1. As $X \in \mathcal{T}$ it follows from [theorem: 14.32] that for $x \in X$ there exist a $B \in \mathcal{B}$ such that $x \in B \in \mathcal{B}$.
2. If $x \in B_1 \bigcap B_2$ then as B_1, $B_2 \in \mathcal{B} \subseteq \mathcal{T}$ we have that $B_1 \bigcap B_2 \in \mathcal{T}$, hence as $\mathcal{B}$ is a basis for $\mathcal{T}$ there exist by [theorem: 14.32] a $B \in \mathcal{B}$ such that $x \in B \subseteq B_1 \bigcap B_2$. □

The above show the necessary conditions that a basis must satisfies, the following shows that any set of subset fulfilling the above conditions can be the basis of a topology.

Theorem 14.39. *Let X be a set, $\mathcal{B} \subseteq \mathcal{P}(X)$ a set of subsets of X satisfying:*

1. *$\forall x \in X$ there exist a $B \in \mathcal{B}$ such that $x \in B$*

2. $\forall B_1, B_2 \in \mathcal{B}$ *we have* $\forall x \in B_1 \bigcap B_2$ *that there exist a* $B \in \mathcal{B}$ *such that* $x \in B \subseteq B_1 \bigcap B_2$

then

$$\mathcal{T}[\mathcal{B}] = \{U \in \mathcal{P}(X) | \forall x \in U \text{ there exist a } B \in \mathcal{B} \text{ such that } x \in B \subseteq U\} \text{ is a topology}$$

and

$$\mathcal{B} \text{ is a basis for } \mathcal{T}[\mathcal{B}]$$

We call $\mathcal{B}$ *the* ***generating basis*** *for* $\mathcal{T}[\mathcal{B}]$ *and* $\mathcal{T}[\mathcal{B}]$ *the* ***topology generated by*** $\mathcal{B}$.

Proof.

a) $\forall x \in \varnothing$ we have vacuously that there exist a $B \in \mathcal{B}$ such that $x \in B \subseteq \varnothing$, hence $\varnothing \in \mathcal{T}[\mathcal{B}]$.

b) Let $x \in X$ then by (1) there exists a $B \in \mathcal{B} \subseteq \mathcal{P}(X)$ such that $x \in B \subseteq X$ hence $X \in \mathcal{T}[\mathcal{B}]$.

c) Let $U_1, U_2 \in \mathcal{T}[\mathcal{B}]$. If $x \in U_1 \bigcap U_2$ then $x \in U_1 \wedge x \in U_2$, so there exists $B_1, B_2 \in \mathcal{B}$ such that $x \in B_1 \subseteq U_1$ and $x \in B_2 \subseteq U_2$, so $x \in B_1 \bigcap B_2 \subseteq U_1 \bigcap U_2$. By (2) there exist a $B \in \mathcal{B}$ such that $x \in B \subseteq B_1 \bigcap B_2 \subseteq U_1 \bigcap U_2$ proving that $U_1 \bigcap U_2 \in \mathcal{T}[\mathcal{B}]$

d) Let $\{U_i\}_{i \in I} \subseteq \mathcal{T}[\mathcal{B}]$, if $x \in \bigcup_{i \in I} U_i$ then there exist a $i \in I$ such that $x \in U_i$, hence there exist a $B \in \mathcal{B}$ such that $x \in B \subseteq U_i$ which, as $U_i \subseteq \bigcup_{i \in I} U_i$ proves that $\bigcup_{i \in I} U_i \in \mathcal{T}[\mathcal{B}]$

From (a),(b),(c) and (d) it follows that

$$\mathcal{T}[\mathcal{B}] \text{ is a topology on } X$$

If $B \in \mathcal{B}$ then $\forall x \in B$ we have $x \in B \subseteq B$ which proves that $B \in \mathcal{T}[\mathcal{B}]$, hence

$$\mathcal{B} \subseteq \mathcal{T}[\mathcal{B}]$$

Further if $U \in \mathcal{T}[\mathcal{B}]$ then if $x \in U$ there exist by definition of $\mathcal{T}[\mathcal{B}]$ a $B \in \mathcal{B}$ such that $x \in B \subseteq U$. By [theorem: 14.34] it follows that

$$\mathcal{B} \text{ is a basis of } \mathcal{T}[\mathcal{B}]$$ □

The above theorem shows how a subset of $\mathcal{P}(X)$ satisfying condition (1) and (2) can be used to generate a topology on X. What about a general subset of $\mathcal{P}(X)$ (without any conditions), can we construct a topology from it. It tuns out that the answer is yes. Given a $S \subseteq \mathcal{P}(X)$ we can create a $\mathcal{B} \subseteq \mathcal{P}(X)$ that satisfies (1) and (2) and then generate a topology from $\mathcal{B}$.

Theorem 14.40. *Let* X *be a set and* $\mathcal{S} \subseteq \mathcal{P}(X)$ *then if we define* $\mathcal{B}[\mathcal{S}]$ *by*

$$\mathcal{B}[\mathcal{S}] = \left\{ B \in \mathcal{P}(X) | \exists \{S_i\}_{i \in I} \subseteq \mathcal{S},\ I \text{ finite and } I \neq \varnothing \text{ such that } B = \bigcap_{i \in I} S_i \right\} \bigcup \{X\}$$

we have that:

1. $\forall x \in X$ *there exist a* $B \in \mathcal{B}[\mathcal{S}]$ *such that* $x \in B$
2. $\forall B_1, B_2 \in \mathcal{B}[\mathcal{S}]$ *we have* $\forall x \in B_1 \bigcap B_2$ *there exist a* $B \in \mathcal{B}[\mathcal{S}]$ *such that* $x \in B \subseteq B_1 \bigcap B_2$
3. $\mathcal{S} \subseteq \mathcal{B}[\mathcal{S}]$

hence by [theorem: 14.39] we have that

$$\mathcal{T}[\mathcal{B}[\mathcal{S}]] = \{U \in \mathcal{P}(X) | \forall x \in U \text{ there exist a } B \in \mathcal{B}[\mathcal{S}] \text{ such that } x \in B \subseteq U\}$$

is a topology on X. *This topology is called the* ***topology generated by the sub-basis*** $\boldsymbol{\mathcal{S}}$.

Proof.

1. As $\mathcal{B}[\mathcal{S}] = \{B \in \mathcal{P}(X) | \exists \{S_i\}_{i \in I} \subseteq \mathcal{S},\ I \text{ finite and } I \neq \varnothing \text{ such that } B[\mathcal{S}] = \bigcap_{i \in I} S_i\} \bigcup \{X\}$ we have that $X \in \mathcal{B}[\mathcal{S}]$. Hence

$$\forall x \in X \text{ we have } x \in X \subseteq X \text{ where } X \in \mathcal{B}[\mathcal{S}]$$

2. Let $x \in B_1 \bigcap B_2$ where $B_1, B_2 \in \mathcal{B}[\mathcal{S}]$ then there exists finite non empty families $\{S_i\}_{i \in I_1} \subseteq \mathcal{S}$, $\{T_i\}_{i \in I_2} \subseteq \mathcal{S}$ such that $B_1 = \bigcap_{i \in I_1} S_1$ and $B_2 = \bigcap_{i \in I_2} T_i$. Define

$$\{R_i\}_{i \in (I_1 \times \{0\}) \bigcup (I_2 \times \{1\})} \subseteq \mathcal{S} \text{ by } R_{(i,j)} = \begin{cases} S_i \text{ if } j = 0 \\ T_i \text{ if } j = 1 \end{cases}$$

then we have

$$\begin{aligned} y \in \bigcap_{i \in (I_1 \times \{0\}) \bigcup (I_2 \times \{1\})} R_i &\Leftrightarrow \forall (i,j) \in (I_1 \times \{0\}) \bigcup (I_2 \times \{1\}) \text{ we have } y \in R_{(i,j)} \\ &\Leftrightarrow [\forall (i,j) \in I_1 \times \{0\} \text{ we have } y \in R_{(i,j)}] \wedge [\forall (i,j) \in I_2 \times \{1\} \text{ we have } y \in R_{(i,j)}] \\ &\Leftrightarrow [\forall i \in I_1 \text{ we have } y \in R_{(i,0)}] \wedge [\forall i \in I_2 \text{ we have } y \in R_{(i,1)}] \\ &\Leftrightarrow [\forall i \in I_1 \text{ we have } y \in S_i] \wedge [\forall i \in I_2 \text{ we have } y \in T_i] \\ &\Leftrightarrow y \in \bigcap_{i \in I_1} S_i \wedge y \in \bigcap_{i \in I_2} T_i \\ &\Leftrightarrow y \in B_1 \bigcap B_2 \end{aligned}$$

This proves that $B_1 \bigcap B_2 = \bigcap_{i \in (I_1 \times \{0\}) \bigcup (I_2 \times \{1\})} R_i \in \mathcal{B}$ and thus we have found a $B = B_1 \bigcap B_2 \in \mathcal{B}$ such that $x \in B \subseteq B_1 \bigcap B_2$.

3. If $B \in \mathcal{S}$ define $\{S_i\}_{i \in \{1\}} \subseteq \mathcal{S}$ with $S_1 = B$ then $B = S_1 = \bigcap_{i \in \{1\}} S_i$ so that $B \in \mathcal{B}[\mathcal{S}]$. □

Given a family of a topological spaces we can generate a topology for the products of the spaces. It turns out that we have two trivial choices: the box topology and the product topology. In the finite case these topologies are the same.

Definition 14.41. *Let I be a non empty set, $\{\langle X_i, \mathcal{T}_i \rangle\}_{i \in I}$ be a family of of topological spaces then the* ***box topology*** *noted by $\mathcal{T}_{\text{box}}$ is the topology on $\prod_{i \in I} X_i$ generated by the basis*

$$\mathcal{A} = \left\{ \prod_{i \in I} U_i | \{U_i\}_{i \in I} \text{ is a family such that } \forall i \in I \; U_i \in \mathcal{T}_i \right\}$$

or

$$\mathcal{T}_{\text{box}} = \mathcal{T}[\mathcal{A}]$$

Proof. Of course we must ensure that $\mathcal{A}$ satisfies the conditions specified in [theorem: 14.39]. First if $B \in \mathcal{A}$ then there exist a $\{U_i\}_{i \in I}$ satisfying $\forall i \in I$ we have $U_i \in \mathcal{T}_i \subseteq \mathcal{P}(X_i) \Rightarrow U_i \subseteq X_i$ such that $B = \prod_{i \in I} U_i$. Hence using]theorem: 2.141] we have that $B = \prod_{i \in I} U_i \subseteq \prod_{i \in I} X_i$, proving that $B \in \mathcal{P}(\prod_{i \in I} X_i)$ or

$$\mathcal{A} \subseteq \mathcal{P}\left(\prod_{i \in I} X_i \right)$$

Further we have:

1. As $\forall i \in I \;\; \prod_{i \in I} X_i \subseteq \bigcup_{i \in I} X_i \Rightarrow \prod_{i \in I} X_i \in \mathcal{P}(\prod_{i \in I} X_i)$ and $\forall i \in I \; X_i \in \mathcal{T}_i$ it follows that

$$\prod_{i \in I} X_i \in \mathcal{A}$$

Hence $\forall x \in \prod_{i \in I} X_i$ we have for $B = \prod_{i \in I} X_i \in \mathcal{A}$ that $x \in B \in \mathcal{A}$.

2. Let $B_1, B_2 \in \mathcal{A}$ then there exist $\{U_i\}_{i \in I}, \{V_i\}_{i \in I}$ satisfying $\forall i \in I \; U_i, V_i \in \mathcal{T}_i$ such that $B_1 = \prod_{i \in I} U_i$ and $B_2 = \prod_{i \in I} V_i$ then $\forall i \in I$ we have $U_i \bigcap V_i \in \mathcal{T}_i$ so that

$$B_1 \bigcap B_2 = \left(\prod_{i \in I} U_i \right) \bigcap \left(\prod_{i \in I} V_i \right) \underset{\text{[theorem: 2.142]}}{=} \prod_{i \in I} \left(U_i \bigcap V_i \right) \in \mathcal{A}$$

hence $\forall x \in B_1 \bigcap B_2$ we have $x \in B_1 \bigcap B_2 \subseteq B_1 \bigcap B_2$ where $B_1 \bigcap B_2 \in \mathcal{A}$.

By [theorem: 14.39] it follows that $\mathcal{T}[\mathcal{A}]$ is a topology on $\prod_{i \in I} X_i$. □

We can construct the box topology based on the bases of $\mathcal{T}_i$.

Theorem 14.42. *Let I be a non empty set, $\{\langle X_i, \mathcal{T}_i \rangle\}_{i \in I}$ be a family of of topological spaces with $\forall i \in I \; \mathcal{B}_i$ a basis for $\mathcal{T}_i$ then*

$$\mathcal{B} = \left\{ \prod_{i \in I} B_i | \{B_i\}_{i \in I} \text{ is a family such that } \forall i \in I \; B_i \in \mathcal{B}_i \right\}$$

is a basis of $\mathcal{T}_{\text{box}}$ or

$$\mathcal{T}_{\text{box}} = \mathcal{T}[\mathcal{B}]$$

Proof. Using [theorem: 14.41] we have

$$\mathcal{T}_{\text{box}} = \mathcal{T}[\mathcal{A}] \text{ where } \mathcal{A} = \left\{ \prod_{i \in I} U_i | \{U_i\}_{i \in I} \text{ is a family such that } \forall i \in I \; U_i \in \mathcal{T}_i \right\}$$

So if $U \in \mathcal{T}_{\text{box}}$ and $x \in U$ then by [theorem: 14.39] there exist a $\{U_i\}_{i \in I}$ satisfying $\forall i \in I \; U_i \in \mathcal{T}_i$ such that

$$x \in \prod_{i \in I} U_i \subseteq U \text{ hence } \forall i \in I \text{ we have } x_i \in U_i$$

Let $i \in I$ then as $\mathcal{B}_i$ is a basis of $\mathcal{T}_i$ there exist by [theorem: 14.32] a $B \in \mathcal{B}_i$ such that $x_i \in B \subseteq U_i$. So if we define $\mathcal{A}_i = \{B \in \mathcal{B}_i | x_i \in B \subseteq U_i\} \subseteq \mathcal{B}_i$ then $\mathcal{A}_i \neq \varnothing$. Using the Axiom of Choice [see theorem: 3.134] there exist a function $B: I \to \bigcup_{i \in I} \mathcal{A}_i$ such that $\forall i \in I \; B_i \in \mathcal{A}_i \subseteq \mathcal{B}_i$. This defines a family $\{B_i\}_{i \in I}$ such that $\forall i \in I \; x_i \in B_i \subseteq U_i$ and thus by [theorem: 2.141] $x \in \prod_{i \in I} B_i \subseteq \prod_{i \in I} U_i = U$ where $\prod_{i \in I} B_i \in \mathcal{B}$. So by [theorem: 14.34] $\mathcal{B}$ is a basis of $\mathcal{T}_{\text{box}}$. □

The second topology that we can define on a product of sets is the product topology.

Definition 14.43. *Let I be a non empty set, $\{\langle X_i, \mathcal{T}_i \rangle\}_{i \in I}$ be a family of topological spaces then the product topology $\mathcal{T}_{\text{product}}$ on $\prod_{i \in I} X_i$ is defined by the subbase*

$$\mathcal{S} = \{\pi_i^{-1}(V) | i \in I \wedge V \in \mathcal{T}_i\}$$

where $\forall i \in I$

$$\pi_i: \prod_{j \in I} X_j \to X_i \text{ is the projection map defined by } \pi_i(x) = x_i$$

or in other terms

$$\mathcal{T}_{\text{product}} = \mathcal{T}[\mathcal{B}[\mathcal{S}]]$$

[see theorem: 14.40].

***Note* 14.44.** *As $\forall i \in I$ we have $\pi_i^{-1}(X_i) = X$ it follows that $X \in S$ so the basis for $\mathcal{T}_{\text{poduct}}$ is by [theorem: 14.40]*

$$\mathcal{B}[S] = \left\{ B \in \mathcal{P}\left(\prod_{i \in I} X_i \right) | \exists \{S_i\}_{i \in J} \subseteq \mathcal{S}, \; J \text{ finite and } J \neq \varnothing \text{ such that } B = \bigcap_{i \in J} S_i \right\}$$

Theorem 14.45. *Let I be a non empty set, $\{\langle X_i, \mathcal{T}_i \rangle\}_{i \in I}$ be a family of topological spaces then if we define*

$$\mathcal{B} = \left\{ \prod_{i \in I} U_i | \{U_i\}_{i \in I} \text{ is such that there exist a finite } J \subseteq I \text{ with } \forall i \in J \; U_i \in \mathcal{T}_i \text{ and } \forall i \in I \setminus J \; U_i = X_i \right\}$$

we have

$$\mathcal{B} = \mathcal{B}[\mathcal{S}]$$

where [see definition: 14.43]

$$\mathcal{B}[\mathcal{S}] = \left\{ B \in \mathcal{P}\left(\prod_{i \in I} X_i \right) | \exists \{S_i\}_{i \in J} \subseteq \mathcal{S}, \; J \text{ finite and } J \neq \varnothing \text{ such that } B = \bigcap_{i \in J} S_i \right\}$$

and

$$\mathcal{S} = \{\pi_i^{-1}(V) | i \in I \wedge V \in \mathcal{T}_i\}$$

So

$$\mathcal{T}_{\text{product}} \underset{\textit{definition}}{=} \mathcal{T}[\mathcal{B}[\mathcal{S}]] = \mathcal{T}[\mathcal{B}]$$

Proof. Let $B \in \mathcal{B}[S]$. Then there must exist a $\{S_i\}_{i \in J} \subseteq \mathcal{S}$, $\varnothing \neq J$ finite such that $B = \bigcap_{i \in J} S_i$. Let $i \in J$ then as $S_i \in \mathcal{S}$ we have $\exists k_i \in I$ and a $U_{k_i} \in \mathcal{T}_{k_i}$ such that $S_i = \pi_{k_i}^{-1}(U_{k_i})$. Define

$$\forall i \in J \; \{B_{k_i,k}\}_{k \in I} \text{ by } B_{k_i,k} = \begin{cases} U_{k_i} \in \mathcal{T}_k \text{ if } k_i = k \\ X_k \in \mathcal{T}_k \text{ if } k \in I \setminus \{k_i\} \end{cases} \in \mathcal{T}_k$$

Let $x \in S_i = \pi_{k_i}^{-1}(U_{k_i})$ then $\forall k \in I$ we have either:

- $\boldsymbol{k = k_i}$**.** Then $\pi_k(x) = \pi_{k_i}(x) \in U_{k_i} = B_{k_i,k}$
- $\boldsymbol{k \in I \setminus \{k_i\}}$**.** Then $\pi_k(x) \in X_k = B_{k_i,k}$

proving that

$$S_i \subseteq \prod_{k\in I} B_{k_i,k} \tag{14.5}$$

Further if $x \in \prod_{k\in I} B_{k_i,k}$ then $\pi_{k_i}(x) \in B_{k_i,k_i} = U_{k_i}$ so that $x \in \pi_{k_i}^{-1}(U_{k_i}) = S_i$, hence $\prod_{k\in I} B_{k_i,k} \subseteq \mathcal{S}_i$. Combining this with [eq: 14.5] gives

$$S_i = \prod_{k\in I} B_{k_i,k}$$

Then

$$\begin{aligned} B &= \bigcap_{i\in J} S_i \\ &= \bigcap_{i\in J}\left(\prod_{k\in I} B_{k_i,k}\right) \\ &\underset{\text{[theorem: 2.143]}}{=} \prod_{k\in I}\left(\bigcap_{i\in J} B_{k_i,k}\right) \\ &= \prod_{k\in I} C_k \end{aligned} \tag{14.6}$$

where $\{C_k\}_{k\in I}$ is defined by $C_k = \bigcap_{i\in J} B_{k_i,k}$. Let $k \in I$ then as $\varnothing \neq J$ is finite and $B_{k_i,k} \in \mathcal{T}_k$ it follows by [theorem: 14.6] that $C_k \in \mathcal{T}_k$, hence

$$\forall k \in I \text{ we have } C_k \in \mathcal{T}_k \tag{14.7}$$

Define $K = \{k_i | i \in J\} \subseteq I$ which is finite as J is finite [see theorem: 6.44], further as $J \neq \varnothing$ $K \neq \varnothing$. If $k \in I \setminus K$ then $\forall i \in J$ we have $k \neq k_i$ so that $B_{k_i,k} = X_k$ hence $C_k = \bigcap_{i\in J} X_k = X_k$. To conclude we have

$$B = \prod_{k\in I} C_k \text{ and } \forall k \in I\ C_k \in \mathcal{T}_k \text{ and } \forall k \in I \setminus K\ C_k = X_k \text{ where } K \text{ is finite and non empty}$$

So by definition of $\mathcal{B}$ we have $B \in \mathcal{B}$. Hence

$$\mathcal{B}(\mathcal{S}) \subseteq \mathcal{B} \tag{14.8}$$

Let $B \in \mathcal{B}$. Then $B = \prod_{i\in I} U_i$ where $\{U_i\}_{i\in I}$ is a family such that there exist a finite non empty $J \subseteq I$ such that

$$\forall i \in J\ U_i \in \mathcal{T}_i \text{ and } \forall i \in I \setminus J \text{ we have } U_i = X_i \tag{14.9}$$

Define

$$\{U_{i,j}\}_{(i,j)\in I\times J} \text{ by } U_{i,j} = \begin{cases} U_i \text{ if } i = j \\ X_i \text{ if } (i,j) \in I \times J \setminus \{(i,j) \in I \times J | i = j\} \end{cases} = \begin{cases} U_i \text{ if } i = j \\ X_i \text{ if } i \neq j \end{cases} \tag{14.10}$$

Let $i \in I$. If $x \in U_i$ then $\forall j \in J$ we have either $i = j$ then $x \in U_i = U_{i,j}$ or $i \neq j$ so that $x \in X_i = U_{i,j}$ proving that $x \in \bigcap_{j\in J} U_{i,j}$. Hence

$$U_i \subseteq \bigcap_{j\in J} U_{i,j} \tag{14.11}$$

If $x \in \bigcap_{j\in J} U_{i,j}$ then $\forall j \in J$ $x \in U_{i,j}$. For i we have either:

$i \in I \setminus J$. Then $\forall j \in J$ we have $i \neq j$ so that $x \in U_{i,j} \underset{\text{[eq: 14.10]}}{=} X_i \underset{\text{[eq: 14.9]}}{=} U_i$

$i \in J$. As $x \in \bigcap_{j\in J} U_{i,j}$ we have $x \in U_{i,i} \underset{\text{[eq: 14.10]}}{=} U_i$

Hence $\bigcap_{j\in J} U_{i,j} \subseteq U_i$ which by [eq: 14.11] proves that $U_i = \bigcap_{j\in J} U_{i,j}$. Summarized

$$\forall i \in I \text{ we have } U_i = \bigcap_{j\in J} U_{i,j} \tag{14.12}$$

Next

$$\begin{aligned} B &= \prod_{i\in I} U_i \\ &\underset{\text{[eq: 14.12]}}{=} \prod_{i\in I}\left(\bigcap_{j\in J} U_{i,j}\right) \\ &\underset{\text{[theorem: 2.143]]}}{=} \bigcap_{j\in J}\left(\prod_{i\in I} U_{i,j}\right) \end{aligned} \tag{14.13}$$

Let $j \in J$. If $x \in \prod_{i \in I} U_{i,j}$ then $\pi_j(x) \in U_{j,j} \underset{\text{[eq: 14.10]}}{=} U_j$ so that $x \in \pi_j^{-1}(U_j)$ proving that

$$\prod_{i \in I} U_{i,j} \subseteq \pi_j^{-1}(U_j) \tag{14.14}$$

Let $x \in \pi_j^{-1}(U_j)$ then for $i \in I$ we have either:

$i = j$. Then $\pi_i(x) \underset{i=j}{=} \pi_j(x) \in U_j \underset{\text{[eq: 14.10]}}{=} U_{j,j} = U_{i,j}$

$i \neq j$. Then $\pi_i(x) \in X_i \underset{\text{[eq: 14.10]}}{=} U_{i,j}$

so that in all cases $\pi_i(x) \in U_{i,j}$ proving that $x \in \prod_{i \in I} U_{i,j}$. Hence $\pi_j^{-1}(U_j) \subseteq \prod_{i \in I} U_{i,j}$ which combined with [eq: 14.14] proves that

$$\prod_{i \in I} U_{i,j} = \pi_j^{-1}(U_j)$$

Substituting this in [eq: 14.13] gives

$$B = \bigcap_{j \in J} \pi_j^{-1}(U_j)$$

Further $\forall j \in J\ U_j \in \mathcal{T}_j$ so that by definition of S $\pi_j^{-1}(U_j) \in S$ which together with the above and the fact that J is finite proves that $B \in \mathcal{B}[\mathcal{S}]$. Hence $\mathcal{B} \subseteq \mathcal{B}[S]$ which combined with [eq: 14.8] gives

$$\mathcal{B} = \mathcal{B}[\mathcal{S}]$$

proving the theorem. □

Corollary 14.46. *Let I be a non empty set, $\{\langle X_i, \mathcal{T}_i \rangle\}_{i \in I}$ be a family of topological spaces then*

$$\mathcal{B} = \left\{ \bigcap_{i \in J} \pi_i^{-1}(U_i) | \{U_i\}_{i \in J} \text{ is a family such that } J \text{ is finite non empty and } \forall j \in U_j \in \mathcal{T}_j \right\}$$

is basis for the product topology $\mathcal{T}_{\text{product}}$ on $\prod_{i \in I} X_i$.

Proof. Using the definition of the product topology [definition: 14.43] we have

$$\mathcal{T}_{\text{product}} = \mathcal{T}[\mathcal{B}[\mathcal{S}]] \text{ where } \mathcal{S} = \{\pi_i^{-1}(V) | i \in I \wedge V \in \mathcal{T}_i\}$$

Let $B \in \mathcal{B}$ then there exist a finite non empty J and $\{U_i\}_{i \in J}$ satisfying $\forall j \in J\ U_j \in \mathcal{T}_j$ such that $B = \bigcap_{i \in J} \pi_i^{-1}(U_i)$. If $i \in J$ then $\pi_i^{-1}(U_i) \in \mathcal{S} \subseteq \mathcal{B}[\mathcal{S}] \subseteq \mathcal{T}_{\text{product}}$ so that $\pi_i^{-1}(U_i) \in \mathcal{T}_{\text{product}}$. As J is finite non empty it follows from [theorem: 14.6] that $B = \bigcap_{i \in J} \pi_i^{-1}(U_i) \in \mathcal{T}_{\text{product}}$. Hence we have

$$\mathcal{B} \subseteq \mathcal{T}_{\text{product}} \tag{14.15}$$

Using [theorem: 14.45] we have that

$\mathcal{A} = \left\{ \prod_{i \in I} U_i | \{U_i\}_{i \in I} \text{ such that there exist a finite non empty } J \subseteq I \text{ with } \forall i \in J\ U_i \in \mathcal{T}_i \text{ and } \forall i \in I \setminus J\ U_i = X_i \right\}$ is a basis for the product topology $\mathcal{T}_{\text{product}}$ on $\prod_{i \in I} X_i$

If $B \in \mathcal{A}$ then $B = \prod_{i \in I} U_i$ where for $\{U_i\}_{i \in I}$ there exist a finite non empty $J \subseteq I$ such that $\forall i \in J\ U_i \in \mathcal{T}_i$ and $\forall I \setminus J$ we have $U_i = X_i$. Then we have:

1. If $x \in \prod_{i \in I} U_i$ then $\forall i \in I$ we have that $\pi_i(x) \in U_i$ or $x \in \pi_i^{-1}(U_i)$ proving that $x \in \bigcap_{i \in I} \pi_i^{-1}(U_i)$ proving that

$$\prod_{i \in I} U_i \subseteq \bigcap_{i \in I} \pi_i^{-1}(U_i)$$

2. If $x \in \bigcap_{i \in I} \pi_i^{-1}(U_i)$ then $\forall i \in I$ we have either:

   $i \in J$. Then $x \in \pi_i^{-1}(U_i)$ so that $\pi_i(x) \in U_i$

   $i \in I \setminus J$. Then $U_i = X_i$ and $\pi_i(x) \in X_i = U_i$

   so that $x \in \prod_{i \in I} U_i$. Hence we have

$$\bigcap_{i \in I} \pi_i^{-1}(U_i) \subseteq \prod_{i \in I} U_i$$

hence

$$B=\prod_{i\in I}U_i=\bigcap_{i\in I}\pi_i^{-1}(U_i)$$

proving that $B\in\mathcal{B}$. Hence we have that $\mathcal{A}\subseteq\mathcal{B}\subseteq\mathcal{T}_{\text{product}}$ which as $\mathcal{A}$ is a basis for $\mathcal{T}_{\text{product}}$ proves by [theorem: 14.35] that $\mathcal{B}$ is a basis for $\mathcal{T}_{\text{product}}$. □

Using the above corollary it is easy to prove that in the finite case the box topology is equivalent with the product topology.

Theorem 14.47. *Let $\{\langle X_i,\mathcal{T}_i\rangle\}_{i\in I}$ be a family of topological spaces then*

1. $\mathcal{T}_{\text{product}}\subseteq\mathcal{T}_{\text{box}}$ *[in other words the box topology is finer then the product topology]*
2. *If I is finite then $\mathcal{T}_{\text{box}}=\mathcal{T}_{\text{product}}$*

Proof. Consider the bases $\mathcal{B}_{\text{product}}$, $\mathcal{B}_{\text{box}}$ for the product and box topologies [see: 14.41 and 14.45]

$$\mathcal{B}_{\text{box}}=\left\{\prod_{i\in I}U_i|\{U_i\}_{i\in I}\text{ is a family such that }\forall i\in I\ U_i\in\mathcal{T}_i\right\}$$

$$\mathcal{B}_{\text{product}}=\left\{\prod_{i\in I}U_i|\{U_i\}_{i\in I}\text{ is such that there exist a finite }J\subseteq I\text{ with }\forall i\in J\ U_i\in\mathcal{T}_i\text{ and }\forall i\in I\setminus J\ U_i=X_i\right\}$$

1. Let $B\in\mathcal{B}_{\text{product}}$ then $B=\prod_{i\in I}U_i$ where $\{U_i\}_{i\in I}$ is such that there exist a finite $J\subseteq I$ with $\forall i\in J\ U_i\in\mathcal{T}_i$ and $\forall i\in I\setminus J\ U_i=X_i$. As $\forall i\in I\setminus J\ U_i=X_i\in\mathcal{T}_i$ we have $\forall i\in I$ that $U_i\in\mathcal{T}_i$ it follows that $B\in\mathcal{B}_{\text{box}}$. Hence
$$\mathcal{B}_{\text{product}}\subseteq\mathcal{B}_{\text{box}}\tag{14.16}$$
If $x\in X$ and $B\in\mathcal{B}_{\text{product}}$ satisfies $x\in B$ then as $\mathcal{B}_{\text{product}}\subseteq\mathcal{B}_{\text{box}}$ we have also $B\in\mathcal{B}_{\text{box}}$ hence $x\in B\subseteq B$ where $B\in\mathcal{B}_{\text{box}}$. So by [theorem: 14.36] we have that $\mathcal{T}_{\text{box}}$ is finer then $\mathcal{T}_{\text{product}}$ hence $\mathcal{T}_{\text{product}}\subseteq\mathcal{T}_{\text{box}}$.
2. Assume that I is finite. Take $B\in\mathcal{B}_{\text{box}}$ then $B=\prod_{i\in I}U_i\subseteq\prod_{i\in I}X_i$ is such that $\forall i\in I\ U_i\in\mathcal{T}_i$ which as I is finite and $I\setminus I=\varnothing$ means that $B\in\mathcal{B}_{\text{product}}$. Hence $\mathcal{B}_{\text{box}}\subseteq\mathcal{B}_{\text{product}}$ so combining this with [eq: 14.16] gives
$$\mathcal{B}_{\text{product}}=\mathcal{B}_{\text{box}}$$
hence
$$\mathcal{T}_{\text{box}}=\mathcal{B}[\mathcal{B}_{\text{box}}]=\mathcal{B}[\mathcal{B}_{\text{product}}]=\mathcal{T}_{\text{product}}$$ □

Theorem 14.48. *Let $\{\langle X_i,\mathcal{T}_i\rangle\}_{i\in I}$ be a family of topological spaces and let $\forall i\in I\ A_i\subseteq X_i$ be equipped with the subspace topology $(\mathcal{T}_i)_{|A_i}$ then the subspace topology $(\mathcal{T}_{\text{product}})_{|\prod_{i\in I}A_i}$ for $\prod_{i\in I}A_i$ is the product topology of $\{\langle A_i,(\mathcal{T}_i)_{|A_i}\rangle\}_{i\in I}$.*

Proof. Let $\mathcal{B}_{\text{product}}$ be the basis of $\mathcal{T}_{\text{product}}$ then by [theorem: 14.33]

$$(\mathcal{B}_{\text{product}})_{|\prod_{i\in I}A_i}=\left\{B\bigcap\prod_{i\in I}A_i|B\in\mathcal{B}_{\text{product}}\right\}\text{ is a basis for }(\mathcal{T}_{\text{product}})_{|\prod_{i\in I}A_i}$$

further let $\mathcal{T}^{\text{product}}$ be the product topology of $\{\langle A_i,(\mathcal{T}_i)_{|A_i}\rangle\}_{i\in I}$ and $\mathcal{B}^{\text{product}}$ the basis van $\mathcal{T}^{\text{product}}$.

1. If $B\in(\mathcal{B}_{\text{product}})_{|\prod_{i\in I}A_i}$ then by [definition: 14.45] $B=(\prod_{i\in I}U_i)\bigcap(\prod_{i\in I}A_i)$ where $U_i=X_i$ except for a finite subset J of I where $U_i\in\mathcal{T}$. Hence $B=\prod_{i\in I}(U_i\bigcap A_i)$ where for $i\in I\setminus J\ U_i\bigcap A_i=X_i\bigcap A_i=A_i$ and for $i\in J\ \ U_i\bigcap A_i\in(\mathcal{T}_i)_{|A_i}$. So by [definition: 14.45] it follows that $B\in\mathcal{B}^{\text{product}}$ the basis of $\mathcal{T}^{\text{product}}$ [the product topology of $\{\langle A_i,(\mathcal{T}_i)_{|A_i}\rangle\}_{i\in I}$]. Hence we have
$$(\mathcal{B}_{\text{product}})_{|\prod_{i\in I}A_i}\subseteq\mathcal{B}^{\text{product}}$$
2. If $B\in\mathcal{B}^{\text{product}}$ then by [definition: 14.45] $B=\prod_{i\in I}U_i$ where $U_i=A_i=X_i\bigcap A_i$ except for a finite $J\subseteq I$ where $U_i\in(\mathcal{T}_i)_{A_i}\Rightarrow U_i=W_i\bigcap A_i$ where $W_i\in\mathcal{T}_i$. Then if we define $\{V_i\}_{i\in I}$ by $V_i=\begin{cases}X_i\text{ if }i\in I\setminus J\\W_i\text{ if }i\in J\end{cases}$ then $B=\prod_{i\in I}(V_i\bigcap A_i)\underset{\text{[theorem: 2.142]}}{=}(\prod_{i\in I}V_i)\bigcap(\prod_{i\in I}A_i)$. By [definition: 14.45] $\prod_{i\in I}V_i\in\mathcal{B}_{\text{product}}$ so that $B\in(\mathcal{B}_{\text{product}})_{|\prod_{i\in I}A_i}$. Hence we have
$$\mathcal{B}^{\text{product}}\subseteq(\mathcal{B}_{\text{product}})_{|\prod_{i\in I}A_i}$$

Using (1) and (2) it follows that $(\mathcal{B}_{\text{product}})_{|\prod_{i\in I}A_i} = \mathcal{B}^{\text{product}}$ proving that

$$(\mathcal{T}_{\text{product}})_{|\prod_{i\in I}A_i} = \mathcal{T}^{\text{product}} \text{ the product topology of } \{\langle A_i, \mathcal{T}_i\rangle\}_{i\in I}$$ □

14.1.3 Dense sets

Definition 14.49. (Dense set) *Let $\langle X, \mathcal{T}\rangle$ be a topological space then $A \subseteq X$ is a **dense subset of X** if $\overline{A} = X$ [see definition: 14.22 for $\overline{A}$].*

Theorem 14.50. *Let $\langle X, \mathcal{T}\rangle$ be a topological space and $A \subseteq X$ then*

$$A \text{ is a dense subset of } X$$
$$\Updownarrow$$
$$\forall x \in X \text{ we have } \forall U \in \mathcal{T} \text{ with } x \in U \text{ that there } \exists a \in A \text{ such that } a \in U.$$

Proof.

- **⇒.** If A is dense then $X = \overline{A} \underset{\text{[theorem: 14.28]}}{=} \{x \in X | \forall U \in \mathcal{T} \text{ with } x \in U \text{ we have } U \bigcap A \neq \varnothing\}$. So if $x \in X$ then $\forall U \in \mathcal{T}$ with $x \in U$ we have $U \bigcap A \neq \varnothing \Rightarrow \exists a \in A$ such that $a \in U$.
- **⇐.** If $x \in X$ then if $U \in \mathcal{T}$ with $x \in U$ there exist by the hypothesis a $x \in A$ such that $a \in U$, hence $a \in U \bigcap A$ proving that $U \bigcap A \neq \varnothing$. So by [theorem: 14.28] $x \in \overline{A}$. Hence $X \subseteq \overline{A}$ which as $\overline{A} \subseteq X$ proves that $X = \overline{A}$ or that A is dense in X. □

We can rephrase the previous theorem in terms of a basis of a topology.

Theorem 14.51. *Let $\langle X, \mathcal{T}\rangle$ be a topological space with basis $\mathcal{B}$ and $A \subseteq X$ then*

$$A \text{ is dense in } X$$
$$\Updownarrow$$
$$\forall x \in X \text{ we have } \forall B \in \mathcal{B} \text{ with } x \in B \text{ there exist a } a \in A \text{ such that } a \in B$$

Proof.

- **⇒.** Assume that A is dense in X. Let $B \in \mathcal{B}$ be such that $x \in B$ then as $\mathcal{B} \subseteq \mathcal{T}$ we have by the previous theorem [theorem: 14.50] that there exists a $a \in A$ such that $a \in B$.
- **⇐.** Let $x \in X$ then if $U \in \mathcal{T}$ satisfies $x \in U$ we have, as $\mathcal{B}$ is a basis for $\mathcal{T}$, by [theorem: 14.32] that $x \in B \subseteq U$. Using the hypothesis there exist a $a \in A$ such that $a \in B \subseteq U$. Hence using the previous theorem [theorem: 14.50] it follows that A is dense in X. □

Theorem 14.52. *Let $\langle X, \mathcal{T}\rangle$ be a topological space and $A \subseteq X$ then*

$$A^\circ = \varnothing \Leftrightarrow X \setminus A \text{ is dense in } X$$

Proof.

- **⇒.** Assume that $A^\circ = \varnothing$. Let $x \in X$ and $U \in \mathcal{T}$ such that $x \in U$. Assume that $U \subseteq A$ then by [definition: 14.12] $x \in A^\circ$ contradicting $A^\circ \neq \varnothing$, hence we must have that $A \nsubseteq U$. So there exist a $y \in U$ such that $y \notin A \Rightarrow y \in X \setminus A$ proving that $y \in U \bigcap (X \setminus A)$ or $U \bigcap (X \setminus A) \neq \varnothing$. By [theorem: 14.28] it follows that $x \in \overline{X \setminus A}$, hence $X \subseteq \overline{X \setminus A}$ which as $\overline{X \setminus A} \subseteq X$ proves that $X = \overline{X \setminus A}$. Hence $X \setminus A$ is dense in X.
- **⇐.** Assume that $x \in A^\circ$ then as A° is open and by the hypothesis $X \setminus A$ dense there exist by [theorem: 14.50] a $a \in X \setminus A$ such that $a \in A^\circ$, hence $\varnothing \neq A^\circ \bigcap (X \setminus A) \subseteq A \bigcap (X \setminus A) = \varnothing$, leading the the contradiction $\varnothing \neq \varnothing$, Hence the assumption is wrong and we must have that

$$A^\circ = \varnothing$$ □

Definition 14.53. *A topological space $\langle X, \mathcal{T}\rangle$ is a Baire space if for every $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{P}(X)$ satisfying $\forall i \in \mathbb{N}$ A_i is closed and $(A_i)^\circ = \varnothing$ we have that $(\bigcup_{i\in\mathbb{N}} A_i)^\circ = \varnothing$. In other words the union of any family of closed sets with empty interior has also a empty interior.*

The most trivial and least usefully example of a Baire set is $\langle \varnothing, \{\varnothing\}\rangle$

Example 14.54. Let $X=\varnothing$ then by [theorem: 14.2] the only topology on X is $\{\varnothing\}$. The topological $\langle\varnothing,\{\varnothing\}\rangle$ is a Baire space.

Proof. If $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{P}(X)=\{\varnothing\}$ then $\forall i\in\mathbb{N}\ A_i=\varnothing$ so that so that $(\bigcup_{i\in\mathbb{N}}A_i)^\circ\subseteq\bigcup_{i\in\mathbb{N}}A_i=\varnothing$. □

Theorem 14.55. *Let $\langle X,\mathcal{T}\rangle$ be a topological space then*

$$\langle X,\mathcal{T}\rangle \text{ is a Baire space}$$
$$\Updownarrow$$
$$\text{For every family } \{U_i\}_{i\in\mathbb{N}}\subseteq\mathcal{T} \text{ such that } \forall i\in\mathbb{N}\ U_i \text{ is open en dense in } X \text{ we have that } \bigcap_{i\in\mathbb{N}}U_i \text{ is dense in } X$$

Proof.

⇒. Let $\{U_i\}_{i\in\mathbb{N}}$ be a family of open sets that are dense in X. Define $\{A_i\}_{i\in\mathbb{N}}$ by $A_i=X\setminus U_i$ then $\forall i\in\mathbb{N}\ A_i$ is closed and as $X\setminus A_i=X\setminus(X\setminus U_i)=U_i$ is dense in X we have by [theorem: 14.52] that $(A_i)^\circ=\varnothing$. Hence by the definition of a Baire space we have

$$\left(\bigcup_{i\in\mathbb{N}}A_i\right)^\circ=\varnothing$$

Using [theorem: 14.52] again we have that

$$X\setminus\left(\bigcup_{i\in\mathbb{N}}A_i\right) \text{ is dense in } X$$

As $X\setminus(\bigcup_{i\in\mathbb{N}}A_i)\underset{\text{[theorem: 2.132]}}{=}\bigcap_{i\in\mathbb{N}}(X\setminus A_i)=\bigcap_{i\in\mathbb{N}}(X\setminus(X\setminus U_i))=\bigcap_{i\in\mathbb{N}}U_i$ proving by the above that

$$\bigcap_{i\in\mathbb{N}}U_i \text{ is dense in } X$$

⇐. Let $\{A_i\}_{i\in\mathbb{N}}$ be a family of closed sets with $\forall i\in\mathbb{N}\ (A_i)^\circ=\varnothing$. Define $\{U_i\}_{i\in\mathbb{N}}$ by $U_i=X\setminus A_i$ then $\forall i\in\mathbb{N}$ we have that U_i is open and as $(X\setminus U_i)^\circ=(X\setminus(X\setminus A_i))^\circ=(A_i)^\circ=\varnothing$ we have by [theorem: 14.52] that $U_i=X\setminus(X\setminus U_i)$ is dense in X. By the hypothesis we have then that $\bigcap_{i\in\mathbb{N}}U_i$ is dense in X. As $\bigcap_{i\in\mathbb{N}}U_i=\bigcap_{i\in\mathbb{N}}(X\setminus A_i)\underset{\text{[theorem: 2.132]}}{=}X\setminus(\bigcup_{i\in\mathbb{N}}A_i)$ it follows that

$$X\setminus\left(\bigcup_{i\in\mathbb{N}}A_i\right) \text{ is dense in } X$$

Using [theorem: 14.52] again it follows that

$$\left(\bigcup_{i\in\mathbb{N}}A_i\right)^\circ=\varnothing$$

Hence by definition $\langle X,d\rangle$ is a Baire space. □

14.2 Metric spaces

A metric space is a set with a concept of a distance that allows us to define a topology.

Definition 14.56. (Pseudo Metric Space) *A pseudo metric space $\langle X,d\rangle$ is a **non empty** set X together with a function*

$$d\colon X\times X\to\mathbb{R}$$

such that

1. $\forall x\in X\ d(x,x)=0$
2. $\forall x,y\in X$ *we have* $d(x,y)=d(y,x)$
3. $\forall x,y,z\in X$ *we have* $d(x,z)\leqslant d(x,y)+d(y,z)$

*the function $d\colon X\times X\to\mathbb{R}$ is called a **pseudo metric**.*

Definition 14.57. (Metric Space) *A **pseudo metric space** $\langle X,d\rangle$ is called a **metric space** if we have $\forall x,y\in X$ we have $d(x,y)=0\Leftrightarrow x=y$. In other words*

$$d\colon X\times X\to\mathbb{R}$$

satisfies:

1. $\forall x, y \in X$ *we have* $d(x, y) = d(y, x)$
2. $\forall x, y, z \in X$ *we have* $d(x, z) \leqslant d(x, y) + d(y, z)$
3. $\forall x, y \in X$ *we have* $d(x, y) = 0 \Leftrightarrow x = y$ *[hence* $\forall x \in X\ d(x, x) = 0$*]*

the function $d: X \times X \to \mathbb{R}$ *is called a metric.*

Theorem 14.58. *If* $\langle X, d \rangle$ *is a pseudo metric space then* $\forall x, y \in X$ *we have* $0 \leqslant d(x, y)$

Proof. If $x, y \in X$ then $0 = d(x, x) \leqslant d(x, y) + d(y, x) = d(x, y) + d(x, y) = 2 \cdot d(x, y)$ hence

$$0 \leqslant d(x, y)$$

□

To define a topology we need the concept of balls.

Definition 14.59. (Open Ball) *Let* $\langle X, d \rangle$ *be a metric space,* $\varepsilon \in \mathbb{R}^+$ *and* $x \in X$ *then a* ***open ball centered around*** x *noted by* $B_d(x, \varepsilon)$ *is defined by*

$$B_d(x, \varepsilon) = \{ y \in X \,|\, d(x, y) < \varepsilon \} \subseteq X$$

Definition 14.60. (Closed Ball) *Let* $\langle X, d \rangle$ *be a metric space,* $\varepsilon \in \mathbb{R}^+$ *and* $x \in X$ *then a* ***closed ball centered around*** x *noted by* $\overline{B_d(x, \varepsilon)}$ *is defined by*

$$\overline{B_d(x, \varepsilon)} = \{ y \in X \,|\, d(x, y) \leqslant \varepsilon \} \subseteq X$$

We proceed now to define topology based on a pseudo metric.

Lemma 14.61. *Let* $\langle X, d \rangle$ *be a pseudo metric space then if* $x_1, x_2 \in X$ *and* $\varepsilon_1, \varepsilon_2 \in \mathbb{R}^+$ *we have that*

$$\forall x \in B_d(x_1, \varepsilon_1) \bigcap B_d(x_2, \varepsilon_2) \text{ there } \exists \varepsilon \in \mathbb{R}^+ \text{ such that } x \in B_d(x, \varepsilon) \subseteq B_d(x_1, \varepsilon_1) \bigcap B_d(x_2, \varepsilon_2)$$

Proof. Let $x \in B_d(x_1, \varepsilon_1) \bigcap B_d(x_2, \varepsilon_2)$ then $d(x, x_1) < \varepsilon_1$ and $d(x, x_2) < \varepsilon_2$. Define

$$\varepsilon = \min(\varepsilon_1 - d(x_1, x), \varepsilon_2 - d(x_2, x))$$

then as $0 < \varepsilon_1 - d(x_1, x) \wedge 0 < \varepsilon_2 - d(x_2, x)$ we have that

$$\varepsilon \in \mathbb{R}^+$$

Let $y \in B_d(x, \varepsilon)$ then $d(x, y) < \varepsilon$ so that

$$d(x_1, y) \leqslant d(x_1, x) + d(x, y) < d(x_1, y) + \varepsilon \leqslant d(x_1, x) + \varepsilon_1 - d(x_1, x) = \varepsilon_1$$

and

$$d(x_2, y) \leqslant d(x_2, x) + d(x, y) < d(x_2, y) + \varepsilon < d(x_2, x) + \varepsilon_2 - d(x_2, x) = \varepsilon_2$$

so that $y \in B_d(x_1, \varepsilon_1) \wedge y \in B_d(x_2, \varepsilon_2)$ or $y \in B_d(x_1, \varepsilon_1) \bigcap B_d(x_2, \varepsilon_2)$, Hence

$$B_d(x, \varepsilon) \subseteq B_d(x_1, \varepsilon_1) \bigcap B_d(x_2, \varepsilon_2)$$

Finally as $d(x, x) = 0 < \varepsilon$ we have that

$$x \in B_d(x, \varepsilon)$$

□

Corollary 14.62. *Let* $\langle X, d \rangle$ *be a pseudo metric space,* $x \in X$ *and* $\varepsilon \in \mathbb{R}^+$ *then*

$$\forall y \in B_d(x, \varepsilon) \text{ there exist a } \delta \in \mathbb{R}^+ \text{ such that } y \in B_d(y, \delta) \subseteq B_d(x, \varepsilon)$$

Proof. As $y \in B_d(x, \varepsilon) = B_d(x, \varepsilon) \bigcap B_d(x, \varepsilon)$ we can use the previous lemma [lemma: 14.61] to find a $\delta \in \mathbb{R}^+$ such that $B_d(y, \delta) \subseteq B_d(x, \varepsilon) \bigcap B_d(x, \varepsilon) = B_d(x, \varepsilon)$. □

Next we show that open balls can be used to define a topology on a metric space.

Theorem 14.63. *Let $\langle X, d\rangle$ be a pseudo metric space then if we define $\mathcal{B}_d$ by*

$$\mathcal{B}_d = \{B_d(x,\varepsilon) | x \in X \wedge \varepsilon \in \mathbb{R}^+\}$$

we have:

1. *$\forall x \in X$ there exists a $B \in \mathcal{B}_d$ such that $x \in B$.*
2. *$\forall B_1, B_2 \in \mathcal{B}_d$ we have $\forall x \in B_1 \bigcap B_2$ that there exist a $B \in \mathcal{B}_d$ such that $x \in B \subseteq B_1 \bigcap B_2$*

so that by [theorem: 14.39]

$$\mathcal{T}_d = \mathcal{T}[\mathcal{B}_d] \underset{\text{def}}{=} \{U \in \mathcal{P}(X) | \forall x \in U \text{ there exist a } B \in \mathcal{B}_d \text{ such that } x \in B \subseteq U\}$$

is a topology with $\mathcal{B}_d$ as a basis.

Proof.

1. $\forall x \in X$ we have as $d(x,x) = 0 < 1$ that $x \in B_d(x,1) \in \mathcal{B}_d$.
2. If $B_1, B_2 \in \mathcal{B}_d$ then there exist a $x_1, x_2 \in X$ and $\varepsilon_1, \varepsilon_2 \in \mathbb{R}^+$ such that $B_1 = B_d(x_1, \varepsilon_1)$ and $B_2 = B_d(x_2, \varepsilon_2)$. So if $x \in B_1 \bigcap B_2$ we have $x \in B_d(x_1, \varepsilon_1) \bigcap B_d(x_2, \varepsilon_2)$ hence by [lemma: 14.61] there exist a $\varepsilon \in \mathbb{R}^+$ such that for $B = B_d(x.\varepsilon) \in \mathcal{B}_d$ we have

$$x \in B = B_d(x.\varepsilon) \subseteq B_d(x_1, \varepsilon_1) \bigcap B_d(x_2, \varepsilon_2) = B_1 \bigcap B_2$$ □

Corollary 14.64. *Let $\langle X, d\rangle$ be a pseudo metric space that*

$$U \in \mathcal{T}_d \Leftrightarrow \forall x \in U \text{ there exist a } \varepsilon \in \mathbb{R}^+ \text{ such that } x \in B_d(x,\varepsilon) \subseteq U$$

Proof.

⇒. If $x \in U$ open in the metric topology then by the definition of a basis there exists a $y \in X$ and a $\varepsilon > 0$ such that $x \in B_d(y,\varepsilon) \subseteq U$. Using [corollary: 14.62] there exists a $\delta > 0$ such that $x \in B_d(x,\delta) \subseteq B_d(y,\varepsilon) \subseteq U$.

⇐. If for every $x \in U$ there exists a $\delta > 0$ such that $x \in B_d(x,\delta) \subseteq U$ we have as $B_d(x,\delta) \in \mathcal{B}_d$ that $U \in \mathcal{T}_d$ [using theorem: 14.32]. □

The reason why $\overline{B_d(x,\varepsilon)}$ is called a closed ball because it is closed using the metric topology.

Theorem 14.65. *Let $\langle X, d\rangle$ be a pseudo metric space with the metric topology $\mathcal{T}_d$, $x \in X$ and $\varepsilon \in \mathbb{R}^+$ then $\overline{B_d(x,\varepsilon)}$ is closed.*

Proof. Let $y \in X \setminus \overline{B_d(x,\varepsilon)}$ then we must have that $\varepsilon < d(x,y)$. Take $\delta = d(x,y) - \varepsilon > 0$ then if $z \in B_d(y,\delta)$ we have $d(y,z) < \delta = d(x,y) - \varepsilon$. Assume that $d(x,z) \leqslant \varepsilon$ then we have

$$d(x,y) \leqslant d(x,z) + d(y,z) < \varepsilon + d(x,y) - \varepsilon < d(x,y)$$

leading to the contradiction $d(x,y) < d(x,y)$. Hence the assumption is wrong and we must have $\varepsilon < d(x,z)$ so that $z \in X \setminus \overline{B_d(x,\varepsilon)}$ proving that $y \in B_d(y,\delta) \subseteq X \setminus \overline{B_d(x,\varepsilon)}$. So $X \setminus \overline{B_d(x,\varepsilon)}$ is open from which it follows that $\overline{B_d(x,\varepsilon)}$ is closed. □

If we have a metric space $\langle X, d\rangle$ with the metric topology $\mathcal{T}_d$ then the subspace topology has a very simple form as is show in the next theorem:

Theorem 14.66. *Let $\langle X, d\rangle$ be a pseudo metric space with the metric topology $\mathcal{T}_d$ and $A \subseteq X$ then for the restricted function $d_{|A\times A}$: $A \times A \to R$ we have*

1. *$\langle A, d_{|A\times A}\rangle$ is a pseudo metric space.*
2. *If $\langle X, d\rangle$ is a metric space then $\langle A, d_{|A\times A}\rangle$ is a metric space.*
3. *$\mathcal{T}_{d_{|A\times A}} = (\mathcal{T}_d)_{|A}$ [the induced subspace topology on A is the metric topology of the restricted metric topology].*

Proof.

1. We have:
   a. $\forall x \in A \quad d_{|A\times A}(x,x) = d(x,x) = 0$
   b. $\forall x, y \in A \quad d_{|A\times A}(x,y) = d(x,y) = d(y,x) = d_{|A\times A}(y,x)$

c. $\forall x, y, z \in A \quad d_{|A\times A}(x,z) = d(x,z) \leqslant d(x,y) + d(y,z) = d_{|A\times A}(x,y) + d_{|A\times A}(y,z)$

2. Let $x, y \in A$ such that $d_{|A\times A}(x,y) = 0$ then $d(x,y) = 0$ hence $x = y$.
3. Let $x \in A$ and $\varepsilon \in \mathbb{R}^+$ then we have

$$\begin{aligned} y \in B_{d_{|A\times A}}(x,\varepsilon) \quad &\Leftrightarrow \quad y \in A \wedge d_{|A\times A}(x,y) < \varepsilon \\ &\Leftrightarrow \quad y \in A \wedge d(x,y) < \varepsilon \\ &\underset{A\subseteq X \wedge x\in A}{\Leftrightarrow} \quad y \in A \wedge x \in X \wedge d(x,y) < \varepsilon \\ &\Leftrightarrow \quad y \in A \wedge x \in B_d(x,y) \\ &\Leftrightarrow \quad y \in B_d(x,y) \bigcap A \end{aligned}$$

proving that

$$\forall x \in A \text{ and } \forall \varepsilon \in \mathbb{R}^+ \; B_{d_{|A\times A}}(x,\varepsilon) = B_d(x,\varepsilon) \bigcap A \tag{14.17}$$

Let $U \in (\mathcal{T}_d)_{|A}$ then there exist a $V \in \mathcal{T}_d$ such that $U = V \bigcap A$. Let $x \in U$ then $x \in V$ so that that by [corollary: 14.64] there exist a $\varepsilon \in \mathbb{R}^+$ such that $x \in B_d(x,\varepsilon) \subseteq V$, hence $x \in B_d(x,\varepsilon) \bigcap A \subseteq V \bigcap A = U$ or using [eq: 14.17] $x \in B_{d_{|A\times A}}(x,\varepsilon) \subseteq U$. So using [corollary: 14.64] again it follows that $U \in \mathcal{T}_{d_{|A\times A}}$ giving

$$(\mathcal{T}_d)_{|A} \subseteq \mathcal{T}_{d_{|A\times A}} \tag{14.18}$$

Let $U \in \mathcal{T}_{d_{|A\times A}}$ and $x \in U$ then as $\mathcal{T}_{d_{|A\times A}}$ is a topology on A we have $U \subseteq A$, hence $x \in A$. By [corollary: 14.64] there exist a $\varepsilon \in \mathbb{R}^+$ such that $x \in B_{d_{|A\times A}}(x,\varepsilon) \subseteq U \underset{\text{[eq: 14.17]}}{\Rightarrow} x \in B_d(x,\varepsilon) \bigcap A \subseteq U$. As $B_d(x,\varepsilon) \bigcap A \in (\mathcal{B}_d)_{|A}$ a basis for $(\mathcal{T}_d)_{|A}$ [see theorem: 14.33] it follows from [theorem: 14.32] that $U \in (\mathcal{T}_d)_{|A}$. Hence $\mathcal{T}_{d_{|A\times A}} \subseteq (\mathcal{T}_d)_{|A}$ which combined with [eq: 14.18] result in

$$(\mathcal{T}_d)_{|A} = \mathcal{T}_{d_{|A\times A}}$$

□

Definition 14.67. *Two pseudo metrics d_1, d_2 on a set X are equivalent if $\mathcal{T}_{d_1} = \mathcal{T}_{d_2}$. In other words two pseudo metrics are equivalent iff there generated topologies are the same.*

Theorem 14.68. *Let d_1, d_2 be two pseudo metrics on a set X then*

$$\mathcal{T}_{d_2} \text{ is a finer then } \mathcal{T}_{d_1}$$

$$\Updownarrow$$

$$\forall x \in X, \forall \varepsilon \in \mathbb{R}^+ \text{ there exist s } \delta \in \mathbb{R}^+ \text{ such that } x \in B_{d_2}(x,\delta) \subseteq B_{d_1}(x,\varepsilon)$$

Proof.

⇒. If $x \in X$ and $\varepsilon \in \mathbb{R}^+$ we have for $B_{d_1}(x,\varepsilon) \in \mathcal{B}_{d_1}$ using [theorem: 14.36] that there exist a $y \in X$ and a $\delta' \in \mathbb{R}^+$ such that $x \in B_{d_2}(y,\delta') \subseteq B_{d_1}(x,\varepsilon)$. Hence using [theorem: 14.62] there exist a $\delta \in \mathbb{R}^+$ such that $x \in B_{d_2}(x,\delta) \subseteq B_{d_2}(y,\delta') \subseteq B_{d_1}(x,\varepsilon)$.

⇐. Let $B \in \mathcal{B}_{d_1}$ then $\exists x \in X, \varepsilon \in \mathbb{R}^+$ such that $B = B_{d_1}(x,\varepsilon)$, using the hypothesis there exists a $\delta \in \mathbb{R}^+$ such that $x \in B_{d_2}(x,\delta) \subseteq B_{d_1}(x,\varepsilon)$. As $B_{d_2}(x,\varepsilon) \in \mathcal{B}_{d_2}$ it follows from [theorem: 14.36] that $\mathcal{T}_{d_2}$ is finer then $\mathcal{T}_{d_1}$. □

Definition 14.69. *Let $\langle X, d_X \rangle$ and $\langle Y, d_Y \rangle$ be two pseudo metric spaces then a function*

$$\varphi: X \to Y$$

*is a **isometry** if $\forall x, y \in X$ we have*

$$d_Y(\varphi(x), \varphi(y)) = d_X(x,y)$$

*If in addition $\varphi: X \to Y$ is **bijective** then we say that $\varphi: X \to Y$ is a **isometric isomorphism**.*
*If between two pseudo metric spaces there exist a **isometric isomorphism** then we say that these pseudo metric spaces are **isometric**. We note this relation as*

$$X \approx Y$$

*In essence two metric spaces are **isometric** if there exist a bijection between these spaces that conserves distances.*

Note that a isometry between a metric space [not just pseudo metric space] and a pseudo metric space is automatically injective.

Theorem 14.70. *Let $\langle X, d_X\rangle$ be a metric space, $\langle Y, d_Y\rangle$ a pseudo metric space and*

$$\varphi: X \to Y \text{ a isometry}$$

then

$$\varphi \text{ is injective}$$

Hence if in addition $\varphi: X \to Y$ is surjective it follows that $\varphi: X \to Y$ is a bijection so making $\varphi: X \to Y$ a isometric isomorphism.

Proof. If for $x, y \in X$ we have that $\varphi(x) = \varphi(y)$ then $d_X(x, y) = d_Y(\varphi(x), \varphi(y)) = 0$. As d_X is a metric it follows that $x = y$ proving injectivity. □

Theorem 14.71. *Let $\langle X, d_X\rangle$, $\langle Y, d_Y\rangle$ be two pseudo metric spaces and $\varphi: X \to Y$ a **isometric isomorphism** then*

$$\varphi^{-1}: Y \to X$$

is a isometry.

Proof. By [theorem: 2.73] $\varphi^{-1}: Y \to X$ is a function. Further if $x, y \in Y$ then $d_Y(x, y) = d_Y(\varphi(\varphi^{-1}(x)), \varphi(\varphi^{-1}(y))) \underset{\varphi \text{ is a isometry}}{=} d_X(\varphi^{-1}(x), d_x(\varphi^{-1}(y)))$. □

Theorem 14.72. *Let $\langle X, d_X\rangle$, $\langle Y, d_Y\rangle$, $\langle Z, d_Z\rangle$ be pseudo metric spaces and $\varphi: X \to Y$, $\psi: Y \to Z$ isometries then*

$$\psi \circ \varphi: X \to Z \text{ is a isometry}$$

If in addition φ and ψ are isometric isomorphisms then

$$\psi \circ \varphi: X \to Z \text{ is a isometric isomorphism}$$

Proof. First we have

$$d_Z((\psi \circ \varphi)(x), (\psi \circ \varphi)(y)) = d_Z(\psi(\varphi(x)), \psi(\varphi(y))) = d_Y(\varphi(x), \varphi(y)) = d_X(x, y)$$

proving that $\psi \circ \varphi: X \to Z$ is a isometry. Further if φ, ψ isometric isomorphisms, hence bijective, then by [theorem: 2.76] $\psi \circ \varphi$ is a bijection, so $\psi \circ \varphi$ is a isometric isomorphism. □

Theorem 14.73. *Let $\langle X, d_X\rangle$, $\langle Y, d_Y\rangle$ be two pseudo metric spaces and $\varphi: X \to Y$ a isometric isomorphism then we have:*

1. *$\forall x \in X$, $\varepsilon \in \mathbb{R}^+$ we have $\varphi(B_{d_X}(x, \varepsilon)) = B_{d_Y}(\varphi(x), \varepsilon)$*
2. *$\forall x \in Y$, $\varepsilon \in \mathbb{R}^+$ we have $\varphi^{-1}(B_{d_Y}(y, \varepsilon)) = B_{d_X}(\varphi^{-1}(y), \varepsilon)$*

Proof.

1. If $y \in \varphi(B_{d_X}(x, \varepsilon))$ then there exist a $z \in B_{d_X}(x, \varepsilon)$ such that $y = \varphi(z)$, hence $d_X(x, z) < \varepsilon$ or as φ is a isometry
$$d_Y(\varphi(x), y) = d_Y(\varphi(x), \varphi(z)) = d_X(x, z) < \varepsilon$$
proving that $y \in B_{d_Y}(\varphi(x), \varepsilon)$. On the other hand if $y \in B_{d_Y}(\varphi(x), \varepsilon)$ then $d_Y(\varphi(x), y) < \varepsilon$, hence
$$d_X(x, \varphi^{-1}(y)) = d_Y(\varphi(x), \varphi(\varphi^{-1}(y))) = d_Y(\varphi(x), y) < \varepsilon$$
so that $\varphi^{-1}(y) \in B_{d_X}(x, \varepsilon)$.
2. As $\psi = \varphi^{-1}: Y \to X$ is also a isometry we have
$$B_{d_X}(\varphi^{-1}(y), \varepsilon) = B_{d_X}(\psi(y), \varepsilon) \underset{(1)}{=} \psi(B_{d_Y}(y, \varepsilon)) = \varphi^{-1}(B_{d_Y}(y, \varepsilon))$$ □

Theorem 14.74. *Let $\langle X, d_x\rangle$, $\langle Y, d_Y\rangle$ be two pseudo metric spaces and $\varphi: X \to Y$ a isometric isomorphism. Then*

1. *$\mathcal{T}_{d_X} = \{\varphi^{-1}(V) | V \in \mathcal{T}_{d_Y}\} = \{U \subseteq X | \varphi(U) \in \mathcal{T}_{d_Y}\}$*
2. *$\mathcal{T}_{d_Y} = \{\varphi(U) | U \in \mathcal{T}_{d_X}\} = \{V \subseteq Y | \varphi^{-1}(V) \in \mathcal{T}_{d_X}\}$*

Proof.

1. Let $U \in \{\varphi^{-1}(V) | V \in \mathcal{T}_{d_Y}\}$ then there exist a $V \in \mathcal{T}_{d_Y}$ such that $U = \varphi^{-1}(V)$, hence $\varphi(U) = V \in \mathcal{T}_{d_Y}$ proving that
$$\{\varphi^{-1}(V) | V \in \mathcal{T}_{d_Y}\} \subseteq \{U \subseteq X | \varphi(U) \in \mathcal{T}_{d_Y}\} \tag{14.19}$$

If $U \in \{U \subseteq X \,|\, \varphi(U) \in \mathcal{T}_{d_Y}\}$ then $\varphi(U) \in \mathcal{T}_{d_Y}$ so, as $U = \varphi^{-1}(\varphi(U))$, we have $U \in \{\varphi^{-1}(V) | V \in \mathcal{T}_{d_Y}\}$, proving that $\{U \subseteq X \,|\, \varphi(U) \in \mathcal{T}_{d_Y}\} \subseteq \{\varphi^{-1}(V) | V \in \mathcal{T}_{d_Y}\}$. Combining this with [eq: 14.19] proves that

$$\{\varphi^{-1}(V) | V \in \mathcal{T}_{d_Y}\} = \{U \subseteq X \,|\, \varphi(U) \in \mathcal{T}_{d_Y}\} \tag{14.20}$$

Let $U \in \mathcal{T}_{d_X}$ and take $y \in \varphi(U)$ then $\exists x \in U$ such that $y = \varphi(x)$. Using [theorem: 14.64] there exist a $\varepsilon \in \mathbb{R}^+$ such that $x \in B_{d_X}(x, \varepsilon) \subseteq U$ hence

$$y = \varphi(x) \in \varphi(B_{d_X}(x, \varepsilon)) \underset{\text{[theorem: 14.73]}}{=} B_{d_Y}(\varphi(x), \varepsilon) \subseteq \varphi(U)$$

Hence, using [theorem: 14.64] it follows that $\varphi(U) \in \mathcal{T}_{d_Y}$ giving $U \in \{U \subseteq X \,|\, \varphi(U) \in \mathcal{T}_{d_Y}\}$. So we conclude that

$$\mathcal{T}_{d_X} \subseteq \{U \subseteq X \,|\, \varphi(U) \in \mathcal{T}_{d_Y}\} \tag{14.21}$$

Let $U \in \{\varphi^{-1}(V) | V \in \mathcal{T}_{d_Y}\}$ and $x \in U$ then there exist a $V \in \mathcal{T}_{d_Y}$ such that $x \in U = \varphi^{-1}(V) \Rightarrow \varphi(x) \in V$. As V is open there exist by [theorem: 14.64] a $\varepsilon \in \mathbb{R}^+$ such that

$$\varphi(x) \in B_{d_Y}(\varphi(x), \varepsilon) \subseteq V$$

Hence

$$x = \varphi^{-1}(\varphi(x)) \in \varphi^{-1}(B_{d_Y}(\varphi(x), \varepsilon)) \subseteq \varphi^{-1}(V) = U$$

As $\varphi^{-1}(B_{d_Y}(\varphi(x), \varepsilon)) \underset{\text{[theorem: 14.73]}}{=} B_{d_X}(\varphi^{-1}(\varphi(x)), \varepsilon) = B_{d_X}(x, \varepsilon)$ it follows from the above that

$$x \in B_{d_X}(x, \varepsilon) \subseteq U$$

So by [theorem: 14.64] we have $U \in \mathcal{T}_{d_X}$. Hence $\{\varphi^{-1}(V) | V \in \mathcal{T}_{d_Y}\} \subseteq \mathcal{T}_{d_X}$ and combining this with [eq: 14.21] gives

$$\mathcal{T}_{d_X} \subseteq \{U \subseteq X \,|\, \varphi(U) \in \mathcal{T}_{d_Y}\} \underset{\text{[eq: 14.20]}}{=} \{\varphi^{-1}(V) | V \in \mathcal{T}_{d_Y}\} \subseteq \mathcal{T}_{d_X}$$

or

$$\mathcal{T}_{d_X} = \{U \subseteq X \,|\, \varphi(U) \in \mathcal{T}_{d_Y}\} = \{\varphi^{-1}(V) | V \in \mathcal{T}_{d_Y}\}$$

2. As $\psi: Y \to X$ where $\psi = \varphi^{-1}$ is a isometry it follows from (1) that

$$\begin{aligned} \mathcal{T}_{d_Y} &= \{U \subseteq Y \,|\, \psi(U) \in \mathcal{T}_{d_X}\} \\ &= \{U \subseteq Y \,|\, \varphi^{-1}(U) \in \mathcal{T}_{d_X}\} \\ \mathcal{T}_{d_Y} &= \{\psi^{-1}(V) | V \in \mathcal{T}_{d_X}\} \\ &= \{\varphi(V) | V \in \mathcal{T}_{d_X}\} \end{aligned}$$

hence

$$\mathcal{T}_{d_Y} = \{U \subseteq Y \,|\, \varphi^{-1}(U) \in \mathcal{T}_{d_X}\} = \{\varphi(V) | V \in \mathcal{T}_{d_X}\}$$ □

Definition 14.75. *Let $\langle X, d\rangle$ be a pseudo metric space and $A \subseteq X$ then A **is bounded** if*

$$\exists M \in \mathbb{R}^+ \text{ such that } \forall x, y \in A \text{ we have } d(x, y) \leqslant M$$

*If A is bounded and **non empty** then using the fact that $\langle \mathbb{R}, \leqslant\rangle$ is conditional complete [see theorem: 10.18] it follows that*

$$\sup(\{d(x, y) | x, y \in A\}) \text{ exist for } A$$

*The **diameter of A** noted as $\operatorname{diam}(A)$ is then defined by*

$$\operatorname{diam}(A) = \sup(\{d(x, y) | x, y \in A\})$$

Example 14.76. Let $\langle X, d\rangle$ be a metric space then $\varnothing$ is bounded.

