$ we have either:

$\boldsymbol{\mu(\bigcup_{i\in\mathbb{N}} A_i)\in\mathbb{R}}$**.** Then from [eq: 20.755] it follows that $\sum_{i=1}^{k}\mu(A_i),\mu(B_{k+1})\in\mathbb{R}$ so that

$$\forall k\in\mathbb{N} \text{ we have } \left|\sum_{i=1}^{k}\mu(A_i)-\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right)\right|=|\mu(B_{k+1})|$$

Let $\varepsilon\in\mathbb{R}^+$ then as $\lim_{i\to\infty}\mu(B_{k+1})\underset{\text{[eq: 20.754]}}{=}0$ there exist a $N\in\mathbb{N}$ such that $\forall k\in\{N,\ldots,\infty\}$ $|\mu(B_{k+1})|<\varepsilon\Rightarrow|\sum_{i=1}^{k}\mu(A_i)-\mu(\bigcup_{i\in\mathbb{N}} A_i)|<\varepsilon$. This proves that

$$\lim_{k\to\infty}\sum_{i=1}^{k}\mu(A_i) \text{ exist and } \sum_{i=1}^{\infty}\mu(A_i)=\lim_{k\to\infty}\sum_{i=1}^{k}\mu(A_i)=\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right)$$

$\boldsymbol{\mu(\bigcup_{i\in\mathbb{N}} A_i) = -\infty}$. As $\lim_{i\to\infty} \mu(B_{k+1}) \underset{\text{[eq: 20.754]}}{=} 0$ there exist a $N \in \mathbb{N}$ such that $\forall n \in \{N,\ldots,\infty\}$ $|\mu(B_{n+1})| < 1$. So we have $\forall n \in \{N,\ldots,\infty\}$ that $\mu(B_{n+1}) \in \mathbb{R}$ which combined with [eq: 20.755] proves that $\forall n \in \{N,\ldots,\infty\}$ $\sum_{i=1}^{n} \mu(A_i) = -\infty$. Hence if $C \in \mathbb{R}^+$ we have that $\forall n \in \{N,\ldots,\infty\}$ $\sum_{i=1}^{n} \mu(A_i) < -C$ which proves by [theorem: 20.76] that $\lim_{n\to\infty} \sum_{i=1}^{n} \mu(A_i)$ exist and $\lim_{n\to\infty} \sum_{i=1}^{n} \mu(A_i) = -\infty$. So that

$$\sum_{i=1}^{\infty} \mu(A_i) = \lim_{n\to\infty} \sum_{i=1}^{n} \mu(A_i) = -\infty = \mu\left(\bigcup_{i\in\mathbb{N}} A_i\right)$$

So in all cases we have that

$$\sum_{i=1}^{\infty} \mu(A_i) \text{ exist and } \sum_{i=1}^{\infty} \mu(A_i) = \mu\left(\bigcup_{i\in\mathbb{N}} A_i\right)$$

This together with (a) and (b) proves that μ is signed measure. □

20.7.1.2 Hahn and Jordan decomposition

In [theorem: 20.519] we have showed that for two measures where one of them is finite the difference of these measures is a signed measure. In this section we want to show that every signed measure can be written as the difference of two measures.

Definition 20.525. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space and $\mu: \mathcal{A} \to \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$ then for $A \subseteq X$ we say that*

1. *A is a **positive set for μ** if $A \in \mathcal{A}$ and $\forall B \in \mathcal{A}$ with $B \subseteq A$ we have $0 \leqslant \mu(B)$.*
2. *A is a **negative set for μ** if $A \in \mathcal{A}$ and $\forall B \in \mathcal{A}$ with $B \subseteq A$ we have $\mu(B) \leqslant 0$.*

Example 20.526. Let $\langle X, \mathcal{A}\rangle$ be a measurable space and $\mu: \mathcal{A} \to \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$ then $\varnothing$ is a positive set for μ and $\varnothing$ is a negative set for μ.

Proof. First $\emptyset \in \mathcal{A}$, second if $E \subseteq \emptyset$ then $E = \emptyset$ and $\mu(E) = \mu(\emptyset) = 0$ hence $\emptyset$ is a positive and negative set for μ. □

Lemma 20.527. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space and $\mu: \mathcal{A} \to \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$ then we have for the signed measure $-\mu: \mathcal{A} \to \overline{\mathbb{R}}$ defined by $(-\mu)(A) = -\mu(A) = (-1)\cdot\mu(A)$ [see theorem: 20.520]*

1. *If A is a positive set for $\mu \Leftrightarrow A$ is a negative set for $-\mu$*
2. *If A is a negative set for $\mu \Leftrightarrow A$ is positive set for $-\mu$*

Proof.

1.
   - **$\Rightarrow$.** If A is a positive set for μ then we have for $B \in \mathcal{A}$ with $B \subseteq A$ that $0 \leqslant \mu(B)$ hence $(-\mu)(B) = -\mu(B) \leqslant 0$ which proves that A is a negative set for $-\mu$.
   - **$\Leftarrow$.** If A is a negative set for $-\mu$ then we have for $B \in \mathcal{A}$ with $B \subseteq A$ that $(-\mu)(B) \leqslant 0$ hence $-\mu(B) \leqslant 0$ so that $0 \leqslant \mu(B)$ which proves that μ is a positive set for μ.
2.
   - **$\Rightarrow$.** If A is a negative set for μ then we have for $B \in \mathcal{A}$ with $B \subseteq A$ that $\mu(B) \leqslant 0$ hence $(-\mu)(B) = -\mu(B) \geqslant 0$ which proves that A is a positive set for $-\mu$.
   - **$\Leftarrow$.** If A is a positive set for $-\mu$ then we have for $B \in \mathcal{A}$ with $B \subseteq A$ that $0 \leqslant (-\mu)(B)$ hence $0 \leqslant -\mu(B)$ so that $\mu(B) \leqslant 0$ which proves that μ is a negative set for μ. □

Lemma 20.528. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space and $\mu: \mathcal{A} \to \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$ then we have*

1. *If A is a positive set for μ then $\forall B \in \mathcal{A}$ with $B \subseteq A$ we have $\mu(B) \leqslant \mu(A)$*
2. *If A is a negative set for μ then $\forall B \in \mathcal{A}$ with $B \subseteq A$ we have $\mu(A) \leqslant \mu(B)$*

Proof.

1. As A is a positive set for μ and $A, B, A \setminus B \in \mathcal{A}$ with $A \subseteq A, B \subseteq A, A \setminus B \subseteq A$ we have that
$$0 \leqslant \mu(A) \wedge 0 \leqslant \mu(B) \wedge 0 \leqslant \mu(A \setminus B)$$
Now as $B \subseteq A$ we have $A = (A \setminus B) \bigsqcup B$, hence
$$\mu(A) = \mu(B \setminus A) + \mu(B)$$
For $\mu(A)$ we have now as $0 \leqslant \mu(A)$ either
   $\mu(A) = \infty$. then $\mu(B) \leqslant \mu(A)$.
   $\mu(A) < \infty$. then we have $\mu(B \setminus A) < \infty$ and $\mu(B) < \infty$ so that $\mu(B) = \mu(A) - \mu(B \setminus A)$ giving $\mu(B) \leqslant \mu(A)$.
   So in all cases we have $\mu(B) \leqslant \mu(A)$
2. As A is a negative set for μ and $A, B, A \setminus B \in \mathcal{A}$ with $A \subseteq A, B \subseteq A, A \setminus B \subseteq A$ we have that
$$\mu(A) \leqslant 0 \wedge \mu(B) \leqslant 0 \wedge \mu(A \setminus B) \leqslant 0$$
Now as $B \subseteq A$ we have $A = (A \setminus B) \bigsqcup B$, hence
$$\mu(A) = \mu(B \setminus A) + \mu(B)$$
For $\mu(A) \leqslant 0$ we have now as $\mu(A) \leqslant 0$ either
   $\mu(A) = -\infty$. then $\mu(A) \leqslant \mu(B)$
   $-\infty < \mu(A)$. then $-\infty < \mu(A \setminus B)$ and $-\infty < \mu(B)$ so that $\mu(A) \leqslant \mu(B)$
   So in all cases we have $\mu(A) \leqslant \mu(B)$ □

Lemma 20.529. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \to \overline{\mathbb{R}}$ be a signed measure on $\mathcal{A}$. Let $A \in \mathcal{A}$ be such that $-\infty < \mu(A) < 0$ then there exist a **negative set** B such that $B \subseteq A$ and $\mu(B) \leqslant \mu(A)$.*

Proof. Consider the set $\{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}$ then as $\mu(\varnothing) = 0$, $\varnothing \in \mathcal{A}$ and $\varnothing \subseteq A$ we have that $0 \in \{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\} \Rightarrow \{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\} \neq \varnothing$ so that
$$\delta_1 = \sup(\{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}) \text{ exist and } 0 \leqslant \delta_1 \tag{20.756}$$
For δ_1 we have now two possible cases:

$\delta_1 = \infty$. Then $0 \leqslant \min\left(\frac{\delta_1}{2}, 1\right) < 1 < \infty = \delta_1$

$\delta_1 < \infty$. Then $0 \leqslant \min\left(\frac{\delta_1}{2}, 1\right) < \frac{\delta_1}{2} < \delta_1$

Hence we have
$$0 \leqslant \min\left(\frac{\delta_1}{2}, 1\right) < \delta_1$$
so that there exist $A_1 \in \{B \in \mathcal{B} | B \subseteq A\}$ and $\min\left(\frac{\delta_1}{2}, 1\right) < \mu(A_1) \leqslant \delta_1$. Define now
$$\{(\rho_n, B_n)\}_{n \in \mathbb{N}}$$
recursively by:

$n = 1$. Then we define (ρ_1, B_1) by $\rho_1 = \delta_1$ and $B_1 = A_1$ so that
$$B_1 \in \mathcal{A} \wedge B_1 \subseteq A \text{ and } \min\left(\frac{\delta_1}{2}, 1\right) < \mu(A_1) \leqslant \delta_1$$

$n \in \{2, \ldots, \infty\}$. Then $\emptyset \subseteq A \setminus (\bigcup_{i=1}^{n-1} B_i), \emptyset \in \mathcal{A}$ and $0 = \mu(\emptyset)$. So that
$$0 \in \left\{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A \setminus \left(\bigcup_{i=1}^{n-1} B_i\right)\right\}$$

hence

$$\rho_n = \sup\left(\left\{\mu(B)|B \in \mathcal{A} \wedge B \subseteq A \setminus \left(\bigcup_{i=1}^{n-1} B_i\right)\right\}\right) \text{ exist and } 0 \leqslant \rho_n$$

For ρ_n we have either:

$\boldsymbol{\rho_n = \infty}$**.** Then $0 \leqslant \min\left(\frac{\rho_n}{2}, 1\right) \leqslant 1 < \infty = \rho_n$

$\boldsymbol{\rho_n < \infty}$**.** Then $0 \leqslant \min\left(\frac{\rho_n}{2}, 1\right) \leqslant \frac{\rho_n}{2} < \rho_n$

so that

$$0 \leqslant \min\left(\frac{\rho_n}{2}, 1\right) < \rho_n$$

Hence there exist a $B_n \in \left\{B \in \mathcal{A}|B \subseteq A \setminus \left(\bigcup_{i \in \{1,\ldots,n-1\}} B_i\right)\right\}$ such that $\min\left(\frac{\rho_n}{2}, 1\right) < \mu(B_n) \leqslant \rho_n$ so that

$$B \in \mathcal{A} \wedge B \subseteq A \setminus \left(\bigcup_{i \in \{1,\ldots,n-1\}} B_i\right) \text{ and } 0 \leqslant \min\left(\frac{\rho_n}{2}, 1\right) < \mu(B_n) \leqslant \rho_n$$

So the constructed sequence $\{(\rho_n, B_n)\}_{n \in \mathbb{N}}$ satisfies that $\forall n \in \mathbb{N}$

$$\rho_n = \begin{cases} \sup\left(\{\mu(B)|B \in \mathcal{A} \wedge B \subseteq A\}\right) \text{ if } n = 1 \\ \sup\left(\left\{\mu(B)|B \in \mathcal{A} \wedge B \subseteq A \setminus \left(\bigcup_{k \in \{1,\ldots,n-1\}} B_i\right)\right\}\right) \text{ if } i \in \{2,\ldots,n\} \end{cases} \text{ and}$$

$$B_n \in \begin{cases} \{B \in \mathcal{A}|B \subseteq A\} \text{ if } n = 1 \\ \left\{B \in \mathcal{A}|B \subseteq A \setminus \left(\bigcup_{i \in \{1,\ldots,n-1\}} B_i\right)\right\} \text{ if } i \in \{2,\ldots,n\} \end{cases} \text{ and } 0 \leqslant \min\left(\frac{\rho_n}{2}, 1\right) < \mu(B_n) \leqslant \rho_n \tag{20.757}$$

Let $i, j \in \mathbb{N}$ with $i \neq j$ then we may always assume that $i < j$ [otherwise exchange i and j]. Let $x \in B_i \bigcap B_j$ then as $i \leqslant j - 1$ we have from $x \in B_j = A \setminus \left(\bigcup_{k \in \{1,\ldots,j-1\}} A_k\right)$ that $x \in B_i$ contradicting $x \in B_i \bigcap B_j$ hence we must have that $B_i \bigcap B_j = \varnothing$. This proves that

$$\{B_n\}_{n \in \mathbb{N}} \subseteq \mathcal{A} \text{ is pairwise disjoint} \tag{20.758}$$

Define

$$B_\infty = \bigsqcup_{n \in \mathbb{N}} B_n \in \mathcal{A} \text{ and } B = A \setminus B_\infty \in \mathcal{A} \text{ then } B \subseteq A \tag{20.759}$$

We will prove now that B is the required negative set. As $\forall n \in \mathbb{N}$ we have from [eq: 20.757] that

$$0 \leqslant \min\left(\frac{\delta_1}{2}, 1\right) < \mu(B_1) \leqslant \sum_{i=1}^{n} \mu(B_i) \leqslant \sup\left(\left\{\sum_{i=1}^{n} \mu(B_i)|n \in \mathbb{N}\right\}\right) = \sum_{i=1}^{\infty} \mu(B_i)$$

so that $0 < \sum_{i=1}^{\infty} \mu(B_i)$. As further μ is a signed measure we have from [eq: 20.758 that

$$0 < \sum_{i=1}^{\infty} \mu(B_i) = \mu(B_\infty) \tag{20.760}$$

Using [eq: 20.757] we have $\forall i \in \mathbb{N}$ that $B_i \subseteq A$ so that $B_\infty \subseteq A$ hence $A = (A \setminus B_\infty) \bigsqcup B_\infty = B \bigsqcup B_\infty$ so that by [theorem: 20.521]

$$\mu(A) = \mu(B) + \mu(B_\infty) \tag{20.761}$$

As $0 < \mu(B_\infty)$ we have by [theorem: 20.29] that $\mu(B) = \mu(B) + 0 \leqslant \mu(B) + \mu(B_\infty) = \mu(A)$ so that

$$B \in \mathcal{A} \text{ and } \mu(B) \leqslant \mu(A) \tag{20.762}$$

The proves the last part of the lemma, the only thing that still must be proved is that B is a negative set for μ. As $0 < \mu(B_\infty) \leqslant \mu(A) < \infty$ it follows that $\sum_{i=1}^{\infty} \mu(B_i) \underset{\text{[eq: 20.760]}}{=} \mu(B_\infty) \in \mathbb{R}$ it follows from [theorem: 14.355] that

$$\lim_{i \to \infty} \mu(B_i) = 0$$

Let $\varepsilon \in \mathbb{R}^+$ there exist a $N \in \mathbb{N}$ such that $\forall n \in \{N, \ldots, \infty\}$ $\mu(B_n) \underset{\text{[eq: 20.757]}}{=} |\mu(B_n) - 0| < \min\left(\frac{\varepsilon}{2}, \frac{1}{2}\right)$. So that $\min\left(\frac{\rho_n}{2}, 1\right) \leqslant \mu(B_n) < \min\left(\frac{\varepsilon}{2}, \frac{1}{2}\right)$ so that $\min\left(\frac{\rho_n}{2}, 1\right) \leqslant \min\left(\frac{\varepsilon}{2}, \frac{1}{2}\right)$. Assume that $1 < \frac{\rho_n}{2}$ then $\min\left(\frac{\rho_n}{2}, 1\right) = 1 < \min\left(\frac{\varepsilon}{2}, \frac{1}{2}\right) \leqslant \frac{1}{2}$ giving the contradiction $1 \leqslant \frac{1}{2}$. Hence must have $\frac{\rho_n}{2} \leqslant 1$ so that $\frac{\rho_n}{2} = \min\left(\frac{\rho_n}{2}, 1\right) < \min\left(\frac{\varepsilon}{2}, \frac{1}{2}\right) \leqslant \frac{\varepsilon}{2}$ giving $|\rho_n - 0| = \rho_n < \varepsilon$. So we conclude that

$$\lim_{i \to \infty} \rho_n = 0 \tag{20.763}$$

Let $E \in \mathcal{A}$ with $E \subseteq B$. For $n \in \mathbb{N}$ we have either:

$n = 1$. Then as $B_1 \subseteq \bigcup_{i \in \mathbb{N}} B_i = B_\infty$ we have that $B = A \setminus B_\infty \subseteq A \setminus B_1 \subseteq A$ so that $E \subseteq A$ proving that $E \in \{B \in \mathcal{A} | B \subseteq A\}$ so that $\mu(E) \leqslant \sup\left(\{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}\right) \underset{\text{[eq: 20.757]}}{=} \rho_1$

$n \in \{2, \ldots, \infty\}$. Then as $\bigcup_{i \in \{1, \ldots, n-1\}} B_i \subseteq \bigcup_{i \in \mathbb{N}} B_i = B_\infty$ we have that

$$E \subseteq B = A \setminus B_\infty \subseteq A \setminus \left(\bigcup_{i \in \{1, \ldots, n-1\}} B_i \right)$$

so that $E \in \left\{B \in \mathcal{A} | B \subseteq \setminus \left(\bigcup_{i \in \{1, \ldots, n-1\}} B_i\right)\right\}$. Hence

$$\mu(A) \leqslant \sup\left(\left\{ \mu(B) | B \in \mathcal{A} \wedge B \subseteq \setminus \left(\bigcup_{i \in \{1, \ldots, n-1\}} B_i \right) \right\} \right) = \rho_n$$

So we have proved that

$$\forall n \in \mathbb{N} \text{ we have } \mu(E) \leqslant \rho_n \tag{20.764}$$

Assume that $0 < \mu(E)$ then as $\lim_{n \to \infty} \rho_n \underset{\text{[eq: 20.763]}}{=} 0$ there exist a $N \in \mathbb{N}$ such that $\rho_n = |\rho_n - 0| < \mu(E)$ contradicting [eq: 20.764]. Hence we must have that $\mu(E) \leqslant 0$. So we have proved that

$$\forall E \in \mathcal{A} \text{ with } E \subseteq B \text{ we have } \mu(E) \leqslant 0$$

which proves that

$$B \text{ is a negative set for } \mu$$

The above combined with [eq: 20.762] proves the lemma. □

Lemma 20.530. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \to \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$. If A and B are negative sets for μ such that $A \bigcap B = \varnothing$ then $A \bigcup B$ is a negative set for μ.*

Proof. Let $C \in \mathcal{A}$ be such that $C \subseteq A \bigcup B$. Then $C = C \bigcap (A \bigcup B) = (C \bigcap A) \bigcup (C \bigcap B)$ and $(C \bigcap A) \bigcap (C \bigcap B) = C \bigcap (A \bigcap B) = \emptyset$. So

$$\mu(C) = \mu\left(C \bigcap A\right) + \mu\left(C \bigcap B\right)$$

As A, B are negative sets for μ, $C \bigcap A, C \bigcap B \in \mathcal{A}$ and $C \bigcap A \subseteq A$, $C \bigcap B \subseteq B$, we have $\mu(C \bigcap A) \leqslant 0$ and $\mu(C \bigcap B) \leqslant 0$. So we have that

$$\mu(C) = \mu\left(C \bigcap A\right) + \mu\left(C \bigcap B\right) \leqslant 0$$

Hence $A \bigcup B$ is a negative set. □

Definition 20.531. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \to \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$. Then (P, N) is a **Hahn Decomposition of μ** if*

$$X = P \bigcup N \text{ and } P \bigcap N = \varnothing$$
$$P \text{ is a positive set for } \mu$$
$$N \text{ is a negative set for } \mu$$

It is possible that there are two Hahn Decompositions of a measure but then there is a relation between the positive and negative sets.