Proof. $\forall x, y \in \varnothing$ we have vacuously that $d(x, y) \leqslant 1$ □

Theorem 14.77. *Let $\langle X, d\rangle$ a pseudo metric space and $U \subseteq X$ a bounded set then every subset of U is also bounded.*

Proof. As U is bounded there exist a $M \in \mathbb{R}^+$ such that $\forall x, y \in U$ we have $d(x, y) \leqslant M$. Let $V \subseteq U$ then $\forall x, y \in V$ we have as $V \subseteq U$ that $x, y \in U$ hence $d(x, y) \leqslant M$, proving that V is bounded. □

Theorem 14.78. *Let $\langle X, d\rangle$ be a pseudo metric space then $\forall x \in X$, $\forall \varepsilon \in \mathbb{R}^+$ we have that*

$$B_d(x,\varepsilon) \text{ and } \overline{B_d(x,\varepsilon)} \text{ are bounded}$$

and

$$\operatorname{diam}(B_d(x,\varepsilon)) \leqslant 2\cdot\varepsilon \wedge \operatorname{diam}(\overline{B_d(x,\varepsilon)}) \leqslant 2\cdot\varepsilon$$

Proof.

1. Let $y, z \in B_d(x,\varepsilon)$ then $d(y,z) \leqslant d(y,x) + d(x,z) < \varepsilon + \varepsilon = 2\cdot\varepsilon$ proving that $B_d(x,\varepsilon)$ is bounded and $\operatorname{diam}(B_d(x,\varepsilon)) = \sup(\{d(x,y)|x, y \in B_d(x,\varepsilon)\}) \leqslant 2\cdot\varepsilon$.
2. Let $y, z \in \overline{B_d(x,\varepsilon)}$ then $d(y,z) \leqslant d(y,x) + d(x,z) \leqslant \varepsilon + \varepsilon = 2\cdot\varepsilon$ proving that $\overline{B_d(x,\varepsilon)}$ is bounded and $\operatorname{diam}(\overline{B_d(x,\varepsilon)}) = \sup(\{d(x,y)|x, y \in \overline{B_d(x,\varepsilon)}\}) \leqslant 2\cdot\varepsilon$. □

Theorem 14.79. *Let $\{\langle X_i, d_i\rangle\}_{i\in I}$ be a **finite** family of pseudo metric spaces then for*

$$d_{\max}: \left(\prod_{i\in I} X_i\right) \times \left(\prod_{i\in I} X_i\right) \to \mathbb{R} \text{ defined by } d_{\max}(x,y) = \max(\{d_i(\pi_i(x), \pi_i(y))|i \in I\})$$

where $\forall i \in I$ π_i is the projection map defined by

$$\pi_i: \prod_{j\in I} X_j \to X_i \text{ is defined by } \pi_i(x) = x(i) \underset{\text{note}}{=} x_i$$

we have:

1. *$\langle \prod_{i\in I} X_i, d_{\max}\rangle$ is a pseudo metric space.*
2. *If $\forall i \in I$ $\langle X_i, d_i\rangle$ is a metric space then $\langle \prod_{i\in I} X_i, d_{\max}\rangle$ is a metric space*
3. *$\mathcal{T}_{d_{\max}} = \mathcal{T}_{\text{box}} = \mathcal{T}_{\text{product}}$ [the metric topology is equal to the box and product topology of $\prod_{i\in I} X_i$.*

***Note* 14.80.** *As I is finite $\max(\{d_i(\pi_i(x), \pi_i(y))|i \in I\})$ exist by [theorem: 6.49].*

Proof.

1. Let $x, y, z \in \prod_{i\in I} X_i$ then
   a. $d_{\max}(x,x) = \max(\{d_i(\pi_i(x), \pi_i(x))|i \in I\}) = \max(\{0\}) = 0$
   b. $d_{\max}(x,y) = \max(\{d_i(\pi_i(x).\pi_i(y))\}|i \in I) = \max(\{d_i(\pi_i(y).\pi_i(x))|i \in I\}) = d(y,x)$
   c. We have

$$\begin{aligned} d_{\max}(x,z) &= \max(\{d_i(\pi_i(x), \pi_i(z))|i \in I\}) \\ &\leqslant_{\text{[theorem: 3.69]}} \max(\{d_i(\pi_i(x), \pi_i(y)) + d(\pi_i(y), \pi_i(z))|i \in I\}) \\ &\leqslant_{\text{[theorem: 3.69]}} \max(\{\max(\{d_i(\pi_i(x), \pi_i(y))|i \in I\}) + d(\pi_i(y), \pi_i(z))|i \in I\}) \\ &\underset{\text{[theorem: 10.26]}}{=} \max(\{d_i(\pi_i(x), \pi_i(y))|i \in I\}) + \max(\{d(\pi_i(y), \pi_i(z))|i \in I\}) \\ &= d_{\max}(x,y) + d_{\max}(y,z) \end{aligned}$$

2. Let $d(x,y) = 0$ then as $\forall i \in I$ we have

$$0 \leqslant d_i(\pi_i(x), \pi_i(y)) \leqslant \max(\{d_i(\pi_i(x), \pi_i(y))|i \in I\} = d(x,y) = 0$$

   so that $d_i(\pi_i(x), \pi_i(y)) = 0$. As d_i is a metric it follows that $\pi_i(x) = \pi_i(y) \Rightarrow x(i) = y(i)$ proving finally that $x = y$.
3. As I is finite we have by [theorem: 14.47] that

$$\mathcal{T}_{\text{box}} = \mathcal{T}_{\text{product}} \tag{14.22}$$

   The bases of $\mathcal{T}_d$ and $\mathcal{T}_{\text{box}}$ are [see definitions: 14.63, 14.42]

$$\mathcal{B}_{d_{\max}} = \{B_{d_{\max}}(x,\varepsilon)|x \in X \wedge \varepsilon \in \mathbb{R}^+\}$$

   and

$$\mathcal{B}_{\text{box}} = \left\{\prod_{i\in I} B_i|\{B_i\}_{i\in I} \text{ such that } \forall i \in I B_i \in \mathcal{B}_{d_i}\right\}$$

Let $x \in \prod_{i \in I} X_i$ and $B \in \mathcal{B}_{d_{\max}}$ such that $x \in B$. Then there exists a $y \in X$, $\varepsilon \in \mathbb{R}^+$ such that $x \in B_{d_{\max}}(y, \varepsilon) \subseteq B$ or using [theorem: 14.62] there exist a $\delta \in \mathbb{R}^+$ such that

$$x \in B_{d_{\max}}(x, \delta) \subseteq B_{d_{\max}}(y, \varepsilon) \subseteq B$$

Take $\prod_{i \in I} B_{d_i}(\pi_i(x), \delta) \in \mathcal{B}_{\text{box}}$ then, as $\forall i \in I$ we have $d_i(\pi_i(x), \pi_i(x_i)) = 0 < \delta$, it follows that $\pi_i(x) \in B_{d_i}(\pi_i(x), \delta)$, proving

$$x \in \prod_{i \in I} B_{d_i}(\pi_i(x), \delta)$$

Let $z \in \prod_{i \in I} B_{d_i}(\pi_i(x), \delta)$ then $\forall i \in I$ we have $\pi_i(z) \in B_{d_i}(\pi_i(x), \delta)$ so that $d_i(\pi_i(x), \pi_i(z)) < \delta$. Hence $d_{\max}(x, z) = \max(\{d_i(\pi_i(x), \pi_i(z)) | i \in I\}) < \delta$ which proves that $z \in B_{d_{\max}}(x, \delta)$, giving

$$\prod_{i \in I} B_{d_i}(\pi_i(x), \delta) \subseteq B_{d_{\max}}(x, \delta) \subseteq B$$

So if we take $B' = \prod_{i \in I} B_{d_i}(\pi_i(x), \delta) \in \mathcal{B}_{\text{box}}$ then we have

$$\forall x \in \prod_{i \in I} X_i \text{ and } \forall B \in \mathcal{B}_{d_{\max}} \text{ there exist a } B' \in \mathcal{B}_{\text{box}} \text{ such that } x \in B' \subseteq B \tag{14.23}$$

Let $x \in \prod_{i \in I} X_i$ and $B \in \mathcal{B}_{\text{box}}$ such that $x \in B$. So $B = \prod_{i \in I} B_i$ where $\forall i \in I$ $B_i \in \mathcal{B}_{d_i} \subseteq \mathcal{T}_{d_i}$ and $\pi_i(x) \in B_i$. Using [theorem: 14.64] there exist a $\delta_i \in \mathbb{R}^+$ such that $\pi_i(x) \in B_{d_i}(\pi_i(x), \delta_i) \subseteq B_i$. Take $\delta = \min(\{\delta_i | i \in I\}) \in \mathbb{R}^+$ then for $z \in B_{d_{\max}}(x, \delta)$ we have

$$\forall i \in I \; d_i(\pi_i(x), \pi_i(z)) \leqslant \max(\{d_i(\pi_i(x), \pi_i(x)) | i \in I\}) = d(x, z) < \delta \leqslant \delta_i$$

so that $\forall i \in I$ $\pi_i(z) \in B_{d_i}(\pi_i(x), \pi_i(z)) \subseteq B_i$. So we have that $z \in \prod_{i \in I} B_i$ proving that $\mathcal{B}_{d_{\max}}(x, \delta) \subseteq \prod_{i \in I} B_i = B$. So if we take $B' = B_{d_{\max}}(x, \delta)$ then we have proved that

$$\forall x \in \prod_{i \in I} X_i \text{ and } \forall B \in \mathcal{B}_{\text{box}} \text{ there exist a } B' \in \mathcal{B}_{d_{\max}} \text{ such that } x \in B' \subseteq B \tag{14.24}$$

Combining now [eqs: 14.23, 14.24] with [theorem: 14.36] proves

$$\mathcal{T}_{d_{\max}} = \mathcal{T}_{\text{box}}$$

□

For metric spaces we have a simple test to determine if a set is dense in a topological space.

Theorem 14.81. *Let $\langle X, d \rangle$ a pseudo metric space and $A \subseteq X$ then we have*

$$A \text{ is dense in } X \text{ [using the metric topology } \mathcal{T}_d]$$

$$\Updownarrow$$

$$\forall x \in X \text{ we have } \forall \varepsilon \in \mathbb{R}^+ \text{ that there exist a } a \in A \text{ such that } d(x, a) < \varepsilon$$

Proof.

⇒. Let $x \in X$ then $\forall \varepsilon \in \mathbb{R}^+$ $x \in B_d(x, \varepsilon)$ so that by [theorem: 14.51] there exist a $a \in A$ such that $a \in B_d(x, \varepsilon)$, hence $d(x, a) < \varepsilon$.

⇐. Let $x \in X$ and let $B \in \mathcal{B}_d$ such that $x \in B$. As $B \in \mathcal{B}_d$ there exists a $y \in X$ and a $\varepsilon \in \mathbb{R}^+$ such that $x \in B = B_d(y, \varepsilon)$. By [theorem: 14.62] there exist a $\delta \in \mathbb{R}^+$ such that

$$x \in B_d(x, \delta) \subseteq B_d(y, \varepsilon) = B.$$

By the hypotheses there exist a $a \in A$ such that $d(x, a) < \delta$ or $a \in B_d(x, \delta) \subseteq B$. So

$$\forall x \in X \text{ we have } \forall B \in \mathcal{B}_d \text{ with } x \in B \text{ there exist a } a \in A \text{ such that } a \in B$$

which by [theorem: 14.51] implies that A is dense in X. □

14.3 Normed space

The idea of a (pseudo) normed space is that of a real or complex vector space where the concept of a length of a vector is defined.

Notation 14.82. *from now on* $\mathbb{K}$ *represent either the field* $\mathbb{R}$ *or the field* $\mathbb{C}$

Definition 14.83. (Pseudo Norm) *A* ***pseudo normed*** *space noted as* $\langle X, \|\|\rangle$ *is a real [or complex] vector space* X *together with a function* $\|\|: X \to \mathbb{R}$ *called the* ***norm*** *such that*

1. $\forall x \in X$ *we have* $0 \leqslant \|x\|$
2. $\forall x \in X$, $\forall \alpha \in \mathbb{K}$ *we have* $\|\alpha \cdot x\| = |\alpha| \cdot \|x\|$
3. $\forall x, y \in X$ *we have* $\|x + y\| \leqslant \|x\| + \|y\|$

Theorem 14.84. *Let* $\langle X, \|\|\rangle$ *be a pseudo normed space then* $\|0\| = 0$

Proof. We have $\|0\| = \|0 \cdot 0\| = |0| \cdot \|0\| = 0 \cdot \|0\| = 0$ □

Definition 14.85. (Norm) *A pseudo normed space* $\langle X, \|\|\rangle$ *is a normed space if we have also*

$$\forall x \in X \text{ with } \|x\| = 0 \text{ we have } x = 0$$

Theorem 14.86. *Let* $\langle X, \|\|\rangle$ *be a pseudo normed space and* $\{x_i\}_{i \in I} \subseteq X$, I *finite then*

$$\left\| \sum_{i \in I} x_i \right\| \leqslant \sum_{i \in I} \|x_I\|$$

Proof. We first prove this for $I = \{1, \ldots, n\}$, so let

$$\mathcal{S} = \left\{ n \in \mathbb{N}_0 | \forall \{x_i\}_{i \in \{1, \ldots, n\}} \subseteq X \text{ we have } \left\| \sum_{i \in \{1, \ldots, n\}} x_i \right\| \leqslant \sum_{i \in \{1, \ldots, n\}} \|x_I\| \right\}$$

then we have:

$0 \in S$. As $\{1, \ldots, 0\} = \varnothing$ we have

$$\left\| \sum_{i \in \{1, \ldots, 0\}} x_i \right\| = \left\| \sum_{i \in \varnothing} x_i \right\| = \|0\| = 0 = \sum_{i \in \varnothing} \|x_i\| = \sum_{i \in \{1, \ldots, 0\}} \|x_i\|$$

hence $0 \in S$.

$n \in S \Rightarrow n + 1 \in S$. Let $\{x_i\}_{i \in \{1, \ldots, n+1\}} \subseteq X$ then we have

$$\begin{aligned}
\left\| \sum_{i \in \{1, \ldots, n+1\}} x_i \right\| &\underset{\text{[theorem: 11.43]}}{=} \left\| \sum_{i \in \{1, \ldots, n\}} x_i + \sum_{i \in \{n+1\}} x_i \right\| \\
&\underset{\text{[theorem: 11.34]}}{=} \left\| \sum_{i \in \{1, \ldots, n\}} x_i + x_{n+1} \right\| \\
&\leqslant \left\| \sum_{i \in \{1, \ldots, n\}} x_i \right\| + \|x_{n+1}\| \\
&\leqslant_{n \in S} \sum_{i \in \{1, \ldots, n\}} \|x_i\| + \|x_{n+1}\| \\
&\underset{\text{[theorem: 11.34]}}{=} \sum_{i \in \{1, \ldots, n\}} \|x_i\| + \sum_{i \in \{n+1\}} \|x_{n+1}\| \\
&\underset{\text{[theorem: 11.43]}}{=} \sum_{i \in \{1, \ldots, n+1\}} \|x_i\|
\end{aligned}$$

proving that $n + 1 \in S$.

Using mathematical induction proves that

$$\forall n \in \mathbb{N}_0 \text{ we have if } \{x_i\}_{i \in \{1, \ldots, n\}} \subseteq X \text{ that } \left\| \sum_{i \in \{1, \ldots, n\}} x_i \right\| \leqslant \sum_{i \in \{1, \ldots, n\}} \|x_i\| \tag{14.25}$$

Let now I be a finite set and $\{x_i\}_{i\in I}\subseteq X$ then there exist a bijection $\beta\colon\{1,\dots,n\}\to I$ so that we have

$$\begin{aligned}\left\|\sum_{i\in I}x_i\right\| &\underset{\text{[theorem: 11.36]}}{=} \left\|\sum_{i\in\{1,\dots,n\}}x_{\beta(i)}\right\| \\ &\leqslant_{\text{[eq: 14.25]}} \sum_{i\in\{1,\dots,n\}}\|x_{\beta(i)}\| \\ &\underset{\text{[theorem: 11.36]}}{=} \sum_{i\in I}\|x_i\|\end{aligned}$$

□

Theorem 14.87. *Let $\langle X,\|\|\rangle$ be a pseudo normed space then $\forall x,y\in X$ we have*

$$\|x\|-\|y\|\leqslant\|x+y\|\wedge\|y\|-\|x\|\leqslant\|x+y\|\wedge|\|x\|-\|y\||\leqslant\|x+y\|$$

Proof. We have $\|x\|\leqslant\|x+y-y\|\leqslant\|x+y\|+\|y\|$ and $\|y\|\leqslant\|y+x-x\|\leqslant\|x+y\|+\|x\|$ so that

$$\|x\|-\|y\|\leqslant\|x+y\| \text{ and } \|y\|-\|x\|\leqslant\|x+y\|$$

For $\|x\|-\|y\|$ we have either

$0\leqslant\|x\|-\|y\|$. Then $|\|x\|-\|y\||=\|x\|-\|y\|\leqslant\|x+y\|$

$\|x\|-\|y\|<0$. Then $|\|x\|-\|y\||=\|y\|-\|x\|\leqslant\|x+y\|$ □

Given a normed space we can define a metric and thus also a topology.

Theorem 14.88. *Let $\langle X,\|\|\rangle$ be a pseudo normed space and define*

$$d_{\|\|}\colon X\times X\to X \text{ by } d_{\|\|}(x,y)=\|x-y\|$$

then

$$\langle X,d_{\|\|}\rangle \text{ is a pseudo metric space}$$

Further if $\langle X,\|\|\rangle$ is a normed space then $\langle X,d_{\|\|}\rangle$ is a metric space.

Proof. If $\langle X,\|\|\rangle$ is a pseudo normed space then we have for $x,y,z\in X$

1. $d_{\|\|}(x,y)=\|x-y\|\geqslant 0$
2. $d_{\|\|}(x,y)=\|x-y\|=\|(-1)\cdot(y-x)\|=|-1|\cdot\|y-x\|=d_{\|\|}(y,x)$
3. $d_{\|\|}(x,z)=\|x-z\|=\|x-y+y-z\|\leqslant\|x-y\|+\|y-z\|=d_{\|\|}(x,y)+d_{\|\|}(y,z)$

If in addition if $\langle X,\|\|\rangle$ is a normed space then if $d_{\|\|}(x,y)=0$ we have $\|x-y\|=0$ or as $\|\|$ is a norm that $x-y=0\Rightarrow x=y$. Hence $d_{\|\|}$ is a metric. □

As a pseudo metric defines a topology and a pseudo norm defines a pseudo metric a pseudo norm can be used to define a topology.

Definition 14.89. *Let $\langle X,\|\|\rangle$ be pseudo normed space, $x\in X$ and $\varepsilon\in\mathbb{R}^+$ then the open ball $B_{\|\|}(x,\varepsilon)$ in the pseudo normed space is defined by*

$$B_{\|\|}(x,\varepsilon)=\{y\in X\,|\,\|x-y\|<\varepsilon\}$$

the set of all open balls in the pseudo normed space is noted by $\mathcal{B}_{\|\|}$ hence

$$\mathcal{B}_{\|\|}=\{B_{\|\|}(x,\varepsilon)|x\in X\wedge\varepsilon\in\mathbb{R}^+\}$$

***Note* 14.90.** *As $d_{\|\|}(x,y)=\|x-y\|$ we have that*

$$B_{d_{\|\|}}(x,\varepsilon)=\{y\in X\,|\,d_{\|\|}(x,y)<\varepsilon\}=\{y\in X\,|\,\|x-y\|<\varepsilon\}=B_{\|\|}(x,\varepsilon)$$

and further

$$\mathcal{B}_{d_{\|\|}}=\{B_{d_{\|\|}}(x,\varepsilon)|x\in X\wedge\varepsilon\in\mathbb{R}^+\}=\{B_{\|\|}(x,\varepsilon)|x\in X\wedge\varepsilon\in\mathbb{R}^+\}=\mathcal{B}_{\|\|}$$

Theorem 14.91. *Let $\langle X, \|\|_X \rangle$ be a pseudo normed space then we have:*

1. *If $\varepsilon \in \mathbb{R}^+$ then $B_{\|\|}(0,\varepsilon) = \varepsilon \cdot B_{\|\|}(0,1)$*
2. *If $x \in X$ and $\varepsilon \in \mathbb{R}^+$ then $B_{\|\|}(x,\varepsilon) = x + B_{\|\|}(0,\varepsilon)$*

Proof.

1. If $x \in B_{\|\|}(0,\varepsilon)$ then $\|x\| < \varepsilon$, define $x' = \frac{1}{\varepsilon} \cdot x$ so that $x = \varepsilon \cdot x'$ and
$$\|x'\| = \left\| \frac{1}{\varepsilon} \cdot x \right\| = \frac{1}{\varepsilon}\|x\| < \frac{1}{\varepsilon} \cdot \varepsilon = 1$$
proving that $x \in \varepsilon \cdot B_{\|\|}(0,1)$. Further if $x \in \varepsilon \cdot B_{\|\|}(0,1)$ then $x = \varepsilon \cdot x'$ where $x' \in B_{\|\|}(0,1)$ so that $\|x'\| < 1$ or $\|x\| = \varepsilon \cdot \|x\| < \varepsilon \cdot 1 = \varepsilon$ proving that $x \in B_{\|\|}(0,\varepsilon)$. Hence we conclude that
$$B_{\|\|}(0,\varepsilon) = \varepsilon \cdot B_{\|\|}(0,1)$$
2. $y \in B_{\|\|}(x,\varepsilon) \Leftrightarrow \|y - x\| < \varepsilon \Leftrightarrow y - x \in B_{\|\|}(0,\varepsilon) \Leftrightarrow y = x + B_{\|\|}(0,\varepsilon)$ □

Definition 14.92. *Let $\langle X, \|\|\rangle$ be a pseudo normed space then the norm topology $\mathcal{T}_{\|\|}$ on X is defined by*
$$\mathcal{T}_{\|\|} = \mathcal{T}_{d_{\|\|}}$$
where
$$d_{\|\|}: X \times X \to X \text{ is defined by } d_{\|\|}(x,y) = \|x - y\|$$
So
$$\mathcal{T}_{\|\|} = \mathcal{T}[\mathcal{B}_{d_{\|}}]$$
where
$$\mathcal{B}_{d_{\|\|}} = \{B_{d_{\|\|}}(x,\varepsilon) | x \in X \wedge \varepsilon \in \mathbb{R}^+\} = \{B_{\|\|}(x,\varepsilon) | x \in X \wedge \varepsilon \in \mathbb{R}^+\} \underset{\text{def}}{=} \mathcal{B}_{\|\|}$$

Using the above definition we have the equivalent version of [theorem: 14.64].

Theorem 14.93. *Let $\langle X, \|\|_X \rangle$ be a pseudo normed space then we have*
$$U \in \mathcal{T}_{\|\|} \Leftrightarrow \forall x \in U \ \exists \varepsilon \in \mathbb{R}^+ \text{ such that } x \in B_{\|\|}(x,\varepsilon) \subseteq U$$

Proof. This follows from [theorem: 14.64] and the fact that $\mathcal{T}_{\|\|} = \mathcal{T}_{d_{\|\|}}$ and $B_{\|\|}(x,\varepsilon) = B_{d_{\|\|}}(x,\varepsilon)$. □

Giving a finite family of normed spaces we can create a norm for the product of these spaces.

Theorem 14.94. *Let $\langle X_i, \|\|_i \rangle_{i \in I}$, I finite be a finite family of normed spaces then*
$$\|\|_{\max}: \prod_{i \in I} X_i \to \mathbb{R} \text{ defined by } \|x\|_{\max} = \max(\{\|\pi_i(x)\|_i | i \in I\})$$
*is a norm called the **maximum norm**. Further the generated topology $\mathcal{T}_{\|\|_{\max}}$ is the same as the product topology or*
$$\mathcal{T}_{\|\|_{\max}} = \mathcal{T}_{\text{product}}$$

Proof. First we prove that $\|\|_{\max}$ is a norm.

1. Let $x \in \prod_{i \in I} X_i$ then as $\forall i \in I \ 0 \leqslant \|x_i\|_i$ we have $0 \leqslant \max(\{\|x_i\|_i | i \in I\}) = \|x\|_{\max}$.
2. Let $x \in \prod_{i \in I} X_i$ and $\alpha \in \mathbb{K}$ then
$$\begin{aligned}
\|\alpha \cdot x\|_{\max} &= \max(\{\|\pi_i(\alpha \cdot x)\|_i | i \in I\}) \\
&\underset{\text{[example: 11.173]}}{=} \max(\{\|\alpha \cdot \pi_i(x)\|_i | i \in I\}) \\
&= \max(\{|\alpha| \cdot \|\pi_i(x)\|_i | i \in I\}) \\
&\underset{\text{[theorem: 10.27]}}{=} |\alpha| \cdot \max(\{\|\pi_i(x)\|_i | i \in I\}) \\
&= |\alpha| \cdot \|x\|_{\max}
\end{aligned}$$

3. Let $x, y \in \prod_{i \in I} X_i$ then

$$\begin{array}{rcl} \|x+y\|_{\max} & = & \max(\{\|\pi_i(x+y)\|_i | i \in I\}) \\ & \underset{\text{[example: 11.173]}}{=} & \max(\{\|\pi_i(x)+\pi_i(y)\|_i \in I\}) \\ & \leqslant_{\text{[theorem: 3.69]} \wedge \|\|_i \text{ is a norm}} & \max(\{\|\pi_i(x)\|_i + \|\pi_i(y)\|_i | i \in I\}) \\ & \underset{\text{[theorem: 10.25]}}{=} & \max(\{\|\pi_i(x)\|_i | i \in I\}) + \max(\{\|\pi_i(y)\|_i | i \in I\}) \\ & = & \|x\|_{\max} + \|y\|_{\max} \end{array}$$

4. If $\|x\|_{\max} = 0$ then $\forall i \in I$ we have $0 \leqslant \|\pi_i(x)\|_i \leqslant \|x\|_{\max} = 0$, hence $\forall i \in x_i = \pi_i(x) = 0$ so that $x = 0$.

Finally $\forall i \in I$ and $x, y \in X$ we have that

$$\begin{array}{rcl} d_{\|\|_{\max}}(x,y) & = & \|x-y\|_{\max} \\ & = & \max(\{\|\pi_i(x-y)\|_i | i \in I\}) \\ & \underset{\text{[example: 11.173]}}{=} & \max(\{\|\pi_i(x)-\pi_i(y)\|_i | i \in I\}) \\ & = & \max(\{d_{\|\|_i}(x,y) | i \in I\}) \\ & \underset{\text{[theorem: 14.79]}}{=} & d_{\max}(x,y) \end{array}$$

so that we have by [theorem: 14.79] that

$$\mathcal{T}_{d_{\|\|_{\max}}} = \mathcal{T}_{d_{\max}} = \mathcal{T}_{\text{box}} = \mathcal{T}_{\text{product}}$$

□

Example 14.95. Let $n \in \mathbb{N}$ then $\langle \mathbb{R}^n, \|\|_n \rangle$ where $\|x\|_n = \max(\{|x_i| | i \in \{1, \ldots, n\}\})$ is a normed space with $\mathcal{T}_{\|\|_n} = \mathcal{T}_{\text{product}}$. This topology is called the **standard** or **canonical** topology on $\mathbb{R}^n$.

Proof. Take $\langle X_i, \|\|_i \rangle_{i \in \{1, \ldots, n\}}$ by $X_i = \mathbb{R}$ and $\|\|_i = ||$ then $\prod_{i \in \{1, \ldots, n\}} X_i = \mathbb{R}^n$ and $\|\|_{\max} = \|\|_n$ so that by [theorem: 14.94] $\langle \mathbb{R}^n, \|\|_n \rangle$ is a normed space with $\mathcal{T}_{\|\|_n} = \mathcal{T}_{\text{product}}$ □

Example 14.96. $\langle \mathbb{C}, || \rangle$ is a complex normed space where $||$ is the complex norm [see definition: 10.83]

Proof. This was proved in [theorem: 10.84] □

Example 14.97. $\langle \mathbb{R}, || \rangle$ is a real normed space where $||$ is defined by

$$||: \mathbb{R} \times \mathbb{R} \to \mathbb{R} \text{ by } |x| = \begin{cases} x \text{ if } 0 \leqslant x \\ -x \text{ if } x < 0 \end{cases}$$

Note 14.98. If $0 \leqslant x$ then $x = |x| \Rightarrow x < |x|$ and if $x < 0$ then $x < 0 \leqslant -|x|$ so $\forall x \in X$ we have $x < |x|$.

Proof. We have:

1. If $x \in \mathbb{R}$ then we have either:

   $\boldsymbol{0 \leqslant x}$**.** Then $0 \leqslant x = |x|$

   $\boldsymbol{x < 0}$**.** Then $0 < -x = |x|$

   so in all cases we have $0 \leqslant |x|$

2. Let $\alpha \in \mathbb{R}$ and $x \in \mathbb{R}$ then we have either:

   $\boldsymbol{0 \leqslant \alpha \wedge 0 \leqslant x}$**.** Then $0 \leqslant \alpha \cdot x$ so that $|\alpha \cdot x| = \alpha \cdot x = |\alpha| \cdot |x|$.

   $\boldsymbol{\alpha < 0 \wedge 0 \leqslant x}$**.** Then $\alpha \cdot x \leqslant 0$ so that $|\alpha \cdot x| = -(\alpha \cdot x) = (-\alpha) \cdot x = |\alpha| \cdot |x|$.

   $\boldsymbol{0 \leqslant \alpha \wedge x < 0}$**.** Then $\alpha \cdot x \leqslant 0$ so that $|\alpha \cdot x| = -(\alpha \cdot x) = \alpha \cdot (-x) = |\alpha| \cdot |x|$.

   $\boldsymbol{\alpha < 0 \wedge x < 0}$**.** Then $0 < \alpha \cdot x$ so that $|\alpha \cdot x| = (-\alpha) \cdot (-x) = |\alpha| \cdot |x|$.

   so in all cases we have

$$|\alpha \cdot x| = |\alpha| \cdot |x|$$

3. Let $x, y \in \mathbb{R}$ then we have for $x+y$ either:

   $\boldsymbol{0 \leqslant x+y}$. Then $|x+y| = x+y \leqslant |x|+|y|$

   $\boldsymbol{x+y<0}$. Then $|x+y| = -(x+y) = (-x)+(-y) \leqslant |-x|+|-y| \underset{(2)}{=} |-1|\cdot|x|+|-1|\cdot|y| = |x|+|y|$,

   so in all cases we have

$$|x+y| \leqslant |x|+|y|$$

4. If $|x|=0$ then we have for $x \in \mathbb{R}$ either:

   $\boldsymbol{0 \leqslant x}$. Then $x = |x| = 0$

   $\boldsymbol{x<0}$. Then $-x = |x| = 0 \Rightarrow x = 0$ □

For $\langle \mathbb{R}, \|\rangle$ we have the following equivalences for the basis of the normed topology based on the absolute value norm.

Theorem 14.99. *Given the normed space $\langle \mathbb{R}, \|\rangle$ we have for the basis $\mathcal{B}_{||}$ of the normed topology $\mathcal{T}_{||}$ that*

$$\begin{aligned}\mathcal{B}_{||} &\underset{\text{def}}{=} \{B_{||}(x,\varepsilon) | x \in \mathbb{R} \wedge \varepsilon \in \mathbb{R}^+\} \\ &= \{]x-\varepsilon, x+\varepsilon[| x \in \mathbb{R} \wedge \varepsilon \in \mathbb{R}^+\} \\ &= \{]a,b[| a,b \in \mathbb{R} \wedge a<b\}\end{aligned}$$

Proof. First we have for $x \in \mathbb{R}$ and $\varepsilon \in \mathbb{R}^+$ that

$$\begin{aligned}y \in B_{||}(x,\varepsilon) &\Leftrightarrow |x-y| < \varepsilon \\ &\Leftrightarrow x-y<\varepsilon \wedge y-x<\varepsilon \\ &\Leftrightarrow x-\varepsilon<y \wedge y<x+\varepsilon \\ &\Leftrightarrow y \in]x-\varepsilon, x+\varepsilon[\end{aligned}$$

proving that

$$B_{||}(x,\varepsilon) =]x-\varepsilon, x+\varepsilon[$$

From this it follows that

$$\{B_{||}(x,\varepsilon) | x \in \mathbb{R} \wedge \varepsilon \in \mathbb{R}^+\} = \{]x-\varepsilon, x+\varepsilon[| x \in \mathbb{R} \wedge \varepsilon \in \mathbb{R}^+\}$$

If $B \in \{]x-\varepsilon, x+\varepsilon[| x \in \mathbb{R} \wedge \varepsilon \in \mathbb{R}^+\}$ then there exist a $x \in \mathbb{R}$ and a $\varepsilon \in \mathbb{R}^+$ such that $B =]x-\varepsilon, x+\varepsilon[$, which, as $x-\varepsilon, x+\varepsilon \in \mathbb{R} \wedge x-\varepsilon < x+\varepsilon$, proves that $B \in \{]a,b[| a,b \in \mathbb{R} \wedge a<b\}$. Hence

$$\{]x-\varepsilon, x+\varepsilon[| x \in \mathbb{R} \wedge \varepsilon \in \mathbb{R}^+\} \subseteq \{]a,b[| a,b \in \mathbb{R} \wedge a<b\} \tag{14.26}$$

If $B \in \{]a,b[| a,b \in \mathbb{R} \wedge a<b\}$ then there exist a $a,b \in \mathbb{R}$ with $a<b$ such that $B =]a,b[$. Take then $\varepsilon = (b-a)/2$ and $x = a+\varepsilon$ then we have

$$\begin{aligned}y \in]x-\varepsilon, x+\varepsilon[&\Leftrightarrow x-\varepsilon<y \wedge y<x+\varepsilon \\ &\Leftrightarrow (a+\varepsilon)-\varepsilon<y \wedge y<(a+\varepsilon)+\varepsilon \\ &\Leftrightarrow a<y \wedge y<a+2\cdot\varepsilon \\ &\Leftrightarrow a<y \wedge y<a+b-a \\ &\Leftrightarrow a<y \wedge y<b \\ &\Leftrightarrow y \in]a,b[\end{aligned}$$

proving that $B =]x-\varepsilon, x+\varepsilon[\in \{]x-\varepsilon, x+\varepsilon[| x \in \mathbb{R} \wedge \varepsilon \in \mathbb{R}^+\}$. Hence $\{]a,b[| a,b \in \mathbb{R} \wedge a<b\} \subseteq \{]x-\varepsilon, x+\varepsilon[| x \in \mathbb{R} \wedge \varepsilon \in \mathbb{R}^+\}$, combining this with [eq: 14.26] results in

$$\{]x-\varepsilon, x+\varepsilon[| x \in \mathbb{R} \wedge \varepsilon \in \mathbb{R}^+\} = \{]a,b[| a,b \in \mathbb{R} \wedge a<b\}$$ □

Theorem 14.100. *Let $\langle \mathbb{R}, \mathcal{T}_{||}\rangle$ be the topological space generated by the norm $||$, $a,b \in \mathbb{R}$ then the following intervals are open in $\mathcal{T}_{||}$:*

$$]a,b[$$
$$]-\infty, a[$$
$$]a, \infty[$$
$$]-\infty, \infty[$$

the following intervals are closed:

$$[a,b]$$
$$[a,\infty[$$
$$]-\infty,a]$$
$$]-\infty,\infty[$$

and the following intervals are neither open or closed:

$$[a,b[\quad \textit{where } a<b$$
$$]a,b] \quad \textit{where } a<b$$

Proof. Let $a,b\in\mathbb{R}$ then we have:

$]a,b[\in\mathcal{T}_{||}$. For a,b we have either:

$a\leqslant b$. Then by [theorem: 14.99] $]a,b[\in\mathcal{B}_{||}\subseteq\mathcal{T}_{||}$

$b\leqslant a$. Then $]a,b[=\varnothing\in\mathcal{T}_{||}$

$]-\infty,a[\in\mathcal{T}_{||}$. If $x\in]-\infty,a[$ then for $]x-1,a[\in\mathcal{B}_{||}$ we have $x\in]x-1,a[\subseteq]-\infty,a[$ proving by [theorem: 14.32] that $]-\infty,a[\in\mathcal{T}_{||}$.

$]a,\infty[$. If $x\in]a,\infty[$ then for $]a,x+1[\in\mathcal{B}_{||}$ we have $x\in]a,x+1[\subseteq]a,\infty[$ proving by [theorem: 14.32] that $]-\infty,a[\in\mathcal{T}_{||}$.

$]-\infty,\infty[\in\mathcal{T}_{||}$. $]-\infty,\infty[$ is open and closed.

$[a,b]$ is closed. We have

$$\begin{aligned} x\in\mathbb{R}\setminus[a,b] &\Leftrightarrow x\in\mathbb{R}\wedge\neg(a\leqslant x\wedge x\leqslant b)\\ &\Leftrightarrow x\in\mathbb{R}\wedge(x<a\vee b<x)\\ &\Leftrightarrow (x\in\mathbb{R}\wedge x<a)\vee(x\in\mathbb{R}\wedge b<x)\\ &\Leftrightarrow x\in]-\infty,a[\bigcup]b,\infty[\end{aligned}$$

proving that $\mathbb{R}\setminus[a,b]=]-\infty,a[\bigcup]b,\infty[\in\mathcal{T}_{||}$ hence $[a,b]$ is closed.

$[a,\infty[$ is closed. We have

$$\begin{aligned} x\in\mathbb{R}\setminus[a,\infty[&\Leftrightarrow x\in\mathbb{R}\wedge\neg(a\leqslant x)\\ &\Leftrightarrow x\in\mathbb{R}\wedge x<a\\ &\Leftrightarrow x\in]-\infty,a[\end{aligned}$$

proving that $\mathbb{R}\setminus[a,\infty[=]-\infty,a[\in\mathcal{T}_{||}$ so that $[a,\infty[$ is closed.

$]-\infty,a]$ is closed. We have

$$\begin{aligned} x\in\mathbb{R}\setminus]-\infty,a] &\Leftrightarrow x\in\mathbb{R}\wedge\neg(x\leqslant a)\\ &\Leftrightarrow x\in\mathbb{R}\wedge a<x\\ &\Leftrightarrow x\in]a,\infty[\end{aligned}$$

proving that $\mathbb{R}\setminus]-\infty,a[=]a,\infty[\in\mathcal{T}_{||}$ so that $]-\infty,a]$ is closed.

Assume that $a<b$ then we have

$[a,b[$ is neither open/closed. Assume that $[a,b[$ is open then as $a\leqslant a<b$ we have $a\in[a,b[$, so by [theorem: 14.32] there exist a $]x,y[\in\mathcal{B}_{||}\underset{\text{[theorem: 14.99]}}{=}\{]x,y[|x,y\in\mathbb{R}\wedge x<y\}$ such that $a\in]x,y[\subseteq[a,b[$. Hence $x<a<y$, using [theorem: 10.32] there exist a $z\in\mathbb{R}$ such that $x<z<a<y\Rightarrow z\in]x,y[\subseteq[a,b[$ hence $a\leqslant z$ contradicting $z<a$, hence

$$[a,b[\text{ is not open}$$

Assume that $\mathbb{R}\setminus[a,b[$ is open then as $b\in\mathbb{R}\setminus[a,b[$ we have by [theorem: 14.32] that there exist a $]x,y[\in\mathcal{B}_{||}\underset{\text{[theorem: 14.99]}}{=}\{]x,y[|x,y\in\mathbb{R}\wedge x<y\}$ such that $b\in]x,y[\subseteq\mathbb{R}\setminus[a,b[$ so that $x<b<y$. As also $a<b$ we have that $x\leqslant\max(a,x)<b<y$, using [theorem: 10.32] there exists $z\in\mathbb{R}$ such that

$$x\leqslant\max(a,x)<z<b<y \tag{14.27}$$

so that $z \in]x, y[\subseteq \mathbb{R} \backslash [a, b[$. Hence we have $z < a \vee b \leqslant z$, as $a \leqslant \max(a, x) < z$ we can't have $z < a$ so we must have that $b \leqslant z$ contradicting $z < b$ [see eq: 14.27] hence the assumption is wrong and $\mathbb{R} \backslash [a, b]$ is not open proving that

$$[a, b[\text{ is not closed}$$

$]a, b]$ is neither open/closed. Assume that $]a, b]$ is open then as $a < b \leqslant b$ we have $b \in [a, b[$, so by [theorem: 14.32] there exist a $]x, y[\in \mathcal{B}_{||} \underset{\text{[theorem: 14.99]}}{=} \{]x, y[| x, y \in \mathbb{R} \wedge x < y\}$ such that $b \in]x, y[\subseteq]a, b]$. Hence $x < b < y$, using [theorem: 10.32] there exist a $z \in \mathbb{R}$ such that $x < b < z < y \Rightarrow z \in]x, y[\subseteq]a, b]$ giving $z \leqslant b$ contradicting $b < z$, hence

$$[a, b[\text{ is not open}$$

Assume that $\mathbb{R} \backslash]a, b]$ is open then as $a \in \mathbb{R} \backslash]a, b]$ we have by [theorem: 14.32] that there exist a $]x, y[\in \mathcal{B}_{||} \underset{\text{[theorem: 14.99]}}{=} \{]x, y[| x, y \in \mathbb{R} \wedge x < y\}$ such that $a \in]x, y[\subseteq \mathbb{R} \backslash]a, b]$ so that $x < a < y$. As also $a < b$ we have that $x < a < \min(b, y) \leqslant y$, using [theorem: 10.32] there exists a $z \in \mathbb{R}$ such that

$$x < a < z < \min(b, y) \leqslant y \tag{14.28}$$

so that $z \in]x, y[\subseteq \mathbb{R} \backslash]a, b]$ hence we have $z \leqslant a \vee b < z$, as $z < \min(b, y) < b$ we can't have $b < z$ so we must have $z \leqslant a$ contradicting $a < z$ [see eq: 14.28]. So the assumption is wrong and $\mathbb{R} \backslash]a, b]$ is not open proving that

$$]a, b] \text{ is not closed}$$

□

Corollary 14.101. *Let $\langle \mathbb{R}, \mathcal{T}_{||} \rangle$ be the topological space generated by the norm $||$ and I a* ***non empty open generalized interval*** *then I is one of the following sets*

$$\begin{array}{rl}]a, b[& a, b \in \mathbb{R} \text{ where } a < b \text{ [otherwise } I = \varnothing] \\ ]-\infty, a[& a \in \mathbb{R} \\ ]a, \infty[& a \in \mathbb{R} \\ ]-\infty, \infty[& \end{array}$$

Proof. Let I be a **non empty** generalized interval then by [theorem: 3.142] I is of the following forms, where $a, b \in \mathbb{R}$

$]a, b[\wedge a < b$. Then by the previous theorem [theorem: 14.100]

$$I =]a, b[\text{ is open}$$

$]a, b] \wedge a \leqslant b$. Then by the previous theorem [theorem: 14.100]

$$I =]a, b[\text{ is not open}$$

$[a, b[\wedge a \leqslant b$. Then by the previous theorem [theorem: 14.100]

$$I = [a, b[\text{ is not open}$$

$[a, b] \wedge a \leqslant b$. As $[a, b] = I \neq \varnothing$ we must have $a \leqslant b$. Assume that $[a, b]$ is open then as $a \leqslant a \leqslant b$ we have $a \in [a, b]$, so by [theorem: 14.32] there exist a $]x, y[\in \mathcal{B}_{||} \underset{\text{[theorem: 14.99]}}{=} \{]x, y[| x, y \in \mathbb{R} \wedge x < y\}$ such that $a \in]x, y[\subseteq [a, b]$, hence $x < a < y$ and using [theorem: 10.32] there exists a $z \in \mathbb{R}$ such that $x < z < a < y$. So $z \in]x, y[\subseteq [a, b]$ resulting in $a \leqslant z$ contradicting $z < a$. Hence the assumption is wrong and we have that

$$I = [a, b] \text{ is not open}$$

$[a, \infty[$. Assume that $[a, \infty[$ is open then as $a \in [a, \infty[$ there exist by [theorem: 14.32] a $]x, y[\in \mathcal{B}_{||} \underset{\text{[theorem: 14.99]}}{=} \{]x, y[| x, y \in \mathbb{R} \wedge x < y\}$ such that $a \in]x, y[\subseteq [a, \infty[$, hence $x < a < y$. Using [theorem: 10.32] there exist a $z \in \mathbb{R}$ such that $x < z < a < y$ hence $z \in]x, y[\subseteq [a, \infty[$ giving $a \leqslant z$ which contradict $z < a$, hence the assumption is wrong and

$$I = [a, \infty[\text{ is not open}$$

$]a, \infty[$. Then by the previous theorem [theorem: 14.100]

$$I =]a, \infty[\text{ is open}$$

$]-\infty, a]$. Using [theorem: 10.32] there exist a $z \in \mathbb{R}$ such that $x < a < z < y$ hence $z \in]x, y[\subseteq]-\infty, a]$ giving $z \leqslant a$ which contradict $a < z$, hence the assumption is wrong and

$$I =]-\infty, a] \text{ is not open}$$

$]-\infty, a[$. Then by the previous theorem [theorem: 14.100]

$$I =]-\infty, a[\text{ is open}$$

$]-\infty, \infty[$. Then by the previous theorem [theorem: 14.100]

$$I =]-\infty, \infty[\text{ is open}$$

□

Corollary 14.102. *Let $\langle \mathbb{R}, \mathcal{T}_{||} \rangle$ be the topological space generated by the norm $||$ and I a **non empty closed generalized interval** then I is one of the following sets.*

$$\begin{aligned} [a, b] &\quad \textit{where} \quad a, b \in \mathbb{R} \textit{ with } a \leqslant b \textit{ [otherwise } I = \varnothing\textit{]} \\ [a, \infty[&\quad \textit{where} \quad a \in \mathbb{R} \\ ]-\infty, a] &\quad \textit{where} \quad a \in \mathbb{R} \end{aligned}$$

Proof. Let I be a **non empty** generalized interval then by [theorem: 3.142] I is of the following forms, where $a, b \in \mathbb{R}$

$]a, b[\wedge a < b$. Assume that $]a, b[$ is closed then $\mathbb{R} \backslash]a, b[$ is open. As $a \notin]a, b[$ hence $a \in \mathbb{R} \backslash]a, b[$, we have by [theorems: 14.32, 14.99] that there exists $r, s \in \mathbb{R}$ such that $a \in]r, s[\subseteq \mathbb{R} \backslash]a, b[$ so that $r < a < s$ and thus $a < \min(s, b)$. Using [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $r < a < x < \min(s, b)$ so that $r < x < s \wedge a < x < b$ hence $x \in]r, s[\bigcap]a, b[$ contradicting $]r, s[\subseteq \mathbb{R} \backslash]a, b[$. Hence the assumption is wrong and $]a, b[$ is not closed.

$]a, b] \wedge a \leqslant b$. Then by the previous theorem [theorem: 14.100]

$$I =]a, b[\text{ is not closed}$$

$[a, b[\wedge a \leqslant b$. Then by the previous theorem [theorem: 14.100]

$$I = [a, b[\text{ is not closed}$$

$[a, b] \wedge a \leqslant b$. Then by the previous theorem [theorem: 14.100] $I = [a, b]$ is closed.

$[a, \infty[$. Then by the previous theorem [theorem: 14.100] $I = [a, \infty[$ is closed.

$]a, \infty[$. Assume that $]a, \infty[$ is closed then $\mathbb{R} \backslash]a, \infty[$ is open. As $a \notin]a, \infty[$ we have $a \in \mathbb{R} \backslash]a.\infty[$ so that by [theorems: 14.32, 14.99] there exists $r, s \in \mathbb{R}$ with $a \in]r, s[\subseteq \mathbb{R} \backslash]a, \infty[$. Hence $r < a < s$ so that by [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $r < a < x < s$, hence $x \in]r, s[\bigcap]a, \infty[$ contradicting $]r, s[\subseteq \mathbb{R} \backslash]a, \infty[$. So the assumption is wrong and $]a, \infty[$ is not closed.

$]-\infty, a]$. Then by the previous theorem [theorem: 14.100] $I =]-\infty, a]$ is closed.

$]-\infty, a[$. Assume that $]-\infty, a[$ is closed then $\mathbb{R} \backslash]-\infty, a[$ is open. As $a \notin]-\infty, a[$ we have $a \in \mathbb{R} \backslash]-\infty.a[$ so that by [theorems: 14.32, 14.99] there exists $r, s \in \mathbb{R}$ with $a \in]r, s[\subseteq \mathbb{R} \backslash]-\infty, a[$. Hence $r < a < s$ so that by [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $r < x < a < s$, hence $x \in]r, s[\bigcap]-\infty, a[$ contradicting $]r, s[\subseteq \mathbb{R} \backslash]-\infty, a[$. So the assumption is wrong and $]-\infty, a[$ is not closed.

$]-\infty, \infty[$. Then by the previous theorem [theorem: 14.100]

$$I =]-\infty, \infty[\text{ is closed}$$

□

Note 14.103. The condition that $I \neq \varnothing$ in the above theorem is essential because if $I = \varnothing$ then I is open and closed and either of the form:

$$\begin{aligned}]a, b[&\quad \text{where} \quad b \leqslant a \\ [a, b] &\quad \text{where} \quad b < a \\ [a, b[&\quad \text{where} \quad b < a \\ ]a, b] &\quad \text{where} \quad b < a \end{aligned}$$

so that for the empty interval there are more forms then stated in the previous two corollaries.

We prove now that every open set in $\langle \mathbb{R}.\mathcal{T}_{||}\rangle$ is a countable union of open intervals.

Theorem 14.104. *Given $\langle \mathbb{R}, \mathcal{T}_{||}\rangle$ the set of real numbers endowed with the topology generated by the absolute value norm and $U \in \mathcal{T}_{||}$ a open set then there exists a $\mathcal{U} \subseteq \mathcal{T}_{||}$ where $\mathcal{U}$ is countable and $\forall I \in \mathcal{U}$ we have that I is a non empty open generalized interval such that*

$$U = \bigcup_{I \in \mathcal{U}} I$$

and

$$\forall I, J \in \mathcal{U} \text{ with } I \neq J \text{ we have } I \bigcap J = \varnothing$$

Proof. Define the relation $\sim \in U \times U$ by $x \sim y$ iff $]\min(x, y), \max(x, y)[\subseteq U$ then we have

reflexivity. $\forall x \in U$ $]\min(x, x), \max(x, x)[=]x, x[= \varnothing \subseteq U$ so that $x \sim x$

symmetry. If $x \sim y$ then $]\min(x, y), \max(x, y)[\subseteq U$ so that

$$]\min(y, x), \max(y, x)[=]\min(x, y), \max(x, y)] \subseteq U$$

giving $y \sim x$.

transitivity. If $x \sim y$ and $y \sim z$ then we have

$$]\min(x, y), \max(x, y)[\subseteq U \text{ and }]\min(y, z), \max(y, z)[\subseteq U \tag{14.29}$$

now for $x, y, z \in U$ we have either:

$\boldsymbol{x \leqslant y \leqslant z}$**.** Then by [eq: 14.29] we have

$$]x, y[=]\min(x, y), \max(x, y)[\subseteq U \wedge]y, z[=]\min(y, z), \max(y, z)[\subseteq U$$

and as $y \in U$

$$]\min(x, z), \max(x, z)[=]x, z[=]x, y[\bigcup \{y\} \bigcup]y, z[\subseteq U$$

proving that $x \sim z$.

$\boldsymbol{x \leqslant z \leqslant y}$**.** Then by [eq: 14.29] we have

$$]x, y[=]\min(x, y), \max(x, y)[\subseteq U \wedge]z, y[=]\min(y, z), \max(y, z)[\subseteq U$$

$$]\min(x, z), \max(x, z)[=]x, z[\subseteq]x, y[\subseteq U$$

proving that $x \sim z$.

$\boldsymbol{y \leqslant x \leqslant z}$**.** Then by [eq: 14.29] we have

$$]y, x[=]\min(x, y), \max(x, y)[\subseteq U \wedge]y, z[=]\min(y, z), \max(y, z)[\subseteq U$$

$$]\min(x, z), \max(x, z)[=]x, z[\subseteq]y, z[\subseteq U$$

proving that $x \sim z$.

$\boldsymbol{y \leqslant z \leqslant x}$**.** Then by [eq: 14.29] we have

$$]y, x[=]\min(x, y), \max(x, y)[= \subseteq U \wedge]y, z[=]\min(y, z), \max(y, z)[\subseteq U$$

$$]\min(x, z), \max(x, z)[=]z, x[\subseteq]y, x[\subseteq U$$

proving that $x \sim z$.

$\boldsymbol{z \leqslant x \leqslant y}$**.** Then by [eq: 14.29] we have

$$]x, y[=]\min(x, y), \max(x, y)[\subseteq U \wedge]z, y[=]\min(y, z), \max(y, z)[\subseteq U$$

$$]\min(x, z).\max(x, z)[=]z, x[\subseteq]z, y[\subseteq U$$

proving that $x \sim z$.

$\boldsymbol{z \leqslant y \leqslant x}$**.** Then by [eq: 14.29] we have

$$]y, x[=]\min(x, y), \max(x, y)[\subseteq U \wedge]z, y[=]\min(y, z), \max(y, z)[\subseteq U$$

and as $y \in U$ we have that

$$]\min(x,z),\max(x,z)[=]z,x[=]z,y[\bigcup\{y\}\bigcup]y,x[\subseteq U$$

proving that $x \sim z$.

So in all cases we have $x \sim z$.

Hence we have that

$$\sim \text{ is a equivalence relation}$$

Define then $\mathcal{U}=\{\sim[x]|x \in U\}=I/\sim$ the set of equivalence classes defined by $\sim$ then we have using [theorem: 3.18] that

$$U=\bigcup_{I \in \mathcal{U}} I \text{ and } \forall I,J \in \mathcal{U} \text{ with } I \neq J \;\; I\bigcap J=\varnothing \tag{14.30}$$

Let $I \in \mathcal{U}$ then there exist a $x \in U$ such that $I=\sim[x]$. Let $y \in \sim[x] \subseteq U$ then by [theorem: 14.32] there exist a $]a,b[\in \mathcal{B}_{||} \underset{\text{[theorem: 14.99]}}{=} \{]x,y[|x,y \in \mathbb{R} \wedge x<y\}$ such that $y \in]a,b[\subseteq U$ then $\forall z \in]a,b[$ we have either:

$\boldsymbol{y \leqslant z}$. Then $a<y \leqslant z<b$ so that $]\min(y,z),\max(y,z)[=]y,z[\subseteq]a,b[\subseteq U$

$\boldsymbol{z<y}$. Then $a<z<y<b$ so that $]\min(y,z),\max(y,z)[=]z,y[\subseteq]a,b[\subseteq U$

proving that $y \sim z$. From $y \in \sim[x]$ we have $y \sim x$ so by transitivity and symmetry that $z \sim x$ hence $z \in \sim[x]=I$ proving that $]a,b[\subseteq I$ or as $y \in]a,b[$ that $y \in]a,b[\subseteq I$. To summarize

$$\forall y \in I=\sim[x] \text{ there exist a }]a,b[\in \mathcal{B}_{||} \text{ such that } y \in]a,b[\subseteq I$$

proving by [definition: 14.31] that

$$I=\sim[x] \text{ is open and as } x \in \sim[x]=I \; I \neq 0 \tag{14.31}$$

Let $r,s \in I=\sim[x]$ with $r<s$ then $r \sim x \wedge s \sim x$ so that by symmetry and transitivity we have $s \sim r$ so that $]r,s[=]\min(r,s),\max(r,s)[\subseteq U$. If $t \in]r,s[\Rightarrow r<t<s$ then

$$]\min(t,r),\max(t,r)[=]r,t[\subseteq]r,s[\subseteq U$$

proving that $t \sim r$, as $r \sim x$ it follows that $t \sim x$ so that $t \in \sim[x]=I$. Hence

$$\forall r,s \in I \text{ with } r<s \text{ we have that }]r,s[\subseteq I$$

which by [definition: 3.140] proves that

$$I \text{ is a generalized interval} \tag{14.32}$$

As by [eq: 14.31] I is open it follows from [corollary: 14.101] that

$$\forall I \in \mathcal{U} \text{ we have } I=]a,b[\text{ or } I=]a,\infty[\text{ or } I=]-\infty,a[\text{ or } I=]-\infty,\infty[\text{ where } a,b \in \mathbb{R}$$

Now if $I \in \mathcal{U}$ then $\exists x \in U$ so that $I=\sim[x] \neq \varnothing$, by the above we have the following cases to consider:

$\boldsymbol{I=]a,b[}$. Then as $I \neq \varnothing$ we have $a<b$ so using the density of $\mathbb{Q}$ in $\mathbb{R}$ [see theorem: 10.32] there exist a $q \in \mathbb{Q}$ such that $a<q<b$, hence $q \in]a,b[=I$ so that

$$\mathbb{Q}\bigcap I \neq \varnothing$$

$\boldsymbol{I=]-\infty,a[}$. Then as $a-1<a$ we have by the density of $\mathbb{Q}$ in $\mathbb{R}$ [see theorem: 10.32] that there exist a $q \in \mathbb{Q}$ such that $a-1<q<a$ hence $q \in]-\infty,a[=I$ proving

$$\mathbb{Q}\bigcap I \neq \varnothing$$

$\boldsymbol{I=]a,\infty[}$. Then as $a<a+1$ we have by the density of $\mathbb{Q}$ in $\mathbb{R}$ [see theorem: 10.32] that there exist a $q \in \mathbb{Q}$ such that $a<q<a+1$ hence $q \in]a,\infty[=I$ proving

$$\mathbb{Q}\bigcap I \neq \varnothing$$

$\boldsymbol{I=]-\infty,\infty[}$. Then as $0 \in \mathbb{Q} \subseteq \mathbb{R}=]-\infty,\infty[$ we have

$$\mathbb{Q}\bigcap I \neq \varnothing$$

So we have

$$\forall I \in \mathcal{U} \text{ we have that } \mathbb{Q}\bigcap I \neq \varnothing \text{ so that } \left\{\mathbb{Q}\bigcap I\right\}_{I \in \mathcal{U}} \subseteq \mathcal{P}(\mathbb{R}) \text{ is a family of non empty subsets of } \mathbb{R}$$

Using a consequence of the Axiom of Choice [see theorem 3.106] there exist a function

$$f:\mathcal{U}\to\bigcup_{I\in\mathcal{U}}\left(\mathbb{Q}\bigcap I\right)\text{ such that }f(I)\in\mathbb{Q}\bigcap I$$

Let $I,J\in\mathcal{U}$ such that $f(I)=f(J)$. As $f(I)\in\mathbb{Q}\bigcap I$ and $f(J)\in\mathbb{Q}\bigcap J$ we have as $f(I)=f(J)$ that $f(I)\in(\mathbb{Q}\bigcap I)\bigcap(\mathbb{Q}\bigcap J)=\mathbb{Q}\bigcap(I\bigcap J)$ so that $I\bigcap J\neq\varnothing$. Then by [eq: 14.30] we must have $I=J$ which proves as $\bigcup_{I\in\mathcal{U}}(\mathbb{Q}\bigcap I)\subseteq\mathbb{Q}$ that

$$f:\mathcal{U}\to\mathbb{Q}\text{ is injective}$$

Now as by [theorem: 10.5] $\mathbb{Q}$ is denumerable we have by [theorem: 6.72] that

$$\mathcal{U}\text{ is countable and by [eqs: 14.30, 14.31,14.32] }U=\bigcup_{I\in\mathcal{U}}I\text{ and }\forall I\in\mathcal{U}\ I\text{ is a open generalized interval that is not empty.}$$ □

Corollary 14.105. *Given $\langle\mathbb{R},\mathcal{T}_{||}\rangle$ the set of reals endowed with the topology generated by the absolute value norm and $U\in\mathcal{T}_{||}$ a open set then there exist a countable set $\mathcal{I}$ and a family*

$$\{]a_i,b_i[\}_{i\in\mathcal{I}}\subseteq\mathcal{T}_{||}\text{ such that }U=\bigcup_{i\in\mathcal{I}}]a_i,b_i[$$

such that $\forall i\in\mathcal{I}\ ]a_i,b_i[\neq\varnothing$

Proof. Using the previous theorem [theorem: 14.104] there exists a countable set $\mathcal{U}\subseteq\mathcal{T}_{||}$ such that $\forall I\in\mathcal{U}\ I$ is a open generalized interval and non empty and

$$U=\bigcup_{I\in\mathcal{U}}I \tag{14.33}$$

So let $I\in\mathcal{U}$ then by [corollary: 14.101] I is either

$\boldsymbol{I=]a,b[}$. Define then $\mathcal{I}_I=\{1\}$ and $\{]a_{(I,i)},b_{(I,i)}[\}_{i\in\mathcal{I}_I}$ by $a_1=a\wedge b_1=b$ so that

$$\mathcal{I}_i\text{ is countable [because it is finite] and }I=\bigcup_{i\in\mathcal{I}_I}]a_{(I,i)},b_{(I,i)}[$$

Further as $]a_1,b_1[=I\neq\varnothing$ we have $\forall i\in\mathcal{I}_i$ that $]a_{(I,i)},b_{(I,i)}[\neq\varnothing$.

$\boldsymbol{I=]-\infty,a[}$. Take $\mathcal{I}_I=\mathbb{N}$ and $\{]a_{(I,i)},b_{(I,i)}[\}_{i\in\mathcal{I}_I}=\{]a_{(I,i)},b_{(I,i)}[\}_{i\in\mathbb{N}_0}$ by $a_{(I,i)}=-i+a\wedge b_{(I,i)}=a$. Then $\forall i\in\mathcal{I}_I$ we have $\forall x\in]a_{(I,i)},b_{(I,i)}[=]-i+a,a[\Rightarrow -i+a<x<a\Rightarrow x\in]-\infty,a[=I$ proving that

$$\bigcup_{i\in\mathcal{I}_I}]a_{(I,i)},b_{(I,i)}[\subseteq I \tag{14.34}$$

Further if $x\in I$ then $x<a$ and by a consequence of the Archimedean Property of the real numbers [see theorem: 10.30] there exist a $n\in\mathbb{N}=\mathcal{I}_I$ such that $-n<x-a$ hence $-n+a<x$ so that $x\in]-n+a,a[=]a_{(I,n)},b_{(I,n)}[\subseteq\bigcup_{i\in\mathcal{I}_I}]a_{(I,i)},b_{(I,i)}[$. Proving that $I\subseteq\bigcup_{i\in\mathcal{I}_I}]a_{(I,i)},b_{(I,i)}[$ which combined with 14.34] proves that

$$\mathcal{I}_I\text{ is countable and }I=\bigcup_{i\in\mathcal{I}_I}]a_{(I,i)},b_{(I,i)}[$$

Further $\forall i\in\mathcal{I}_I=\mathbb{N}$ we have as $-i+a<a$ that $\varnothing\neq]-i+a,a[=]a_{(I,i)},b_{(I,i)}[$.

$\boldsymbol{I=]a,\infty[}$. Take $\mathcal{I}_I=\mathbb{N}$ and $\{]a_{(I,i)},b_{(I,i)}[\}_{i\in\mathcal{I}_I}=\{]a_{(I,i)},b_{(I,i)}[\}_{i\in\mathbb{N}_0}$ by $a_{(I,i)}=a\wedge b_{(I,i)}=a+i$. Then $\forall i\in\mathcal{I}_I$ we have $\forall x\in]a_{(I,i)},b_{(I,i)}[=]a,a+i[\Rightarrow a<x<a+i\Rightarrow x\in]a,\infty[$ proving that

$$\bigcup_{i\in\mathcal{I}_I}]a_{(I,i)},b_{(I,i)}[\subseteq I \tag{14.35}$$

Further if $x\in I$ then $a<x$ and by a consequence of the Archimedean Property of the real numbers [see theorem: 10.30] there exist a $n\in\mathbb{N}=\mathcal{I}_I$ such that $x-a<n$ hence $x<n+a$ or $x\in]a,a+n[=]a_{(I,n)},b_{(I,n)}[\subseteq\bigcup_{i\in\mathcal{I}_I}]a_{(I,i)},b_{(I,i)}[$. Proving that $I\subseteq\bigcup_{i\in\mathcal{I}_I}]a_{(I,i)},b_{(I,i)}[$ which combined with 14.35] proves that

$$\mathcal{I}_I\text{ is countable and }I=\bigcup_{i\in\mathcal{I}_I}]a_{(I,i)},b_{(I,i)}[$$

Further $\forall i\in\mathcal{I}_I=\mathbb{N}$ we have as $a<a+i$ that $\varnothing\neq]a,a+i[=]a_{(I,i)},b_{(I,i)}[$

$\boldsymbol{I=]-\infty,\infty[}$. Then $I=\mathbb{R}$. Take $\mathcal{I}_I=\mathbb{N}$ and $\{]a_{(I,i)},b_{(I,i)}[\}_{i\in\mathcal{I}_I}=\{]a_{(I,i)},b_{(I,i)}[\}_{i\in\mathbb{N}_0}$ by $a_{(I,i)}=-i\wedge b_{(I,i)}=i$. Then $\forall i\in\mathcal{I}_I$ we have $]a_{(I,i)},b_{(I,i)}[\subseteq\mathbb{R}=I$ so that

$$\bigcup_{i\in\mathcal{I}_I}]a_{(I,i)},b_{(I,i)}[\subseteq I \tag{14.36}$$

Further if $x\in\mathbb{R}$ then by [theorem: 10.30] there exist a $n\in\mathbb{N}_0=\mathcal{I}_I$ such that $|x|<n$ hence $x<|x|<n$ and $-x<|x|<n\Rightarrow -n<x$ proving that $-n<x<n\Rightarrow x\in]-n,n[=]a_n,b_n[\subseteq\bigcup_{i\in\mathcal{I}_I}]a_{(I,i)},b_{(I,i)}[$. Hence $I\subseteq\bigcup_{i\in\mathcal{I}_I}]a_{(I,i)},b_{(I,i)}[$ which combined with [eq: 14.36] proves that

$$\mathcal{I}_I \text{ is countable and } I=\bigcup_{i\in\mathcal{I}_I}]a_{(I,i)},b_{(I,i)}[$$

Further $\forall i\in\mathcal{I}_I$ we have $\varnothing\neq 0]-i,i[=]a_{(I,i)},b_{(I,i)}[$

So we have that $\forall I\in\mathcal{U}$ there exist a countable $\mathcal{I}_I$ and $\{]a_{(I,i)},b_{(I,i)}[\}_{i\in\mathcal{I}_i}\subseteq\mathcal{T}_{||}$ so that

$$I=\bigcup_{i\in\mathcal{I}_I}]a_{(I,i)},b_{(I,i)}[\text{ and } \forall i\in I \text{ we have that }]a_{(I,i)},b_{(I,i)}[\neq\varnothing \tag{14.37}$$

Now we have

$$\begin{aligned}
x\in\bigcup_{r\in\bigcup_{I\in\mathcal{U}}\{I\}\times\mathcal{I}_I}]a_r,b_r[\quad &\Rightarrow \quad x\in\bigcup_{r\in\bigcup_{I\in\mathcal{U}}\{I\}\times\mathcal{I}_I}]a_{(r_1,r_2)},b_{(r_1,r_2)}[\\
&\Rightarrow \quad \exists r\in\bigcup_{I\in\mathcal{U}}\{I\}\times\mathcal{I}_I \text{ such that } x\in]a_{(r_1,r_2)},b_{(r_1,r_2)}[\\
&\Rightarrow \quad \exists I\in\mathcal{U} \text{ such that } r\in\{I\}\times\mathcal{T}_I \text{ such that } x\in]a_{(r_1,r_2)},b_{(r_1,r_2)}[\\
&\underset{\text{[eq: 14.37]}}{\Rightarrow} \quad x\in I\\
&\Rightarrow \quad x\in\bigcup_{I\in\mathcal{U}} I
\end{aligned}$$

proving that

$$\bigcup_{r\in\bigcup_{I\in\mathcal{U}}\{I\}\times\mathcal{I}_I}]a_r,b_r[\subseteq\bigcup_{I\in\mathcal{U}} I \tag{14.38}$$

and

$$\begin{aligned}
x\in\bigcup_{I\in\mathcal{U}} I \quad &\Rightarrow \quad \exists I\in\mathcal{U} \text{ such that } x\in I\\
&\underset{\text{[eq: 14.37]}}{\Rightarrow} \quad \exists i\in\mathcal{I}_I \text{ such that } x\in]a_{(I,i)},b_{(I,i)}[\\
&\Rightarrow \quad x\in]a_{(r_1,r_2)},b_{(r_1,r_2)}[\text{ where } r=(I,i)\in\{I\}\times\mathcal{T}_I\\
&\Rightarrow \quad x\in]a_r,b_r[\text{ where } r=(I,i)\in\{I\}\times\mathcal{T}_I\subseteq\bigcup_{I\in\mathcal{U}}\{I\}\times\mathcal{I}_I\\
&\Rightarrow \quad x\in\bigcup_{r\in\bigcup_{I\in\mathcal{U}}\{I\}\times\mathcal{I}_I}]a_r,b_r[
\end{aligned}$$

proving that $\bigcup_{I\in\mathcal{U}}I\subseteq\bigcup_{r\in\bigcup_{I\in\mathcal{U}}\{I\}\times\mathcal{I}_I}]a_r,b_r[$. Combining this with [eqs: 14.33, 14.38] results in

$$U=\bigcup_{I\in\mathcal{U}} I=\bigcup_{r\in\bigcup_{I\in\mathcal{U}}\{I\}\times\mathcal{I}_I}]a_r,b_r[\tag{14.39}$$

Using [theorem: 6.76] together with [eq: 14.37] we have $\forall I\in\mathcal{U}$ that $\{I\}\times\mathcal{I}_I$ is countable. As $\mathcal{U}$ is countable it follows from [theorem: 6.73] that $\bigcup_{I\in\mathcal{U}}\{I\}\times\mathcal{I}_I$ is countable. Hence if we take $\mathcal{I}=\bigcup_{I\in\mathcal{U}}\{I\}\times\mathcal{I}_I$ we have that

$$\mathcal{I} \text{ is countable, } U\underset{\text{[eq: 14.39]}}{=}\bigcup_{r\in\mathcal{I}}]a_r,b_r[\text{ and } \forall i\in I \text{ we have }]a_i,b_i[\neq\varnothing$$

□

Theorem 14.106. *Given $\langle\mathbb{R},\mathcal{T}_{||}\rangle$ the set of real numbers endowed with the topology generated by the absolute value norm and $S\subseteq\mathbb{R}$ a non empty closed set then we have:*

1. *If $\sup(S)$ exist then $\sup(S)\in S$*

2. *If* $\inf(S)$ *exist then* $\inf(S) \in S$

Proof.

1. Assume that $\sup(S) \notin S$ then $\sup(S) \in X \setminus S \in \mathcal{T}_{\|}$, hence by [theorems: 14.93, 14.99] there exist a $\varepsilon \in \mathbb{R}^+$ such that $\sup(S) \in]\sup(S) - \varepsilon, \sup(S) + \varepsilon[\subseteq X \setminus S$. As $\sup(S) - \varepsilon < \sup(S)$ there exist a $s \in S$ such that $\sup(S) - \varepsilon < s \leqslant \sup(S) < \sup(S) + \varepsilon$ so that $s \in X \setminus S$ contradicting $s \in S$. Hence we must have $\sup(S) \in S$.
2. Assume that $\inf(S) \notin S$ then $\inf(S) \in X \setminus S \in \mathcal{T}_{\|}$, hence by [theorems: 14.93, 14.99] then there exist a $\varepsilon \in \mathbb{R}^+$ such that $\inf(S) \in]\inf(S) - \varepsilon, \inf(S) + \varepsilon[\subseteq X \setminus S$. As $\inf(S) < \inf(S) + \varepsilon$ there exist a $s \in S$ such that $\inf(S) - \varepsilon < \inf(S) \leqslant s < \inf(S) + \varepsilon$ so that $s \in X \setminus S$ contradicting $s \in S$. Hence we must have $\inf(S) \in S$. □

The concept of a bounded set [see definition: 14.75] in a metric space becomes simpler if the metric space happens to be a normed space.

Theorem 14.107. *Let* $\langle X, \|\|\rangle$ *be a pseudo normed space,* $A \subseteq X$ *then*

$$A \text{ is bounded} \Leftrightarrow \exists M \in \mathbb{R}^+ \text{ such that } \forall x \in X \text{ we have } \|x\| \leqslant M$$

Proof.

⇒. If A is a bounded set then we have either:

$A = \varnothing$. Then $\forall x \in A$ we have vacuously that $\|x\| \leqslant 1$.

$A \neq \varnothing$. Then $\exists x_0 \in A$. As A is bounded there exist a $N \in \mathbb{R}$ such that $\forall x, y \in A$ we have $\|x - y\| = d_{\|\|}(x, y) \leqslant N$. Take $M = N + \|x_0\|$ then if $z \in A$ we have $\|z\| = \|z - x_0 + x_0\| \leqslant \|z - x_0\| + \|x_0\| \leqslant N + \|x_0\| = M$

⇐. Let $\mathbb{N} \in \mathbb{R}$ such that $\forall x \in A$ we have $\|x\| \leqslant N$ and set $M = 2 \cdot N$. Then $\forall x, y \in A$ we have $d_{\|\|}(x, y) = \|x - y\| \leqslant \|x\| + \|y\| = N + N = 2 \cdot N = M$ □

Example 14.108. Let $\langle \mathbb{R}, \|\rangle$ be the normed space of the real numbers then we have:

1. $\forall a, b \in \mathbb{R}$ with $a \leqslant b$ we have that
   a. $[a, b]$ is bounded
   b. $[a, b[$ is bounded
   c. $]a, b]$ is bounded
   d. $]a, b[$ is bounded
2. $\forall a \in \mathbb{R}$ we have that
   a. $[a, \infty[$ is not bounded
   b. $]a, \infty[$ is not bounded
   c. $]-\infty, a]$ is not bounded
   d. $]-\infty, a[$ is not bounded

Proof.

1. Let $M = \max(|a|, |b|)$ then
   a. Then for $x \in [a, b]$ we have either:

      $0 \leqslant x$. Then $|x| = x \leqslant b \leqslant |b| \leqslant \max(|a|, |b|) = M$

      $x < 0$. Then $|x| = -x \leqslant -a \leqslant |a| \leqslant \max(|a|, |b|) = M$
   b. Then for $x \in [a, b[$ we have either:

      $0 \leqslant x$. Then $|x| = x < b \leqslant |b| \leqslant \max(|a|, |b|) = M$

      $x < 0$. Then $|x| = -x \leqslant -a \leqslant |a| \leqslant \max(|a|, |b|) = M$
   c. Then for $x \in]a, b]$ we have either:

      $0 \leqslant x$. Then $|x| = x \leqslant b \leqslant |b| \leqslant \max(|a|, |b|) = M$

$x < 0$. Then $|x| = -x < -a \leqslant |a| \leqslant \max(|a|, |b|) = M$

d. Then for $x \in]a, b[$ we have either:

$0 \leqslant x$. Then $|x| = x < b \leqslant |b| \leqslant \max(|a|, |b|) = M$

$x < 0$. Then $|x| = -x < -a \leqslant |a| \leqslant \max(|a|, |b|) = M$

2.

a. Assume that $[a, \infty[$ is bounded then there exist a M such that $\forall x \geqslant a$ we have $|x| \leqslant M$. As $a \leqslant |a|$ it follows that $|a| \leqslant M$ hence $a < |a| \leqslant M < M + 1$ so that $|M + 1| = M + 1 \leqslant M$, a contradiction. Hence $[a, \infty[$ is not bounded.

b. Assume that $]a, \infty[$ is bounded then there exist a M such that $\forall x > a$ we have $|x| \leqslant M$. As $a \leqslant |a| < |a| + 1$ it follows that $|a| + 1 \leqslant M$ hence $a < |a| + 1 \leqslant M < M + 1$ so that $|M + 1| = M + 1 \leqslant M$, a contradiction. Hence $]a, \infty[$ is not bounded.

c. Assume that $]-\infty, a]$ is bounded then there exist a M such that $\forall x \leqslant a$ we have that $|x| \leqslant M$. As $-|a| \leqslant a$ it follows that $|a| = |-|a|| \leqslant M < M + 1$ so that $-(M + 1) < -|a| \leqslant a$, hence $M + 1 = |-(M + 1)| \leqslant M$, a contradiction. So $]-\infty, a]$ is not bounded.

d. Assume that $]-\infty, a[$ is bounded then there exist a M such that $\forall x < a$ we have that $|x| \leqslant M$. As $-|a| - 1 < -|a| \leqslant a$ it follows that $|a| + 1 = |-|a| - 1| \leqslant M < M + 1$ so that $-(M + 1) < -|a| - 1 < -|a| \leqslant a$, hence $M + 1 = |-(M + 1)| \leqslant M$, a contradiction. So $]-\infty, a]$ is not bounded. □

Theorem 14.109. *Let $\langle X, \|\|\rangle$ be a pseudo normed space with norm topology $\mathcal{T}_{\|\|}$ and $A \subseteq X$ then for $\|\|_{|A}$ defined by*

$$\|\|_{|A|}: A \to \mathbb{R} \text{ defined by } \|x\|_{|A} = \|x\|$$

we have

1. *$\langle A, \|\|_{|A}\rangle$ is a pseudo normed space.*
2. *If $\langle A, \|\|\rangle$ is a normed space $\langle A, \|\|_{|A}\rangle$ is also a normed space*
3. *$\mathcal{T}_{\|\|_{|A}} = (\mathcal{T}_{\|\|})_{|A}$*

Proof.

1. We have:

   a. $\forall x \in A$ we have $0 \leqslant \|x\| = \|x\|_{|A}$

   b. $\forall x \in A$ we have $\forall \alpha \in \mathbb{R}$ [or $\alpha \in \mathbb{C}$] that $\|\alpha \cdot x\|_{|A} = |\alpha| \|x\| = |a| \cdot \|x\|_{|A}$

   c. $\forall x, y \in A$ we have $\|x + y\|_{|A} = \|x + y\| \leqslant \|x\| + \|y\| \leqslant \|x\|_{|A} + \|y\|_{|A}$

2. Let $x \in A$ such that $\|x\|_{|A} = 0$ then $\|x\| = 0$ hence as $\|\|$ is a norm we have $x = 0$.

3. Let $x, y \in A$ then $(d_{\|\|})_{|A \times A}(x, y) = d_{\|\|}(x, y) = \|x - y\| = \|x - y\|_{|A} = d_{\|\|_{|A}}(x, y)$ proving that

$$(d_{\|\|})_{|A} = d_{\|\|_{|A}} \tag{14.40}$$

   So we have

$$\mathcal{T}_{\|\|_{|A}} \underset{\text{def}}{=} \mathcal{T}_{d_{\|\|_{|A}}} \underset{\text{[eq: 14.40]}}{=} \mathcal{T}_{(d_{\|\|})_{|A \times A}} \underset{\text{[theorem: 14.66}}{=} (\mathcal{T}_{d_{\|\|}})_{|A} \underset{\text{def}}{=} (\mathcal{T}_{\|\|})_{|A}$$ □

Theorem 14.110. *Let $\langle X, \|\|\rangle$ be a pseudo normed space, $M \subseteq X$ then $\forall \alpha \in \mathbb{K}$ with $\alpha \neq 0$ and $\forall x \in X$ we have:*

1. *$\overline{\alpha \cdot M} = \alpha \cdot \overline{M}$*
2. *If M is closed in $\mathcal{T}_{\|\|}$ then $\alpha \cdot M$ is closed in $\mathcal{T}_{\|\|}$*
3. *If M is open in $\mathcal{T}_{\|\|}$ then $\alpha \cdot M$ is open in $\mathcal{T}_{\|\|}$*
4. *If M is open in $\mathcal{T}_{\|\|}$ then $x + M$ is open in $\mathcal{T}_{\|\|}$*
5. *If M is open in $\mathcal{T}_{\|\|}$ and $A \subseteq X$ then $A + M$ is open in $\mathcal{T}_{|M}$*
6. *If $x \in X$ then $x + \overline{M} \subseteq \overline{x + M}$*
7. *$\overline{M} - \overline{M} \subseteq \overline{M - M}$*

See [definition: 11.72] for the definition of $\alpha\cdot M$, $x+M$, $A+M$ and $M-M$

Proof.

1. Let $x\in\overline{\alpha\cdot M}$ then as $\alpha\neq 0$ we can define $z=1/\alpha\cdot x$ so that $x=\alpha\cdot z$. Assume that U is a open set such that $z\in U$ then by [theorem: 14.64] there exist a $\delta\in\mathbb{R}^+$ such that
$$z\in B_{\|\|}(z,\delta)\subseteq U \tag{14.41}$$
Further we have trivially $x\in B_{\|\|}(x,|\alpha|\cdot\delta)$ which is open so by [theorem: 14.28] and $x\in\overline{\alpha\cdot M}$ we have that $B_{\|\|}(x,|\alpha|\cdot\delta)\bigcap(\alpha\cdot M)\neq\varnothing$, hence there exist a $m\in M$ such that $\alpha\cdot m\in B_{\|\|}(x,|\alpha|\cdot\delta)$, from which it follows that $\|x-\alpha\cdot m\|<|\alpha|\cdot\delta$ or as $x=\alpha\cdot z$ that $|\alpha|\|z-m\|=\|\alpha\cdot z-\alpha\cdot m\|=\|x-\alpha\cdot m\|<|\alpha|\cdot\delta$ from which we conclude, as $|\alpha|\neq 0$, that $\|z-m\|<\delta$ or that $m\in B_{\|\|}(z,\delta)\subseteq_{\text{[eq: 14.41]}}U$. Hence $U\bigcap M\neq\varnothing$ which, as $z\in U$, means by [theorem: 14.28], that $z\in\overline{M}$ so that $x=\alpha\cdot z\in\alpha\cdot\overline{M}$. So we have proved that
$$\overline{\alpha\cdot M}\subseteq\alpha\cdot\overline{M} \tag{14.42}$$
For the opposite inclusion, assume that $x\in\alpha\cdot\overline{M}$. If U is a open set such that $x\in U$ then by [theorem: 14.64] there exist a $\delta\in\mathbb{R}^+$ such that
$$x\in B_{\|\|}(x,\delta)\subseteq U \tag{14.43}$$
As $x\in\alpha\cdot\overline{M}$ there exist a $z\in\overline{M}$ such that $x=\alpha\cdot z$, further we have trivially $z\in B_{\|\|}(z,\delta/|\alpha|)$ which is a open set so that by [theorem: 14.28] we have that $M\bigcap B_{\|\|}(z,\delta/|\alpha|\}\neq\varnothing$, hence there exist a $m\in M$ such that $m\in B_{\|\|}(z,\delta/|\alpha|\}\Rightarrow\|z-m\|<\delta/|\alpha|$. So $\|x-\alpha\cdot m\|=\|\alpha\cdot z-\alpha\cdot m\|=|\alpha|\cdot\|z-m\|<|\alpha|\cdot(\delta/|\alpha|)=\delta$ proving that $\alpha\cdot m\in B_{\|\|}(x,\delta)\subseteq U$ hence, as $\alpha\cdot m\in\alpha\cdot M$ we have that $U\bigcap(a\cdot M)\neq\varnothing$, proving by [theorem: 14.28] that $x\in\overline{\alpha\cdot M}$. So $\alpha\cdot\overline{M}\subseteq\overline{\alpha\cdot M}$ which combined with [eq: 14.42] gives
$$\overline{\alpha\cdot M}=\alpha\cdot\overline{M}$$
2. If A is closed then by [theorem: 14.25] $A=\overline{A}$, hence $\alpha\cdot A=\alpha\cdot\overline{A}\underset{(1)}{=}\overline{\alpha\cdot A}$ proving by [theorem: 14.25] that $\alpha\cdot A$ is closed.
3. If $x\in\alpha\cdot M$ then $x=\alpha\cdot m$ where $m\in M$. As M is open there exists by [theorem: 14.64] a $\delta\in\mathbb{R}^+$ such that $m\in B_{\|\|}(m,\delta)\subseteq M$. If $z\in B_{\|\|}(x,|\alpha|\cdot\delta)$ then $\|z-x\|<|\alpha|\cdot\delta$ so that
$$\|m-(1/\alpha)\cdot z\|=\|(1/\alpha)\cdot x-(1/\alpha)\cdot z\|=(1/|\alpha|)\cdot\|x-z\|<(1/|\alpha|)\cdot|\alpha|\cdot\delta=\delta$$
proving that $(1/\alpha)\cdot z\in B_{\|\|}(m,\delta)\subseteq M\Rightarrow z\in\alpha\cdot M$. Hence $x\in B_{\|\|}(x,|\alpha|\cdot\delta)\subseteq\alpha\cdot M$ proving by [theorem: 14.64] that $\alpha\cdot M$ is open.
4. Let $z\in x+M$ then $z-x\in M$ a open set, hence there exist by [theorem: 14.64] a $\delta\in\mathbb{R}^+$ such that
$$z-x\in B_{\|\|}(z-x,\delta)\subseteq M$$
Take $y\in B_{\|\|}(z,\delta)$ then $\|z-y\|<\delta\Rightarrow\|(y-x)-(z-x)\|=\|y-z\|=\|z-y\|<\delta$ proving that $y-x\in\mathcal{B}_{\|\|}(z-x,\delta)\subseteq M\Rightarrow y\in x+M$. Hence $z\in B_{\|\|}(z,\delta)\subseteq x+M$ proving by [theorem: 14.32] that $x+M$ is open.
5. This follows from (4) as $A+M=\bigcup_{x\in A}(x+M)$ that is a union of open sets, which is open by definition.
6. Let $z\in x+\overline{M}$ then $z=x+y$ where $y\in\overline{M}$. If U is a open set such that $z\in U$ then by [theorem: 14.64] there exist a $\delta\in\mathbb{R}^+$ such that
$$z\in B_{\|\|}(z,\delta)\subseteq U$$
As $y\in B_{\|\|}(y,\delta)\in\mathcal{T}_{\|\|}$ and $y\in\overline{M}$ it follows from [theorem: 14.28] that $B_{\|\|}(y,\delta)\bigcap M\neq\varnothing$, hence there exist a $y_1\in B_{\|\|}(y,\delta)\bigcap M$. Take $z_1=x+y_1$ then $z_1\in x+M$ and $\|z-z_1\|=\|x+y-x-y_1\|=\|y-y_1\|<\delta$ so that $z_1\in B_{\|\|}(z,\delta)\subseteq U$. Hence $z_1\in U\bigcap(x+M)$ so that $U\bigcap(x+M)\neq\varnothing$ proving by [theorem: 14.28] that $z\in\overline{x+M}$. Hence
$$x+\overline{M}\subseteq\overline{x+M}$$
7. If $x\in\overline{M}-\overline{M}$ then $x=y_1-y_2$ where $y_1,y_2\in\overline{M}$. Let U be a open set such that $x\in U$ then by [theorem: 14.64] there exist a $\delta\in\mathbb{R}^+$ such that
$$x\in B_{\|\|}(x,\delta)\subseteq U \tag{14.44}$$
As $y_1,y_2\in\overline{M}$ we have, as $y_1\in B_{\|\|}(y_1,\delta/2)\in\mathcal{T}_{\|\|}$, $y_2\in B_{\|\|}(y_2,\delta/2)\in\mathcal{T}_{\|\|}$, by [theorem: 14.28] that there exists a $z_1\in B_{\|\|}(y_1,\delta/2)\bigcap M$ and a $z_2\in B_{\|\|}(y_2,\delta/2)\bigcap M$. Take $z=z_1-z_2\in M-M$ then
$$\|x-z\|=\|(y_1-y_2)-(z_1-z_2)\|=\|(y_1-z_1)+(z_2-y_2)\|\leqslant\|y_1-z_1\|+\|y_2-z_2\|<\delta$$

proving that $z \in B_{\|\|}(x,\delta)$. As $z \in M - M$ it follows that $\varnothing \neq B_{\|\|}(x,\delta) \bigcap (M - M \subseteq U \bigcap (M - M$. So applying [theorem: 14.28] proves then that $\overline{M - M} \subseteq \overline{M} - \overline{M}$. □

Theorem 14.111. *Let $\langle X, d\rangle$ a pseudo normed space and $A \subseteq X$ then we have*

$$A \text{ is dense in } X \text{ [using the norm topology } \mathcal{T}_{\|\|}]$$

$$\Updownarrow$$

$$\forall x \in X \text{ we have } \forall \varepsilon \in \mathbb{R}^+ \text{ there exist a } a \in A \text{ such that } \|x - a\| < \varepsilon$$

Proof.

⇒. Let $x \in X$ then $\forall \varepsilon \in \mathbb{R}^+$ such that $x \in B_{d_{\|\|}}(x,\varepsilon)$ we have by [theorem: 14.51] that $\exists a \in A$ such that $a \in B_{d_{\|\|}}(x,\varepsilon)$, hence $\|x - a\| < \varepsilon$.

⇐. Let $x \in X$ and let $B \in \mathcal{B}_{d_{\|\|}}$ such that $x \in B$. As $B \in \mathcal{B}_{d_{\|\|}}$ there exists a $y \in X$ and a $\varepsilon \in \mathbb{R}^+$ such that $x \in B = B_{d_{\|\|}}(y,\varepsilon)$. By [theorem: 14.62] there exist a $\delta \in \mathbb{R}^+$ such that $x \in B_{d_{\|\|}}(x,\delta) \subseteq B_{d_{\|\|}}(y,\varepsilon) = B$. By the hypothesis there exist a $a \in A$ such that $\|x - a\| < \delta$ or $a \in B_{d_{\|\|}}(x,\delta) \subseteq B_{d_{\|\|}}(y,\varepsilon) = B$. So

$$\forall x \in X \text{ we have } \forall B \in \mathcal{B}_{d_{\|\|}} \text{ with } x \in B \text{ that there exist a } a \in A \text{ such that } a \in B$$

Applying [theorem: 14.51] on the above proves that A is dense in X. □

Theorem 14.112. *Let $\|\|_1$, $\|\|_2$ two norms on a vector space X and $\mathcal{T}_{\|\|_1}$, $\mathcal{T}_{\|\|_2}$ the associated topologies then $\mathcal{T}_{\|\|_2}$ is finer then $\mathcal{T}_{\|\|_1}$*

$$\mathcal{T}_{\|\|_1} \text{ is finer then } \mathcal{T}_{\|\|_2} \Leftrightarrow \exists M \in \mathbb{R}^+ \text{ such that } \forall x \in X \text{ we have } \|x\|_1 \leqslant M \cdot \|x\|_2$$

Proof.

⇒. As $\mathcal{T}_{\|\|_1}$ is finer then $\mathcal{T}_{\|\|_2}$ we have by [theorem: 14.68] there exist a $\delta \in \mathbb{R}^+$ such that

$$0 \in B_{\|\|_2}(0,\delta) \subseteq B_{\|\|_1}(0,1) \tag{14.45}$$

Take $M = 2/\delta$. Let $x \in X$ then we have either:

$x = 0$. Then $\|x\|_1 = 0 \leqslant 0 = M \cdot 0 = M \cdot \|x\|_2$

$x \neq 0$. Take $y = (1/(M \cdot \|x\|_2)) \cdot x$ [as $\|\|_2$ is a norm $\|x\|_2 \neq 0$] then we have

$$\|y\|_2 = |1/(M \cdot \|x\|_2)| \cdot \|x\|_2 = 1/M = \delta/2 < \delta$$

so that by [eq: 14.45] $y \in B_{\|\|_1}(0,1)$, hence $\|y\|_1 < 1$ or as

$$1 > \|y\|_1 = \|(1/(M \cdot \|x\|_2)) \cdot x\|_1 = |1/(M \cdot \|x\|_2)| \cdot \|x\|_1 = \|x\|_1/(M \cdot \|x\|_2)$$

so that $\|x\|_1/(M \cdot \|x\|_2) < 1$ proving that

$$\|x\|_1 \leqslant M \cdot \|x\|_2$$

hence

$$\forall x \in X \text{ we have } \|x\|_1 \leqslant M \cdot \|x\|_2$$

⇐. Let $\varepsilon \in \mathbb{R}^+$ and $x \in B_{\|\|_1}(x,\varepsilon)$. As $M \in \mathbb{R}^+$ we can tan take $\delta = \varepsilon/M \in \mathbb{R}^+$ then if $y \in B_{\|\|_2}(x,\delta)$ we have $\|x - y\|_2 < \delta$ and by the hypothesis

$$\|x - y\|_1 \leqslant M \cdot \|x - y\|_2 < M \cdot \delta = M \cdot (\varepsilon/M) = \varepsilon$$

so that $y \in B_{\|\|_1}(x,\varepsilon_1)$. Hence $B_{\|\|_2}(x,\delta) \subseteq B_{\|\|_1}(x,\varepsilon)$ which by [theorem: 14.68] proves that

$$\mathcal{T}_{\|\|_2} \text{ is finer then } \mathcal{T}_{\|\|_1}$$

□

Definition 14.113. *Let X be a real or complex vector space then two pseudo norms are equivalent if*

$$\mathcal{T}_{\|\|_1} = \mathcal{T}_{\|\|_2}$$

Theorem 14.114. *Let X be a real or complex vector space and*

$$\mathcal{N}(X) = \{\|\| \in \mathbb{R}^{X \times X} \mid \|\| \text{ is a pseudo norm}\}$$

then if we define $\approx \subseteq \mathcal{N}(X) \times \mathcal{N}(X)$ *by* $\|\|_1 \approx \|\|_2$ *if* $\|\|_1$ *is equivalent with* $\|\|_3$ *we have that*

$$\approx \text{ is a equivalence relation}$$

Proof. The proof is trivial because set equality is a equivalence relation

reflexivity. If $\|\|$ is a pseudo norm on X then clearly $\mathcal{T}_{\|\|} = \mathcal{T}_{\|\|}$ so that $\|\| \approx \|\|$

symmetry. If $\|\|_1 \approx \|\|_2$ then $\mathcal{T}_{\|\|_1} = \mathcal{T}_{\|\|_2} \Rightarrow \mathcal{T}_{\|\|_2} = \mathcal{T}_{\|\|_1}$ so that $\|\|_2 \approx \|\|_1$

transitivity. If $\|\|_1 \approx \|\|_1$ and $\|\|_2 \approx \|\|_3$ then $\mathcal{T}_{\|\|_1} = \mathcal{T}_{\|\|_2} \wedge \mathcal{T}_{\|\|_2} \approx \mathcal{T}_{\|\|_3}$, hence $\mathcal{T}_{\|\|_1} = \mathcal{T}_{\|\|_3}$ proving that $\|\|_1 \approx \|\|_3$ □

Theorem 14.115. *Let* X *be a real or complex vector space and* $\|\|_1$, $\|\|_2$ *pseudo norms on* X *then*

$$\|\|_1 \text{ is equivalent with } \|\|_2 \Leftrightarrow \exists M_1, M_2 \in \mathbb{R}^+ \text{ such that } \forall x \in X \ M_1 \cdot \|x\|_1 \leqslant \|x\|_2 \leqslant M_2 \cdot \|x\|_1$$

Proof. Let $\mathcal{T}_{\|\|_1}$, $\mathcal{T}_{\|\|_2}$ be the topologies generated by $\|\|_1$, $\|\|_2$ then we have

$\Rightarrow$. Then as $\mathcal{T}_{\|\|_1} = \mathcal{T}_{\|\|_2}$ we have that $\mathcal{T}_{\|\|_2}$ is finer then $\mathcal{T}_{\|\|_1}$ and $\mathcal{T}_{\|\|_1}$ is finer then $\mathcal{T}_{\|\|_2}$ so by [theorem: 14.112] there exists $M_1', M_2 \in \mathbb{R}^+$ such that $\forall x \in X \ \|x\|_1 \leqslant M_1' \cdot \|x\|_2$ and $\|x\|_2 \leqslant M_2 \cdot \|x\|_1$ hence if we take $M_1 = 1/M_1'$ then we have

$$M_1 \cdot \|x\|_1 \leqslant \|x\|_2 \leqslant M_2 \cdot \|x\|_1$$

$\Leftarrow$. Let $x \in X$ then as $M_1 \cdot \|x\|_1 \leqslant \|x\|_2 \leqslant M_2 \cdot \|x\|_1$ we have $\|x\|_1 \leqslant (1 \setminus M_1) \cdot \|x\|_2$ and $\|x\|_2 \leqslant M_2 \cdot \|x\|_1$ so that by [theorem: 14.112] we have that $\mathcal{T}_{\|\|_1}$ is finer then $\mathcal{T}_{\|\|_2}$ and $\mathcal{T}_{\|\|_2}$ is finer then $\mathcal{T}_{\|\|_1}$. So $\mathcal{T}_{\|\|_1} = \mathcal{T}_{\|\|_2}$ or $\|\|_1$ is equivalent with $\|\|_2$. □

Example 14.116. In the real vector space $\mathbb{R}$ all norms are equivalent.

Proof. Note that by [example: 14.97]

$$|| \text{ is a norm on } \mathbb{R}$$

Let $\|\|$ be a norm on $\mathbb{R}$ then given $x \in X$ we have $\|x\| = \|1 \cdot x\| = |x| \cdot \|1\|$, so if we take $N = M = \|1\| \in \mathbb{R}^+$ [because $1 \neq 0$ and $\|\|$ is a norm] we have

$$N \cdot |x| \leqslant N \cdot |x| = \|1\| \cdot |x| = \|x\| = \|1\| \cdot |x| = M \cdot |x| \leqslant M \cdot |x|$$

so that $\|\|$ is equivalent with $||$. Hence every norm on $\mathbb{R}$ is equivalent with $||$. As norm equivalence is a equivalence relation [see theorem: 14.114] it follows that all norms on $\mathbb{R}$ are equivalent. □

Example 14.117. In the complex vector space $\mathbb{C}$ all norms are equivalent.

Proof. Note that by [example: 14.97]

$$|| \text{ is a norm on } \mathbb{C}$$

Let $\|\|$ be a norm on $\mathbb{C}$ then given $x \in X$ we have $\|x\| = \|1 \cdot x\| = |x| \cdot \|1\|$, so if we take $N = M = \|1\| \in \mathbb{R}^+$ [because $1 \neq 0$ and $\|\|$ is a norm] we have

$$N \cdot |x| \leqslant N \cdot |x| = \|1\| \cdot |x| = \|x\| = \|1\| \cdot |x| = M \cdot |x| \leqslant M \cdot |x|$$

so that $\|\|$ is equivalent with $||$. Hence every norm on $\mathbb{C}$ is equivalent with $||$. As norm equivalence is a equivalence relation [see theorem: 14.114] it follows that all norms on $\mathbb{C}$ are equivalent. □

Definition 14.118. *Let* $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ *be pseudo normed spaces then* $\varphi: X \to Y$ *is a* ***linear isometry*** *if*

1. $\varphi: X \to Y$ *is a linear mapping*
2. $\forall x \in X$ *we have* $\|x\|_X = \|\varphi(x)\|_Y$

If in addition $\varphi: X \to Y$ *is a* ***bijection*** *then*

$$\varphi: X \to Y \textbf{ \textit{is a linear isometric isomorphism}}$$

If between $\langle X, \|\|_X \rangle$ *and* $\langle Y, \|\|_Y \rangle$ *there exist a linear isometric isomorphism then we says that* $\langle X, \|\|_X \rangle$ *and* $\langle Y, \|\|_Y \rangle$ ***are isometric***. *We note this as*

$$X \approx Y$$

Theorem 14.119. *Let $\langle X, \|\|_X\rangle$ a normed space, $\langle Y, \|\|_Y\rangle$ a pseudo normed spaces and $\varphi: X \to Y$ a* ***linear isometry*** *then φ is* ***injective****. Hence if $\varphi: X \to Y$ is also surjective then $\varphi: X \to Y$ is a bijection and thus a* ***linear isometric isomorphism****.*

Proof. Let $x, y \in X$ such that $\varphi(x) = \varphi(y)$ then

$$\|x - y\|_X = \|\varphi(x - y)\|_Y = \|\varphi(x) - \varphi(y)\|_Y = \|0\|_Y = 0$$

which as $\|\|_X$ is a norm proves that $x - y = 0$ hence $x = y$. □

Theorem 14.120. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be pseudo normed spaces and $\varphi: X \to Y$ a linear isometric isomorphism then $\varphi^{-1}: Y \to X$ is a linear isometric isomorphism.*

Proof. Because of [theorem: 11.176] we have that $\varphi^{-1}: Y \to X$ is a linear isomorphism. Further if $y \in Y$ then $\|y\|_Y = \|\varphi(\varphi^{-1}(y))\|_Y = \|\varphi^{-1}(y)\|_X$. Hence $\varphi^{-1}: Y \to X$ is a linear isometry. □

Theorem 14.121. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ and $\langle Z, \|\|_Z\rangle$ be pseudo metric spaces and $\varphi: X \to Y$, $\psi: Y \to Z$ linear isometries then*

$$\psi \circ \varphi: X \to Z \text{ is a linear isometry}$$

If in addition φ, ψ are linear isometric isomorphisms then

$$\psi \circ \varphi: X \to Z \text{ is a linear isometric isomorphism}$$

Proof. Using [theorem: 11.177] $\psi \circ \varphi: X \to Z$ is a linear mapping. Further given $x \in X$ we have

$$\|(\psi \circ \varphi)(x)\|_Z = \|\psi(\varphi(x))\|_Z = \|\varphi(x)\|_Y = \|x\|_X$$

hence

$$\psi \circ \varphi: X \to Z \text{ is a linear isometry}$$

Further if φ, ψ are linear isometric isomorphisms,then they are bijection, hence by [theorem: 2.76] $\psi \circ \varphi$ is a bijection, so that $\psi \circ \varphi$ is a linear isometric isomorphism. □

We have the following relation between a linear isometry in a normed space and a linear isometry in its associated metric space.

Theorem 14.122. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces with associated metric spaces and $\varphi: X \to Y$ a linear isometry then*

$$\forall x, y \in X \text{ we have } d_{\|\|_X}(x, y) = d_{\|\|_Y}(\varphi(x), \varphi(y)) \Leftrightarrow \forall x \in X \text{ we have } \|x\|_X = \|\varphi(x)\|_Y$$

In other words if φ is a linear mapping then

$$\varphi \text{ is a isometry } \Leftrightarrow \varphi \text{ is a linear isometry}$$

and

$$\varphi \text{ is a isometric isomorphism} \Leftrightarrow \varphi \text{ is a linear isometric isomorphism}$$

Proof.

⇒. Let $x \in X$ then we have

$$\|x\|_X = \|x - 0\|_X = d_{\|\|_X}(x, 0) = d_{\|\|_Y}(\varphi(x), \varphi(0)) = \|\varphi(x) - \varphi(y)\|_Y = \|\varphi(x - 0)\|_Y = \|\varphi(x)\|_Y$$

⇐. Let $x, y \in X$ then we have

$$d_{\|\|_X}(x, y) = \|x - y\|_X = \|\varphi(x - y)\|_Y = \|\varphi(x) - \varphi(y)\|_Y = d_{\|\|_Y}(\varphi(x), \varphi(y))$$ □

Theorem 14.123. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces and $\varphi: X \to Y$ a linear isometric isomorphism then*

$$\mathcal{T}_{\|\|_X} = \{\varphi^{-1}(V) | V \in \mathcal{T}_{\|\|_Y}\} = \{U \subseteq X | \varphi(U) \in \mathcal{T}_{\|\|_Y}\}$$

and

$$\mathcal{T}_{\|\|_Y} = \{V \subseteq Y | \varphi^{-1}(V) \in \mathcal{T} \in \mathcal{T}_{\|\|_X}\} = \{\varphi(U) | U \in \mathcal{T}_{\|\|_X}\}$$

Proof. This follows from [theorem: 14.74] and [theorem: 14.122] □

14.4 Continuous functions

14.4.1 Continuous and open functions

Definition 14.124. *Let $\langle X, \mathcal{T}_X \rangle$, $\langle Y, \mathcal{T}_Y \rangle$ be topological spaces, $x \in X$ then a function*

$$f: X \to Y \text{ is } \textbf{\textit{continuous at}} \ x \text{ if } \forall V \in \mathcal{T}_Y \text{ with } f(x) \in V \text{ there exist a } U \in \mathcal{T}_X \text{ such that } x \in U \wedge f(U) \subseteq V$$

Note 14.125. Be aware that the notation of continuity does depends on the function but also on the chosen topologies.

Theorem 14.126. *Let $\langle X, \mathcal{T}_X \rangle$, $\langle Y, \mathcal{T}_Y \rangle$ be topological spaces, $\mathcal{B}_X$ a topological basis for $\mathcal{T}_X$, $\mathcal{B}_Y$ a topological basis for $\mathcal{T}_Y$, $x \in X$ and $f: X \to Y$ a function then we have the following equivalences:*

1. *f is continuous at x*
2. *$\forall V \in \mathcal{B}_Y$ with $f(x) \in V$ there exist a $U \in \mathcal{T}_X$ such that $x \in U$ and $f(U) \subseteq V$*
3. *$\forall V \in \mathcal{B}_Y$ with $f(x) \in V$ there exist a $U \in \mathcal{B}_X$ such that $x \in U$ and $f(U) \subseteq V$*

Proof.

1 ⇒ 2. This is trivial as $\mathcal{B}_Y \in \mathcal{T}_Y$.

2 ⇒ 3. Let $V \in \mathcal{B}_Y$ with $f(x) \in V$ then by (2) there exist a $U' \in \mathcal{T}_X$ such that $x \in U' \wedge f(U') \subseteq V$, by [theorem: 14.32] there exist a $U \in \mathcal{B}_X$ with $x \in U \subseteq U'$ so that $f(U) \subseteq f(U') \subseteq V$.

3 ⇒ 1. Let $V \in \mathcal{T}_Y$ with $f(x) \in V$ then by [theorem: 14.32] there exist a $W \in \mathcal{B}_Y$ such that $f(x) \in W \subseteq V$. Hence by (3) there exist a $U \in \mathcal{B}_X$ such that $x \in U$ and $f(U) \subseteq W \subseteq V$ proving that f is continuous at x. □

If we work with metric or normed spaces then we can use the classical ε-δ definition of functions continuous at a point.

Theorem 14.127. *Let $\langle X, d_X \rangle$, $\langle Y, d_Y \rangle$ be metric spaces, $x \in X$ and $f: X \to Y$ then we have*

$$f: X \to Y \text{ is continuous at } x \text{ using the topologies } \mathcal{T}_{d_X}, \mathcal{T}_{d_Y}$$

$$\Updownarrow$$

$$\forall \varepsilon \in \mathbb{R}^+ \ \exists \delta \in \mathbb{R}^+ \text{ such that } \forall z \in X \text{ satisfying } d_X(x,z) < \delta \text{ we have } d_Y(f(x), f(z)) < \varepsilon$$

Proof.

⇒. Let $\varepsilon \in \mathbb{R}^+$ then $f(x) \in B_{d_Y}(f(x), \varepsilon) \in \mathcal{B}_{d_Y}$, hence by [theorem: 14.126] there exists a $B \in \mathcal{B}_{d_X}$ such that $f(x) \in B$ and $f(B) \subseteq B_{d_Y}(f(x), \varepsilon)$, hence there exist a $y \in X$ and a $\delta' \in \mathbb{R}^+$ such that $x \in B_{d_X}(y, \delta') \in \mathcal{B}_{d_X}$ and $f(B_{d_X}(y, \delta')) \subseteq B_{d_Y}(f(x), \varepsilon)$. Using [theorem: 14.62] there exist a $\delta \in \mathbb{R}^+$ such that $x \in B_{d_X}(x, \delta) \subseteq B_{d_X}(y, \delta')$. So we have

$$f(B_{d_X}(x, \delta)) \subseteq f(B_{d_X}(y, \delta')) \subseteq B_{d_Y}(f(x), \varepsilon)$$

So if $z \in X$ satisfies $d_X(x, y) < \delta$ then $z \in B_{d_X}(x, \delta)$ so that $f(z) \in B_{d_Y}(f(x), \varepsilon)$ or $d_Y(f(x), f(z)) < \varepsilon$.

⇐. Let $V \in \mathcal{T}_Y$ such that $f(x) \in V$ then by [theorem: 14.64] there exist a $\varepsilon \in \mathbb{R}^+$ such that $f(x) \in B_{d_Y}(f(x), \varepsilon) \subseteq V$. By the hypothesis there exist a $\delta \in \mathbb{R}^+$ such that

$$\forall z \in X \text{ with } d_X(x,z) < \delta \text{ we have } d_Y(f(x), f(z)) < \varepsilon$$

If $y \in f(B_{d_X}(x, \delta))$ then there exist a $z \in X$ such that $d_X(x,z) < \delta$ and $y = f(x)$ hence using the above we have that $d_Y(f(x), f(z)) < \varepsilon$ or $y = f(z) \in B_{d_Y}(f(x), \varepsilon) \subseteq V$. As $y \in f(B_{d_X}(x, \delta))$ was chosen arbitrary it follows that

$$f(B_d(x, y)) \subseteq V \text{ where } x \in B_{d_X}(x, \delta) \in \mathcal{T}_X$$

So we have that $\forall V \in \mathcal{T}_Y$ with $f(x) \in V$ we found a $B_{d_X}(x, \delta) \in \mathcal{T}_X$ such that $f(B_d(x, y)) \subseteq V$ proving that f is continuous at x.

□

Theorem 14.128. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be pseudo normed spaces, $x \in X$ and $f: X \to Y$ then we have*

$$f: X \to Y \text{ is continuous at } x \text{ using the topologies } \mathcal{T}_{\|\|_X}, \mathcal{T}_{\|d\|_Y}$$

$$\Updownarrow$$

$$\forall \varepsilon \in \mathbb{R}^+ \ \exists \delta \in \mathbb{R}^+ \text{ such that } \forall y \in X \text{ satisfying } \|x-y\|_X < \delta \text{ we have } \|f(x)-f(y)\|_Y < \varepsilon$$

Proof.

- **⇒.** Let $\varepsilon \in \mathbb{R}^+$ then by [theorem: 14.127] there exist a $\delta \in \mathbb{R}^+$ such that $\forall y \in X$ with $d_X(x,y) < \delta$ we have $d_Y(f(x), f(y)) < \varepsilon$. Hence if $\|x-y\|_X < \delta$ then $d_X(x,y) < \delta$ so that $\|f(x)-f(y)\|_Y = d_Y(f(x), f(y)) < \varepsilon$.
- **⇐.** Let $\varepsilon \in \mathbb{R}^+$ then by the hypothesis there exist a $\delta \in \mathbb{R}^+$ such that for all $y \in X$ with $\|x-y\|_X < \delta$ we have $\|f(x)-f(y)\|_Y < \varepsilon$. So if $y \in X$ satisfies $d_{\|\|_X}(x,y) < \delta$ then $\|x-y\|_Y < \delta$ and we have $d_{\|\|_Y}(f(x), f(y)) = \|f(x)-f(y)\|_Y < \varepsilon$. Hence by [theorem: 14.127] it follows that f is continuous at x. □

The above works also for the subspace topology.

Corollary 14.129. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be pseudo normed spaces, $U \subseteq X$, $x \in U$ and $f: U \to Y$ then using the subspace topology $(\mathcal{T}_{\|\|_X})_{|U}$ on X and $\mathcal{T}_{\|\|_Y}$ on Y we have:*

$$f: U \to Y \text{ is continuous at } x$$

$$\Updownarrow$$

$$\forall \varepsilon \in \mathbb{R}^+ \ \exists \delta \in \mathbb{R}^+ \text{ such that } \forall y \in U \text{ satisfying } \|x-y\|_X < \delta \text{ we have } \|f(x)-f(y)\|_Y < \varepsilon$$

Proof. Note that using [theorem: 14.109] the norm for the subspace topology $(\|\|_X)_{|U \times U}$ is defined by $\forall x \in U \ (\|\|_X)_{|U \times U}(x) = \|x\|_X$.

- **⇒.** Let $\varepsilon \in \mathbb{R}^+$ then by [theorem: 14.128] there exist a $\delta \in \mathbb{R}^+$ such that $\forall y \in U$ satisfying $(\|x-y\|_X)_{|U \times U} < \delta$ we have $\|(x)-f(y)\|_Y < \varepsilon$. If $y \in U$ satisfies $\|x-y\|_X < \delta$ then $(\|x-y\|_X)_{|U \times U} < \delta$ so that $\|f(x)-f(y)\|_Y < \varepsilon$.
- **⇐.** Let $\varepsilon \in \mathbb{R}^+$ then there exist a $\delta \in \mathbb{R}^+$ such that $\forall y \in U$ with $\|x-y\|_X < \delta$ we have $\|f(x)-f(y)\|_Y < \varepsilon$. Hence if $(\|x-y\|_X)_{|U \times U} < \delta$ we have $\|x-y\|_X < \delta$ so that $\|f(x)-f(y)\|_Y < \varepsilon$, so that, using [theorem: 14.128], $f: U \to Y$ is continuous. □

Definition 14.130. *Let $\langle X, \mathcal{T}_X\rangle$, $\langle Y, \mathcal{T}_Y\rangle$ be topological spaces then a function $f: X \to Y$ is* ***continuous*** *if $\forall x \in X$ f is continuous at x. The set of all the graphs of continuous functions from X to Y is noted as $\mathcal{C}(X,Y)$. So*

$$\mathcal{C}(X,Y) = \{f \in Y^X \,|\, f: X \to Y \text{ is continuous}\}$$

Theorem 14.131. *Let $\langle X, \mathcal{T}_X\rangle$, $\langle Y, \mathcal{T}_Y\rangle$ be topological spaces and $f: X \to Y$ a function then*

$$\forall x \in f \text{ is continuous at } x \Leftrightarrow \forall V \in \mathcal{T}_Y \text{ we have } f^{-1}(V) \in \mathcal{T}_X$$

or using the above definition:

$$f \text{ is continuous} \Leftrightarrow \forall V \in \mathcal{T}_Y \text{ we have } f^{-1}(V) \in \mathcal{T}_X$$

Proof.

- **⇒.** Let $V \in \mathcal{T}_Y$ then $\forall x \in f^{-1}(V) \subseteq X$ we have $f(x) \in V$ so that by continuity at x there exist a $U \in \mathcal{T}_X$ such that $x \in U \wedge f(U) \subseteq V$. Hence by a consequence of the axiom of choice [see: 3.107] there exist a $\{U_x\}_{x \in f^{-1}(V)} \subseteq \mathcal{T}_X$ such that $\forall x \in f^{-1}(V)$ $x \in U_x$ and $f(U_x) \subseteq V$. So $U_x \subseteq f^{-1}(f(U_x)) \subseteq f^{-1}(V)$ so that
$$\bigcup_{x \in f^{-1}(V)} U_x \subseteq f^{-1}(V)$$
Further if $x \in f^{-1}(V)$ then $x \in U_x \subseteq \bigcup_{x \in f^{-1}(V)} U_x$ so that $f^{-1}(V) \subseteq \bigcup_{x \in f^{-1}(V)} U_x$ or combining this with the above that
$$f^{-1}(V) = \bigcup_{x \in f^{-1}(V)} U_x \text{ where } \{U_x\}_{x \in f^{-1}(V)} \subseteq \mathcal{T}_X$$
so that by definition
$$f^{-1}(V) \in \mathcal{T}_X$$
- **⇐.** Let $x \in X$ and $V \in \mathcal{T}_Y$ such that $f(x) \in V$ then $x \in f^{-1}(V)$. By the hypothesis we have $f^{-1}(V) \in \mathcal{T}_X$, so if we take $U = f^{-1}(V)$ then $U \in \mathcal{T}_X$ and $x \in U$. Further by [theorem: 2.25] we have $f(f^{-1}(V)) \subseteq V$ so that $f(U) = f(f^{-1}(V)) \subseteq V$ proving that f is continuous at x. □

Example 14.132. Let $\langle X, \mathcal{T}_X\rangle$, $\langle Y, \mathcal{T}_Y\rangle$ be topological spaces, $y \in Y$ then $C_y: X \to Y$ defined by $C_y(x) = y$ is continuous.

Proof. If $V \in \mathcal{T}_X$ then we have either:

$\boldsymbol{y \in V}$**.** Then $f^{-1}(V) = X \in \mathcal{T}_X$

$\boldsymbol{y \notin V}$**.** Then $f^{-1}(V) = \varnothing \in \mathcal{T}_X$

So using [theorem: 14.131] it follows that C_y is continuous. □

Example 14.133. Let $\langle X, \mathcal{T}_X\rangle$ be a topological space then $\mathrm{Id}_X: X \to X$ is continuous.

Proof. Let $V \in \mathcal{T}_X$ then $(\mathrm{Id}_X)^{-1}(V) = V \in \mathcal{T}_X$ proving by [theorem: 14.131] continuity. □

Theorem 14.134. *Let $\langle X, \mathcal{T}_X\rangle$, $\langle Y, \mathcal{T}_Y\rangle$ be topological spaces, $A \subseteq X$, $x \in A$ and $f: X \to Y$ a function that is continuous at x then*

$$f_{|A}: A \to Y$$

is continuous at x using the subspace topology $(\mathcal{T}_X)_{|A} = \{A \bigcap U | U \in \mathcal{T}_X\}$ on A and the topology $\mathcal{T}_Y$ on Y.

Proof. Let $V \in \mathcal{T}_Y$ such that $f_{|A}(x) \in V$. Then $f(x) \in V$ and by continuity of f at X there exist a $U \in \mathcal{T}_X$ with $x \in U$ and $f(U) \subseteq V$. As $x \in A$ we have that $x \in A \bigcap U \in (\mathcal{T}_X)_{|A}$ and $f_{|A}(A \bigcap U) \underset{\text{[theorem: 2.86]}}{=} f(A \bigcap U) \subseteq f(U) \subseteq V$ proving that $f_{|A}$ is continuous at x. □

The opposite is true if A is open showing that continuity at a point is a local property.

Theorem 14.135. *Let $\langle X, \mathcal{T}_X\rangle$, $\langle Y, \mathcal{T}_Y\rangle$ be topological spaces, $U \in \mathcal{T}_X$, $x \in U$ and $f: X \to Y$ a function such that $f_{|U}: U \to Y$ is continuous at x then f is continuous at x.*

Proof. Let $V \in \mathcal{T}_Y$ such that $f(x) \in V$ then as $f_{|U}$ is continuous at x there exist a $W' \in (\mathcal{T}_X)_{|U}$ such that $x \in W'$ and $f_{|U}(W') \subseteq V \Rightarrow f(W') \subseteq V$. As $W' \in (\mathcal{T}_X)_{|U}$ there exist a $W \in \mathcal{T}_X$ such that $W' = W \bigcap U$, as $U \in \mathcal{T}_X$ it follows that $W' \in \mathcal{T}_X$. So we found a $W' \in \mathcal{T}_X$ such that $x \in W'$ and $f(W') \subseteq V$ proving that f is continuous at x. □

Theorem 14.136. *Let $\langle X, \mathcal{T}_X\rangle$, $\langle Y, \mathcal{T}_Y\rangle$ be topological spaces, $A \subseteq X$ and $f: X \to Y$ a continuous function then*

$$f_{|A}: A \to Y$$

is a continuous function using the subspace topology $(\mathcal{T}_X)_{|A} = \{A \bigcap U | U \in \mathcal{T}_X\}$ on A and the topology $\mathcal{T}_Y$ on Y.

Proof. Let $V \in \mathcal{T}_Y$ then we have $(f_{|A})^{-1}(V) \underset{\text{[theorem: 2.86]}}{=} A \bigcap f^{-1}(V)$. As f is continuous $f^{-1}(V) \in \mathcal{T}_X$ so that $A \bigcap f^{-1}(V) \in (\mathcal{T}_X)_{|A}$ proving that $(f_{|A})^{-1}(V) \in (f_{|A})^{-1}(V)$, hence by [theorem: 14.131] f is continuous. □

Theorem 14.137. *Let $\langle X, \mathcal{T}_X\rangle$, $\langle Y, \mathcal{T}_Y\rangle$ be topological spaces then the following are equivalent:*

1. *f is continuous*
2. *$\forall A \subseteq X$ we have $f(\overline{A}) \subseteq \overline{f(A)}$*
3. *$\forall F \subseteq Y$ F closed we have that $f^{-1}(F)$ is closed*

Proof.

1 ⇒ 2. Let $y \in f(\overline{A})$ then there exist a $x \in \overline{A}$ such that $y = f(x)$. Let $V \in \mathcal{T}_Y$ such that $y \in V$ then, as f is continuous, there exist a $U \in \mathcal{T}_X$ such that $x \in U$ and $f(U) \subseteq V$. Given that $x \in \overline{A}$ we have by [theorem: 14.29] that $A \bigcap U \neq 0$ so that $\varnothing \neq f(A \bigcap U)$. By [theorem: 2.95] $f(A \bigcap U) \subseteq f(A) \bigcap f(U)$ so that $\varnothing \neq f(A) \bigcap f(U) \subseteq f(A) \bigcap V$ proving that $y \in \overline{f(A)}$. As $y \in f(\overline{A})$ was chosen arbitrary it follows that

$$f(\overline{A}) \subseteq \overline{f(V)}$$

2 ⇒ 3. Let $A \subseteq Y$ be closed then by (2)

$$f(\overline{f^{-1}(A)}) \subseteq \overline{f(f^{-1}(A))} \tag{14.46}$$

Further by [theorem: 2.25] we have that $f(f^{-1}(A)) \subseteq A$ so that by [corollary: 14.30] we have $\overline{f(f^{-1}(A))} \subseteq \overline{A} \underset{\text{[theorem: 14.25]}}{=} A$ or combining this with [eq: 14.46] gives

$$f(\overline{f^{-1}(A)}) \subseteq A$$

Hence by [theorem: 2.94] we have that $f^{-1}(f(\overline{f^{-1}(A)})) \subseteq f^{-1}(A)$ and by [theorem: 2.25] $\overline{f^{-1}(A)} \subseteq f^{-1}(f(\overline{f^{-1}(A)}))$ so that $\overline{f^{-1}(A)} \subseteq f^{-1}(A)$. As by [theorem: 14.27] $f^{-1}(A) \subseteq \overline{f^{-1}(A)}$ it follows that $f^{-1}(A) = \overline{f^{-1}(A)}$. Hence by [theorem: 14.25] that

$$f^{-1}(A) \text{ is closed}$$

3 ⇒ 1. If $V \in \mathcal{T}_Y$ then by [theorem: 14.20] $Y \setminus V$ is closed so by (3) we have that $f^{-1}(Y \setminus V)$ is closed so that $X \setminus f^{-1}(Y \setminus V) \in \mathcal{T}_X$. Finally by [theorem: 2.94] we have that

$$f^{-1}(V) = f^{-1}(Y \setminus (Y \setminus V)) = X \setminus f^{-1}(Y \setminus V) \in \mathcal{T}_X$$

proving that for every $V \in \mathcal{T}_Y$ we have $f^{-1}(V) \in \mathcal{T}_X$. Hence by [theorem: 14.131] $f: X \to Y$ is continuous. □

If a function is continuous then the preimage of a open set is open, we can consider also functions so that the image of a open set is open. This is the idea of a open function.

Definition 14.138. (Open Function) *Let $\langle X, \mathcal{T}_X \rangle$, $\langle Y, \mathcal{T}_Y \rangle$ be topological spaces then a function*

$$f: X \to Y \textbf{ \textit{is open}}$$

if $\forall U \in \mathcal{T}_X$ we have that $f(U) \in \mathcal{T}_Y$

The composition of two continuous or open functions is again a continuous or open function.

Theorem 14.139. *Let $\langle X, \mathcal{T}_X \rangle$, $\langle Y, \mathcal{T}_Y \rangle$ and $\langle Z, \mathcal{T}_Z \rangle$ be topological spaces then we have:*

1. *If $f: X \to Y$ is a function that is coninuous at x and $g: Y \to Z$ a function that is continuous at $f(x)$ then $g \circ f$ is continuous at x.*
2. *If $f: X \to Y$ and $g: Y \to Z$ are continuous functions then $g \circ f: X \to Z$ is continuous.*
3. *If $f: X \to Y$ and $g: Y \to Z$ are open functions then $g \circ f: X \to Z$ is open*

Proof.

1. Let $W \in T_Z$ such that $(g \circ f)(x) \in W$ then $g(f(x)) \in W$. As g is continuous at $f(x)$ there exist a open set $V \in \mathcal{T}_Y$ such that $f(x) \in V$ and $g(V) \subseteq W$. Using the fact that f is continuous at x there exist a open set $U \in \mathcal{T}_X$ such that $x \in U$ and $f(U) \subseteq V$. Further we have
$$(g \circ f)(U) \underset{\text{[theroem: 2.23]}}{=} g(f(U)) \underset{\text{[theorem: 2.17]}}{\subseteq} g(V) \subseteq W$$
which proves that
2. Let $V \in \mathcal{T}_Z$ then, as g is continuous we have by [theorem: 14.131] that $g^{-1}(V) \in \mathcal{T}_Y$, applying [theorem: 14.131] again results in $f^{-1}(g^{-1}(V)) \in \mathcal{T}_X$. As
$$(g \circ f)^{-1}(V) \underset{\text{[theorem: 2.23]}}{=} f^{-1}(g^{-1}(V)) \in \mathcal{T}_X$$
we have by [theorem: 14.131] that $g \circ f$ is continuous.
3. Let $U \in \mathcal{T}_Z$ then, as f is open, $f(U) \in \mathcal{T}_Y$, hence as g is open we have that
$$(g \circ f)(U) \underset{\text{[theorem: 2.23]}}{=} g(f(U)) \in \mathcal{T}_Z$$
proving that $g \circ f$ is open. □

One of the reasons to use the product topology on a product of topological spaces is that the projection map is open and continuous.

Theorem 14.140. *Let $\{\langle X_i, \mathcal{T}_i \rangle\}_{i \in I}$ be a family of topological spaces and $\langle \prod_{i \in I} X_i, \mathcal{T}_{\text{product}} \rangle$ be the product topological space [see definition: 14.43] then $\forall i \in I$ we have that the projection map*

$$\pi_i: \prod_{j \in I} X_j \to X_i \textit{ defined by } \pi_i(x) = x_i$$

is open and continuous.

Proof. Let $S = \{\pi_i^{-1}(U) | i \in I \wedge U \in \mathcal{T}_i\}$ then by [theorem: 14.40] we have

$$S \subseteq \mathcal{B}[\mathcal{S}] \subseteq \mathcal{T}[\mathcal{B}[S]] \underset{\text{[definition: 14.43]}}{=} \mathcal{T}_{\text{product}}$$

So if $i \in I$ then for $U \in \mathcal{T}_i$ we have $\pi_i^{-1}(U) \in \mathcal{S} \subseteq \mathcal{T}_{\text{product}}$ so that

$$\forall i \in I \text{ we have } \pi_i \text{ is continuous} \tag{14.47}$$

Let $U \in \mathcal{T}_{\text{product}}$ and let $t \in \pi_i(U)$ then there exist a $x \in U$ so that $t = \pi_i(x) = x_i$. By [theorem: 14.45] we have that

$$\mathcal{B}[S] = \left\{ \prod_{i \in I} U_i | \{U_i\}_{i \in I} \subseteq \mathcal{P}\left(\prod_{i \in I} X_i \right) \text{ is such that there exist a finite } J \subseteq I \text{ with } \forall i \in J\ U_i \in \mathcal{T}_i \text{ and } \forall i \in I \setminus J\ U_i = X_i \right\}$$

Hence there exist J finite and a $\{U_i\}_{i \in I}$ satisfying $U_i \in \mathcal{T}_i$ if $i \in J$ and $U_i = X_i \in \mathcal{T}_i$ if $i \in I \setminus J$ such that

$$x \in \prod_{i \in I} U_i \subseteq U$$

so $t = \pi_i(x) = x_i \in U_i \subseteq \pi_i(\prod_{i \in I} U_i) \subseteq \pi_i(U)$. To summarize we have

$$\forall t \in \pi_i(U) \text{ there exist a } U_i \in \mathcal{T}_i \text{ such that } t \in U_i \subseteq \pi_i(U)$$

which by [theorem: 14.7] proves that $\pi_i(U) \in \mathcal{T}_i$. Hence

$$\forall i \in I \text{ we have that } \pi_i \text{ is open}$$

□

Corollary 14.141. *Let $\langle X, \mathcal{T}_X \rangle$ be a topological space, $\{\langle X_i, \mathcal{T}_i \rangle\}_{i \in I}$ be a family of topological spaces, $\langle \prod_{i \in I} X_i, \mathcal{T}_{\text{product}} \rangle$ be the product topological space [see definition: 14.43] and*

$$f: X \to \prod_{i \in I} X_i \text{ a function}$$

then

$$f \text{ is continuous} \Leftrightarrow \forall i \in I\ f_i = \pi_i \circ f \text{ is continuous}$$

Proof.

⇒. Let $i \in I$ then as f is continuous and by [theorem: 14.140] π_i is continuous we have by [theorem: 14.139] that $\pi_i \circ f$ is continuous.

⇐. Using [definitions: 14.43] we have that the basis for $\mathcal{T}_{\text{product}}$ is

$$\mathcal{B}_{\text{product}} = \left\{ B \in \mathcal{P}(X) | \exists \{S_i\}_{i \in J} \subseteq \mathcal{S},\ J \text{ finite and } J \neq \varnothing \text{ such that } B = \bigcap_{i \in J} S_i \right\}$$

where

$$S = \{\pi_i^{-1}(U) | i \in I \wedge U \in \mathcal{T}_i\}$$

Let $x \in X$ and $V \in \mathcal{T}_{\text{product}}$ such that $f(x) \in V$ then by [theorem: 14.32] there exists a finite J, $\{S_i\}_{i \in J} \subseteq S$ such that

$$f(x) \in \bigcap_{i \in J} S_i \subseteq V \text{ and } \bigcap_{i \in J} S_i \in \mathcal{B}_{\text{product}} \subseteq \mathcal{T}_{\text{product}} \tag{14.48}$$

Let $i \in J$ then $\exists i_j \in I$ and a $U_j \in \mathcal{T}_{i_j}$ such that $S_i = \pi_{i_j}^{-1}(U_j)$ and as $f(x) \in \bigcap_{i \in J} S_i \subseteq V$ we have also $f(x) \in S_i$. Hence we have

$$x \in f^{-1}(S_i) = f^{-1}(\pi_{i_j}^{-1}(U_j)) = (\pi_{i_j} \circ f)^{-1}(U_j) = (f_{i_j})^{-1}(U_j)$$

As f_{i_j} is continuous and $U_j \in \mathcal{T}_j$ we have that $f_{i_j}^{-1}(U_j) \in \mathcal{T}_X$ so, as J is finite, it follows that, if we take $U = \bigcap_{i \in J} f^{-1}(S_i)$, that

$$U = \bigcap_{i \in J} f^{-1}(S_i) = \bigcap_{i \in J} (f_{i_j})^{-1}(U_j) \in \mathcal{T}_X$$

and as $x \in f^{-1}(S_i)\ \forall i \in J$ that

$$x \in \bigcap_{i \in J} f^{-1}(S_i) = U$$

Further

$$\begin{aligned} f(U) &= f\left(\bigcap_{i \in J} f^{-1}(S_i) \right) \\ &\subseteq_{\text{[theorem: 2.136]}} \bigcap_{i \in J} f(f^{-1}(S_i)) \\ &\subseteq_{\text{[theorem: 2.25]}} \bigcap_{i \in J} S_i \\ &\subseteq_{\text{[eq: 14.48]}} V \end{aligned}$$

Hence we have proved that for $\forall x \in X$ we have $\forall V \in \mathcal{T}_{\text{product}}$ with $x \in V$ there exist a $U \in \mathcal{T}_X$ such that $x \in U$ and $f(U) \subseteq V$ which proves that f is continuous at x. Hence we have that f is continuous. □

Theorem 14.142. *Let $\langle X_1, \mathcal{T}_1\rangle$, $\langle X_2, \mathcal{T}_2\rangle$, $\langle Y, \mathcal{T}_Y\rangle$ be topological spaces, $\left\langle \prod_{i\in\{1,2\}} X_i, \mathcal{T}_{\text{product}}\right\rangle$ the topological space based on the product of X_1, X_2 and*

$$f\colon \prod_{i\in\{1,2\}} X_i \to Y \text{ a continuous function}$$

then we have

1. *$\forall x \in X_1$ $f_1(x)\colon X_2 \to Y$ defined by $f_1(x)(y) = f(x,y)$ is continuous.*
2. *$\forall x \in X_2$ $f_2(x)\colon X_1 \to Y$ defined by $f_2(x)(y) = f(y,x)$ is continuous.*

Proof. First as $\{1,2\}$ is finite we have that $\mathcal{T}_{\text{product}} \underset{\text{[theorem: 14.47]}}{=} \mathcal{T}_{\text{box}}$ so that the basis for $\mathcal{T}_{\text{product}}$ is

$$\mathcal{B} \underset{\text{[definition: 14.41}}{=} \left\{\prod_{i\in I} U_i | \{U_i\}_{i\in I} \subseteq \mathcal{P}\left(\prod_{i\in I} X_i\right) \text{ is a family such that } \forall i \in I\ U_i \in \mathcal{T}_i\right\} \tag{14.49}$$

1. Let $x \in X_1$ and let $V \in \mathcal{T}_Y$ then by continuity of f we have that $f^{-1}(V) \in \mathcal{T}_{\text{product}}$. Take now $y \in f_1(x)^{-1}(V)$ then $f(x,y) = f_1(x)(y) \in V$ so that $(x,y) \in f^{-1}(V)$ and by [eq: 14.49] there exists a $U_1 \in \mathcal{T}_1$, $U_2 \in \mathcal{T}_2$ such that $(x,y) \in \prod_{i\in\{1,2\}} U_i \subseteq f^{-1}(V)$. Hence $x \in U_1$ and $y \in U_2$. If $t \in U_2$ then $(x,t) \in \prod_{i\in\{1,2\}} U_i \subseteq f^{-1}(V)$ hence $f_1(x)(t) = f(x,t) \in V$ or $t \in f_1(x)^{-1}(V)$ proving that $y \in U_2 \subseteq f_1(x)^{-1}(V)$ which by [theorem: 14.7] proves that $f_1(x)^{-1}(V)$ is open. Hence by [theorem: 14.131]
$$f_1(x) \text{ is continuous}$$
2. Let $x \in X_2$ and let $V \in \mathcal{T}_Y$ then by continuity of f we have that $f^{-1}(V) \in \mathcal{T}_{\text{product}}$. Take now $y \in f_2(x)^{-1}(V)$ then $f(y,x) = f_2(x)(y) \in V$ so that $(y,x) \in f^{-1}(V)$ and by [eq: 14.49] there exists a $U_1 \in \mathcal{T}_1$, $U_2 \in \mathcal{T}_2$ such that $(y,x) \in \prod_{i\in\{1,2\}} U_i \subseteq f^{-1}(V)$. Hence $x \in U_2$ and $y \in U_1$. If $t \in U_1$ then $(t,x) \in \prod_{i\in\{1,2\}} U_i \subseteq f^{-1}(V)$ hence $f_2(x)(t) = f(t,x) \in V$ or $t \in f_2(x)^{-1}(V)$ proving that $y \in U_1 \subseteq f_2(x)^{-1}(V)$ which by [theorem: 14.7] proves that $f_2(x)^{-1}(V)$ is open. Hence by [theorem: 14.131]
$$f_2(x) \text{ is continuous}$$

□

Theorem 14.143. *Let $\langle X, \|\|\rangle$ be a pseudo normed space then*

$$\cdot\colon \mathbb{K} \times X \to X \text{ defined by } \cdot(\alpha, x) = \alpha \cdot x$$

is continuous [using the product topology based on $\mathcal{T}_{||}, \mathcal{T}_{\|\|}$ and $\mathcal{T}_{\|\|}$]

Proof. Using [theorem: 14.94] the product topology on $\mathcal{T}_{\text{product}} = \mathcal{T}_{\|\|_{\max}}$ where for $(\alpha, x) \in \mathbb{K} \times X$ $\|(\alpha, x)\|_{\max} = \max(\{|a|, \|x\|\})$. Let $(\alpha, x) \in \mathbb{K} \times X$ and take $\varepsilon \in \mathbb{R}^+$. If $(\beta, y) \in \mathbb{K} \times X$ is such that $\|x - y\| \leqslant \delta$ and $|\alpha - \beta| < \delta$ then we have

$$\begin{aligned}
\|\cdot(\alpha, x) - \cdot(\beta, y)\| &= \|\alpha \cdot x - \beta \cdot y\| \\
&= \|\alpha \cdot x - \beta \cdot x + \beta \cdot x - \beta \cdot y\| \\
&= \|(\alpha - \beta) \cdot x + \beta \cdot (x - y)\| \\
&\leqslant |\alpha - \beta| \cdot \|x\| + |\beta| \cdot \|x - y\| \\
&= |\alpha - \beta| \cdot \|x\| + |\beta - \alpha + \alpha| \cdot \|x - y\| \\
&\leqslant |\alpha - \beta| \cdot \|x\| + (|\beta - \alpha| + |\alpha|) \cdot \|x - y\| \\
&= |\alpha - \beta| \cdot \|x\| + |\beta - \alpha| \cdot \|x - y\| + |\alpha| \cdot \|x - y\| \\
&< \delta \cdot \|x\| + \delta \cdot \delta + |\alpha| \cdot \delta \\
&= \delta \cdot (\|x\| + \delta + |\alpha|)
\end{aligned}$$

Take now $\delta = \min(1, \varepsilon / (\|x\| + |\alpha| + 1)) > 0$ then we have that

$$\begin{aligned}
\delta \cdot (\|x\| + \delta + |\alpha|) &<_{\delta \leqslant 1} \delta \cdot (\|x\| + 1 + |\alpha|) \\
&< (\varepsilon / (\|x\| + |\alpha| + 1)) \cdot (\|x\| + 1 + |\alpha|) \\
&= \varepsilon
\end{aligned}$$

So we have proved that for $\delta = \min(1, \varepsilon/(\|x\| + |\alpha| + 1))$ and $(\beta, y) \in \mathbb{K} \times X$ such that $\|x - y\| \leqslant \delta$ and $|\alpha - \beta| < \delta$ that

$$\|\cdot(\alpha, x) - \cdot(\beta, y)\| < \varepsilon$$

So if we take $(\beta, y) \in \mathbb{K} \times X$ such that $\|(\alpha, x) - (\beta, y)\|_{\max} < \delta$ then $|\alpha - \beta| < \delta$ and $\|x - y\| < \delta$ resulting in $\|\cdot(\alpha, x) - \cdot(\beta, y)\| < \varepsilon$. Applying then [theorem: 14.128] proves that $\cdot$ is continuous at $(\alpha, x) \in \mathbb{K} \times X$ which as (α, x) was chosen arbitrary proves continuity. □

Corollary 14.144. *Let $\langle X, \|\|\rangle$ be a pseudo normed space over the field $\mathbb{K}$ then we have:*

1. *$\forall \alpha \in \mathbb{K}$ the function $\mu_\alpha : X \to X$ defined by $\mu_\alpha(x) = \alpha \cdot x$ is continuous*
2. *$\forall x \in \mathbb{K}$ the function $\nu_x : \mathbb{K} \to X$ defined by $\nu_x(\alpha) = \alpha \cdot x$ is continuous*

Proof. This follows from [theorem: 14.142] and [theorem: 14.143]. □

Theorem 14.145. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be pseudo normed spaces then we have:*

1. *If $f : X \to Y$, $g : X \to Y$ are continuous functions at $x \in X$ then*

$$f + g : X \to Y \text{ where } (f + g)(x) = f(x) + g(x)$$

is continuous at x. So if f, g are continuous then $f + g$ is continuous.

2. *If $\alpha \in \mathbb{K}$ and $f : X \to Y$ is a continuous function at x then*

$$\alpha \cdot f : X \to Y \text{ where } (\alpha \cdot f)(x) = \alpha \cdot f(x)$$

is continuous at x. So if f are continuous then $\alpha \cdot f$ is continuous.

Proof. We use the ε-δ-definition of continuity [see theorem: 14.128] to proof this theorem. So take $x \in X$ and $\varepsilon \in \mathbb{R}^+$.

1. As f, g are continuous at x there exists $\delta_1, \delta_2 \in \mathbb{R}^+$ such that $\forall x' \in X$ such that $\|x - x'\|_X < \delta_1$ we have $\|f(x) - f(x')\|_Y < \frac{\varepsilon}{2}$ and $\forall x' \in X$ such that $\|x - x'\|_X < \delta_2$ we have $\|g(x) - g(x')\|_Y < \frac{\varepsilon}{2}$. So if $\|x - x'\|_X < \delta$ then

$$\begin{aligned}
\|(f + g)(x) - (f + g)(x')\|_Y &= \|f(x) + g(x) - f(x') - g(x')\|_Y \\
&\leqslant \|f(x) - f(x')\|_Y + \|g(x) - g(x')\|_Y \\
&< \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \\
&= \varepsilon
\end{aligned}$$

proving that $f + g$ is continuous at x.

2. As f is continuous at x there exist a $\delta \in \mathbb{R}^+$ such that if $\|x - x'\|_X < \delta$ then

$$\|f(x) - f(x')\|_Y \leqslant \varepsilon/(|\alpha| + 1)$$

then we have

$$\|(\alpha \cdot f)(x) - (\alpha \cdot f)(x')\|_Y = \|\alpha \cdot (f(x) - f(x'))\|_Y = |\alpha| \cdot \|f(x) - f(x')\|_Y < \alpha \cdot (\varepsilon/(|\alpha| + 1)) < \varepsilon$$

proving that $\alpha \cdot f$ is continuous at x. □

Using induction we can extend the above to a finite family of functions.