Theorem 20.532. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $\mu:\mathcal{A}\to\overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$ and (P_1,N_1), (P_2,N_2) be two Hahn decompositions of μ then $\mu(P_1\bigcap N_2)=0=\mu(P_2\bigcap N_1)$.*

Proof. As $P_1\bigcap N_2\in\mathcal{A}$, $P_1\bigcap N_2\subseteq P_1, P_1\bigcap N_2\subseteq N_2$, P_1 a positive set for μ and N_2 a negative set for μ, we have $0\leqslant\mu(P_1\bigcap N_2)\leqslant 0$ proving that

$$\mu\left(P_1\bigcap N_2\right)=0$$

Likewise, as $P_2\bigcap N_2\in\mathcal{A}$, $P_2\bigcap N_1\subseteq P_2, P_2\bigcap N_1\subseteq N_1$, P_2 a positive set for μ and N_1 a negative set for μ, we have $0\leqslant\mu(P_2\bigcap N_1)\leqslant 0$ proving that

$$\mu\left(P_2\bigcap N_1\right)=0$$

□

Theorem 20.533. (Hahn Decomposition Theorem) *Let $\langle X,\mathcal{A}\rangle$ be a measurable space and $\mu:\mathcal{A}\to\overline{\mathbb{R}}$ a signed measure on $\langle X,\mathcal{A}\rangle$. Then there exists a Hahn decomposition of μ. In other words there exists subsets $P,N\subseteq X$ such that*

$$X=P\bigcup N\wedge P\bigcap N=\emptyset$$
$$P \text{ is a positive set for } \mu$$
$$N \text{ is a negative set for } \mu$$

Proof. For μ we have two cases to consider:

$\{\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_\infty$. As $\varnothing$ is a negative set for μ [see example: 20.526] and $\mu(\varnothing)=0$ it follows that $0\in\{\mu(A)|A \text{ is a negative set for } \mu\}$ so that

$$L=\inf\left(\{\mu(A)|A \text{ is a negative set for } \mu\}\right) \text{ exist and } L\leqslant 0 \tag{20.765}$$

Using [theorem: 20.80] there exist a sequence $\{x_i\}_{i\in\mathbb{N}}\subseteq\{\mu(A)|A \text{ is a negative set for } \mu\}$ such that $\lim\limits_{n\to\infty}x_n$ exist and $\lim\limits_{n\to\infty}x_n=L$. Hence there exist a sequence $\{A_n\}_{n\in\mathbb{N}}$ of negative sets for μ such that $\forall n\in\mathbb{N}$ we have $\mu(A_n)=x_n$. Hence we have

$$\lim_{n\to\infty}\mu(A_n) \text{ exist and } \lim_{n\to\infty}\mu(A_n)=L \tag{20.766}$$

By the definition of a negative set we have $\{A_n\}_{n\in\mathbb{N}}\subseteq\mathcal{A}$ so that

$$N=\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A} \tag{20.767}$$

We prove now that N is a negative set for μ. Using [theorem: 20.204] there exist a sequence $\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ such that

$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A} \text{ is pairwise disjoint, } N=\bigsqcup_{i\in\mathbb{N}}B_i \text{ and } \forall i\in\mathbb{N} \text{ we have } B_i\subseteq A_i \tag{20.768}$$

Let $E\in\mathcal{A}$ with $E\subseteq N$ then

$$\begin{aligned}\mu(E) &= \mu\left(E\bigcap N\right)\\ &= \mu\left(E\bigcap\left(\bigsqcup_{i\in\mathbb{N}}B_i\right)\right)\\ &= \mu\left(\bigsqcup_{i\in\mathbb{N}}\left(E\bigcap B_i\right)\right)\\ &= \sum_{i=1}^{\infty}\mu\left(E\bigcap B_i\right)\end{aligned} \tag{20.769}$$

Given $i\in\mathbb{N}$ we have by [eq: 20.768] $E\bigcap B_i\in\mathcal{A}$ and $E\bigcap B_i\subseteq B_i\subseteq A_i$. As A_i is a negative set for μ it follows that $\mu(E\bigcap B_i)\leqslant 0$. Hence

$$\mu(E)\underset{\text{[eq: 20.769]}}{=}\sum_{i=1}^{\infty}\mu\left(E\bigcap B_i\right)=\lim_{n\to\infty}\sum_{i=1}^{n}\mu\left(E\bigcap B_i\right)\underset{\text{[eq: 20.82]}}{\leqslant}0$$

So $\forall E \in \mathcal{A}$ with $E \subseteq N$ we have $\mu(E) \leqslant 0$ which proves that

$$N \text{ is a negative set for } \mu \tag{20.770}$$

From the above it follows that $\mu(N) \in \{\mu(A)|A \text{ is a negative set for } \mu\}$ so that

$$L = \inf(\{\mu(A)|A \text{ is a negative set for } \mu\}) \leqslant \mu(N) \tag{20.771}$$

Further given $n \in \mathbb{N}$ $A_n \in \mathcal{A}$ and $A_n \subseteq \bigcup_{i \in \mathbb{N}} A_i = N$ and N is a negative set it follows from [theorem: 20.528] $\mu(N) \leqslant \mu(A_n)$. Using [theorem: 20.82] it follows that $\mu(N) \leqslant \lim\limits_{n \to \infty} \mu(A_n) \underset{\text{[eq: 20.766]}}{=} L$ which combined with [eq: 20.771]

$$L = \mu(N) \tag{20.772}$$

As $L \underset{\text{[eq: 20.765]}}{\leqslant} 0$ we have from the above that $\mu(N) \leqslant 0 < \infty$ so that $\mu(N) \neq \infty$, further as $\mu(N) \underset{N \in \mathcal{A}}{\in} \{\mu(A)|A \in \mathcal{A}\} \subseteq \mathbb{R}_+$ we have that $\mu(N) \neq -\infty$. Hence we have

$$\mu(N) \in \mathbb{R} \tag{20.773}$$

Let $P = X \setminus N$ then we prove that P is a positive set for μ. As $\mathrm{N} \in \mathcal{A}$ we have that $P \in \mathcal{A}$. Assume that there exist a $C \in \mathcal{A}$ with $C \subseteq P$ such that $\mu(C) < 0$. As $\mu(C) \in \{\mu(A)|A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$ we have $\mu(C) \neq -\infty$. Using [lemma: 20.529] there exist a negative set B for μ such that

$$B \subseteq C \text{ and } \mu(B) \leqslant \mu(C) < 0 \tag{20.774}$$

Also we have $N \bigcap B \subseteq N \bigcap C \subseteq N \bigcap P = N \bigcap (X \setminus N) = \varnothing$ so that

$$N \bigcap B = \varnothing \tag{20.775}$$

As N, B are negative sets for μ we have by the above and]lemma: 20.530] that

$$N \bigcup B \text{ is a negative set for } \mu \tag{20.776}$$

Now as $\mu(N) \in \mathbb{R}$ and $\mu(B) < 0$ [see eq: 20.773, 20.774] we have that $\mu(N) + \mu(B) < \mu(N) = L$. So

$$\begin{aligned}
\mu\big(N \bigcup B\big) &\underset{N \bigcap B = \varnothing}{=} \mu(N) + \mu(B) \\
&< L \\
&= \inf(\{\mu(A)|A \text{ is a negative set for } \mu\}) \\
&\underset{\text{[eq: 20.776}}{\leqslant} \mu\big(N \bigcup B\big)
\end{aligned}$$

leading to the contradiction $\mu(N \bigcup B) < \mu(N \bigcup B)$. So the assumption is wrong and we must have that $\forall C \in \mathcal{A}$ with $C \subseteq P$ we have $0 \leqslant C$ which proves that

$$P \text{ is a positive set for } \mu \tag{20.777}$$

To summarize we have by [eqs: 20.770, 20.777] and $P = X \setminus N$ that for a signed measure $\mu: \mathcal{A} \to \overline{\mathbb{R}}$ with $\{\mu(A)|A \in \mathcal{A}\} \subseteq \mathbb{R}_{+1}$ we have

$$N \text{ is a negative set for } \mu,\ P \text{ is a positive set for } \mu,\ \varnothing = P \bigcap N \text{ and } X = P \bigcup N$$

$\{\mu(A)|A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$. Using [lemma: 20.527] we have that $\nu = (-\mu): \mathcal{A} \to \overline{\mathbb{R}}$ is a signed measure on $\mathcal{A}$. Further if $x \in \{\nu(A)|A \in \mathcal{A}\}$ then $\exists A \in \mathcal{A}$ such that $x = \nu(A) = -\mu(A) \subseteq \mathbb{R}_{-\infty}$. For $\mu(A)$ we have either $x = \mu(A) \in \mathbb{R} \Rightarrow -\mu(A) \in \mathbb{R}$ or $\mu(A) = -\infty \Rightarrow x = -\mu(A) = \infty$ which proves that $\{\nu(A)|A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$. Using then the previous case [see eq: 20.777] there exist a positive set N for ν and a negative set P for ν such that $P \bigcap N = \varnothing$ and $X = P \bigcup N$. Using [lemma: 20.527] it follows that P is a positive set for $-\nu = -(-\mu) = \mu$ and N is a negative set for $-\nu = -(-\mu) = \mu$. Which conclude the prove for this case. □

The Hahn Decompositions allows us to write every signed measure as the difference of two measures.

Theorem 20.534. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space and $\mu: \mathcal{A} \to \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$. Then for every Hahn decomposition (P, N) of μ we have that*

$$\forall A \in \mathcal{A} \text{ we have } \mu\big(A \bigcap P\big) \subset [0, \infty] \wedge -\mu\big(A \bigcap N\big) \subseteq [0, \infty]$$

$$\mu^+: \mathcal{A} \to [0, \infty] \text{ defined by } \mu^+(A) = \mu\big(A \bigcap P\big) \text{ is a measure on } \mathcal{A}$$

$$\mu^-: \mathcal{A} \to [0, \infty] \text{ defined by } \mu^-(A) = -\mu\big(A \bigcap N\big) \text{ is a measure on } \mathcal{A}$$

$$\mu^+ \text{ or } \mu^- \text{ is finite}$$

$$\forall A \in \mathcal{A} \text{ we have } \mu(A) = \mu^+(A) - \mu^-(A)$$

Further we have that

$$\forall A \in \mathcal{A}\ \mu^+(A) = \sup\left(\{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}\right) \text{ and } \mu^-(A) = \sup\left(\{-\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}\right)$$

Proof. Let $A \in \mathcal{A}$. As P is a positive set for μ and N is a negative set for N we have that $N, P \in \mathcal{A}$ so that $A \bigcap P, A \bigcap N \in \mathcal{A}$ and as $A \bigcap P \subseteq P$, $A \bigcap N \subseteq N$ it follows that $0 \leqslant \mu(A \bigcap P)$ and $\mu(A \bigcap N) \leqslant 0$ so that

$$\forall A \in \mathcal{A} \text{ we have } \mu\big(A \bigcap P\big) \subset [0, \infty] \wedge -\mu\big(A \bigcap N\big) \subseteq [0, \infty] \tag{20.778}$$

Further we have

$$\mu^+(\varnothing) = \mu\big(\varnothing \bigcap P\big) = \mu(\varnothing) = 0 \text{ and } \mu^-(\varnothing) = -\mu\big(\varnothing \bigcap N\big) = -\mu(\varnothing) = 0$$

and for every $\{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A}$ pairwise disjoint that

$$\begin{aligned}
\mu^+\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &= \mu\left(\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) \bigcap P\right) \\
&= \mu\left(\bigsqcup_{i \in \mathbb{N}} \big(A_i \bigcap P\big)\right) \\
&= \sum_{i=1}^{\infty} \mu\big(A_i \bigcap P\big) \\
&= \sum_{i=1}^{\infty} \mu^+(A_i) \\
\mu^-\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &= -\mu\left(\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) \bigcap N\right) \\
&= -\mu\left(\bigsqcup_{i \in \mathbb{N}} \big(A_i \bigcap N\big)\right) \\
&= (-1) \cdot \sum_{i-1}^{\infty} \mu\big(A_i \bigcap N\big) \\
&= (-1) \cdot \lim_{n \to \infty} \sum_{i=1}^{n} \mu\big(A_i \bigcap N\big) \\
&\underset{\text{[theorem: 20.82]}}{=} \lim_{n \to \infty} \sum_{i=1}^{n} \big(-\mu\big(A_i \bigcap N\big)\big) \\
&= \lim_{n \to \infty} \sum_{i=1}^{n} \mu^-(A_i) \\
&= \sum_{i=1}^{\infty} \mu^-(A_i)
\end{aligned}$$

Which proves that

$$\mu^+: \mathcal{A} \to [0, \infty] \text{ and } \mu^-: \mathcal{A} \to [0, \infty] \text{ are measures} \tag{20.779}$$

For μ we have either:

$\{\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_\infty$. Suppose that there exist a $A\in\mathcal{A}$ such that $\mu^-(A)=\infty$ then $\infty=-\mu(A\bigcap N)\Rightarrow\mu(A\bigcap N)=-\infty$ contradicting $\{\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_\infty$. Hence we have that $\forall A\in\mathcal{A}\ \mu^-(A)\subset[0,\infty[$, in other words μ^- is finite.

$\{\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_{-\infty}$. Suppose that there exist a $A\in\mathcal{A}$ such that $\mu^+(A)=\infty$ then $\mu(A\bigcap N)=\infty$ contradicting $\{\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}_{-\infty}$. Hence we have that $\forall A\in\mathcal{A}\ \mu(A)\subset[0,\infty[$, in other words μ is finite.

Hence we have that

$$\mu^+ \text{ is finite or } \mu^- \text{ is finite} \tag{20.780}$$

Let $A\in\mathcal{A}$ then as $X=P\bigsqcup N$ and $P\bigcap N=\varnothing$ we have

$$\begin{aligned}\mu(A) &= \mu\left(A\bigcap X\right)\\ &= \mu\left(A\left(\bigcap\left(P\bigsqcup N\right)\right)\right)\\ &= \mu\left(\left(A\bigcap P\right)\bigcup\left(A\bigcap N\right)\right)\\ &\underset{P\bigcap N=\varnothing}{=} \mu\left(A\bigcap P\right)+\mu\left(A\bigcap N\right)\\ &= \mu^+(A)-\mu^-(A)\end{aligned}$$

Hence we have

$$\forall A\in\mathcal{A} \text{ we have } \mu(A)=\mu^+(A)-\mu^-(A) \tag{20.781}$$

So the only thing left to prove is that we can define μ^+ and μ^- in terms of the supremums. Let $A\in\mathcal{A}$ then if $B\in\mathrm{A}$ with $B\subseteq A$ we have

$$\mu(B)\underset{\text{[eq: 20.781]}}{=}\mu^+(B)-\mu^-(B)\underset{\text{[eq: 20.780]}\wedge\text{[theorem: 20.27]}}{\leqslant}\mu^+(B)\underset{\text{[theorem: 20.201]}}{\leqslant}\mu^+(A)$$

so that

$$\sup\left(\{\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right)\leqslant\mu^+(A) \tag{20.782}$$

Further as $A\bigcap P\in\mathcal{A}$ and $A\bigcap P\subseteq A$ and $\mu^+(A)=\mu(A\bigcap P)$ it follows that $\mu^+(A)\in\{\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}$ so that $\mu^+(A)\leqslant\sup\left(\{\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right)$ which combined with [eq: 20.782] proves that $\mu^+(A)=\sup\left(\{\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right)$. Hence

$$\forall A\in\mathcal{A} \text{ we have } \mu^+((A))=\sup\left(\{\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right) \tag{20.783}$$

Similar, let $A\in\mathcal{A}$ then if $B\in\mathcal{A}$ with $B\subseteq A$ we have

$$-\mu(B)\underset{\text{[eq: 20.781]}}{=}\mu^-(B)-\mu^+(B)\underset{\text{[eq: 20.780]}\wedge\text{[theorem: 20.27]}}{\leqslant}\mu^-(B)\underset{\text{[theorem: 20.201]}}{\leqslant}\mu^+(A)$$

so that

$$\sup\left(\{-\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right)\leqslant\mu^+(A) \tag{20.784}$$

Further as $A\bigcap N\in\mathcal{A}$, $A\bigcap N\subseteq A$ and $\mu^-(A)=-\mu(N\bigcap A)$, we have that $\mu^-(A)\in\{-\mu(B)|B\in\mathcal{A}\text{ and }B\subseteq A\}$ so that $\mu^-(A)\leqslant\sup\left(\{-\mu(B)|B\in\mathcal{A}\text{ and }B\subseteq A\}\right)$. Combining this with [eq: 20.784] proves that $\mu^-(A)=\sup\left(\{-\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right)$ Hence

$$\forall A\in\mathcal{A} \text{ we have } \mu^-(A)=\sup\left(\{-\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right) \tag{20.785}$$ □

Theorem 20.535. (Jordon Decomposition) *Let $\langle X,\mathcal{A}\rangle$ be a measurable space and $\mu:\mathcal{A}\to\overline{\mathbb{R}}$ a signed measure then*

$$\forall A\in\mathcal{A} \textit{ we have } \sup\left(\{\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right)\subseteq[0,\infty] \textit{ and } \sup\left(\{-\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right)\subseteq[0,\infty]$$

$$\mu^+:\mathcal{A}\to[0,\infty] \textit{ defined by } \mu^+(A)=\sup\left(\{\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right) \textit{ is a measure on } \mathcal{A}$$

$$\mu^-:\mathcal{A}\to[0,\infty] \textit{ defined by } \mu^-(A)=\sup\left(\{-\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right) \textit{ is a measure on } \mathcal{A}$$

$$\mu^+ \textit{ or } \mu^- \textit{ are finite}$$

$$\mu=\mu^+-\mu^-$$

Further there exist a Hahn Decomposition (P,N) *of* μ *such that*

$$\forall A\in\mathcal{A} \text{ we have } \mu^+(A)=\mu(A) \text{ and } \mu^-\big(A\bigcap P\big)=-\mu\big(A\bigcap N\big)$$

The function

$$|\mu|=\mu^++\mu^-:\mathcal{A}\to[0,\infty] \text{ is a } \textbf{finite} \text{ measure and } \forall A\in\mathcal{A} \text{ we have } |\mu(A)|\leqslant|\mu|(A)$$

For every Hahn Decomposition (P',N') *of* μ *we have*

$$\forall A\in\mathcal{A} \text{ we have } \mu^+(A)=\mu\big(A\bigcap P'\big)\wedge\mu^-(A)=-\mu\big(A\bigcap N'\big)$$

Further if there exists a measure ν *on* $\langle X,\mathcal{A}\rangle$ *such that* $\forall A\in\mathcal{A}$ *we have that* $|\mu(A)|\leqslant\nu(A)$ *then* $\forall A\in\mathcal{A}$ *we have that* $|\mu|(A)\leqslant\nu(A)$*. In other words* $|\mu|$ *is the smallest positive measure such that* $\forall A\in\mathcal{A}$ *we have* $|\mu(A)|<\nu(A)$*. The pair* (μ^+,μ^-) *is called a* ***Jordon Decomposition*** *of* μ*.* μ^+ *is called the* ***positive part of*** $\boldsymbol{\mu}$ *and* μ^- *is called the* ***negative part of*** $\boldsymbol{\mu}$***.*** *The function* $|f|$ *is called the* ***variation of*** $\boldsymbol{\mu}$*. the* ***total variation*** *of the signed measure* μ *noted as* $\|\mu\|$ *is defined to be*

$$\|\mu\|=|\mu|(X)=\mu^+(X)+\mu^-(X)$$

Proof. Using the Hahn Decomposition Theorem [see theorem: 20.533] there exist a Hahn Decomposition (P,N) of μ. Using the previous theorem [theorem: 20.534] we have that

$$\forall A\in\mathcal{A} \text{ we have } \mu\big(A\bigcap P\big)\subset[0,\infty]\wedge-\mu\big(A\bigcap N\big)\subseteq[0,\infty] \tag{20.786}$$

$$\mu^+:\mathcal{A}\to[0,\infty] \text{ defined by } \mu^+(A)=\mu\big(A\bigcap P\big) \text{ is a measure on } \mathcal{A} \tag{20.787}$$

$$\mu^-:\mathcal{A}\to[0,\infty] \text{ defined by } \mu^-(A)=-\mu\big(A\bigcap N\big) \text{ is a measure on } \mathcal{A} \tag{20.788}$$

$$\mu^+ \text{ or } \mu^- \text{ is finite} \tag{20.789}$$

$$\forall A\in\mathcal{A} \text{ we have } \mu(A)=\mu^+(A)-\mu^-(A) \tag{20.790}$$

$$\forall A\in\mathcal{A}\ \mu^+(A)=\sup\left(\{\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right) \text{ and } \mu^-(A)=\sup\left(\{-\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right) \tag{20.791}$$

Applying [eq: 20.791] on [eqs: 20.786, 20.787, 20.788, 20.789 and 20.790] we have that

$$\forall A\in\mathcal{A}\ \ \sup\left(\{\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right)\subseteq[0,\infty] \text{ and } \sup\left(\{-\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right)\subseteq[0,\infty]$$

$$\mu^+:\mathcal{A}\to[0,\infty] \text{ defined by } \mu^+(A)=\sup\left(\{\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right)=\mu\big(A\bigcap P\big) \text{ is a measure on } \mathcal{A}$$

$$\mu^-:\mathcal{A}\to[0,\infty] \text{ defined by } \mu^-(A)=\sup\left(\{-\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right)=-\mu\big(A\bigcap N\big) \text{ is a measure on } \mathcal{A}$$

$$\mu^+ \text{ or } \mu^- \text{ is finite}$$

$$\forall A\in\mathcal{A} \text{ we have } \mu(A)=\mu^+(A)-\mu^-(A)$$

As μ^+, μ^- are **finite** measures on $\mathcal{A}$ we have by [theorem: 20.197] that

$$|\mu|=\mu^++\mu^-:\mathcal{A}\to[0,\infty] \text{ is a finite measure on } \mathcal{A}$$

Let $A\in\mathcal{A}$ then

$$|\mu(A)|=|\mu^+(A)-\mu^-(A)|\leqslant|\mu^+(A)|+|\mu^-(A)|\underset{0\leqslant\mu^+(A),\mu^-(A)}{=}\mu^+(A)+\mu^-(A)=|\mu|(A)$$

which proves that

$$\forall A\in\mathcal{A} \text{ we have } |\mu(A)|\leqslant|\mu|(A)$$

Further if (P',N') is any Hahn Decomposition of μ we have by [theorem: 20.534] that

$$\mu^+(A)=\sup\left(\{\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right)=\mu\big(A\bigcap P'\big)$$

$$\mu^-(A)=\sup\left(\{-\mu(B)|B\in\mathcal{A}\wedge B\subseteq A\}\right)=\mu\big(A\bigcap N'\big)$$

Let ν be a measure on $\langle X, \mathcal{A}\rangle$ such that $\forall A \in \mathcal{A}$ we have $|\mu(A)| < \nu(A)$. If $A \in \mathcal{A}$ then we have

$$\begin{aligned}
\mu^+(A) &\underset{\text{[eq: 20.787]}}{=} \mu\big(A \bigcap P\big) \\
&\underset{0 \leqslant \mu^+(A)}{=} \big|\mu\big(A \bigcap P\big)\big| \\
&\leqslant \nu\big(A \bigcap P\big) \\
\mu^-(A) &\underset{\text{[eq: 20.788]}}{=} -\mu\big(A \bigcap N\big) \\
&\underset{0 \leqslant \mu^-(A)}{=} \big|\mu\big(A \bigcap N\big)\big| \\
&\leqslant \nu\big(A \bigcap N\big)
\end{aligned}$$

So that

$$|\mu|(A) = \mu^+(A) + \mu^-(A) \leqslant \nu\big(A \bigcap P\big) + \nu\big(A \bigcap N\big) \underset{N \bigcap P = \emptyset}{=} \nu(A)$$

proving that

$$\forall A \in \mathcal{A} \text{ we have } |\mu|(A) \leqslant \nu(A)$$

□

20.7.2 Complex Measure

20.7.2.1 Definition and properties

Just as we defined signed measures it is possible to define complex measures.

Definition 20.536. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space then a function $\mu: \mathcal{A} \to \mathbb{C}$ is a **complex measure** if*

1. $\mu(\emptyset) = 0$
2. $\forall \{A_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{A}$ *paiwise disjoint we have*

$$\sum_{i=1}^{\infty} \mu(A_i) = \lim_{n \to \infty} \sum_{i=1}^{n} \mu(A_i) \text{ exists}$$

and

$$\mu\Big(\bigcup_{i=\mathbb{N}} A_i\Big) = \sum_{i=1}^{\infty} \mu(A_i)$$

***Note* 20.537.** *As $\forall A \in \mathcal{A}$ we have that $\mu(A) \in \mathbb{C}$ it follows that $\operatorname{Img}(\mu(A)), \operatorname{Re}(\mu(A)) \in \mathbb{R}$, or the real and imaginary parts are finite.*

Theorem 20.538. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space and $\mu: X \to \mathbb{C}$ a complex measure then*

$$\operatorname{Re}(\mu): X \to \overline{\mathbb{R}} \text{ defined by } \operatorname{Re}(\mu)(A) = \operatorname{Re}(\mu(A)) \text{ is a finite measure on } \mathcal{A}$$

$$\operatorname{Img}(\mu): X \to \overline{\mathbb{R}} \text{ defined by } \operatorname{Img}(\mu)(A) = \operatorname{Img}(\mu(A)) \text{ is a finite measure on } \mathcal{A}$$

***Note* 20.539.** *As $\forall A \in \mathcal{A}$ we have*

$$\mu(A) = \operatorname{Re}(\mu(A)) + i \cdot \operatorname{Img}(\mu(A)) = \operatorname{Re}(\mu)(A) + \operatorname{Img}(\mu)(A) = (\operatorname{Re}(\mu) + i \cdot \operatorname{Img}(\mu))(A)$$

we have that

$$\mu = \operatorname{Re}(\mu) + i \cdot \operatorname{Img}(\mu)$$

Proof. First we have that

$$\operatorname{Re}(\mu)(\varnothing) = \operatorname{Re}(\mu(\varnothing)) = \operatorname{Re}(\varnothing) = 0 \text{ and } \operatorname{Img}(\mu)(\varnothing) = \operatorname{Img}(\mu(\varnothing)) = \operatorname{Img}(\varnothing) = 0 \tag{20.792}$$

$$\forall A \in \mathcal{A} \ \operatorname{Re}(\mu)(A) = \operatorname{Re}(\mu(A)) \in \mathbb{R} \text{ and } \operatorname{Img}(\mu)(A) = \operatorname{Img}(\mu(A)) \in \mathbb{R} \tag{20.793}$$

Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ be pairwise disjoint then $\sum_{i=1}^{\infty}\mu(A_i)$ exist and $\sum_{i=1}^{\infty}\mu(A_i)=\mu(\bigcup_{i\in\mathbb{N}}A_i)$. Using [theorem: 14.361] it follows that

$$\sum_{i\to\infty}^{\infty}\mathrm{Re}(\mu(A_i))\text{ exist with }\sum_{i\to\infty}^{\infty}\mathrm{Re}(\mu(A_i))=\mathrm{Re}\left(\sum_{i=1}^{\infty}\mu(A_i)\right)\tag{20.794}$$

$$\sum_{i\to\infty}^{\infty}\mathrm{Img}(\mu(A_i))\text{ exist with }\sum_{i\to\infty}^{\infty}\mathrm{Img}(\mu(A_i))=\mathrm{Img}\left(\sum_{i=1}^{\infty}\mu(A_i)\right)\tag{20.795}$$

Hence we have as $\forall i\in\mathbb{N}$ $\mathrm{Re}\,(\mu)(A_i)=\mathrm{Re}(\mu(A_i))$ and $\mathrm{Img}(\mu)(A_i)=\mathrm{Img}(\mu(A_i))$ that

$$\sum_{i=1}^{\infty}\mathrm{Re}(\mu)(A_i)\text{ exist and }\sum_{i=1}^{\infty}\mathrm{Img}(\mu)(A_i)\text{ exist}$$

$$\sum_{i=1}^{\infty}\mathrm{Re}(\mu)(A_i)=\mathrm{Re}\left(\sum_{i=1}^{\infty}\mu(A_i)\right)\underset{\text{[eq: 20.794]}}{=}\mathrm{Re}\left(\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)\right)=\mathrm{Re}(\mu)\left(\bigcup_{i\in\mathbb{N}}A_i\right)$$

$$\sum_{i=1}^{\infty}\mathrm{Img}(\mu)(A_i)=\mathrm{Img}\left(\sum_{i=1}^{\infty}\mu(A_i)\right)\underset{\text{[eq: 20.795]}}{=}\mathrm{Img}\left(\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)\right)=\mathrm{Img}(\mu)\left(\bigcup_{i\in\mathbb{N}}A_i\right)$$

The above together with [eqs: 20.792,20.793,20.794, 20.795] proves that

$$\mathrm{Re}(\mu)\text{ and }\mathrm{Img}(\mu)\text{ are finite signed measures}$$ □

Complex measures are evidently finite additive

Theorem 20.540. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $n\in\mathbb{N}$ and $\mu:\mathcal{A}\to\mathbb{C}$ be a complex measure on $\mathcal{A}$ then*

1. *$\forall\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{A}$ pairwise disjoint we have that*

$$\mu\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)=\sum_{i=1}^{n}\mu(A_i)$$

2. *$\forall A,B\in\mathcal{A}$ with $B\subseteq A$ we have $\mu(A\setminus B)=\mu(A)-\mu(B)$*

In other words μ is finite additive.

Proof.

1. Using the previous theorem [theorem: 20.538] we have that $\mathrm{Re}(\mu)$ and $\mathrm{Img}(\mu)$ are signed measures, hence by [theorem: 20.521] we have that

$$\mathrm{Re}(\mu)\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)=\sum_{i=1}^{n}\mathrm{Re}(A_i)\text{ and }\mathrm{Img}(\mu)\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)=\sum_{i=1}^{n}\mathrm{Img}(A_i)$$

So that

$$\begin{aligned}\mu\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)&=\mathrm{Re}\left(\mu\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\right)+i\cdot\mathrm{Img}\left(\mu\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\right)\\&=\mathrm{Re}(\mu)\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)+i\cdot\mathrm{Img}(\mu)\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\\&=\sum_{i=1}^{n}\mathrm{Re}(\mu)(A_i)+i\cdot\sum_{i=1}^{n}\mathrm{Img}(\mu)(A_i)\\&=\sum_{i=1}^{n}(\mathrm{Re}(u)(A_i)+i\cdot\mathrm{Img}(\mu)(A_i))\\&=\sum_{i=1}^{n}(\mathrm{Re}(\mu(A_i))+i\cdot\mathrm{Img}(\mu(A_i)))\\&=\sum_{i=1}^{n}\mu(A_i)\end{aligned}$$

2. As $B \subseteq A$ we have $A = (A \setminus B) \bigcup B$ with $(A \setminus B) \bigcap B = \infty$ so that $\mu(A) \underset{(1)}{=} \mu(A \setminus B) + \mu(B)$ so that $\mu(A \setminus B) = \mu(A) - \mu(B)$. □

We have now similar theorems as [theorems: 20.523, 20.524] for complex measures.

Theorem 20.541. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \to \mathbb{C}$ a complex measure on $\mathcal{A}$ then we have:*

1. *$\forall \{A_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N}_0$ $A_i \subseteq A_{i+1}$ we have that $\lim_{i \to \infty} \mu(A_i)$ exists and*
$$\mu\left(\bigcup_{i \in \mathbb{N}_0} A_i\right) = \lim_{i \to \infty} \mu(A_i)$$
2. *$\forall \{A_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N}_0$ $A_{i+1} \subseteq A_i$ we have that $\lim_{i \to \infty} \mu(A_i)$ exists and*
$$\mu\left(\bigcap_{i \in \mathbb{N}_0} A_i\right) = \lim_{i \to \infty} \mu(A_i)$$

Proof.

1. Define
$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \begin{cases} A_i \text{ if } i = 1 \\ A_i \setminus A_{i-1} \text{ if } i \in \{2, \ldots, \infty\} \end{cases} \in \mathcal{A}$$
Let $i, j \in \mathbb{N}$ with $i \neq j$ then we may always assume that $i < j$ [otherwise exchange i and j] then for i we have either:

   $i = 1$. Then $1 < j$ so that $1 \leqslant j - 1$ from which it follows that $A_1 \subseteq A_{j-1} \Rightarrow A_j \setminus A_{j-1} \subseteq A_j \setminus A_1$ hence $B_i \bigcap B_j = A_1 \bigcap (A_j \setminus A_{j-1}) \subseteq A_1 \bigcap (A_j \setminus A_1) = \varnothing$ so that $B_i \bigcap B_j = \varnothing$

   $i \in \{2, \ldots, \infty\}$. Then as $i < j$ we have $i \leqslant j - 1$ so that $A_i \subseteq A_{j-1}$ from which it follows that $A_j \setminus A_{j-1} \subseteq A_j \setminus A_i$. So
$$B_i \bigcap B_j = (A_i \setminus A_{i-1}) \bigcap (A_j \setminus A_{j-1}) \subseteq (A_i \setminus A_{j-1}) \bigcap (A_j \setminus A_i) = \varnothing$$
   or $B_i \bigcap B_j = \varnothing$.

   Hence
$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ is pairwise disjoint} \tag{20.796}$$
   Let $n \in \mathbb{N}$ then $\forall i \in \{1, \ldots, n\}$ we have that $B_i = \begin{cases} A_1 \subseteq A_i \text{ if } i = 1 \\ A_i \setminus A_{i-1} \subseteq A_i \text{ if } i \in \{2, \ldots, \infty\} \end{cases} \subseteq A_i \underset{i \leqslant n}{\subseteq} A_n$ so that $\bigcup_{i \in \{1, \ldots, n\}} B_i \subseteq A_n$ and $B_n \subseteq A_n \Rightarrow \bigcup_{n \in \mathbb{N}} B_n \subseteq \bigcup_{n \in \mathbb{N}} A_n$. Summarized we have
$$\forall n \in \mathbb{N} \text{ we have } \bigcup_{i \in \{1, \ldots, n\}} B_i \subseteq A_n \text{ and } \bigcup_{i \in \mathbb{N}} B_i \subseteq \bigcup_{i \in \mathbb{N}} A_i \tag{20.797}$$
   Let $n \in \mathbb{N}$ then for $x \in A_n$ we have that $n \in \{i \in \{1, \ldots, n\} | x \in A_i\}$ a finite set so that $m = \min(\{i \in \{1, \ldots, n\} | x \in A_i\})$ exist. For m we then either:

   $m = 1$. Then $x \in A_1 = B_1 \subseteq \bigcup_{i \in \{1, \ldots, n\}} B_i$

   $1 < m$. Then $x \notin A_{m-1}$ and $x \in A_m$ so that $x \in A_m \setminus A_{m-1} = B_m \subseteq \bigcup_{i \in \{1, \ldots, n\}} B_i$

   So we have that $A_n \subseteq \bigcup_{i \in \{1, \ldots, n\}} B_i \subseteq \bigcup_{i \in \mathbb{N}} B_i$ which combined with [eq: 20.797] gives
$$\forall n \in \mathbb{N} \text{ we have } A_n = \bigcup_{i \in \{1, \ldots, n\}} B_i \text{ and } \bigcup_{i \in \mathbb{N}} B_i = \bigcup_{i \in \mathbb{N}} A_i \tag{20.798}$$
   By the definition of a complex measure we have that
$$\sum_{i=1}^{\infty} \mu(B_i) = \lim_{n \to \infty} \sum_{i=1}^{n} \mu(B_i) \text{ exist and } \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \sum_{i=1}^{\infty} \mu(B_i) \tag{20.799}$$

Finally

$$\begin{aligned}
\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right) &\underset{\text{[eq: 20.798]}}{=} \mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) \\
&\underset{\text{[eq: 20.799]}}{=} \lim_{n\to\infty}\sum_{i=1}^{n}\mu(B_i) \\
&\underset{\text{[theorem: 20.540]}}{=} \lim_{n\to\infty}\mu\left(\bigcup_{i\in\{1,\ldots,n\}} B_i\right) \\
&\underset{\text{[eq: 20.798]}}{=} \lim_{n\to\infty}\mu(A_n)
\end{aligned}$$

hence

$$\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right) = \lim_{n\to\infty}\mu(A_n)$$

2. Let $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ such that $\forall i\in\mathbb{N}$ we have $A_{i+1}\subseteq A_i$. Define now

$$\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = A_1\setminus A_i \in \mathcal{A}$$

If $i\in\mathbb{N}$ then we have $B_i = A_1\setminus A_i \underset{A_{i+1}\subseteq A_i}{\subseteq} A_1\setminus A_{i+1} = B_{i+1}$ so that

$$\forall i\in\mathbb{N} \text{ we hae } B_i\subseteq B_{i+1}$$

Using (1) it follows that

$$\lim_{i\to\infty}\mu(B_i) \text{ exist and } \mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) = \lim_{i\to\infty}\mu(B_i) \tag{20.800}$$

Now

$$\begin{aligned}
A_1\setminus\left(\bigcup_{i\in\mathbb{N}} B_i\right) &\underset{\text{[theorem: 2.132]}}{=} \bigcap_{i\in\mathbb{N}}(A_1\setminus B_i) \\
&= \bigcap_{i\in\mathbb{N}}(A_1\setminus(A_1\setminus A_i)) \\
&\underset{\text{[theorem: 1.33}\}\wedge A_i\subseteq A_1}{=} \bigcap_{i\in\mathbb{N}} \text{Ai}
\end{aligned}$$

so that

$$A_1\setminus\left(\bigcup_{i\in\mathbb{N}} B_i\right) = \bigcap_{i\in\mathbb{N}} A_i \tag{20.801}$$

As $\forall i\in\mathbb{N}$ $B_i = A_1\setminus A_i\subseteq A_1$ we have

$$\bigcup_{i\in\mathbb{N}} B_i \subseteq A_1 \tag{20.802}$$

Next

$$\begin{aligned}
\mu\left(\bigcap_{i\in\mathbb{N}} A_i\right) &\underset{\text{[eq: 20.801]}}{=} \mu\left(A_1\setminus\left(\bigcup_{i\in\mathbb{N}} B_i\right)\right) \\
&\underset{\text{[eq: 20.802]}\wedge\text{[theorem: 20.540]}}{=} \mu(A_1) - \mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) \\
&\underset{\text{[eq: 20.800]}}{=} \mu(A_1) - \lim_{i\to\infty}\mu(B_i) \\
&\underset{B_i=A_1\setminus A_i\wedge A_i\subseteq A_1\wedge\text{[theorem: 20.540]}}{=} \mu(A_1) - \lim_{i\to\infty}(\mu(A_1)-\mu(A_i)) \\
&\underset{\text{[theorem: 20.82]}}{=} \mu(A_1) - \mu(A_1) + \lim_{i\to\infty}\mu(A_i) \\
&= \lim_{i\to\infty}\mu(A_i)
\end{aligned}$$

To summarize we have

$$\mu\left(\bigcap_{i\in\mathbb{N}} A_i\right) = \lim_{i\to\infty}\mu(A_i)$$

□

Theorem 20.542. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space and let $\mu: X \to \mathbb{C}$ be a complex function such that*

a) $\mu(\varnothing) = 0$

b) For all finite pairwise disjoint measurable sets $\{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{A}$, $n \in \mathbb{N}$ we have $\mu\left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right) = \sum_{i=1}^{n} \mu(A_i)$

then we have

1. *If $\forall \{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N}$ $A_i \subseteq A_{i+1}$ we have that $\lim_{i\to\infty} \mu(A_i)$ exists and $\mu(\bigcup_{i\in\mathbb{N}_0} A_i) = \lim_{n\to\infty} \mu(A_n)$ then μ is a complex measure on $\mathcal{A}$.*
2. *If $\forall \{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N}$ $\mathcal{A}_{i+1} \subseteq A_i$ and $\bigcap_{i\in\mathbb{N}} A_i = \emptyset$ we have that $\lim_{i\to\infty} \mu(A_i)$ exists and $\lim_{i\to\infty} \mu(A_i) = 0$ then μ is a complex measure on $\mathcal{A}$.*

Proof.

1. Let $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ be a pairwise disjoint sequence of measurable sets. Define

$$\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ by } B_n = \bigsqcup_{i\in\{1,\ldots,n\}} A_i$$

Then using [lemma: 20.114] we have that

$$\bigcup_{i\in\mathbb{N}} B_i = \bigsqcup_{i\in\mathbb{N}} A_i \text{ and } \forall i \in \mathbb{N} \text{ we have } B_i \subseteq B_{i+1}$$

Hence we have

$$\begin{aligned}
\mu\left(\bigsqcup_{i\in\mathbb{N}} A_i\right) &= \mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) \\
&\underset{\text{hypothesis}}{=} \lim_{i\to\infty} \mu(B_i) \text{ [where the limit exist]} \\
&= \lim_{i\to\infty} \mu\left(\bigsqcup_{j\in\{1,\ldots,i\}} A_i\right) \\
&\underset{(a)}{=} \lim_{i\to\infty} \sum_{j=1}^{i} \mu(A_i) \\
&= \sum_{j=1}^{\infty} \mu(A_j)
\end{aligned}$$

which together with (a) proves that μ is a complex measure.