Theorem 14.146. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be pseudo normed spaces and $\{f_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{C}(X, Y)$ a family of continuous functions then*

$$\sum_{i=1}^{n} f_i : X \to Y \text{ defined by } \left(\sum_{i=1}^{n} f_i\right)(x) = \sum_{i=1}^{n} f_i(x)$$

is continuous.

Proof. Let

$$S = \left\{ n \in \mathbb{N} | \text{If } \{f_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{C}(X, Y) \text{ then } \sum_{i=1}^{n} f_i \in \mathcal{C}(X, Y) \right\}$$

then we have:

$1 \in S$. If $\{f_i\}_{i \in \{1\}} \subseteq \mathcal{C}(X, Y)$ then $\forall x \in X$ we have $(\sum_{i=1}^{1} f_i)(x) = \sum_{i=1}^{1} f_i(x) = f_1(x)$, proving that $\sum_{i=1}^{1} f_i = f_1 \in \mathcal{C}(X, Y)$. Hence

$$1 \in S$$

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$. Let $\{f_i\}_{i\in\{1,\ldots,n+1\}} \subseteq \mathcal{C}(X,Y)$ then we have $\forall x \in X$ that

$$\begin{aligned}\left(\sum_{i=1}^{n+1} f_i\right)(x) &= \sum_{i=1}^{n+1} f_i(x)\\ &= \left(\sum_{i=1}^{n} f_i(x)\right) + f_{n+1}(x)\\ &= \left(\sum_{i=1}^{n} f_i\right)(x) + f_{n+1}(x)\\ &= \left(\left(\sum_{i=1}^{n} f_i\right) + f_{n+1}\right)(x)\end{aligned}$$

proving that $\sum_{i=1}^{n+1} f_i = (\sum_{i=1}^{n} f_i) + f_{n+1}$. As $n \in S$ $\sum_{i=1}^{n} f_i$ is continuous, so by the continuity of f_{n+1} we have by [theorem: 14.145] that $\sum_{i=1}^{n+1} f_i$ is continuous. Hence $n+1 \in S$. □

Theorem 14.147. *Let $\langle X, \|\|\rangle$ be a pseudo normed space and $f: X \to \mathbb{K}$, $g: X \to \mathbb{K}$ functions continuous at x then*

$$f \cdot g: X \to \mathbb{K} \text{ defined by } (f \cdot g)(x) = f(x) \cdot g(x)$$

is continuous at x. Hence if f, g are continuous functions then $f \cdot g$ is a continuous function.

Proof. We use the ε-δ-definition of continuity [see theorem: 14.128] to proof this theorem. So take $x \in X$ and $\varepsilon \in \mathbb{R}^+$. Then as f is continuous at x there exist a $\delta_1 \in \mathbb{R}^+$ such that $\forall x' \in X$ with $\|x - x'\| < \varepsilon$ we have $|f(x) - f(x')| < 1$. Then

$$|f(x')| \leqslant |f(x') - f(x) + f(x)| \leqslant |f(x)| + |f(x) - f(x')| < |f(x)| + 1 \tag{14.50}$$

Using continuity again there exist a $\delta_2 \in \mathbb{R}^+$ such that $\forall x \in X$ with $\|x - x'\| < \delta_2$ we have

$$|f(x) - f(x')| < \frac{\varepsilon}{2 \cdot (1 + |g(x)|)} \tag{14.51}$$

As g is also continuous at x there exists a $\delta_2 \in \mathbb{R}^+$ such that $\forall x' \in X$ with $\|x - x'\| < \delta_3$

$$|g(x) - g(x')| < \frac{\varepsilon}{2 \cdot (1 + |f(x)|)} \tag{14.52}$$

Take $\delta = \min(\delta_1, \delta_2, \delta_3) \in \mathbb{R}^+$ then

$$\begin{aligned}|(f \cdot g)(x) - f(x') \cdot g(x')| &= |f(x) \cdot g(x) - f(x') \cdot g(x')|\\ &= |f(x) \cdot g(x) - f(x') \cdot g(x) + f(x') \cdot g(x) - f(x') \cdot g(x')|\\ &\leqslant |f(x) \cdot g(x) - f(x') \cdot g(x)| + |f(x') \cdot g(x) - f(x') \cdot g(x')|\\ &= |(f(x) - f(x')) \cdot g(x)| + |f(x') \cdot (g(x) - g(x'))|\\ &= |g(x)| \cdot |f(x) - f(x')| + |f(x')| \cdot |g(x) - g(x')|\\ &<_{\text{[eq: 14.50]}} |g(x)| \cdot |f(x) - f(x')| + (|f(x)| + 1) \cdot |g(x) - g(x')|\\ &<_{\text{[eqs: 14.51,14.52]}} |g(x)| \cdot \frac{\varepsilon}{2 \cdot (1 + |g(x)|)} + (|f(x)| + 1) \cdot \frac{\varepsilon}{2 \cdot (1 + |f(x)|)}\\ &< \frac{\varepsilon}{2} + \frac{\varepsilon}{2}\\ &= \varepsilon\end{aligned}$$

proving that $f \cdot g$ is continuous at x. □

Using mathematical induction we can then prove the following corollary

Corollary 14.148. *Let $n \in \mathbb{N}_0$, $\langle X, \|\|\rangle$ a pseudo normed space and $f: X \to \mathbb{K}$ a function continuous at x then*

$$f^n: X \to \mathbb{K} \text{ defined by } f^n(x) = (f(x))^n$$

is continuous at x. So if f is continuous then f^n is also continuous.

Proof. Take

$$S=\{n\in\mathbb{N}_0|f^n \text{ is continuous at } x\}$$

then we have:

$0\in S$. As $\forall x\in X\ (f^0)(x)=(f(x))^0=1$ we have that $f^0=\mathcal{C}_1$ which is continuous by [example: 14.132]. Hence $0\in S$

$n\in S\Rightarrow n+1\in S$. As $\forall x\in X\ f^{n+1}(x)=(f(x))^{n+1}=(f(x))^n\cdot f(x)=(f^n\cdot f)(x)$ we have that $f^{n+1}=f^n\cdot f$. From $n\in S$ we have that f^n is continuous at x so that by the continuity of f at x and [theorem: 14.147] $f^{n+1}=f^n\cdot f$ is continuous at x. Hence $n+1\in S$ □

Using the identity function Id_X in the above corollary proves then that the power function itself is continuous.

Corollary 14.149. *Let $n\in\mathbb{N}_0$ then for $\langle\mathbb{K},\|\rangle$ we have that the function*

$$\cdot^n:\mathbb{K}\to\mathbb{K} \text{ defined by } (.^n)(x)=x^n$$

is continuous.

Proof. $\forall x\in X$ we have $(.^n)(x)=x^n=(\mathrm{Id}_X(x))^n=(\mathrm{Id}_X)^n(x)$ which proves that $\cdot^n=(\mathrm{Id}_X)^n$. So we can apply [example: 14.133] and the previous corollary [corollary: 14.148]. □

Theorem 14.150. *Let $\langle X,\|\|\rangle$ be a pseudo normed space and $f:X\to\mathbb{K}$ a continuous function such that $\forall x\in X\ f(x)\neq 0$ then $\frac{1}{f}:X\to\mathbb{K}$ defined by $\left(\frac{1}{f}\right)(x)=\frac{1}{f(x)}$ is continuous.*

Proof. Let $x\in X$ then as f is continuous there exist a $\delta_1\in\mathbb{R}^+$ such that $\forall y\in X$ with $|x-y|<\delta_1$ we have $|f(x)-f(y)|<\frac{|f(x)|}{2}$ so that

$$|f(x)|=|f(x)-f(y)+f(y)|\leqslant|f(x)-f(y)|+|f(y)|<\frac{|f(x)|}{2}+|f(y)|$$

so $\frac{|f(x)|}{2}=|f(x)|-\frac{|f(x)|}{2}<|f(y)|$ or $\frac{1}{|f(y)|}<\frac{2}{|f(x)|}$. Summarized we have proved that

$$\forall y\in X \text{ with } |x-y|<\delta_1 \text{ we have } \frac{1}{|f(y)|}<\frac{2}{|f(x)|} \tag{14.53}$$

Let $\varepsilon\in\mathbb{R}^+$ then as f is continuous there exist a $\delta_2\in\mathbb{R}^+$ such that

$$\forall y\in X \text{ with } |x-y|<\delta_2 \text{ we have } |f(x)-f(y)|<\varepsilon\cdot\frac{|f(x)|^2}{2} \tag{14.54}$$

So if we take $\delta=\min(\delta_1,\delta_2)\in\mathbb{R}^+$ then we have

$$\begin{aligned}\left|\frac{1}{f(x)}-\frac{1}{f(y)}\right| &= \left|\frac{f(y)-f(x)}{|f(x)\cdot f(y)|}\right|\\ &= \frac{|f(y)-f(x)|}{|f(x)|\cdot|f(y)|}\\ &<_{\text{[eq: 14.53]}} \frac{2\cdot}{|f(x)|^2}\cdot|f(y)-f(x)|\\ &<_{\text{[eq: 14.54]}} \frac{2}{|f(x)|^2}\cdot\varepsilon\cdot\frac{|f(x)|^2}{2}\\ &= \varepsilon\end{aligned}$$

proving that $\frac{1}{f(x)}$ is continuous. □

Example 14.151. Let Let $\langle X,\|\|\rangle$ be a pseudo normed space and $f:X\to\mathbb{K}$ a continuous function such that $\forall x\in X\ f(x)\neq 0$ then $\frac{1}{f^2}$: $X\to\mathbb{K}$ defined by $\left(\frac{1}{f^2}\right)(x)=\frac{1}{f(x)^2}$ is continuous.

Proof. As f is continuous it follows from [theorem: 14.148] it follows that f^2 is continuous, so usiing [theorem: 14.150] it follows that $\frac{1}{f^2}$ is continuous. □

Theorem 14.152. *Let $n\in\mathbb{N}$ and $\langle\mathbb{R}^n,\|\|_n\rangle$ the normed space with the maximum norm $\|\|_n$ defined by $\|x\|_n=\max(\{|\pi_i(x)||i\in\{1,\ldots,n\}\})$ and $\|\|$ another norm on $\mathbb{R}^n$ then*

$$\|\|:\mathbb{R}^n\to\mathbb{R} \text{ defined by } \|\|(x)=\|x\|$$

is continuous [using the topological spaces $\langle\mathbb{R}^n,\|\|_n\rangle$ and $\langle\mathbb{R},\|\|\rangle$

Proof. Let $E=\{e_1,\ldots,e_n\}$ be the canonical basis of $\mathbb{R}^n$ defined by $(e_i)_j=\delta_{i,j}$ [see: 11.165] then $\forall x=(x_1,\ldots,x_n)\in\mathbb{R}^n$ we have $x=\sum_{i\in\{1,\ldots,n\}}x_i\cdot e_i$. Hence

$$\begin{aligned}
\|x\| &= \left\|\sum_{i\in\{1,\ldots,n\}} x_i\cdot e_i\right\| \\
&\leqslant_{\text{[theorem: 14.86]}} \sum_{i\in\{1,\ldots,n\}} \|x_i\cdot e_i\| \\
&= \sum_{i\in\{1,\ldots,n\}} |x_i|\cdot\|e_i\| \\
&\leqslant \sum_{i\in\{1,\ldots,n\}} \max\{|x_i| | i\in\{1,\ldots,n\}\}\cdot\|e_i\| \\
&= \sum_{i\in\{1,\ldots,n\}} \max\{|\pi_i(x)| | i\in\{1,\ldots,n\}\}\cdot\|e_i\| \\
&= \sum_{i\in\{1,\ldots,n\}} \|x\|_n\cdot\|e_i\| \\
&= \|x\|_n\cdot\sum_{i\in\{1,\ldots,n\}}\|e_i\| \\
&= \|x\|_n\cdot A \text{ where } A=\sum_{i\in\{1,\ldots,n\}}\|e_i\|
\end{aligned}$$

hence we have that

$$\forall x\in\mathbb{R}^n \text{ we have } \|x\|\leqslant\|x\|\cdot A$$

Let $x\in\mathbb{R}^n$ and $\varepsilon\in\mathbb{R}^+$ then if we take $\delta=\frac{\varepsilon}{A+1}$ then if $\|x-y\|_n\leqslant\delta$ we have

$$\|x-y\|\leqslant A\cdot\|x-y\|_n<A\cdot\delta=A\cdot\frac{\varepsilon}{1+A}<\varepsilon$$

proving that $\|\|$ is continuous [see theorem: 14.128]. □

14.4.2 Uniform and Lipschitz continuity

We have a stronger form of continuity in the case of normed spaces called uniform continuity.

Definition 14.153. *Let $\langle X,d_X\rangle$, $\langle Y,d_Y\rangle$ be topological spaces, then a function $f:X\to Y$ is **uniform continuous** if $\forall\varepsilon\in\mathbb{R}^+$ there exists a $\delta\in\mathbb{R}^+$ such that $\forall x,y\in X$ with $d_X(x,y)<\delta$ we have $d_Y(f(x),f(y))<\varepsilon$*

Theorem 14.154. *Let $\langle X,\|\|_X\rangle$, $\langle Y,\|\|_Y\rangle$ be topological spaces, then a function $f:X\to Y$ is **uniform continuous** if $\forall\varepsilon\in\mathbb{R}^+$ there exists a $\delta\in\mathbb{R}^+$ such that $\forall x,y\in X$ with $\|x-y\|_X<\delta$ we have $\|f(x)-f(y)\|_Y<\varepsilon$*

Proof. This follows from the fact that $d_X(x,y)=\|x-y\|_Y$ □

The difference with normal continuity at x is that there exist a δ **which can depend** on x such that $\forall y\in Y$ with $\|x-y\|_X$ we have $\|f(x)-f(y)\|_Y<\varepsilon$. However uniform continuity implies continuity as is mentioned in the following theorem.

Theorem 14.155. *Let $\langle X,\|\|_X\rangle$, $\langle Y,\|\|_Y\rangle$ be pseudo normed spaces and $f:X\to Y$ a uniform continuous function then f is continuous.*

Proof. Let $x\in X$ and $\varepsilon\in\mathbb{R}^+$ then there exist a $\delta\in\mathbb{R}^+$such that for $x,y\in X$ with $\|x-y\|_X<\delta$ we have $\|f(x)-f(y)\|_Y<\varepsilon$. Hence if $x\in X$ then for every $y\in X$ such that $\|x-y\|_X<\delta$ we have $\|f(x)-f(y)\|_Y<\varepsilon$ proving that f is continuous at x. As $x\in X$ was chosen arbitrary it follows that f is continuous. □

Example 14.156. Let $\langle X,\|\|\rangle$ be a pseudo normed space then

$$\|\|:X\to\mathbb{R} \text{ where } \|\|(x)=\|x\|$$

is **uniform continuous** [hence by [theorem: 14.153] continuous] using the topological spaces $\langle X,\mathcal{T}_{\|\|}\rangle$ and $\langle\mathbb{R},\mathcal{T}_{||}\rangle$

Proof. Let $x\in X$ then if $\varepsilon\in\mathbb{R}^+$ we have for $\delta=\varepsilon\in\mathbb{R}^+$ that $\forall x,y\in X$ such that $\|x-y\|<\delta=\varepsilon$

$$|\|\|(x)-\|\|(y)|=|\|x\|-\|y\||\leqslant_{\text{[theorem: 14.87]}}\|x-y\|<\delta=\varepsilon$$

proving by [theorem: 14.128] that $\|\|$ is uniform continuous at x. □

Example 14.157. Given the topological spaces $\langle \mathbb{C}, \mathcal{T}_{||} \rangle$ and $\langle \mathbb{R}, \mathcal{T}_{||} \rangle$ [see examples: 14.97 and 14.96] then

1. $\mathrm{Re}: \mathbb{C} \to \mathbb{R}$ is uniform continuous [hence by [theorem: 14.155] continuous]
2. $\mathrm{Img}: \mathbb{C} \to \mathbb{R}$ is uniform continuous [hence by [theorem: 14.155] continuous]

Proof. Let $\varepsilon \in \mathbb{R}^+$, take $\delta = \varepsilon \in \mathbb{R}^+$ then $\forall x, y \in \mathbb{C}$ such that $|x - y| < \delta = \varepsilon$ we have

1. $|\mathrm{Re}(x) - \mathrm{Re}(y)| \underset{\text{[theorem: 10.79}}{=} |\mathrm{Re}(x - y)| \leqslant_{\text{[theorem: 10.84]}} |x - y| < \delta = \varepsilon$ proving that Re is uniform continuous at x.
2. $|\mathrm{Img}(x) - \mathrm{Img}(y)| \underset{\text{[theorem: 10.79}}{=} |\mathrm{Img}(x - y)| \leqslant_{\text{[theorem: 10.84]}} |x - y| < \delta = \varepsilon$ proving that Img is uniform continuous at x. □

Theorem 14.158. *Let $\langle X, \|\|\rangle$ be a pseudo normed space, $\mathcal{T}_{\|\|}$ the norm topology on X and $\mathcal{T}_{\text{product}}$ the product topology on $X \times X$ then $+: X \times X \to X$ is uniform continuous [hence by [theorem: 14.155 continuous] where $+(x, y) = x + y$.*

Proof. Using [theorem: 14.94] the product topology on $\mathcal{T}_{\text{product}} = \mathcal{T}_{\|\|_{\max}}$ where for $x = (x_1, x_2) \in X \times X \quad \|x\|_{\max} = \|(x_1, x_2)\|_{\max} = \max(\{\|x_i\| | i \in \{1, 2\}\})$. Let $\varepsilon \in \mathbb{R}^+$ and take $\delta = \frac{\varepsilon}{2}$ then $\forall x = (x_1, x_2), y = (y_1, y_2) \in X \times X$ with $\|x - y\|_{\max} < \delta$ we have $\max(\{\|x_1 - y_1\|, \|x_2 - y_2\|\}) < \delta$ so that

$$\|x_1 - y_1\| < \delta \wedge \|x_2 - y_2\| < \delta$$

Next

$$\begin{aligned}
\|+(x) - (+(y))\| &= \|(x_1 + x_2) - (y_1 + y_2)\| \\
&= \|(x_1 - y_1) + (x_2 - y_2)\| \\
&\leqslant \|x_1 - y_1\| + \|x_2 - y_2\| \\
&< \delta + \delta \\
&= \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \\
&= \varepsilon
\end{aligned}$$

which proves that $+: X \times X \to X$ is uniform continuous. □

Definition 14.159. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be pseudo normed spaces then a function is **Lipschitz continuous** if $\forall x, y \in X$ we have $\|f(x) - f(y)\|_Y \leqslant \|x - y\|_X$*

It turns out that Lipschitz continuous is a stronger condition then uniform continuity.

Theorem 14.160. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be pseudo normed spaces and $f: X \to Y$ a **Lipschitz continuous function** then f is **uniform continuous** and by [theorem: 14.155] f is continuous.*

Proof. Let $\varepsilon \in \mathbb{R}^+$ and take $\delta = \varepsilon \in \mathbb{R}^+$ then if $x, y \in X$ satisfies $\|x - y\|_X < \delta$ we have

$$\|f(x) - f(y)\|_Y \leqslant \|x - y\|_X < \delta = \varepsilon$$

proving uniform continuity. □

Theorem 14.161. *Let $\langle X, \|\|\rangle$ be a pseudo normed space then $\forall x \in X$ we have that*

$$\delta_x: X \to X \text{ defined by } \delta_x(y) = x + y$$

is Lipschitz continuous [hence by [theorem: 14.160] absolute continuous and uniform continuous]

Proof. Let $x \in X$ and $y, z \in X$ then

$$\|\delta_x(y) - \delta_x(z)\| = \|x + y - (x + z)\| = \|y - z\|$$ □

An example of a Lipschitz continuous function is the set distance function to a non empty set.

Definition 14.162. *Let $\langle X, \|\|\rangle$ be a pseudo normed space and $\varnothing \neq S \subseteq X$ a non empty set then the **set distance function** noted by δ_S is defined by*

$$\delta_S: X \to \mathbb{R} \text{ where } \delta_S(x) = \inf(\{\|x - y\| | y \in S\})$$

***Note* 14.163.** *$\forall d \in \{\|x-y\| | y \in S\}$ we have $0 \leqslant d$, hence 0 is a lower bound of $\{\|x-y\| | y \in S\}$, further $S \neq 0 \Rightarrow \{\|x-y\| | y \in S\} \neq 0$. So using the conditional completeness of $\mathbb{R}$ [see theorem: 10.18] it follows that $\inf(\{\|x-y\| | y \in S\})$ exists.*
Further if $x \in S$ then $0 \leqslant \inf(\{\|x-y\| | y \in S\}) \leqslant 0$ proving that

$$\forall x \in S \text{ we have } \delta_S(x) = 0$$

Theorem 14.164. *Let $\langle X, \|\|\rangle$ be a pseudo normed space $\varnothing \neq S \subseteq X$ then $\delta_S: X \to \mathbb{R}$ is Lipschitz continuous [hence uniform continuous and thus continuous [see theorems: 14.155, 14.160]*

Proof. Let $x, y \in X$ and $\varepsilon \in \mathbb{R}^+$ then as $\delta_S(x) = \inf(\{\|x-z\| | z \in S\}) < \inf(\{\|x-z\| | z \in S\}) + \varepsilon$ there exist a $z_\varepsilon \in S$ such that $\delta_S(x) \leqslant \|x - z_\varepsilon\| < \delta_S(x) + \varepsilon$ hence

$$-\delta_S(x) < \varepsilon - \|x - z_\varepsilon\|.$$

Further, as $z_\varepsilon \in S$, we have $\delta_S(y) = \inf(\{\|y-z\| | z \in S\}) \leqslant \|y - z_\varepsilon\|$ hence we have that

$$\begin{aligned}
\delta_S(y) - \delta_S(x) &< \|y - z_\varepsilon\| - \|x - z_\varepsilon\| + \varepsilon \\
&= \|y - x + x - z_\varepsilon\| - \|x - z_\varepsilon\| + \varepsilon \\
&\leqslant \|y - x\| + \|x - z_\varepsilon\| - \|x - z_\varepsilon\| + \varepsilon \\
&= \|y - x\| + \varepsilon
\end{aligned}$$

So we have

$$\forall \varepsilon \in \mathbb{R}^+ \text{ we have } \delta_S(y) - \delta_S(x) < \|y - x\| + \varepsilon$$

which by [theorem: 10.31] proves that $\delta_S(y) - \delta_S(x) \leqslant \|y - x\|$. Interchanging x and y gives $-(\delta_S(y) - \delta_S(x)) = \delta_S(x) - \delta_S(y) \leqslant \|x - y\| = \|y - x\|$, hence we have

$$|\delta_S(y) - \delta_S(x)| \leqslant \|y - x\|$$

proving Lipschitz continuity. □

14.4.3 Homeomorphism

Ring-, group, order- and linear- isomorphisms allows use to identify two rings, groups, partial ordered sets and vector spaces. We can do the same thing for topological spaces.

Definition 14.165. *Let $\langle X, \mathcal{T}_X\rangle$, $\langle Y, \mathcal{T}_Y\rangle$ be two topological spaces then a **homeomorphism** between $\langle X, \mathcal{T}_X\rangle$ and $\langle Y, \mathcal{T}\rangle$ is a **bijection** $f: X \to Y$ such that $f: X \to Y$ and $f^{-1}: Y \to X$ are **continuous**. If there exist a homeomorphism between two topological space then these spaces are called **homeomorphic** spaces.*

We have trivially the following equivalent definition of a homeomorphism

Theorem 14.166. *Let $\langle X, \mathcal{T}_X\rangle$, $\langle Y, \mathcal{T}_Y\rangle$ be two topological spaces and $f: X \to Y$ a bijection then*

$$f \text{ is a homeomorphism} \Leftrightarrow f \text{ is continuous and open}$$

Proof.

- **⇒.** As f is a homeomorphism we have that $f: X \to Y$ is continuous and $f^{-1}: Y \to X$ is continuous. So if $U \in \mathcal{T}_X$ we have $(f^{-1})^{-1}(U) \in \mathcal{T}_Y$ which, as $(f^{-1})^{-1}(U) \underset{\text{[theorem: 2.69]}}{=} f(U)$, proves that $f(U) \in \mathcal{T}_Y$. Hence $f: X \to Y$ is continuous and open.
- **⇐.** Let $U \in \mathcal{T}_X$ then as $f: X \to Y$ is open we have $f(U) \in \mathcal{T}_Y$, which as $(f^{-1})^{-1}(U) \underset{\text{[theorem: 2.69]}}{=} f(U)$ proves that $(f^{-1})^{-1}(U) \in \mathcal{T}_Y$. So $f^{-1}: Y \to X$ is continuous, as by the hypothesis $f: X \to Y$ is also continuous, it follows that $f: X \to Y$ is a homeomorphism. □

We have trivially that the the inverse of a homeomorphism is a homeomorphism.

Theorem 14.167. *Let $\langle X, \mathcal{T}_X\rangle$, $\langle Y, \mathcal{T}_Y\rangle$ be two topological spaces and $f: X \to Y$ a homeomorphism then $f^{-1}: Y \to X$ is a homeomorphism.*

Proof. This follows from the definition and [theorems: 2.73 and 2.74]. □

Theorem 14.168. *Let $\langle X, \mathcal{T}_X\rangle$, $\langle Y, \mathcal{T}_Y\rangle$ and $\langle Z, \mathcal{T}_Z\rangle$ be topological spaces and $f: X - Y$, $g: Y \to Z$ be homeomorphisms then $g \circ f: X \to Z$ is a homeomorphism.*

Proof. This follows from the definition and [theorems: 2.76, 14.139]. □

Theorem 14.169. *Let $\langle X, \mathcal{T}_X\rangle$, $\langle Y, \mathcal{T}_Y\rangle$ be two topological spaces, $\varnothing \neq A \subseteq X$ a non empty subset of X, $f: X \to Y$ a homeomorphism then $f_{|A}: A \to f(A)$ is a homeomorphism [using the subspace topologies $(\mathcal{T}_X)_{|A}$ and $(\mathcal{T}_Y)_{|f(A)}$*

Proof. First, by [theorem: 2.90]

$$f_{|A}: A \to f(A) \text{ is a bijection} \tag{14.55}$$

Further if $V \in (\mathcal{T}_Y)_{|f(A)}$ then there exist a $V' \in \mathcal{T}_Y$ such that $V = V' \bigcap f(A)$. So

$$\begin{aligned}
(f_{|A})^{-1}(V) &= (f_{|A})^{-1}\big(V' \bigcap f(A)\big) \\
&\underset{\text{[theorem: 2.86]}}{=} A \bigcap f^{-1}\big(V' \bigcap f(A)\big) \\
&\underset{\text{[theorem: 2.95]}}{=} A \bigcap \big(f^{-1}(V') \bigcap f^{-1}(f(A))\big) \\
&\underset{\text{[theorem: 2.56]}}{=} A \bigcap \big(f^{-1}(V') \bigcap A\big) \\
&= f^{-1}(V') \bigcap A
\end{aligned}$$

As f is continuous and V' open we have that $f^{-1}(V') \in \mathcal{T}_X$ hence $f^{-1}(V') \bigcap A \in (\mathcal{T}_X)_{|A}$ proving that $(f_{|A})^{-1}(V) \in (\mathcal{T}_X)_{|A}$, Hence

$$f_{|A}: A \to f(A) \text{ is continuous} \tag{14.56}$$

Let $U \in (\mathcal{T}_X)_{|A}$ then there exist a $U' \in \mathcal{T}_X$ such that $U = U' \bigcap A$ then

$$f_{|A}(U) = f_{|\mathrm{A}}\big(U' \bigcap A\big) \underset{U' \bigcap A \subseteq U}{=} f\big(U' \bigcap A\big) \underset{\text{[theorem: 2.95]} \wedge f_{|A} \text{ is bijective}}{=} f(U') \bigcap f(A)$$

By [theorem: 14.166] f is open so that $f(U') \in \mathcal{T}_Y$ hence $f(U') \bigcap f(A) \in (\mathcal{T}_Y)_{|f(A)}$ proving that $f_{|A}(U) \in (\mathcal{T}_Y)_{|f(A)}$. Hence we have that

$$f_{|A}: A \to f(A) \text{ is open} \tag{14.57}$$

Finally using [theorem: 14.166] on [eqs: 14.55, 14.56 and 14.57] proves that

$$f_{|A}: A \to f(A) \text{ is a homeomorphism using the topologies } (\mathcal{T}_X)_{|A} \text{ and } (\mathcal{T}_Y)_{|f(A)}$$ □

Every linear isometric isomorphism [see definition: 14.122] is automatically a homeomorphism.

Theorem 14.170. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be pseudo normed spaces over $\mathbb{K}$ and $f: X \to Y$ a linear isometric isomorphism then $f: X \to Y$ is a homeomorphism using the topologies $\mathcal{T}_{\|\|_X}$, $\mathcal{T}_{\|\|_Y}$. In other words isometric spaces are homeomorphic.*

Proof. As $f: X \to Y$ is a linear isometric isomorphism it follows that

$$f: X \to Y \text{ is a bijection}$$

Further as $\forall x, y \in X$ we have $\|f(x) - f(y)\|_Y = \|f(x-y)\|_Y = \|x-y\|_X$ it follows that $f: X \to Y$ is Lipschitz continuous, hence continuous. Further by [theorem: 14.120] $f^{-1}: Y \to X$ is also a linear isometry hence continuous. So $f: X \to Y$ and $f^{-1}: Y \to X$ are continuous which proves that $f: X \to Y$ is homeomorphism. □

Theorem 14.171. *Let $\langle X, \mathcal{T}\rangle$ be a topological space. Y a set and $f: X \to Y$ a bijection. Then we have:*

1. *$\mathcal{T}_{f,\mathcal{T}} = \{f(U) | U \in \mathcal{T}\}$ forms a topology on Y*
2. *$f: X \to Y$ is a homeomorphism using the topologies $\mathcal{T}$ and $\mathcal{T}_{f,\mathcal{T}}$*
3. *If $g: X \to Y$ satisfies $f = g \circ h$ where $h: X \to X$ is a homeomorphism using the topologies $\mathcal{T}$ and $\mathcal{T}$ then g is a homeomorphism and $\mathcal{T}_{f,\mathcal{T}} = \mathcal{T}_{g,\mathcal{T}}$*

Proof.

1.
    a. As $f(\varnothing) = \varnothing$ it follows that

$$\varnothing \in \mathcal{T}_{f,\mathcal{T}}$$

b. As $f: X \to Y$ is a bijection we have $f(X) = Y$ hence as $X \in \mathcal{T}$

$$Y \in \mathcal{T}_{f,\mathcal{T}}$$

c. If $\{V_i\}_{i \in I} \subseteq \mathcal{T}_{f,\mathcal{T}}$ then $\forall i \in I$ there exist a $U \in \mathcal{T}$ such that $f(U) = V_i$, hence by a consequence of the Axiom of Choice [see theorem: 3.107] there exist a $\{U_i\}_{i \in I} \subseteq \mathcal{T}$ such that $\forall i \in I$ $f(U_i) = V_i$. Hence

$$\bigcup_{i \in I} V_i = \bigcup_{i \in I} f(U_i) \underset{\text{[theorem: 2.136]}}{=} f\left(\bigcup_{i \in I} U_i\right)$$

which, as $\bigcup_{i \in I} U_i \in \mathcal{T}$, proves that

$$\bigcup_{i \in I} V_i \in \mathcal{T}_{f,\mathcal{T}}$$

d. Let $V_1, V_2 \in \mathcal{T}_{f,\mathcal{T}}$ then $\exists U_1, U_2 \in \mathcal{T}$ such that $V_1 = f(U_1)$, $V_2 = f(U_2)$ then

$$V_1 \bigcap V_2 = f(U_1) \bigcap f(U_2) \underset{\text{[theorem: 2.95]}}{=} f\left(U_1 \bigcap U_2\right)$$

which, as $U_1 \bigcap U_2 \in \mathcal{T}$, proves that

$$V_1 \bigcap V_2 \in \mathcal{T}_{f,\mathcal{T}}$$

2. If $U \in \mathcal{T}$ then by definition $f(U) \in \mathcal{T}_{f,\mathcal{T}}$ proving that

$$f \text{ is open}$$

Further if $V \in \mathcal{T}_{f,\mathcal{T}}$ then there exist a $U \in \mathcal{T}$ so that $V = f(U)$, so

$$f^{-1}(V) = f^{-1}(f(U)) \underset{\text{[theorem: 2.56]}}{=} U \in \mathcal{T}$$

proving that

$$f \text{ is continuous}$$

Hence as $f: X \to Y$ is a bijection we have that

$$f: X \to Y \text{ is s homeomorphism}$$

3. First as as $h: X \to X$ is a homeomorphism we have by [theorem: 14.167] that $h^{-1}: X \to X$ is a homeomorphism. Further

$$g = g \circ \mathrm{Id}_X = g \circ (h \circ h^{-1}) = (g \circ h) \circ h^{-1} = f \circ h^{-1} \tag{14.58}$$

so, as f is a homeomorphism by (2) and h^{-1} is a homeomorphism, we have by [theorem: 14.168] that

$$g: X \to Y \text{ is a homeomorphism}$$

Next if $V \in \mathcal{T}_{g,\mathcal{T}}$ then there exist a $U \in \mathcal{T}$ such that $V = g(U)$, as

$$V = g(U) \underset{\text{[eq: 14.58]}}{=} (f \circ h^{-1})(U) = f((h^{-1})(U)) \in \mathcal{T}_{f,\mathcal{T}} \text{ [as } h^{-1} \text{ is open } (h^{-1})(U) \in \mathcal{T}] \tag{14.59}$$

So

$$\mathcal{T}_{g,\mathcal{T}} \subseteq \mathcal{T}_{f,\mathcal{T}} \tag{14.60}$$

If $V \in \mathcal{T}_{f,\mathcal{T}}$ then there exist a $U \in \mathcal{T}$ such that $V = f(U)$, as

$$f(U) = (g \circ h)(U) = g(h(U)) \in \mathcal{T}_{g,\mathcal{T}} \text{ [as } h \text{ is open } h(U) \in \mathcal{T}]$$

Proving that $\mathcal{T}_{f,\mathcal{T}} \subseteq \mathcal{T}_{g,\mathcal{T}}$, combining this with [eq: 14.60] gives finally

$$\mathcal{T}_{f,\mathcal{T}} = \mathcal{T}_{g,\mathcal{T}}$$

□

Theorem 14.172. *Let X be a set, $\langle Y, \mathcal{T} \rangle$ a topological space and $f: X \to Y$ a function then*

$$\mathcal{T}_{f,\mathcal{T}}^{-1} = \{f^{-1}(U) | U \in \mathcal{T}\} \text{ is a topology on } X$$

This topology is called the ***inverse induced topology of $\mathcal{T}$ by f****. Further $f: X \to Y$ is continuous using the topologies $\mathcal{T}_{f,\mathcal{T}}^{-1}$ and $\mathcal{T}$.*

Proof. First we have

1. As $\varnothing = f^{-1}(\varnothing)$ we have

$$\varnothing \in \mathcal{T}_{f,\mathcal{T}}^{-1}$$

2. As $X = f^{-1}(Y)$ we have
$$X \in \mathcal{T}_{f,\mathcal{T}}^{-1}$$
3. Let $\{V_i\}_{i\in I} \subseteq \mathcal{T}_{f,\mathcal{T}}^{-1}$ then $\forall i \in I$ there exist a $U \in \mathcal{T}$ such that $f^{-1}(U) = V_i$, hence by a consequence of the Axiom of Choice [see theorem: 3.107] there exist a $\{U_i\}_{i\in I} \subseteq \mathcal{T}$ such that $\forall i \in I\ f^{-1}(U_i) = V_i$. Hence
$$\bigcup_{i\in I} V_i = \bigcup_{i\in I} f^{-1}(U_i) \underset{\text{[theorem: 2.136]}}{=} f^{-1}\left(\bigcup_{i\in I} U_i\right) \in \mathcal{T}_{f,\mathcal{T}}^{-1} \text{ [as } \bigcup_{i\in I} U_i \in \mathcal{T}]$$
4. If $V_1, V_2 \in \mathcal{T}_{f,\mathcal{T}}^{-1}$ then $\exists U_1, U_2 \in \mathcal{T}$ such that $f^{-1}(U_1) = V_1,\ f^{-1}(U_2) = V_2$. So
$$V_1 \bigcap V_2 = f^{-1}(U_1) \bigcap f^{-1}(U_2) \underset{\text{[theorem: 2.95]}}{=} f^{-1}(U_1 \bigcap U_2) \text{ [as } U_1 \bigcap U_2 \in \mathcal{T}]$$ □

Theorem 14.173. *Let $\langle X, \|\|_X\rangle$ be a finite dimensional pseudo normed vector space with $\dim(X) = n$ then we have given a basis $E = \{e_1, \ldots, e_n\}$ for E that*

1. *$\|\|_{\langle E\rangle}: \mathbb{K}^n \to \mathbb{R}$ defined by $\|(x_1, \ldots, x_n)\|_{\langle E\rangle} = \left\|\sum_{i\in\{1,\ldots,.n\}} x_i \cdot e_i\right\|_X$ is a pseudo norm on $\mathbb{K}^n$. Further if $\|\|_X$ is a norm then $\|\|_{\langle E\rangle}$ is a norm.*
2. *$\varphi: \mathbb{K}^n \to X$ defined by $\varphi(x_1, \ldots, x_n) = \sum_{i\in\{1,\ldots,.n\}} x_i \cdot e_i$ is a linear isometric isomorphism using the norms $\|\|_{\langle E\rangle}$ and $\|\|_X$*

Hence by [theorem: 14.170] φ is a homeomorphism so that $\mathbb{K}^n$ is homeomorphic with X.

Proof.

1. To prove that $\|\|_{\langle E\rangle}$ is a norm
   a. $\forall x = (x_1, \ldots, x_n) \in \mathbb{K}^n$ we have $\|x\|_{\langle E\rangle} = \left\|\sum_{i\in\{1,\ldots,.n\}} x_i \cdot e_i\right\|_X \geqslant 0$
   b. If $\alpha \in \mathbb{K}$, $x = (x_1, \ldots, x_n) \in \mathbb{K}^n$ we have
$$\begin{aligned}
\|\alpha \cdot x\|_{\langle E\rangle} &= \|(\alpha \cdot x_1, \ldots, \alpha_n \cdot x_n)\|_{\langle E\rangle} \\
&= \left\|\sum_{i\in\{1,\ldots,.n\}} (\alpha \cdot x_i) \cdot e_i\right\|_X \\
&= \left\|\sum_{i\in\{1,\ldots,.n\}} \alpha \cdot (x_i \cdot e_i)\right\|_X \\
&= \left\|\alpha \cdot \sum_{i\in\{1,\ldots,.n\}} x_i \cdot e_i\right\|_X \\
&= |\alpha| \cdot \left\|\sum_{i\in\{1,\ldots,.n\}} x_i \cdot e_i\right\|_X \\
&= |\alpha| \cdot \|x\|_{\langle E\rangle}
\end{aligned}$$
   c. Let $x = (x_1, \ldots, x_n),\ y = (y_1, \ldots, y_n) \in \mathbb{K}^n$ then we have
$$\begin{aligned}
\|x + y\|_{\langle E\rangle} &= \|(x_1 + y_1, \ldots, x_n + y_n)\|_{\langle E\rangle} \\
&= \left\|\sum_{i\in\{1,\ldots,.n\}} (x_i + y_i)\right\|_X \\
&= \left\|\sum_{i\in\{1,\ldots,.n\}} x_i + \sum_{i\in\{1,\ldots,.n\}} y_i\right\|_X \\
&\leqslant \left\|\sum_{i\in\{1,\ldots,.n\}} x_i\right\|_X + \left\|\sum_{i\in\{1,\ldots,.n\}} y_i\right\|_X \\
&= \|x\|_{\langle E\rangle} + \|y\|_{\langle E\rangle}
\end{aligned}$$

Assume that $\|\|_X$ is a norm. If $x=(x_1,\dots,x_n)\in\mathbb{K}^n$ satisfies $\|x\|_{\langle E\rangle}=0$ then

$$\left\|\sum_{i\in\{1,\dots,.n\}} x_i\cdot e_i\right\|_X=\|x\|_{\langle E\rangle}=0.$$

So as, $\|\|_X$ is a norm, $0=\sum_{i\in\{1,\dots,.n\}} x_i\cdot e_i$. As $\{e_1,...,e_n\}$ is a basis we have by linear independency that $\forall i\in\{1,...,n\}$ $x_i=0$ or $x=0$.

2. For $\varphi:\mathbb{K}^n\to X$ we have:

   injectivity. Let $\varphi(x)=\varphi(y)$ then $\sum_{i\in\{1,\dots,n\}} x_i\cdot e_i=\sum_{i\in\{1,\dots,n\}} y_i\cdot e_i$, hence, as $\{e_1,\dots,e_n\}$ is a basis we have by [theorem: 11.141] that $\forall i\in\{1,\dots,n\}$ $x_i=y_i$. Hence $x=y$.

   surjectivity. If $y\in X$ then by [theorem: 11.141] there exists a $\{y_i\}_{i\in\{,\dots,\dots,n\}}\subseteq\mathbb{K}$ such that $y=\sum_{i\in\{1,\dots,n\}} y_i\cdot e_i$. So if we take $x=(y_1,\dots,y_n)$ then $\varphi(x)=y$.

From the above it follows that

$$\varphi:\mathbb{K}^n\to X \text{ is a bijection}$$

Let $x=(x_1,\dots,x_n)$, $y=(y_1,\dots,y_n)\in\mathbb{K}^n$ and $\alpha\in\mathbb{K}$ then we have

$$\begin{aligned}\varphi(x+\alpha\cdot y) &= \sum_{i\in\{1,\dots,n\}}(x_i+\alpha\cdot y_i)\cdot e_i\\ &= \sum_{i\in\{1,\dots,n\}} x_i\cdot e_i+\alpha\cdot\sum_{i\in\{1,\dots,n\}} y_i\cdot e_i\\ &= \varphi(x)+\alpha\cdot\varphi(y)\end{aligned}$$

proving that

$$\varphi \text{ is linear}$$

Finally if $x=(x_1,\dots,x_n)\in\mathbb{K}^n$ then we have

$$\|\varphi(x)\|_X=\left\|\sum_{i\in\{1,\dots,n\}} x_i\cdot e_i\right\|_X=\|x\|_{\langle E\rangle}$$

proving that

$$\varphi:\mathbb{K}^n\to X \text{ is a linear isometric isomorphism}$$ □

14.5 Linear mappings and continuity

Definition 14.174. *Let $\langle X,\|\|_X\rangle$, $\langle Y,\|\|_Y\rangle$ be normed spaces then the set of linear continuous function graphs is noted as $L(X,Y)$. So*

$$L(X,Y)=\{L\in\mathrm{Hom}(X,Y)|L:X\to Y \text{ is continuous using the topologies } \mathcal{T}_{\|\|_X} \text{ and } \mathcal{T}_{\|\|_Y}\}$$

Example 14.175. Let $\langle X,\|\|\rangle$ be a normed space then $\mathrm{Id}_X\in L(X,X)$

Proof. This follows from [theorem: 11.180] and [example: 14.133]. □

Theorem 14.176. *Let $\langle X,\|\|_X\rangle$ and $\langle Y,\|\|_Y\rangle$ be normed spaces over $\mathbb{K}$ then $L(X,Y)$ is a subspace of the vector space $\mathrm{Hom}(X,Y)$ [see theorem: 11.182]. Hence by [theorem: 11.60] $L(X,Y)$ is a vector space.*

Proof. Let $L_1,L_2\in L(X,Y)$ and $\alpha\in\mathbb{K}$ then by [theorem: 14.145] $L_1+\alpha\cdot L_2\in L(X,Y)$. Further as C_0 is continuous [see theorem: 14.132] we have that $C_0\in L(X,Y)$ hence $L(X,Y)=\varnothing$. □

We examine now the conditions for a linear mapping to be continuous in the normed topologies.

Theorem 14.177. *Let $\langle X,\|\|_X\rangle$, $\langle Y,\|\|_Y\rangle$ be normed spaces and $L\in\mathrm{Hom}(X,Y)$ then we have the following equivalences:*

1. *L is continuous [in other words $L\in L(X,Y)$]*

2. *L is continuous at $0 \in X$*
3. *$\exists M \in \mathbb{R}_0^+$ such that $\forall x \in X$ with $\|x\|_X = 1$ we have $\|L(x)\|_Y \leqslant M$*
4. *$\exists M \in \mathbb{R}_0^+$ such that $\forall x \in X$ we have $\|L(x)\|_Y \leqslant M \cdot \|x\|_X$*

Proof.

1 ⇒ 2. This follows from the definition of continuity.

2 ⇒ 3. As L is continuous at 0 we have by [theorem: 14.128] that there exist a $\delta \in \mathbb{R}^+$ such that $\forall x \in X$ satisfying $\|x\|_X = \|x - 0\|_X < \delta$ we have $\|L(x)\|_Y = \|L(x) - L(0)\|_Y < 1$. As $0 < \delta$ there exist by [theorem: 10.30] a $\delta' \in \mathbb{R}$ such that $0 < \delta' < \delta$. If $x \in X$ such that $\|x\|_X = 1$ then $\|\delta' \cdot x\|_X = |\delta'| \cdot \|x\|_X = \delta' \cdot 1 = \delta' < \delta$ so that $\delta' \cdot \|L(x)\|_Y = \|\delta' \cdot L(x)\|_Y = \|L(\delta' \cdot x)\|_Y < 1$, hence $\|L(x)\|_Y < \frac{1}{\delta'}$. So if we take $M = \frac{1}{\delta'} \in \mathbb{R}^+ \subseteq \mathbb{R}_0^+$ then $\forall x \in X$ with $\|x\|_X = 1$ we have $\|L(x)\|_Y < M \Rightarrow \|L(x)\|_Y \leqslant M$.

3 ⇒ 4. By (3) there exist a $M \in \mathbb{R}_0^+$ such that $\forall x \in X$ with $\|x\|_X = 1$ we have $\|L(x)\|_Y \leqslant M$. Let $x \in X$ then we have either:

$\|x\|_X = 0$. Then as $\|\|_X$ is a norm $x = 0$ hence $\|L(x)\|_X = \|L(0)\|_Y = \|0\|_Y = 0 = M \cdot \|x\|_X$

$\|x\|_X \neq 0$. Then we have $\left\|\frac{1}{\|x\|_X} \cdot x\right\|_X = \left|\frac{1}{\|x\|_X}\right| \cdot \|x\|_x = \frac{\|x\|_X}{\|x\|_X} = 1$ so that

$$\frac{1}{\|x\|_X} \cdot \|L(x)\|_Y = \left\|\frac{1}{\|x\|_X} \cdot L(x)\right\|_Y = \left\|L\left(\frac{1}{\|x\|_X} \cdot x\right)\right\|_Y \leqslant M$$

Hence

$$\|L(x)\|_Y \leqslant M \cdot \|x\|_X$$

4 ⇒ 1. Let $M \in \mathbb{R}_0^+$ such that $\forall x \in X$ we have $\|L(x)\|_Y \leqslant M \cdot \|x\|_X$. Let $x \in X$ and $\varepsilon \in \mathbb{R}^+$ then, if we take $\delta = \frac{\varepsilon}{M+1}$, we have for $y \in X$ with $\|x - y\|_X < \delta$ that

$$\|L(x) - L(y)\|_X = \|L(x - y)\|_Y \leqslant M \cdot \|x - y\|_X \leqslant M \cdot \frac{\varepsilon}{M+1} < \varepsilon$$

So L is continuous at x and as $x \in X$ was chosen arbitrary it follows that f is continuous. □

A consequence of the above is the following corollary.

Corollary 14.178. *Let $n, m \in \mathbb{N}$ and $\langle \mathbb{K}^n, \|\|_n \rangle$, $\langle \mathbb{K}^m, \|\|\rangle$ where*

$$\|x\|_n = \max(\{|\pi_i(x)| | i \in \{1, \ldots, n\}\}),\ \|x\|_m = \max(\{|\pi_i(x)| | i \in \{1, \ldots, m\}\})$$

are the maximum norms then every linear function $L: \mathbb{K}^n \to \mathbb{K}^m$ is continuous.

Proof. Let $\{e_i\}_{i \in \{1, \ldots, n\}}$ be the canonical basis of $\mathbb{K}^n$ [see 11.165] then $\forall x = (x_1, \ldots, x_n) \in \mathbb{K}^n$ we have $x = \sum_{i \in \{1, \ldots, n\}} x_i \cdot e_i = \sum_{i \in \{1, \ldots, n\}} \pi_i(x) \cdot e_i$ where $\pi_i(x) = x_i$. So that

$$\|L(x)\|_m = \left\|\sum_{i \in \{1, \ldots, n\}} \pi_i(x) \cdot L(e_i)\right\|_m \leqslant \sum_{i \in \{1, \ldots, n\}} |\pi_i(x)| \cdot \|L(e_i)\|_m \leqslant M' \cdot \sum_{i \in \{1, \ldots, n\}} |\pi_i(x)|$$

where $M' = \max(\{\|L(e_i)\|_m | i \in \{1, \ldots, n\}\})$. As $\forall i \in \{1, \ldots, n\}$ we have

$$|\pi_i(x)| \leqslant \max(\{|\pi_i(x)| | i \in \{1, \ldots, n\}\}) = \|x\|_n$$

it follows that $\sum_{i \in \{1, \ldots, n\}} |\pi_i(x)| \leqslant \sum_{i \in \{1, \ldots, n\}} \|x\|_m = n \cdot \|x\|_m$. So if $M = n \cdot M'$ then

$$\|L(x)\|_m \leqslant M \cdot \|x\|_m$$

By the previous theorem [theorem: 14.177] it follows then that

$$L: \mathbb{K}^n \to \mathbb{K}^m \text{ is continuous}$$ □

Corollary 14.179. *Let $n, m \in \mathbb{N}$ and $\langle \mathbb{R}^n, \|\|_n \rangle$ where $\|\|_n$ is the maximum norm then every linear isomorphism $L: \mathbb{R}^n \to \mathbb{R}^n$ is a homeomorphism*

Proof. This follows directly from the previous corollary [corollary: 14.178]. □

Theorem 14.180. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces and $L \in L(X,Y)$ then for $A_{L.s}$ and $A_{L,r}$ defined by*

$$A_{l,s} = \{M \in \mathbb{R}_0^+ | \forall x \in X \text{ with } \|x\|_X = 1 \text{ we have } \|L(x)\|_Y \leqslant M\}$$

and

$$A_{L,r} = \{M \in \mathbb{R}_0^+ | \forall x \in X \text{ we have } \|L(x)\|_Y \leqslant M \cdot \|x\|_X\}$$

we have

1. $A_{L,s} = A_{L,r}$
2. $\inf(A_{L,r})$ *exist and* $0 \leqslant \inf(A_{L,r})$ *[or by (1)* $\inf(A_{L,r})$ *exist and* $0 \leqslant \inf(A_{L,r})$

Proof.

1. Let $M \in A_{L,s}$ then $\forall x \in X$ we have either:

   $\|\boldsymbol{x}\|_{\boldsymbol{X}} = \mathbf{0}$. Then as $\|\|_X$ is a norm $x = 0$ and thus

   $$\|L(x)\|_Y = \|L(0)\|_Y = \|0\|_Y = 0 \leqslant M \cdot 0 = M \cdot \|x\|_X$$

   $\|\boldsymbol{x}\|_{\boldsymbol{X}} \neq \mathbf{0}$. Then $\left\|\frac{1}{\|x\|_X} \cdot x\right\|_X = \frac{1}{\|x\|_X} \cdot \|x\|_X = 1$ so that as $M \in A_{L,s}$, we have

   $$\frac{1}{\|x\|_X} \cdot \|L(x)\|_Y = \left\|\frac{1}{\|x\|_X} \cdot L(x)\right\|_Y = \left\|L\left(\frac{1}{\|x\|_X} \cdot x\right)\right\|_Y \leqslant M$$

   hence

   $$\|L(x)\|_X \leqslant M \cdot \|x\|_X$$

   So as in all cases $\|L(x)\|_X \leqslant M \cdot \|x\|_X$ for $x \in X$, hence it follows that $M \in A_{L,r}$ proving that

   $$A_{L,s} \subseteq A_{L,r} \tag{14.61}$$

   If $M \in A_{L,r}$ then if $x \in X$ with $\|x\|_X = 1$ we have $\|L(x)\|_X \leqslant M \cdot \|x\|_X = M \cdot 1 = M$ so that $M \in A_{L,s}$, hence $A_{L,r} \subseteq A_{L,s}$. Combining this with [eq: 14.61] proves that

   $$A_{L,s} = A_{L,r}$$

2. As $L \in L(X,Y)$ we have by [theorem: 14.177] that there exist a $M \in \mathbb{R}_0^+$ such that $\forall x \in X$ with $\|x\|_X = 1$ $\|L(x)\|_Y \leqslant M$ proving that $M \in A_{L,r}$. Hence we have

   $$A_{L,r} \neq \varnothing$$

   Further, as $A_{L,r} \subseteq \mathbb{R}_0^+$, it follows that $A_{L,r}$ is bounded below by 0, so as $\mathbb{R}$ is conditional complete [see theorem: 10.18] we have that

   $$\inf(A_{L,r}) \text{ exist and } 0 \leqslant \inf(A_{L,r})$$

□

The above theorem allows the following definition.

Definition 14.181. (Operator Norm) *Let , $\langle Y, \|\|_Y\rangle$ be normed spaces and $L \in L(X,Y)$ then the* ***operator norm****, noted as $\|\|_{L(X,Y)}$ is defined by*

$$\|L\|_{L(X,Y)} = \inf(A_{L,s}) \underset{\text{[theorem: 14.180]}}{=} \inf(A_{L,r})$$

where

$$A_{L,s} = \{M \in \mathbb{R}_0^+ | \forall x \in X \text{ with } \|x\|_X = 1 \text{ we have } \|L(x)\|_Y \leqslant M\}$$

and

$$A_{L,r} = \{M \in \mathbb{R}_0^+ | \forall x \in X \text{ we have } \|L(x)\|_Y \leqslant M \cdot \|x\|_X\}$$

By [theorem: 14.176] $L(X,Y)$ is a vector space, we prove now that $\|\|_{L(X,Y)}$ is a norm on $L(X,Y)$.

Theorem 14.182. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces over a field $\mathbb{K}$ then we have that:*

1. $\forall x \in X$ *we have* $\|L(x)\|_Y \leqslant \|L\|_{L(X,Y)} \cdot \|x\|_Y$
2. $\|C_0\|_{L(X,Y)} = 0$ *where* $C_0 \colon X \to Y$ *is defined by* $C_0(x) = 0$ *[the neutral element in* $L(X,Y)$
3. $\|\|_{L(X,Y)}$ *is a norm on* $L(X,Y)$ *making* $\langle L(X,Y), \|\|_{L(X,Y)}\rangle$ *a normed space.*

Proof.

1. Let $x \in X$ then we have either:

   $\|\boldsymbol{x}\|_{\boldsymbol{X}} = \mathbf{0}$. Then
   $$\|L(x)\|_Y = \|L(0)\|_Y = \|0\|_Y = 0 = \|L\|_{L(X,Y)} \cdot 0 = \|L\|_{L(X,Y)} \cdot \|x\|_X$$

   $\|\boldsymbol{x}\|_{\boldsymbol{X}} \neq \mathbf{0}$. Assume that $\|L\|_{L(X,Y)} < \frac{1}{\|x\|_X} \cdot \|L(x)\|_Y$ then, as $\|L\|_{L(X,Y)} = \inf(A_{L,r})$, there exist a
   $$M \in A_{L,r} = \{M \in \mathbb{R}_0^+ | \forall x \in X \text{ we have } \|L(x)\|_Y \leqslant M \cdot \|x\|_X\}$$
   such that $\|L\|_{L(X,Y)} \leqslant M < \frac{1}{\|x\|_X} \cdot \|L(x)\|_Y$ so that $M \cdot \|x\|_X < \|L(x)\|_Y$ contradicting the fact that $M \in A_{L,r} \Rightarrow \|L(x)\|_Y \leqslant M \cdot \|x\|_X$. So we must have that $\frac{1}{\|x\|_X} \cdot \|L(x)\|_Y \leqslant \|L\|_{L(X,Y)}$ or
   $$\|L(x)\|_Y \leqslant \|L\|_{L(X,Y)} \cdot \|x\|_X$$

   So in all cases we have
   $$\|L(x)\|_Y \leqslant \|L\|_{L(X,Y)} \cdot \|x\|_X$$

2. $\forall x \in X$ we have $\|C_0(x)\|_Y = \|0\|_Y = 0 \leqslant 0 \cdot \|x\|_X$ proving that $0 \in A_{C_0,r}$, hence
   $$0 \leqslant \inf(A_{C_0,r}) \leqslant 0$$
   resulting in
   $$\|C_0\|_{L(X,Y)} = \inf(A_{C_0,r}) = 0$$

3. Let $L \in L(X,Y)$ then by [theorem: 14.180] we have
   $$\forall L \in L(X,Y) \text{ that } 0 \leqslant \|L\|_{L(X,Y)} \tag{14.62}$$
   Further if $L_1, L_2 \in L(X,Y)$ then for $x \in X$ we have by (1) that
   $$\|L_1(x)\|_Y \leqslant \|L\|_{L(X,Y)} \cdot \|x\|_X \text{ and } \|L_2(x)\|_Y \leqslant \|L_2\|_{L(X,Y)} \cdot \|x\|_X \tag{14.63}$$
   Further
   $$\begin{array}{rcl} \|(L_1+L_2)(x)\|_Y & = & \|L_1(x)+L_2(x)\|_Y \\ & \leqslant & \|L_1(x)\|_Y + \|L_2(x)\|_Y \\ & \leqslant_{\text{[eq: 14.63]}} & \|L\|_{L(X,Y)} \cdot \|x\|_X + \|L_2\|_{L(X,Y)} \cdot \|x\|_x \\ & = & (\|L\|_{L(X,Y)} + \|L\|_{L(X,Y)}) \cdot \|x\|_X \end{array}$$
   proving that $\|L\|_{L(X,Y)} + \|L\|_{L(X,Y)} \in A_{(L_1+L_2),r}$ so that
   $$\|L_1+L_2\|_{L(X,Y)} = \inf(A_{(L_1+L_2),r}) \leqslant \|L\|_{L(X,Y)} + \|L\|_{L(X,Y)} \tag{14.64}$$
   Let $\alpha \in \mathbb{K}$ and $L \in L(X,Y)$. By (1) we have $\forall x \in X$ that $\|L(x)\|_Y \leqslant \|L\|_{L(X,Y)} \cdot \|x\|_X$ then
   $$\|(\alpha \cdot L)(x)\|_X = \|\alpha \cdot L(x)\|_X = |\alpha| \cdot \|L(x)\|_Y \leqslant |\alpha| \cdot \|L\|_{L(X,Y)} \cdot \|x\|_X$$
   proving that $|\alpha| \cdot \|L\|_{L(X,Y)} \in A_{\alpha \cdot L,r}$. Hence
   $$\|\alpha \cdot L\|_{L(X,Y)} = \inf(A_{\alpha \cdot L,r}) \leqslant |\alpha| \cdot \|L\|_{L(X,Y)} \tag{14.65}$$
   For the opposite inequality we have two cases for $|\alpha|$ to consider:

   $|\boldsymbol{\alpha}| = \mathbf{0}$. Then, as $||$ is a norm in $\mathbb{K}$, we have $\alpha = 0$ so that $\alpha \cdot L = C_0$, hence
   $$\|\alpha \cdot L\|_{L(X,Y)} = \|C_0\|_{L(X,Y)} \underset{(2)}{=} 0 = |\alpha| \cdot \|L\|_{L(X,Y)}$$
   or
   $$|\alpha| \cdot \|L\|_{L(X,Y)} = 0 = \|\alpha \cdot L\|_{L(X,Y)} \Rightarrow |\alpha| \cdot \|L\|_{L(X,Y)} \leqslant \|\alpha \cdot L\|_{L(X,Y)}$$

   $|\boldsymbol{\alpha}| \neq \mathbf{0}$. As $\forall x \in X$ we have $\|(\alpha \cdot L)(x)\|_Y = \|\alpha \cdot L(x)\|_Y = |\alpha| \cdot \|L(x)\|_Y \leqslant |$ so that
   $$\|L(x)\|_Y = \frac{\|(\alpha \cdot L)(x)\|_Y}{|\alpha|} \leqslant \frac{\|\alpha \cdot L\|_{L(X,Y)} \cdot \|x\|_X}{|a|}$$

proving that $\frac{\|\alpha\cdot L\|_{L(X,Y)}}{|\alpha|}\in A_{L,r}$, hence $\|L\|_{L(X,Y)}=\inf(A_{L,r})\leqslant\frac{\|\alpha\cdot L\|_{L(X,Y)}}{|\alpha|}$. So

$$|\alpha|\cdot\|L\|_{L(X,Y)}\leqslant\|\alpha\cdot L\|_{L(X,Y)}$$

So in all cases we have $|\alpha|\cdot\|L\|_{L(X,Y)}\leqslant\|\alpha\cdot L\|_{L(X,Y)}$ which combined with [eq: 14.65] results in

$$\|\alpha\cdot L\|_{L(X,Y)}=|\alpha|\cdot\|L\|_{L(X,Y)} \tag{14.66}$$

Using [eqs: 14.62, 14.64 and 14.66] it follows that

$$\|\|_{L(X,Y)}\text{ is a pseudo norm}$$

To prove that $\|\|_{L(X,Y)}$ is a norm let $L\in L(X,Y)$ such that $\|L\|_{L(X,Y)}$. Assume that $L\neq C_o$ [the neutral element in $L(X,Y)$] then there exist a $x\in X$ such that $L(x)\neq C_o(x)=0$. As $\|\|_Y$ is a norm we have $\|L(x)\|_Y\neq 0$, but then as $0\neq\|L(x)\|_Y\leqslant_{(1)}\|L\|_{L(X,Y)}\cdot\|x\|_X=0$ resulting in a contradiction. So the assumption is wrong and we must have that $L=C_0$ which proves that

$$\|\|_{L(X,Y)}\text{ is a norm on }L(X,Y)$$ □

Up to now the operator norm $\|\|_{L(\mathrm{XY})}$ is defined using a infinum, the following theorem shows that we can also define the operator norm as a supremum.

Theorem 14.183. *Let $\langle X\|\|_X\rangle$, $\langle Y\|\|_Y\rangle$ be normed spaces where X is not trivial [there exists a $x\in X$ with $x\neq 0$], $L\in L(X,Y)$ and define*

$$A_{L,t}=\{\|L(x)\|_Y|x\in X\text{ with }\|x\|_X=1\}$$

and

$$A_{L,u}=\{\|L(x)\|_Y|x\in X\text{ with }\|x\|_X\leqslant 1\}$$

then

$$\|L\|_{L(X,Y)}=\sup(A_{L,t})=\sup(A_{L,u})$$

Proof. If $M\in A_{L,t}$ then $\exists x\in X$ with $\|x\|_X=1$ such that $M=\|L(x)\|_Y$ which as $\|x\|_X=1\leqslant 1$ proves that $M\in A_{L,u}$. Hence

$$A_{L,t}\subseteq A_{L,u} \tag{14.67}$$

As $\exists x_0\in X$ with $x_0\neq 0$ we have as $\|\|_X$ is a norm that $\left\|\frac{1}{\|x_0\|}\cdot x_0\right\|_X=\frac{1}{\|x_0\|_X}\cdot\|x_0\|_X=1$ so that $\|L(x_0)\|_Y\in A_{L,t},A_{L,u}$ proving that

$$\varnothing\neq A_{L.t}\wedge\varnothing=A_{L,u} \tag{14.68}$$

Now if $M\in A_{L,u}$ then $\exists x\in X$ with $\|x\|_X\leqslant 1$ such that $M=\|L(x)\|_Y$, using [theorem: 14.182] we have that $\|L(x)\|_Y\leqslant\|L\|_{L(X,Y)}\cdot\|x\|_X\leqslant\|L\|_{L(X,Y)}\cdot 1=\|L\|_{L(X,Y)}$, proving that $\|L\|_{L(X,Y)}$ is a upper bound for $A_{L,u}$ and by [eq: 14.67] $A_{L,u}$. Hence by [theorem: 10.18] $\sup(A_{L,t})$, $\sup(A_{L,u})$ exists and $\sup(A_{L,t}),\sup(A_{L,u})\leqslant\|L\|_{L(X,Y)}$. Further by by [eq: 14.67] and [theorem: 3.77] we have that $\sup(A_{L,t})\leqslant\sup(A_{L,u})$. Summarized we have that

$$\sup(A_{L,t})\leqslant\sup(A_{L,u})\leqslant\|L\|_{L(X,Y)}$$

Now $\forall x\in X$ with $\|x\|_X=1$ we have that $\|L(x)\|_Y\in A_{L,t}$ so that $\|L(x)\|_Y\leqslant\sup(A_{L,t})$ or using the definition of $A_{L,s}$ [see: 14.181] that $\sup(A_{L,t})\in A_{L,s}$. Hence

$$\|L\|_{L(X,Y)}=\inf(A_{L,s})\leqslant\sup(A_{L,t})\leqslant\sup(A_{L,u})\leqslant\|L\|_{L(X,Y)}$$

proving that

$$\sup(A_{L,t})=\sup(A_{L,u})=\|L\|_{L(X,Y)}$$ □

To summarize the the above theorems about $L(X,Y)$ we have

Theorem 14.184. *Let $\langle X,\|\|_X\rangle$, $\langle Y,\|\|_Y\rangle$ be normed spaces then*

$$\langle L(X,Y),\|\|_{L(X,Y)}\rangle$$

is a normed space where

$$\forall L\in L(X,Y)\text{ we have }\|L\|_{L(X,Y)}=\inf(A_{L,s})=\inf(A_{L,r})=\sup(A_{L,t})=\sup(A_{L,u})$$

and

$$\begin{aligned} A_{L,s} &= \{M \in \mathbb{R}_0^+ | \forall x \in X \text{ with } \|x\|_X = 1 \text{ we have } \|L(x)\|_Y \leqslant M\} \\ A_{L,r} &= \{M \in \mathbb{R}_0^+ | \forall x \in X \text{ we have } \|L(x)\|_Y \leqslant M \cdot \|x\|_X\} \\ A_{L,t} &= \{\|L(x)\|_Y | x \in X \text{ with } \|x\|_X = 1\} \\ A_{L,u} &= \{\|L(x)\|_Y | x \in X \text{ with } \|x\|_X \leqslant 1\} \end{aligned}$$

Proof. This follows from [theorems: 14.176, 14.182, 14.183]. □

Example 14.185. Let $\langle X, \|\|\rangle$ be a normed space then $\mathrm{Id}_X \in L(X, X)$ and $\|\mathrm{Id}_X\|_{L(X,X)} \leqslant 1$.

Proof. From [example: 14.185] $\mathrm{Id}_X \in L(X, X)$. Further for $x \in X$ we have $\|\mathrm{Id}_X(x)\| = \|x\|$ which, using [theorem: 14.184], proves that $\|\mathrm{Id}_X\|_{L(X,X)} \leqslant 1$. □

Example 14.186. Let $\langle X, \|\|\rangle$ be a normed space, $\langle \mathbb{K}, \|\rangle$ be normed space of real or complex numbers and $x \in X$ then if we define

$$(\cdot x): \mathbb{K} \to X \text{ by } (\cdot x)(r) = r \cdot x$$

we have that

$$(\cdot x) \in L(\mathbb{K}, X)$$

with

$$\|(\cdot x)\|_{L(\mathbb{K},X)} = \|x\|$$

Proof. Let $r, s \in \mathbb{K}$ and $\alpha \in \mathbb{K}$ then we have

$$(\cdot x)(r + \alpha \cdot s) = (r + \alpha \cdot s) \cdot x = r \cdot x + (\alpha \cdot s) \cdot x = r \cdot x + \alpha \cdot (s \cdot x) = (\cdot x)(r) + \alpha \cdot (\cdot x)(s)$$

proving that

$$(\cdot x) \in \mathrm{Hom}(\mathbb{K}, X)$$

Let $r \in \mathbb{K}$ be such that $|r| = 1$ then $\|(\cdot x)(r)\| = \|r \cdot x\| = |r| \cdot \|x\| = \|x\|$ so that by [theorem: 14.177]

$$(\cdot x) \in L(\mathbb{K}, X)$$

Further

$$A_{(\cdot x),t} = \{\|(\cdot x)(r)\| \,|\, |r| = 1\} = \{\|x\|\}$$

so that

$$\|(\cdot x)\|_{L(\mathbb{K},X)} \underset{\text{[theorem: 14.184]}}{=} \sup(A_{(\cdot x),t}) = \sup(\{\|x\|\}) = \|x\|$$ □

Example 14.187. Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i\rangle\}_{i \in \{1,\ldots,n\}}$ be a family of normed spaces and $\left\langle \prod_{i \in \{1,\ldots,n\}} X_i, \|\|_{\max}\right\rangle$ the product space with the maximum norm [see theorem: 14.94] then

$$\forall i \in \{1, \ldots, n\} \ \pi_i \in L\left(\prod_{j \in \{1,\ldots,n\}} X_j, X_i\right) \text{ and } \|\pi_i\|_{L(\prod_{j \in \{1,\ldots,n\}} X_j, X_i)} \leqslant 1$$

Proof. By [theorem: 11.173] we have

$$\forall i \in \{1, \ldots, n\} \ \pi_i: \prod_{j \in \{1,\ldots,n\}} X_j \to X_i \text{ is a linear mapping}$$

Further if $x \in \prod_{j \in \{1,\ldots,n\}} X_i$ then

$$\|\pi_i(x)\|_i \leqslant \max(\{\|\pi_i(x)\| \,|\, i \in \{1, \ldots, n\}\}) = \|x\|_{\max} \leqslant 1 \cdot \|x\|_{\max}$$

so that by [theorem: 14.177] π_i is continuous. Further $1 \in A_{L,r}$ so that $\|\pi_i\|_{L(\prod_{j \in \{1,\ldots,n\}} X_j, X_i)} \leqslant 1$. Hence we have

$$\forall i \in \{1, \ldots, n\} \ \pi_i \in L\left(\prod_{j \in \{1,\ldots,n\}} X_j, X_i\right) \text{ and } \|\pi_i\|_{L(\prod_{j \in \{1,\ldots,n\}} X_j, X_i)} \leqslant 1$$ □

Theorem 14.188. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ and $\langle Z, \|\|_Z\rangle$ be normed spaces over $\mathbb{K}$, $L_1 \in L(X,Y)$, $L_2 \in L(Y,Z)$ then $L_2 \circ L_1 \in L(X,Z)$ and $\|L_2 \circ L_1\|_{L(X,Z)} \leqslant \|L_1\|_{L(X,Y)} \cdot \|L_2\|_{L(Y,Z)}$*

Proof. By [theorems: 11.177 and 14.139] it follows that

$$L_2 \circ L_1 \in L(X,Z)$$

Further $\forall x \in X$ we have

$$\|(L_2 \circ L_1)(x)\|_Z = \|L_2(L_1(x))\|_Z \leqslant \|L_2\|_{L(Y,Z)} \cdot \|L_1(x)\|_Y \leqslant \|L_1\|_{L(X,Y)} \cdot \|L_2\|_{L(Y,Z)} \cdot \|x\|_X$$

Hence $\|L_1\|_{L(X,Y)} \cdot \|L_2\|_{L(Y,Z)} \in A_{L_2 \circ L_1, r}$ so that

$$\|L_2 \circ L_1\|_{L(X,Z)} = \inf(A_{L_2 \circ L_1, r}) \leqslant \|L_1\|_{L(X,Y)} \cdot \|L_2\|_{L(Y,Z)}$$ □

For open linear mappings we have:

Theorem 14.189. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces over $\mathbb{K}$ then for a linear mapping*

$$L: X \to Y$$

we have

$$L \text{ is open} \Leftrightarrow \exists \delta \in \mathbb{R}^+ \text{ such that } B_{\|\|_Y}(0,\delta) \subseteq L(B_{\|\|_X}(0,1))$$

Proof.