2. Let $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ be a pairwise disjoint sequence of measureable sets. Define

$$\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \bigsqcup_{j\in\{i,\ldots,\infty\}} A_j$$

Then $\forall i \in \mathbb{N}$ we have $B_{i+1} = \bigsqcup_{j\in\{i+1,\ldots,\infty\}} A_j \underset{\text{[theorem: 2.128]}}{\subseteq} \bigsqcup_{j\in\{i,\ldots,i\}} A_j = B_i$ proving that

$$\forall i \in \mathbb{N} \text{ we have } B_{i+1} \subseteq B_i \tag{20.803}$$

Assume that $x \in \bigcap_{i\in\mathbb{N}} B_i$ then $x \in B_1$ so there exist a $k \in \{1,\ldots,\infty\}$ such that $x \in A_k$. From $x \in \bigcap_{i\in\mathbb{N}} B_i$ we have $x \in B_{k+1}$ so there exist a $j \in \{k+1,\ldots,\infty\}$ such that $x \in A_j$ hence $x \in A_k \bigcap A_j \underset{k\neq j}{=} \varnothing$ giving the contradiction $x \in \varnothing$. So the assumption is false and we must have

$$\bigcap_{i\in\mathbb{N}} B_i = \varnothing$$

Using the hypothesis we have that $\lim_{i\to\infty} \mu(B_i)$ exist and $\lim_{i\to\infty} \mu(B_i) = 0$. Using [theorem: 14.291] it follows that

$$\lim_{i\to\infty} \mu(B_{i+1}) = 0 \tag{20.804}$$

Let $k \in \mathbb{N}$. If $x \in \left(\bigcup_{i \in \{1,\ldots,k\}} A_i\right) \bigcap \left(\bigcup_{i \in \{k+1,\ldots,\infty\}} A_i\right)$ then $\exists i \in \{1,\ldots,k\}$ and a $j \in \{k+1,\ldots,\infty\}$ such that $x \in A_i \bigcap A_j$. As $i \leqslant k < k+1 \leqslant j$ we have that $A_i \bigcap A_j = \emptyset$ contradicting $x \in A_i \bigcap A_j$ so we have

$$\left(\bigcup_{i \in \{1,\ldots,k\}} A_i\right) \bigcap \left(\bigcup_{i \in \{k+1,\ldots,\infty\}} A_i\right) = \emptyset$$

and

$$\bigcup_{i \in \mathbb{N}} A_i = \left(\bigcup_{i \in \{1,\ldots,k\}} A_i\right) \bigcup \left(\bigcup_{i \in \{k+1,\ldots,\infty\}} A_i\right)$$

So that

$$\begin{aligned}
\mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &\underset{(b)}{=} \mu\left(\bigcup_{i \in \{1,\ldots,k\}} A_i\right) + \mu\left(\bigcup_{i \in \{k+1,\ldots,\infty\}} A_i\right) \\
&= \mu\left(\bigcup_{i \in \{1,\ldots,k\}} A_i\right) + \mu(B_{k+1}) \\
&\underset{(b)}{=} \sum_{i=1}^{k} \mu(A_i) + \mu(B_{k+1})
\end{aligned}$$

Hence we have that

$$\mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{k} \mu(A_i) + \mu(B_{k+1})$$

so that

$$\forall k \in \mathbb{N} \text{ we have } \left|\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) - \sum_{i=1}^{k} \mu(A_i)\right| = |\mu(B_{k+1})| \tag{20.805}$$

Let $\varepsilon \in \mathbb{R}^+$. Then by [eq: 20.804] there exist a $N \in \mathbb{N}$ such that $\forall k \in \{N,\ldots,\infty\}$

$$|\mu(B_k)| < \varepsilon \underset{[\text{eq: } 20.805]}{\Rightarrow} \left|\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) - \sum_{i=1}^{k} \mu(A_i)\right| < \varepsilon$$

which proves that

$$\sum_{i=1}^{\infty} \mu(A_i) = \lim_{k \to \infty} \sum_{i=1}^{k} \mu(A_i) \text{ exist and } \sum_{i=1}^{\infty} \mu(A_i) = \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right)$$

This together wit (a) proves that

$$\mu \text{ is a complex measure}$$

□

20.7.2.2 Jordan decomposition of a complex measure

As every complex measure μ can be written as $\mu = \mathrm{Re}(\mu) + i \cdot \mathrm{Img}(\mu)$, we can do a Jordan Decomposition of the real and imaginair part of μ. This lead to the following definition.

Theorem 20.543. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: X \to \mathbb{C}$ a complex measure then*

$$\mu_r^+ : \mathcal{A} \to \overline{\mathbb{R}} \text{ defined by } \mu_r^+(A) = \sup\left(\{\mathrm{Re}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\}\right) \text{ is a finite measure on } \mathcal{A}$$

$$\mu_r^- : \mathcal{A} \to \overline{\mathbb{R}} \text{ defined by } \mu_r^-(A) = \sup\left(\{-\mathrm{Re}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\}\right) \text{ is a finite measure on } \mathcal{A}$$

$$\mu_c^+ : \mathcal{A} \to \overline{\mathbb{R}} \text{ defined by } \mu_c^+(A) = \sup\left(\{\mathrm{Img}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\}\right) \text{ is a finite measure on } \mathcal{A}$$

$$\mu_c^- : \mathcal{A} \to \overline{\mathbb{R}} \text{ defined by } \mu_c^-(A) = \sup\left(\{-\mathrm{Img}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\}\right) \text{ is a finite measure on } \mathcal{A}$$

and

$$\mu = \mu_r^+ - \mu_r^- + i \cdot (\mu_c^+ - \mu_c^-)$$

The quadruple is called the Jordan Decomposition of μ

Proof. Using [theorem: 20.538] it follows that $\mathrm{Re}(\mu)$ and $\mathrm{Img}(\mu)$ are finite signed measures such that

$$\mu = \mathrm{Re}(\mu) + \mathrm{Img}(\mu)$$

Using [theorem: 20.535] we have that

$$(\mathrm{Re}(\mu))^+ : \mathcal{A} \to \overline{\mathbb{R}} \text{ by } (\mathrm{Re}(\mu))^+(A) = \sup(\{\mathrm{Re}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\}) \text{ is a measure on } \mathcal{A}$$

$$(\mathrm{Re}(\mu))^- : \mathcal{A} \to \overline{\mathbb{R}} \text{ by } (\mathrm{Re}(\mu))^-(A) = \sup(\{-\mathrm{Re}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\}) \text{ is a measure on } \mathcal{A}$$

$$(\mathrm{Img}(\mu))^+ : \mathcal{A} \to \overline{\mathbb{R}} \text{ by } (\mathrm{Img}(\mu))^+(A) = \sup(\{\mathrm{Img}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\}) \text{ is a measure on } \mathcal{A}$$

$$(\mathrm{Img}(\mu))^- : \mathcal{A} \to \overline{\mathbb{R}} \text{ by } (\mathrm{Img}(\mu))^-(A) = \sup(\{-\mathrm{Img}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\}) \text{ is a measure on } \mathcal{A}$$

and

$$\mathrm{Re}(\mu) = (\mathrm{Re}(\mu))^+ - (\mathrm{Re}(\mu))^- \text{ and } \mathrm{Img}(\mu) = (\mathrm{Img}(\mu))^+ - (\mathrm{Img}(\mu))^+$$

As $\mathrm{Re}(\mu), \mathrm{Img}(\mu)$ are finite we have $\forall A \in \mathcal{A}$ that

$$(\mathrm{Re}(\mu))^+(A), (\mathrm{Re}(\mu))^-(A), (\mathrm{Img}(\mu))^+(A), (\mathrm{Img}(\mu))^-(A) \in \mathbb{R}$$

so that

$$(\mathrm{Re}(\mu))^+, (\mathrm{Re}(\mu))^-, (\mathrm{Img}(\mu))^+, (\mathrm{Img}(\mu))^- \text{ are finite measures}$$

Further

$$\mu = (\mathrm{Re}(\mu))^+ + (\mathrm{Re}(\mu))^- + i \cdot ((\mathrm{Img}(\mu))^+ - (\mathrm{Img}(\mu))^-)$$

The theorem is then proved by taking $\mu_r^+ = (\mathrm{Re}(\mu))^+$, $\mu_r^- = (\mathrm{Re}(\mu))^-$, $\mu_c^+ = (\mathrm{Img}(\mu))^+$ and $\mu_c^- = (\mathrm{Img}(\mu))^-$. □

Definition 20.544. (Variation of a Complex Measure) *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $\mu : \mathcal{A} \to \mathbb{C}$ a complex measure then the **variation** of μ noted by $|\mu|$ is defined by*

$$|\mu| : \mathcal{A} \to [0, \infty] \text{ where } |\mu|(A) = \sup\left(\left\{\sum_{i=1}^{n} |\mu(A_i)| | n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i \in \{1, \ldots, n\}} A_i\right\}\right)$$

*In the above definition we use $A = \bigsqcup_{i \in \{1, \ldots, n\}} A_i$ to indicate that $\{A_i\}_{i \in \{1, \ldots, n\}}$ is pairwise disjoint and $A = \bigcup_{i \in \{1, \ldots, n\}} A_i$. The **total variation** of μ noted by $\|\mu\|$ is defined by*

$$\|\mu\| = |\mu|(X)$$

Theorem 20.545. *Let $\langle X, \mathcal{A} \rangle$ and $\mu : \mathcal{A} \to \mathbb{C}$ a complex measure the variation*

$$|\mu| : \mathcal{A} \to [0, \infty]$$

is a finite measure. Further we have that

$$\forall A \in \mathcal{A} \text{ we have that } |\mu(A)| \leqslant |\mu|(A)$$

Proof. First we prove that $|\mu|$ is finite. Use [theorem: 20.543] to get a Jordon decomposition of **finite measures** $(\mu_r^+, \mu_r^-, \mu_c^+, \mu_c^-)$ of μ. Let $A \in \mathcal{A}$ and take $\{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A}$ pairwise disjoint with $A = \bigsqcup_{i=1}^{n} A_i$ then we have

$$\begin{aligned}
\sum_{i=1}^{n} |\mu(A_i)| &= \\
\sum_{i=1}^{n} |\mu_r^+(A_i) + \mu_r^-(A_i) + i \cdot (\mu_c^+(A_i) - \mu_c^-(A_i))| &\leqslant \\
\sum_{i=1}^{n} (|\mu_r^+(A_i)| + |\mu_r^+(A_i)| + |\mu_c^+(A_i)| + |\mu_c^-(A_i)|) &= \\
\sum_{i=1}^{n} |\mu_r^+(A_i)| + \sum_{i=1}^{n} |\mu_r^+(A_i)| + \sum_{i=1}^{n} |\mu_c^+(A_i)| + \sum_{i=1}^{n} |\mu_c^-(A_i)| &\underset{\text{measures are nonnegative}}{=} \\
\sum_{i=1}^{n} \mu_r^+(A_i) + \sum_{i=1}^{n} \mu_r^+(A_i) + \sum_{i=1}^{n} \mu_c^+(A_i) + \sum_{i=1}^{n} \mu_c^-(A_i) &= \\
\mu_r^+\left(\bigsqcup_{i=1}^{n} A_i\right) + \mu_r^-\left(\bigsqcup_{i=1}^{n} A_i\right) + \mu_c^+\left(\bigsqcup_{i=1}^{n} A_i\right) + \mu_c^-\left(\bigsqcup_{i=1}^{n} A_i\right) &= \\
\mu_r^+(A) + \mu_r^-(A) + \mu_c^+(A) + \mu_c^-(A) &
\end{aligned}$$

which proves that $\mu_r^+(A)+\mu_r^-(A)+\mu_c^+(A)+\mu_c^-(A)$ is a real upper bound of

$$\left\{\sum_{i=1}^{n}|\mu(A_i)||n\in\mathbb{N}\wedge\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}\wedge A=\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right\}$$

So that by [theorems: 10.18, 20.13] we have that $\forall A\in\mathrm{A}$

$$\begin{aligned}|\mu|(A) &= \sup\left(\left\{\sum_{i=1}^{n}|\mu(A_i)||n\in\mathbb{N}\wedge\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}\wedge A=\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right\}\right)\\ &\leqslant \mu_r^+(A)+\mu_r^-(A)+\mu_c^+(A)+\mu_c^-(A)\in\mathbb{R}\end{aligned}$$

which proves that

$$\forall A\in\mathcal{A}\text{ we have }|\mu|(A)\in\mathbb{R}\text{ and }|\mu|(A)\leqslant\mu_r^+(A)+\mu_r^-(A)+\mu_c^+(A)+\mu_c^-(A)\tag{20.806}$$

Next we use [theorem: 20.207] to prove that $|\mu|$ is a measure. Let $\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}$ be a pairwise disjoint sequence of measurable sets such that $\varnothing=\bigsqcup_{i\in\mathbb{N}}A_i$ then we have $\forall i\in\mathbb{N}$ that $A_i=\varnothing\Rightarrow|\mu(A_i)|=|\varnothing|=0$. Hence $\sum_{i=1}^{n}|\mu(A_i)|=0$ so that

$$|\mu|(\varnothing)=\sup\left(\left\{\sum_{i=1}^{n}|\mu(A_i)||n\in\mathbb{N}\wedge\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}\wedge\varnothing=\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right\}\right)=\sup(\{0\})=0$$

proving that

$$|\mu|(\varnothing)=0\tag{20.807}$$

Let $A,B\in\mathcal{A}$ with $A\bigcap B=\varnothing$. Let $\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}$ be pairwise disjoint such that $A\bigcup B=\bigsqcup_{i\in\{1,\ldots,n\}}A_i$, Then given $i\in\{1,\ldots,n\}$ we have $A_i=A_i\bigcap(A\bigsqcup B)=(A_i\bigcap A)\bigsqcup(A_i\bigcap B)$ so that $|\mu(A_i)|\underset{\text{[theorem: 20.540]}}{=}|\mu(A_i\bigcap A)+\mu(A_i\bigcap B)|\leqslant|\mu(A_i\bigcap A)|+|\mu(A_i\bigcap B)|$. Hence we have that

$$\begin{aligned}\sum_{i=1}^{n}|\mu(A_i)| &\leqslant \sum_{i=1}^{n}\left(\left|\mu\left(A_i\bigcap A\right)\right|+\left|\mu\left(A_i\bigcap B\right)\right|\right)\\ &= \sum_{i=1}^{n}\left|\mu\left(A_i\bigcap A\right)\right|+\sum_{i=1}^{n}\left|\mu\left(A_i\bigcap B\right)\right|\end{aligned}\tag{20.808}$$

Further

$$A=A\bigcap\left(A\bigsqcup B\right)=A\bigcap\left(\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)=\bigsqcup_{i\in\{1,\ldots,n\}}\left(A_i\bigcap A\right)$$

and

$$B=B\bigcap\left(A\bigsqcup B\right)=B\bigcap\left(\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)=\bigsqcup_{i\in\{1,\ldots,n\}}\left(A_i\bigcap B\right)$$

Hence

$$\begin{aligned}\sum_{i=1}^{n}\left|\mu\left(A_i\bigcap A\right)\right| &\leqslant \sup\left(\left\{\sum_{i=1}^{n}|\mu(B_i)||n\in\mathbb{N}_0\wedge\{B_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}\wedge A=\bigsqcup_{i=1}^{n}B_i\right\}\right)\\ &= |\mu|(A)\\ \sum_{i=1}^{n}\left|\mu\left(A_i\bigcap A\right)\right| &\leqslant \sup\left(\left\{\sum_{i=1}^{n}|\mu(B_i)||n\in\mathbb{N}_0\wedge\{B_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}\wedge B=\bigsqcup_{i=1}^{n}B_i\right\}\right)\\ &= |\mu|(B)\end{aligned}$$

which combined by [eq: 20.808] proves that

$$\sum_{i=1}^{n}|\mu(A_i)|\leqslant|\mu|(A)+|\mu|(B)$$

Hence $|\mu|(A)+|\mu|(B)$ is a upper bound for

$$\left\{\sum_{i=1}^{n}|\mu(B_i)|\,|\,n\in\mathbb{N}_0\wedge\{B_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}\wedge A\bigsqcup B=\bigsqcup_{i=1}^{n}B_i\right\}$$

so that

$$\begin{aligned}|\mu|\big(A\bigsqcup B\big) &= \sup\left(\left\{\sum_{i=1}^{n}|\mu(B_i)|\,|\,n\in\mathbb{N}_0\wedge\{B_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}\wedge A\bigsqcup B=\bigsqcup_{i=1}^{n}B_i\right\}\right)\\ &\leqslant |\mu|(A)+|\mu|(B)\end{aligned}$$

which proves that

$$|\mu|\big(A\bigsqcup B\big)\leqslant|\mu|(A)+|\mu|(B) \tag{20.809}$$

For the opposite inequality. Let $\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}$, $\{B_i\}_{i\in\{1,\ldots,m\}}\subseteq\mathcal{A}$ be pairwise disjoint such that $A=\bigsqcup_{i=1}^{n}A_i$, $B=\bigsqcup_{i=1}^{m}B_i$. Define

$$\{C_i\}_{i\in\{1,\ldots,n+m\}}\text{ by }\begin{cases}C_i=A_i\text{ if }i\in\{1,\ldots,n\}\\ C_i=B_{i-n}\text{ if }i\in\{n+1,\ldots,n+m\}\end{cases}$$

then

$$\begin{aligned}x\in A\bigcup B &\Leftrightarrow x\in A\vee x\in B\\ &\Leftrightarrow(\exists i\in\{1,\ldots,n\}\,x\in A_i)\vee(\exists j\in\{1,\ldots,m\}\,x\in B_j)\\ &\Leftrightarrow(\exists i\in\{1,\ldots,n\}\,x\in C_i)\vee(\exists j\in\{1,\ldots,m\}\,x\in C_{j+n})\\ &\Leftrightarrow(\exists i\in\{1,\ldots,n\}\,x\in C_i)\vee(\exists j\in\{n+1,\ldots,n+m\}\,x\in C_j)\\ &\Leftrightarrow\exists i\in\{1,\ldots,n+m\}\,x\in C_i\\ &\Leftrightarrow\bigcup_{i\in\{1,\ldots,n+m\}}C_i\end{aligned}$$

proving that

$$A\bigcup B=\bigcup_{i=1}^{n+m}C_i \tag{20.810}$$

Further If $i,j\in\{1,\ldots,n+m\}$ with $i\neq j$ then we have either

$\boldsymbol{i\in\{1,\ldots,n\}\wedge j\in\{1,\ldots,n\}}$. then $C_i\bigcap C_j=A_i\bigcap A_j=\emptyset$

$\boldsymbol{i,j\in\{1,\ldots,n\}\wedge j\in\{n+1,\ldots,n+m\}}$. then $C_i\bigcap C_j=A_i\bigcap B_{j-n}\subseteq A\bigcap B=\emptyset$

$\boldsymbol{i\in\{n+1,\ldots n+m\}\wedge j\in\{1,\ldots,n\}}$. then $C_i\bigcap C_j=B_{i-n}\bigcap A_j=\subseteq B\bigcap A=\emptyset$

$\boldsymbol{i\in\{n+1,\ldots,n+m\}\wedge j\in\{n+1,\ldots,n+m\}}$. then $C_i\bigcap C_j=B_{i-n}\bigcap B_{j-n}=\emptyset$

combining this with [eq: 20.809] gives

$$\{C_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}\text{ is pairwise disjoint} \tag{20.811}$$

So

$$\begin{aligned}\sum_{i=1}^{n}|\mu(A_i)|+\sum_{i=1}^{m}|\mu(B_i)| &= \sum_{i=1}^{n}|\mu(C_i)|+\sum_{i=1}^{m}|\mu(C_{i+n})|\\ &= \sum_{i=1}^{n}|\mu(C_i)|+\sum_{i=n+1}^{n+m}|\mu(C_i)|\\ &= \sum_{i=1}^{n+m}|\mu(C_i)|\\ &\leqslant \sup\left(\left\{\sum_{i=1}^{n}|\mu(C_i)|\,|\,n\in\mathbb{N}_0\wedge\{C_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}\wedge\bigsqcup_{i=1}^{n}C_i=A\bigcup B\right\}\right)\\ &= |\mu|\big(A\bigsqcup B\big)\end{aligned} \tag{20.812}$$

Then as $\sum_{i=1}^{m} |\mu(B_i)| \in \mathbb{R}$ we have that $\sum_{i=1}^{n} |\mu(A_i)| \leqslant |\mu|(A \bigsqcup B) - \sum_{i=1}^{m} |\mu(B_i)|$ so that $|\mu|(A \bigsqcup B) - \sum_{i=1}^{m} |\mu(B_i)|$ is a upper bound for

$$\left\{ \sum_{i=1}^{n} |\mu(B_i)| | n \in \mathbb{N}_0 \wedge \{B_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i=1}^{n} B_i \right\}$$

so that

$$|\mu|(A) = \sup\left(\left\{ \sum_{i=1}^{n} |\mu(B_i)| | n \in \mathbb{N}_0 \wedge \{B_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i=1}^{n} B_i \right\} \right) \leqslant |\mu|\left(A \bigsqcup B\right) - \sum_{i=1}^{m} |\mu(B_i)|$$

As by [eq: 20.806] $|\mu|(A) \in \mathbb{R}, |\mu|(A \bigsqcup B), \in \mathbb{R}, \sum_{i=1}^{m} |\mu(B_i)| \in \mathbb{R}$ we have that

$$\sum_{i=1}^{m} |\mu(B_i)| \leqslant |\mu|\left(A \bigsqcup B\right) - |\mu|(A)$$