⇒. As $B_{\|\|_X}(0,1) \in \mathcal{T}_{\|\|_X}$ and L is open it follows that $L(B_{\|\|_X}(0,1)) \in \mathcal{T}_{\|\|_Y}$, further $0 \in B_{\|\|_X}(0,1) \Rightarrow 0 = L(0) \in L(B_{\|\|_X}(0,1))$. So by [theorem: 14.93] there exist a $\delta \in \mathbb{R}^+$ such that

$$0 \in B_{\|\|_Y}(0,\delta) \subseteq L(B_{\|\|_X}(0,1)).$$

⇐. Let $U \in \mathcal{T}_{\|\|_X}$ and let $y \in L(U)$ then there exist a $x \in U$ such that $y = L(x)$, by [theorem: 14.93] there exists a $\delta' \in \mathbb{R}^+$ such that

$$x \in B_{\|\|_X}(x,\delta') \subseteq U \Rightarrow L(x) \in L(B_{\|\|_X}(x,\delta')) \subseteq L(U).$$

By the hypothesis there exist a $\delta'' \in \mathbb{R}^+$ such that $0 \in B_{\|\|_Y}(0,\delta'') \subseteq L(B_{\|\|_X}(0,1))$. Then we have for $\delta = \delta'' \cdot \delta'$ that

$$\begin{aligned}
z \in B_{\|\|_Y}(y,\delta) &\Rightarrow z \in B_{\|\|_Y}(y,\delta'' \cdot \delta') \\
&\Rightarrow z \in B_{\|\|_Y}(L(x),\delta'' \cdot \delta') \\
&\Rightarrow \|z - L(x)\|_Y < \delta'' \cdot \delta' \\
&\Rightarrow \frac{1}{\delta'} \cdot \|z - L(x)\|_Y < \delta'' \\
&\Rightarrow \left\|\frac{1}{\delta'} \cdot (z - L(x))\right\|_Y < \delta'' \\
&\Rightarrow \frac{1}{\delta'} \cdot (z - L(x)) \in B_{\|\|_Y}(0,\delta'') \subseteq L(B_{\|\|_X}(0,1)) \\
&\Rightarrow \exists x_0 \in X \text{ such that } \|x_0\|_X < 1 \text{ and } L(x_0) = \frac{1}{\delta'} \cdot (z - L(x)) \\
&\Rightarrow z = \delta' \cdot L(x_0) + L(x) \wedge \|x_0\|_X < 1 \\
&\Rightarrow z = L(\delta' \cdot x_0 + x) \wedge \|x_0\|_X < 1 \\
&\Rightarrow z = L(\delta' \cdot x_0 + x) \wedge \|\delta' \cdot x_0\|_X < \delta' \\
&\Rightarrow z = L(\delta' \cdot x_0 + x) \wedge \|(\delta' \cdot x_0 + x) - x\|_X < \delta' \\
&\Rightarrow z = L(\delta' \cdot x + x) \wedge \delta' \cdot x_0 + x \in B_{\|\|_X}(x,\delta') \\
&\Rightarrow z \in L(B_{\|\|_X}(x,\delta')) \subseteq L(U)
\end{aligned}$$

proving that $B_{\|\|_Y}(y,\delta) \subseteq L(U)$. In other words

$$\forall y \in L(U) \text{ there exist a } \delta \in \mathbb{R}^+ \text{ such that } y \in B_{\|\|_Y}(y,\delta) \subseteq L(U)$$

So by [theorem: 14.93] it follows that $L(U) \in \mathcal{T}_{\|\|_Y}$ proving that L is open. □

14.6 Multilinear mappings and continuity

We prove now that the set of continuous multilinear mappings is a sub space of the set of multilinear mappings.

Theorem 14.190. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_{i\in\{1,\dots,n\}}\rangle\}$ a family of normed vector spaces, $\langle Y, \|\|_Y\rangle$ a normed vector space over $\mathbb{K}$ and $L \in \mathrm{Hom}(X_1,\dots,X_n;Y)$ then we have the following equivalences:*

1. *L is continuous [using the product topology on $\prod_{i\in\{1,\dots,n\}} X_i$ [see theorem: 14.94] and the topology $\mathcal{T}_{\|\|_Y}$ on Y].*
2. *L is continuous at 0.*
3. *$\exists M \in \mathbb{R}_0^+$ such that $\forall x \in \prod_{i\in\{1,\dots,n\}} X_i$ satisfying $\forall i \in \{1,\dots,n\}$ $\|x_i\|_i = 1$ we have that $\|L(x)\|_Y \leqslant M$.*
4. *$\exists M \in \mathbb{R}_0^+$ such that $\forall x \in \prod_{i\in\{1,\dots,n\}} X_i$ we have $\|L(x)\|_Y \leqslant M \cdot \prod_{i\in\{1,\dots,n\}} \|x_i\|_i$.*

Proof. First by [theorem: 14.94] we have $\mathcal{T}_{\text{product}} = \mathcal{T}_{\|\|_{\max}}$ where

$$\|x\|_{\max} = \max\left(\{\|\pi_i(x)\|_i | i \in \{1,\dots,n\}\}\right) = \max\left(\{\|x_i\|_i | i \in \{1,\dots,n\}\}\right)$$

Secondly we have:

1 ⇒ 2. This is trivial.

2 ⇒ 3. Using [theorem: 14.128] there exist a $\delta \in \mathbb{R}^+$ such that $\forall y = (y_1,\dots,y_n) \in \prod_{i\in\{1,\dots,n\}} X_i$ with $\|y\|_{\max} < \delta$ we have $\|L(y)\|_Y = \|L(y) - L(0)\|_Y < 1$. Let $x \in \prod_{i\in\{1,\dots,n\}} X_i$ such that $\forall i \in \{1,\dots,n\}$ $\|x_i\|_i = 1$ then $\|x\|_{\max} = \max\left(\{\|x_i\|_i | i \in \{1,\dots,n\}\}\right) = 1$ so

$$\left\|\frac{\delta}{2}\cdot x\right\|_{\max} = \frac{\delta}{2}\cdot\|x\|_{\max} = \frac{\delta}{2} < \delta$$

and we must have that $\left\|L\left(\frac{\delta}{2}\cdot x\right)\right\|_Y < 1$. So if we take $M = \left(\frac{2}{\delta}\right)^n$ then

$$\begin{aligned}
\frac{1}{M}\cdot\|L(x)\|_Y &= \left(\frac{\delta}{2}\right)^n \cdot \|L(x)\|_Y \\
&= \left\|\left(\frac{\delta}{2}\right)^n \cdot L(x)\right\|_Y \\
&= \left\|\left(\frac{\delta}{2}\right)^n \cdot L(x_1,\dots,x_n)\right\|_Y \\
&\underset{\text{[theorem: 11.265]}}{=} \left\|L\left(\frac{\delta}{2}\cdot x_1,\dots,\frac{\delta}{2}\cdot x_n\right)\right\|_Y \\
&= \left\|L\left(\frac{\delta}{2}\cdot(x_1,\dots,x_n)\right)\right\|_Y \\
&= \left\|L\left(\frac{\delta}{2}\cdot x\right)\right\|_Y \\
&< 1
\end{aligned}$$

proving that

$$\|L(x)\|_Y < M$$

3 ⇒ 4. Let $M \in \mathbb{R}_0^+$ be such that $\forall y \in \prod_{i\in\{1,\dots,n\}} X_i$ with $\forall i \in \{1,\dots,n\}$ $\|y_i\|_i = 1$ we have $\|L(y)\|_Y \leqslant M$. Then given $x \in \prod_{i\in\{1,\dots,n\}} \|x_i\|_i$ we have two cases possible:

$\exists i \in \{1,\dots,n\}$ with $x_i = 0$. Then by [theorem: 11.254] $L(x) = 0$ so that

$$\|L(x)\|_Y = \|0\|_Y = 0 \leqslant 0 = M\cdot 0 = M \cdot \prod_{i\in\{1,\dots,n\}} \|x_i\|_i$$

$\forall i \in \{1,\dots,n\}$ we have $x_i \neq 0$. Define then $y \in \prod_{i\in\{1,\dots,n\}} X_i$ by $y_i = \frac{1}{\|x_i\|}\cdot x_i$ then

$$\|y_i\|_i = \left\|\frac{1}{\|x\|_i}\cdot x_i\right\|_i = \frac{1}{\|x_i\|_i}\cdot\|x_i\|_i = 1.$$

Further

$$\begin{aligned}
\frac{1}{\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i}\cdot\|L(x_1,\ldots,x_n)\|_Y &= \\
\left\|\frac{1}{\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i}\cdot L(x_1,\ldots,x_n)\right\|_Y &= \text{[theorem: 11.265]} \\
\left\|L\left(\frac{1}{\|x\|_1}\cdot x_1,\ldots,\frac{1}{\|x_n\|_n}\cdot x_n\right)\right\|_Y &= \\
\|L(y_1,\ldots,y_n)\|_Y &\leqslant M
\end{aligned}$$

so that

$$\|L(x_1,\ldots,x_n)\|_Y \leqslant M\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i$$

hence in all cases we have

$$\|L(x_1,\ldots,x_n)\|_Y \leqslant M\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i$$

4 ⇒ 1. By the hypothesis there exist a $M\in\mathbb{R}_0^+$ such that

$$\forall x\in\prod_{i\in\{1,\ldots,n\}}X_i \text{ we have } \|L(x)\|_Y\leqslant M\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i$$

Let $x\in\prod_{i\in\{1,\ldots,n\}}X_i$ and $\varepsilon\in\mathbb{R}^+$ take then $\delta=\min\left(1,\frac{\varepsilon}{M+1}\right)$ then we have if $\|x-y\|_{\max}<\delta$ that $\forall i\in\{1,\ldots,n\}$ $\|x_i-y_i\|_i<\delta$ so that

$$\begin{aligned}
\|L(x)-L(y)\|_Y &= \|L(x-y)\|_Y \\
&\leqslant M\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i-y_i\|_i \\
&= M\cdot\left(\prod_{i\in\{1,\ldots,n-1\}}\|x_i-y_i\|_i\right)\cdot\|x_n-y_i\|_n \\
&< M\cdot 1\cdot\|x_n-y_n\|_n \\
&< M\cdot\frac{\varepsilon}{M+1} \\
&< \varepsilon
\end{aligned}$$

proving that L is continuous at x. As $x\in\prod_{i\in\{1,\ldots,n\}}X_i$ was chosen arbitrary it follows that L is continuous. □

Example 14.191. Let $n\in\mathbb{N}$, $\langle\mathbb{K},\|\rangle$ be the complex [real] vector space over $\mathbb{K}$ then we have:

1. $\forall x=(x_1,\ldots,x_n)\in\mathbb{K}^n$ we have $\left|\prod_{i\in\{1,\ldots,n\}}x_i\right|=\prod_{i\in\{1,\ldots,n\}}|x_i|$
2. $g:\mathbb{K}^n\to\mathbb{K}$ defined by $g(x_1,\ldots,x_n)=\prod_{i\in\{1,\ldots,n\}}x_i$ is multilinear and continuous [using the norms $||_n=\max(\{|x_i||i\in\{1,\ldots,n\}\})$ and $||$.
3. Let $\langle X,\|\|_X\rangle$ be a normed space and $z\in X$ then

$$h_z:\mathbb{K}^n\to X \text{ defined by } h_z(x)=z\cdot g(x)=\left(\prod_{i\in\{1,\ldots,n\}}x_i\right)\cdot z$$

is multilinear and continuous [using the norms $||_n=\max(\{|x_i||i\in\{1,\ldots,n\}\})$ and $\|\|_X$.

Proof.

1. We prove this by induction, so let

$$S=\left\{n\in\mathbb{N}|\text{If } (x_1,\ldots,x_n)\in\mathbb{K}^n \text{ then } \left|\prod_{i\in\{1,\ldots,n\}}x_i\right|=\prod_{i\in\{1,\ldots,n\}}|x_i|\right\}$$

then we have:

$1 \in S$. If $(x_1, \ldots, x_1) \in \mathbb{K}^1$ then $\left|\prod_{i\in\{1\}} x_i\right| = |x_1| = \prod_{i\in\{1\}} |x_i|$ proving that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $(x_1,...,x_{n+1}) \in \mathbb{K}^{n+1}$ then $(x_1,...,x_n) \in \mathbb{K}^n$ so that, as $n \in S$, we have $\left|\prod_{i\in\{1,\ldots,n\}} x_i\right| = \prod_{i\in\{1,\ldots,n\}} |x_i|$. So

$$\begin{aligned}
\left|\prod_{i\in\{1,\ldots,n+1\}} x_i\right| &= \left|\left(\prod_{i\in\{1,\ldots,n\}} x_i\right)\cdot x_{n+1}\right| \\
&= \left|\prod_{i\in\{1,\ldots,n\}} x_i\right| \cdot |x_{n+1}| \\
&= \left(\prod_{i\in\{1,\ldots,n\}} |x_i|\right) \cdot |x_{n+1}| \\
&= \prod_{i\in\{1,\ldots,n+1\}} |x_i|
\end{aligned}$$

proving that $n+1 \in S$.

2. First using [theorem: 11.258] it follows that

$$g: \mathbb{K}^n \to \mathbb{K} \text{ is multi linear}$$

Secondly let $(x_1, \ldots, x_n) \in \mathbb{K}^n$ then we have

$$|g(x_1, \ldots, x_n)| = \left|\prod_{i\in\{1,\ldots,n\}} x_i\right| \underset{(1)}{=} \prod_{i\in\{1,\ldots,n\}} |x_i| = 1 \cdot \prod_{i\in\{1,\ldots,n\}} |x_i|$$

which by [theorem: 14.190] proves that

$$g: \mathbb{K}^n \to \mathbb{K} \text{ is continuous}$$

3. Let $\alpha, x, y \in \mathbb{K}$, $i \in \{1, \ldots, n\}$ then for $\left(x_1, \ldots \underbrace{x+\beta\cdot y}_{i} \ldots, x_n\right) \in \mathbb{K}^n$ we have:

$$\begin{aligned}
h_z\left(x_1, \ldots \underbrace{x+\beta\cdot y}_{i} \ldots, x_n\right) &= \\
g\left(x_1, \ldots \underbrace{x+\beta\cdot y}_{i} \ldots, x_n\right)\cdot z &\underset{(2)}{=} \\
\left(g\left(x_1, \ldots \underbrace{x}_{i} \ldots, x_n\right) + \beta\cdot g\left(x_1, \ldots \underbrace{y}_{i} \ldots, x_n\right)\right)\cdot z &= \\
h_z\left(x_1, \ldots \underbrace{x}_{i} \ldots, x_n\right) + \beta\cdot h_z\left(x_1, \ldots \underbrace{y}_{i} \ldots, x_n\right)
\end{aligned}$$

proving that

$$h_z: \mathbb{K}^n \to X \text{ is multilinear}$$

Further we have

$$\begin{aligned}
\|h_z(x_1, \ldots, x_n)\|_X &= \|g(x_1, \ldots, x_n)\cdot z\| \\
&= |g(x_1, \ldots, x_n)| \cdot \|z\|_X \\
&\leqslant_{(2)} \|z\|_X \cdot \prod_{i\in\{1,\ldots,n\}} |x_i|
\end{aligned}$$

proving that

$$h_z: \mathbb{K}^n \to X \text{ is continuous}$$

□

Definition 14.192. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ be a family of normed spaces and $\langle Y, \|\|_Y\rangle$ a normed space then the set of the graphs of multilinear continuous mappings between $\prod_{i\in\{1,\ldots,n\}} X_i$ and Y is noted as $L(X_1 \ldots X_n; Y)$ hence*

$$L(X_1 \ldots X_n; Y) = \{L \in \mathrm{Hom}(X_1 \ldots X_n; Y) | L \textit{ is continuous}\}$$

Theorem 14.193. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ be a family of normed spaces and $\langle Y, \|\|_Y\rangle$ a normed space then $L(X_1,\ldots,X_n;Y)$ is a subspace of $\mathrm{Hom}(X_1\ldots X_n;Y)$ [and thus by [theorem: 11.60] a vector space].*

Proof. Let C_0: $\prod_{i\in\{1,\ldots,n\}} X_i \to Y$ be defined by $C_0(x)=0$. By [theorem: 11.263]

$$C_0 \in \mathrm{Hom}(X_1\ldots X_n;Y) \tag{14.69}$$

Further as $\forall x \in \prod_{i\in\{1,\ldots,n\}} X_i$ we have that $\|C_0(x)\|_Y = \|0\|_Y = 0 \leqslant 1\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i$ it follows by [theorem: 14.190] that

$$C_0 \text{ is continuous} \tag{14.70}$$

Hence by [eqs: 14.69, 14.70] $C_0 \in L(X_1,\ldots,X_n;Y)$ proving that

$$L(X_1\ldots X_n;Y) \neq \varnothing$$

Further if $\alpha \in \mathbb{K}$ and L_1, $L_2 \in L(X_1\ldots X_n;Y)$ then by [theorem: 11.263]

$$L_1 + \alpha\cdot L_2 \in \mathrm{Hom}(X_1\ldots X_n;Y) \tag{14.71}$$

Also using [theorem: 14.190] we have that there exists M_1, $M_2 \in \mathbb{R}^+$ such that $\forall x \in \prod_{i\in\{1,\ldots,n\}} X_i$ $\|L_1(x)\|_Y \leqslant M_1\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i$ and $\|L_2(x)\|_Y \leqslant M_2\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i$. Hence

$$\begin{aligned}
\|(L_1+\alpha\cdot L_2)(x)\|_Y &= \|L_1(x)+\alpha\cdot L_2(x)\|_Y \\
&\leqslant \|L_1(x)\|_Y + \|\alpha\cdot L_2(x)\|_Y \\
&= \|L_1(x)\|_Y + |\alpha|\cdot\|L_2(x)\|_Y \\
&\leqslant M_1\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i + |\alpha|\cdot M_2\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i \\
&= (M_1+|\alpha|\cdot M_2)\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i
\end{aligned}$$

proving by [theorem: 14.190] that

$$L_1+\alpha\cdot L_2 \text{ is continuous} \tag{14.72}$$

Combining [eqs: 14.71, 14.72] proves

$$L_1+\alpha\cdot L_2 \in L(X_1,\ldots,X_n;Y)$$

□

Next we proceed to create a norm for the vector space $L(X_1,\ldots,X_n;Y)$.

Theorem 14.194. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ be a finite family of normed vector spaces, $\langle Y, \|\|_Y\rangle$ a normed spaces and $L \in L(X_1\ldots X_n)$ and define $M_{L,s}$ and $M_{L,r}$ by*

$$M_{L,s} = \left\{M \in \mathbb{R}_0^+ | \forall x \in \prod_{i\in\{1,\ldots,n\}} X_i \vdash \forall i \in \{1,\ldots,n\} \text{ we have } \|x_i\| = 1 \text{ then we have } \|L(x)\|_Y \leqslant M\right\}$$

and

$$M_{L,r} = \left\{M \in \mathbb{R}_0^+ | \forall x \in \prod_{i\in\{1,\ldots,n\}} X_i \text{ we have } \|L(x)\|_Y \leqslant M\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i\right\}$$

then we have:

1. $M_{L,s} = M_{L,r}$
2. $\inf(M_{L,s})$ *exists [hence by (1)* $\inf(M_{L,r})$ *exist and* $\inf(M_{L,s}) = \inf(M_{L,r})$

Proof.

1. First we prove that $M_{L,s} = M_{L,r}$. Let $\mathrm{M} \in M_{L,s}$ then if $x = (x_1,\ldots,x_n) \in \prod_{i\in\{1,\ldots,n\}} X_i$ we have to look at the following possibilities for x:

   $\exists i \in \{1,\ldots,n\}$ with $\|x_i\|_i = 0$. Then as $\|\|_i$ is a norm it follows that $x_i = 0$. So by [theorem: 11.254] we have $L(x) = 0$, hence

$$\|L(x)\|_Y = \|0\|_Y = 0 = M\cdot 0 \underset{\text{[theorem: 11.54]}}{=} M\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i$$

$\forall i \in \{1,\ldots,n\}$ **we have** $\|x_i\|_i \neq 0$. Then we can define $\{y_i\}_{i\in I}$ by $y_i = \frac{1}{\|x_i\|}\cdot x_i$ so that $\|y_i\| = 1$. Hence we have as $M \in M_{L,s}$

$$\begin{aligned}
\frac{1}{\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i}\cdot\|L(x)\|_Y &= \frac{1}{\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i}\cdot\|L(x_1,\ldots,x_n)\|_Y \\
&= \left\|\frac{1}{\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i}\cdot L(x_1,\ldots,x_n)\right\|_Y \\
&\underset{\text{[theorem: 11.265]}}{=} \left\|L\left(\frac{1}{\|x_1\|_1}\cdot x_1,\ldots,\frac{1}{\|x_n\|_n}\cdot x_n\right)\right\|_Y \\
&= \|L(y_1,\ldots,y_n)\|_Y \\
&\leqslant M
\end{aligned}$$

hence we have

$$\|L(x)\|_Y \leqslant M\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i$$

So in all cases we have

$$\|L(x)\|_Y \leqslant M\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i$$

proving that $M \in M_{L,r}$ or that

$$M_{L,s} \subseteq M_{L,r} \tag{14.73}$$

For the opposite inclusion let $M \in M_{L,r}$ then for $x \in \prod_{i\in\{1,\ldots,n\}} X_i$ satisfying $\forall i \in \{1,\ldots,n\}$ $\|x_i\|_i = 1$ we have

$$\|L(x)\|_Y \leqslant M\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i = M\cdot 1 = M$$

which proves that $M \in M_{L,s}$, hence $M_{L,r} \subseteq M_{L,s}$ which combined with [eq: 14.73] results in

$$M_{L,s} = M_{L.r}$$

2. Using [theorem: 14.190] there exists a $M \in \mathbb{R}^+$ such that $\forall x \in \prod_{i\in\{1,\ldots,n\}} X_i$ we have $\|L(x)\|_Y \leqslant M\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i$, so $M \in M_{L,r}$ proving that $M_{L,r} \neq 0$. As $\forall M \in M_{L,r}$ $0 \leqslant M$ and the real numbers are conditional complete [see theorem: 10.18] it follows that

$$\inf(M_{L,s}) \text{ exists and } 0 \leqslant \inf(M_{L,s})$$

□

The above theorem ensures that the following definition makes sense.

Definition 14.195. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ be a finite family of normed vector spaces over the field $\mathbb{K}$, $\langle Y, \|\|_Y\rangle$ is a normed spaces over $\mathbb{K}$ and $L \in L(X_1\ldots X_n;Y)$ then the operator norm of L noted as $\|L\|_{L(X,\ldots X_n;Y)}$ is defined as*

$$\|L\|_{L(X_1\ldots X_n;Y)} = \inf(M_{L,r}) \underset{\text{[theorem: 14.194]}}{=} \inf(M_{L,s})$$

It turns out that $\|L\|_{L(X_1,\ldots,X_n;Y)}$ is a norm on $L(X_1,\ldots,X_n;Y)$.

Theorem 14.196. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ be a finite family of normed vector spaces over the field $\mathbb{K}$ and $\langle Y, \|\|_Y\rangle$ a normed spaces over $\mathbb{K}$ then we have*

1. *If $L \in L(X_1\ldots X_n;Y)$ then $\forall x \in \prod_{i\in\{1,\ldots,n\}} X_i$ we have*

$$\|L(x)\|_Y \leqslant \|L\|_{L(X_1\ldots X_n;Y)}\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i$$

2. *If $L \in L(X_1\ldots X_n;Y)$ then $\forall M \in \mathbb{R}^+$ such that $\forall x \in \prod_{i\in\{1,\ldots,n\}} X_i$*

$$\|L(x)\|_Y \leqslant M\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i$$

we have

$$\|L\|_{L(X_1\ldots X_n;Y)} \leqslant M$$

3. *If* $L \in L(X_1 \ldots X_n; Y)$ *then* $\forall M \in \mathbb{R}^+$ *such that* $\|L(x)\|_Y \leqslant M$ $\forall x \in \prod_{i \in \{1,\ldots,n\}} X_i$ *with* $\forall i \in \{1,\ldots,n\}$ $\|x_i\|_i = 1$ *we have*

$$\|L\|_{L(X_1 \ldots X_n;Y)} \leqslant M$$

4. $\|\|_{L(X_1,\ldots,X_n;Y)}: L(X_1 \ldots X_n; Y) \to \mathbb{R}$ *defined by* $\|\|_{L(X_1 \ldots X_n;Y)}(L) = \|L\|_{L(X_1 \ldots X_n;Y)}$ *is a norm on* $L(X_1 \ldots X_n; Y)$. *In other words* $\langle L(X_1 \ldots X_n; Y), \|\|_{L(X_1 \ldots X_n;Y)} \rangle$ *is a normed space.*

Proof.

1. Let $x \in \prod_{i \in \{1,\ldots,n\}} X_i$ then we have the following possibilities for x

   $\boldsymbol{\exists i \in \{1,\ldots,n\}}$ **with** $\boldsymbol{\|x_i\|_i = 0}$**.** Then by [theorem: 11.254] $L(x) = 0$ so that

$$\begin{aligned} \|L(x)\|_Y &= \|0\|_Y \\ &= 0 \\ &= \|L\|_{L(X_1 \ldots X_n;Y)} \cdot 0 \\ &\underset{\text{[theorem: 11.54]}}{=} \|L\|_{L(X_1 \ldots X_n;Y)} \cdot \prod_{i \in \{1,\ldots,n\}} \|x_i\|_i \end{aligned}$$

   $\boldsymbol{\forall i \in \{1,\ldots,n\}}$ **we have** $\boldsymbol{\|x_i\|_i \neq 0}$**.** Then by [theorem: 11.53] $0 < \prod_{i \in \{1,\ldots,n\}} \|x_i\|_i$. Assume that $\|L\|_{L(X_1,\ldots,X_n;Y)} \cdot \prod_{i \in \{1,\ldots,n\}} \|x_i\|_i < \|L(x)\|_Y$ then

$$\|L\|_{L(X_1,\ldots,X_n;Y)} < \frac{1}{\prod_{i \in \{1,\ldots,n\}} \|x_i\|_i} \cdot \|L(x)\|_Y$$

   As $\|L\|_{L(X_1,\ldots,X_n;Y)} = \inf(M_{L,r})$ there exist a $M \in M_{L,r}$ such that

$$\|L\|_{L(X_1 \ldots X_n;Y)} \leqslant M < \frac{1}{\prod_{i \in \{1,\ldots,n\}} \|x_i\|_i} \cdot \|L(x)\|_Y$$

   hence $M \cdot \prod_{i \in \{1,\ldots,n\}} \|x_i\|_i < \|L(x)\|_Y$ contradicting $M \in M_{L,r}$. Hence we must have that

$$\|L(x)\|_Y \leqslant \|L\|_{L(X_1 \ldots X_n;Y)} \cdot \prod_{i \in \{1,\ldots,n\}} \|x_i\|_i$$

   So in all cases we have

$$\|L(x)\|_Y \leqslant \|L\|_{L(X_1 \ldots X_n;Y)} \cdot \prod_{i \in \{1,\ldots,n\}} \|x_i\|_i$$

2. This follows from

$$\begin{aligned} \|L\|_{L(X_1 \ldots X_n;Y)} &= \\ \inf(M_{L,r}) &= \\ \inf\left(\left\{M \in \mathbb{R}_+ | \forall x \in \prod_{i \in \{1,\ldots,n\}} X_i \text{ we have } \|L(x)\|_Y \leqslant M \cdot \prod_{i \in \{1,\ldots,n\}} \|x_i\|_i\right\}\right) &= \end{aligned}$$

3. This follows from

$$\begin{aligned} \|L\|_{L(X_1 \ldots X_n;Y)} &= \\ \inf(M_{L,s}) &= \\ \inf\left(M \in \mathbb{R}_+ | \forall x \in \prod_{i \in \{1,\ldots,n\}} X_i \vdash \forall i \in \{1,\ldots,n\}\ \|x_i\| = 1 \text{ we have } \|L(x)\|_Y \leqslant M\right) \end{aligned}$$

4. Let L_1, $L_2 \in L(X_1 \ldots X_n; Y)$ then by [theorem: 14.193] we have $L_1 + L_2 \in L(X_1 \ldots X_n; Y)$. Further we have for $x \in \prod_{i \in \{1,\ldots,n\}} X_i$ with $\forall i \in \{1,\ldots,n\}$ $\|x_i\|_i = 1$ that

$$\begin{aligned} \|(L_1 + L_2)(x)\|_Y &= \\ \|L_1(x) + L_2(x)\|_Y &\leqslant \\ \|L_1(x)\|_Y + \|L_2(x)\|_Y &\leqslant_{(1)} \\ \|L_1\|_{L(X_1,\ldots,X_n;Y)} \cdot \prod_{i \in \{1,\ldots,n\}} \|x_i\|_i + \|L_2\|_{L(X_1,\ldots,X_n;Y)} \cdot \prod_{i \in \{1,\ldots,n\}} \|x_i\|_i &= \\ (\|L_1\|_{L(X_1,\ldots,X_n;Y)} + \|L_2\|_{L(X_1,\ldots,X_n;Y)}) \cdot \prod_{i \in \{1,\ldots,n\}} \|x_i\|_i \end{aligned}$$

which by (2) proves that

$$\|L_1+L_2\|_{|L(X_1\ldots X_n;Y)} \leqslant \|L_1\|_{L(X_1\ldots X_n;Y)} + \|L_2\|_{L(X_1\ldots X_n;Y)} \tag{14.74}$$

For C_0 we have by [theorem: 14.193] that $C_0 \in L(X_1\ldots X_n;Y)$. Further for $x \in \prod_{i\in\{1,\ldots,n\}} X_i$ we have

$$\|C_0(x)\|_Y = \|0\|_Y = 0 = 0 \cdot \prod_{i\in\{1,\ldots,n\}} \|x_i\|_i$$

so that by (1)

$$\|C_0\|_{L(X_1\ldots X_n;Y)} = 0 \tag{14.75}$$

Assume that for $L \in L(X_1\ldots X_n;Y)$ we have that $\|L\|_{L(X_1\ldots X_n;Y)} = 0$ then by (1) we have $\forall x \in \prod_{i\in\{1,\ldots,n\}} X_i$ that $0 \leqslant \|L(x)\|_Y \leqslant \|L\|_{L(X_1,\ldots,X_n;Y)} \cdot \prod_{i\in\{1,\ldots,n\}} \|x_i\|_i = 0$. Hence $\|L\|_Y = 0$ which as $\|\|_Y$ is a norm proves that $L = C_0$ [the neutral element of $L(X_1\ldots X_n;Y)$. So we have

$$L = C_0 \Leftrightarrow \|L\|_{L(X_1\ldots X_n;Y)} = 0 \tag{14.76}$$

If $L \in L(X_1\ldots X_n;Y)$ and $\alpha \in \mathbb{K}$ then by [theorem: 14.193] $\alpha \cdot L \in L(X_1\ldots X_n;Y)$. Let $x \in \prod_{i\in\{1,\ldots,n\}} X_i$ then we have

$$\|(\alpha\cdot L)(x)\|_Y = \|\alpha\cdot L(x)\|_Y = |\alpha|\cdot\|L(x)\|_Y \leqslant |\alpha|\cdot\|L\|_{L(X_1\ldots X_n;Y)} \prod_{i\in\{1,\ldots n\}} \|x_i\|_i$$

which proves by (1) that

$$\|\alpha\cdot L\|_{L(X_1\ldots X_n;Y)} \leqslant |\alpha|\cdot\|L\|_{L(X_1\ldots X_n;Y)} \tag{14.77}$$

Now for the opposite inequality for $\alpha \in \mathbb{K}$ we have either:

$\alpha = 0$. Then

$$\begin{aligned} |\alpha|\cdot\|L\|_{L(X_1,\ldots X_n;Y)} &= 0 \\ &\underset{\text{[eq: 14.75]}}{=} \|C_0\|_{L(X_1\ldots X_n;Y)} \\ &= \|(0\cdot L)\|_{L(X_1\ldots X_n;Y)} \\ &= \|(\alpha\cdot L)\|_{L(X_1,\ldots X_n;Y)} \end{aligned}$$

$\alpha \neq 0$. Assume that $\|\alpha\cdot L\|_{L(X_1\ldots X_n;Y)} < |\alpha|\cdot\|L\|_{L(X_1\ldots X_n;Y)}$. Then as we have $\|\alpha\cdot L\|_{L(X_1\ldots X_n;Y)} = \inf(M_{\alpha\cdot L,r})$ it follows that there exist a $M \in M_{\alpha\cdot L,r}$ such that

$$\|\alpha\cdot L\|_{L(X_1\ldots X_n;Y)} \leqslant M < |\alpha|\cdot\|L\|_{L(X_1\ldots X_n;Y)} \tag{14.78}$$

If $x \in \prod_{i\in\{1,\ldots,n\}} X_i$ we have, as $M \in M_{\alpha\cdot L,r}$ that

$$|\alpha|\cdot\|L(x)\|_Y = \|\alpha\cdot L(x)\| = \|(\alpha\cdot L)(x)\|_Y \leqslant M \cdot \prod_{i\in\{1,\ldots,n\}} \|x_i\|_i$$

so that

$$\|L(x)\|_Y \leqslant \frac{M}{|\alpha|} \cdot \prod_{i\in\{1,\ldots,n\}} \|x_i\|_i$$

proving that $\frac{M}{|\alpha|} \in M_{L,r}$ hence

$$\|L\|_{L(X_1\ldots X_n;Y)} = \inf(M_{L,r}) \leqslant \frac{M}{|a|} \underset{\text{[eq: 14.78]}}{<} \frac{|\alpha|}{|\alpha|}\cdot\|L\|_{L(X_1\ldots X_n;Y)}$$

leading to the contradiction $\|L\|_{L(X_1\ldots X_n;Y)} > \|L\|_{L(X_1\ldots X_n;Y)}$. Hence we must have that $\|\alpha\cdot L\|_{L(X_1\ldots X_n;Y)} \leqslant |\alpha|\cdot\|L\|_{L(X_1\ldots X_n;Y)}$.

So in both cases we have $\|\alpha\cdot L\|_{L(X_1\ldots X_n;Y)} \leqslant |\alpha|\cdot\|L\|_{L(X_1\ldots X_n;Y)}$ which combined with [eq: 14.77] proves that

$$\|\alpha\cdot L\|_{L(X_1\ldots X_n;Y)} = |\alpha|\cdot\|L\|_{L(X_1\ldots X_n;Y)} \tag{14.79}$$

Finally using [eqs: 14.74, 14.76 and 14.79] it follows that

$$\|\|_{L(X_1\ldots X_n;Y)} \text{ is a norm in } L(X_1\ldots X_n;Y)$$

□

If all $\langle X_i, \|\|_i\rangle$ are the same normed space then we use the following definition.

Definition 14.197. *Let $n \in \mathbb{N}$ and $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces over $\mathbb{K}$ then we define*

$$L^n(X;Y) = \begin{cases} L(X,Y) & \text{if } n=1 \\ L\Big(\underbrace{X\ldots X}_{n};Y\Big) & \text{if } 1<n \end{cases}$$

and for $L \in L^n(X;Y)$

$$\|L\|_{L^n(X;Y)} = \begin{cases} \|L\|_{L(X,Y)} & \text{if } n=1 \\ \|L\|_{L\Big(\underbrace{X\ldots X}_{n};Y\Big)} & \text{if } 1<n \end{cases}$$

Theorem 14.198. *Let $n \in \mathbb{N}$, $\langle X, \|\|\rangle$ a normed space and $L \in L^n(\mathbb{K}^n;X)$ then*

$$\|L\|_{L^n(\mathbb{K}^n;X)} \leqslant \left\| L\Big(\underbrace{1,\ldots,1}_{n}\Big)\right\|$$

Proof. If $x \in \mathbb{K}^n$ then

$$\begin{aligned} \|L(x_1,\ldots,x_n)\| &= \|L(x_1\cdot 1,\ldots,x_n\cdot 1)\| \\ &\underset{\text{[theorem: 11.265]}}{=} \left\|\left(\prod_{i=1}^n x_i\right)\cdot L\Big(\underbrace{1,\ldots,1}_{n}\Big)\right\| \\ &= \left\| L\Big(\underbrace{1,\ldots,1}_{n}\Big)\right\| \cdot \left|\prod_{i=1}^n x_i\right| \\ &= \left\| L\Big(\underbrace{1,\ldots,1}_{n}\Big)\right\| \cdot \prod_{i=1}^n |x_i| \end{aligned}$$

so that $\left\| L\Big(\underbrace{1,\ldots,1}_{n}\Big)\right\| \in M_{L,r}$. Hence we have

$$\|L\|_{L^n(\mathbb{K}^n;X)} = \inf(M_{L,r}) \leqslant \left\| L\Big(\underbrace{1,\ldots,1}_{n}\Big)\right\|$$

□

Theorem 14.199. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ be a finite family of normed vector spaces, $\langle Y, \|\|_Y\rangle$, $\langle Z, \|\|_Z\rangle$ normed spaces, $L \in L(X_1\ldots X_n;Y)$ and $K \in L(Y,Z)$ then*

1. *$K \circ L \in L(X_1\ldots X_n;Y)$*
2. *$\|K\circ L\|_{L(X_1\ldots X_n;Z)} \leqslant \|L\|_{L(X_1\ldots X_n;Y)} \cdot \|K\|_{L(Y,Z)}$*

Proof.

1. From [theorem: 11.264] it follows that $K\circ L \in \mathrm{Hom}(X_1\ldots X_n;Y)$, Further as the composition of continuous mappings is continuous [see theorem: 14.139] we have that $K\circ L$ is continuous. Hence
$$K\circ L \in L(X_1\ldots X_n;Y)$$
2. Let $x \in \prod_{i\in\{1,\ldots,n\}} X_i$ then we have
$$\begin{aligned} \|(K\circ L)(x)\|_Z &= \|K(L(x))\|_Z \\ &\leqslant_{\text{[theorem: 14.182]}} \|K\|_{L(Y,Z)}\cdot\|L(x)\|_Y \\ &\leqslant_{\text{[theorem: 14.196]}} \|K\|_{L(Y,Z)}\cdot\|L\|_{L(X_1,\ldots,X_n;Y)}\cdot \prod_{i\in\{1,\ldots,n\}} \|x_i\|_i \end{aligned}$$
proving by [theorem: 14.196] that
$$\|K\circ L\|_{L(X_1\ldots X_n;Y)} \leqslant \|L\|_{L(X_1\ldots X_n;Y)}\cdot\|K\|_{L(Y,Z)}$$
□

We show now that the composition of linear mappings is a multilinear mapping itself.

Theorem 14.200. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ and $\langle Z, \|\|_Z\rangle$ be normed spaces over $\mathbb{K}$ then if we define*

$$(\circ): L(Y,Z)\times L(X,Y)\to L(X,Z) \text{ defined by } (\circ)(L_2,L_1)=L_2\circ L_1$$

then we have that

1. $(\circ)\in L(L(Y,Z),L(X,Y);L(X,Z))$ *[in other words $(\circ)$ is multilinear and continuous]*
2. $\|(\circ)\|_{L(L(Y,Z),L(X,Y);L(X,Z))}\leqslant 1$

Proof. Let $\alpha\in\mathbb{K}$. Then we have for $L_1,L_2\in L(Y,Z)$ and $L\in L(X,Y)$ that $\forall x\in X$ we have

$$\begin{aligned}(\circ)(L_1+\alpha\cdot L_2,L)(x) &= ((L_1+\alpha\cdot L_2)\circ L)(x)\\ &= (L_1+\alpha\cdot L_2)(L(x))\\ &= L_1(L(x))+\alpha\cdot L_2(L(x))\\ &= (L_1\circ L)(x)+\alpha\cdot(L_2\circ L)(x)\\ &= ((L_1\circ L)+\alpha\cdot(L_2\circ L))(x)\\ &= (\circ(L_1,L)+\alpha\cdot\circ(L_2,L))(x)\end{aligned}$$

proving that

$$\circ(L_1+\alpha\cdot L_2,L)=\circ(L_1,L)+\alpha\cdot\circ(L_2,L)$$

Further if $L\in L(Y,Z)$ and $L_1,L_2\in L(X,Y)$ then $\forall x\in X$ we have

$$\begin{aligned}\circ(L,L_1+\alpha\cdot L_2)(x) &= (L\circ(L_1+\alpha\cdot L_2))(x)\\ &= L((L_1+\alpha\cdot L_2)(x))\\ &= L(L_1(x)+\alpha\cdot L_2(x))\\ &= L(L_1(x))+\alpha\cdot L(L_2(x))\\ &= (L\circ L_1)(x)+\alpha\cdot(L\circ L_2)(x)\\ &= ((L\circ L_1)+\alpha\cdot(L\circ L_2))(x)\\ &= ((\circ)(L,L_1)+\alpha\cdot(\circ)(L,L_2))(x)\end{aligned}$$

proving that

$$(\circ)(L,L_1+\alpha\cdot L_2)=(\circ)(L,L_1)+\alpha\cdot(\circ)(L,L_2)$$

Hence $\circ$ is multilinear or

$$(\circ)\in\mathrm{Hom}(L(Y,Z),L(X,Y);L(X,Z))$$

For continuity note that for $L_1\in L(Y,Z)$, $L_2\in L(X,Y)$ and $x\in X$ we have

$$\begin{aligned}\|(\circ)(L_1,L_2)(x)\|_Z &= \|(L_1\circ L_2)(x)\|_Z\\ &= \|L_1(L_2(x))\|_Z\\ &\leqslant_{\text{[theorem: 14.182]}} \|L_1\|_{L(Y,Z)}\cdot\|L_2(x)\|_Y\\ &\leqslant_{\text{[theorem: 14.182]}} \|L_1\|_{L(Y,Z)}\cdot\|L_2\|_{L(X,Y)}\cdot\|x\|_x\end{aligned}$$

which proves by [theorem: 14.196 that

$$\|(\circ)(L_1,L_2)\|_{L(X,Z)}\leqslant\|L_1\|_{L(Y,Z)}\cdot\|L_2\|_{L(X,Y)}=1\cdot\|L_1\|_{L(Y,Z)}\cdot\|L_2\|_{L(X,Y)}$$

so that by [theorem: 14.190] $(\circ)$ is continuous. Hence

$$(\circ)\in L(L(Y,Z),L(X,Y);L(X,Z))$$

and by [theorem 14.196] that

$$\|(\circ)\|_{L(L(Y,Z),L(X,Y);L(X,Z))}\leqslant 1.$$

□

Theorem 14.201. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ and $\langle Z, \|\|_Z\rangle$ be normed spaces over $\mathbb{K}$ then we can construct a linear isometric isomorphism*

$$\varphi: L(X,Y;Z)\to L(X,L(Y,Z))$$

Likewise if we take $\psi = \varphi^{-1}$ *then*

$$\psi: L(X, L(Y, Z)) \to L(X, Y; Z) \text{ is a linear isometric isomorphism}$$

In other words $L(X, L(Y, Z))$ *and* $L(X, Y; Z)$ *are isometric [see definition: 14.118] or*

$$L(X, L(Y, Z)) \approx L(X, Y; Z)$$

Further we have $\forall (x, y) \in X \cdot Y$ *that*

$$\forall L \in L(X, Y; Z) \ \varphi(L)(x)(y) = L(X, Y)$$

and

$$\forall L \in L(X, (L(Y, Z))) \text{ that } \psi(L)(x, y) = L(x)(y)$$

Proof. Let $L \in L(X, Y; Z)$ and given $x \in X$ define

$$L_x: Y \to Z \text{ by } L_x(y) = L(x, y) \tag{14.80}$$

If $r, s \in Y$ and $\alpha \in \mathbb{K}$ then

$$L_x(r + \alpha \cdot s) = L(x, r + \alpha \cdot s) \underset{\text{multilinearity}}{=} L(x, r) + \alpha \cdot L(x, s) = L_x(r) + \alpha \cdot L_x(s)$$

proving that

$$L_x \in \mathrm{Hom}(Y, Z) \tag{14.81}$$

Further for $r \in Y$ we have

$$\|L_x(r)\|_Z = \|L(x, r)\|_Z \leqslant_{\text{[theorem: 14.196]}} \|L\|_{L(X,Y;Z)} \cdot \|x\|_X \cdot \|r\|_Y$$

proving by [theorem: 14.177] and [definition: 14.181] that

$$\forall x \in X \ L_x \in L(Y, Z) \text{ and } \|L_x\|_{L(Y,Z)} \leqslant \|L\|_{L(X,Y;Z)} \cdot \|x\|_X \tag{14.82}$$

The above allows us, given $L \in L(X, Y; Z)$, define

$$\varphi_L: X \to L(Y, Z) \text{ by } \varphi_L(x) = L_x \tag{14.83}$$

Then if $x, y \in X$ and $\alpha \in \mathbb{K}$ we have for $r \in Y$ that

$$\begin{aligned}
(\varphi_L(x + \alpha \cdot y))(r) &= L_{x+\alpha \cdot y}(r) \\
&\underset{\text{[eq: 14.80]}}{=} L(x + \alpha \cdot y, r) \\
&\underset{\text{multilinearity}}{=} L(x, r) + \alpha \cdot L(y, r) \\
&\underset{\text{[eq: 14.80]}}{=} L_x(r) + \alpha \cdot L_y(r) \\
&= (\varphi_L(x))(r) + \alpha \cdot (\varphi_L(y))(r) \\
&= (\varphi_L(x) + \alpha \cdot \varphi_L(y))(r)
\end{aligned}$$

proving that $\varphi_L(x + \alpha \cdot y) = \varphi_L(x) + \alpha \cdot \varphi_L(y)$. Hence

$$\varphi_L \in \mathrm{Hom}(X, L(Y, Z)) \tag{14.84}$$

For $x \in X$ we have

$$\|\varphi_L(x)\|_{L(Y,Z)} \underset{\text{[eq: 14.83]}}{=} \|L_x\|_{L(Y,Z)} \leqslant_{\text{[eq: 14.82]}} \|L\|_{L(X,Y;Z)} \cdot \|x\|_X$$

proving by [theorem: 14.177] and [definition: 14.181] that

$$\varphi_L \in L(X, L(Y, Z)) \text{ and } \|\varphi_L\|_{L(X,L(Y,Z))} \leqslant \|L\|_{L(X,Y;Z)} \tag{14.85}$$

The above let us define

$$\varphi: L(X, Y; Z) \to L(X, L(Y, Z)) \text{ by } \varphi(L) = \varphi_L \tag{14.86}$$

Let $L_1, L_2 \in L(X, Y; Z)$ and $\alpha \in \mathbb{K}$ then for $x \in X$ we have $\forall r \in Y$ that

$$\begin{aligned}
(L_1 + \alpha \cdot L_2)_x(r) &\underset{\text{[eq: 14.80]}}{=} (L_1 + \alpha \cdot L_2)(x, r) \\
&= L_1(x, r) + \alpha \cdot L_2(x, r) \\
&= (L_1)_x(r) + \alpha \cdot (L_2)_x(r) \\
&= ((L_1)_x + \alpha \cdot (L_2)_x)(r)
\end{aligned}$$

proving that $(L_1+\alpha\cdot L_2)_x=(L_1)_x+\alpha\cdot(L_2)_x$. Hence

$$\varphi_{L_1+\alpha\cdot L_2}(x)=(L_1+\alpha\cdot L_2)_x=(L_1)_x+\alpha\cdot(L_2)_x=\varphi_{L_1}(x)+\alpha\cdot\varphi_{L_2}(x)=(\varphi_{L_1}+\alpha\cdot\varphi_{L_2})(x)$$

proving that $\varphi_{L_1+\alpha\cdot L_2}=\varphi_{L_1}+\alpha\cdot\varphi_{L_2}$. So

$$\varphi(L_1+\alpha\cdot L_2)=\varphi_{L_1+\alpha\cdot L_2}=\varphi_{L_1}+\alpha\cdot\varphi_{L_2}=\varphi(L_1)+\alpha\cdot\varphi(L_2)$$

proving that

$$\varphi\in\mathrm{Hom}(L(X,Y;Z),L(X,L(Y,Z))) \tag{14.87}$$

Further giving $L\in L(X,Y;Z)$ we have

$$\|\varphi(L)\|_{L(X,L(Y,Z))}=\|\varphi_L\|_{L(X,L(Y,Z))}\leqslant_{[\text{eq: }14.85]}\|L\|_{L(X,Y;Z)}$$

giving by [theorem: 14.177]

$$\varphi\in L((L(X,Y;Z),L(X,L(Y,Z)))) \text{ and } \|\varphi(L)\|_{L(X,L(Y,Z))}\leqslant\|L\|_{L(X,Y;Z)} \tag{14.88}$$

Next we will define the inverse mapping of φ. Let $L\in L(X,L(Y,Z))$ and define

$$\psi_L\colon X\cdot Y\to Z \text{ by } \psi_L(x,y)=(L(x))(y) \tag{14.89}$$

Let $x,y\in X$, $r\in Y$ and $\alpha\in\mathbb{K}$ then we have

$$\begin{aligned}\psi_L(x+\alpha\cdot y,r) &\underset{[\text{eq: }14.89]}{=} (L(x+\alpha\cdot y))(r)\\ &\underset{L\in L(X,L(Y,Z))}{=} (L(x)+\alpha\cdot L(y))(r)\\ &= (L(x))(r)+\alpha\cdot(L(y))(r)\\ &\underset{[\text{eq: }14.89]}{=} \psi_L(x,r)+\alpha\cdot\psi_L(y,r)\end{aligned}$$

and for $x\in X$, $r,s\in Y$ and $\alpha\in\mathbb{K}$ we have

$$\begin{aligned}\psi_L(x,r+\alpha\cdot s) &\underset{[\text{eq: }14.89]}{=} (L(x))(r+\alpha\cdot s)\\ &\underset{L(x)\in L(Y,Z)}{=} (L(x))(r)+\alpha\cdot(L(x))(s)\\ &\underset{[\text{eq: }14.89]}{=} \psi_L(x,r)+\alpha\cdot\psi_L(x,s)\end{aligned}$$

proving that

$$\psi_L\in\mathrm{Hom}(X,Y;Z)$$

If $(x,y)\in X\cdot Y$ then

$$\|\psi_L(x,y)\|_Z=\|(L(x))(y)\|_Z\leqslant_{L(x)\in L(Y,Z)}\|L(x)\|_{L(Y,Z)}\cdot\|y\|_Y\leqslant\|L\|_{L(X,L(Y,Z))}\cdot\|x\|_X\cdot\|y\|_Y$$

proving by [theorems: 14.190, 14.196] that

$$\psi_L\in L(X,Y;Z) \text{ and } \|\psi_L\|_{L(X,Y;Z)}\leqslant\|L\|_{L(X,L(Y,Z))} \tag{14.90}$$

The above allows use to define

$$\psi\colon L(X,L(Y,Z))\to L(X,Y;Z) \text{ by } \psi(L)=\psi_L \tag{14.91}$$

where by [eq: 14.90]

$$\forall L\in L(X,L(Y,Z))\ \|\psi(L)\|_{L(X,Y;Z)}=\|\psi_L\|_{L(X,Y;Z)}\leqslant\|L\|_{L(X,L(Y,Z))} \tag{14.92}$$

Let $L\in L(X,L(Y,Z))$ and $x\in X$, $y\in Y$ then we have

$$\begin{aligned}(((\varphi\circ\psi)(L))(x))(y) &= ((\varphi(\psi(L)))(x))(y)\\ &\underset{[\text{eq: }14.86]}{=} ((\varphi_{\psi(L)})(x))(y)\\ &\underset{[\text{eq: }14.83]}{=} (\psi(L))_x(y)\\ &\underset{[\text{eq: }14.80]}{=} \psi(L)(x,y)\\ &\underset{[\text{eq: }14.91]}{=} \psi_L(x,y)\\ &\underset{[\text{eq: }14.89]}{=} (L(x))(y)\end{aligned}$$

so that $((\varphi\circ\psi)(L))(x)=L(x)$ from which it follows that $(\varphi\circ\psi)(L)=L$. Hence we have that

$$\varphi\circ\psi=\mathrm{Id}_{L(X,L(Y,Z))} \tag{14.93}$$

On the other hand if $L\in L(X,Y;Z)$ and $(x,y)\in X\cdot Y$ then we have

$$\begin{aligned}((\psi\circ\varphi)(L))(x,y) &= (\psi(\varphi(L)))(x,y)\\ &\underset{\text{[eq: 14.91]}}{=} \psi_{\varphi(L)}(x,y)\\ &\underset{\text{[eq: 14.89]}}{=} ((\varphi(L))(x))(y)\\ &\underset{\text{[eq: 14.86]}}{=} ((\varphi_L)(x))(y)\\ &\underset{\text{[eq: 14.83]}}{=} L_x(y)\\ &\underset{\text{[eq: 14.80]}}{=} L(x,y)\end{aligned}$$

proving that $(\psi\circ\varphi)(L)=L$, hence

$$\psi\circ\varphi=\mathrm{Id}_{L(X,Y;Z)} \tag{14.94}$$

From [eqs: 14.93, 14.94] it follows by [theorem: 2.72] that $\varphi\colon L(X,Y;Z)\to L(X,L(Y,Z))$ is a bijection. Combining this with]eq: 14.87] proves that

$$\varphi \text{ is a linear isomorphism with } \psi=\varphi^{-1} \tag{14.95}$$

Finally we have for $L\in L(X,Y;Z)$ that

$$\begin{aligned}\|L\|_{L(X,Y;Z)} &= \|\mathrm{Id}_{L(X,Y;Z)}(L)\|_{L(X,Y;Z)}\\ &\underset{\text{[eq: 14.94]}}{=} \|(\psi\circ\varphi)(L)\|_{L(X,Y;Z)}\\ &= \|\psi(\varphi(L))\|_{L(X,Y;Z)}\\ &\leqslant_{\text{[eq: 14.92]}} \|\varphi(L)\|_{L(X,L(Y,Z))}\end{aligned}$$

which combined with [eq: 14.88] proves that $\|\varphi(L)\|_{L(X,Y;Z)}=\|L\|_{L(X,Y;Z)}$. This together with [eq: 14.95] proves that

$$\varphi\colon L(X,Y;Z)\to L(X,L(Y,Z)) \text{ is a linear isometric isomorphism}$$

As $\psi=\varphi^{-1}$ we have by [theorem: 14.120] that

$$\psi\colon L(X,L(Y,Z))\to L(X,Y;Z) \text{ is a linear isometric isomorphism}$$

Finally if $x\in X,\ y\in Y$ then we have for $L\in L(X,Y;Z)$ that

$$\varphi(L)(x)(y)\underset{\text{[eq: 14.86]}}{=}\varphi_L(x)(y)\underset{\text{[eq: 14.83]}}{=}L_x(y)\underset{\text{[eq: 14.80]}}{=}L(x,y)$$

so that

$$\forall L\in L(X,L(Y,Z)) \text{ we have } \varphi(L)(x)(y)=L(x,y) \tag{14.96}$$

Further if $L\in L(X,L(Y,Z))$ then

$$\begin{aligned}L(x)(y) &= ((\varphi\circ\psi)(L))(x)(y)\\ &= (\varphi(\psi(L))(x))(y)\\ &\underset{\text{[eq: 14.96]}}{=} \psi(L)(x,y)\end{aligned}$$

so that

$$\forall L\in L(X,L(Y,Z)) \text{ we have } \psi(L)(x,y)=(L(x))(y)$$

□

If $\langle X,\|\|_X\rangle$ and $\langle Y,\|\|_Y\rangle$ are the same in the above then we have

$$L(X,L(X,Z))\approx L(X,X;Y)\underset{\text{[definition: 14.197]}}{=}L^2(X;Z)$$

actually we can extend this to arbitrary $n\in\mathbb{N}$ as is show in the next theorem. This result will be very important if we define higher order derivatives.

Theorem 14.202. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces over $\mathbb{K}$ then we can construct a* ***unique*** *linear isometric isomorphism*

$$\varphi_{[X,Y,n]}: L^{n+1}(X;Y) \to L(X, L^n(X;Y))$$

and if we take $\psi_{[X,Y,n]} = \varphi^{-1}_{[X,Y,n]}$ we have the linear isometric isomorphism

$$\psi_{[X,Y,n]}: L(X, L^n(X;Y)) \to L^{n+1}(X;Y)$$

such that for every $(x_1, \dots, x_{n+1}) \in X^n$

$$\forall L \in L^{n+1}(X;Y) \;\; \varphi_{[X,Y,n]}(L)(x_1)(x_2, \dots, x_{n+1}) = L(x_1, \dots, x_{n+1})$$

and

$$\forall L \in L(X, L^n(X;Y)) \;\; \psi_{[X,Y,n]}(L)(x_1, \dots, x_{n+1}) = L(x_1)(x_2, \dots, x_{n+1})$$

Further if there exist a $\varphi': L^{n+1}(X;Y) \to L(X, L^n(X;Y))$ such that $\forall (x_1, \dots, x_{n+1}) \in X^n \;\; \varphi(L)(x_1)(x_2, \dots, x_{n+1}) = L(x_1, \dots, x_{n+1})$ then

$$\varphi_{[X,Y,n]} = \varphi'$$

and if there exist a $\psi': L(X, L^n(X;Y)) \to L^{n+1}(X;Y)$ such that $\forall (x_1, \dots, x_{n+1}) \in X^n \;\; \psi(L)(x_1, \dots, x_{n+1}) = L(x_1)(x_2, \dots, x_{n+1})$ then

$$\psi_{[X,Y,n]} = \psi'$$

In other words using [definition: 14.197] it follows that

$$L(X, L^n(X;Y)) \approx L^{n+1}(X;Y)$$

so we can identify $L(X, L^n(X;Y))$ with $L^{n+1}(X;Y)$ using a ***unique linear isometric isomorphism****.*

Proof. For $n \in \mathbb{N}$ we have either:

$n = 1$. Then by [theorem: 14.201] we have that there exist linear isometric isomorphisms

$$\varphi L(X, X; Y) \to L(X, L(X, Y))$$

$$\psi: L(X, L(X, Y)) \to L(X, X; Y)$$

and for $(x_1, x_2) \in X \cdot X = X^2$ that

$$\forall L \in L(X \cdot X; Y) \text{ we have } \varphi(L)(x_1)(x_2) = L(x_1, x_2)$$

and

$$\forall L \in L(X, L(X, Y)) \text{ we have } \psi(L)(x_1, x_2) = L(x_1)(x_2)$$

Which, as by [definition: 14.197] $L(X, Y) = L^1(X, Y)$ and $L(X, X; Y) = L^2(X, Y)$, proves the first part of the theorem for the case $n = 1$.

$1 < n$. To prove the theorem for this case we use a slightly modified version of the proof of the previous theorem. Let $L \in L^{n+1}(X; Z)$ and $x \in X$ define

$$L_x: X^n \to Y \text{ by } L_x(x_1, \dots, x_n) = L(x, x_1, \dots, x_n) \tag{14.97}$$

Given $r, s \in X$ and $\alpha \in \mathbb{K}$ then we have for $i \in \{1, \dots, n\}$ that

$$\begin{aligned}
L_x\Big(x_1, \dots \underbrace{r + \alpha \cdot s}_{i} \dots, x_n\Big) &= \\
L\Big(x, x_1, \dots \underbrace{r + \alpha \cdot s}_{i+1} \dots, x_n\Big) &\underset{\text{multilinearity}}{=} \\
L\Big(x, x_1, \dots \underbrace{r}_{i+1} \dots, x_n\Big) + \alpha \cdot L\Big(x, x_1, \dots \underbrace{s}_{i+1} \dots, x_n\Big) &= \\
L_x\Big(x_1, \dots \underbrace{r}_{i} \dots, x_n\Big) + \alpha \cdot L_x\Big(x_1, \dots \underbrace{s}_{i} \dots, x_n\Big) &
\end{aligned}$$

proving that

$$L_x \in \mathrm{Hom}^n(X;Y) \underset{\text{def}}{=} \mathrm{Hom}\Big(\underbrace{X, \dots, X}_{n}; Y\Big)$$

Further for $r \in X^n$ we have if we define $(y_1, \ldots, y_{n+1}) \in X^{n+1}$ by $y_i = \begin{cases} x \text{ if } i = 1 \\ r_{i-1} \text{ if } i \in \{2, \ldots, n+1\} \end{cases}$

$$\begin{aligned}
\|L_x(r_1, \ldots, r_n)\|_Y &= \|L(x, r_1, \ldots, r_n)\|_Y \\
&= \|L(y_1, \ldots, y_{n+1})\|_Y \\
&\leqslant_{\text{[theorem: 14.196]}} \|L\|_{L\left(\underbrace{X, \ldots, X}_{n+1}; Y\right)} \cdot \prod_{i \in \{1, \ldots, n+1\}} \|y_i\|_X \\
&\underset{\text{def}}{=} \|L\|_{L^{n+1}(X;Y)} \cdot \prod_{i \in \{1, \ldots, n+1\}} \|y_i\|_X \\
&= \|L\|_{L^{n+1}(X;Y)} \cdot \|y_1\|_X \cdot \prod_{i \in \{2, \ldots, n+1\}} \|y_i\|_X \\
&= \|L\|_{L^{n+1}(X;Y)} \cdot \|x\|_X \cdot \prod_{i \in \{2, \ldots, n+1\}} \|r_{i-1}\|_X \\
&= (\|L\|_{L^{n+1}(X;Y)} \cdot \|x\|_X) \cdot \prod_{i \in \{1, \ldots, n\}} \|r_i\|_X
\end{aligned}$$

proving by [theorem: 14.190] and [definition: 14.181] that

$$\forall x \in X \; L_x \in L^n(X;Y) \text{ and } \|L_x\|_{L^n(X;Y)} \leqslant \|L\|_{L^{n+1}(X;Y)} \cdot \|x\|_X \tag{14.98}$$

The above allows us, given $L \in L^{n+1}(X;Y)$, to define

$$\varphi_L : X \to L^n(X;Y) \text{ by } \varphi_L(x) = L_x \tag{14.99}$$

Then if $x, y \in X$ and $\alpha \in \mathbb{K}$ we have for $r \in X^n$ that

$$\begin{aligned}
(\varphi_L(x + \alpha \cdot y))(r) &\underset{\text{[eq: 14.99]}}{=} L_{x+\alpha \cdot y}(r_1, \ldots, r_n) \\
&\underset{\text{[eq: 14.97]}}{=} L(x + \alpha \cdot y, r_1, \ldots, r_n) \\
&= L(x, r_1, \ldots, r_n) + \alpha \cdot L(y, r_1, \ldots, r_n) \\
&\underset{\text{[eq: 14.97]}}{=} L_x(r_1, \ldots, r_n) + \alpha \cdot L_y(r_1, \ldots, r_n) \\
&\underset{\text{[eq: 14.99]}}{=} \varphi_L(x)(r) + \alpha \cdot \varphi_L(y)(r) \\
&= (\varphi_L(x) + \alpha \cdot \varphi_L(y))(r)
\end{aligned}$$

proving that $\varphi_L(x + \alpha \cdot y) = \varphi_L(x) + \alpha \cdot \varphi_L(y)$. Hence

$$\varphi_L \in \mathrm{Hom}(X, L^n(X;Y)) \tag{14.100}$$

For $x \in X$ we have

$$\|\varphi_L(x)\|_{L^n(X;Y)} \underset{\text{[eq: 14.99]}}{=} \|L_x\|_{L^n(X;Y)} \leqslant_{\text{[eq: 14.98]}} \|L\|_{L^{n+1}(X;Y)} \cdot \|x\|_X$$

proving by [theorem: 14.177] and [definition: 14.181] that

$$\varphi_L \in L(X, L^n(X;Y)) \text{ and } \|\varphi_L\|_{L(X, L^n(X;Y))} \leqslant \|L\|_{L^{n+1}(X;Y)} \tag{14.101}$$

The above let us define

$$\varphi : L^{n+1}(X;Y) \to L(X, L^n(X;Y)) \text{ by } \varphi(L) = \varphi_L \tag{14.102}$$

Let $L_1, L_2 \in L^{n+1}(X;Y)$ and $\alpha \in \mathbb{K}$ then for $x \in X$ and $\forall r \in X^n$ we have

$$\begin{aligned}
(L_1 + \alpha \cdot L_2)_x(r) &= (L_1 + \alpha \cdot L_2)(x, r_1, \ldots, r_n) \\
&= L_1(x, r_1, \ldots, r_n) + \alpha \cdot L_2(x, r_1, \ldots, r_n) \\
&= (L_1)_x(r_1, \ldots, r_n) + \alpha \cdot (L_2)_x(r_1, \ldots, r_n) \\
&= ((L_1)_x + \alpha \cdot (L_2)_x)(r_1, \ldots, r_n) \\
&= ((L_1)_x + \alpha \cdot (L_2)_x)(r)
\end{aligned}$$

proving that $(L_1 + \alpha \cdot L_2)_x = (L_1)_x + \alpha \cdot (L_2)_x$. Hence

$$\varphi_{L_1 + \alpha \cdot L_2}(x) = (L_1 + \alpha \cdot L_2)_x = (L_1)_x + \alpha \cdot (L_2)_x = \varphi_{L_1}(x) + \alpha \cdot \varphi_{L_2}(x)$$

so

$$\varphi_{L_1+\alpha\cdot L_2}=\varphi_{L_1}+\alpha\cdot\varphi_{L_2}$$

proving by [eq: 14.102]

$$\varphi(L_1+\alpha\cdot L_2)\underset{\text{[eq: 14.102]}}{=}\varphi(L_1)+\alpha\cdot\varphi(L_2)$$

so that

$$\varphi\in\mathrm{Hom}(L^{n+1}(X;Y),L(X,L^n(X;Y))) \tag{14.103}$$

Further given $L\in L^{n+1}(X;Y)$ we have

$$\|\varphi(L)\|_{L(X,L^n(X;Y))}\underset{\text{[eq: 14.102]}}{=}\|\varphi_L\|_{L(X,L^n(X;Y))}\leqslant_{\text{[eq: 14.101]}}\|L\|_{L^{n+1}(X;Y)}$$

giving by [theorem: 14.177]

$$\varphi\in L(L^{n+1}(X;Y),L(X,L^n(X;Y)))\text{ and }\|\varphi(L)\|_{L(X,L^n(X;Y))}\leqslant\|L\|_{L^{n+1}(X;Y)} \tag{14.104}$$

Next we must define the inverse mapping of φ. Let $L\in L(X,L^n(X;Y))$ and define

$$\psi_L\colon X^{n+1}\to Y\text{ by }\psi_L(x_1,\dots,x_{n+1})=L(x_1)(x_2,\dots,x_{n+1}) \tag{14.105}$$

Let $i\in\{1,\dots,n+1\}$, $y,z\in X$, $x\in\prod_{j\in\{1,\dots,n+1\}\setminus\{i\}}X$ and $\alpha\in\mathbb{K}$ then for i we have either:

$i=1$. Then

$$\begin{aligned}
\psi_L\Big(x_1,\dots\underbrace{y+\alpha\cdot z}_{i}\dots,x_{n+1}\Big) &\underset{i=1}{=}\\
\psi_L(y+\alpha\cdot z,x_2,\dots,x_{n+1}) &\underset{\text{[eq: 14.105]}}{=}\\
L(y+\alpha\cdot z)(x_2,\dots,x_{n+1}) &\underset{L\in L(X,L^n(X;Y))}{=}\\
(L(y)+\alpha\cdot L(z))(x_2,\dots,x_{n+1}) &=\\
(L(y))(x_2,\dots,x_{n+1})+\alpha\cdot(L(z))(x_2,\dots,x_{n+1}) &\underset{\text{[eq: 14.105]}}{=}\\
\psi_L(y,x_2,\dots,x_{n+1})+\alpha\cdot\psi_L(z,x_2,\dots,x_{n+1}) &\underset{i=1}{=}\\
\psi_L\Big(x_1,\dots\underbrace{y}_{i}\dots,x_{n+1}\Big)+\alpha\cdot\psi_L\Big(x_1,\dots\underbrace{z}_{i}\dots,x_{n+1}\Big)&
\end{aligned}$$

$i\in\{2,\dots,n+1\}$. Then

$$\begin{aligned}
\psi_L\Big(x_1,\dots\underbrace{y+\alpha\cdot z}_{i}\dots,x_{n+1}\Big) &\underset{\text{[eq: 14.105]}\wedge i\neq 1}{=}\\
(L(x_1))\Big(x_2,\dots\underbrace{y+\alpha\cdot z}_{i-1}\dots,x_{n+1}\Big) &\underset{L(x_1)\in L^n(X;Y)}{=}\\
(L(x_1))\Big(x_2,\dots\underbrace{y}_{i-1}\dots,x_{n+1}\Big)+\alpha\cdot(L(x_1))\Big(x_2,\dots\underbrace{z}_{i-1}\dots,x_{n+1}\Big) &\underset{\text{[eq: 14.105]}}{=}\\
\psi_L\Big(x_1,\dots\underbrace{y}_{i}\dots,x_{n+1}\Big)+\alpha\cdot\psi_L\Big(x_1,\dots\underbrace{z}_{i}\dots,x_{n+1}\Big)&
\end{aligned}$$

proving that

$$\psi_L\in\mathrm{Hom}^{n+1}(X;Y) \tag{14.106}$$

Further if $x\in X^{n+1}$ then

$$\begin{aligned}
\|\psi_L(x_{1,\dots,}x_{n+1})\|_Y &\underset{\text{[eq: 14.105]}}{=} \|L(x_1)(x_2,\dots,x_{n+1})\|_Y\\
&\leqslant_{L(x_1)\in L^n(X;Y)} \|L(x_1)\|_{L^n(X;Y)}\cdot\prod_{i\in\{2,\dots,n+1\}}\|x_i\|_X\\
&\leqslant_{L\in} \|L\|_{L(X,L^n(X;Y))}\cdot\|x_1\|_X\cdot\prod_{i\in\{2,\dots,n+1\}}\|x_i\|_X\\
&= \|L\|_{L(X,L^n(X;Y))}\cdot\prod_{i\in\{1,\dots,n+1\}}\|x_i\|_X
\end{aligned}$$

proving by [theorems: 14.190, 14.196] that

$$\psi_L \in L^{n+1}(X;Y) \text{ and } \|\psi_L\|_{L^{n+1}(X;Y)} \leqslant \|L\|_{L(X,L^n(X;Y))} \tag{14.107}$$

The above allows us to define

$$\psi: L(X,L^n(X;Y)) \to L^{n+1}(X;Y) \text{ by } \psi(L) = \psi_L \tag{14.108}$$

where by [eq: 14.107]

$$\forall L \in L(X,L^n(X;Y)) \text{ we have } \|\psi(L)\|_{L^{n+1}(X;Y)} \leqslant \|L\|_{L(X,L^n(X;Y))} \tag{14.109}$$

Let $L \in L(X,L^n(X,Y))$ then for $x \in X$ and $r \in X^n$ we have

$$\begin{aligned}
(((\varphi \circ \psi)(L))(x))(r) &= (((\varphi \circ \psi)(L))(x))(r_1,\ldots,r_n) \\
&= (((\varphi(\psi(L)))(x)))(r_1,\ldots,r_n) \\
&\underset{\text{[eq: 14.102}}{=} (\varphi_{\psi(L)}(x))(r_1,\ldots,r_n) \\
&\underset{\text{[eq: 14.99]}}{=} (\psi(L))_x(r_1,\ldots,r_n) \\
&\underset{\text{[eq: 14.97]}}{=} (\psi(L))(x,r_1,\ldots,r_n) \\
&\underset{\text{[eq: 14.108]}}{=} \psi_L(x,r_1\ldots,r_n) \\
&\underset{\text{[eq: 14.105]}}{=} (L(x))(r_1,\ldots,r_n) \\
&= (L(x))(r)
\end{aligned}$$

from which it follows that $((\varphi \circ \psi)(L))(x) = L(x)$, hence $(\varphi \circ \psi)(L) = L$ proving that

$$\varphi \circ \psi = \mathrm{Id}_{L(X,L^n(X;Y))} \tag{14.110}$$

On the other hand if $L \in L^{n+1}(X;Y)$ and $x \in X^{n+1}$ then we have

$$\begin{aligned}
((\psi \circ \varphi)(L))(x) &= ((\psi \circ \varphi)(L))(x_1,\ldots,x_{n+1}) \\
&= (\psi(\varphi(L)))(x_1,\ldots,x_{n+1}) \\
&\underset{\text{[eq: 14.108]}}{=} \psi_{\varphi(L)}(x_1,\ldots,x_{n+1}) \\
&\underset{\text{[eq: 14.105]}}{=} ((\varphi(L))(x_1))(x_2,\ldots,x_n) \\
&\underset{\text{[eq: 14.102]}}{=} (\varphi_L(x_1))(x_2,\ldots,x_{n+1}) \\
&\underset{\text{[eq: 14.99]}}{=} L_{x_1}(x_2,\ldots,x_{n+1}) \\
&\underset{\text{[eq: 14.97]}}{=} L(x_1,x_2,\ldots,x_{n+1}) \\
&= L(x)
\end{aligned}$$

proving that $(\psi \circ \varphi)(L) = L$ or

$$\psi \circ \varphi = \mathrm{Id}_{L^{n+1}(X;Y)} \tag{14.111}$$

From [eqs: 14.110, 14.111] it follows by [theorem: 2.72] that

$$\varphi: L^{n+1}(X;Y) \to L(X,L^n(X;Y))$$

is a bijection. Combining this with]eq: 14.103] proves that

$$\varphi \text{ is a linear isomorphism} \tag{14.112}$$

Finally we have for $L \in L^{n+1}(X;Y)$ that

$$\begin{aligned}
\|L\|_{L^{n+1}(X;Y)} &= \|\mathrm{Id}_{L^{n+1}(X;Y)}(L)\|_{L^{n+1}(X;Y)} \\
&\underset{\text{[eq: 14.111]}}{=} \|(\psi \circ \varphi)(L)\|_{L^{n+1}(X;Y)} \\
&= \|\psi(\varphi(L))\|_{L^{n+1}(X;Y)} \\
&\leqslant_{\text{[eq: 14.109]}} \|\varphi(L)\|_{L(X,L^n(X;Y))}
\end{aligned}$$

which combined with [eq: 14.104] proves that $\|\varphi(L)\|_{L(X,L^n(X;Y))} = \|L\|_{L^{n+1}(X;Y)}$. This together with [eq: 14.112] proves that

$$\varphi: L^{n+1}(X;Y) \to L(X,L^n(X,Y)) \text{ is a linear isometric isomorphism}$$

and as $\psi = \varphi^{-1}$ we have by [theorem: 14.120] that

$$\psi: L(X, L^n(X,Y)) \to L^{n+1}(X;Y) \text{ is a linear isometric isomorphism}$$

Let $(x_1, \ldots, x_{n+1}) \in X^{n+1}$. Take $L \in L^{n+1}(X;Y)$ then we have

$$\begin{aligned}\varphi(L)(x_1)(x_2, \ldots, x_{n+1}) &\underset{\text{[eq: 14.102]}}{=} \varphi_L(x_2, \ldots, x_{n+1}) \\ &\underset{\text{[eq: 14.99]}}{=} L_{x_1}(x_2, \ldots, x_{n+1}) \\ &\underset{\text{[eq: 14.97]}}{=} L(x_1, \ldots, x_{n+1})\end{aligned}$$

proving that

$$\forall L \in L^{n+1}(X;Y) \text{ we have } \varphi(L)(x_1)(x_2, \ldots, x_{n+1}) = L(x_1, \ldots, x_{n+1}) \tag{14.113}$$

further if $L \in L(X, L^n(X,Y))$ then

$$\begin{aligned}L(x_1)(x_2, \ldots, x_{n+1}) &= ((\varphi \circ \psi)(L))(x_1)(x_2, \ldots, x_{n+1}) \\ &= (\varphi(\psi(L))(x_1))(x_2, \ldots, x_{n+1}) \\ &\underset{\text{[eq: 14.113]}}{=} \psi(L)(x_1, x_2, \ldots, x_{n+1})\end{aligned}$$

proving that

$$\forall L \in L(X, L^n(X,Y)) \text{ we have } \psi(L)(x_1, x_2, \ldots, x_{n+1}) = L(x_1)(x_2, \ldots, x_{n+1})$$

proving the first part of the theorem for the case $1 < n$.

As for uniqueness if $\varphi': L^{n+1}(X;Y) \to L(X, L^n(X,Y))$ satisfies

$$\varphi(L)(x_1)(x_2, \ldots, x_{n+1}) = L(x_1, \ldots, x_{n+1})$$

then we have $\forall L \in L^{n+1}(X;Y)$ $\forall x \in X$ that $\forall y \in X^n$

$$\varphi(L)(x)(y) = L(x, y_1, \ldots, y_n) = \varphi(L)(x)(y)$$

so that $\varphi'(L)(x) = \varphi(L)(x)$ or $\varphi'(L) = \varphi(L)$ proving that

$$\varphi' = \varphi$$

Likewise if $\psi': L(X, L^n(X,Y)) \to L^{n+1}(X;Y)$ satisfies

$$\psi'(L)(x_1, x_2, \ldots, x_{n+1}) = L(x_1)(x_2, \ldots, x_{n+1})$$

then we have $\forall L \in L(X, L^n(X;Y))$ $\forall x \in X^{n+1}$ that $\forall y \in X^n$

$$\psi'(L)(x_1, \ldots, x_{n+1}) = L(x_1)(x_2, \ldots, x_{n+1}) = \psi(L)(x_1, \ldots, x_{n+1})$$

so that $\psi'(L) = \psi(L)$ proving that

$$\psi' = \psi$$

Taking $\varphi_{[X,Y,n]} = \varphi$ and $\psi_{[X,Y,n]} = \psi$ completes then the proof if the theorem. □

14.7 Separation

Definition 14.203. *A topological space $\langle X, \mathcal{T} \rangle$ is **Hausdorff** if $\forall x, y \in X$ with $x \neq y$ there exists $U, V \in \mathcal{T}$ such that $x \in U$, $y \in V$ and $U \bigcap V = \varnothing$. In other words a topological space is **Hausdorff** if two different points can be separated by disjoint open sets.*

It turns out that all metric and normed spaces are Hausdorff

Theorem 14.204. *If $\langle X, d \rangle$ is a metric space then $\langle X, \mathcal{T}_d \rangle$ is Hausdorff [using the metric topology $\mathcal{T}_d$]*

***Note* 14.205.** *If $\langle X, \|\| \rangle$ is a normed space then $\langle X, \mathcal{T}_{\|\|} \rangle \underset{\text{[definition: 14.92]}}{=} \langle X, \mathcal{T}_{d_{\|\|}} \rangle$ so that every normed space is also Hausdorff.*

Proof. Let $x, y \in X$ such that $x \neq y$ then as d is a metric we have that $0 < d(x,y)$ [for if $d(x,y) = 0$ then $x = y$]. Take $\varepsilon = d(x,y) > 0$ then $x \in B_d\left(x, \frac{\varepsilon}{2}\right)$ and $y \in B_d\left(y, \frac{\varepsilon}{2}\right)$. Assume that

$$z \in B_d\left(x, \frac{\varepsilon}{2}\right) \bigcap B_d\left(y, \frac{\varepsilon}{2}\right)$$

then $\varepsilon = d(x,y) \leqslant d(x,z) + d(z,y) = d(x,z) + d(y,z) < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$ leading to the contradiction $\varepsilon < \varepsilon$. Hence the assumption is wrong so that

$$B_d\left(x, \frac{\varepsilon}{2}\right) \bigcap B_d\left(y, \frac{\varepsilon}{2}\right) = \varnothing \text{ and } x \in B_d\left(x, \frac{\varepsilon}{2}\right) \in \mathcal{T}_d,\ y \in B_d\left(y, \frac{\varepsilon}{2}\right) \in \mathcal{T}_d$$ □

One benefit of a Hausdorff spaces is that every finite set is closed in a Hausdorff space.

Theorem 14.206. *If $\langle X, \mathcal{T} \rangle$ is a Hausdorff topological space then every finite set is closed.*

Proof. Let $x \in X$ then if $y \in X \setminus \{x\}$ we have $y \neq x$ so by the Hausdorff condition there exists $U, V \in \mathcal{T}$ with $x \in U$, $y \in V$ and $U \bigcap V = \varnothing$. Hence $x \notin V$ so that $y \in V \subseteq X \setminus \{x\}$ proving by [theorem: 14.7] that $X \setminus \{x\}$ is open so that $\{x\}$ is closed. Hence we have that

$$\forall x \in X \text{ we have that } \{x\} \text{ is closed} \tag{14.114}$$

Now if $A \subseteq X$ is finite then we have either:

$A = \varnothing$. Then A is trivially closed.

$A \neq \varnothing$. Then by [theorem: 10.86] there exist a bijection $\beta: \{1, \ldots, n\} \to A$ so that

$$A = \beta(\{1, \ldots, n\}) = \beta\left(\bigcup_{i \in \{1, \ldots, n\}} \{i\}\right) = \bigcup_{i \in \{1, \ldots, n\}} \beta(\{i\}) = \bigcup_{i \in \{1, \ldots, n\}} \{\beta(i)\}$$

proving by [eq: 14.114] and [theorem: 14.21] that A is closed. □

Definition 14.207. *A topological space $\langle X, \mathcal{T} \rangle$ is **regular** if for every closed set A and $x \in X \setminus A$ there exists $U, V \in \mathcal{T}$ such that $x \in U$, $A \subseteq V$ and $U \bigcap V = \varnothing$. In other words a topological space is **regular** if every closed set and a point outside the closed set can be separated by disjoint open sets.*

All metric and normed spaces are not only Hausdorff but also regular.

Theorem 14.208. *If $\langle X, d \rangle$ is a metric space then $\langle X, \mathcal{T}_d \rangle$ is regular [using the metric topology $\mathcal{T}_d$]*

***Note* 14.209.** *If $\langle X, \|\| \rangle$ is a normed space then $\langle X, \mathcal{T}_{\|\|} \rangle \underset{\text{[definition: 14.92]}}{=} \langle X, \mathcal{T}_{d_{\|\|}} \rangle$ so that every normed space is also regular.*

Proof. Let A be a closed set and $x \in X \setminus A$. As A is closed $X \setminus A$ is open, hence by [theorem: 14.64] there exist a $\delta \in \mathbb{R}^+$ such that

$$x \in B_d(x, \delta) \subseteq X \setminus A \text{ hence } B_d(x, \delta) \bigcap A = \varnothing \tag{14.115}$$

Given $a \in A$ assume that $z \in B_d\left(x, \frac{\delta}{2}\right) \bigcap B_d(a, \delta_2)$ then $d(z,x) < \frac{\delta}{2} \wedge d(z,a) < \frac{\delta}{2}$ then

$$d(x,a) \leqslant d(x,z) + d(z,a) < \frac{\delta}{2} + \frac{\delta}{2} = \delta$$

so that $a \in B_d(x, \delta)$, hence $a \in A \bigcap B_d(x, \delta) = \varnothing$ contradicting [eq: 14.115]. Hence it follows that

$$B_d\left(x, \frac{\delta}{2}\right) \bigcap B_d\left(a, \frac{\delta}{2}\right) = \varnothing \tag{14.116}$$

Take $V = \bigcup_{a \in A} B_d\left(a, \frac{\delta}{2}\right) \in \mathcal{T}_d$ and $U = B_d\left(x, \frac{\delta}{2}\right) \in \mathcal{T}_d$ then clearly

$$A \subseteq V \text{ and } x \in U$$

Further

$$V \bigcap U = \left(\bigcup_{a \in A} B_d\left(a, \frac{\delta}{2}\right)\right) \bigcap B_d\left(x, \frac{\delta}{2}\right) = \bigcup_{a \in A} \left(B_d\left(a, \frac{\delta}{2}\right) \bigcap B_d\left(x, \frac{\delta}{2}\right)\right) \underset{\text{[eq: 14.116]}}{=} \varnothing$$ □

Theorem 14.210. *Let $\langle X, \mathcal{T} \rangle$ be a **regular** topological space, U a open set, $x \in U$ then there exist a $V \in \mathcal{T}$ such that $x \in V$ and $\bar{V} \subseteq U$.*

Proof. Take $x \in U$ then as $X \setminus U$ is a closed set and $x \in U \underset{\text{[theorem: 1.33]}}{=} X \setminus (X \setminus U)$ there exist a $V, W \in \mathcal{T}$ such that $x \in V$, $X \setminus U \subseteq W$ and $V \bigcap W = \varnothing$. As $V \bigcap W = \varnothing$ we have that $V \subseteq X \setminus W$, as $X \setminus W$ is closed it follows from [theorem: 14.24] that $\bar{V} \subseteq X \setminus W$. As $X \setminus U \subseteq W$ we have $X \setminus W \subseteq X \setminus (X \setminus U) = U$ so that

$$\bar{V} \subseteq U$$ □

Corollary 14.211. *Let $\langle X, \mathcal{T}\rangle$ be a regular topological space, A a closed set, $x \in X \setminus A$ and U a open set with $x \in U$ then there exist a open set $V \in \mathcal{T}$ such that*

$$x \in V,\ \bar{V} \bigcap A = \varnothing \text{ and } \bar{V} \subseteq U$$

Proof. As A is a closed set and $x \notin A$ there exists by regularity two open sets $V_1, V_2 \in \mathcal{T}$ such that

$$x \in V_1,\ A \subseteq V_2 \text{ and } V_1 \bigcap V_2 = \varnothing$$

As $x \in V_1 \bigcap U \in \mathcal{T}$ there exist by [theorem: 14.210] a open set $V \in \mathcal{T}$ such that

$$x \in V \text{ and } \bar{V} \subseteq V_1 \bigcap U \subseteq U$$

so that

$$\bar{V} \bigcap A \subseteq (V_1 \bigcap U) \bigcap A \subseteq V_1 \bigcap A \subseteq V_1 \bigcap V_2 = \varnothing$$

Hence we have

$$V \in \mathcal{T},\ x \in V,\ \bar{V} \subseteq U \text{ and } \bar{V} \bigcap A = \varnothing$$

□

Definition 14.212. *A topological space $\langle X, \mathcal{T}\rangle$ is **normal** if for every pair of distinct closed sets A, B there exist $U, V \in \mathcal{T}$ such that $A \subseteq U$, $B \subseteq V$ and $U \bigcap V$. In other words a topological space is normed if every disjoint pair of closed sets can be separated by a disjoint pair of open sets.*

Theorem 14.213. *Let $\langle X, \mathcal{T}\rangle$ be a topological space then we have:*

1. *If $\langle X, \mathcal{T}\rangle$ is a normal space such that $\forall x \in X\ \{x\}$ is closed then $\langle X, \mathcal{T}\rangle$ is regular*
2. *If $\langle X, \mathcal{T}\rangle$ is a regular space such that $\forall x \in X\ \{x\}$ is closed then $\langle X, \mathcal{T}\rangle$ is Hausdorff.*

Proof.

1. Let A be a closed set and $x \in X \setminus A$ then by the hypothesis $\{x\}$ is closed, so by normality there exists $U, V \in \mathcal{T}$ such that $A \subseteq U$, $x \in \{x\} \subseteq V$ and $U \bigcap V = \varnothing$. Hence $\langle X, \mathcal{T}\rangle$ is regular.
2. Let $x, y \in X$ such that $x \neq y$ then $\{x\}$ and $\{y\}$ are closed and $\{x\} \bigcap \{y\} = \varnothing$ so that by normality there exists $U, V \in \mathcal{T}$ such that $x \in \{x\} \subseteq U$, $y \in \{y\} \subseteq V$ and $U \bigcap V = \varnothing$. Hence $\langle X, \mathcal{T}\rangle$ is Hausdorff. □

Definition 14.214. *Let $\langle X, \mathcal{T}\rangle$ be a topological space and $x \in X$ then $A \subseteq X$ is a **neighborhood of x** iff there exist a open set $U \in \mathcal{T}$ such that $x \in U \subseteq A$. If A itself is open then A is called a **open neighborhood of** x.*

Definition 14.215. *Let $\langle X, T\rangle$ be a topological space, $x \in X$ then a **fundamental system of neighborhoods of x** is a set $\mathcal{N}$ of **neighborhoods of** x such that for every neighborhood A of x there exist a $N \in \mathcal{N}$ such that $x \in N \subseteq A$.*

Definition 14.216. *A topological space $\langle X, \mathcal{T}\rangle$ is **first countable** if every element of X has a **countable** fundamental system of neighborhoods.*

Theorem 14.217. *If $\langle X, d\rangle$ is a metric space then $\langle X, \mathcal{T}_d\rangle$ is **first countable** [using the metric topology $\mathcal{T}_d$].*

***Note* 14.218.** *If $\langle X, \|\|\rangle$ is a normed space then $\langle X, \mathcal{T}_{\|\|}\rangle \underset{[definition:\ 14.92]}{=} \langle X, \mathcal{T}_{d_{\|\|}}\rangle$ so that every normed space is also first countable.*

Proof. Given $x \in X$ define $\mathcal{N}_x = \left\{B_d\left(x, \frac{1}{n}\right) | n \in \mathbb{N}\right\}$ which is countable [see theorem: 6.72]. If A is a neighborhood of x then there exist a $U \in \mathcal{T}$ such that $x \in U \subseteq A$. Using [theorem: 14.64] there exist a $\delta \in \mathbb{R}^+$ such that $x \in B_d(x, \delta) \subseteq U$. As $0 < \delta$ there exist a $n \in \mathbb{N}$ such that $0 < \frac{1}{n} < \delta$ [see theorem: 10.30] hence we have that $x \in B_d\left(x, \frac{1}{n}\right) \subseteq B_d(x, \delta) \subseteq U \subseteq A$ which as $B_d\left(x, \frac{1}{n}\right) \in \mathcal{N}_x$ proves first countability. □

Definition 14.219. *A topological space $\langle X, \mathcal{T}\rangle$ is **second countable** if $\mathcal{T}$ has a **countable basis**.*

Theorem 14.220. *Let $\langle X, \mathcal{T}\rangle$ be a **second countable** topological space then $\langle X, \mathcal{T}\rangle$ is **first countable**.*

Proof. Let $\langle X, \mathcal{T}\rangle$ be a second countable topological space and let $\mathcal{B} \subseteq \mathcal{T}$ be the countable basis of $\mathcal{T}$ then if $x \in X$ and A a neighborhood of x then there exists a $U \in \mathcal{T}$ such that $x \in U \subseteq A$. As $\mathcal{B}$ is a basis there exists a $B \in \mathcal{B}$ such that $x \in B \subseteq U \subseteq A$ [see theorem: 14.34]. So $\mathcal{B}$ is a fundamentally system of neighborhoods of every element of x. □

14.8 Compact Spaces

Definition 14.221. *A topological space $\langle X,\mathcal{T}\rangle$ is* ***compact*** *if for every $\{U_i\}_{i\in I}\subseteq\mathcal{T}$ satisfying $X=\bigcup_{i\in I}U_i$ there exist a finite $J\subseteq I$ such that $X=\bigcup_{i\in J}U_i$. In other words a topological space is compact if every covering of the space by a family of open sets contains a finite subfamily of sets that covers the space.*

In addition to compact topological spaces we have also compact subsets of a topological space.

Definition 14.222. *Let $\langle X,\mathcal{T}\rangle$ be a topological space and $C\subseteq X$ then C is a* ***compact subset*** *if $\langle X,\mathcal{T}_{|C}\rangle$ is a* ***compact topological space*** *where $\mathcal{T}_{|C}=\{U\bigcap C|U\in\mathcal{T}\}$ is the subspace topology on C [see definition: 14.8]*

We show now that a compact topological spaces is a topological space that is its own compact subspace.

Theorem 14.223. *Let $\langle X,\mathcal{T}\rangle$ be a topological space then we have*

$$\langle X,\mathcal{T}\rangle \text{ is compact} \Leftrightarrow X \text{ is a compact subset of } \langle X,\mathcal{T}\rangle$$

Proof. First note that $\mathcal{T}_{|X}\underset{\text{[definition: 14.8]}}{=}X$ so that $\langle X,\mathcal{T}\rangle=\langle X,\mathcal{T}_{|X}\rangle$

- **$\Rightarrow$.** If $\langle X,\mathcal{T}\rangle$ is compact then $\langle X,\mathcal{T}_{|X}\rangle$ is compact so that X is a compact subset of $\langle X,\mathcal{T}\rangle$.
- **$\Leftarrow$.** If X is a compact subset of $\langle X,\mathcal{T}\rangle$ then $\langle X,\mathcal{T}_{|X}\rangle$ is compact so that $\langle X,\mathcal{T}\rangle$ is compact. □

A alternative definition of a compact subset is given in the following theorem.

Theorem 14.224. *Let $\langle X,\mathcal{T}\rangle$ be a topological space and $C\subseteq X$ then*

$$C \text{ is compact}$$
$$\Updownarrow$$
$$\text{For every } \{U_i\}_{i\in I}\subseteq\mathcal{T} \text{ satisfying } C\subseteq\bigcup_{i\in I}U_i \text{ there exist a finite } J\subseteq I \text{ such that } C\subseteq\bigcup_{i\in J}U_i$$

Proof.

- **$\Rightarrow$.** If $\{U_i\}_{i\in I}$ is a collection of open sets such that $C\subseteq\bigcup_{i\in I}U_i$ then $C=\bigcup_{i\in I}(C\bigcap U_i)$ where $\forall i\in I$ we have that $U_i\bigcap C\in\mathcal{T}_{|C}$ so that by the fact that $\langle C,\mathcal{T}_{|C}\rangle$ is compact there exists a finite $J\subseteq I$ such that $C=\bigcup_{i\in J}(U_i\bigcap C)\subseteq\bigcup_{i\in J}U_i$.
- **$\Leftarrow$.** Assume that $\{V_i\}_{i\in I}$ is a collection of open sets in $\mathcal{T}_{|C}$ such that $C=\bigcup_{i\in I}V_i$, then by the definition of the subspace topology we have $\forall i\in I$ there exists a U_i such that $V_i=U_i\bigcap C$, so that $C=\bigcup_{i\in I}(U_i\bigcap C)\subseteq\bigcup_{i\in I}U_i$. Hence by the hypothesis there exists a finite $J\subseteq I$ such that $C\subseteq\bigcup_{i\in J}U_i\Rightarrow C=C\bigcap(\bigcup_{i\in J}U_i)=\bigcup_{i\in J}(U_i\bigcap C)=\bigcup_{i\in J}V_i$ proving that $\langle C,\mathcal{T}_{|C}\rangle$ is a compact topological space. Hence by definition C is a topological subset of $\langle X,\mathcal{T}\rangle$. □

We can also express compactness using a basis for the topology.

Theorem 14.225. *Let $\langle X,\mathcal{T}\rangle$ be a topological space with a basis $\mathcal{B}$ and $C\subseteq X$ then*

$$C \text{ is a compact subset} \Leftrightarrow \forall\{B_i\}_{i\in I}\subseteq\mathcal{B} \text{ with } C\subseteq\bigcup_{i\in I}B_i \text{ there exist a finite } J \text{ we have } C\subseteq\bigcup_{i\in J}B_i$$

Proof.

- **$\Rightarrow$.** This follows from $\mathcal{B}\subseteq\mathcal{T}$ and [theorem: 14.224].
- **$\Leftarrow$.** Let $\{U_i\}_{i\in I}\subseteq\mathcal{T}$ be a family of open sets such that $C\subseteq\bigcup_{i\in I}U_i$. Then $\forall c\in C$ there exist a $i_c\in I$ such that $c\in U_{i_c}$ as $\mathcal{B}$ is a basis it follows from [theorem: 14.34] that there exists a B_c such that $c\in B_c\subseteq U_{i_c}$. So $C\subseteq\bigcup_{c\in C}B_c$ and by the hypothesis there exists a finite set $F\subseteq C$ such that $C\subseteq\bigcup_{c\in F}B_c$. Define then the finite set $J=\{i_c|c\in F\}\subseteq I$ then if $c\in C$ there exist a $c\in F$ such that $c\in B_c\subseteq U_{i_c}$ where $i_c\in J$ proving that

$$C\subseteq\bigcup_{i\in J}U_i$$ □

Example 14.226. If $\langle X,\mathcal{T}\rangle$ is a topological space then $\varnothing$ is a compact set.

Proof. If $\{U_i\}_{i\in I}$ is a non empty family of open sets covering $\emptyset$ then we have for I either

$\boldsymbol{I=\emptyset}$. then $J=\emptyset=I$ is finite and $\varnothing=\bigcup_{i\in\varnothing}U_i=\bigcup_{i\in J}U_i$ so $\{U_i\}_{i\in J}$ is a finite covering of $\emptyset$

$\boldsymbol{I\neq\emptyset}$. then $\exists i\in I$ so if we take $J=\{i\}\subseteq I$ then J is finite and $\emptyset\subseteq E_i=\bigcup_{j\in\{i\}}U_i$ □

Example 14.227. Let $\langle X,\mathcal{T}\rangle$ be a topological space, $x\in X$ then $\{x\}$ is a compact subset of X.

Proof. Let $\{U_i\}_{i\in I}\subseteq\mathcal{T}$ be such that $\{x\}\subseteq\bigcup_{i\in I}U_i$ then $x\in\bigcup_{i\in I}U_i$ so there exist a $i\in I$ such that $x\in U_i$. Hence $\{x\}\subseteq U_i=\bigcup_{j\in\{i\}}U_j$ which as $\{i\}$ is finite and $\{i\}\subseteq I$ proves that $\{x\}$ is compact. □

Theorem 14.228. *Let $\langle X,\mathcal{T}\rangle$ be a topological space, $n\in\mathbb{N}$ and $\{C_i\}_{i\in\{1,\dots,n\}}$ a finite family of compact subsets of X then $\bigcup_{i\in\{1,\dots,n\}}C_i$ is a compact subset.*

Proof. Let $\bigcup_{i\in I}U_i$ be a open cover of $\bigcup_{i\in\{1,\dots,n\}}C_i$ then $\forall i\in\{1,\dots,n\}$ we have

$$C_i\subseteq\bigcup_{i\in\{1,\dots,n\}}C_i\subseteq\bigcup_{j\in I}U_j\underset{\text{[theorem: 14.224]}}{\Rightarrow}\exists\text{finite } I_i\subseteq I \text{ such that } C_i\subseteq\bigcup_{j\in I_i}U_j$$

so that

$$\bigcup_{i\in\{1,\dots,n\}}C_i\subseteq\bigcup_{i\in\{1,\dots,n\}}\left(\bigcup_{j\in I_i}U_j\right)$$

If now $x\in\bigcup_{i\in\{1,\dots,.n\}}(\bigcup_{j\in I_i}U_i)$ then there exist a $i\in\{1,\dots,n\}$ such that $x\in\bigcup_{j\in I_i}U_j$, hence there exists a $j\in I_i\subseteq\bigcup_{k\in\{1,\dots,n\}}I_k$ with $x\in U_j$, proving that $x\in\bigcup_{j\in\bigcup_{k\in\{1,\dots,n\}}I_k}U_j$. So we have

$$\bigcup_{i\in\{1,\dots,.n\}}\left(\bigcup_{j\in I_i}U_i\right)\subseteq\bigcup_{j\in\bigcup_{k\in\{1,\dots,n\}}I_k}U_j$$

hence

$$\bigcup_{i\in\{1,\dots,n\}}C_i\subseteq\bigcup_{j\in\bigcup_{k\in\{1,\dots,n\}}I_k}U_j$$

where $\bigcup_{k\in\{1,\dots,n\}}I_k\subseteq I$ and by [theorem: 6.36] $\bigcup_{k\in\{1,\dots,n\}}I_k$ is finite. □

Theorem 14.229. *Let $\langle X,\mathcal{T}\rangle$ be a topological space, $A\subseteq X$ and $C\subseteq A$ then*

$$C \text{ is compact in } \langle A,\mathcal{T}_{|A}\rangle\Leftrightarrow C \text{ is compact in } \langle X,\mathcal{T}\rangle$$

Proof.

$\Rightarrow$. If $\{U_i\}_{i\in I}\subseteq\mathcal{T}$ satisfies $C\subseteq\bigcup_{i\in I}U_i$ then $C\underset{C\subseteq A}{=}C\bigcap A\subseteq\bigcup_{i\in I}(U_i\bigcap A)$ where $\forall i\in I\ U_i\bigcap A\in\mathcal{T}_{|A}$. As C is compact in $\langle A,\mathcal{T}_{|A}\rangle$, it follows from [theorem: 14.224] that there exist a finite $J\subseteq I$ so that $C\subseteq\bigcup_{i\in J}(U_i\bigcap A)\subseteq\bigcup_{i\in J}U_i$ proving by [theorem: 14.224] that C is compact in $\langle X,\mathcal{T}\rangle$.

$\Leftarrow$. If $\{V_i\}_{i\in I}\subseteq\mathcal{T}_{|A}$ satisfies $C\subseteq\bigcup_{i\in I}V_i$ then $\forall i\in I$ we have that $\exists U_i\in\mathcal{T}$ such that $V_i=U_i\bigcap A\subseteq U_i$. Hence $C\subseteq\bigcup_{i\in I}U_i$ which as C is compact in $\langle X,\mathcal{T}\rangle$ proves by [theorem: 14.224] that there exist a $J\subseteq I$ such that $C\subseteq\bigcup_{i\in J}U_i$. So

$$C=C\bigcap A\subseteq\left(\bigcup_{i\in J}U_i\right)\bigcap A=\bigcup_{i\in J}(U_i\bigcap A)=\bigcup_{i\in J}V_i$$

proving by [theorem: 14.224] that C is compact in $\langle A,\mathcal{T}_{|A}\rangle$ □

In pseudo metric [or normed spaces] every compact set must be bounded.

Theorem 14.230. *Let $\langle X,d\rangle$ be a pseudo metric space and $C\subseteq X$ a compact subset then C is bounded.*

Proof. Let C be a compact subset of X then for $\{B_d(c,1)\}_{c\in C}\subseteq\mathcal{T}_d$ we have $C\subseteq\bigcup_{c\in C}B_d(c,1)$. As C is compact in $\langle X,\mathcal{T}_d\rangle$ we have by [theorem: 14.224] that there exist a finite set $J\subseteq C$ such that

$$C\subseteq\bigcup_{c\in J}B_d(c,1)\tag{14.117}$$

We have now two cases for J:

$J=\varnothing$. Then $C\subseteq\bigcup_{c\in J}B_d(c,1)=\varnothing$ hence by [example: 14.76] C is bounded

$J\neq\varnothing$. Then $\{d(c,t)|(c,t)\in J\times J\}\neq\varnothing$ and by [theorems: 6.41, 6.46] $\{d(c,t)|(c,t)\in J\times J\}$ is finite, so that by [theorem: 6.49] $N=\max(\{d(c,t)|(c,t)\in J\times J\})$ exists. Take then

$$M=N+2$$

Let $x,y\in C$ then by [eq: 14.117] there exists $c_x,c_y\in J$ such that $x\in B_d(c_x,1)$, $y\in B_d(c_y,1)$, hence

$$\begin{aligned}d(x,y)&\leqslant d(x,c_x)+d(c_x,y)\\&\leqslant d(x,c_x)+d(c_x,c_y)+d(c_y,y)\\&<1+N+1\\&=M\end{aligned}$$

proving that C is bounded. □

Corollary 14.231. *Let $\langle X,\|\|\rangle$ be a pseudo normed space and $C\subseteq X$ a compact subset then there exist a $M\in\mathbb{R}^+$ such that $\forall c\in C$ we have $\|c\|\leqslant M$*

Proof. This follows from the previous theorem [theorem: 14.230] and [theorem: 14.107] □

Continuous maps preserves compactness.

Theorem 14.232. *Let $\langle X,\mathcal{T}_X\rangle$, $\langle Y,\mathcal{T}_Y\rangle$ be topological spaces, $f:X\to Y$ a continuous function and C a compact set in $\langle X,\mathcal{T}_X\rangle$ then $f(C)$ is compact in $\langle Y,\mathcal{T}_Y\rangle$.*

Proof. Let $\{V_i\}_{i\in I}$ be a family of open sets in Y so that $f(C)\subseteq\bigcup_{i\in I}V_i$. Let $x\in C$ then we have $f(x)\in f(C)\subseteq\bigcup_{i\in I}V_i$ and thus $\exists i\in I$ such that $f(x)\in V_i$. By continuity of f there exists a U_i open in X with $x\in U_i$ and $f(x)\in f(U_i)\subseteq V_i$, hence $x\in\bigcup_{i\in I}U_i$. As $x\in C$ was chosen arbitrary it follows that

$$C\subseteq\bigcup_{i\in I}V_i$$

By compactness of C there exist a finite $J\subseteq I$ with

$$C\subseteq\bigcup_{i\in J}U_i\Rightarrow f(C)\subseteq f\left(\bigcup_{i\in J}U_i\right)=\bigcup_{i\in J}f(U_i)\subseteq\bigcup_{i\in J}V_i$$

proving that $f(C)$ is compact. □

The following two theorems shows the relation between compactness and closedness.

Theorem 14.233. *Let $\langle X,\mathcal{T}\rangle$ be a Hausdorff topological space then every compact subset is closed.*

Proof. Let C be a compact subset of X. Take $y\in X\setminus C$ then $\forall c\in C$ we have by the Hausdorff condition that there exists $U_c,V_c\in\mathcal{T}$ such that $c\in U_c$, $y\in V_c$ and $\varnothing\neq U_c\bigcap V_c$. So $C\subseteq\bigcup_{c\in C}U_c$, hence, as C is compact, there exist a finite $F\subseteq C$ satisfying $C\subseteq\bigcup_{c\in F}U_c$. As $\forall c\in F\subseteq C$ we have $y\in V_c$ it follows that $y\in\bigcap_{c\in F}V_c$ which is open because F is finite. Further

$$\begin{aligned}\left(\bigcap_{c\in F}V_c\right)\bigcap C&\subseteq\left(\bigcap_{c\in F}V_c\right)\bigcap\left(\bigcup_{x\in F}U_x\right)\\&=\bigcup_{x\in F}\left(\left(\bigcap_{c\in F}V_c\right)\bigcap U_x\right)\\&\underset{x\in F\Rightarrow\bigcap_{c\in F}V_c\subseteq V_x}{\subseteq}\bigcup_{x\in F}\left(V_x\bigcap U_x\right)\\&=\bigcup_{x\in F}\varnothing\\&=\varnothing\end{aligned}$$

So for every $y\in X\setminus C$ we have found a open set $\bigcap_{c\in F}V_c$ such that $y\in\bigcap_{c\in F}V_c\subseteq X\setminus C$ proving by [theorem: 14.7] that $X\setminus C$ is open or that C is closed. □

Theorem 14.234. *Let $\langle X,\mathcal{T}\rangle$ be a topological space, C a compact subset of X, $F\subseteq C$ a closed subset of C then C is compact.*

Proof. Let $\{U_i\}_{i\in I}\subseteq\mathcal{T}$ be a family of open sets such that $F\subseteq\bigcup_{i\in I}U_i$. As F is closed we have that $X\setminus F$ is open, using [theorem: 1.71] there exist a k such that $k\notin I$. Define then

$$\{V_i\}_{i\in I\bigcup\{k\}}\subseteq\mathcal{T}\text{ by }V_i=\begin{cases}U_i\text{ if }i\in I\\ X\setminus F\text{ if }i=k\end{cases}$$

Then for $x\in C$ we have either:

- $\boldsymbol{x\in F}$**.** Then $\exists i\in I\subseteq I\bigcup\{k\}$ such that $x\in U_i=V_i$ hence $x\in\bigcup_{i\in I\bigcup\{k\}}V_i$
- $\boldsymbol{x\notin F}$**.** Then $x\in X\setminus F=V_k$ such that $x\in\bigcup_{i\in I\bigcup\{k\}}V_i$

this proves that $C\subseteq\bigcup_{i\in I\bigcup\{k\}}V_i$. As C is compact there exist a finite set $J\subseteq I$ such that $C\subseteq\bigcup_{i\in J}V_i$ which as $F\subseteq C$ gives

$$F\subseteq\bigcup_{i\in J}V_i$$

Let $x\in F$ then there exist a $i\in J$ such that $x\in V_i$. Assume that $i=k$ then $x\in V_k=X\setminus F$ contradicting $x\in F$, hence $i\in J\setminus\{k\}$ and $x\in V_i=U_i$. So $F\subseteq\bigcup_{i\in J\setminus\{k\}}U_i$ which as $J\setminus\{k\}$ is finite proves that F is compact. □

We have seen that for a Hausdorff space a compact set is closed and bounded. We show now that the opposite is true for the real numbers.

Theorem 14.235. (Heine Borel) *Let $a,b\in\mathbb{R}$ then $[a,b]$ is a compact subset of $\mathbb{R}$ [using the norm topology $\mathcal{T}_{||}$ generated by the absolute value $||$].*

Proof. First if $b<a$ then $[a,b]=\varnothing$ which is compact by [example: 14.226] hence we have only to prove the remaining case $a\leqslant b$. Let $\{U_i\}_{i\in I}\subseteq\mathcal{T}$ be family of open sets such that $[a,b]\subseteq\bigcup_{i\in I}U_i$. Define

$$\mathcal{G}=\left\{x\in\mathbb{R}|a\leqslant x\text{ and there exist a finite }J\subseteq I\text{ such that }[a,x]\subseteq\bigcup_{i\in J}U_i\right\}$$

If $x\in\mathcal{G}$ then there exist a finite $J\subseteq I$ such that $[a,x]\subseteq\bigcup_{i\in J}U_i$, let $y\in[a,x]$ then

$$a\leqslant y\text{ and }[a,y]\subseteq[a,x]\subseteq[a,x]\subseteq\bigcup_{i\in J}U_i$$

proving that $y\in\mathcal{G}$. Hence we have proved that

$$\forall x\in\mathcal{G}\ [a,x]\subseteq\mathcal{G}\tag{14.118}$$

As $a\in[a,b]\subseteq\bigcup_{i\in I}U_i$ there exist a $k\in I$ such that $a\in U_k$, by [theorems: 14.34, 14.99] there exist a $\delta\in\mathbb{R}^+$ such that $]a-\delta,a+\delta[\subseteq U_k=\bigcup_{i\in\{k\}}U_i$. Hence $\forall y\in[a,a+\delta[$ we have $y\in U_k=\bigcup_{i\in\{k\}}U_i$ which as $\{k\}$ is finite, $\{k\}\subseteq I$ and $a\leqslant y$ proves that $y\in\mathcal{G}$. So we have

$$\exists\delta\in\mathbb{R}^+\text{ such that }[a,a+\delta[\subseteq\mathcal{G}\text{ and as }a\in[a,a+\delta[\ \mathcal{G}\neq\varnothing\tag{14.119}$$

For $\mathcal{G}$ we have now two possible cases:

- $\boldsymbol{\forall u\in\mathbb{R}\ \exists x\in\mathcal{G}\text{ such that }u\leqslant x}$**.** In particular there exist a $x\in\mathcal{G}$ such that $b\leqslant x$ so that by [eq: 14.118] $[a,x]\subseteq\mathcal{G}$ which as $b\in[a,x]$ [because $a\leqslant b\leqslant x$] proves that

$$b\in\mathcal{G}$$

- $\boldsymbol{\exists u\in\mathbb{R}\ \forall x\in\mathcal{G}\text{ we have }x\leqslant u}$**.** Then $\mathcal{G}$ is bounded above by u hence, as by [eq: 14.119] $\mathcal{G}\neq\varnothing$, we have by the conditional completeness of $\mathbb{R}$ [see theorem: 10.18] that

$$s=\sup(\mathcal{G})\text{ exist}$$

Assume that $s\leqslant b$. Then as $a+\frac{\delta}{2}\in[a,a+\delta[\subseteq_{[\text{eq: }14.119]}\mathcal{G}$ it follows that $a<a+\frac{\delta}{2}\leqslant s$ proving that

$$a<s\leqslant b$$

hence $s\in[a,b]\subseteq\bigcup_{i\in I}U_i$. So there exist a $l\in I$ such that $s\in U_l$, hence by [theorems: 14.34, 14.99] there exist a $\varepsilon\in\mathbb{R}^+$ such that

$$s\in]s-\varepsilon,s+\varepsilon[\subseteq U_l\Rightarrow s\in\left[s-\frac{\varepsilon}{2},s+\frac{\varepsilon}{2}\right]\subseteq]s-\varepsilon,s+\varepsilon[\subseteq U_l$$

As $s-\frac{\varepsilon}{2}<s=\sup(\mathcal{G})$ there exist a $c\in\mathcal{G}$ with

$$s-\frac{\varepsilon}{2}<c\leqslant s.\tag{14.120}$$

As $c \in \mathcal{G}$ there exist a finite $J \subseteq I$ such that $[a,c] \subseteq \bigcup_{i \in J} U_i$ and $a \leqslant c$. Hence

$$[a,c] \bigcup \left[s - \frac{\varepsilon}{2}, s + \frac{\varepsilon}{2}\right] \subseteq \bigcup_{i \in J \bigcup \{l\}} U_i \tag{14.121}$$

If $y \in \left[a, s + \frac{\varepsilon}{2}\right]$ then $a \leqslant y \leqslant s + \frac{\varepsilon}{2}$ and for y we have either:

$y \leqslant c$. Then $y \in [a.c] \subseteq [a,c] \bigcup \left[s - \frac{\varepsilon}{2}, s + \frac{\varepsilon}{2}\right]$

$c < y$. Then by [eq: 14.120] $s - \frac{\varepsilon}{2} < c < y \leqslant s + \frac{\varepsilon}{2}$ proving that $y \in \left[s - \frac{\varepsilon}{2}, s + \frac{\varepsilon}{2}\right] \subseteq [a,c] \bigcup \left[s - \frac{\varepsilon}{2}, s + \frac{\varepsilon}{2}\right]$

proving using [eq: 14.121] that

$$\left[a, s + \frac{\varepsilon}{2}\right] \subseteq \bigcup_{i \in J \bigcup \{l\}} U_i$$

which as $J \bigcup \{l\}$ is finite, $J \bigcup \{l\} \subseteq I$ and $c \in \mathcal{G} \Rightarrow a \leqslant c \leqslant s < s + \frac{\varepsilon}{2}$ proves that $s + \frac{\varepsilon}{2} \in \mathcal{G}$. Hence as $s = \sup(\mathcal{G})$ we must have that $s + \frac{\varepsilon}{2} \leqslant s$ a contradiction. Hence the assumption is wrong and we must have that

$$b < s$$

As $s = \sup(\mathcal{G})$ there exist a $d \in \mathcal{G}$ such that $b < d \leqslant s$, using [eq: 14.118] we have then that $[a,d] \in \mathcal{G}$. From $a \leqslant b < d$ it follows that $b \in [a,d]$ proving that

$$b \in \mathcal{G}$$

So in all cases we have $b \in \mathcal{G}$ which means by the definition of $\mathcal{G}$ that there exist a finite $J \subseteq I$ such that $[a,b] \subseteq \bigcup_{i \in J} U_i$. Hence $[a,b]$ is compact. □

Corollary 14.236. *If $C \subseteq \mathbb{R}$ then using the topology $\mathcal{T}_{||}$*

$$C \text{ is compact} \Leftrightarrow C \text{ is closed and bounded}$$

Proof.

$\Rightarrow$. Using [theorem: 14.230] C is bounded, further by [theorem: 14.204] $\mathcal{T}_{||_{\max}}$ is Hausdorff, so using [theorem: 14.233] C is closed.

$\Leftarrow$. As C is bounded there exist a $M \in \mathbb{R}^+$ such that $\forall x \in C \ |x| \leqslant M$ so we have $x \leqslant M$ and $-x \leqslant M \Rightarrow -M \leqslant x$ proving that $C \subseteq [-M, M]$. By [theorem: 14.235] $[-M, M]$ is compact which as C is closed proves by [theorem: 14.234] that C is compact. □

Theorem 14.237. (Extreme Value Theorem) *Let $\langle X, \mathcal{T} \rangle$ be a topological space, $f: X \to \mathbb{R}$ a continuous function [using the topology $\mathcal{T}_{||}$ on $\mathbb{R}$] and $C \subseteq X$ a compact subset of X then there exist a $M \in \mathbb{R}^+$ such that*

$$\forall x \in C \text{ we have } |f(x)| \leqslant M$$

Proof. As C is compact and f continuous we have by [theorem: 14.232] that $f(C)$ is a compact subset of $\mathbb{R}$, hence using [corollary: 14.236] $f(C)$ is bounded. So by [theorem:14.231] there exist a $M \in \mathbb{R}^+$ such that $\forall y \in f(C)$ we have $|f(y)| \leqslant M$, hence if $x \in C \Rightarrow f(x) \in f(C)$ we have that $|f(x)| \leqslant M$. □

Theorem 14.238. (Extreme Value Theorem) *Let $\langle X, \mathcal{T} \rangle$ be a topological space, $\varnothing \neq C \subseteq X$ a non empty compact subset of X and $f: X \to \mathbb{R}$ a continuous function [using the topology $\mathcal{T}_{||}$ on $\mathbb{R}$] then there exists $m, M \in C$ such that*

$$\forall x \in C \text{ we have } f(m) \leqslant f(x) \leqslant f(M)$$

Proof. As C is compact and f continuous we have by [theorem: 14.232] that

$$f(C) \text{ is compact}$$

As by [theorem: 14.204] $\langle \mathbb{R}, \mathcal{T}_{||} \rangle$ is Hausdorff and $f(C)$ is compact it follows from [theorem: 14.233] that

$$f(C) \text{ is closed}$$

Using [theorem:14.231] there exist a $N \in \mathbb{R}^+$ such that $\forall x \in f(C)$ we have $|x| \leqslant N \Rightarrow -N \leqslant x \leqslant N$ proving that $f(C)$ is bounded above and below. As further $f(C) \neq \varnothing$ we have using the fact that $\mathbb{R}$ is conditional complete [see theorem: 10.18] that $\sup(f(C))$ and $\inf(f(C))$ exist. As $f(C)$ is closed and non empty we have by [theorem: 14.106] that $\sup(f(C)) \in f(C)$ and $\inf(f(C)) \in f(C)$. Hence there exists $m, M \in C$ such that $\sup(f(C)) = f(M)$ and $\inf(f(C)) = f(m)$. So we have $\forall x \in C$ that

$$f(m) = \inf(f(C)) \leqslant f(x) \leqslant \sup(C) = f(M)$$ □

Theorem 14.239. *Let $\langle X,\mathcal{T}\rangle$ be a **compact Hausdorff space** then it is **regular** and **normal***

Proof. Let A be a closed set and $x\in X\setminus A$. As A is closed we have we have by [theorem: 14.234] that

$$A \text{ is compact}$$

then by the Hausdorff condition we have $\forall a\in A$ that there exists $U_a,V_a\in\mathcal{T}$ such that $a\in U_a$, $x\subseteq V_a$ and $U_a\bigcap V_a=\varnothing$. So $A\subseteq\bigcup_{a\in A}U_a$ which as A is compact means that there exist a finite $I\subseteq A$ such that $A\subseteq\bigcup_{a\in I}U_a$. Take now $U=\bigcup_{a\in I}U_a\in\mathcal{T}$ and $V=\bigcap_{a\in I}V_a\in\mathcal{T}$ [as I is finite] then we have $A\subseteq U$, $x\in V$ and

$$U\bigcap V=\left(\bigcup_{a\in I}U_a\right)\bigcap\left(\bigcap_{b\in I}V_b\right)=\bigcup_{a\in I}\left(U_a\bigcap\left(\bigcap_{b\in I}V_b\right)\right)\underset{U_a\bigcap(\bigcap_{b\in I}V_b)\subseteq U_a\bigcap V_a=\varnothing}{=}\varnothing$$

proving that

$$\langle X,\mathcal{T}\rangle \text{ is regular} \tag{14.122}$$

Let A,B be closed sets such that $A\bigcap B=\varnothing$. Then $\forall a\in A$ we have as $a\in X\setminus B$ by [eq: 14.122] that there exists $U_a,V_a\in\mathcal{T}$ with $a\in U_a$, $B\subseteq V_a$ and $U_a\bigcap V_a=\varnothing$. As by [theorem: 14.234] A is compact and $A\subseteq\bigcup_{a\in A}U_a$ there exist a finite $I\subseteq A$ such that $A\subseteq\bigcup_{a\in I}U_a$. So if we take $U=\bigcup_{a\in I}U_a\in\mathcal{T}$ and $V=\bigcap_{a\in I}V_a\in\mathcal{T}$ [as I is finite] then we have $A\subseteq U$ and $B\subseteq V$ and

$$U\bigcap V=\left(\bigcup_{a\in I}U_a\right)\bigcap\left(\bigcap_{b\in I}V_b\right)=\bigcup_{a\in I}\left(U_a\bigcap\left(\bigcap_{b\in I}V_b\right)\right)\underset{U_a\bigcap(\bigcap_{b\in I}V_b)\subseteq U_a\bigcap V_a=\varnothing}{=}\varnothing$$

proving that

$$\langle X,\mathcal{T}\rangle \text{ is normal}$$

□

A weaker version of compactness is sequential compactness.

Definition 14.240. (Limit Point Compact Set) *Let $\langle X,\mathcal{T}\rangle$ be a topological space then a subset $C\subseteq X$ is **limit point compact** if every **infinite** $A\subseteq K$ has a limit point [see definition: 14.26]*

Theorem 14.241. *Every compact subspace of a topological space $\langle X,\mathcal{T}\rangle$ is limit point compact.*

Proof. We proceed by contradiction. Let C be a compact subset and let $A\subseteq C$ be a infinite subset of C that does not have a limit point. Then by the definition of a limit point [see definition: 14.26] we have $\forall x\in X$ that there exist a $U_x\in\mathcal{T}$ with $x\in U_x$ so that $U_x\bigcap(A\setminus\{x\})=\varnothing$. Let $y\in U_x\bigcap A$ then if $y\neq x$ we have $y\in(U_x\bigcap A)\setminus\{x\}=U_x\bigcap(A\setminus\{x\})=\varnothing$ a contradiction, hence we have that $y=x\in\{x\}$, proving that

$$U_x\bigcap A\subseteq\{x\} \tag{14.123}$$

As $C\subseteq\bigcup_{x\in C}U_x$ we have, as C is compact, that there exist a finite $F\subseteq C$ such that $C\subseteq\bigcup_{x\in F}U_x$. Further from $A\subseteq C$ we have

$$A=C\bigcap A\subseteq\left(\bigcup_{x\in F}U_x\right)\bigcap A=\bigcup_{x\in F}(U_x\bigcap A)\subseteq_{\text{[eq: 14.123]}}\bigcup_{x\in F}\{x\}=F$$

proving that A is finite contradicting the fact that we have taken A to be infinite. So we must have that every infinite subset of C has a limit point. □

Definition 14.242. (Compact Class) *Let X be a set then $C\subseteq\mathcal{P}(X)$ a set of subsets of X is a **compact class** if for any sequence $\{K_i\}_{i\in\mathbb{N}}\subseteq C$ with $\bigcap_{i\in\mathbb{N}}K_i=\varnothing$ there exist a $N\in\mathbb{N}$ such that $\bigcap_{i\in\{1,\dots,N\}}K_i=\varnothing$.*

Theorem 14.243. *Let $\langle X,\mathcal{T}\rangle$ be a Hausdorff topological space and C a set of compact subsets of X then C is a compact class.*

Proof. We prove this by contradiction. Let $\{K_i\}_{i\in\mathbb{N}}\subseteq C$ be a sequence of subsets of C such that $\bigcap_{i\in\mathbb{N}}K_i=\varnothing$. Assume that $\forall n\in\mathbb{N}$ we have $\bigcap_{i\in\{1,\dots,n\}}K_i\neq\varnothing$. Define

$$\{E_i\}_{i\in\mathbb{N}}\subseteq\mathcal{P}(X) \text{ by } E_i=\bigcap_{j\in\{1,\dots,n\}}K_j \tag{14.124}$$

so that

$$E_n\subseteq E_m \text{ for } n,m\in\mathbb{N} \text{ with } m\leqslant n \tag{14.125}$$

Let $j\in\mathbb{N}$ then K_i is compact hence, as $\mathcal{T}$ is Hausdorff it follows from [theorem: 14.233] that K_j is closed, hence for $i\in\mathbb{N}$ we have by [theorem: 14.21] that $E_i=\bigcap_{j\in\{1,\dots,n\}}K_j$ is closed, hence $X\setminus E_i$ is open proving that

$$\{X\setminus E_i\}_{i\in\mathbb{N}} \text{ is a sequence of open sets in other words } \{X\setminus E_i\}_{i\in\mathbb{N}}\subseteq\mathcal{T}$$

Further as $\forall i \in \mathbb{N}$ we have that $E_i = \bigcap_{j \in \{1, \ldots, i\}} K_i \subseteq K_i$ it follows from [theorem: 1.33] that $X \setminus K_i \subseteq X \setminus E_i$. Let $x \in K_1$ then as $\bigcap_{i \in \mathbb{N}} K_i = \varnothing$ there exist a $n \in \mathbb{N}$ such that $x \notin K_n$ hence $x \in X \setminus K_n \subseteq X \setminus E_n$ proving that $K_1 \subseteq \bigcup_{n \in \mathbb{N}} (X \setminus E_n)$. As K_1 is compact there exist a finite $I \subseteq \mathbb{N}$ such that

$$K_1 \subseteq \bigcup_{i \in I} (X \setminus E_n) \tag{14.126}$$

Take $m = \max(I)$ then as $\forall i \in I$ we have $i \leqslant m$ so that by [eq: 14.125] $E_m \subseteq E_i \Rightarrow X \setminus E_i \subseteq X \setminus E_m$ which using [eq: 14.126] proves that

$$K_1 \subseteq X \setminus E_m \tag{14.127}$$

Hence

$$E_m \underset{[\text{eq: } 14.124]}{=} \bigcap_{i \in \{1, \ldots, m\}} K_i \subseteq K_1 \subseteq_{[\text{eq: } 14.127]} X \setminus E_m$$

from which it follows that $E_m = \varnothing$ [for if $y \in E_m$ then $y \in X \setminus E_m$ so that $y \notin E_m$]. As $E_m = \bigcap_{i \in \{1, \ldots, m\}} K_i$ we have $\varnothing = \bigcap_{i \in \{1, \ldots, m\}} K_i$ which contradicts the assumption that $\forall n \in \mathbb{N}$ we have $\bigcap_{i \in \{1, \ldots, n\}} K_i \neq \varnothing$. So the assumption is wrong and we must have that there exist a $N \in \mathbb{N}$ such that $\bigcap_{i \in \{1, \ldots, N\}} K_i = \varnothing$ from which it follows that C is a compact class □

Theorem 14.244. *Let $\langle X, d_X \rangle$, $\langle Y, d_Y \rangle$, K a non empty compact subset of X and $f: K \to Y$ a continuous function then f is uniform continuous [see definition: 14.153].*

Proof. Let $\varepsilon \in \mathbb{R}^+$. Take $x \in K$ then by the continuity of f there exist by [theorem: 14.127] a $\delta_x \in \mathbb{R}^+$ [depending on x] such that for every $y \in K$ with $(d_X)_{|K \times K}(x, y) < \delta_x$ we have $d_Y(f(x), f(y)) < \frac{\varepsilon}{2}$. As $d_X(x, y) = (d_X)_{|K \times K}(x, y) < \delta_x$ we have $x \in B_{d_X}(x, \delta_x)$ so that

$$K \subseteq \bigcup_{x \in K} B_{d_X}\left(x, \frac{\delta_x}{2}\right), \tag{14.128}$$

hence, as K is compact, there exist a finite $I \subseteq K$ such that $K \subseteq \bigcup_{x \in I} B_{d_X}\left(x, \frac{\delta_x}{2}\right)$. As $K \neq \varnothing$ and $\left\{\frac{\delta_x}{2} | x \in I\right\}$ is finite [see theorem: 6.46] it follows that

$$\delta = \min\left(\left\{\frac{\delta_x}{2} | x \in I\right\}\right) \text{exist} \tag{14.129}$$

Let now $x, y \in K$ be such that $(d_X)_{|K \times K}(x, y) < \delta \Rightarrow d_X(x, y) < \delta$ then, as $x \in K$, there exist by [eq: 14.128] a $z \in I$ such that

$$x \in B_{d_X}\left(z, \frac{\delta_z}{2}\right) \text{ or } (d_X)_{|K \times K}(x, z) = d_X(x, z) < \frac{\delta_z}{2} \tag{14.130}$$

Then

$$(d_X)_{|K \times K}(z, y) = d_X(z, y) \leqslant d_X(z, x) + d_X(x, y) < \frac{\delta_z}{2} + \delta \leqslant_{[\text{eq: } 14.129]} \frac{\delta_z}{2} + \frac{\delta_z}{2} = \delta_z$$

so that

$$d_Y(f(z), f(y)) < \frac{\varepsilon}{2} \tag{14.131}$$

As $(d_X)_{|K \times K}(x, z) <_{[\text{eq: } 14.130]} \frac{\delta_z}{2}$ we have

$$d_Y(f(x), f(z)) < \frac{\varepsilon}{2} \tag{14.132}$$

Finally we have

$$d_Y(f(x), f(y)) \leqslant d_Y(f(x), f(z)) + d_Y(f(z), f(y)) <_{[\text{eqs: } 14.131,\ 14.132]} \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$$

proving uniform continuity. □

14.8.1 Product of Compact sets

The purpose of this section is to prove that the product of compact sets is compact, this is know as Tychonoff's theorem. The best way to do this is to develop the framework of filter bases.

14.8.1.1 Filter bases

Definition 14.245. (Filter Base) *Let X be a set then a a non empty family $\mathfrak{U} = \{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{P}(X)$ of a subsets of X is a **filter base in** X if*

1. *$\forall \alpha \in I$ we have $A_\alpha \neq \varnothing$*
2. *$\forall \alpha, \beta \in I$ there exist a $\gamma \in I$ such that $A_\gamma \subseteq A_\alpha \bigcap B_\beta$*

Using mathematical induction we can extend (2) of the above definition.

Theorem 14.246. *Let X be a set and $\mathfrak{U}=\{A_\alpha\}_{\alpha\in I}\subseteq\mathcal{P}(X)$ a filter base then for a finite non empty $J\subseteq I$ there exist a $\gamma\in I$ such that $A_\gamma\subseteq\bigcap_{\alpha\in J}A_\alpha$*

Proof. Define

$$S=\left\{n\in\mathbb{N}|\text{If } J\subseteq I \text{ with } \operatorname{card}(J)=n \text{ then there exist a } \gamma\in I \text{ such that } A_\gamma\subseteq\bigcap_{\alpha\in J}A_\alpha\right\}$$

then we have:

$1\in S$. If $J\subseteq I$ with $\operatorname{card}(J)=1$ then there exist a $\gamma\in I$ such that $J=\{\gamma\}$. As $A_\gamma\subseteq A_\gamma=\bigcup_{\alpha\in J}A_\alpha$ it follows that $1\in S$.

$n\in S\Rightarrow n+1\in S$. Let $J\subseteq I$ with $\operatorname{card}(J)=n+1$ then there exist a bijection

$$\beta\colon\{1,\dots,n+1\}\to J$$

By [theorem: 2.91] $\beta_{|\{1,\dots,n\}}\colon\{1,\dots,n\}\to J\setminus\{\beta(n+1)\}$ is a bijection so that $\operatorname{card}(J\setminus\beta(n+1))=n$. As $n\in S$ there exist a $\zeta\in J\setminus\{\beta(n+1)\}$ such that

$$A_\zeta\subseteq\bigcap_{\alpha\in J\setminus\{\beta(n+1)\}}A_\alpha$$

By definition of a filter base there exist a $\gamma\in I$ such that

$$A_\gamma\subseteq A_\zeta\bigcap A_{\beta(n+1)}\subseteq\left(\bigcap_{\alpha\in J\setminus\{b(n+1)\}}A_\gamma\right)\bigcap A_{\beta(n+1)}=\bigcap_{\alpha\in J}A_\alpha$$

proving that $n+1\in S$.

By mathematical induction it follows that $S=\mathbb{N}$. Hence if $J\subseteq I$ is finite we have as $\operatorname{card}(J)\in\mathbb{N}$ that there exist a $\gamma\in I$ such that $A_\gamma\subseteq\bigcap_{\alpha\in I}A_\alpha$. □

Example 14.247. Let X be a set, $\varnothing\neq A\subseteq X$ then $\mathfrak{U}=\{A_\alpha\}_{\alpha\in\{A\}}\subseteq\mathcal{P}(X)$ defined by $A_\alpha=\alpha$ is a filter base in X

Proof. First as $\{A\}\neq\varnothing$ $\{A_\alpha\}_{\alpha\in\{A\}}$ is a non empty family of subsets in X. Further

1. $\forall\alpha\in\{A\}$ we have $A_\alpha=\alpha=A\neq\varnothing$.
2. If $\alpha,\beta\in\{A\}$ then $\alpha=\beta=A$ so for $\gamma=A$ we have $A_\gamma=A\subseteq A\bigcap A=A_\alpha\bigcap A_\beta$ □

Definition 14.248. *Let $\langle X,\mathcal{T}\rangle$ be a topological space, $x\in X$ then $\mathfrak{U}(x)=\{U\}_{U\in\{U\in\mathcal{T}|x\in U\}}\subseteq\mathcal{P}(X)$ [a family of open sets containing x] is called a **neighborhood filter base of** x.*

The name used in the above definition suggest that $\mathfrak{U}(x)$ is a filter base in X which is proved in the following theorem.

Theorem 14.249. *Let $\langle X,\mathcal{T}\rangle$ be a topological space then $\mathfrak{U}(x)$ is a filter base in X*

Proof. Let $x\in X$ then as $X\in\mathcal{T}$ we have that $X\in\{U\in\mathcal{T}|x\in U\}$ so that $\mathfrak{U}(x)$ is a non empty family. Further we have

1. If $U\in\{U\in\mathcal{T}|x\in U\}$ then $x\in U$ so that $U\neq\varnothing$,
2. If $U,V\in\{U\in\mathcal{T}|x\in U\}$ then $x\in U\bigcap V\in\mathcal{T}$ so that for $W=U\bigcap V\in\{U\in\mathcal{T}|x\in U\}$ we have

$$W\subseteq U\bigcap V$$

proving by [definition: 14.245] that $\mathfrak{U}(x)$ is a filter base in X. □

Theorem 14.250. *Let X be a set and let $\mathfrak{U}=\{A_\alpha\}_{\alpha\in I}\subseteq\mathcal{P}(X)$ and $\mathfrak{W}=\{B_\alpha\}_{\alpha\in J}\subseteq\mathcal{P}(X)$ filter bases then we have:*

1. *$\mathfrak{U}\bigcup\mathfrak{W}$ is a filter base in X where $\mathfrak{U}\bigcup\mathfrak{W}=\{A_\alpha\bigcup B_\beta\}_{(\alpha,\beta)\in I\times J}$*
2. *If $\forall(\alpha,\beta)\in I\times J$ $A_\alpha\bigcap B_\beta\neq\varnothing$ then $\mathfrak{A}\bigcap\mathfrak{W}$ is a filter base where $\mathfrak{A}\bigcap\mathfrak{W}=\{A_\alpha\bigcap B_\beta\}_{(\alpha,\beta)\in I\times J}$*

Proof. First as $I\neq\varnothing$ and $J\neq\varnothing$ we have that $I\times J\neq\varnothing$, further we have:

$\mathfrak{U}\bigcup\mathfrak{W}$ is a filter base. Because

1. $\forall(\alpha,\beta)\in I\times J$ we have $A_\alpha\neq\varnothing\wedge B_\alpha\neq\varnothing$ so that $A_\alpha\bigcup B_\alpha\neq\varnothing$

2. $\forall(\alpha_1,\beta_1),(\alpha_2,\beta_2)\in I\times J$ there exists a $\gamma_1\in I$ and a $\gamma_2\in J$ such that $A_{\gamma_1}\subseteq A_{\alpha_1}\bigcap A_{\alpha_2}$ and $B_{\gamma_2}\subseteq B_{\beta_1}\bigcap B_{\beta_2}$, hence for $(\gamma_1,\gamma_2)\in I\times J$ we have
$$A_{\gamma_1}\bigcup B_{\gamma_2}\subseteq\left(A_{\alpha_1}\bigcap A_{\alpha_2}\right)\bigcup\left(B_{\beta_1}\bigcap B_{\beta_2}\right)\tag{14.133}$$
Further
$$\begin{aligned}A_{\alpha_1}\bigcap A_{\alpha_2}&\subseteq A_{\alpha_1}\subseteq A_{\alpha_1}\bigcup B_{\beta_1}\\A_{\alpha_1}\bigcap A_{\alpha_2}&\subseteq A_{a_2}\subseteq A_{\alpha_2}\bigcup B_{\beta_2}\end{aligned}$$
so that
$$A_{\alpha_1}\bigcap A_{\alpha_2}\subseteq\left(A_{\alpha_1}\bigcup B_{\beta_1}\right)\bigcap\left(A_{\alpha_2}\bigcup B_{\beta_2}\right)\tag{14.134}$$
and
$$\begin{aligned}B_{\beta_1}\bigcap B_{\beta_2}&\subseteq B_{\beta_1}\subseteq A_{\alpha_1}\bigcup B_{\beta_1}\\B_{\beta_1}\bigcap B_{\beta_2}&\subseteq B_{\beta_2}\subseteq A_{\alpha_2}\bigcup B_{\beta_2}\end{aligned}$$
so that
$$B_{\beta_1}\bigcap B_{\beta_2}\subseteq\left(A_{\alpha_1}\bigcup B_{\beta_1}\right)\bigcap\left(A_{\alpha_2}\bigcup B_{\beta_2}\right)\tag{14.135}$$
Combining [eqs: 14.133, 14.134 and 14.135] gives finally
$$A_{\gamma_1}\bigcup B_{\gamma_2}\subseteq\left(A_{\alpha_1}\bigcup B_{\beta_1}\right)\bigcap\left(A_{\alpha_2}\bigcup B_{\beta_2}\right)$$

$\mathfrak{U}\bigcap\mathfrak{W}$ is a filter base. Because

1. $\forall(\alpha,\beta)\in I\times J$ we have $A_\alpha\bigcap B_\beta\neq\varnothing$ by the definition of $\mathfrak{U}\bigcap\mathfrak{W}$
2. $\forall(\alpha_1,\beta_1),(\alpha_2,\beta_2)\in I\times J$ there exists a $\gamma_1\in I$ and a $\gamma_2\in J$ such that $A_{\gamma_1}\subseteq A_{\alpha_1}\bigcap A_{\alpha_2}$ and $B_{\gamma_2}\subseteq B_{\beta_1}\bigcap B_{\beta_2}$, hence for $(\gamma_1,\gamma_2)\in I\times J$ we have
$$A_{\gamma_1}\bigcap B_{\gamma_2}\subseteq\left(A_{\alpha_1}\bigcap A_{\alpha_2}\right)\bigcap\left(B_{\beta_1}\bigcap B_{\beta_2}\right)=\left(A_{\alpha_1}\bigcap B_{\beta_1}\right)\bigcap\left(A_{\alpha_2}\bigcap B_{\beta_2}\right)$$ □

Theorem 14.251. *Let X be a set and $\mathfrak{U}=\{A_\alpha\}_{\alpha\in I}\subseteq\mathcal{P}(X)$ a filter base in X then it has the **finite intersection property**, meaning that every **finite** $J\subseteq I$ we have $\bigcap_{\alpha\in J}A_\alpha\neq\varnothing$*

Proof. Using [theorem: 14.246] there exist a $\gamma\in I$ such that $A_\gamma\subseteq\bigcap_{\alpha\in J}A_\alpha$, as by the definition of a filter base $A_\gamma\neq\varnothing$ it follows that $\bigcap_{\alpha\in J}A_\alpha\neq\varnothing$. □

Definition 14.252. *Let $\langle X,\mathcal{T}\rangle$ be a topological space, $x\in X$ and $\mathfrak{U}=\{A_\alpha\}_{\alpha\in I}\subseteq\mathcal{P}(X)$ a filter base in X then we say that:*

1. *$\mathfrak{U}$ **converges to** x noted as $\mathfrak{U}\to x$ if $\forall U\in\mathcal{T}$ with $x\in U$ there exist a $\alpha\in I$ such that $A_\alpha\subseteq U$*
2. *$\mathfrak{U}$ **accumulates at** x noted as $\mathfrak{U}\succ x$ if $\forall U\in\mathcal{T}$ with $x\in U$ we have that $\forall\alpha\in I$ $A_\alpha\bigcap U\neq\varnothing$*

Theorem 14.253. *Let $\langle X,\mathcal{T}\rangle$ be a topological space then*
$$\mathcal{T}\text{ is Hausdorff}\Leftrightarrow\text{each filter base that converges converges to exactly one point}$$

Proof.

$\Rightarrow$. Assume that $\mathcal{T}$ is Hausdorff and $\mathfrak{U}=\{A_\alpha\}_{\alpha\in I}\subseteq\mathcal{P}(X)$ be such that for $x,y\in X$ $\mathfrak{U}\to x$ and $\mathfrak{U}\to y$. If $x\neq y$ then as $\mathcal{T}$ is Hausdorff there exist $U,V\in T$ such that $x\in U$, $y\in V$ and $U\bigcap V=\varnothing$. From $\mathfrak{U}\to x$ and $\mathfrak{U}\to y$ it follows that there exists $\alpha,\beta\in I$ such that $A_\alpha\subseteq U$ and $A_\beta\subseteq V$. Then there exist a $\gamma\in I$ such that $\varnothing\neq A_\gamma\subseteq A_\alpha\bigcap A_\beta\subseteq U\bigcap V$, hence $\varnothing\neq U\bigcap V$ contradicting $U\bigcap V=\varnothing$. So we must have that $x=y$ proving uniqueness.