Hence $|\mu|(A \bigsqcup B) - |\mu|$ is a upper bound for

$$\left\{ \sum_{i=1}^{n} |\mu(B_i)| | n \in \mathbb{N}_0 \wedge \{B_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A} \wedge B = \bigsqcup_{i=1}^{n} B_i \right\}$$

so that

$$|\mu|(B) = \sup\left(\left\{ \sum_{i=1}^{n} |\mu(B_i)| | n \in \mathbb{N}_0 \wedge \{B_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A} \wedge B = \bigsqcup_{i=1}^{n} B_i \right\} \right) \leqslant |\mu|\left(A \bigsqcup B\right) - |\mu|(A)$$

which proves that $|\mu|(A) + |\mu|(B) \leqslant |\mu|(A \bigsqcup B)$. Combining this with [eq: 20.809] proves that $|\mu|(A \bigsqcup B) = |\mu|(A) + |\mu|(B)$. Using then [theorem: 20.116] we have that

$$\forall \{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A} \text{ pairwise disjoint we have } |\mu|\left(\bigsqcup_{i \in \{1,\ldots,n\}} A_i \right) = \sum_{i=1}^{n} |\mu|(A_i) \tag{20.813}$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N}\ A_{i+1} \subseteq A_i$ such that $\bigcap_{i \in \mathbb{N}} A_i = \varnothing$. Then as $\mu_r^+, \mu_r^-, \mu_c^+, \mu_c^-$ are finite measures we have by [theorem: 20.206]

$$\lim_{i \to \infty} \mu_r^+(A_i) = \mu_r^+\left(\bigcap_{i \in \mathbb{N}} A_i \right) = \mu_r^+(\varnothing) = 0$$

$$\lim_{i \to \infty} \mu_r^-(A_i) = \mu_r^-\left(\bigcap_{i \in \mathbb{N}} A_i \right) = \mu_r^-(\varnothing) = 0$$

$$\lim_{i \to \infty} \mu_c^+(A_i) = \mu_c^+\left(\bigcap_{i \in \mathbb{N}} A_i \right) = \mu_c^+(\varnothing) = 0$$

$$\lim_{i \to \infty} \mu_c^-(A_i) = \mu_c^-\left(\bigcap_{i \in \mathbb{N}} A_i \right) = \mu_c^-(\varnothing) = 0$$

Let $\varepsilon \in \mathbb{R}^+$ then there exists $N_r^+ \in \mathbb{N}, N_r^- \in \mathbb{N}, N_c^+ \in \mathbb{N}, N_c^- \in \mathbb{N}$ such that

$$\forall n \in \{N_r^+, \ldots, \infty\}\ \mu_r^+(A_i) = |\mu_r^+(A_i) - 0| < \frac{\varepsilon}{4}$$

$$\forall n \in \{N_r^-, \ldots, \infty\}\ \mu_r^-(A_i) = |\mu_r^-(A_i) - 0| < \frac{\varepsilon}{4}$$

$$\forall n \in \{N_c^+, \ldots, \infty\}\ \mu_c^+(A_i) = |\mu_c^+(A_i) - 0| < \frac{\varepsilon}{4}$$

$$\forall n \in \{N_c^-, \ldots, \infty\}\ \mu_c^-(A_i) = |\mu_c^-(A_i) - 0| < \frac{\varepsilon}{4}$$

Take $N = \max(N_r^+, N_r^-, N_c^+, N_c^-)$ then we have $\forall i \in \{N, \ldots, \infty\}$ we have

$$||\mu|(A_i) - 0| = |\mu|(A_i) \underset{\text{[eq: 20.806]}}{\leqslant} \mu_r^+(A_i) + \mu_r^-(A_i) + \mu_c^+(A_i) + \mu_c^-(A_i) < \varepsilon$$

which proves that $\lim_{i\to\infty} |\mu|(A_i) = 0$. Hence we have proved that

$$\forall \{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ with } \forall i \in \mathbb{N}\ A_{i+1} \subseteq A_i \text{ and } \bigcap_{i\in\mathbb{N}} A_i = \varnothing \text{ we have } \lim_{i\to\infty} \mu(A_i) = 0 \tag{20.814}$$

So the conditions for [theorem: 20.207] are satisfied by [eqs: 20.804, 20.813 and 20.814] proves that $|\mu|$ is a measure on $\mathcal{A}$. This together with [eq: 20.806] proves that

$$|\mu|: \mathcal{A} \to [0, \infty] \text{ is a finite measure on } \mathcal{A}$$

Finally let $A \in \mathcal{A}$. Take

$$\{A_i\}_{i\in\{1\}} \subseteq \mathcal{A} \text{ by } A_1 = A$$

then we have that $\{A_i\}_{i\in\{1\}} \subseteq \mathcal{A}$ is pairwise disjoint and $A = \bigcup_{i\in\{1\}} A_i$ so that

$$|\mu(A)| = |\mu(A_1)| = \sum_{i=1}^{1} |\mu(A_i)| \in \left\{ \sum_{i=1}^{n} |\mu(A_i)| | n \in \mathbb{N}_0 \in \wedge \{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i\in\{1,\ldots,n\}} A_i \right\}$$

so that $|\mu(A)| \leqslant \sup\left(\left\{\sum_{i=1}^{n} |\mu(A_i)| | n \in \mathbb{N}_0 \in \wedge \{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i\in\{1,\ldots,n\}} A_i\right\}\right) = |\mu|(A)$. Hence we have

$$\forall A \in \mathcal{A} \text{ we have } |\mu(A)| \leqslant |\mu|(A)$$

□

20.7.3 Banach space of signed (complex) measures

We show now that the collection of finite signed measures [or complex measures] is a Banach space.

Definition 20.546. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space then we define $M(X, \mathcal{A}, \mathbb{K})$ where $\mathbb{K} = \mathbb{R}$ or $\mathbb{K} = \mathbb{C}$ by*

$$M(X, \mathcal{A}, \mathbb{R}) = \{\mu \in \mathbb{R}^{\mathcal{A}} | \mu: \mathcal{A} \to \overline{\mathbb{R}} \text{ is a } \textbf{finite} \text{ signed measure on } \mathcal{A}\}$$

$$M(X, \mathcal{A}, \mathbb{C}) = \{\mu \in \mathbb{C}^{\mathcal{A}} | \mu: \mathcal{A} \to \mathbb{C} \text{ is a complex measure on } \mathcal{A}\}$$

Theorem 20.547. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space then*

$$\forall \mu \in M(X, \mathcal{A}, \mathbb{K}) \text{ we have } \forall A \in \mathcal{A} \text{ that } |\mu|(A) \in [0, \infty[$$

More specific we have for the total variation $\|\|$ that

$$\|\mu\| \underset{\text{[definitions: 20.535, 20.544]}}{=} |\mu|(X) \in [0, \infty[$$

Proof. We must consider the following cases for $M(X, \mathcal{A}, \mathbb{K})$:

$\mathbb{K} = \mathbb{R}$. If $\mu \in M[X, \mathcal{A}, \mathbb{K}] = M[X, \mathcal{A}, \mathbb{R}]$ then μ is a finite signed measure. Using [theorem: 20.535] we have that $\mu = \mu^+ - \mu^-$ where μ^+, μ^- are finite measures on $\mathcal{A}$ and $|\mu| = \mu^+ + \mu^-$. Hence we have

$$\forall A \in \mathcal{A} \text{ we have } |\mu|(A) = \mu^+(A) + \mu^-(A) \in [0, \infty[.$$

$\mathbb{K} = \mathbb{C}$. If $\mu \in M[X, \mathcal{A}, \mathbb{K}] = M[X, \mathcal{A}, \mathbb{C}]$ then μ is a complex measure. Hence using [theorem: 20.545] $|\mu|$ is a finite measure so that

$$\forall A \in \mathcal{A} \text{ we have } |\mu|(A) \in \mathbb{R}$$

□

We construct now on $M[X, \mathcal{A}, \mathbb{K}]$ a addition $+$ and scalar product $\cdot$ operation making $\langle M[X, \mathcal{A}, \mathbb{K}]\rangle$ a vector space.

Theorem 20.548. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space then $\langle M[X,\mathcal{A},\mathbb{K}],+,\cdot\rangle$ is a vector space over $\mathbb{K}$ where*

$$+: M[X,\mathcal{A},\mathbb{K}]\times M[X,\mathcal{A},\mathbb{K}]\to M[X,\mathcal{A},\mathbb{K}] \text{ is defined by } (\mu+\nu)(A)=\mu(A)+\nu(A)$$

$$\cdot: \mathbb{K}\times M[X,\mathcal{A},\mathbb{K}]\to M[X,\mathcal{A},\mathbb{K}] \text{ is defined by } (\alpha\cdot\mu)(A)=\alpha\cdot\mu(A)$$

$$C_0\in M[X,\mathcal{A},\mathbb{K}] \text{ defined by } C_0(A)=0 \text{ is the neutral element}$$

Proof. We have for $\mathbb{K}$ either:

$\mathbb{K}=\mathbb{R}$. Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ be pairwise disjoint then

$$C_0\left(\bigsqcup_{i\in\mathbb{N}} A_i\right)=0=\sum_{i=1}^{\infty}0=\sum_{i=1}^{\infty}\mu(A_i),$$

$$\{C_0(A)|A\in\mathcal{A}\}=\{0\}\subseteq\mathbb{R}\subseteq\mathbb{R}_\infty$$

$$C_0(\varnothing)=0$$

so that $C_o:\mathcal{A}\to\overline{\mathbb{R}}$ is a finite signed measure. Hence

$$C_0\in M(X,\mathcal{A},\mathbb{R})\Rightarrow M(X,\mathcal{A},\mathbb{R})\neq\varnothing \tag{20.815}$$

Let $\mu,\nu\in M[X,\mathcal{A},\mathbb{R}]$. Then

$$(\mu+\nu)(\varnothing)=\mu(\varnothing)+\nu(\varnothing)=0+0=0$$

$$\{(\mu+\nu)(A)|A\in\mathcal{A}\}=\{\mu(A)+\nu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}\subseteq\mathbb{R}_\infty$$

Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ pairwise disjoint then $\sum_{i=1}^{\infty}\mu(A_i)$,$\sum_{i=1}^{\infty}\nu(A_i)$ exists and $\sum_{i=1}^{\infty}\mu(A_i)=\mu(\bigcup_{i\in\mathbb{N}}A_i)$, $\sum_{i=1}^{\infty}\nu(A_i)=\nu(\bigcup_{i\in\mathbb{N}}A_i)$. By [theorem: 20.96] we have that $\sum_{i=1}^{\infty}(\mu(A_i)+\nu(A_i))$ exist and

$$\sum_{i=1}^{\infty}(\mu+\nu)(A_i)=\sum_{i=1}^{\infty}(\mu(A_i)+\nu(A_i))=\sum_{i=1}^{\infty}\mu(A_i)+\sum_{i=1}^{\infty}\nu(A_i)=\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)+\nu\left(\bigcup_{i\in\mathbb{N}}A_i\right)=(\mu+\nu)\left(\bigcup_{i\in\mathbb{N}}A_i\right)$$

which proves that $\mu+\nu$ is a finite signed measure. Hence

$$\forall\mu,\nu\in M[X,\mathcal{A},\mathbb{R}] \text{ we have that } \mu+\nu\in M[X,\mathcal{A},\mu] \tag{20.816}$$

Let $\alpha\in\mathbb{R}$, $\mu\in M[X,\mathcal{A},\mathbb{R}]$ then by [theorem: 20.520] $\alpha\cdot\mu$ is a signed measure, as also $\{(\alpha\cdot\mu)(A)|A\in\mathcal{A}\}=\{\alpha\cdot\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}$ it follows that

$$\forall\mu\in M(X,\mathcal{A},\mathbb{R}) \text{ we have } \forall\alpha\in\mathbb{R} \text{ that } \alpha\cdot\mu\in M(X,\mathcal{A},\mathbb{R}) \tag{20.817}$$

Using [eqs: 20.815, 20.816 and 20.817] together with [theorems: 11.67, 11.60] it follows that

$$\langle M(X,\mathcal{A},\mathbb{R}),+,\cdot\rangle \text{ is a vector space over } \mathbb{R}$$

$\mathbb{K}=\mathbb{C}$. Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ be pairwise disjoint then

$$C_0\left(\bigsqcup_{i\in\mathbb{N}} A_i\right)=0=\sum_{i=1}^{\infty}0=\sum_{i=1}^{\infty}\mu(A_i),$$

$$C_0(\varnothing)=0$$

so that $C_0:\mathcal{A}\to\overline{\mathbb{R}}$ is a finite signed measure. Hence

$$C_0\in M(X,\mathcal{A},\mathbb{C})\Rightarrow M(X,\mathcal{A},\mathbb{C})\neq\varnothing \tag{20.818}$$

Let $\mu,\nu\in M(X,\mathcal{A},\mathbb{C})$ then we have

$$(\mu+\nu)(\varnothing)=\mu(\varnothing)+\nu(\varnothing)=0+0=0 \tag{20.819}$$

Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ be pairwise disjoint then $\sum_{i=1}^{\infty}\mu(A_i)$, $\sum_{i=1}^{\infty}\nu(A_i)$ exists and $\sum_{i=1}^{\infty}\mu(A_i)=\mu(\bigcup_{i\in\mathbb{N}}A_i)$, $\sum_{i=1}^{\infty}\nu(A_I)=\nu(\bigcup_{i\in\mathbb{N}}A_i)$. By [theorem: 20.96] we have that $\sum_{i=1}^{\infty}(\mu(A_i)+\nu(A_i))$ exist and

$$\sum_{i=1}^{\infty}(\mu+\nu)(A_i)=\sum_{i=1}^{\infty}(\mu(A_i)+\nu(A_i))=\sum_{i=1}^{\infty}\mu(A_i)+\sum_{i=1}^{\infty}\nu(A_i)=\mu\left(\bigsqcup_{i\in\mathbb{N}}A_i\right)+\nu\left(\bigsqcup_{i\in\mathbb{N}}A_i\right)=(\mu+\nu)\left(\bigsqcup_{i\in\mathbb{N}}A_i\right)$$

which proves that $\mu+\nu$ is a complex measure. Hence

$$\forall\mu,\nu\in M[X,\mathcal{A},\mathbb{R}]\text{ we have that }\mu+\nu\in M[X,\mathcal{A},\mu] \tag{20.820}$$

Let $\mu\in M(X,\mathcal{A},\mathbb{C})$ and $\alpha\in\mathbb{C}$ then we have

$$(\alpha\cdot\nu)(\varnothing)=\alpha\cdot\nu(\varnothing)=\alpha\cdot 0=0$$

Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ be pairwise disjoint then $\sum_{i=1}^{\infty}\mu(A_i)$ exist and $\sum_{i=1}^{\infty}\mu(A_i)=\mu(\bigcup_{i\in\mathbb{N}}A_i)$ so that by [theorem: 20.96] $\sum_{i=1}^{\infty}\alpha\cdot\mu(A_i)$ exist and

$$\sum_{i=1}^{\infty}(\alpha\cdot\mu)(A_i)=\sum_{i=1}^{\infty}\alpha\cdot\mu(A_i)=\alpha\cdot\sum_{i=1}^{\infty}\mu(A_i)=\alpha\cdot\mu\left(\bigsqcup_{i\in\mathbb{N}}A_i\right)=(\alpha\cdot\mu)\left(\bigsqcup_{i\in\mathbb{N}}A_i\right)$$

which proves that $\alpha\cdot\mu\in M[X,\mathcal{A},\mathbb{C}]$. Hence

$$\forall u\in M(X,\mathcal{A},\mathbb{C})\text{ we have }\forall\alpha\in\mathbb{C}\text{ we have }\alpha\cdot\mu\in M[X,\mathcal{A},\mathbb{C}] \tag{20.821}$$

Using [eqs: 20.819, 20.820 and 20.821] together with [theorems: 11.67, 11.60] it follows that

$$\langle M[X,\mathcal{A},\mathbb{C}],+,\cdot\rangle\text{ is a vector space over }\mathbb{C}$$ □

Next we prove that $\langle M[X,\mathcal{A},\mathbb{K}],\|\|\rangle$ is a normed space.

Theorem 20.549. *Let* $\langle X,\mathcal{A}\rangle$ be *a* measurable space then $\langle M[X,\mathcal{A},\mathbb{R}],\|\|\rangle$ *is a normed space*

Proof. Let $\mu\in M[X,\mathcal{A},\mathbb{R}]$ and let (μ^+,μ^-) be the Jordon Decompsition of μ and $((\alpha\cdot\mu)^+,(\alpha\cdot\mu)^-)$ be the Jordon Decomposition of $\alpha\cdot\mu$ [see theorem: 20.535 for the existence]. Let further (P,N) be a Hahn Decomposition of μ [see theorem: 20.533]. First we consider the cases where $\alpha\in[0,\infty]$.

$0\leqslant\alpha$. Let $A\in\mathcal{A}$ with $A\subseteq P$ a positive set then we have $0\leqslant\mu(A)$ so that $0\underset{0\leqslant\alpha}{\leqslant}\alpha\cdot\mu(A)=(\alpha\cdot\mu)(A)$ which proves by [definition: 20.525] that P is a positive set for $\alpha\cdot\mu$. Let $A\in\mathcal{A}$ with $A\subseteq N$ a negative set then we have $\mu(A)\leqslant 0$ so that $(\alpha\cdot\mu)(A)=\alpha\cdot\mu(A)\underset{0\leqslant\alpha}{\leqslant}0$ which proves that N is a negative set for $\alpha\cdot\mu$. Hence we have that

$$(P,N)\text{ is a Hahn Decomposition of }\alpha\cdot\mu$$

Then we have

$$\begin{aligned}
\|\alpha\cdot\mu\| &= |\alpha\cdot\mu|(X)\\
&= (\alpha\cdot\mu)^+(X)+(\alpha\cdot\mu)^-(X)\\
&\underset{\text{[theorem: 20.535]}}{=} (\alpha\cdot\mu)\big(X\bigcap P\big)-(\alpha\cdot\mu)\big(X\bigcap N\big)\\
&= \alpha\cdot\mu\big(X\bigcap P\big)-\alpha\cdot\mu\big(X\bigcap N\big)\\
&= \alpha\cdot\big(\mu\big(X\bigcap P\big)-\mu\big(X\bigcap N\big)\big)\\
&= \alpha\cdot(\mu^+(X)+\mu^-(X))\\
&= \alpha\cdot|\mu|(X)\\
&= \alpha\cdot\|\mu\|\\
&\underset{0\leqslant\alpha}{=} |\alpha|\cdot\|\mu\|
\end{aligned}$$

$\alpha < 0$. Then if $A \in \mathcal{A}$ with $A \subseteq P$ a positive set for μ then $0 \leqslant \mu(A)$ so that $(\alpha \cdot \mu)(A) = \alpha \cdot \mu(A) \underset{\alpha<0}{\leqslant} 0$ which proves that P is a negative set for $\alpha \cdot \mu$. Likewise if $A \in \mathcal{A}$ with $A \subseteq N$ a negative set for μ then $\mu(A) \leqslant 0$ so that $0 \underset{\alpha<0}{\leqslant} \alpha \cdot \mu(A) = (\alpha \cdot \mu)(A)$ which proves that N is a positive set for $\alpha \cdot \mu$. Hence

$$(N, P) \text{ is a Hahn Decomposition of } \alpha \cdot \mu$$

Then we have

$$\begin{aligned}
\|\alpha \cdot \mu\| &= |\alpha \cdot \mu|(X) \\
&= (\alpha \cdot \mu)^+(X) + (\alpha \cdot \mu)^-(X) \\
&= (\alpha \cdot \mu)\big(X \bigcap N\big) - (\alpha \cdot \mu)\big(X \bigcap P\big) \\
&= \alpha \cdot \mu\big(X \bigcap N\big) - \alpha \cdot \mu\big(X \bigcap P\big) \\
&= -\alpha \cdot \big(\mu\big(X \bigcap P\big) - \mu\big(X \bigcap N\big)\big) \\
&\underset{\alpha \leqslant 0}{=} |\alpha| \cdot \big(\mu\big(X \bigcap P\big) - \mu\big(X \bigcap N\big)\big) \\
&= |\alpha| \cdot (\mu^+(X) + \mu^-(X)) \\
&= |\alpha| \cdot \|\mu\|
\end{aligned}$$

So we have proved that

$$\forall \mu \in M[X, \mathcal{A}, \mathbb{R}] \text{ we have } \forall \alpha \in \mathbb{R} \text{ that } \|\alpha \cdot \mu\| = |\alpha| \cdot \|\mu\| \tag{20.822}$$

Let $\mu_1, \mu_2 \in M[X, \mathcal{A}, \mathbb{R}]$ then μ_1, μ_2 are finite and $\mu_1 + \mu_2 \in M[X, \mathcal{A}, \mathbb{R}]$. By the Hahn Decomposition Theorem [see theorem: 20.533] there exists Hahn docompositions (P_1, N_1), (P_2, N_2), (P_{12}, N_{12}) of μ_1, μ_2, $\mu_1 + \mu_2$ respectively. Then we have

$$\begin{aligned}
\mu_1(P_{12}) &\underset{\text{[theorem: 20.535]}}{=} (\mu_1)^+(P_{12}) - (\mu_1)^-(P_{12}) \\
&= \mu_1\big(P_{12} \bigcap P_1\big) + \mu_1\big(P_{12} \bigcap N_1\big) \\
&\underset{P_{12} \bigcap N_1 \subseteq N_1 \Rightarrow \mu_1(P_{12} \bigcap N_1) \leqslant 0 \wedge \mu_1 \text{ is finite}}{\leqslant} \mu_1\big(P_{12} \bigcap P_1\big) \\
&\underset{\text{[lemma: 20.528]}}{\leqslant} \mu_1(P_1)
\end{aligned} \tag{20.823}$$

$$\begin{aligned}
\mu_1(N_{12}) &\underset{\text{[theorem: 20.535]}}{=} (\mu_1)^+(N_{12}) - (\mu_1)^-(N_{12}) \\
&= \mu_1\big(N_{12} \bigcap P_1\big) + \mu_1\big(N_{12} \bigcap N_1\big) \\
&\underset{P_{12} \bigcap P_1 \subseteq N_1 \Rightarrow \mu_1(P_{12} \bigcap P_1) \geqslant 0 \wedge \mu_1 \text{ is finite}}{\geqslant} \mu_1\big(N_{12} \bigcap N_1\big) \\
&\underset{\text{[lemma: 20.528]}}{\geqslant} \mu_1(N_1)
\end{aligned} \tag{20.824}$$

$$\begin{aligned}
\mu_2(P_{12}) &\underset{\text{[theorem: 20.535]}}{=} (\mu_2)^+(P_{12}) - (\mu_2)^-(P_{12}) \\
&= \mu_2\big(P_{12} \bigcap P_2\big) + \mu_2\big(P_{12} \bigcap N_2\big) \\
&\underset{P_{12} \bigcap N_2 \subseteq N_2 \Rightarrow \mu_1(P_{12} \bigcap N_2) \leqslant 0 \wedge \mu_2 \text{ is finite}}{\leqslant} \mu_2\big(P_{12} \bigcap P_2\big) \\
&\underset{\text{[lemma: 20.528]}}{\leqslant} \mu_2(P_2)
\end{aligned} \tag{20.825}$$

$$\begin{aligned}
\mu_2(N_{12}) &\underset{\text{[theorem: 20.535]}}{=} (\mu_2)^+(N_{12}) - (\mu_2)^-(N_{12}) \\
&= \mu_2\big(N_{12} \bigcap P_2\big) + \mu_2\big(N_{12} \bigcap N_2\big) \\
&\underset{P_{12} \bigcap P_2 \subseteq N_2 \Rightarrow \mu_2(P_{12} \bigcap P_2) \geqslant 0 \wedge \mu_2 \text{ is finite}}{\geqslant} \mu_2\big(N_{12} \bigcap N_2\big) \\
&\underset{\text{[lemma: 20.528]}}{\geqslant} \mu_2(N_2)
\end{aligned} \tag{20.826}$$

Now

$$\begin{aligned}
\|\mu_1+\mu_2\| &= |\mu_1+\mu_2|(X)\\
&= (\mu_1+\mu_2)^+(X)+(\mu_1+\mu_2)^-(X)\\
&= (\mu_1+\mu_2)\big(X\bigcap P_{12}\big)-(\mu_1+\mu_2)\big(X\bigcap N_{12}\big)\\
&= (\mu_1+\mu_2)(P_{12})-(\mu_1+\mu_2)(N_{12})\\
&= \mu_1(P_{12})+\mu_2(P_{12})-\mu_1(N_{12})-\mu_2(N_{12})\\
&\underset{\text{[eqs: 20.824, 20.826]}}{\leqslant} \mu_1(P_{12})+\mu_2(P_{12})-\mu_1(N_1)-\mu_2(N_2)\\
&\underset{\text{[eqs: 20.823,20.825}}{\leqslant} \mu_1(P_1)-\mu_1(N_1)+\mu_2(P_2)-\mu_2(N_2)\\
&= \mu_1\big(X\bigcap P_1\big)-\mu_1\big(X\bigcap N_1\big)+\mu_2\big(X\bigcap P_2\big)-\mu_2\big(X\bigcap N_2\big)\\
&= (\mu_1)^+(X)+(\mu_1)^-(X)+(\mu_2)^+(X)+(\mu_2)^+(X)\\
&= |\mu_1|(X)+|\mu_2|(X)\\
&= \|\mu_1\|+\|\mu_2\|
\end{aligned}$$

Hence we have proved the triangular inequality

$$\forall \mu_1,\mu_2\in M[X,\mathcal{A},\mathbb{R}] \text{ we have } \|\mu_1+\mu_2\|\leqslant\|\mu_1\|+\|\mu_2\| \tag{20.827}$$

Let $\mu\in M[X,\mathcal{A},\mathbb{R}]$ be such that $\|\mu\|=0$ then we have $\forall A\in\mathcal{A}$ that

$$|\mu(A)|\underset{\text{[theorem: 20.535]}}{\leqslant}|\mu|(A)\underset{\text{[theorem: 20.201]}\wedge|\mu|\text{ is a measure}}{=}|\mu|(X)=\|\mu\|=0=C_0(A)$$

So that

$$\text{If } \|\mu\|=0 \text{ then } \mu=C_0 \text{ the neutral element in } M[X,\mathcal{A},\mathbb{R}] \tag{20.828}$$

Let $\mu\in M[X,\mathcal{A},\mathbb{R}]$ then by [theorem: 20.535] $|\mu|$ is a measure so that $\|\mu\|=|\mu|(X)\in[0,\infty]$, this together with [eqs: 20.822, 20.827 and 20.828] proves that

$$\|\|\text{ is a norm on } M[X,\mathcal{A},\mathbb{R}] \qquad \square$$

Next we prove the same for the vector space $\langle M[X,\mathcal{A},\mathbb{C}],+,\cdot\rangle$

Theorem 20.550. *Let* $\langle X,\mathcal{A}\rangle$ be *a* measurable space then $\langle M[X,\mathcal{A},\mathbb{C}],\|\|\rangle$ *is a normed space.*

Proof. Let $\mu\in M[X,\mathcal{A},\mathbb{C}]$ then by [theorem: 20.545] it follows that $|\mu|$ is a finite measure, hence we have that $\|\mu\|=|\mu|(X)\in[0,\infty]$ hence

$$\forall\mu\in M[X,\mathcal{A},\mathbb{C}] \text{ we have } \|\mu\|\in[0,\infty] \tag{20.829}$$

Let $\mu\in M[X,\mathcal{A},\mathbb{C}]$ and $\alpha\in\mathbb{C}$ then we have have as by [theorem: 20.545] $|\mu|$ is a finite measure we have that

$$|\mu|(X)=\sup\left(\left(\left\{\sum_{i=1}^{n}|\mu(A_i)|\,|\,n\in\mathbb{N}\wedge\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{A}\wedge X=\bigsqcup_{i=\{1,\dots,n\}}A_i\right\}\right)\right)\in\mathbb{R} \tag{20.830}$$

$$\begin{aligned}
\|\alpha\cdot\mu\| &= \\
|\alpha\cdot\mu|(X) &\underset{\text{[definition: 20.544]}}{=} \\
\sup\left(\left\{\sum_{i=1}^{n}|(\alpha\cdot\mu)(A_i)|\,|\,n\in\mathbb{N}\wedge\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{A}\wedge X=\bigsqcup_{i=\{1,\dots,n\}}A_i\right\}\right) &= \\
\sup\left(\left\{|\alpha|\cdot\sum_{i=1}^{n}|\mu(A_i)|\,|\,n\in\mathbb{N}\wedge\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{A}\wedge X=\bigsqcup_{i=\{1,\dots,n\}}A_i\right\}\right) &\underset{\text{[theorem: 10.22]}\wedge\text{[eq: 20.830]}}{=} \\
|\alpha|\cdot\sup\left(\left\{\sum_{i=1}^{n}|\mu(A_i)|\,|\,n\in\mathbb{N}\wedge\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{A}\wedge X=\bigsqcup_{i=\{1,\dots,n\}}A_i\right\}\right) &= \\
|\alpha|\cdot|\mu|(X) & \\
|\alpha|\cdot\|\mu\| &
\end{aligned}$$

whic proves that

$$\forall \mu \in M[X, \mathcal{A}, \mathbb{C}] \text{ we have } \forall \alpha \in \mathbb{C} \text{ that } \|\alpha \cdot \mu\| = |\alpha| \cdot \|\mu\| \tag{20.831}$$

Let $\mu_1, \mu_2 \in M[X, \mathcal{A}, \mathbb{C}]$ and

$$x \in \left\{ \sum_{i=1}^{n} |(\mu_1 + \mu_2)(A_i)| | n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i=\{1, \ldots, n\}} A_i \right\}$$

then $\exists \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq$ pairwise disjoint with $X = \bigsqcup_{i \in \{1, \ldots, n\}} A_i$ such that

$$\begin{aligned}
x &= \sum_{i=1}^{n} |(\mu_1 + \mu_2)(A_i)| \\
&= \sum_{i=1}^{n} |\mu_1(A_i) + \mu_2(A_i)| \\
&\leqslant \sum_{i=1}^{n} (|\mu_1(A_i)| + |\mu_2(A_i)|) \\
&= \sum_{i=1}^{n} |\mu_1(A_i)| + \sum_{i=1}^{n} |\mu_2(A_i)| \\
&\leqslant \sup\left(\left\{ \sum_{i=1}^{n} |\mu_1(A_i)| | m \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i \in \{1, \ldots, n\}} A_i \right\} \right) + \sup\left(\left\{ \sum_{i=1}^{n} |\mu_2(A_i)| | m \in \mathbb{N} \wedge \right.\right. \\
&\qquad \left.\left. \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i \in \{1, \ldots, n\}} A_i \right\} \right) \\
&= \|\mu_1\| + \|\mu_2\|
\end{aligned}$$

Hence $\|\mu_1\| + \|\mu_2\|$ is a upper bound for

$$\left\{ \sum_{i=1}^{n} |(\mu_1 + \mu_2)(A_i)| | n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i=\{1, \ldots, n\}} A_i \right\}$$

so that

$$\sup\left(\left\{ \sum_{i=1}^{n} |(\mu_1 + \mu_2)(A_i)| | n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i=\{1, \ldots, n\}} A_i \right\} \right) \leqslant \|\mu_1\| + \|\mu_2\|$$

which proves that

$$\forall \mu_1, \mu_2 \in M[X, \mathcal{A}, \mathbb{C}] \text{ we have } \|\mu_1 + \mu_2\| \leqslant \|\mu_1\| + \|\mu_2\| \tag{20.832}$$

Further if $\mu \in M[X, \mathcal{A}, \mathbb{C}]$ such that $\|\mu\| = 0$ then we have for $A \in \mathcal{A}$ that

$$|\mu(A)| \underset{\text{[theorem: 20.545]}}{\leqslant} |\mu|(A) \underset{\text{[theorem: 20.201]} \wedge |\mu| \text{ is a measure}}{=} |\mu|(X) = \|\mu\| = 0 = C_0(A)$$

it follows that

$$\text{If } \|\mu\| = 0 \text{ then } \mu = C_0 \text{ the neutral element in } M[X, \mathcal{A}, \mathbb{R}] \tag{20.833}$$

From [eqs: 20.829, 20.831, 20.832 and 20.833] it follows that

$$\|\| \text{ is a norm on } M(X, \mathcal{A}, \mathbb{C})$$

□

Next we prove that $\langle M[X, \mathcal{A}, \mathbb{K}], \|\| \rangle$ is not only a normed space but also a Banach space.

Theorem 20.551. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space then $\langle M[X, \mathcal{A}, \mathbb{K}], \|\| \rangle$ is a Banach space*

Proof. Using [theorems: 20.549, 20.550] it follows that

$$\langle M[X, \mathcal{A}, \mathbb{K}], \|\| \rangle \text{ is a normed space}$$

So to prove that $\langle M[X,\mathcal{A},\mathbb{K}],\|\|\rangle$ is a Banach space we must prove that every Cauchy sequence in $M[X,\mathcal{A},\mathbb{K}]$ is a convergent series in $M[X,\mathcal{A},\mathbb{K}]$. So let $\{\mu_i\}_{i\in\mathbb{N}}\subseteq M[X,\mathcal{A},\mathbb{K}]$ be a Cauchy sequence then we have that

$$\forall\varepsilon\in\mathbb{R}^+ \text{ there exist a } N_\varepsilon\in\mathbb{N} \text{ with } \forall n,m\in\{N_\varepsilon,\ldots.\infty\}\ |\mu_n-\mu_m|(X)=\|\mu_n-\mu_m\|<\varepsilon \tag{20.834}$$

Let $\varepsilon\in\mathbb{R}^+$ then we have as $\forall n,m\in\{N_\varepsilon,\ldots,\infty\}$ $|\mu_n-\mu_m|$ is a finite measure [see theorems: 20.548,20.535, 20.545] that $\forall A\in\mathcal{A}$ we have

$$\begin{aligned}
|\mu_n(A)-\mu_m(A)| &= |(\mu_n-\mu_m)(A)| \\
&\underset{\text{[theorems: 20.535, 20.545]}}{\leqslant} |\mu_n-\mu_m|(A) \\
&\underset{\text{[theorem: 20.201]}}{\leqslant} |\mu_n-\mu_m|(X) \\
&= \|\mu_n-\mu_m\| \\
&\underset{\text{[eq: 20.834]}}{<} \varepsilon
\end{aligned}$$

In other words

$$\forall\varepsilon>0\ \ \exists N_\varepsilon\in\mathbb{N} \text{ such that } \forall n,m\in\{N_\varepsilon,\ldots,\infty\} \text{ and } \forall A\in\mathcal{A} \text{ we have } |\mu_n(A)-\mu_m(A)|<\varepsilon \tag{20.835}$$

Hence we have that $\forall A\in\mathcal{A}$ $\{\mu_n(A)\}_{n\in\mathbb{N}}\subseteq\mathbb{K}$ is a Cauchy sequence in $\mathbb{K}$. As by [examples: 14.336, 14.339] $\langle\mathbb{K},\|\rangle$ is a Banach space it follows that

$$\forall A\in\mathcal{A}\ \lim_{n\to\infty}\mu_n(A)\in\mathbb{K}$$

Hence we can define the following function

$$\mu\colon\mathcal{A}\to\mathbb{K} \text{ where } \mu(A)=\lim_{n\to\infty}\mu_n(A)\in\mathbb{K} \tag{20.836}$$

From which it follows that

$$\text{If } \mathbb{K}=\mathbb{R} \text{ then } \{\mu(A)|A\in\mathcal{A}\}\subseteq\mathbb{R}\subseteq\mathbb{R}_\infty \tag{20.837}$$

Take $\varepsilon\in\mathbb{R}^+$ and let $n\in\left\{\mathbb{N}_{\frac{\varepsilon}{2}},\ldots,\infty\right\}$ then given a arbitrary $A\in\mathcal{A}$ we have as $\mu(A)=\lim_{n\to\infty}\mu_n(A)$ there exist a M_ε such that $\forall n\in\{M_\varepsilon,\ldots,\infty\}$ we have $|\mu_n(A)-\mu(A)|<\frac{\varepsilon}{2}$. Let $M=\max\left(N_{\frac{\varepsilon}{2}},M_\varepsilon\right)$ then we have

$$\begin{aligned}
|\mu_n(A)-\mu(A)| &= |\mu_n(A)-\mu_M(A)+\mu_M(A)-\mu(A)| \\
&\leqslant |\mu_n(A)-\mu_M(A)|+|\mu_M(A)-\mu(A)| \\
&< \frac{\varepsilon}{2}+\frac{\varepsilon}{2} \\
&= \varepsilon
\end{aligned}$$

which proves, if we take $K_\varepsilon=N_{\frac{\varepsilon}{2}}$, that

$$\forall\varepsilon\in\mathbb{R}^+\ \exists K_\varepsilon\in\mathbb{N} \text{ such that } \forall n\in\{K_\varepsilon,\ldots,\infty\} \text{ we have } \forall A\in\mathcal{A}\ |\mu_n(A)-\mu(A)|<\varepsilon \tag{20.838}$$

Now we prove that $\mu\in M[X,\mathcal{A},\mathbb{K}]$ by using [theorems: 20.524, 20.542]. First we have

$$\mu(\varnothing)=\lim_{n\to\infty}\mu_n(\varnothing)=\lim_{n\to\infty}0=0 \tag{20.839}$$

Let $\{B_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}$, $n\in\mathbb{N}$ be a finite pairwise disjoint family of measurable sets. Let $\varepsilon\in\mathbb{R}^+$ then $\forall i\in\{1,\ldots,n\}$ we have, as $\mu(A_i)\underset{\text{[eq: 20.836]}}{=}\lim_{k\to\infty}\mu_k(A_i)$, that there exist a $N_i\in\mathbb{N}$ such that $\forall k\in\{N_i,\ldots,\infty\}$ we have $|\mu_k(B_i)-\mu(B_i)|<\frac{\varepsilon}{n}$. Take $N=\max\left(\{N_i|i\in\{1,\ldots,n\}\}\right)$ then we have $\forall k\in\{N,\ldots,\infty\}$ that

$$\begin{aligned}
\left|\sum_{i=1}^n\mu_k(B_i)-\sum_{i=1}^n\mu(B_i)\right| &= \left|\sum_{i=1}^n(\mu_k(B_i)-\mu(B_i))\right| \\
&\leqslant \sum_{i=1}^n|\mu_k(B_i)-\mu(B_i)| \\
&\underset{N_i\leqslant \mathrm{Nk}}{<} \sum_{i=1}^n\frac{\varepsilon}{n} \\
&= \varepsilon
\end{aligned}$$

so that

$$\lim_{k\to\infty}\sum_{i=1}^{n}\mu_k(B_i)=\sum_{i=1}^{n}\mu(B_i) \tag{20.840}$$

Further we have

$$\begin{aligned}\mu\left(\bigsqcup_{i\in\{1,\ldots,n\}}B_i\right) &= \lim_{k\to\infty}\mu_k\left(\bigsqcup_{i\in\{1,\ldots,n\}}B_i\right)\\ &\underset{\mu_k\in\mathrm{M}[X,\mathcal{A},\mathbb{K}]}{=} \lim_{k\to\infty}\sum_{i=1}^{n}\mu_k(B_i)\\ &\underset{[\text{eq: }20.840]}{=} \sum_{i=1}^{n}\mu(B_i)\end{aligned}$$

proving finite additivity

$$\forall\{B_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}, n\in\mathbb{N}\text{ pairwise disjoint we have }\mu\left(\bigsqcup_{i=1}^{n}B_i\right)=\sum_{i=1}^{n}\mu(B_i) \tag{20.841}$$

Let now $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ with $\forall i\in\mathbb{N}\ A_{i+1}\subseteq A_i$ such that $\bigcap_{i\in\mathbb{N}}A_i=\varnothing$. For $\mathbb{K}$ we have then two slightly different cases to consider:

$\mathbb{K}=\mathbb{R}$. Let $i\in\mathbb{N}$ then $\mu_i\in M(X,\mathcal{A},\mathbb{R})\Rightarrow\mu_i$ is a finite signed measure, hence using [theorem: 20.523] it follows that $\lim_{k\to\infty}\mu_i(A_k)=\mu_i(\bigcap_{k\in\mathbb{N}}A_k)=\mu_i(\varnothing)=0$.

$\mathbb{K}=\mathbb{C}$. Let $i\in\mathbb{N}$ then $\mu_i\in M[X,\mathcal{A},\mathbb{C}]\Rightarrow\mu_i$ is a complex measure so that using [theorem: 20.541] we have that limk→∞μ_i(A_k)=μ_i(cap_(k∈N)A_k)=μ_i(∅)=0.