$\Leftarrow$. Assume that $\mathcal{T}$ is not Hausdorff then $\exists x,y\in X$ with $x\neq y$ such that $\forall U,V\in\mathcal{T}$ with $x\in U\wedge y\in V$ we have $U\bigcap V\neq\varnothing$. We construct now a filter base that converges to x and y. By [theorem: 14.250] and [definition: 14.248] we have that $\mathfrak{W}=\mathfrak{U}(x)\bigcap\mathfrak{U}(y)$ is a filter base in X where
$$\mathfrak{U}(x)=\{U\}_{U\in\{U\in\mathcal{T}|x\in U\}}\text{ and }\mathfrak{U}(y)=\{U\}_{U\in\{U\in\mathcal{T}\}}$$
If $U\in\mathcal{T}$ with $x\in U$ then as $y\in X\in\mathcal{T}$ we have that $(U,X)\in\{U\in\mathcal{T}|x\in U\}\times\{V\in\mathcal{T}|y\in V\}$ so that $U\bigcap X=U\subseteq U$ proving that
$$\mathfrak{W}\to x$$

Further if $V \in \mathcal{T}$ with $y \in V$ then as $x \in X \in \mathcal{T}$ we have that $(X, V) \in \{U \in \mathcal{T} | x \in U\} \times \{V \in \mathcal{T} | y \in V\}$ so that $X \bigcap V = V \subseteq V$ proving that

$$\mathfrak{W} \to y$$

By the hypothesis it follows then that $x = y$ contradicting $x \neq y$. So the assumption that $\mathcal{T}$ is not Hausdorff is wrong proving that $\mathcal{T}$ is Hausdorff. □

Theorem 14.254. *Let $\langle X, \mathcal{T} \rangle$ be a topological space, $x \in X$ and $\mathfrak{U} = \{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{P}(X)$ a filter base in X then*

$$\mathfrak{U} \succ x \Leftrightarrow x \in \bigcap_{\alpha \in I} \overline{A_\alpha}$$

Proof.

⇒. If $\mathfrak{U} \succ x$ then $\forall U \in \mathcal{T}$ with $x \in U$ we have $\forall \alpha \in I$ $A_\alpha \bigcap U \neq \varnothing$, so that by [theorem: 14.28] $\forall \alpha \in I$ $x \in \overline{A_\alpha}$ hence $x \in \bigcap_{\alpha \in I} \overline{A_\alpha}$.

⇐. Let $U \in \mathcal{T}$ with $x \in U$ then as $x \in \bigcap_{\alpha \in I} \overline{A_i}$ we have that $\forall \alpha \in I$ $x \in \overline{A_\alpha}$ so that by [theorem: 14.28] $A_\alpha \bigcap U \neq \varnothing$. Hence $\mathfrak{U} \succ x$. □

Example 14.255. Let $\langle X.\mathcal{T} \rangle$ be a topological space and $x \in X$ then $\mathfrak{U}(x) \to x$

Proof. By [definition: 14.248] $\mathfrak{U}(x) = \{U\}_{U \in \{U \in \mathcal{T} | x \in U\}}$. So if $U \in \mathcal{T}$ with $x \in U$ then $U \in \{U \in \mathcal{T} | x \in U\}$ and $U \subseteq U$ proving that $\mathfrak{U}(x) \to x$. □

Definition 14.256. *Let X be a set and $\mathfrak{U} = \{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{P}(X)$, $\mathfrak{W} = \{B_\alpha\}_{\alpha \in J} \subseteq \mathcal{P}(X)$ two filter bases in X then $\mathfrak{W}$ is **subordinate** to $\mathfrak{U}$ noted as $\mathfrak{W} \gg \mathfrak{U}$ or $\mathfrak{U} \ll \mathfrak{W}$ iff*

$$\forall \alpha \in I \text{ we have that } \exists \beta \in J \text{ such that } B_\beta \subseteq \mathcal{A}_\alpha$$

Definition 14.257. *Let X be a set and $\mathfrak{U} = \{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{P}(X)$, $\mathfrak{W} = \{B_\alpha\}_{\alpha \in J} \subseteq \mathcal{P}(X)$ two filter bases in X then $\mathfrak{U} \sqsubseteq \mathfrak{W}$ iff*

$$\forall \alpha \in I \text{ there exist a } \beta \in J \text{ such that } A_\alpha = B_\beta$$

Theorem 14.258. *Let X be a set then we have:*

1. *If $\mathfrak{U} = \{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{P}(X)$, $\mathfrak{W} = \{B_\alpha\}_{\alpha \in J} \subseteq \mathcal{P}(X)$ are two filter bases in X such that $\mathfrak{U} \sqsubseteq \mathfrak{W}$ then $\mathfrak{W} \gg \mathfrak{U}$*
2. *If $\mathfrak{U} = \{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{P}(X)$, $\mathfrak{W} = \{B_\alpha\}_{\alpha \in J} \subseteq \mathcal{P}(X)$ are two filter bases in X such that $\mathfrak{W} \gg \mathfrak{U}$ then $\forall \beta \in J$ and $\forall \alpha \in I$ we have that $A_\alpha \bigcap B_\beta \neq \varnothing$*
3. *If $\langle X, \mathcal{T} \rangle$ is a topological space, $x \in X$ and $\mathfrak{U} = \{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{P}(X)$ a filter base in X*
$$\mathfrak{U} \to x \Leftrightarrow \mathfrak{U} \geqslant \mathfrak{U}(x)$$
4. *If $\mathfrak{U}_1 = \{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{P}(X)$, $\mathfrak{U}_2 = \{B_\alpha\}_{\sigma \in J} \subseteq \mathcal{P}(X)$ and $\mathfrak{U}_3 = \{C_\alpha\}_{\alpha \in K} \subseteq \mathcal{P}(X)$ are filter bases in X such that $\mathfrak{U}_1 \gg \mathfrak{U}_2$ and $\mathfrak{U}_2 \gg \mathfrak{U}_3$ then $\mathfrak{U}_1 \gg \mathfrak{U}_3$*
5. *If $\mathfrak{U}$ is a filter base in X then $\mathfrak{U} \gg \mathfrak{U}$*

Proof.

1. Let $\alpha \in I$ then as $\mathfrak{U} \sqsubseteq \mathfrak{W}$ there exist a $\beta \in J$ such that $A_\alpha = B_\beta$ so that $B_\beta \subseteq A_\alpha$ proving that $\mathfrak{W} \gg \mathfrak{U}$.
2. We proceed by contradiction. So assume that $\exists \beta \in J$ and $\exists \alpha \in I$ such that $A_\alpha \bigcap B_\beta = \varnothing$. As $\mathfrak{W} \gg \mathfrak{U}$ there exist a $\gamma \in J$ such that $B_\gamma \subseteq A_\alpha$ and by the definition of a filter base there exist a $\delta \in J$ such that $\varnothing \neq B_\delta \subseteq B_\gamma \bigcap B_\beta \subseteq A_\alpha \bigcap B_\beta$ proving that $A_\alpha \bigcap B_\beta \neq \varnothing$ a contradiction. Hence the assumption is wrong and we have $\forall \beta \in J$ and $\forall \alpha \in I$ $A_\alpha \bigcap B_\beta \neq \varnothing$.
3. By definition $\mathfrak{U}(x) = \{U\}_{U \in \{U \in \mathcal{T} | x \in U\}} \subseteq \mathcal{P}(X)$ and
$$\begin{aligned} \mathfrak{U} \to x &\Leftrightarrow \forall U \in \mathcal{T} \text{ with } x \in U \ \exists \alpha \in I \text{ such that } A_\alpha \subseteq U \\ &\Leftrightarrow \forall U \in \{U \in \mathcal{T} | x \in U\} \ \exists \alpha \in I \text{ such that } A_\alpha \subseteq U \\ &\Leftrightarrow \mathfrak{U} \gg \mathfrak{U}(x) \end{aligned}$$
4. Let $\gamma \in K$ then as $\mathfrak{U}_2 \geqslant \mathfrak{U}_3$ there exist a $\beta \in J$ such that $B_\beta \subseteq C_\gamma$, as $\mathfrak{U}_1 \gg \mathfrak{U}_2$ there exist a $\alpha \in I$ such that $A_\alpha \subseteq B_\beta$. Hence $A_\alpha \subseteq C_\gamma$ proving that $\mathfrak{U}_1 \geqslant \mathfrak{U}_3$.
5. If $\mathfrak{U} = \{A_i\}_{i \in I} \subseteq \mathcal{P}(X)$ is a filter base in X then $\forall i \in I$ we have $A_i = A_i \Rightarrow A_i \subseteq A_i$, hence $\mathfrak{U} \gg \mathfrak{U}$. □

Theorem 14.259. *Let $\langle X, \mathcal{T}\rangle$ be a topological space and $\mathfrak{U} = \{A_\alpha\}_{\alpha\in I} \subseteq \mathcal{P}(X)$, $\mathfrak{W} = \{B_\alpha\}_{\alpha\in J} \subseteq \mathcal{P}(X)$ be filter bases in X then we have for $x, y \in X$ that*

1. *If $\mathfrak{U} \to x$ then $\mathfrak{U} \succ x$*
2. *If X is Hausdorff, $\mathfrak{U} \to x$ and $\mathcal{U} \succ y$ then $x = y$*
3. *If $\mathfrak{W} \gg \mathfrak{U}$ then we have:*
   a. *If $\mathfrak{U} \to x$ then $\mathfrak{W} \to x$*
   b. *If $\mathfrak{W} \succ x$ then $\mathfrak{U} \succ x$*

Proof.

1. Let $U \in \mathcal{T}$ with $x \in U$ then as $\mathfrak{U} \to x$ there exist a $\alpha \in I$ such that $A_\alpha \subseteq U$. Given $\beta \in I$ then as there exist a $\gamma \in I$ with $\varnothing \neq A_\gamma \subseteq A_\alpha \bigcap A_\beta \subseteq U \bigcap A_\beta \Rightarrow U \bigcap A_\beta \neq \varnothing$ proving that $\mathfrak{U} \succ x$.
2. Assume that $x \neq y$ then as X is Hausdorff there exists $U, V \in \mathcal{T}$ with $x \in U \wedge y \in V$ such that $\bigcup \bigcap V = \varnothing$. As $\mathfrak{U} \to x$ there exist a $\alpha \in I$ such that $A_\alpha \subseteq U$ so that
$$A_\alpha \bigcap V \subseteq U \bigcap V = \varnothing$$
As $\mathfrak{U} \to y$ we have that $A_\alpha \bigcap V \neq \varnothing$ contradicting the above hence we must have $x = y$.
3. Let $\mathfrak{W} \gg \mathfrak{U}$ then we have:
   a. Let $U \in \mathcal{T}$ with $x \in U$ then as $\mathfrak{U} \to x$ there exist a $\alpha \in I$ such that $A_\alpha \subseteq U$. As $\mathfrak{M} \gg \mathfrak{U}$ there exist a $\beta \in J$ such that $B_\beta \subseteq A_\alpha \subseteq U$ proving that $\mathfrak{W} \to x$
   b. Let $U \in \mathcal{T}$ with $x \in U$ then as $\mathfrak{W} \succ x$ we have $\forall \beta \in J\ U \bigcap B_\beta \neq \varnothing$. Let $\alpha \in I$ then as $\mathfrak{W} \gg \mathfrak{U}$ there exist a $\gamma \in J$ such that $B_\gamma \subseteq A_\alpha$ hence $\varnothing \neq U \bigcap B_\gamma \subseteq U \bigcap A_\alpha$ proving that $\mathfrak{A} \succ x$. □

Definition 14.260. *Let $\langle X, \mathcal{T}\rangle$ be a topological space, $A \subseteq X$ and $\mathfrak{U} = \{A_\alpha\}_{\alpha\in I} \subseteq \mathcal{P}(X)$ a filter base then we say that $\mathfrak{U}$ is **on** A iff $\forall \alpha \in I$ we have $A_\alpha \subseteq A$.*

Theorem 14.261. *Let $\langle X, \mathcal{T}\rangle$ be a topological space, $A \subseteq X$ then*
$$x \in \overline{A} \Leftrightarrow \textit{there exist a filter base } \mathfrak{U} = \{A_\alpha\}_{\alpha\in I} \subseteq \mathcal{P}(X) \textbf{ on } A \textit{ with } \mathfrak{U} \to x$$

Proof.

⇒. Let $x \in \overline{A}$ then by [theorem: 14.28] $\forall U \in \mathcal{T}$ with $x \in U$ we have $A \bigcap U \neq \varnothing$. As $\varnothing \neq A \bigcap U \subseteq A \Rightarrow A \neq \varnothing$ we have using [example: 14.247] that $\mathfrak{U} = \{A_\alpha\}_{\alpha\in\{A\}}$ where $A_\alpha = A$ is a filter base in X, further by [theorem: 14.249] $\mathfrak{U}(x) = \{U\}_{U\in\{U\in\mathcal{T}|x\in U\}}$ is also a filter base in X. Define $\mathfrak{W} = \{A_\alpha \bigcap U\}_{(\alpha,U)\in\{A\}\times\{U\in\mathcal{T}|x\in U\}}$. As $\forall (\alpha, U) \in \{A\} \times \{U \in \mathcal{T}|x \in U\}$ we have that $\varnothing \neq A \bigcap U \subseteq U$ it follows from [theorem: 14.250] that
$$\mathfrak{W} \text{ is a filter base } \textbf{on } A$$
Further as $\forall U \in \mathcal{T}$ with $x \in U$ we have that for $(A, U) \in \{A\} \times \{U \in \mathcal{T}|x \in U\}$ $A \bigcap U \subseteq U$ it follows that
$$\mathfrak{W} \to x$$

⇐. By the hypothesis there exist a filter base $\mathfrak{U} = \{A_\alpha\}_{\alpha\in I} \subseteq \mathcal{P}(X)$ **on** A with $\mathfrak{U} \to x$. Then if $U \in \mathcal{T}$ with $x \in U$ there exist a $\alpha \in I$ such that $A_\alpha \subseteq U$ [because $\mathfrak{U} \to x$], further, as $\mathfrak{U}$ is a filter base **on** A, $A_\alpha \subseteq A$. So it follows that $\varnothing \neq A_\alpha = A_\alpha \bigcap A \subseteq U \bigcap A$ which by [theorem: 14.28] proves that $x \in \overline{A}$. □

Theorem 14.262. *Let $f: X \to Y$ be a function between sets X and Y. If $\mathfrak{U} = \{A_\alpha\}_{\alpha\in I} \subseteq \mathcal{P}(X)$ is a filter base in X then if we define $f[\mathfrak{U}]$ by*
$$f[\mathfrak{U}] = \{f(A_\alpha)\}_{\alpha\in I} \subseteq \mathcal{P}(Y)$$
we have that
$$f[\mathfrak{U}] \textit{ is a filter base in } Y$$

Proof. As $\mathfrak{U}$ is a filter base we have $I \neq \varnothing$ and

1. $\forall \alpha \in I\ A_\alpha \neq \varnothing$ so that
$$f(A_\alpha) \neq \varnothing$$

2. If $\alpha, \beta \in I$ then there exist a $\gamma \in I$ such that $A_\gamma \subseteq A_\alpha \bigcap A_\beta$ so that using [theorem: 2.95]

$$f(A_\gamma) \subseteq f\left(A_\alpha \bigcap A_\beta\right) \subseteq f(A_\alpha) \bigcap f(A_\beta)$$

proving that $f[\mathfrak{U}] = \{f(A_\alpha)\}_{\alpha \in I} \subseteq \mathcal{P}(Y)$ is a filter base of Y. □

Filter bases allows us to have a equivalent definition of a continuous function.

Theorem 14.263. *Let $\langle X, \mathcal{T}\rangle$, $\langle Y, \mathcal{S}\rangle$ be topological spaces and $f: X \to Y$ is a function then*

$$f \text{ is continuous at } x \Leftrightarrow f[\mathfrak{U}(x)] \to f(x)$$

where

$$f[\mathfrak{U}(x)] = \{f(U)\}_{U \in \{U \in \mathcal{T} | x \in U\}} \text{ is a filter base by [theorem: 14.262]}$$

Proof. First note that $\mathfrak{U}(x) = \{U\}_{U \in \{U \in \mathcal{T} | x \in U\}} \subseteq \mathcal{P}(X)$ so that

$$f[\mathfrak{U}(x)] = \{f(U)\}_{U \in \{U \in \mathcal{T} | x \in U\}}$$

⇒. Let $V \in \mathcal{S}$ such that $f(x) \in V$ then as f is continuous at x there exist a $U \in T$ with $x \in U$ such that $f(U) \subseteq V$. In other words $\exists U \in \{U \in \mathcal{T} | x \in U\}$ such that $f(U) \subseteq V$ which by [definition: 14.252] proves that

$$f[\mathfrak{U}(x)] \to f(x)$$

⇐. Let $V \in \mathcal{S}$ with $f(x) \in V$ then as $f[\mathfrak{U}(x)] \to f(x)$ there exist a $U \in \{U \in \mathcal{T} | x \in U\}$ such that

$$f(U) \subseteq V$$

proving that f is continuous at x. □

Theorem 14.264. *Let $\langle X, \mathcal{T}\rangle$, $\langle Y, \mathcal{S}\rangle$ be topological spaces and $f: X \to Y$ a function then*

$$f \text{ is continuous on } X \Leftrightarrow \forall x \in X \text{ and for every filter base } \mathfrak{U} \text{ in } X \text{ with } \mathfrak{U} \to x \text{ we have } f[\mathfrak{U}] \to f(x)$$

Proof.

⇒. Let $x \in X$ and $\mathfrak{U} = \{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{P}(X)$ such that $\mathfrak{U} \to x$ then by [theorem: 14.258] $\mathfrak{U} \gg \mathfrak{U}(x)$. So if $U \in \{U \in \mathcal{T} | x \in U\}$ by [definition: 14.256] there exist a $\alpha \in I$ such that $A_\alpha \subseteq U$, hence $f(A_\alpha) \subseteq f(U)$. So by [definition: 14.256]

$$f[\mathfrak{U}] \gg f[\mathfrak{U}(x)] \tag{14.136}$$

As f is continuous, hence continuous at x, we have by the previous theorem [theorem: 14.263] that

$$f[\mathfrak{U}(x)] \to f(x) \tag{14.137}$$

Using [theorem: 14.259] together with [eqs: 14.136, 14.137] proves that

$$f[\mathfrak{U}] \to f(x) \tag{14.138}$$

⇐. Take $A \subseteq X$ and let $y \in f(\overline{A})$ then $\exists x \in \overline{A}$ such that $y = f(x)$. Using [theorem: 14.261] there exist a filter base $\mathfrak{U} = \{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{P}(X)$ **on** A such that $\mathfrak{U} \to x$. As $\mathfrak{U}$ is a filter base **on** A we have that $\forall \alpha \in I$ $A_\alpha \subseteq A$ so that $f(A_\alpha) \subseteq f(A)$ proving that $f[\mathfrak{U}]$ is **on** $f(A)$. This together with $f[\mathfrak{U}] \to f(x)$ [by the hypothesis] gives by [theorem: 14.261] that $y = f(x) \in \overline{f(A)}$ proving that

$$f(\overline{A}) \subseteq \overline{f(A)}$$

Finally using [theorem: 14.137] on the above proves that f is continuous. □

Theorem 14.265. *Let $\{\langle X_i, \mathcal{T}_i\rangle\}_{i \in I}$ be a family of topological spaces, $\langle X, \mathcal{T}_{\text{product}}\rangle$ the topological space defined by $X = \prod_{i \in I} X_i$ together with the product topology $\mathcal{T}_{\text{product}}$ [see theorem: 14.43], $x \in X$ and $\mathfrak{U} = \{A_\alpha\}_{\alpha \in J} \subseteq \prod_{i \in I} X_i$ a filter base in X and $x \in X$ then*

$$\mathfrak{U} \to x \Leftrightarrow \forall i \in I \text{ we have for } \pi_i: X \to X_i \text{ the projection function that } \pi_i[\mathfrak{U}] \to \pi_i(x) = x_i$$

Proof.

⇒. Let $i \in I$ as $\mathfrak{U} \to x$ we have, as $\pi_i: \prod_{i \in I} X_i \to X_i$ is continuous [see theorem: 14.140], by the previous theorem [theorem: 14.264] that $\pi_i[\mathfrak{U}] \to \pi_i(x) = x_i$.

⇐. Let $x \in \prod_{i \in I} X_i$ and $U \in \mathcal{T}_{\text{product}}$ such that $x \in U$. By the definition of the product topology [see theorem: 14.43] there exist a finite J and $\{S_i\}_{i \in J} \subseteq \{\pi_i^{-1}(V) | i \in I \wedge U \in \mathcal{T}_i\}$ such that

$$x \in \bigcap_{j \in J} S_j \subseteq U \tag{14.139}$$

Let $j \in J$ then $\exists i_j \in I$ and a $U_j \in \mathcal{T}_{i_j}$ such that $S_j = \pi_{i_j}^{-1}(U_j)$, so $\pi_{i_j}(S_j) \subseteq U_j$, hence $\pi_{i_j}(x) \in \pi_{i_j}(S_j) \subseteq U_j \in \mathcal{T}_{i_j}$. By the hypothesis $\pi_{i_j}[\mathfrak{U}] \to \pi_{i_j}(x)$ so there exist a $\alpha_j \in I$ such that $\pi_{i_j}(A_{\alpha_j}) \subseteq U_j$ hence $A_{\alpha_j} \subseteq \pi_{i_j}^{-1}(U_j) = S_j$. So $\bigcap_{j \in J} A_{\alpha_j} \subseteq \bigcap_{j \in J} S_j \subseteq U$. As J is finite it follows from [theorem: 14.246] that $\exists \gamma \in I$ such that

$$A_\gamma \subseteq \bigcap_{j \in J} A_{\alpha_j} \subseteq U$$

proving that

$$\mathfrak{U} \to x$$

□

Definition 14.266. *Let X a set then a filter base $\mathfrak{U}$ in X is called **maximal** or a **ultra filter** if for every filter base $\mathfrak{W}$ in X with $\mathfrak{W} \gg \mathfrak{U}$ we have that $\mathfrak{U} \gg \mathfrak{W}$.*

Theorem 14.267. *Let X a set then and $\mathfrak{U} = \{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{P}(X)$ a filter base in X then*

$$\mathfrak{U} \text{ is maximal}$$

$$\Updownarrow$$

$$\forall A \subseteq X \text{ we have } (\exists \beta \in I \text{ with } A_\beta \subseteq A \wedge \forall \alpha \in I\ A_\alpha \nsubseteq X \setminus A\ ) \vee (\forall \alpha \in I A_\alpha \nsubseteq A \wedge \exists \beta \in I \text{ with } A_\beta \subseteq X \setminus A)$$

In other words

$$\mathfrak{U} \text{ is maximal} \Leftrightarrow \forall A \subseteq X \text{ only one of the sets } A, X \setminus A \text{ contains a member of } \mathfrak{U}$$

Proof.

⇒. Let $A \subseteq X$ and assume that there exist $\alpha, \beta \in I$ such that $A_\alpha \subseteq A$ and $A_\beta \subseteq X \setminus A$ then $A_\alpha \bigcap A_\beta \subseteq A \bigcap (X \setminus A) = \varnothing$ proving that $A_\alpha \bigcap A_\beta = \varnothing$. By definition of a filter base there exist a $\gamma \in I$ such that $\varnothing \neq A_\gamma \subseteq A_\alpha \bigcap A_\beta = \varnothing$ leading to the contradiction $\varnothing \neq \varnothing$. Hence

$$\neg(\exists \alpha, \beta \in I \text{ such that } A_\alpha \subseteq A \wedge A_\beta \subseteq X \setminus A) \tag{14.140}$$

We have now two possibilities to consider for $A \subseteq X$:

$\forall \alpha \in I A_\alpha \nsubseteq A$. Then $\forall \alpha \in I$ there exist a $x \in A_\alpha$ so that $x \notin A$, hence $(X \setminus A) \bigcap A_\alpha \neq \varnothing$. Further if $\alpha, \beta \in I$ then as $\mathfrak{U}$ is a filter base there exist a $\gamma \in I$ such that $A_\gamma \subseteq A_\alpha \bigcap A_\beta$ so that $(X \setminus A) \bigcap A_\gamma \subseteq (X \setminus A) \bigcap (A_\alpha \bigcap A_\beta) = ((X \setminus A) \bigcap A_\alpha) \bigcap ((A \setminus A) \bigcap A_\beta)$. Hence we have that

$$\mathfrak{W} = \left\{(X \setminus A) \bigcap A_\alpha\right\}_{\alpha \in I} \subseteq \mathcal{P}(X) \text{ is a filter base in X}$$

Further as $\forall \alpha \in I\ (X \setminus A) \bigcap A_\alpha \subseteq A_\alpha$ we have by [definition: 14.256] that $\mathfrak{W} \gg \mathfrak{U}$, as $\mathfrak{U}$ is maximal it follows that $\mathfrak{U} \gg \mathfrak{W}$. Hence $\forall \alpha \in I$ there exist a $\beta \in I$ such that $A_\beta \subseteq (X \setminus A) \bigcap A_\alpha \subseteq X \setminus A$. So in this case we have proved that

$$\forall \alpha \in I\ A_\alpha \nsubseteq A \wedge \exists \beta \in I \text{ with } A_\beta \subseteq X \setminus A$$

$\exists \beta \in I$ with $A_\beta \subseteq A$. Then by [eq: 14.140] we must have that $\forall \alpha \in I$ that $A_\alpha \nsubseteq X \setminus A$ proving that in this case

$$\exists \beta \in I \text{ with } A_\beta \subseteq A \wedge \forall \alpha \in I\ A_\alpha \nsubseteq X \setminus A$$

⇐. Let $\mathfrak{U} = \{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{P}(X)$ be a filter bases such that

$$\forall A \subseteq X \text{ one and only one of the two sets } A, X \setminus A \text{ contains a member of } \mathfrak{U} \tag{14.141}$$

Let then $\mathfrak{W} = \{B_\beta\}_{\beta \in J}$ such that $\mathfrak{W} \gg \mathfrak{U}$. If $\beta \in J$ then for B_β we have by [eq: 14.141] that there exist a $\alpha \in I$ such that either $A_\alpha \subseteq B_\beta$ or $A_\alpha \subseteq X \setminus B_\beta$. The last case would mean that $A_\alpha \bigcap B_\beta = \varnothing$ contradicting [theorem: 14.258 (2)], so we must have that $A_\alpha \subseteq B_\beta$ proving that $\mathfrak{U} \gg \mathfrak{W}$ and thus maximality of $\mathfrak{U}$. □

Theorem 14.268. *Let X be a set, $\mathfrak{U} = \{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{P}(X)$ a filter base in X then there exist a maximal filter base $\mathfrak{W}$ in X such that $\mathfrak{W} \gg \mathfrak{U}$*

Proof. We use a extension of Zorn's lemma [see theorem: 3.135] in this proof. To use this we must first define a pre-order [see definition: 3.25]. Let

$$\mathcal{A} = \{\mathfrak{W} | \mathfrak{W} \text{ is a filter base in } X \text{ with } \mathfrak{W} \gg \mathfrak{U}\}$$

Using [theorem: 14.258] we have that $\mathfrak{U} \gg \mathfrak{U}$ so that

$$\mathfrak{U} \in \mathcal{A} \text{ hence } \mathcal{A} \neq \varnothing$$

Define now the following relation $\leqslant$ on $\mathcal{A}$

$$\leqslant \subseteq \mathcal{A} \times \mathcal{A} \text{ by } \mathfrak{V} \leqslant \mathfrak{W} \text{ iff } \mathfrak{W} \gg \mathfrak{V}$$

then we have:

reflexivity. Let $\mathfrak{W} \in \mathcal{A}$ then by then by [theorem: 14.258] we have $\mathfrak{W} \leqslant \mathfrak{W}$.

transitivity. Assume that $\mathfrak{W}_1 \leqslant \mathfrak{W}_2 \wedge \mathfrak{W}_2 \leqslant \mathfrak{W}_3$ then $\mathfrak{W}_2 \gg \mathfrak{W}_1 \wedge \mathfrak{W}_3 \gg \mathfrak{W}_2$ hence by [theorem: 14.258] we have $\mathfrak{W}_3 \gg \mathfrak{W}_1$ so that $\mathfrak{W}_1 \leqslant \mathfrak{W}_3$.

Hence we have that

$$\langle \mathcal{A}, \leqslant \rangle \text{ is a pre-ordered set}$$

Let $\mathcal{C} \subseteq \mathcal{A}$ be any **chain** in $\langle \mathcal{A}, \leqslant \rangle$ then we must consider two cases for $\mathcal{C}$

$\mathcal{C} = \varnothing$. Then we have $\forall \mathfrak{C} \in \mathcal{C}$ that $\mathfrak{C} \leqslant \mathfrak{U}$ is satisfied vacuously proving that $\mathfrak{U}$ is a upper bound of $\mathcal{C}$.

$\mathcal{C} \neq \varnothing$. Given $\mathfrak{C} = \{C_\alpha\}_{\alpha \in J} \in \mathcal{C}$ define $S_{\mathfrak{C}} = \{C_\alpha | \alpha \in J\} \neq \varnothing$ [as $J \neq \varnothing$] and define

$$\mathbb{B} = \bigcup_{\mathfrak{C} \in \mathcal{C}} S_{\mathfrak{C}} \neq \varnothing \text{ [as } \mathcal{C} \neq \varnothing] \text{ and } \mathfrak{B} = \{B\}_{B \in \mathbb{B}} \subseteq \mathcal{P}(X) \tag{14.142}$$

then we have

$$\forall \mathfrak{C} = \{C_\alpha\}_{\alpha \in J} \in \mathcal{C} \text{ we have } \forall \alpha \in J \text{ that } C_\alpha \in \mathbb{B} \tag{14.143}$$

Next we have

1. $\forall B \in \mathbb{B}$ there exist a $\mathfrak{C} = \{C_\alpha\}_{\alpha \in J} \in \mathcal{C}$ such that $B \in S_{\mathfrak{C}}$, hence $\exists \alpha \in J$ such that $B = C_\alpha \neq \varnothing$ [as $\mathfrak{C}$ is a filter base]. Hence we have

$$\forall B \in \mathbb{B} \text{ that } B \neq \varnothing \tag{14.144}$$

2. Let $B_1, B_2 \in \mathbb{B}$ then there exists $\mathfrak{C}_1 = \{C^1_\alpha\}_{\alpha \in J_1} \in \mathcal{C}$, $\mathfrak{C}_2 = \{C^2_\alpha\}_{\alpha \in J_2} \in \mathcal{C}$ such that $\exists \gamma_1 \in J_1$, $\exists \gamma_2 \in J_2$ with $B_1 = C^1_{\gamma_1}$, $B_2 = C^2_{\gamma_2}$. Now as $\mathcal{C}$ is a chain we have the following possible cases:

   $\mathfrak{C}_1 \leqslant \mathfrak{C}_2$. Then $\mathfrak{C}_2 \gg \mathfrak{C}_1$, hence there exist a $\gamma \in J_2$ such that $C^2_\gamma \subseteq C^1_{\gamma_1} = B_1$. As $\mathfrak{C}_2$ is a filter base there exist a $\beta \in J_2$ such that $C^2_\beta \subseteq C^2_\gamma \bigcap C^2_{\gamma_2} \subseteq B_1 \bigcap B_2$. Take $B_3 = C^2_\beta \in \mathbb{B}$ then $B_3 \subseteq B_1 \bigcap B_2$.

   $\mathfrak{C}_2 \leqslant \mathfrak{C}_1$. Then $\mathfrak{C}_1 \gg \mathfrak{C}_2$, hence there exist a $\gamma \in J_1$ such that $C^1_\gamma \subseteq C^2_{\gamma_1} = B_2$. As $\mathfrak{C}_1$ is a filter base there exist a $\beta \in J_1$ such that $C^1_\beta \subseteq C^1_{\gamma_1} \bigcap C^1_\gamma \subseteq B_1 \bigcap B_2$. Take $B_3 = C^1_\beta \in \mathbb{B}$ then $B_3 \subseteq B_1 \bigcap B_2$.

   So in all cases we have

$$\forall B_1, B_2 \in \mathbb{B} \text{ there exist a } B_3 \in \mathbb{B} \text{ such that } B_3 \subseteq B_1 \bigcap B_2 \tag{14.145}$$

Combining [eqs: 14.142, 14.144 and 14.145] proves that

$$\mathfrak{B} \text{ is a filter base}$$

As $\mathcal{C} \neq \varnothing$ there exist a $\mathfrak{C} = \{C_\alpha\}_{\alpha \in J} \in \mathcal{C} \subseteq \mathcal{A}$ so that $\mathfrak{C} \gg \mathfrak{U}$, hence if $\alpha \in I$ then there exist a $\gamma \in J$ such that $C_\gamma \subseteq A_\alpha$. By [eq: 14.143] we have that $C_\gamma \in \mathbb{B}$ proving that $\mathfrak{B} \gg \mathfrak{U}$, hence

$$\mathfrak{B} \in \mathcal{A}$$

Further if $\mathfrak{V} = \{D_\alpha\}_{\alpha \in K} \in \mathcal{C}$ then $\forall \alpha \in K$ $D_\alpha \subseteq D_\alpha$ hence, as by [eq: 14.143] $D_\alpha \in \mathbb{B}$, we have that $\mathfrak{B} \gg \mathfrak{D}$ proving that $\mathfrak{D} \leqslant \mathfrak{B}$. Hence

$$\mathfrak{B} \text{ is a upper bound of } \mathfrak{C}$$

So in all cases we have that $\mathfrak{C}$ has a upper bound. In other words we have proved that every chain in $\mathcal{A}$ has a upper bound. So using a variant of Zorn's lemma [theorem: 3.135] there exist a $\mathfrak{M} \in \mathcal{A}$ such that $\forall \mathfrak{N} \in \mathcal{A}$ with $\mathfrak{M} \leqslant \mathfrak{N}$ we have $\mathfrak{N} \leqslant \mathfrak{M}$. Hence

$$\forall \mathfrak{N} \in \mathcal{A} \text{ with } \mathfrak{N} \gg \mathfrak{M} \text{ we have } \mathfrak{M} \gg \mathfrak{N} \text{ and as } \mathfrak{M} \in \mathcal{A} \text{ we have also } \mathfrak{M} \gg \mathfrak{U} \tag{14.146}$$

Now if $\mathfrak{O}$ is a filter base in X with $\mathfrak{O} \gg \mathfrak{W}$ we have as $\mathfrak{W} \geqslant \mathfrak{U}$ by [theorem: 14.258] that $\mathfrak{O} \gg \mathfrak{U}$ so that $\mathfrak{O} \in \mathcal{A}$, hence by [eq: 14.146] it follows that $\mathfrak{M} \gg \mathfrak{O}$. Hence

$$\mathfrak{M} \text{ is a ultra filter or maximal filter base with } \mathfrak{M} \gg \mathfrak{U}$$

□

Theorem 14.269. *Let $\langle X, \mathcal{T} \rangle$ be a topological space and $\mathfrak{U} = \{A_i\}_{i \in I} \subseteq \mathcal{P}(X)$ a maximal filter then $\forall x \in X$*

$$\mathfrak{U} \succ x \Leftrightarrow \mathfrak{U} \to x$$

Proof.

$\Rightarrow$. Let $U \in \mathcal{T}$ with $x \in U$. Using [theorem: 14.267] there exist a $\alpha \in I$ such that either $A_\alpha \subseteq U$ or $A_\alpha \subseteq X \setminus U$. Now as $\mathfrak{U} \succ x$ we must have that $A_\alpha \bigcap U \neq \varnothing$ contradicting $A_\alpha \subseteq X \setminus U$ hence we must have that $A_\alpha \subseteq U$, so $\mathfrak{U} \to x$.

$\Leftarrow$. This follows from [theorem: 14.259]. □

Theorem 14.270. *Let X, Y be sets and $f: X \to Y$ a function then if $\mathfrak{U} = \{A_i\}_{i \in I} \subseteq \mathcal{P}(X)$ is a maximal filter base in X then $f[\mathfrak{U}]$ is a maximal filter base in Y.*

Proof. Using [theorem: 14.262] $f[\mathfrak{U}] = \{f(A_i)\}_{i \in I}$ is a filter base in Y. To prove maximality we use [theorem: 14.267]. So let $A \subseteq Y$ and consider $f^{-1}(A)$ then by the maximality of $\mathfrak{U}$ we have either:

$\exists \beta \in I$ with $A_\beta \subseteq f^{-1}(A) \wedge \forall \alpha \in I\ A_\alpha \nsubseteq X \setminus f^{-1}(A)$. Then $f(A_\beta) \subseteq A$ and $\forall \alpha \in I$ there exist a $x \in A_\alpha$ such that $x \notin X \setminus f^{-1}(A) \Rightarrow x \in f^{-1}(A) \Rightarrow f(x) \in A \Rightarrow f(x) \notin Y \setminus A$ so that $f(A_\alpha) \nsubseteq Y \setminus A$.

$\forall \alpha \in I\ A_\alpha \nsubseteq f^{-1}(A) \wedge \exists \beta \in I$ with $A_\beta \subseteq X \setminus f^{-1}(A)$. Then $\forall \alpha$ we have that $\exists x \in A_\alpha$ such that $x \notin f^{-1}(A) \Rightarrow f(x) \notin A$ proving that $f(A_\alpha) \nsubseteq A$. Further $\forall x \in A_\beta$ we have $x \in X \setminus f^{-1}(A) \Rightarrow x \notin f^{-1}(A) \Rightarrow f(x) \notin A$ proving that $f(A_\beta) \subseteq Y \setminus A$.

Using [theorem: 14.267] it follows then that $f[\mathfrak{U}]$ is a maximal filter base in Y. □

14.8.1.2 Tychonoff's theorem

All this hard work is to prove Tychonoffs theorem on the product of compact spaces. The following theorem creates the relation between compactness and filter bases.

Theorem 14.271. *Let $\langle X, \mathcal{T} \rangle$ be a topological space then the following are equivalent*

1. *X is compact*
2. *If $\{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{T}^c$ is a non empty family of closed sets in X satisfying $\bigcap_{\alpha \in I} A_\alpha = \varnothing$ then there exist a non empty finite $J \subseteq I$ such that $\bigcap_{\alpha \in J} A_\alpha = \varnothing$.*
3. *If $\{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{T}^c$ is a non empty family of closed sets in X such that $\forall J \subseteq I$ J finite and non empty we have $\bigcap_{\alpha \in J} A_\alpha \neq \varnothing$ then $\bigcap_{\alpha \in I} A_\alpha \neq \varnothing$.*
4. *If $\mathfrak{U}$ is a filter base in X then there exist a $x \in X$ such that $\mathfrak{U} \succ x$*
5. *If $\mathfrak{U}$ is a maximal filter base in X then there exist a $x \in X$ such that $\mathfrak{U} \to x$*

Proof.

$1 \Rightarrow 2$. Let $\{A_\alpha\}_{\alpha \in I} \subseteq \mathcal{T}^c$ be a family of closed sets in X such that $\bigcap_{\alpha \in I} A_\alpha = \varnothing$ then

$$X = X \setminus \varnothing = X \setminus \left(\bigcap_{\alpha \in I} A_\alpha \right) \underset{\text{[theorem: 2.132]}}{=} \bigcup_{\alpha \in I} (X \setminus A_\alpha)$$

As $\forall \alpha \in I$ $X \setminus A_\alpha \in \mathcal{T}$ and X is compact there exist a finite $J \subseteq I$ such that

$$X = \bigcup_{\alpha \in J} (X \setminus A_\alpha)$$

hence

$$\varnothing = X \setminus X = X \setminus \left(\bigcup_{\alpha \in J} (X \setminus A_\alpha) \right) \underset{\text{[theorem: 2.132]}}{=} \bigcap_{\alpha \in J} (X \setminus (X \setminus A_\alpha)) = \bigcap_{\alpha \in J} A_\alpha$$

$2 \Rightarrow 1$. Let $\{U_\alpha\}_{\alpha \in I} \subseteq \mathcal{T}$ be a family of open sets such that $X = \bigcup_{\alpha \in I} U_\alpha$ then

$$\varnothing = X \setminus X = X \setminus \left(\bigcup_{\alpha \in I} U_\alpha \right) \underset{\text{[theorem: 2.132]}}{=} \bigcap_{\alpha \in I} (X \setminus U_\alpha)$$

As $\forall \alpha \in I$ we have that $X \setminus U_\alpha$ is closed we have by the hypothesis that there exist a non empty finite $J \subseteq I$ such that $\bigcap_{\alpha \in J} (X \setminus U_\alpha) = \varnothing$. Hence we have

$$X = X \setminus \varnothing = X \setminus \left(\bigcap_{\alpha \in J} (X \setminus U_\alpha) \right) \underset{\text{[theorem: 2.132]}}{=} \bigcup_{\alpha \in J} (X \setminus (X \setminus U_\alpha)) = \bigcup_{\alpha \in J} U_\alpha$$

proving that X is compact.

2 ⇒ 3. Let $\{A_\alpha\}_{\alpha\in I}\subseteq\mathcal{T}^c$ be a family of closed sets in X such that $\forall J\subseteq I$ J finite and non empty we have $\bigcap_{\alpha\in J}A_\alpha\neq\varnothing$. Assume that $\bigcap_{\alpha\in I}A_\alpha=\varnothing$ then by (2) there exist a finite non empty $J\subseteq I$ such that $\bigcap_{\alpha\in J}A_\alpha=\varnothing$ contradiction the fact that $\bigcap_{\alpha\in J}A_\alpha\neq\varnothing$. Hence we must have that

$$\bigcap_{\alpha\in I}A_\alpha\neq\varnothing$$

3 ⇒ 2. Let $\{A_\alpha\}_{\alpha\in I}\subseteq\mathcal{T}^c$ be a family of closed sets in X such that $\bigcap_{\alpha\in I}A_\alpha=\varnothing$. Assume that $\forall J\subseteq I$ finite non empty we have $\bigcap_{\alpha\in J}A_\alpha\neq\varnothing$ then by (3) $\bigcap_{\alpha\in I}A_\alpha\neq\varnothing$ contradicting $\bigcap_{\alpha\in I}A_\alpha=\varnothing$. Hence there must exist a finite non empty $J\subseteq I$ such that $\bigcap_{\alpha\in J}A_\alpha=\varnothing$, proving (3).

3 ⇒ 4. Let $\mathfrak{U}=\{A_\alpha\}_{\alpha\in I}\subseteq\mathcal{P}(X)$ be a filter base, then for every finite $J\subseteq I$ we have by [theorem: 14.246] that there exist a $\gamma\in I$ such that $\varnothing\neq A_\gamma\subseteq\bigcap_{\alpha\in J}A_\alpha$ proving that $\varnothing\neq\bigcap_{\alpha\in J}A_\alpha$ hence, as $\forall\alpha\in J$ we have $A_\alpha\subseteq\overline{A_\alpha}$, $\varnothing\neq\bigcap_{\alpha\in J}\overline{A_\alpha}$. Using (3) it follows then that $\varnothing\neq\bigcap_{\alpha\in I}\overline{A_\alpha}$, hence there exist a $x\in X$ such that $x\in\bigcap_{\alpha\in I}\overline{A_a}$. Applying [theorem: 14.254] proves that

$$\mathfrak{U}\succ x$$

4 ⇒ 5. Let $\mathfrak{U}$ be a maximal filter base then by (4) there exist a $x\in X$ such that $\mathfrak{U}\succ x$, by [theorem: 14.269] we have then that

$$\mathfrak{U}\to x$$

5 ⇒ 3. Let $\{F_\alpha\}_{\alpha\in I}\subseteq\mathcal{T}^c$ a family of closed sets in X such that for every finite non empty $J\subseteq I$ we have $\bigcap_{\alpha\in J}F_\alpha\neq\varnothing$. Take $K=\{\bigcap_{\alpha\in J}F_\alpha|J\subseteq I,\ J\text{ finite non empty}\}$ and define the family

$$\mathfrak{U}=\{A\}_{A\in K}\subseteq\mathcal{P}(X)$$

We prove now that $\mathfrak{U}$ is a filter base. First, as $I\neq\varnothing$ there exist a $i\in I$, as $\{i\}$ is finite and $\{i\}\subseteq I$ it follows that $\bigcap_{\alpha\in\{i\}}F_\alpha\in K$ so that

$$K\neq\varnothing \tag{14.147}$$

Second, if $A\in K$ then there exist a finite $J\subseteq I$ such that $A=\bigcap_{\alpha\in K}F_\alpha$, as $\bigcap_{\alpha\in K}F_\alpha\neq\varnothing$ it follows that $A\neq\varnothing$. So we have proves that

$$\forall A\in K\text{ we have }A\neq\varnothing \tag{14.148}$$

Third, let $A_1,A_2\in K$ then there exist finite non empty $J_1,J_2\subseteq I$ such that $A_1=\bigcap_{\alpha\in J_1}F_\alpha$, $A_2=\bigcap_{\beta\in J_2}F_\beta$. If $x\in A_1\bigcap A_2=(\bigcap_{\alpha\in J_1}F_\alpha)\bigcap(\bigcap_{\beta\in J_2}F_\beta)$ then if $\gamma\in J_1\bigcup J_2$ we have either or both $\gamma\in J_1\Rightarrow x\in F_\gamma$ or $\gamma\in J_2\Rightarrow x\in F_\gamma$ so that $x\in\bigcap_{\gamma\in J_1\bigcup J_2}F_\gamma$, hence

$$A_1\bigcap A_2\subseteq\bigcap_{\gamma\in J_1\bigcup J_2}F_\gamma \tag{14.149}$$

If $x\in\bigcap_{\gamma\in J_1\bigcup J_2}F_\gamma$ then $\forall\alpha\in J_1$ we have $\alpha\in J_1\bigcup J_2$ so that $x\in F_\alpha$, hence $x\in\bigcap_{\alpha\in J_1}F_\alpha=A_1$ and $\forall\beta\in J_2$ we have $\beta\in J_1\bigcup J_2$ so that $x\in F_\beta$, hence $x\in\bigcap_{\alpha\in J_2}F_\beta=A_2$. So $x\in A_1\bigcap A_2$ proving that $\bigcap_{\gamma\in J_1\bigcup J_2}F_\gamma\subseteq A_1\bigcap A_2$, combining this with [eq: 14.149] proves that

$$A_1\bigcap A_2=\bigcap_{\gamma\in J_1\bigcup J_2}F_\gamma$$

As $J_1\bigcup J_2$ is finite non empty it follows that $A_3=\bigcap_{\gamma\in J_1\bigcup J_2}F_\gamma\in K$. So we have proved that

$$\forall A_1,A_2\in K\text{ there exist a }A_3\in K\text{ such that }A_3=A_1\bigcap A_2\in K \tag{14.150}$$

From [eqs: 14.147, 14.148, 14.150] it follows that

$$\mathfrak{U}=\{A\}_{A\in K}\subseteq\mathcal{P}(X)\text{ is a filter base in }X$$

Using [theorem: 14.268] there exist a maximal filter base $\mathfrak{M}$ in X such that $\mathfrak{M}\gg\mathfrak{U}$. By (5) there exist a $x\in X$ such that $\mathfrak{M}\to x$, using [theorem: 14.259] it follows that $\mathfrak{M}\succ x$, finally as $\mathfrak{M}\gg\mathfrak{U}$ it follows from [theorem: 14.259] that

$$\mathfrak{U}\succ x$$

By [theorem: 14.254] we have then $x\in\bigcap_{A\in K}\overline{A}$ hence $\forall A\in K$ we have $x\in\overline{A}$. For every $\alpha\in I$ $\{\alpha\}\subseteq I$ and $\{\alpha\}$ is finite so that $F_\alpha=\bigcap_{\alpha\in\{a\}}F_a\in K$, hence $x\in\overline{F_\alpha}\underset{F_\alpha\text{ is closed}}{=}F_a$. So we have proved that

$$x\in\bigcap_{\alpha\in I}F_\alpha\Rightarrow\bigcap_{\alpha\in I}F_\alpha\neq\varnothing$$

□

We are now ready for Tychonoff's theorem.

Theorem 14.272. *Let $\{\langle X_i, \mathcal{T}_i\rangle\}_{i\in I}$ be a family of non empty topological spaces then for the topological space $\langle \prod_{i\in I} X_i, \mathcal{T}_{\text{product}}\rangle$ based on the product topology we have*

$$\prod_{i\in I} X_i \text{ is compact} \Leftrightarrow \forall i\in I\ X_i \text{ is compact}$$

Proof.

- **⇒.** Let $i\in I$ then by [theorem: 14.140] $\pi_i\colon \prod_{i\in I} X_i \to X_i$ is continuous, hence using [theorem: 14.232] it follows that $\pi_i(\prod_{i\in I} X_i)$ is compact. Further as $\forall i\in I\ X_i \neq \varnothing$ we have by [theorem: 3.108] $\pi_i\colon \prod_{i\in I} X_i \to X_i$ is surjective so that $\pi_i(\prod_{i\in I} X_i) = X_i$. Hence we have that X_i is compact.
- **⇐.** Let $\mathfrak{U}$ be a maximal filter base in $\prod_{i\in I} X_i$. Given $i\in I$ we have by [theorem: 14.270] that $\pi_i[\mathfrak{U}]$ is a maximal filter base in X_i, as X_i is compact it follows from [theorem: 14.271 (5)] that $\exists x_i \in X_i$ such that $\pi_i[\mathfrak{U}] \to x_i$. This defines a $x\in \prod_{i\in I} X_i$ so that $\pi_i[\mathfrak{U}] \to x_i = \pi_i(x)$. Using [theorem: 14.265] it follows that $\mathfrak{U}\to x$ so by [theorem: 14.271 (5)] again we have that $\prod_{i\in I} X_i$ is compact. □

Corollary 14.273. *Let $\{\langle X_i, \mathcal{T}_i\rangle\}_{i\in I}$ be a family of topological spaces then if $\forall i\in I$ we have $\varnothing \neq C_i \subseteq X_i$ we have that*

$$\prod_{i\in I} C_i \text{ is compact} \Leftrightarrow \forall i\in I\ C_i \text{ is compact}$$

Proof. Note that the subspace topology of $\prod_{i\in I} C_i$ is equal to the product topology of the subspace topologies [see theorem 14.48]. As by definition a subset is compact is if it is compact in the subspace topology we can use Tychonoff's [theorem: 14.272] to prove this theorem. □

Note 14.274. If in the above corollary there exist a $i\in I$ such that $C_i = \varnothing$ then $\prod_{i\in I} C_i = \varnothing$ hence by [example: 14.226] compact even if the rest of the C_i's are not compact. Hence

14.8.1.3 Consequences of Tychonoff's Theorem

Theorem 14.275. *Let $\langle \mathbb{R}^n, \mathcal{T}_{\|\|_n}\rangle$ be the topological space of tuples of real numbers where the norm $\|\|_n$ is defined by $\|x\|_n = \max(\{|\pi_i(x)| | i\in \{1,\dots,n\}\})$ then for $\{a_i\}_{i\in\{1,\dots,n\}} \subseteq \mathbb{R}$ and $\{b_i\}_{i\in\{1,\dots,n\}} \subseteq \mathbb{R}$ with $\forall i\in\{1,\dots,n\}$ $a_i \leqslant b_i$ we have that*

$$\prod_{i\in\{1,\dots,n\}} [a_i, b_i] \text{ is compact}$$

Proof. First using [theorem: 14.94] we have that $\mathcal{T}_{\|\|_n}$ is the product topology based on the product of the normed spaces $\langle \mathbb{R}, \|\|\rangle$. Now by Heine Borel for the real numbers [see theorem: 14.235] we have that $\forall i\in\{1,\dots,n\}$ $[a_i, b_i]$ is compact, so using Tychonoff's theorem [theorem: 14.273] it follows that $\prod_{i\in\{1,\dots,n\}} [a_i, b_i]$ is compact. □

Theorem 14.276. (Heine-Borel) *Let $\langle \mathbb{R}^n, \mathcal{T}_{\|\|_n}\rangle$ be the topological space of the tuples of real numbers based on the maximum norm and $C\subseteq \mathbb{R}^n$ then we have*

$$C \text{ is compact} \Leftrightarrow C \text{ is bounded and closed}$$

Proof.

- **⇒.** Using [theorem: 14.230] C is bounded, further by [theorem: 14.204] $\mathcal{T}_{\|\|_n}$ is Hausdorff, so using [theorem: 14.233] C is closed.
- **⇐.** If C is empty then C is compact by [example: 14.226] so we may assume that $C\neq 0$. Hence their exist a $c\in C$. As C is bounded there exist a $M\in\mathbb{R}^+$ such that

  $$\forall x\in C \text{ we have } \max(\{|\pi_i(x-c)| | i\in\{1,\dots,n\}\}) = \|x-c\|_{\max} \leqslant M$$

  So given $x\in C$ and $i\in\{1,\dots,n\}$ we have that $|x_i - c_i| = |\pi_i(x) - \pi_i(c)| = |\pi_i(x-c)| \leqslant M$ or $x_i \in [c_i - M, c_i + M]$, hence we have that $x\in \prod_{i\in\{1,\dots,n\}} [c_i - M, c_i + M]$ proving that

  $$C \subseteq \prod_{i\in\{1,\dots,n\}} [c_i - M, c_i + M]$$

  Using the previous theorem [theorem: 14.275] $\prod_{i\in\{1,\dots,n\}} [c_i - M, c_i + M]$ is compact and as C is closed we have by [theorem: 14.234] that C is compact. □

A important consequence of the Heine-Borel theorem is that all norms on $\mathbb{R}^n$ are equivalent [see definition: 14.113 and theorem: 14.115].

Theorem 14.277. *let $n \in \mathbb{N}$ then all norms on $\mathbb{R}^n$ are equivalent.*

Proof. Let $\|\|_n$ be the maximum norm defined as $\|x\|_n = \max(\{\pi_i(x) | i \in \{1, \ldots, n\}\})$ and let $\|\|$ be another norm defined on $\mathbb{R}^n$. Using [theorem: 14.152] it follows that

$$\|\|: \mathbb{R}^n \to \mathbb{R} \text{ is continuous using the norms } \|\|_n \text{ and } || \tag{14.151}$$

Further using [example: 14.156] it follows that

$$\|\|_n: \mathbb{R}^n \to \mathbb{R} \text{ is continuous using the norms } \|\|_n \text{ and } || \tag{14.152}$$

Define now

$$S = \{x \in \mathbb{R}^n | \|x\|_n = 1\}$$

so that

$$S = \|\|_n^{-1}(\{1\})$$

As $\langle \mathbb{R}, \|\| \rangle$ is Hausdorff [see theorem: 14.204] we have by [theorem: 14.206] that $\{1\}$ is closed. Using the continuity of $\|\|_n$ [see eq: 14.152] it follows from [theorem: 14.137] that $\|\|_n^{-1}(\{1\})$ is closed, hence

$$S \text{ is closed} \tag{14.153}$$

Further if $x, y \in S$ then $\|x - y\|_n \leqslant \|x\|_n + \|y\|_n \leqslant 1 + 1 = 2$ which proves that

$$S \text{ is bounded} \tag{14.154}$$

So [eqs: 14.153, 14.154] allows us to use Heine-Borel [theorem: 14.276] to prove that

$$S \text{ is compact}$$

Using the above and the fact that $\|\|$ is continuous [eq: 14.151] allows us to use the extreme value theorem [theorem: 14.238], hence there exists $x_1, x_2 \in \mathbb{R}^n$ such that $\forall x \in S$ we have $\|x_1\| \leqslant \|x\| \leqslant \|x_2\|$. Define $M_1 = \|x_1\|$ and $M_2 = \|x_2\|$ then as $\|x_1\|_n = 1 \Rightarrow x_1 \neq 0$ and $\|x_2\|_n = 1 \Rightarrow x_2 \neq 0$ we have

$$\exists \alpha, \beta \in \mathbb{R}^+ \text{ such that } \forall x \in \mathbb{R}^n \text{ with } \|x\|_n = 1 \text{ we have } M_1 \leqslant \|x\| \leqslant M_2 \text{ where } M_1, M_2 \in \mathbb{R}^+ \tag{14.155}$$

Let $x \in X$ then we have either

$x = 0$. Then $\|x\|_n = 0 = \|x\|$ so that $M_1 \cdot \|x\|_n = 0 = \|x\| = 0 = M_2 \cdot \|x\|_n$ hence

$$M_1 \cdot \|x\|_n \leqslant \|x\| \leqslant M_2 \cdot \|x\|_n$$

$x \neq 0$. Then $\|x\|_n \neq 0$ so that $\left\| \frac{1}{\|x\|_n} \cdot x \right\|_n = \frac{1}{\|x\|_n} \cdot \|x\|_n = 1$ so that by [eq: 14.155]

$$M_1 \leqslant \left\| \frac{1}{\|x\|_n} \cdot x \right\| \leqslant M_2 \Rightarrow M_1 \leqslant \frac{1}{\|x\|_n} \cdot \|x\| \leqslant M_2$$

giving

$$M_1 \cdot \|x\|_n \leqslant \|x\| \leqslant M_2 \cdot \|x\|_n$$

so in all cases we have $M_1 \cdot \|x\|_n \leqslant \|x\| \leqslant M_2 \cdot \|x\|_n$. Applying then [theorem: 14.115] proves that

$$\|\|_n \text{ and } \|\| \text{ are equivalent norms}$$

As $\|\|$ was chosen arbitrary we have proved that every norm in $\mathbb{R}^n$ is equivalent with $\|\|_n$. Hence by [theorem: 14.114] all the norms in $\mathbb{R}^n$ are equivalent. □

Corollary 14.278. *Let X be a finite dimensional vector space over $\mathbb{R}$ then all norms on X are equivalent*

Proof. Let $\|\|_1$, $\|\|_2$ two norms on X then by [theorem: 14.173] there exist two norms $\|\|_{(1)}$ and $\|\|_{(2)}$ on $\mathbb{R}^n$ and a **isometric** isomorphism (depending only on the basis chosen in X)

$$\varphi: \mathbb{R}^n \to X \text{ so that } \forall x \in \mathbb{R}^n \text{ we have } \|\varphi(x)\|_1 = \|x\|_{(1)} \wedge \|\varphi(x)\|_2 = \|x\|_{(2)}$$

By the previous theorem [theorem: 14.277] $\|\|_{(1)}$ and $\|\|_{(2)}$ are equivalent, hence by [theorem: 14.115] there exists $M_1, M_2 \in \mathbb{R}^+$ such that

$$\forall x \in \mathbb{R}^n \text{ we have } M_1 \cdot \|x\|_{(1)} \leqslant \|x\|_{(2)} \leqslant M_2 \cdot \|x\|_{(1)}$$

Let $x \in X$ then $x = \varphi(\varphi^{-1}(x))$ so that

$$\|x\|_1 = \|\varphi(\varphi^{-1}(x))\|_1 = \|\varphi^{-1}(x)\|_{(1)} \text{ and } \|x\|_2 = \|\varphi(\varphi^{-1}(x))\|_2 = \|\varphi^{-1}(x)\|_{(2)}$$

hence we have

$$M_1 \cdot \|x\|_1 = M_1 \cdot \|\varphi^{-1}(x)\|_{(1)} \leqslant \|\varphi^{-1}(x)\|_{(2)} = \|x\|_2$$

and

$$\|x\|_2 = \|\varphi^{-1}(x)\|_{(2)} \leqslant M_2 \cdot \|\varphi^{-1}(x)\|_{(1)} = M_2 \cdot \|x\|_1$$

giving

$$M_1 \cdot \|x\|_1 \leqslant \|x\|_2 \leqslant M_2 \cdot \|x\|_1$$

proving by [theorem: 14.115] that $\|\|_1$ and $\|\|_2$ are equivalent. □

Theorem 14.279. *Let $\langle X, \|\|\rangle$ be a normed space over $\mathbb{R}$, $n \in \mathbb{N}$, $L: \mathbb{R}^n \to X$ a linear isomorphism and $C \subseteq X$ then*

$$C \text{ is compact} \Leftrightarrow C \text{ is closed and bounded}$$

Proof. Define

$$\|\|^*: \mathbb{R}^n \to \mathbb{R} \text{ by } \|x\|^* = \|L(x)\|$$

then we have

1. If $x \in \mathbb{R}^n$ then $0 \leqslant \|L(x)\| = \|x\|^*$
2. If $\alpha \in \mathbb{R}$, $x \in \mathbb{R}^n$ then
$$\|\alpha \cdot x\|^* = \|L(\alpha \cdot x)\| = \|\alpha \cdot L(x)\| = |\alpha| \cdot \|L(x)\| = |\alpha| \cdot \|x\|^*$$
3. If $x, y \in \mathbb{R}^n$ then
$$\|x + y\|^* = \|L(x + y)\| = \|L(x) + L(y)\| \leqslant \|L(x)\| + \|L(y)\| = \|x\|^* + \|y\|^*$$
4. If $\|x\|^* = 0$ then $\|L(x)\| = 0$ which as $\|\|$ is a norm means that $L(x) = 0$, hence as L is a isomorphism it follows that $x = 0$.

So we have proved that

$$\|\|^* \text{ is a norm on } \mathbb{R}^n \text{ and } L \text{ is a linear isometric isomorphism between } \langle \mathbb{R}^n, \|\|^*\rangle \text{ and } \langle X, \|\|\rangle \tag{14.156}$$

Using [theorem: 14.170] it follows that

$$L: \mathbb{R}^n \to X \text{ is a homeomorphism using the topologies } \mathcal{T}_{\|\|^*} \text{ on } \mathbb{R}^n \text{ and } \mathcal{T}_{\|\|} \text{ on } X$$

As by [theorem: 14.277] all norms are equivalent we have that $\mathcal{T}_{\|\|_n} = \mathcal{T}_{\|\|^*}$ where $\|\|_n$ is the maximum norm on $\mathbb{R}^n$. Hence we have that

$$L: \mathbb{R}^n \to X \text{ is a homeomorphism using the topologies } \mathcal{T}_{\|\|_n} \text{ on } \mathbb{R}^n \text{ and } \mathcal{T}_{\|\|} \text{ on } X \tag{14.157}$$

Further as $\|\|^*$ and $\|\|_n$ are equivalent [see theorem: 14.277] there exist by [theorem: 14.115] a $N_1, N_2 \in \mathbb{R}^+$ such that

$$\forall x \in \mathbb{R}^n \ \|x\|^* \leqslant N_1 \cdot \|x\|_n \text{ and } \|x\|_n \leqslant N_2 \cdot \|x\|^\star \tag{14.158}$$

Assume now that $C \subseteq X$ is compact. Then, as $K = L^{-1}: X \to \mathbb{R}^n$ is a continuous mapping between $\langle X, \mathcal{T}_{\|\|}\rangle$ and $\langle \mathbb{R}^n, \mathcal{T}_{\|\|_n}\rangle$, we have using [theorem: 14.232] that $K(C)$ is compact in $\langle \mathbb{R}^n, \mathcal{T}_{\|\|_n}\rangle$, hence using Heine-Borel [see theorem: 14.276] we have that

$$K(C) \text{ is closed and bounded in } \langle \mathbb{R}^n, \|\|_n\rangle$$

As K is continuous it follows from [theorem: 14.137] we have that $K^{-1}(K(C))$ is closed, which as $K = L^{-1}$ is a bijection, proves by [theorem: 2.56] that $K^{-1}(K(C)) = C$, hence we have that

$$C \text{ is closed in } \langle X, \|\|\rangle$$

Further as $K(C)$ is bounded there exist a $M \in \mathbb{R}^+$ such that $\forall x, y \in K(C)$ we have $\|x - y\|_n \leqslant M$. Let $x, y \in C$ then

$$\|x - y\| = \|L(L^{-1}(x - y))\| = \|L(K(x - y))\| = \|K(x - y)\|^* \leqslant_{[\text{eq: } 14.158]} N_1 \cdot \|K(x - y)\|_n$$

as $K(x), K(y) \in K(C)$ we have $\|K(x - y)\|_n = \|K(x) - K(y)\|_n \leqslant M$, hence $\|x - y\| \leqslant N_1 \cdot M$. So we have proved that

$$C \text{ is bounded in } \langle X, \|\|\rangle$$

Summarized we have proved that

$$C \text{ is compact} \Rightarrow C \text{ is closed and bounded} \tag{14.159}$$

For the opposite implication assume that C is closed and bounded. As by [eq: 14.157] L is a continuous map between $\langle \mathbb{R}^n, \mathcal{T}_{\|\|_n} \rangle$ and $\langle X, \mathcal{T}_{\|\|} \rangle$ it follows from [theorem: 14.137] that

$$L^{-1}(C) \text{ is closed in } \mathcal{T}_{\|\|_n} \tag{14.160}$$

Further as C is bounded there exist a $M \in \mathbb{R}^+$ such that $\forall x, y \in C$ we have $\|x - y\| \leqslant M$. Now if $x, y \in L^{-1}(C)$ then as $L(x), L(y) \in C$ we have

$$\|x - y\|_n \leqslant_{\text{[eq: 14.158]}} N_2 \cdot \|x - y\|^* = N_2 \cdot \|L(x - y)\| = N_2 \cdot \|L(x) - L(y)\| \leqslant N_2 \cdot M$$

proving that

$$L^{-1}(C) \text{ is bounded in } \langle \mathbb{R}^n, \|\|_n \rangle \tag{14.161}$$

Using Heine-Borel [see theorem: 14.276] on [eqs: 14.160, 14.161] proves that $L^{-1}(C)$ is compact in $\mathcal{T}_{\|\|_n}$. As by [eq: 14.157] $L: \mathbb{R}^n \to X$ is continuous [using $\mathcal{T}_{\|\|_n}$ and $\mathcal{T}_{\|\|}$ on $\mathbb{R}^n$ and X] it follows by [theorem: 14.232] that $C \underset{\text{[theorem: 2.56]}}{=} L(L^{-1}(C))$ is compact. Hence we have proved that

$$C \text{ is closed and bounded} \Rightarrow C \text{ is compact} \tag{14.162}$$

Combining [eqs: 14.159, 14.162] proves that

$$C \text{ is compact} \Leftrightarrow C \text{ is closed and bounded}$$

□

A application of the above theorem is the following

Corollary 14.280. *Let $\langle \mathbb{C}, \|\| \rangle$ be the complex space equipped with the absolute value norm $\|\|$ and $C \subseteq \mathbb{C}$ then*

$$C \textit{ is compact} \Leftrightarrow C \textit{ is closed and bounded}$$

Proof. Using [example: 11.175] there exist a linear isomorphism between $\mathbb{R}^2$ and $\mathbb{C}$, hence applying the previous theorem [see 14.279] proves the theorem. □

Corollary 14.281. *Let $\langle \mathbb{C}, \|\|\| \rangle$ be the complex space equiped with a norm $\|\|\|$ then*

$$C \textit{ is compact using } \|\|\| \Leftrightarrow C \textit{ is closed and bounded using } \|\|\|$$

Proof. By [theorem: 14.117] we have that $\|\|\|$ and $\|\|$ are equivalent norms so that there exist $M_1, M_2 \in \mathbb{R}^+$ such that

$$\forall z \in \mathbb{C} \; M_1 \cdot \|z\| \leqslant |z| \leqslant M_2 \cdot \|z\| \tag{14.163}$$

If C is bounded using $\|\|$ then there exist a M such that $\forall z \in C$ we have $|z| \leqslant M$ hence $M_1 \cdot \|z\| < M$ or $\|z\| \leqslant \frac{M}{M_1}$ proving that C is bounded using $\|\|\|$. If C is bounded using $\|\|\|$ then there exist a M such that $\forall z \in C$ we have $\|z\| \leqslant M$ hence $|z| \leqslant M_2 \cdot \|z\| \leqslant M_2 \cdot \|M\|$ proving that C is bounded using $\|\|$. So we have proved that

$$C \text{ is bounded using } \|\| \Leftrightarrow C \text{ is bounded using } \|\|$$

Further using [theorem: 14.113] it follows that

$$C \text{ is closed using } \|\| \Leftrightarrow C \text{ is closed uing } \|\|\|$$

and

$$C \text{ is compact using } \|\| \Leftrightarrow C \text{ is compact using } \|\|\|$$

Hence using [theorem: 14.281] it follows that

$$C \text{ is compact using } \|\|\| \Leftrightarrow C \text{ is closed and bounded using } \|\|\|$$

□

Theorem 14.282. *Let $\langle X, \|\|\| \rangle$ be a finite dimensional normed space over $\mathbb{R}$ and $C \subseteq X$ then*

$$C \textit{ is compact} \Leftrightarrow C \textit{ is closed and bounded}$$

Proof. Using [theorem: 14.173] there exist a isometric isomorphism between X and $\mathbb{R}^n$ where $n = \dim(X)$, hence applying the previous theorem [see 14.279] proves the theorem. □

Theorem 14.283. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be finite dimensional spaces over $\mathbb{R}$ then*

$$\mathrm{Hom}(X,Y) = L(X,Y)$$

in other words every linear mapping is continuous.

Proof. Using [theorem: 14.173] there exist linear isomorphisms $\varphi_1 : \mathbb{R}^n \to X$, $\varphi_2 : \mathbb{R}^m \to Y$ and norms $\|\|_{\langle n\rangle}$, $\|\|_{\langle m\rangle}$ on $\mathbb{R}^n$, $\mathbb{R}^m$ such that

$$\varphi_1 : \mathbb{R}^n \to X \text{ is a homeomorphism using the norms } \|\|_{\langle n\rangle}, \|\|_X \text{ on } \mathbb{R}^n, X \tag{14.164}$$

$$\varphi_2 : \mathbb{R}^n \to Y \text{ is a homeomorphism using the norms } \|\|_{\langle m\rangle}, \|\|_Y \text{ on } \mathbb{R}^n, Y \tag{14.165}$$

Let $L \in \mathrm{Hom}(X,Y)$ and define

$$L' : \mathbb{R}^n \to \mathbb{R}^m \text{ by } L' = \varphi_2^{-1} \circ L \circ \varphi_1$$

Then as φ_1, φ_2^{-1} and L are linear mappings it follows from [theorem: 11.177] that

$$L' : \mathbb{R}^n \to \mathbb{R}^m \text{ is a linear mapping}$$

Using [theorem: 14.178]

$$L' : R^n \to R^m \text{ is linear continuous using the maximum norms } \|\|_n,\ \|\|_m$$

As by [theorem: 14.277] it follows that $\mathcal{T}_{\|\|_{\langle n\rangle}} = \mathcal{T}_{\|\|_n}$ and $T_{\|\|_{\langle m\rangle}} = \mathcal{T}_m$ proving that

$$L' : R^n \to R^m \text{ is linear continuous using the norms } \|\|_{\langle n\rangle},\ \|\|_{\langle m\rangle} \tag{14.166}$$

Using [theorem: 14.188] on [eqs: 14.164, 14.165 and 14.166] that

$$\varphi_2 \circ L' \circ \varphi_1^{-1} \in L(X,Y)$$

Finally, as $\varphi_2 \circ L' \circ \varphi_1^{-1} = \varphi_2 \circ \varphi_2^{-1} \circ L \circ \varphi_1 \circ \varphi_1^{-1} = \mathrm{Id}_Y \circ L \circ \mathrm{Id}_X = L$, it follows from the above that

$$L \in L(X,Y)$$

□

14.9 Convergence

Convention 14.284. For simplicity we use the following convention if $N \in \mathbb{N}_0$

$$\begin{aligned} \forall n \geqslant N \ &\text{ is a shorthand for } \ \forall n \in \mathbb{N}_0 \text{ with } n \geqslant N \\ \forall n > N \ &\text{ is a shorthand for } \ \forall n \in \mathbb{N}_0 \text{ with } n > N \end{aligned}$$

14.9.1 Sequences and limits

Definition 14.285. *Let X be a set, $k \in \mathbb{N}_0$ then a family $\{x_i\}_{i\in\{k,\dots,\infty\}} \subseteq X$ is called a **sequence in X**.*

A special kind of sequence in a partial ordered set are increasing or decreasing sequences.