So we have proved that in all cases we have

$$\forall i\in\mathbb{N}\text{ that }\lim_{k\to\infty}\mu_i(A_k)=0 \tag{20.842}$$

Let $\varepsilon\in\mathbb{R}^+$ then by [eq: 20.838] there exist a $N\in\mathbb{N}$ such that $\forall A\in\mathcal{A}\ |\mu_N(A)-\mu(A)|<\frac{\varepsilon}{2}$. From [eq: 20.842] it follows that there exist a $K\in\mathbb{N}$ such that $\forall n\in\{N_2,\ldots,\infty\}$ we have $|\mu_N(A_n)|<\frac{\varepsilon}{2}$. Let $n\in\{K,\ldots,\infty\}$ then we have

$$|\mu(A_n)|\leqslant|\mu(A_n)-\mu_N(A_n)+\mu_N(A_n)|\leqslant|\mu(A_n)-\mu_N(A_n)|+|\mu_N(A_n)|<\frac{\varepsilon}{2}+\frac{\varepsilon}{2}=\varepsilon$$

which proves $\lim_{n\to\infty}\mu(A_n)=0$. To summarize we have proved that

$$\forall\{A_k\}_{k\in\mathbb{N}}\subseteq\mathcal{A}\text{ with }A_{k+1}\subseteq A_k\text{ such that }\bigcap_{k\in\mathbb{N}}A_k=0\text{ we have }\lim_{k\to\infty}\mu(A_k)=0 \tag{20.843}$$

Again we look at the the two cases for $\mathbb{K}$

$\mathbb{K}=\mathbb{R}$. Then [eqs: 20.839, 20.837, 20.841 and 20.843] allows us to use [theroem: 20.524] to prove that μ is a signed measure. As by [eq: 20.837] is finite it follows that

$$\mu\in M[X,\mathcal{A},\mathbb{R}]$$

$\mathbb{K}=\mathbb{C}$. Then [eqs: 20.839, 20.841 and 20.843] allows us to use [theorem: 20.542] to prove that μ is a complex measure. Hence

$$\mu\in M[X,\mathcal{A},\mathbb{C}]$$

Hence in all cases we have that

$$\mu\in M[X,\mathcal{A},\mathbb{K}] \tag{20.844}$$

Next we must prove that $\lim_{n\to\infty}\mu_n$ converges using the norm $\|\|$. Consider for $\mathbb{K}$ either

$\mathbb{K}=\mathbb{R}$. Let $\varepsilon\in\mathbb{R}^+$ then for $n\in\left\{K_{\frac{\varepsilon}{4}},\ldots,\infty\right\}$ we have by [eq: 20.838] that

$$\mu_n-\mu\leqslant|\mu_n-\mu|<\frac{\varepsilon}{4}\text{ and }-(\mu_n-\mu)\leqslant|\mu_n-\mu|<\frac{\varepsilon}{4}$$

so that $\frac{\varepsilon}{2}$ is a upper bound for

$$\{(\mu_n-\mu)(A)|A\in\mathcal{A}\wedge A\subseteq X\}\text{ and }\{-(\mu_n-\mu)(A)|A\in\mathcal{A}\wedge A\subseteq X\}$$

Hence we have that

$$(\mu_n-\mu)^+(X) \underset{\text{[theorem: 20.535]}}{=} \sup\{(\mu_n-\mu)(A)|A\in\mathcal{A}\wedge A\subseteq X\}<\frac{\varepsilon}{4}$$

$$(\mu_n-\mu)^-(X) \underset{\text{[theorem: 20.535]}}{=} \sup\{-(\mu_n-\mu)(A)|A\in\mathcal{A}\wedge A\subseteq X\}<\frac{\varepsilon}{4}$$

so that

$$\|\mu_n-\mu\|=(\mu_n-\mu)^++(\mu_n-\mu)^-=\frac{\varepsilon}{4}+\frac{\varepsilon}{4}=\frac{\varepsilon}{2}<\varepsilon$$

which proves that

$$\mu=\lim_{n\to\infty}\mu_n \text{ exist in } \langle B[X,\mathcal{A},\mathbb{R}],\|\|\rangle$$

$\mathbb{K}=\mathbb{C}$. Let $\varepsilon\in\mathbb{R}^+$. As $\{\mu_n\}_{n\in\mathbb{N}_0}$ is Cauchy there exist a $N\in\mathbb{N}$ such that $\forall n,m\in\{N,\ldots,\infty\}$ we have $\|\mu_n-\mu_m\|<\frac{\varepsilon}{4}$. Hence using [definition: 20.544] we have that

$$\sup\left(\left\{\sum_{i=1}^k|(\mu_n-\mu_m)(A_i)|\{A_i\}_{i\in\{1,\ldots,k\}}\subseteq\mathcal{A}\wedge X=\bigsqcup_{i\in\{1,\ldots,k\}}A_i\right\}\right)<\frac{\varepsilon}{4} \tag{20.845}$$

Take $\{A_i\}_{i\in\{1,\ldots,k\}}\subseteq\mathcal{A}$ pairwise disjoint such that $X=\bigsqcup_{i\in\{1,\ldots,k\}}A_i$. Using [eq: 20.838] there exist a $K\in\mathbb{N}$ such that $\forall l\in\{K,\ldots,\infty\}$ we have $\forall i\in\{1,\ldots,k\}$ we have $|(\mu_l-\mu)(A_i)|<\frac{\varepsilon}{4\cdot k}$. So that

$$\sum_{i=1}^k|\mu_l-\mu|<\sum_{i=1}^k\frac{\varepsilon}{4\cdot k}=\frac{\varepsilon}{4} \tag{20.846}$$

Take now $n\in\{N,\ldots,\infty\}$ and $M=\max(N,K)$ then we have

$$\begin{aligned}
\sum_{i=1}^k|(\mu_n-\mu)(A_i)| &= \\
\sum_{i=1}^k|\mu_n(A_i)-\mu(A_i)| &= \\
\sum_{i=1}^k|\mu_n(A_i)-\mu_M(A_i)+\mu_M(A_i)-\mu(A_i)| &\leqslant \\
\sum_{i=1}^k|\mu_n(A_i)-\mu_M(A_i)|+\sum_{i=1}^k|\mu_M(A_i)-\mu(A_i)| &\underset{\text{[eq: 20.846]}}{<} \\
\sum_{i=1}^k|\mu_n(A_i)-\mu_M(A_i)|+\frac{\varepsilon}{4} &= \\
\sup\left(\left\{\sum_{i=1}^k|(\mu_n-\mu_m)(A_i)|\{A_i\}_{i\in\{1,\ldots,k\}}\subseteq\mathcal{A}\wedge X=\bigsqcup_{i\in\{1,\ldots,k\}}A_i\right\}\right)+\frac{\varepsilon}{4} &\underset{\text{[eq: 20.845]}}{<} \\
\frac{\varepsilon}{4}+\frac{\varepsilon}{4} &= \\
\frac{\varepsilon}{2} &< \\
\varepsilon &
\end{aligned}$$

So $\frac{\varepsilon}{2}$ is a upper bound for $\left\{\sum_{i=1}^k|(\mu_n-\mu)(A_i)|\{A_i\}_{i\in\{1,\ldots,k\}}\subseteq\mathcal{A}\wedge X=\bigsqcup_{i\in\{1,\ldots,k\}}A_i\right\}$ which proves that

$$\|\mu_n-\mu\|\underset{\text{def}}{=}\text{up}\left(\sum_{i=1}^k|(\mu_n-\mu)(A_i)|\{A_i\}_{i\in\{1,\ldots,k\}}\subseteq\mathcal{A}\wedge X=\bigsqcup_{i\in\{1,\ldots,k\}}A_i\right)\leqslant\frac{\varepsilon}{2}<\varepsilon$$

Hence we have that

$$\mu=\lim_{n\to\infty}\mu_n \text{ exist in } \langle B[X,\mathcal{A},\mathbb{C}],\|\|\rangle$$

Hence we have proved that

If $\{\mu_n\}_{n\in\mathbb{N}}\subseteq B[X,\mathcal{A},\mathbb{K}]$ is a Cauchy sequence then $\mu=\lim_{n\to\infty}\mu_n$ exist in $\langle M[X,\mathcal{A},\mathbb{K}],\|\|\rangle$

which proves finally that

$$\langle M[X,\mathcal{A},\mathbb{K}],\|\|\rangle \text{ is a Banach space} \qquad \square$$

20.7.3.1 Integrals based on signed or complex measures.

As a signed measure μ can be written as $\mu=\mu^+-\mu^-$ where (μ^+,μ^-) is the Jordan decomposition of μ it make sense to define $\int fd\mu$ as $\int fd\mu=\int fd\mu^+-\int fd\mu^+$. Likewise as a complex measure can be written as as $\mu=\mu_r^+-\mu_r^-+i\cdot(\mu_c^+-\mu_c^-)$ where $(\mu_r^+,\mu_r^-,\mu_c^+,\mu_c^-)$ is the Jordan decomposition of μ it make sense to define $\int fd\mu$ as $\int fd\mu=\int fd\mu_r^+-\int fd\mu_r^-+i\cdot(\int fd\mu_c^+-\int fd\mu_c^-)$ but this works only if the integrals on the left side are finite. Hence as with the definition of μ-integrable functions we need a extra condition on the measurable functions. This is provided in the following definition.

Definition 20.552. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space then the set of* ***bounded measurable functions*** $B[X,\mathcal{A},\mathbb{K}]$ *si defined by*

$$B[X,\mathcal{A},\mathbb{K}]=\{f\in\mathcal{M}[X,\mathcal{A},\mathbb{K}]|\exists M\in[0,\infty[\text{ such that } \forall x\in X \text{ we have } |f(x)|\leqslant M\}\subseteq M[X,\mathcal{A},\mathbb{K}]$$

more specific we have

$$B[X,\mathcal{A},\mathbb{R}]=\{f\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]|\exists M\in[0,\infty[\text{ such that } \forall x\in X \text{ we have } |f(x)|\leqslant M\}\subseteq M[X,\mathcal{A},\mathbb{R}]$$

$$B[X,\mathcal{A},\mathbb{C}]=\{f\in\mathcal{M}[X,\mathcal{A},\mathbb{C}]|\exists M\in[0,\infty[\text{ such that } \forall x\in X \text{ we have } |f(x)|\leqslant M\}\subseteq M[X,\mathcal{A},\mathbb{C}]$$

We show now that that $B[X,\mathcal{A},\mathbb{K}]$ is actually a normed vector space.

Theorem 20.553. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space then we have*

1. *$\langle B[X,\mathcal{A},\mathbb{R}],+,\cdot\rangle$ is a vector space [where $+$ and $\cdot$ are pointwise defined] and C_0 defined by $C_0(x)=0$ is the neutral element.*
2. *$\langle B[X,\mathcal{A},\mathbb{C}],+,\cdot\rangle$ is a vector space [where $+$ and $\cdot$ are pointwise defined] and C_0 defined by $C_0(x)=0$ is the neutral element.*
3. *If we defined*

$$\|f\|_\infty: B[X,\mathcal{A},\mathbb{K}]\to[0,\infty[\text{ by } \|f\|_\infty=\sup(\{|f(x)||x\in X\})$$

then $\langle B[X,\mathcal{A},\mathbb{K}],\|\|_\infty\rangle$ is a normed space.

Proof.

1. As $C_0\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$ [see example: 20.314] and $\forall x\in X\ C_0(x)=0\leqslant 0$ it follows that

$$C_0\in B[X,\mathcal{A},\mathbb{R}]\Rightarrow\varnothing=B[X,\mathcal{A},\mathbb{R}]$$

Let $f,g\in B[X,\mathcal{A},\mathbb{R}]$ then $f,g\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$ and there exist a $M_1,M_2\in[0,\infty[$ such that $\forall x\in X$ we have $|f(x)|\leqslant M_1$ and $|g(x)|\leqslant M_2$. Using [theorem: 20.338] it follows that $f+g\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$, further we have $\forall x\in X$ that $|(f+g)(x)|=|f(x)|+|g(x)|\leqslant M_1+M_2$ which proves that $f+g\in B[X,\mathcal{A},\mathbb{R}]$. Hence we have

$$\forall f,g\in B[X,\mathcal{A},\mathbb{R}]\ f+g\in B[X,\mathcal{A},\mathbb{R}]$$

If $\alpha\in\mathbb{R}$ then by [theorem: 20.344] we have $\alpha\cdot f\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$, further $\forall x\in X$ we have $|(\alpha\cdot f)(x)|=|\alpha|\cdot|f|\leqslant|\alpha|\cdot M_1\leqslant|\alpha|\cdot M_1+1$ which proves that $\alpha\cdot f\in B[X,\mathcal{A},\mathbb{R}]$. Hence we have

$$\forall f\in B[X,\mathcal{A},\mathbb{R}] \text{ we have } \alpha\cdot f\in B[X,\mathcal{A},\mathbb{R}]$$

Using [theorem: 11.67] and [theorem: 11.60] it follows that

$$\langle B[X,\mathcal{A},\mathbb{R}],+,\cdot\rangle \text{ is a vector space}$$

2. As $C_0\in\mathcal{M}[X,\mathcal{A},\mathbb{C}]$ [see example: 20.314] and $\forall x\in X\ C_0(x)=0\leqslant 0$ it follows that

$$C_0\in B[X,\mathcal{A},\mathbb{C}]\Rightarrow\varnothing=B[X,\mathcal{A},\mathbb{C}]$$

Let $f, g \in B[X, \mathcal{A}, \mathbb{C}]$ then $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ and there exist a $M_1, M_2 \in [0, \infty[$ such that $\forall x \in X$ we have $|f(x)| \leqslant M_1$ and $|g(x)| \leqslant M_2$. Using [theorem: 20.456] it follows that $f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$, further we have $\forall x \in X$ that $|(f+g)(x)| = |f(x)| + |g(x)| \leqslant M_1 + M_2$ which proves that $f + g \in B[X, \mathcal{A}, \mathbb{C}]$. Hence we have

$$\forall f, g \in B[X, \mathcal{A}, \mathbb{C}] \;\; f + g \in B[X, \mathcal{A}, \mathbb{C}]$$

If $\alpha \in \mathbb{R}$ then by [theorem: 20.456] we have $\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$, further $\forall x \in X$ we have $|(\alpha \cdot f)(x)| = |\alpha| \cdot |f| \leqslant |\alpha| \cdot M_1 \leqslant |\alpha| \cdot M_1 + 1$ which proves that $\alpha \cdot f \in B[X, \mathcal{A}, \mathbb{C}]$. Hence we have

$$\forall f \in B[X, \mathcal{A}, \mathbb{C}] \text{ we have } \alpha \cdot f \in B[X, \mathcal{A}, \mathbb{C}]$$

Using [theorem: 11.67] and [theorem: 11.60] it follows that

$$\langle B[X, \mathcal{A}, \mathbb{C}], +, \cdot \rangle \text{ is a vector space}$$

3. Let $f \in B[X, \mathcal{A}, \mathbb{K}]$ then $\exists M \in [0, \infty[$ such that $\forall x \in X$ we have $|f(x)| \leqslant M$ so that M is a upper bound of $\{|f(x)| | x \in X\}$ which is not empty as $X \neq \varnothing$ by the definition of a measurable space [see definition: 20.139]. As $\mathbb{R}$ is conditional complete [see theorem: 10.18] it follows that

$$\sup(\{|f(x)| | x \in X\}) \in \mathbb{R} \text{ exist}$$

So the fnction

$$\|\|_\infty : B[X, \mathcal{A}, \mathbb{K}] \to [0, \infty[\text{ where } \|f\|_\infty = \sup(\{|f(x)| | x \in X\}) \tag{20.847}$$

is well defined. Let $f, g \in B[X, \mathcal{A}, \mathbb{K}]$ then we have then we have $\forall x \in X$ that

$$|(f+g)(x)| \leqslant |f(x)| + |g(x)| \leqslant \sup(|f(x)| | x \in X) + \sup(|g(x)| | x \in X) \leqslant \|f\|_\infty + \|g\|_\infty$$

so that $\|f\|_\infty + \|g\|_\infty$ is a upper bound of $\{|(f+g)(x)| | x \in X\}$. Hence

$$\|f+g\|_\infty = \sup(\{|(f+g)(x)| | x \in X\}) \leqslant \|f\|_\infty + \|g\|_\infty$$

which proves that

$$\forall f, g \in B[X, \mathcal{A}, \mathbb{K}] \text{ we have } \|f+g\|_\infty \leqslant \|f\|_\infty + \|g\|_\infty \tag{20.848}$$

Let $\alpha \in \mathbb{R}$ and $f \in M[X, \mathcal{A}, \mathbb{K}]$ then

$$\begin{aligned} \|\alpha \cdot f\|_\infty &= \sup(\{|(\alpha \cdot f)(x)| | x \in X\}) \\ &= \sup(\{|\alpha| \cdot |f(x)| | x \in X\}) \\ &\underset{\text{[theorem: 10.22]}}{=} |\alpha| \cdot \sup(\{|f(x)| | x \in X\}) \\ &= |\alpha| \cdot \|f\|_\infty \end{aligned}$$

hence we have

$$\forall a \in \mathbb{R}, \forall f \in M[X, \mathcal{A}, \mathbb{K}] \text{ we have } \|\alpha \cdot f\|_\infty = |\alpha| \cdot \|f\|_\infty \tag{20.849}$$

If $f \in M[X, \mathcal{A}, \mathbb{K}]$ is such that $\|f\|_\infty = 0$ hence $\forall x \in X$

$$0 \leqslant |f(x)| \leqslant \sup(\{|f(x)| | x \in X\}) = \|f\|_\infty = 0$$

proving that $\forall x \in X \;\; |f(x)| = 0 = C_0(x)$. Hence

$$\forall f \in B[X, \mathcal{A}, \mathbb{K}] \text{ with } \|f\|_\infty = 0 \text{ we have that } f = C_0 \tag{20.850}$$

From [eqs: 20.847, 20.848, 20.849 and 20.850] it follows by definition that $\|\|_\infty$ is a norm on $B[X, \mathcal{A}, \mathbb{K}]$. □

Next we show that all bounded measurable functions are integrable.

Theorem 20.554. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, μ a finite measure and $f \in B(X, \mathcal{A}, \mathbb{K})$ then*

$$f \in \mathcal{L}[X, \mathcal{A}, \mu]$$

In other words if $f \in B[X, \mathcal{A}, \mathbb{K}]$ then $\int f d\mu$ exist.

Proof. For $\mathbb{K}$ we have either

$\mathbb{K}=\mathbb{R}$. Then $f\in\mathcal{M}[X,\mathcal{A},\mathbb{R}]$ and there exist a $M\in\mathbb{R}$ such that $\forall x\in X$ we have $|f(x)|\leqslant M$. By [theorem: 20.413] $f^+,f^-\in\mathcal{M}[X,\mathcal{A},\overline{\mathbb{R}}]$, further we have by [theorem: 20.414] that $\forall x\in X$ $f_+(x)\leqslant|f(x)|\leqslant M=C_M(x)$. So

$$\int^+ f^+d\mu \underset{\text{[theorem: 20.405]}}{\leqslant} \int^+ C_M d\mu \underset{\text{[example: 20.396]}}{\leqslant} M\cdot\mu(A) \underset{\mu\text{ is finite}}{<} \infty$$

$$\int^+ f^-d\mu \underset{\text{[theorem: 20.405]}}{\leqslant} \int^+ C_M d\mu \underset{\text{[example: 20.396]}}{\leqslant} M\cdot\mu(A) \underset{\mu\text{ is finite}}{<} \infty$$

Hence by [definition: 20.415] we have that

$$f\in\mathcal{L}[X,\mathcal{A},\mu,\mathbb{R}]$$

$\mathbb{K}=\mathbb{C}$. Then $f\in\mathcal{M}[X,\mathcal{A},\mathbb{C}]$ and there exist a $M\in\mathbb{R}$ such that $\forall x\in X$ we have $|f(x)|\leqslant M$. Then we have

$$\forall x\in X \text{ we have } |\mathrm{Re}(f)(x)|=|\mathrm{Re}(f(x))| \underset{\text{[theorem: 10.85]}}{\leqslant} |f(x)|\leqslant M$$

$$\forall x\in X \text{ we have } |\mathrm{Img}(f)(x)|=|\mathrm{Re}(f(x))| \underset{\text{[theorem: 10.85]}}{\leqslant} |f(x)|\leqslant M$$

Using the case $\mathbb{K}=\mathbb{R}$ on the above proves that $\mathrm{Re}(f),\mathrm{Img}(f)\in\mathcal{L}[X,\mathcal{A},\mathbb{R}]$. Hence it follows from [definition: 20.458] that $f\in\mathcal{L}[X,\mathcal{A},,\mu,\mathbb{C}]$. □

Now we are ready to define integration using signed and complex measures:

Definition 20.555. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $\mu\in M[X,\mathcal{A},\mathbb{R}]$ and $f\in B(X,\mathcal{A},\mathbb{R})$ then we define $\int fd\mu$ as*

$$\int fd\mu=\int fd\mu^+-\int fd\mu^- \text{ where } (\mu^+,\mu^-) \text{ is the Jordon Decomposition of } \mu$$

***Note* 20.556.** *As $\mu\in M[X,\mathcal{A},\mathbb{R}]$ we have by [theorem: 20.535] that μ^+, μ^- are finite so that by [theorem: 20.554] $f\in\mathcal{L}[X,\mathcal{A},\mu^+,\mathbb{R}]\wedge f\in\mathcal{L}[X,\mathcal{A},\mu^-,\mathbb{R}]$. Hence $\int fd\mu^+-\int fd\mu^-$ is well defined.*

Definition 20.557. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $\mu\in M[X,\mathcal{A},\mathbb{R}]$ and $f\in B(X,\mathcal{A},\mathbb{C})$ then we define $\int^{\mathbb{C}} fd\mu$ as*

$$\int^{\mathbb{C}} fd\mu=\int^{\mathbb{C}} fd\mu^+-\int^{\mathbb{C}} fd\mu^- \text{ where } (\mu^+,\mu^-) \text{ is the Jordon Decomposition of } \mu$$

***Note* 20.558.** *As $\mu\in M[X,\mathcal{A},\mathbb{R}]$ we have by [theorem: 20.535] that μ^+, μ^- are finite measures so that by [theorem: 20.554] $f\in\mathcal{L}[X,\mathcal{A},\mu^+,\mathbb{C}]\wedge f\in\mathcal{L}[X,\mathcal{A},\mu^-,\mathbb{C}]$. Hence $\int^{\mathbb{C}} fd\mu^+-\int^{\mathbb{C}} fd\mu^-$ is well defined.*

Definition 20.559. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $\mu\in M[X,\mathcal{A},\mathbb{C}]$ and $f\in B(X,\mathcal{A},\mathbb{R})$ then we define $\int fd\mu$ as*

$$\int fd\mu=\int fd\mu_r^+-\int fd\mu_r^-+i\cdot\left(\int fd\mu_c^+-\int fd\mu_c^-\right)$$

where $(\mu_r^+,\mu_r^-,\mu_c^+,\mu_c^-)$ is the Jordon Decomposition of μ.

***Note* 20.560.** *As $\mu\in M[X,\mathcal{A},\mathbb{C}]$ we have by [theorem: 20.543] that μ_r^+, μ_r^-, μ_c^+, μ_c^- are finite measures so that by [theorem: 20.554] $f\in\mathcal{L}[X,\mathcal{A},\mu^+,\mathbb{R}]\wedge f\in\mathcal{L}[X,\mathcal{A},\mu^-,\mathbb{C}]$. Hence $\int fd\mu_r^+$, $\int fd\mu_r^-$, $\int fd\mu_c^+$, $\int fd\mu_c^-$ are well defined.*

Definition 20.561. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $\mu\in M[X,\mathcal{A},\mathbb{C}]$ and $f\in B(X,\mathcal{A},\mathbb{C})$ then we define $\int^{\mathbb{C}} fd\mu$ as*

$$\int^{\mathbb{C}} fd\mu=\int^{\mathbb{C}} fd\mu_r^+-\int^{\mathbb{C}} fd\mu_r^-+i\cdot\left(\int^{\mathbb{C}} fd\mu_c^+-\int^{\mathbb{C}} fd\mu_c^-\right)$$

where $(\mu_r^+, \mu_r^-, \mu_c^+, \mu_c^-)$ *is the Jordon Decomposition of* μ.

***Note* 20.562.** *As* $\mu \in M[X, \mathcal{A}, \mathbb{C}]$ *we have by [theorem: 20.543] that* μ_r^+, μ_r^-, μ_c^+, μ_c^- *are finite measures so that by [theorem: 20.554]* $f \in \mathcal{L}[X, \mathcal{A}, \mu^+, \mathbb{R}] \wedge f \in \mathcal{L}[X, \mathcal{A}, \mu^-, \mathbb{C}]$. *Hence* $\int f d\mu_r^+$, $\int f d\mu_r^-$, $\int f d\mu_c^+$, $\int f d\mu_c^-$ *are well defined.*

20.7.3.2 Radon-Nikodym Theorem

Definition 20.563. *Let* $\langle X, \mathcal{A} \rangle$ *be a measurable space and* μ, ν *measures on* $\mathcal{A}$ *then* ***ν is absolute continuous with respect to μ*** *noted as* $\nu \ll \mu$ *if*

$$\forall A \in \mathcal{A} \text{ we have if } \mu(A) = 0 \text{ that } \nu(A) = 0$$

Example 20.564. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $\mu \ll \mu$

Proof. As $\forall A \in \mathcal{A}$ we have $\mu(A) \Rightarrow \mu(A)$ it follows trivially that $\mu \ll \mu$ □

Example 20.565. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then

$$\nu: \mathcal{A} \to [0, \infty] \text{ defined by } \nu(A) = \int^+ (\mathcal{X}_A \cdot f) d\mu$$

is a measure on $\mathcal{A}$ and

$$\nu \ll \mu$$

Proof. Using [theorem: 20.441] it follows that $\nu: \mathcal{A} \to [0, \infty]$ is a measure on $\mathcal{A}$. Let $A \in \mathcal{A}$ be such that $\mu(A) = 0$ then if $x \in \{x \in X | (f \cdot \mathcal{X}_A)(x) \neq 0\}$ we must have that $x \in A$ [for if $x \in X \setminus A$ then $(\mathcal{X}_A \cdot f) = \mathcal{X}_A(x) \cdot f(x) = 0$] which proves that $\{x \in X | (f \cdot \mathcal{X}_A)(x) \neq 0\} \subseteq A \in \mathcal{A}$ with $\mu(A) = 0$. Hence $\mathcal{X}_A \cdot f = 0$ μ-a.e.. Using [theorem: 20.403] it follows that $\nu(A) = \int^+ (\mathcal{X}_A \cdot f) d\mu = 0$. □

The following lemma explains why we use the name absolute continuity for $\nu \ll \mu$ and shows the similarity with absolute continuity on functions based on the μ δ definition.

Lemma 20.566. *Let* $n \in \mathbb{N}$ *then* $\sum_{k=n}^{\infty} \frac{1}{2^k} = \frac{1}{2^{n-1}}$

Proof. For $n \in \mathbb{N}$ we have either:

$n = 1$. Then $\sum_{k=n}^{\infty} \frac{1}{2^k} = \sum_{k=1}^{\infty} \frac{1}{2^k} \underset{\text{[example: 14.354]}}{=} \frac{\frac{1}{2}}{1 - \frac{1}{2}} = 1 = \frac{1}{2^{1-1}} = \frac{1}{2^{n-1}}$

$n \in \mathbb{N} \setminus \{1\}$. Then

$$\begin{aligned}
1 &\underset{\text{[example: 14.354]}}{=} \sum_{k=1}^{\infty} \frac{1}{2^k} \\
&\underset{\text{[theorem: 14.358]}}{=} \sum_{k=1}^{n-1} \frac{1}{2^k} + \sum_{k=n}^{\infty} \frac{1}{2^k} \\
&\underset{\text{[lemma: 14.353]}}{=} \frac{1}{2} \cdot \left(\frac{1 - \frac{1}{2^{n-1}}}{1 - \frac{1}{2}} \right) + \sum_{k=n}^{\infty} \frac{1}{2^k} \\
&= 1 - \frac{1}{2^{n-1}} + \sum_{k=n}^{\infty} \frac{1}{2^k}
\end{aligned}$$

which proves that $\sum_{k=n}^{\infty} \frac{1}{2^k} = \frac{1}{2^{n-1}}$.

□

Theorem 20.567. *Let* $\langle X, \mathcal{A}, \mu \rangle$ *be a measure space and let* ν *be a* ***finite measure*** *on* $\mathcal{A}$ *then we have*

$$\nu \ll \mu$$
$$\Updownarrow$$
$$\forall \varepsilon \in \mathbb{R}^+ \ \exists \delta \in \mathbb{R}^+ \text{ such that } \forall A \in \mathcal{A} \text{ with } \mu(A) < \delta \text{ we have } \nu(A) < \varepsilon$$

Proof.

⇒. We prove this by contradiction. So asssume that there exist a $\varepsilon \in \mathbb{R}^+$ such that $\forall \delta \in \mathbb{R}^+$ there exist $A \in \mathcal{A}$ with $\mu(A) < \delta$ such that $\varepsilon \leqslant \nu(A)$. More specific $\forall k \in \mathbb{N}$ there exist a $A_k \in \mathcal{A}$ with $\mu(A_k) < \frac{1}{2^k}$ such that $\varepsilon \leqslant \nu(A_k)$. Define now

$$\{B_n\}_{n \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_n = \bigcup_{k \in \{n, \ldots, \infty\}} A_k \text{ and } B = \bigcap_{k \in \mathbb{N}} B_k \in \mathcal{A}$$

Then we have $\forall n \in \mathbb{N}$ that

$$B_{n+1} = \bigcup_{k \in \{n+1, \ldots, \infty\}} A_k \underset{\text{[theorem: 2.128]}}{\subseteq} \bigcup_{k \in \{n, \ldots, \infty\}} A_k = B_n$$

Further we have

$$\mu(B_1) = \mu\left(\bigcup_{k \in \mathbb{N}} A_k\right) \underset{\text{[theorem: 20.205]}}{\leqslant} \sum_{k=1}^{\infty} \mu(A_k) \underset{\text{[theorem: 20.96]}}{\leqslant} \sum_{k=1}^{\infty} \frac{1}{2^k} \underset{\text{[example: 14.354]}}{=} 1 < \infty$$

Hence we can use [theorem: 20.206] to get

$$\mu(B) = \mu\left(\bigcap_{k \in \mathbb{N}} B_k\right) = \lim_{k \to \infty} \mu(B_k) = \inf(\{\mu(B_i) | i \in \mathbb{N}\}) \tag{20.851}$$

Further, as ν is finite, we have by [theorem: 20.206] that

$$\nu(B) = \nu\left(\bigcap_{k \in \mathbb{N}} B_k\right) = \lim_{k \to \infty} \nu(B_k) = \inf(\{\nu(B_i) | i \in \mathbb{N}\}) \tag{20.852}$$

Also for $n \in \mathbb{N}$ we have

$$\mu(B_n) = \mu\left(\bigcup_{k \in \{n, \ldots, \infty\}} A_k\right) \underset{\text{[theorem: 20.205]}}{\leqslant} \sum_{k=n}^{\infty} \mu(A_k) \underset{\text{[lemma: 20.566]}}{\leqslant} \frac{1}{2^{n-1}}$$

so that by [example: 14.297[and [theorem: 14.300] $\lim_{k \to \infty} \mu(B_k) = 0$ which combined with [eq: 20.851] gives $\mu(B) = 0$. As $\nu \ll \mu$ we must have also

$$\nu(B) = 0 \tag{20.853}$$

Now $\forall n \in \mathbb{N}$ we have $A_n \subseteq \bigcup_{k \in \{n, \ldots, \infty\}} A_n = B_n$ so that $\varepsilon \leqslant \nu(A_n) \leqslant \nu(B_n)$. Hence ε is a lower bound of $\{\nu(B_n) | n \in \mathbb{N}\}$ from which it follows that $0 < \varepsilon \leqslant \inf(\{\nu(B_n) | n \in \mathbb{N}\}) \underset{\text{[eq: 20.852]}}{=} \nu(B)$ which contradicts [eq: 20.853]. So the assumption is wrong and we must have that

$$\forall \varepsilon \in \mathbb{R}^+ \ \exists \delta \in \mathbb{R}^+ \text{ such that } \forall A \in \mathcal{A} \text{ with } \mu(A) < \delta \text{ we have } \nu(A) < \varepsilon$$

⇐. Let $A \in \mathcal{A}$ such that $\mu(A) = 0$ and assume that $0 < \nu(A) \in \mathbb{R}^+$. Then by the hypothesis there exists a $\delta > 0$ such if $\mu(A) < \delta$ then $\nu(A) < \nu(A)$ a contradiction. Hence the assumption is wrong and we must have $\nu(A) = 0$ which proves that

$$\nu \ll \mu$$

□

We are now ready to prove the Radon-Nikodym theorem. This theorem states that given a measurable space $\langle X, \mathcal{A} \rangle$ and two σ-finite measures μ, ν on $\mathcal{A}$ such that $\nu \ll \mu$ then there exist a μ-a-e. unique non negative measurable function h such that $\nu(A) = \int_A^+ h \, d\mu = \int^+ (\mathcal{X}_A \cdot h) d\mu$. We do this in different steps.

1. First we prove that if ν is finite and $\forall A \in \mathcal{A}$ $\int_A^+ h \, d\mu = \nu(A) = \int_A^+ f d\mu$ then $f = h$ μ-a.e.
2. We extended (1) to the cases where ν is σ-finite
3. Next we prove that there exist a h such that $\forall A \in \mathcal{A}$ $\nu(A) = \int_A^+ f d\mu$

Lemma 20.568. *Let X be a set and $f: X \to \mathbb{R}$, $h: X \to \mathbb{R}$ be two functions then we have*

1. $(f - h)^+ = \mathcal{X}_F \cdot (f - h)$ *where* $F = \{f > h\} \underset{\text{def}}{=} \{x \in X | f(x) > h(x)\}$

2. $(f-h)^- = \mathcal{X}_G \cdot (h-f)$ *where* $G = \{f < h\} \underset{\text{def}}{=} \{x \in X \,|\, f(x) < h(x)\}$

Proof.

1. Let $x \in X$ then we have either:

   $\boldsymbol{x \in F}$. then $(f-h)(x) = f(x) - h(x) > 0$ so that

   $$(f-h)^+(x) = \max((f-h)(x), 0) = (f-h)(x) = \mathcal{X}_F(x) \cdot (f-h)(x) = (\mathcal{X}_F \cdot (f-h))(x)$$

   $\boldsymbol{x \in X \setminus F}$. then $(f-h)(x) = f(x) - h(x) \leqslant 0$ so that

   $$(f-h)^+(x) = \max((f-h)(x), 0) = 0 = \mathcal{X}_F(x) \cdot (f-h)(x) = (\mathcal{X}_F \cdot (f-h))(x)$$

   proving that

   $$(f-h)^+ = \mathcal{X}_F \cdot (f-h)$$

2. Let $x \in X$ then we have either:

   $\boldsymbol{x \in G}$. then $(f-h)(x) = f(x) - h(x) < 0$ so that

   $$(f-h)^- = -\min((f-h)(x), 0) = h(x) - f(x) = \mathcal{X}_G(x) \cdot (h-f)(x) = (\mathcal{X}_G \cdot (h-f))(x)$$

   $\boldsymbol{x \in X \setminus G}$. then $(f-h)(x) = f(x) - h(x) \geqslant 0$ so that

   $$(f-h)^- = -\min((f-h)(x), 0) = 0 = \mathcal{X}_G(x) \cdot (h-f)(x) = (\mathcal{X}_G \cdot (h-f))(x)$$

   proving that

   $$(f-h)^- = \mathcal{X}_G \cdot (h-f)$$

□

Lemma 20.569. *Let* $\langle X, \mathcal{A} \rangle$ *be a measurable space* μ *a measure on* $\mathcal{A}$, ν *a* ***finite*** *measure on* $\mathcal{A}$ *and* h, $f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ *such that*

$$\forall A \in \mathcal{A} \int_A^+ f d\mu = \nu(A) = \int_A^+ h d\mu$$

then

$$f = h \ \mu\text{-a.e.}$$

Here $\int_A^+ f d\mu \underset{\text{[defintion: 20.393]}}{=} \int^+ (\mathcal{X}_A \cdot f) d\mu$ *and* $\int_A^+ h d\mu \underset{\text{[defintion: 20.393]}}{=} \int^+ (\mathcal{X}_A \cdot h) d\mu$

Proof. Let $A \in \mathcal{A}$ then as ν is finite we have $\nu(A) < \infty$ so that

$$\int^+ (\mathcal{X}_A \cdot h)\, d\mu = \int_A^+ h d\mu = \int^+ (\mathcal{X}_A \cdot f)\, d\mu = \int_A^+ f d\mu < \infty$$

hence, using [theorem: 20.419] it follows that

$$\mathcal{X}_A \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \wedge \mathcal{X}_A \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

and

$$\int^+ \mathcal{X}_A \cdot h d\mu = \int \mathcal{X}_A \cdot h d\mu = \int^+ \mathcal{X}_A \cdot f d\mu = \int \mathcal{X}_A \cdot f d\mu$$

Using the linearity of $\int$ [see theorem: 20.425] it follows that

$$\mathcal{X}_A \cdot (f-h) = \mathcal{X}_A \cdot f - \mathcal{X}_A \cdot h \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

and

$$\int \mathcal{X}_A \cdot (f-h) d\mu = \int \mathcal{X}_A \cdot f d\mu - \int \mathcal{X}_A \cdot h d\mu = 0$$

or

$$\forall A \in \mathcal{A} \text{ we have } \int \mathcal{X}_A \cdot (f-h) d\mu = 0 \tag{20.854}$$

Define now $F = \{f > h\}$ and $G = \{f < h\}$ then $F, G \in \mathcal{A}$ [see theorem: 20.337] and

$$(f-h)^+ \underset{\text{[lemma: 20.568]}}{=} \mathcal{X}_F \cdot (f-h) \text{ and } (f-h)^- \underset{\text{[lemma: 20.568]}}{=} \mathcal{X}_G \cdot (h-f) = -\mathcal{X}_G \cdot (f-h) \tag{20.855}$$

Then

$$\int (f-h)^+ d\mu \underset{\text{[eq: 20.855]}}{=} \int (\mathcal{X}_F \cdot (f-h)) d\mu \underset{\text{[eq: 20.854]}}{=} 0$$

$$\int (f-h)^- d\mu \underset{\text{[eq: 20.855]}}{=} -\int (\mathcal{X}_F \cdot (f-h)) d\mu \underset{\text{[eq: 20.854]}}{=} 0$$

so that

$$\begin{aligned}
\int |f-h| d\mu &\underset{\text{[theorem: 20.412]}}{=} \int ((f-h)^+ + (f-h)^-) d\mu \\
&\underset{\text{[theorem: 20.425]}}{=} \int (f-h)^+ d\mu + \int (f-h)^- d\mu \\
&= 0+0 \\
&= 0
\end{aligned}$$

Using now [theorem: 20.430] it follows that $f-h=0$ μ-a.e. or using [theorem: 20.361] it follows that

$$f = h \ \mu\text{-a.e.}$$

□

Next we extend the previous lemma to the cases where ν is a σ-finite measure [see definition: 20.196].

Lemma 20.570. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, μ a measure on $\mathcal{A}$, ν a **σ-finite** measure on $\mathcal{A}$ and f, $h \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ such that*

$$\forall A \in \mathcal{A} \text{ we have } \int_A^+ h d\mu = \nu(A) = \int_A^+ f d\mu$$

then we have that

$$h = f \ \mu\text{-a.e.}$$

Proof. As ν is σ-finite we have by [definition: 20.196] and [theorem: 20.204] that there exist a $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ pairwise disjoint such that

$$X = \bigsqcup_{i \in \mathbb{N}} A_i \text{ and } \forall i \in \mathbb{N} \text{ we have } \nu(A_i) < \infty \tag{20.856}$$

Let $i \in \mathbb{N}$ then and take the measure spaces [see theorem: 20.199]

$$\langle A_i, \mathcal{A}_{|A_i}, \nu_{\mathcal{A}_{|A_i}} \rangle \ \langle A_i, \mathcal{A}_{|A_i}, \mu_{\mathcal{A}_{|A_i}} \rangle$$

where

$$\mathcal{A}_{|A_i} = \{B \in \mathcal{A} | B \subseteq A_i\} \text{ and } \nu_{\mathcal{A}_{|A_i}}, \mu_{\mathcal{A}_{|A_i}} \text{ are the restrictions of } \nu, \mu \text{ to } \mathcal{A}_{|A_i}$$

Then for $C \in \mathcal{A}_{|A_i}$ we have $C \in \mathcal{A}$ and $C \subseteq A_i$ so that $\nu_{|\mathcal{A}_{|A_i}}(C) = \nu(C) \leqslant \nu(A_i) < \infty$ which proves that

$$\nu_{|\mathcal{A}_{|A_i}} \text{ is a finite measure}$$

Using [theorem: 20.355] and the fact that $f, h \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows that

$$f_{|A_i}, h_{|A_i} \in \mathcal{M}[A_i, \mathcal{A}_{|A_i}, \overline{\mathbb{R}}]$$

Let $C \in \mathcal{A}_{A_i}$ then $C \in \mathcal{A}$ and $C \subseteq A_i$ then using [theorem: 20.353] that

$$\mathcal{X}_{A_i,C} \cdot f_{|A_i}, \mathcal{X}_{A_i,C} \cdot h_{|A_i} \in \mathcal{M}[A_i, \mathcal{A}_{|A_i}, \overline{\mathbb{R}}] \text{ [see definition: 20.350]}$$

so that the following is well defined

$$\begin{aligned}
\int_C^+ h_{|A_i} d\mu_{|\mathcal{A}_{|A_i}} &\underset{\text{def}}{=} \int^+ (\mathcal{X}_{A_i,C} \cdot h_{|A_i}) d\mu_{|\mathcal{A}_{|A_i}} \\
&\underset{\text{[theorem: 20.351]}}{=} \int^+ (\mathcal{X}_{X,C} \cdot h)_{|A_i} d\mu_{|\mathcal{A}_{|A_i}}
\end{aligned}$$