Definition 14.286. *Let $\langle X, \leqslant\rangle$ be a partial ordered set, $k \in \mathbb{N}_0$ and $\{x_i\}_{i\in\{k,\dots,\infty\}} \subseteq X$ a sequence in X then we say:*

1. *$\{x_i\}_{i\in\{k,\dots,\infty\}}$ is **increasing** if $\forall i \in \{k,\dots,\infty\}$ $x_i \leqslant x_{i+1}$.*
2. *$\{x_i\}_{i\in\{k,\dots,\infty\}}$ is **strictly increasing** if $\forall i \in \{k,\dots,\infty\}$ $x_i < x_{i+1}$.*
3. *$\{x_i\}_{i\in\{k,\dots,\infty\}}$ is **decreasing** if $\forall i \in \{k,\dots,\infty\}$ $x_{i+1} \leqslant x_i$.*
4. *$\{x_i\}_{i\in\{k,\dots,\infty\}}$ is **strictly decreasing** if $\forall i \in \{k,\dots,\infty\}$ $x_{i+1} < x_i$.*

Using mathematical induction on the above definition gives the following theorem.

Theorem 14.287. *Let $\langle X, \leqslant\rangle$ be a partial ordered set, $k \in \mathbb{N}_0$ and $\{x_i\}_{i\in\{k,\dots,\infty\}} \subseteq X$ a sequence in X then*

1. *If $\{x_i\}_{i\in\{k,\dots,\infty\}}$ is **increasing** then $\forall n, m \in \{k,\dots,\infty\}$ with $n \leqslant m$ we have $x_n \leqslant x_m$.*
2. *If $\{x_i\}_{i\in\{k,\dots,\infty\}}$ is **strictly increasing** then $\forall n, m \in \{k,\dots,\infty\}$ with $n < m$ we have $x_n < x_m$.*

3. *If* $\{x_i\}_{i\in\{k,\dots,\infty\}}$ *is* ***decreasing*** *then* $\forall n,m\in\{k,\dots,\infty\}$ *with* $n\leqslant m$ *we have* $x_m\leqslant x_n$.
4. *If* $\{x_i\}_{i\in\{k,\dots,\infty\}}$ *is* ***strictly decreasing*** *then* $\forall n,m\in\{k,\dots,\infty\}$ *with* $n<m$ *we have* $x_m<x_n$.

Proof.

1. Let $n\in\{k,\dots,n\}$ and take
$$S_n=\{m\in\mathbb{N}_0|x_n\leqslant x_{n+m}\}$$
then we have:

   $\boldsymbol{0\in S_n}$. As $x_n=x_{n+0}$ it follows that $0\in S_n$

   $\boldsymbol{m\in S_n\Rightarrow m+1\in S_n}$. As $m\in S_n$ we have $x_n\leqslant x_{n+m}$ which as $x_{n+m}\leqslant x_{(n+m)+1}$ proves that $x_n\leqslant x_{(n+m)+1}$, hence $m+1\in S_n$.

   Using mathematical induction $S_n=\mathbb{N}_0$ so if $n\in\{k,\dots,\infty\}$ and $m\in\{k,\dots,\infty\}$ with $n\leqslant m$ then $m-n\in\mathbb{N}_0=S_n$ so that $x_n\leqslant x_{n+(m-n)}=x_m$.
2. Let $n\in\{k,\dots,n\}$ and take
$$S_n=\{m\in\mathbb{N}|x_n<x_{n+m}\}$$
then we have:

   $\boldsymbol{1\in S_n}$. As $x_n<x_{n+1}$ it follows that $1\in S_n$

   $\boldsymbol{m\in S_n\Rightarrow m+1\in S_n}$. As $m\in S_n$ we have $x_n<x_{n+m}$ which as $x_{n+m}<x_{(n+m)+1}$ proves that $x_n<x_{(n+m)+1}$, hence $m+1\in S_n$.

   Using mathematical induction $S_n=\mathbb{N}$ so if $n\in\{k,\dots,\infty\}$ and $m\in\{k,\dots,\infty\}$ with $n<m$ then $m-n\in\mathbb{N}=S_n$ so that $x_n<x_{n+(m-n)}=x_m$.
3. Let $n\in\{k,\dots,n\}$ and take
$$S_n=\{m\in\mathbb{N}_0|x_{n+m}\leqslant x_n\}$$
then we have:

   $\boldsymbol{0\in S_n}$. As $x_n=x_{n+0}$ it follows that $0\in S_n$

   $\boldsymbol{m\in S_n\Rightarrow m+1\in S_n}$. As $m\in S_n$ we have $x_{n+m}\leqslant x_n$ which as $x_{(n+m)+1}\leqslant x_m$ proves that $x_{(n+m)+1}\leqslant x_n$, hence $m+1\in S_n$.

   Using mathematical induction $S_n=\mathbb{N}_0$ so if $n\in\{k,\dots,\infty\}$ and $m\in\{k,\dots,\infty\}$ with $n\leqslant m$ then $m-n\in\mathbb{N}_0=S_n$ so that $x_m=x_{n+(m-n)}\leqslant x_n$.
4. Let $n\in\{k,\dots,n\}$ and take
$$S_n=\{m\in\mathbb{N}|x_{n+m}<x_n\}$$
then we have:

   $\boldsymbol{1\in S_n}$. As $x_{n+1}<x_n$ it follows that $0\in S_n$

   $\boldsymbol{m\in S_n\Rightarrow m+1\in S_n}$. As $m\in S_n$ we have $x_{n+m}<x_n$ which as $x_{(n+m)+1}<x_m$ proves that $x_{(n+m)+1}<x_n$, hence $m+1\in S_n$.

   Using mathematical induction $S_n=\mathbb{N}$ so if $n\in\{k,\dots,\infty\}$ and $m\in\{k,\dots,\infty\}$ with $n<m$ then $m-n\in\mathbb{N}=S_n$ so that $x_m=x_{n+(m-n)}<x_n$. □

Corollary 14.288. *Let* $k\in\mathbb{N}_0$, $\{A_i\}_{i\in\{k,\dots,\infty\}}$ *be a sequence of sets then we have*

1. *If* $\forall i\in\{k,\dots,\infty\}$ $A_i\subseteq A_{i+1}$ *then* $\forall n,m\in\{k,\dots,\infty\}$ *with* $n\leqslant m$ *we have* $A_n\subseteq A_m$
2. *If* $\forall i\in\{k,\dots,\infty\}$ $A_{i+1}\subseteq A_i$ *then* $\forall n,m\in\{k,\dots,\infty\}$ *with* $n\leqslant m$ *we have* $A_m\subseteq A_n$

Proof. This follows from [theorem: 3.33] and [theorem: 14.287]. □

We introduce now the concept of convergence of a sequence.

Definition 14.289. *Let* $\langle X,\mathcal{T}\rangle$ *be a topological space,* $k\in\mathbb{N}_0$, $x\in X$ *and* $\{x_i\}_{i\in\{k,\dots,\infty\}}\subseteq X$ *a sequence then we say that* $\{x_i\}_{i\in\{k,\dots,\infty\}}$ *is* ***convergent to x*** *if* $\forall U\in\mathcal{T}$ *with* $x\in X$ *there exist a* $N\in\{k,\dots,\infty\}$ *such that* $\forall n\geqslant N$ *we have* $x_n\in U$. *We call* $\{x_i\}_{i\in\{k,\dots,\infty\}}$ *a* ***convergent sequence****.*

We show now that convergence is independent of the start point of the domain of the family.

Theorem 14.290. *Let $\langle X, \mathcal{T}\rangle$ be a topological space, $k \in \mathbb{N}_0$, $x \in X$ and $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq X$ a sequence then we have:*

1. *$\forall m \in \{k,\ldots,\infty\}$ we have $\{x_i\}_{i\in\{k,\ldots,\infty\}}$ converges to $x \Leftrightarrow \{x_i\}_{i\in\{m,\ldots,\infty\}}$ converges to x*
2. *$\forall m \in \mathbb{N}_0$ if $\{x_i\}_{i\in\{k,\ldots,\infty\}}$ converges to x then $\{x_{i+m}\}_{i\in\{k,\ldots,\infty\}}$ converges to x*

Proof.

1. We have

   $\Rightarrow$. Let $U \in \mathcal{T}$ such that $x \in U$ then, as $\{x_i\}_{i\in\{k,\ldots,\infty\}}$ converges to x, there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall n \geqslant N$ we have $x_n \in U$. Hence if we take $M = \max(N, m)$ then $M \in \{m,\ldots,\infty\}$and we have $\forall n \geqslant M$ that $x_n \in U$. So $\{x_i\}_{i\in\{m,\ldots,\infty\}}$ converges to x.

   $\Leftarrow$. Let $U \in \mathcal{T}$ such that $x \in U$ then as $\{x_i\}_{i\in\{m,\ldots,\infty\}}$ converges to x there exist a $N \in \{m,\ldots,\infty\}$ such that $\forall n \geqslant M$ we have $x_n \in U$. As $m \in \{k,\ldots,\infty\}$ we have that $N \in \{k,\ldots,\infty\}$ hence $\{x_i\}_{i\in\{k,\ldots,\infty\}}$ converges to x.

2. Let $U \in \mathcal{T}$ such that $x \in U$ then as $\{x_i\}_{i\in\{k,\ldots,\infty\}}$ converges to x there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall n \geqslant N$ we have $x_n \in U$. As $N \leqslant n \leqslant n+m$ we have that $x_{n+m} \in U$ proving that $\{x_{n+m}\}_{n\in\{k,\ldots,\infty\}}$ converges to x. □

Theorem 14.291. *Let $\langle X, \mathcal{T}\rangle$ be a Hausdorff topological space, $k \in \mathbb{N}_0$, $x, y \in X$ and $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq X$ a sequence that is **convergent to x and y** then $\boldsymbol{x = y}$.*

Proof. Assume that $x \neq y$ then as $\mathcal{T}$ is Hausdorff there exist a $U, V \in \mathcal{T}$ such that $x \in U$, $y \in V$ and $U \bigcap V = \varnothing$. By the definition of convergence there exist a $N_x, N_y \in \{k,\ldots,\infty\}$ such that $\forall n \geqslant N_x$ $x_n \in U$ and $\forall n \geqslant N_n$ we have $x_n \in V$. So for $N = \max(N_x, N_y)$ we have $x_N \in U \bigcap V$ contradicting $U \bigcap V = \varnothing$. Hence we must have

$$x = y$$

□

Definition 14.292. *Let $\langle X, \mathcal{T}\rangle$ be a Hausdorff topological space, $k \in \mathbb{N}_0$ and $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq X$ a sequence that is convergent to the **unique** $x \in X$ then we note this x as*

$$\lim_{n\to\infty} x_n$$

*and say that x is the **limit** of $\{x_i\}_{i\in\{k,\ldots,\infty\}}$. So if we say that*

$$\lim_{n\to\infty} x_n = x$$

then we mean that $\{x_n\}_{n\in\{k,\ldots,\infty\}}$ is convergent to $x \in X$.

We have the following equivalent definition for the limit in a metric space.

Theorem 14.293. *Let $\langle X, d\rangle$ be a metric space [which by [theorem: 14.204 is Hausdorff], $k \in \mathbb{N}_0$, $x \in X$ and $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq X$ then*

$$\lim_{n\to\infty} x_n = x \Leftrightarrow \forall \varepsilon \in \mathbb{R}^+ \ \exists N \in \{k,\ldots,\infty\} \text{ such that } \forall n \in \mathbb{N} \text{ with } N \leqslant n \ d(x, x_n) < \varepsilon$$

Further if $\langle X, \|\|\rangle$ is a normed space we have as $d(x, x_n) = \|x_n - x\|$ that

$$\lim_{n\to\infty} x_n = x \Leftrightarrow \forall \varepsilon \in \mathbb{R}^+ \ \exists N \in \{k,\ldots,\infty\} \text{ such that } \forall n \in \mathbb{N} \text{ with } N \leqslant n \ \|x_n - x\| < \varepsilon$$

Proof. If $\langle X, d\rangle$ is a metric space then we have

$\Rightarrow$. Let $\varepsilon \in \mathbb{R}^+$ then as $x \in B_d(x, \varepsilon) \in \mathcal{T}$ we have from $\lim_{n\to\infty} x_n = x$ that there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall n \geqslant N$ we have $x_n \in B_d(x, \varepsilon)$, hence $d(x, x_n) < \varepsilon$.

$\Leftarrow$. Let $U \in \mathcal{T}$ be such that $x \in U$ then by [theorem: 14.64] there exist a $\varepsilon \in \mathbb{R}^+$ such that $x \in B_d(x, \varepsilon) \subseteq U$. By the hypothesis there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall n \geqslant N$ we have $d(x, x_n) < \varepsilon$, hence $x \in B_d(x, \varepsilon) \subseteq U$, proving that $\lim_{n\to\infty} x_n = x$.

If $\langle X, \|\|\rangle$ is a normed space then we have

$\Rightarrow$. Let $\varepsilon \in \mathbb{R}^+$ then as $x \in B_{\|\|}(x, \varepsilon) \in \mathcal{T}$ we have from $\lim_{n\to\infty} x_n = x$ that there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall n \geqslant N$ we have $x_n \in B_{\|\|}(x, \varepsilon)$, hence $\|x_n - x\| < \varepsilon$.

$\Leftarrow$. Let $U \in \mathcal{T}$ be such that $x \in U$ then by [theorem: 14.93] there exist a $\varepsilon \in \mathbb{R}^+$ such that $x \in B_{\|\|}(x, \varepsilon) \subseteq U$. By the hypothesis there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall n \geqslant N$ we have $\|x_n - x\| < \varepsilon$, hence $x \in B_{\|\|}(x, \varepsilon) \subseteq U$, proving that $\lim_{n\to\infty} x_n = x$. □

We can reformulate the above theorem to a limit to 0 in $\mathbb{R}$.

Theorem 14.294. *If $\langle X, d\rangle$ is a metric space, $k \in \mathbb{N}_0$, $x \in X$ and $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq X$ a sequence then we have*

$$\lim_{n\to\infty} x_n = x \text{ [defined in } \langle X, d\rangle] \Leftrightarrow \lim_{n\to\infty} d(x, x_n) = 0 \text{ [defined in } \langle \mathbb{R}, \|\rangle]$$

If $\langle X, \|\|\rangle$ is a normed space, $k \in \mathbb{N}_0$, $x \in X$ and $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq X$ a sequence then we have

$$\lim_{n\to\infty} x_n = x \text{ [defined in } \langle X, \|\|\rangle] \Leftrightarrow \lim_{n\to\infty} \|x_n - x\| = 0 \text{ [defined in } \langle \mathbb{R}, \|\rangle]$$

Proof. If $\langle X, d\rangle$ is a metric space then we have

$\Rightarrow$. Let $\varepsilon \in \mathbb{R}^+$ then, as $\lim_{n\to\infty} x_n = x$, there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N$ we have $d(x, x_n) < \varepsilon$. Hence $|d(x, x_n) - 0| = |d(x, x_n)| = d(x, x_n) < \varepsilon$ proving that $\{d(x, x_n)\}_{n\in\{k,\ldots,\infty\}}$ converges to 0 or that

$$\lim_{n\to\infty} d(x, x_n) = 0$$

$\Leftarrow$. Let $\varepsilon \in \mathbb{R}^+$ then there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N$ we have

$$d(x, x_n) = |d(x, x_n)| = |d(x, x_n) - 0| < \varepsilon$$

proving that

$$\lim_{n\to\infty} x_n = x$$

If $\langle X, \|\|\rangle$ is a normed space then we have

$\Rightarrow$. Let $\varepsilon \in \mathbb{R}^+$ then, as $\lim_{n\to\infty} x_n = x$, there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N$ $\|x_n - x\| < \varepsilon$. Hence $|\|x_n - x\| - 0| = |\|x_n - x\|| = \|x_n - x\| < \varepsilon$ proving that $\{\|x_n - x\|\}_{n\in\{k,\ldots,\infty\}}$ converges to 0 or that

$$\lim_{n\to\infty} \|x_n - x\| = 0$$

$\Leftarrow$. Let $\varepsilon \in \mathbb{R}^+$ then there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N$ we have

$$\|x_n - x\| = |\|x_n - x\|| = |\|x_n - x\| - 0| < \varepsilon$$

proving that

$$\lim_{n\to\infty} x_n = x$$

□

Example 14.295. If $\langle X, \|\|\rangle$ is a normed space, $k \in \mathbb{N}_0$, $x \in X$ then we have for $\{x_i\}_{i\in\{k\}} \subseteq X$ defined by $x_i = x$ that

$$\lim_{n\to\infty} x_n = x$$

Proof. Let $\varepsilon \in \mathbb{R}^+$ and take $N = k$ then we have $\forall n \geqslant N$ that

$$\|x_n - x\| = \|x - x\| = 0 < \varepsilon$$

proving that $\lim_{n\to\infty} x_n = x$. □

Example 14.296. If $b \in \mathbb{R}$ with $0 \leqslant b < 1$ then $\{b^n\}_{n\in\mathbb{N}}$ converges to 0.

Proof. We have to consider two cases for b

$b = 0$. Then $\forall n \in \mathbb{N}$ we have $b^n = 0$ so that by [example: 14.295] $\lim_{n\to\infty} b^n = 0$.

$0 < b$. Let $\varepsilon \in \mathbb{R}^+$ then by [theorem: 10.64] there exist a $N \in \mathbb{N}$ such that $\forall n \geqslant N$ we have $0 < b^n < \varepsilon$ hence $|b^n - 0| = |b^n| = b^n < \varepsilon$, proving that $\lim_{n\to\infty} b^n = 0$. □

Example 14.297. If $a \in \mathbb{R}$, $k \in \mathbb{N}_0$ with $0 < a + k$ so that $\left\{\frac{1}{a+n}\right\}_{n\in\{k,\ldots,\infty\}} \subseteq \mathbb{R}$ is well defined then

$$\lim_{n\to\infty} \frac{1}{a+n} = 0$$

Proof. Let $\varepsilon \in \mathbb{R}^+$ then by [theorem: 10.30] there exist a $N \in \mathbb{N}$ such that $\max\left(\frac{1}{\varepsilon} - a, -a\right) < N$ so if $N \leqslant n$ then we have $\frac{1}{\varepsilon} - a < N \leqslant n \Rightarrow \frac{1}{\varepsilon} < n + a \Rightarrow \frac{1}{a+n} < \varepsilon$ and $-a < n \Rightarrow 0 < a + n$. Hence $0 < \frac{1}{a+n} < \varepsilon$, so that

$$\left|\frac{1}{a+n} - 0\right| = \left|\frac{1}{a+n}\right| = \frac{1}{a+n} < \varepsilon$$

proving

$$\lim_{n\to\infty} \frac{1}{a+n} = 0$$

□

Example 14.298. Let $k \in \mathbb{N}_0$, $a, b \in \mathbb{R}$ with $0 < b + k$ so that $\left\{\frac{a+n}{b+n}\right\}_{n\in\{k,\ldots,\infty\}}$ is well defined then

$$\lim_{n\to\infty} \frac{a+n}{b+n} = 1$$

Proof. Let $\varepsilon \in \mathbb{R}^+$ then by the Archimedan property of the real numbers [see theorem: 10.30] there exist a $M \in \{k, \ldots, \infty\}$ such that $\frac{|a-b|}{\varepsilon} - b < M$. Take $N = \max(k, M)$ then for $\forall n \geqslant N$ we have

$$\frac{|a-b|}{\varepsilon} - b < n \Rightarrow \frac{|a-b|}{\varepsilon} < n + b \underset{0<b+k<b+n}{\Rightarrow} \frac{|a-b|}{b+n} < \varepsilon \Rightarrow \left|\frac{a-b}{b+n}\right| < \varepsilon$$

Next

$$\left|\frac{a+n}{b+n} - 1\right| = \left|\frac{a+n-(b+n)}{b+n}\right| = \left|\frac{a-b}{b+n}\right| < \varepsilon$$

proving that

$$\lim_{n\to\infty} \frac{a+n}{b+n} = 1$$

□

14.9.2 Properties of the limit

Theorem 14.299. *Let $k \in \mathbb{N}_0$, $\langle X, \|\|\rangle$ be a normed space, $\{s_i\}_{i\in\{k,\ldots,\infty\}} \subseteq \mathbb{R}$ such that $\lim_{i\to\infty} s_i = 0$ exist and $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq X$ satisfies that $\forall i \in \{k, \ldots, \infty\}$ $\|x_i\| < s_i$ then $\lim_{i\to\infty} x_i = 0$ exists.*

Proof. Let $\varepsilon \in \mathbb{R}^+$ then there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N$ $|s_n| = |s_n - 0| < \varepsilon$. Hence if $n \geqslant N$ we have $\|x_n - 0\| = \|x\| \leqslant s_n < \varepsilon$ proving that

$$\lim_{i\to\infty} x_i = 0 \text{ exists}$$

□

Theorem 14.300. *Let $\langle X, \|\|\rangle$ be a normed space, $k \in \mathbb{N}_0$ and $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq X$ a sequence such that*

$$\lim_{n\to\infty} x_n = x$$

then for $a \in X$ we have for $\{x_n + a\}_{n\in\{k,\ldots,\infty\}} \subseteq X$ that

$$\lim_{n\to\infty} (x_n + a) = x + a$$

In other words

$$\lim_{n\to\infty} (x_n + a) = \lim_{n\to\infty} x_n + a$$

Proof. As $\lim_{n\to\infty} x_n = x$ there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N$ we have $\|x_n - x\| < \varepsilon$. Hence we have

$$\|(x_n + a) - (x + a)\| = \|x_n - x\| < \varepsilon$$

proving that

$$\lim_{n\to\infty} (x_n + a) = x + a$$

□

Theorem 14.301. *Let $\langle X, \|\|\rangle$ be a normed space, $k, l \in \mathbb{N}_0$ and $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq X$, $\{y_n\}_{n\in\{k,\ldots,\infty\}} \subseteq Y$ sequences such that*

$$\lim_{n\to\infty} x_n = x \text{ and } \lim_{n\to\infty} y_n = y$$

then for $\{x_n + y_n\}_{n\in\{\max(k,l),\ldots,\infty\}} \subseteq X$ we have

$$\lim_{n\to\infty} (x_n + y_n) = x + y$$

In other words

$$\lim_{n\to\infty}(x_n+y_n)=\lim_{n\to\infty}x_n+\lim_{n\to\infty}y_n$$

Proof. As $\lim_{n\to\infty}x_n=x$ and $\lim_{n\to\infty}y_n=y$ there exists $N_x\in\{k,\ldots,\infty\}$, $N_y\in\{l,\ldots,\infty\}$ such that $\forall n\geqslant N_1$ we have $\|x_n-x\|<\frac{\varepsilon}{2}$ and $\forall n\in N_2$ we have $\|y_n-y\|<\frac{\varepsilon}{2}$. Hence if we take $N=\max(N_1,N_2)$ then $\forall n\geqslant N$ we have

$$\|(x_n+y_n)-(x+y)\|\leqslant\|x_n-x\|+\|y_n-y\|<\frac{\varepsilon}{2}+\frac{\varepsilon}{2}=\varepsilon$$

proving that

$$\lim_{n\to\infty}(x_n+y_n)=x+y$$

□

Theorem 14.302. *Let $\langle X,\|\|\rangle$ be a normed space, $k\in\mathbb{N}_0$ and $\{x_n\}_{n\in\{k,\ldots,\infty\}}\subseteq X$ a sequence such that*

$$\lim_{n\to\infty}x_n=x$$

then given $\alpha\in\mathbb{K}$ we have for the sequence $\{\alpha\cdot x_n\}_{n\in\{k,\ldots,\infty\}}\subseteq X$ that

$$\lim_{n\to\infty}(\alpha\cdot x_n)=\alpha\cdot x$$

In other words

$$\lim_{n\to\infty}(\alpha\cdot x_n)=\alpha\cdot\lim_{n\to\infty}x_n$$

Proof. For $\alpha\in\mathbb{K}$ we have either:

$\alpha=0$. Then $\forall n\in\{k,\ldots,\infty\}$ we have $\alpha\cdot x_n=0$ so that by [example: 14.295]

$$\lim_{n\to\infty}(\alpha\cdot x_n)=0=0\cdot x=\alpha\cdot x$$

$\alpha\neq 0$. As $\lim_{n\to\infty}x_n=x$ there exist a $N\in\{k,\ldots,\infty\}$ such that $\forall n\geqslant N$ we have $\|x_n-x\|<\frac{\varepsilon}{|\alpha|}$. Hence we have

$$\|(\alpha\cdot x_n)-(\alpha\cdot x)\|=\|\alpha(x_n-x)\|=|\alpha|\cdot\|x_n-x\|<|\alpha|\cdot\frac{\varepsilon}{|\alpha|}=\varepsilon$$

proving that

$$\lim_{n\to\infty}(\alpha\cdot x_n)=\alpha\cdot x$$

□

Theorem 14.303. *Let $k\in\mathbb{N}_0$ and $\{z_n\}_{n\in\{k,\ldots,\infty\}}\subseteq\mathbb{C}$ a sequence of complex numbers then if $||$ is the absolute value norm on $\mathbb{R}$ and $||_c$ is the canonical norm on $\mathbb{C}$ [see definition: 10.83] then we have that*

$$\{z_n\}_{n\in\{k,\ldots,\infty\}}\text{ converges in }\langle\mathbb{C},\|_c\}$$

$$\Updownarrow$$

$$\{\mathrm{Re}(z_n)\}_{n\in\{k,\ldots,\infty\}}\text{ and }\{\mathrm{Img}(z_n)\}_{n\in\{k,\ldots,\infty\}}\text{ converges in }\langle\mathbb{R},\|\rangle$$

Further if $\{z_n\}_{n\in\{k,\ldots,\infty\}}$ converges then

$$\lim_{n\to\infty}z_n=\lim_{n\to\infty}\mathrm{Re}(z_n)+\lim_{n\to\infty}\mathrm{Img}(z_n)$$

Proof. We have

$\Rightarrow$. As $\{z_n\}_{n\in\{k,\ldots,\infty\}}$ converges there exist a $z\in\mathbb{C}$ such that $\forall\varepsilon\in\mathbb{R}^+$ there exist a $N\in\{k,\ldots,n\}$ such that

$$\forall n\geqslant N\text{ we have }|z_n-z|_c<\varepsilon$$

Now using [theorem: 10.84] we have that

$$|\mathrm{Re}(z_n)-\mathrm{Re}(z)|=|\mathrm{Re}(z_n-z)|\leqslant|z_n-z|_c<\varepsilon$$

$$|\mathrm{Img}(z_n)-\mathrm{Img}(z)|=|\mathrm{Img}(z_n-z)|<|z_n-z|_c<\varepsilon$$

proving that $\{\mathrm{Re}(z_n)\}_{n\in\{k,\ldots,\infty\}}$ converges to $\mathrm{Re}(x)$ and $\{\mathrm{Img}(z_n)\}_{n\in\{k,\ldots,\infty\}}$ converges to $\mathrm{Img}(z)$, Hence

$$\lim_{n\to\infty}z_n=\lim_{n\to\infty}\mathrm{Re}(z_n)+\lim_{n\to\infty}\mathrm{Img}(z_n)$$

$\Leftarrow$. As $\{\mathrm{Re}(z_n)\}_{n\in\{k,\ldots,\infty\}}$ and $\{\mathrm{Img}(z_n)\}_{n\in\{k,\ldots,\infty\}}$ converges there exists $x,y\in\mathbb{R}$ such that $\forall\varepsilon\in\mathbb{R}^+$ there exists $N_1,N_2\in\{k,\ldots,\infty\}$ such that $\forall n\geqslant N_1$ $|\mathrm{Re}(z_n)-x|<\frac{\varepsilon}{2}$ and $\forall m\geqslant N_2$ $|\mathrm{Img}(z_n)-y|<\frac{\varepsilon}{2}$. Hence if we take $z=x+i\cdot y$ and $m\geqslant\max(N_1,N_2)$ then we have that

$$|z_n-z|_c\leqslant_{[\text{theorem: }10.84]}|\mathrm{Re}(z_n-z)|+|\mathrm{Img}(z_n-z)|=|\mathrm{Re}(z_n)-x|+|\mathrm{Img}(z_n)-y|<\frac{\varepsilon}{2}+\frac{\varepsilon}{2}=\varepsilon$$

proving that $\{z_n\}_{n\in\{k,\ldots,\infty\}}$ converges to z. □

Theorem 14.304. *Let $k\in\mathbb{N}_0,\{x_n\}_{i\in\{n,\ldots,\infty\}}\subseteq\mathbb{C}$ be a convergent sequence of complex numbers then $\{\overline{x_n}\}_{n\in\{k,\ldots,\infty\}}$ is convergent and $\lim\limits_{n\to\infty}\overline{x_n}=\overline{\lim\limits_{n\to\infty}x_n}$*

Proof. Let $x=\lim\limits_{n\to\infty}x_n$ then for $\varepsilon\in\mathbb{R}^+$ there exist a $N\in\{k,\ldots,\infty\}$ such that $\forall n\geqslant N$ we have $|x_n-x|<\varepsilon$. Now $|\overline{x_n}-\overline{x}|\underset{[\text{theorem: }10.82]}{=}|\overline{x_n-x}|\underset{[\text{theorem: }10.84]}{=}|x_n-x|<\varepsilon$ proving that

$$\lim_{n\to\infty}\overline{x_n}=\overline{x}=\overline{\lim_{n\to\infty}x_n}$$ □

Theorem 14.305. *Let $k\in\mathbb{N}_0,\langle X,\|\|\rangle$ be a normed space and $\{x_n\}_{n\in\{k,\ldots,\infty\}}\subseteq X$ a convergent sequence such that $\lim\limits_{n\to\infty}x_n=x$ then we have for $A\in\mathbb{R}$:*

1. *If $\exists M\in\{k,\ldots,\infty\}$ such that $\forall n\geqslant M$ $\|x_n\|\leqslant A$ then $\|x\|\leqslant A$.*
2. *If $\exists M\in\{k,\ldots,\infty\}$ such that $\forall n\geqslant M$ $A\leqslant\|x_n\|$ then $A\leqslant\|x\|$.*

Proof.

1. We proceed by contradiction. So assume that $A<\|x\|$ then $\varepsilon=\|x\|-A\in\mathbb{R}^+$ hence, as $\lim\limits_{n\to\infty}x_n=x$, there exist a $N\in\{k,\ldots,\infty\}$ such that $\forall n\geqslant N$ $\|x_n-x\|<\varepsilon$ or as $N\leqslant\max(N,M)$
$$\|x\|\leqslant\|x-x_{\max(N,M)}\|+\|x_{\max(N,M)}\|<\varepsilon+\|x_{\max(N,M)}\|\leqslant\varepsilon+A=\|x\|-A+A=\|x\|$$
leading to the contradiction $\|x\|<\|x\|$. Hence we must have $\|x\|\leqslant A$.
2. We proceed by contradiction. So assume that $\|x\|<A$ then $\varepsilon=A-\|x\|\in\mathbb{R}^+$ hence, as $\lim\limits_{n\to\infty}x_n=x$, there exist a $N\in\{k,\ldots,\infty\}$ such that $\forall n\geqslant N$ $\|x_n-x\|<\varepsilon$ or as $N\leqslant\max(N,M)$
$$A\leqslant\|x_{\max(M,N)}\|\leqslant\|x_{\max(M,N)}-x\|+\|x\|<\varepsilon+\|x\|=A-\|x\|+\|x\|=A$$
leading to the contradiction $A<A$. Hence we must have $A\leqslant\|x\|$. □

Theorem 14.306. *Let $\langle X,\|\|\rangle$ be a normed space, $k\in\mathbb{N}_0$ and $\{x_n\}_{n\in\{k,\ldots,\infty\}}\subseteq X$ a convergent sequence then there exist a $K\in\mathbb{R}^+$ such that $\forall n\in\{k,\ldots,\infty\}$ we have $\|x_n\|\leqslant K$.*

Proof. Let $x=\lim\limits_{n\to\infty}x_i$ then as $1\in\mathbb{R}^+$ there exist a $N\in\{k,\ldots,\infty\}$ such that $\forall n\geqslant N$ we have $\|x_n\|=\|x_n-x+x\|\leqslant\|x_n-x\|+\|x\|<1+\|x\|$. Hence if we define

$$K=\max(1+\|x\|,\max(\{x_i|i\in\{k,\ldots,N\}\}))$$

we have

$$\forall n\in\{k,\ldots,\infty\}\text{ that }\|x_n\|\leqslant K$$ □

Theorem 14.307. *Let $k\in\mathbb{N}_0$, $\langle X,\|\|\rangle$ a normed space, $\{x_n\}_{n\in\{k,\ldots,\infty\}}\subseteq X$ a **convergent** sequence in X and $\{s_n\}_{n\in\{k,\ldots,\infty\}}\subseteq\mathbb{R}$ a **convergent** sequence such that $\forall n\in\{k,\ldots,\infty\}$ we have $\|x_n\|\leqslant s_n$ then $\left\|\lim\limits_{n\to\infty}x_n\right\|\leqslant\lim\limits_{n\to\infty}s_n$*

Proof. Let $x=\lim\limits_{n\to\infty}x_n$ and $s=\lim\limits_{n-<\infty}s_n=s$. As $\forall n\in\{k,\ldots,\infty\}$ we have $0\leqslant\|x_n\|<s_n$ it follows from [theorem: 14.305] that

$$0\leqslant s$$

Assume that $s<\|x\|$ then $\varepsilon=\|x\|-s\in\mathbb{R}^+$. Using the definition of a limit there exists N_1, $N_2\in\{k,\ldots,\infty\}$ such that $\forall n\geqslant N_1$ $\|x_n-x\|<\frac{\varepsilon}{2}$ and $\forall m\geqslant N_2$ $|s_n-s|<\frac{\varepsilon}{2}$. Take $N=\max(N_1,N_2)$ then we have

$$\|x\|\leqslant\|x-x_N\|+\|x_N\|<\frac{\varepsilon}{2}+\|x_N\|\leqslant\frac{\varepsilon}{2}+s_N\leqslant\frac{\varepsilon}{2}+|s_N|\leqslant\frac{\varepsilon}{2}+|s_N-s|+|s|<\frac{\varepsilon}{2}+\frac{\varepsilon}{2}+|s|=\varepsilon+s=\|x\|$$

leading to the contradiction $\|x\| < \|x\|$. Hence we must have that $\|x\| \leqslant s$. □

Example 14.308. Let $k \in \mathbb{N}$ then $\left\{\frac{(-1)^n}{n}\right\}_{n\in\{k,\ldots,\infty\}}$ has a limit where $\lim\limits_{n\to\infty}\left(\frac{(-1)^n}{n}\right) = 0$

Proof. As $\forall n \in \{k,\ldots,\infty\}$ $\left|\frac{(-1)^n}{n}\right| = \frac{1}{n}$ and by [example: 14.297] $\lim\limits_{n\to\infty}\frac{1}{n} = 0$ exists it follows from [theorem: 14.307] that $\lim\limits_{n\to\infty}\left(\frac{(-1)^n}{n}\right)$ exists and $0 \leqslant \left|\lim\limits_{n\to\infty}\left(\frac{(-1)^n}{n}\right)\right| \leqslant \lim\limits_{n\to\infty}\frac{1}{n} = 0$ so that

$$\lim_{n\to\infty}\left(\frac{(-1)^n}{n}\right) = 0$$

□

Theorem 14.309. *Let $k \in \mathbb{N}_0$, $\langle X, \|\|\rangle$ a normed space, $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq X$, $\{y_n\}_{n\in\{k,\ldots\infty\}} \subseteq X$ convergent sequences such that $\forall n \in \{k,\ldots,\infty\}$ $\|x_n\| \leqslant \|y_n\|$ then $\left\|\lim\limits_{n\to\infty} x_n\right\| \leqslant \left\|\lim\limits_{n\to\infty} y_n\right\|$*

Proof. Let $x = \lim\limits_{n\to\infty} x_n$, $y = \lim\limits_{n\to\infty} y_n$ and assume that $\|y\| < \|x\|$ so that $\varepsilon = \|x\| - \|y\| \in \mathbb{R}^+$. Find $N_1, N_2 \in \{k,\ldots\infty\}$ such that $\forall n \geqslant N_1$ $\|x_n - x\| < \frac{\varepsilon}{2}$ and $\forall m > N_2$ $\|y_m - y\| < \frac{\varepsilon}{2}$. Take $N = \max(N_1, N_2)$ then we have:

$$\begin{aligned}
\|x\| &\leqslant \|x_N - x\| + \|x_N\| \\
&\leqslant \|x_N - x\| + \|y_N\| \\
&\leqslant \|x_N - x\| + \|y_N - y\| + \|y\| \\
&< \frac{\varepsilon}{2} + \frac{\varepsilon}{2} + \|y\| \\
&= \varepsilon + \|y\| \\
&= \|x\|
\end{aligned}$$

giving the contradiction $\|x\| < \|x\|$. So the assumption is wrong and we must have that $\|x\| \leqslant \|y\|$. □

Theorem 14.310. *Let $k \in \mathbb{N}_0$, $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq [0,\infty[$ a convergent sequence of non negative numbers then $0 \leqslant \lim\limits_{n\to\infty} x_n$*

Proof. Assume that $x = \lim\limits_{i\to\infty} x_i < 0$ then $\varepsilon = -x \in \mathbb{R}^+$. By the definition of a limit there exists a $N \in \{k,\ldots,\infty\}$ such that $|x_N - x| < \frac{\varepsilon}{2}$. As $0 \leqslant x_N \wedge x < 0 \Rightarrow 0 < -x$ we have that $0 < x_N - x$ so that $x_N - x = |x_N - x| < \frac{\varepsilon}{2} \Rightarrow x_N < \frac{\varepsilon}{2} + x = \frac{\varepsilon}{2} - \varepsilon = -\frac{\varepsilon}{2} < 0$ contradicting $0 \leqslant x_N$ so we must have that $0 \leqslant \lim\limits_{i\to\infty} x_i$ □

Corollary 14.311. *Let $\{x_n\}_{n\in\{k,\ldots,\infty\}}, \{y_n\}_{n\in\{k,\ldots n\}} \subseteq \mathbb{R}$ be convergent sequences with $\forall n \in \{k,\ldots,\infty\}$ $x_n \leqslant y_n$ then $\lim\limits_{n\to\infty} x_n \leqslant \lim\limits_{n\to\infty} y_n$*

Proof. Using the assumption we have that $\{y_i - x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq [0,\infty[$ and using [theorems: 14.301, 14.302] it follows that $\lim\limits_{n\to\infty}(y_n - x_n) = \lim\limits_{n\to\infty} y_n - \lim\limits_{n\to\infty} x_n$. From [theorem: 14.310] we have that $0 \leqslant \lim\limits_{n\to\infty}(y_n - x_n)$ so that $\lim\limits_{n\to\infty} x_n \leqslant \lim\limits_{n-<\infty} x_n$. □

There is a relation between convergence and continuity of a function.

Theorem 14.312. *If $\langle X, \mathcal{T}_X\rangle$, $\langle Y, \mathcal{T}_Y\rangle$ and $f: X \to Y$ a continuous function at x then*

$$\forall\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq X \text{ with } \lim_{n\to\infty} x_n = x \text{ we have that } \lim_{n\to\infty} f_n(x) = f(x)$$

Proof. As f is continuous at x we have for $V \in \mathcal{T}_Y$ with $f(x) \in V$ that there exist a $U \in \mathcal{T}_X$ such that $x \in U$ and $f(x) \in f(U) \subseteq V$. If $\{x_n\}_{n\in\{k,\ldots,n\}} \subseteq X$ satisfies $\lim\limits_{n\to\infty} x_n = x$ then there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall n \geqslant N$ we have $x_n \in U$, hence as $f(U) \subseteq V$ we have $f(x_n) \in V$. So we have

$$\lim_{n\to\infty} f(x_n) = f(x)$$

□

For metric and normed spaces we have also the opposite of the above implication.

Theorem 14.313. *If $\langle X, d_x\rangle$ and $\langle Y, d_Y\rangle$ are metric spaces, $f: X \to Y$ a function then we have*

$$f \text{ is continuous at } x \Leftrightarrow \forall\{x_n\}_{n\in\mathbb{N}} \subseteq X \text{ with } \lim_{n\to\infty} x_n = x \text{ we have } \lim_{n\to\infty} f(x_n) = f(x)$$

***Note* 14.314.** *As a normed space is a metric space the theorem is also applicable to normed spaces.*

Proof.

⇒. This follows from the previous theorem [theorem: 14.312].

⇐. Assume that f is not continuous at x then by [theorem: 14.127] there exist a $\varepsilon > 0$ such that $\forall \delta \in \mathbb{R}^+$ there exist a $y \in X$ with $d_X(x, y) < \delta$ such that $\varepsilon \leqslant d_Y(f(x), f(y))$. Hence $\forall n \in \mathbb{N}_0$ there exist a $x_n \in X$ with $d_X(x, x_n) < \frac{1}{n}$ such that $\varepsilon \leqslant d_Y(f(x), f(x_n))$. Take $\zeta \in \mathbb{R}^+$ then by the Archimedean property [see theorem: 10.29] there exist a $N \in \mathbb{N}$ such that $\frac{1}{N} < \zeta$, hence $\forall n \geqslant N$ we have

$$d_X(x, x_n) < \frac{1}{n} \leqslant \frac{1}{N} < \zeta$$

proving that

$$\lim_{n\to\infty} x_n = x$$

Hence by the hypothesis we have that

$$\lim_{n\to\infty} f(x_n) = x$$

So there exist a $M \in \mathbb{N}$ such that $d_Y(f(x), f(x_M)) < \varepsilon$ contradicting the fact that $\forall n \in \mathbb{N}\ \varepsilon \leqslant d_Y(f(x), f(x_n))$. So the assumption is wrong and we must have that f is continuous at x. □

Corollary 14.315. *Let $k \in \mathbb{N}_0$, $\langle X, \|\|\rangle$ a normed space and $\{x_i\}_{i\in\{k,\dots,\infty\}} \subseteq X$ a sequence such that $\lim\limits_{n\to\infty} x_n$ exist then $\lim\limits_{n\to\infty} \|x_n\|$ exist and $\lim\limits_{n\to\infty} \|x_n\| = \left\| \lim\limits_{n\to\infty} x_n \right\|$*

Proof. Using [example: 14.156] $\|\|: X \to \mathbb{R}$ defined by $\|\|(x) = \|x\|$ is continuous. So as $\lim\limits_{n\to\infty} x_n$ converges to x we have by the previous theorem [theorem: 14.313] that $\lim\limits_{n\to\infty} \|\|(x_n)$ converges to $\|\|(x) = \|x\|$. In other words we have $\lim\limits_{n\to\infty} \|x_n\| = \left\| \lim\limits_{n\to\infty} x_n \right\|$, □

14.9.3 Sequences of real numbers

In this section we always assume that we work with the normed space $\langle \mathbb{R}, |\,| \rangle$. The basic property that sets $\mathbb{R}$ apart from other normed spaces is the fact that $\langle \mathbb{R}, \leqslant \rangle$ is conditional complete.

For the real numbers there is a nice relation between the supremum and infinum and increasing or decreasing sequences.

Theorem 14.316. *Let $k \in \mathbb{N}_0$ and $\{x_n\}_{n\in\{k,\dots,\infty\}} \subseteq \mathbb{R}$ then we have*

1. *If $\{x_n\}_{n\in\{k,\dots,\infty\}}$ is increasing then we have*

$$\sup(\{x_n | n \in \{k, \dots, \infty\}\}) \text{ exists} \Leftrightarrow \lim_{n\to\infty} x_n \text{ exists}$$

further if the supremum or the limit exists we have that

$$\lim_{n\to\infty} x_n = \sup(\{x_n | n \in \{k, \dots, \infty\}\})$$

2. *If $\{x_n\}_{n\in\{k,\dots,\infty\}}$ is decreasing then we have*

$$\inf(\{x_n | n \in \{k, \dots, \infty\}\}) \text{ exists} \Leftrightarrow \lim_{n\to\infty} x_n \text{ exists}$$

further if the supremum or the limit exists we have that

$$\lim_{n\to\infty} x_n = \inf(\{x_n | n \in \{k, \dots, \infty\}\})$$

Proof.

1. We have

⇒. Let $x = \sup(\{x_n | n \in \{k, \dots, \infty\}\})$ and take $\varepsilon \in \mathbb{R}^+$ then $x - \varepsilon < x$ so that there exist a $N \in \{k, \dots, \infty\}$ such that $x - \varepsilon < x_N$. By [theorem: 14.287] we have $\forall n \leqslant N$ that $x - \varepsilon < x_N \leqslant x_n \leqslant x < x + \varepsilon$, hence $x - x_n < \varepsilon \wedge x_n - x < \varepsilon \Rightarrow |x_n - x| < \varepsilon$, proving that

$$\lim_{n\to\infty} x_n \text{ exists and } \lim_{n\to\infty} x_n = x = \sup(\{x_n | n \in \{k, \dots, \infty\}\})$$

$\Leftarrow$. Let $x = \lim_{n\to\infty} x_n$ then as $1 \in \mathbb{R}^+$ there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N$ we have $|x_n - x| < 1 \Rightarrow x_n - x < 1 \Rightarrow x_n < x + 1$. So $\forall n \in \{k, \ldots, \infty\}$ we have that $x_n \leqslant \max(\{x_i | i \in \{1, \ldots, N\} \bigcup \{x+1\}|\})$ or in other words $\{x_n | n \in \{k, \ldots, \infty\}\}$ is bounded above. Using the conditional completeness of the real numbers [see theorem: 10.18] it follows that

$$\sup(\{x_n | n \in \{k, \ldots, \infty\}\}) \text{ exist}$$

2. We have

$\Rightarrow$. Let $x = \inf(\{x_n | n \in \{k, \ldots, \infty\}\})$ and take $\varepsilon \in \mathbb{R}^+$ then $x < x + \varepsilon$ so that there exist a $N \in \{k, \ldots, \infty\}$ such that $x_N < x + \varepsilon$. By [theorem: 14.287] we have $\forall n \leqslant N$ that $x - \varepsilon < x \leqslant x_n \leqslant x_N < x + \varepsilon$, hence $x - x_n < \varepsilon \wedge x_n - x < \varepsilon \Rightarrow |x_n - x| < \varepsilon$, proving that

$$\lim_{n\to\infty} x_n \text{ exists and } \lim_{n\to\infty} x_n = x = \inf(\{x_n | n \in \{k, \ldots, \infty\}\})$$

$\Leftarrow$. Let $x = \lim_{n\to\infty} x_n$ then as $1 \in \mathbb{R}^+$ there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N$ we have $|x_n - x| < 1 \Rightarrow x - x_n < 1 \Rightarrow x - 1 < x_n$. So $\forall n \in \{k, \ldots, \infty\}$ we have that $\min(\{x_i | i \in \{1, \ldots, N\} \bigcup \{x-1\}|\}) \leqslant x_n$ or in other words $\{x_n | n \in \{k, \ldots, \infty\}\}$ is bounded below. Using the conditional completeness of the real numbers [see theorem: 10.18] it follows that

$$\inf(\{x_n | n \in \{k, \ldots, \infty\}\}) \text{ exist}$$

□

Corollary 14.317. *Let $k \in \mathbb{N}_0$ and $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq \mathbb{R}$ then we have*

1. *If $\{x_n\}_{n\in\{k,\ldots,\infty\}}$ is increasing and there exist a $M \in \mathbb{R}$ and a $N \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N$ $x_n \leqslant M$ then $\lim_{n\to\infty} x_n$ exist and $\lim_{n\to\infty} x_n \leqslant M$.*
2. *If $\{x_n\}_{n\in\{k,\ldots,\infty\}}$ is decreasing and there exist a $M \in \mathbb{R}$ and a $N \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N$ $M \leqslant x_n$ then $\lim_{n\to\infty} x_n$ exist and $M \leqslant \lim_{n\to\infty} x_n$.*

Proof.

1. As $\forall n \geqslant N$ $x_n \leqslant M$ we have that $\emptyset \neq \{x_n | n \in \{N, \ldots, \infty\}\} \leqslant M$ it follows from the conditional completeness of $\mathbb{R}$ [see theorem: 10.18] that $\sup(\{x_n \in \{N, \ldots, \infty\}\})$ exist and

$$\sup(\{x_n | n \in \{N, \ldots, \infty\}\}) \leqslant M.$$

Hence by [theorem: 14.316] $\{x_n\}_{n\in\{N,\ldots,\infty\}}$ converges to $\sup(\{x_n \in \{N, \ldots, \infty\}\})$. Which using [theorem: 14.290] proves that $\{x_n\}_{n\in\{k,\ldots,\infty\}}$ converges to $\sup(\{x_n \in \{N, \ldots, \infty\}\})$. In other words

$$\lim_{n\to\infty} x_n \text{ exist and } \lim_{n\to\infty} x_n \leqslant M$$

2. As $\forall n \geqslant N$ $M \leqslant x_n$ we have that $\emptyset \neq \{x_n | n \in \{N, \ldots, \infty\}\} \geqslant M$ it follows from the conditional completeness of $\mathbb{R}$ [see theorem: 10.18] that $\inf(\{x_n \in \{N, \ldots, \infty\}\})$ exist and

$$M \leqslant \inf(\{x_n | n \in \{N, \ldots, \infty\}\}).$$

Hence by [theorem: 14.316] $\{x_n\}_{n\in\{N,\ldots,\infty\}}$ converges to $\inf(\{x_n \in \{N, \ldots, \infty\}\})$. Which using [theorem: 14.290] proves that $\{x_n\}_{n\in\{k,\ldots,\infty\}}$ converges to $\inf(\{x_n \in \{N, \ldots, \infty\}\})$. In other words

$$\lim_{n\to\infty} x_n \text{ exist and } M \leqslant \lim_{n\to\infty} x_n$$

□

We introduce now a extension of the concept of a limit.

Definition 14.318. *Let $k \in \mathbb{N}_0$, $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq \mathbb{R}$ a sequence of real numbers then the limit superior and the limit inferior noted as $\limsup_{n\to\infty} x_i$ and $\liminf_{n\to\infty} x_i$ are defined as follows:*

1. *$\limsup_{n\to\infty} x_n$ exist if*
   a. *$\forall n \in \{k, \ldots, \infty\}$ $\sup(\{x_i | i \in \{n, \ldots, \infty\}\})$ exist*
   b. *$\lim_{n\to\infty} \sup(\{x_i | i \in \{n, \ldots, \infty\}\})$ exist*

   If $\limsup_{n\to\infty} x_n$ exist then $\limsup_{n\to\infty} x_n = \lim_{m\to\infty} \sup(\{x_i | i \in \{n, \ldots, \infty\}\})$

2. $\liminf_{n\to\infty} x_n$ *exist if*
   a. $\forall n \in \{k,\ldots,\infty\}$ $\inf(\{x_i | i \in \{n,\ldots,\infty\}\})$ *exist*
   b. $\lim_{n\to\infty} \inf(\{x_i | i \in \{n,\ldots,\infty\}\})$ *exist*

   If $\liminf_{n\to\infty} x_n$ *exist then* $\liminf_{n\to\infty} x_n = \lim_{m\to\infty} \inf(\{x_i | i \in \{n,\ldots,\infty\}\})$

Theorem 14.319. *Let* $k \in \mathbb{N}_0, \{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq \mathbb{R}$ *such that* $\liminf_{n\to\infty} x_i$ *and* $\limsup_{n\to\infty} x_i$ *exists then*

$$\liminf_{n\to\infty} x_i \leqslant \limsup_{n\to\infty} x_i$$

Proof. Let $n \in \{k,\ldots,\infty\}$ then we have

$$\inf(\{x_i | i \in \{n,\ldots,\infty\}\}) \leqslant x_n \leqslant \sup(\{x_i | i \in \{n,\ldots,\infty\}\})$$

So that by [theorem: 14.311]

$$\liminf_{n\to\infty} x_i \underset{\text{def}}{=} \lim_{n\to\infty} \inf(\{x_i | i \in \{n,\ldots,\infty\}\}) \leqslant \lim_{n\to\infty} \sup(\{x_i | i \in \{n,\ldots,\infty\}\}) \underset{\text{def}}{=} \limsup_{n\to\infty} x_i$$

□

We have the following equivalent definition of the lim sup and lim inf of a sequence.

Theorem 14.320. *Let* $k \in \mathbb{N}$, $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq \mathbb{R}$ *a sequence of real numbers then*

1.
$$\limsup_{n\to\infty} x_n \text{ exist}$$
$$\Updownarrow$$
$$\forall n \in \{k,\ldots,\infty\} \ \sup(\{x_i | i \in \{n,\ldots,\infty\}\}) \text{ exist}$$
$$\text{and}$$
$$\inf(\{\sup(\{x_i | i \in \{n,\ldots,\infty\}\}) | n \in \{k,\ldots,\infty\}\}) \text{ exist}$$
   Further if $\limsup_{n\to\infty} x_n$ *exist then*
$$\limsup_{n\to\infty} x_n = \inf(\{\sup(\{x_i | i \in \{n,\ldots,\infty\}\}) | n \in \{k,\ldots,\infty\}\})$$
2.
$$\liminf_{n\to\infty} x_n \text{ exist}$$
$$\Updownarrow$$
$$\forall n \in \{k,\ldots,\infty\} \ \inf(\{x_i | i \in \{n,\ldots,\infty\}\}) \text{ exist}$$
$$\text{and}$$
$$\sup(\{\inf(\{x_i | i \in \{n,\ldots,\infty\}\}) | n \in \{k,\ldots,\infty\}\}) \text{ exist}$$
   Further if $\liminf_{n\to\infty} x_n$ *exist then*
$$\liminf_{n\to\infty} x_n = \sup(\{\inf(\{x_i | i \in \{n,\ldots,\infty\}\}) | n \in \{k,\ldots,\infty\}\})$$

Proof.

1. Assume that $\forall n \in \{k,\ldots,\infty\}$ $\sup(\{x_i | i \in \{k,\ldots,\infty\}\})$ exist. Then $\forall n \in \{k,\ldots,\infty\}$ we have $\{x_i | i \in \{n+1,\ldots,\infty\}\} \subseteq \{x_i | i \in \{n,\ldots,\infty\}\}$ so that by [theorem: 3.77]
$$\sup(\{x_i | i \in \{n+1,\ldots,\infty\}\}) \leqslant \sup(\{x_i | i \in \{n,\ldots,\infty\}\})$$
   proving that $\{\sup(\{x_i | i \in \{n,\ldots,\infty\}\})\}_{n\in\{k,\ldots,\infty\}}$ is a decreasing sequence. The rest of the proof follows then from [definition: 14.318] and [theorem: 14.316].
2. Assume that $\forall n \in \{k,\ldots,\infty\}$ $\inf(\{x_i | i \in \{k,\ldots,\infty\}\})$ exist. Then $\forall n \in \{k,\ldots,\infty\}$ we have $\{x_i | i \in \{n+1,\ldots,\infty\}\} \subseteq \{x_i | i \in \{n,\ldots,\infty\}\}$ so that by [theorem: 3.77]
$$\inf(\{x_i | i \in \{n,\ldots,\infty\}\}) \leqslant \inf(\{x_i | i \in \{n+1,\ldots,\infty\}\})$$

proving that $\{\inf(\{x_i|i\in\{n,\ldots,\infty\}\})\}_{n\in\{k,\ldots,\infty\}}$ is a increasing sequence. The rest of the proof follows then from [definition: 14.318] and [theorem: 14.316]. □

We have the following relation between the limit of a sequence and the limit inferior and the limit superior of a sequence.

Theorem 14.321. *Let $k\in\mathbb{N}_0$, $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\mathbb{R}$ then we have that*

$$\lim_{n\to\infty} x_n \text{ exist} \Leftrightarrow \liminf_{n\to\infty} x_n \text{ and } \limsup_{n\to\infty} x_n \text{ exists and } \liminf_{n\to\infty} x_n = \limsup_{n\to\infty} x_n$$

Further if $\lim_{n\to\infty} x_i$ *exist then*

$$\lim_{n\to\infty} x_n = \liminf_{n\to\infty} x_i = \limsup_{n\to\infty} x_n$$

Proof.

⇒. As $\lim_{n\to\infty} x_i$ exist we have by [theorem: 14.306] that there exist a $K\in\mathbb{R}^+$ such that $\forall i\in\{k,\ldots,\infty\}$ $|x_i|\leqslant K\Rightarrow -x_i, x_i\leqslant K\Rightarrow -K\leqslant x_i\leqslant K$. Hence $\forall n\in\{k,\ldots,\infty\}$ $\{x_i|i\in\{n,\ldots,\infty\}\}$ is bounded below by $-K$ and above by K. So by the fact that $\mathbb{R}$ is conditional complete [see theorem: 10.18] it follows that

$$\sup(\{x_i|\in\{n,\ldots,\infty\}\}) \text{ and } \inf(\{x_i|i\in\{n,\ldots,\infty\}\}) \text{ exists}$$

and

$$\inf(\{x_i|i\in\{n,\ldots,\infty\}\})\leqslant x_n\leqslant K \text{ and } -K\leqslant x_n\leqslant\sup(\{x_i|i\in\{n,\ldots,\infty\}\})$$

Using the above we have that $\{\inf(\{x_i|i\in\{n,\ldots,\infty\}\})|n\in\{k,\ldots,\infty\}\}$ is bounded above by K and $\{\sup(\{x_i|i\in\{n,\ldots,\infty\}\})|n\in\{k,\ldots,\infty\}\}$ is bounded below by $-K$. Using [theorem: 10.18] again it follows that $\sup(\{\inf(\{x_i|i\in\{n,\ldots,\infty\}\})|n\in\{k,\ldots,\infty\}\})$ and $\inf(\{\sup(\{x_i|i\in\{n,\ldots,\infty\}\})|n\in\{k,\ldots,\infty\}\})$ exists. Using then [theorem: 14.320] it follows that

$$\liminf_{n\to\infty} x_i \text{ and } \limsup_{n\to\infty} x_i \text{ exist} \tag{14.167}$$

and

$$\liminf_{n\to\infty} x_n = \sup(\{\inf(\{x_i|i\in\{n,\ldots,\infty\}\})|n\in\{k,\ldots,\infty\}\}) \tag{14.168}$$

$$\limsup_{n\to\infty} x_n = \inf(\{\sup(\{x_i|i\in\{n,\ldots,\infty\}\})|n\in\{k,\ldots,\infty\}\}) \tag{14.169}$$

Let $x=\lim_{n\to\infty} x_n$. Then giving $\varepsilon\in\mathbb{R}^+$ there exist a $n\in\{k,\ldots,\infty\}$ such that $\forall i\in\{n,\ldots,\infty\}$ we have $|x_i-x|<\varepsilon\Rightarrow x-\varepsilon<x_i<x+\varepsilon$. Hence $x-\varepsilon\leqslant\inf(\{x_i|i\in\{n,\ldots,\infty\}\})$ or $x\leqslant\inf(\{x_i|i\in\{n,\ldots,\infty\}\})+\varepsilon$ and $\sup(\{x_i|i\in\{n,\ldots,\infty\}\})\leqslant x+\varepsilon$. Hence using [theorem: 10.31] we have that

$$x\leqslant\inf(\{x_i|i\in\{n,\ldots,\infty\}\} \text{ and } \sup(\{x_i|i\in\{n,\ldots,\infty\}\})\leqslant x$$

hence

$$x\leqslant\sup(\{\inf(\{x_i|i\in\{n,\ldots,\infty\}\})|n\in\{k,\ldots,\infty\}\}) \underset{\text{[eq: 14.168]}}{=} \liminf_{n\to\infty} x_n$$

and

$$\limsup_{n\to\infty} x_n \underset{\text{[eq: 14.169]}}{=} \inf(\{\sup(\{x_i|i\in\{n,\ldots,\infty\}\})|n\in\{k,\ldots,\infty\}\})\leqslant x$$

which as by [theorem: 14.319] $\liminf_{n\to\infty} x_n\leqslant\limsup_{n\to\infty} x_n$ proves that

$$x\leqslant\liminf_{n\to\infty} x_n\leqslant\limsup_{n\to\infty} x_n\leqslant x$$

so that

$$\lim_{n\to\infty} x_n = x = \liminf_{n\to\infty} x_n = \limsup_{n\to\infty} x_n$$

⇐. By the hypothesis $\liminf_{n\to\infty} x_n$ and $\limsup_{n\to\infty} x_n$ exist and $x=\liminf_{n\to\infty} x_n=\limsup_{n\to\infty} x_n$. Let $\varepsilon\in\mathbb{R}^+$. Then $x-\varepsilon<x=\liminf_{n\to\infty} x_n \underset{\text{[theorem: 14.320]}}{=} \sup(\{\inf(\{x_i|i\in\{n,\ldots,\infty\}\})|n\in\{k,\ldots,\infty\}\})$ so there exist a $N\in\{k,\ldots,\infty\}$ such that $x-\varepsilon<\inf(\{x_i|i\in\{N,\ldots,\infty\}\})$. In other words

$$\forall i\geqslant N \text{ we have } x-\varepsilon<x_i \tag{14.170}$$

Further $\inf(\{\sup(\{x_i|i\in\{n,\ldots,\infty\}\})|n\in\{k,\ldots,\infty\}\})=\limsup_{n\to\infty} x_n=x<x+\varepsilon$ so there exist a $M\in\{k,\ldots,\infty\}$ such that $\sup(\{x_i|i\in\{M,\ldots,\infty\}\})<x+\varepsilon$. In other words

$$\forall i\geqslant M \text{ we have } x_i<x+1 \tag{14.171}$$

Let $i \geqslant \max(M, N)$ then by [eqs: 14.170 and 14.171] we have $x - \varepsilon < x_i < x + \varepsilon \Rightarrow |x_i - x| < \varepsilon$ which as $\varepsilon \in \mathbb{R}^+$ was chosen arbitrary proves that

$$\lim_{n\to\infty} x_n \text{ exists and } \lim_{n\to\infty} x_n = x$$

□

Theorem 14.322. *Let $k \in \mathbb{N}$, $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq \mathbb{R}$ a sequence of real numbers then we have*

1. *If $\liminf\limits_{n\to\infty} x_n$ exists then $\limsup\limits_{n\to\infty}(-x_n)$ exists and $\liminf\limits_{n\to\infty} x_n = -\limsup\limits_{n\to\infty}(-x_n)$*
2. *If $\limsup\limits_{n\to\infty} x_n$ exists then $\liminf\limits_{n\to\infty}(-x_n)$ exists and $\limsup\limits_{n\to\infty} x_n = -\liminf\limits_{n\to\infty}(-x_n)$*
3. *If $\limsup\limits_{n\to\infty} x_n$ exists and $\alpha \in [0, \infty[$ then $\limsup\limits_{n\to\infty}(\alpha \cdot x_n)$ exists and*
$$\limsup_{n\to\infty}(\alpha \cdot x_n) = \alpha \cdot \limsup_{n\to\infty} x_i$$
4. *If $\liminf\limits_{n\to\infty} x_n$ exists and $\alpha \in [0, \infty[$ then $\liminf\limits_{n\to\infty}(\alpha \cdot x_n)$ exists and $\liminf\limits_{n\to\infty}(\alpha \cdot x_n) = \alpha \cdot \liminf\limits_{n\to\infty} x_n$*
5. *If $x \in \mathbb{R}$ and $\liminf\limits_{n\to\infty} x_n$ exists then for $\{x_n + x\}_{n\in\{k,\ldots,\infty\}}$ $\liminf\limits_{n\to\infty}(x_n + x)$ exists and*
$$\liminf_{n\to\infty}(x_n + x) = \liminf_{n\to\infty} x_n + x$$
6. *If $x \in \mathbb{R}$ and $\limsup\limits_{n\to\infty} x_n$ exists then for $\{x_n + x\}_{n\in\{k,\ldots,\infty\}}$ $\limsup\limits_{n\to\infty}(x_n + x)$ exists and*
$$\limsup_{n\to\infty}(x_n + x) = \limsup_{n\to\infty} x_n + x$$

Proof.

1. As $\liminf\limits_{n\to\infty} x_i$ exists we have
$$\forall n \in \{k, \ldots, \infty\} \text{ that } \inf(\{x_i | i \in \{n, \ldots, \infty\}\}) \text{ exists} \tag{14.172}$$
Using [theorem: 10.21] we have then that $\sup(\{-x_i | i \in \{n, \ldots, \infty\}\})$ exists and
$$\forall n \in \mathbb{N}_0 \in \{k, \ldots, \infty\} \sup(\{-x_i | i \in \{n, \ldots, \infty\}\}) = -\inf(\{x_i | i \in \{n, \ldots, \infty\}\}) \tag{14.173}$$
Again using the existence of $\liminf\limits_{n\to\infty} x_i$ we have the existence of $\lim\limits_{n\to\infty} \inf(\{x_i | i \in \{n, \ldots, \infty\}\})$ and further we have
$$\begin{aligned}
\liminf_{n\to\infty} x_n &= \lim_{n\to\infty} \inf(\{x_i | i \in \{n, \ldots, \infty\}\}) \\
&\underset{\text{[eq: 14.173]}}{=} \lim_{n\to\infty} (-\sup(\{-x_i | i \in \{n, \ldots, \infty\} \\
&\underset{\text{[theorem: 14.302]}}{=} -\lim_{n\to\infty} (\sup(\{-x_i | i \in \{n, \ldots, \infty\}\})) \\
&\underset{\text{def}}{=} -\limsup_{n\to\infty}(-x_n)
\end{aligned}$$
2. As $\limsup\limits_{n\to\infty} x_i$ exists we have
$$\forall n \in \{k, \ldots, \infty\} \sup(\{x_i | i \in \{n, \ldots, \infty\}\}) \text{ exists} \tag{14.174}$$
Using [theorem: 10.21] we have then that $\inf(\{-x_i | i \in \{n, \ldots, \infty\}\})$ exists and
$$\forall n \in \mathbb{N}_0 \in \{k, \ldots, \infty\} \inf(\{-x_i | i \in \{n, \ldots, \infty\}\}) = -\sup(\{x_i | i \in \{n, \ldots, \infty\}\}) \tag{14.175}$$
Again using the existence of $\limsup\limits_{n\to\infty} x_i$ we have the existence of $\lim\limits_{n\to\infty} \sup(\{x_i | i \in \{n, \ldots, \infty\}\})$, further we have
$$\begin{aligned}
\limsup_{n\to\infty} x_n &= \lim_{n\to\infty} \sup(\{x_i | i \in \{n, \ldots, \infty\}\}) \\
&\underset{\text{[eq: 14.175]}}{=} \lim_{n\to\infty} (-\inf(\{-x_i | i \in \{n, \ldots, \infty\} \\
&\underset{\text{[theorem: 14.302]}}{=} -\lim_{n\to\infty} (\inf(\{-x_i | i \in \{n, \ldots, \infty\}\})) \\
&\underset{\text{def}}{=} -\liminf_{n\to\infty}(-x_n)
\end{aligned}$$
3. As $\limsup\limits_{n\to\infty} x_i$ exists we have
$$\forall n \in \{k, \ldots, \infty\} \sup(\{x_i | i \in \{n, \ldots, \infty\}\}) \text{ exists}$$

Using [theorem: 10.22] we have that $\sup(\{\alpha\cdot x_i|i\in\{n,...,\infty\}\})$ exists and is equal to $\alpha\cdot\sup(\{x_i|i\in\{n,...,\infty\}\})$. So as $\lim\limits_{n\to\infty}\sup(\{x_i|i\in\{n,\ldots,\infty\}\})$ exists we have by [theorem: 14.302] that $\lim\limits_{n\to\infty}(\alpha\cdot\sup(\{x_i|i\in\{n,\ldots,\infty\}\}))$ exists and

$$\begin{aligned}\alpha\cdot\limsup_{n\to\infty}x_n &= \alpha\cdot\lim_{n\to\infty}\sup(\{\alpha\cdot x_i|i\in\{n,\ldots,\infty\}\})\\ &\underset{\text{[theorem: 14.302]}}{=} \lim_{n\to\infty}(\alpha\cdot\sup(\{x_i|i\in\{n,\ldots,\infty\}\}))\\ &= \lim_{n\to\infty}(\sup(\{\alpha\cdot x_i|i\in\{n,\ldots,\infty\}\}))\\ &= \limsup_{n\to\infty}(\alpha\cdot x_n)\end{aligned}$$

4. As $\liminf\limits_{n\to\infty}x_i$ exists we have

$$\forall n\in\{k,\ldots,\infty\}\ \inf(\{x_i|i\in\{n,\ldots,\infty\}\})\text{ exists}$$

Using [theorem: 10.22] we have that $\inf(\{\alpha\cdot x_i|i\in\{n,...,\infty\}\})$ exists and is equal to $\alpha\cdot\inf(\{x_i|i\in\{n,...,\infty\}\})$. So as $\lim\limits_{n\to\infty}\inf(\{x_i|i\in\{n,\ldots,\infty\}\})$ exists we have by [theorem: 14.302] that $\lim\limits_{n\to\infty}(\alpha\cdot\inf(\{x_i|i\in\{n,\ldots,\infty\}\}))$ exists and

$$\begin{aligned}\alpha\cdot\liminf_{n\to\infty}x_n &= \alpha\cdot\lim_{n\to\infty}\inf(\{\alpha\cdot x_i|i\in\{n,\ldots,\infty\}\})\\ &\underset{\text{[theorem: 14.302]}}{=} \lim_{n\to\infty}(\alpha\cdot\inf(\{x_i|i\in\{n,\ldots,\infty\}\}))\\ &= \lim_{n\to\infty}(\inf(\{\alpha\cdot x_i|i\in\{n,\ldots,\infty\}\}))\\ &= \liminf_{n\to\infty}(\alpha\cdot x_n)\end{aligned}$$

5. As $\liminf\limits_{n\to\infty}x_i$ exists we have

$$\forall n\in\{k,\ldots,\infty\}\ \inf(\{x_i|i\in\{n,\ldots,\infty\}\})\text{ exist}$$

Using [theorem: 10.24] we have that $\inf(\{x_i+x|i\in\{n,\ldots,\infty\}\})$ exists and

$$\inf(\{x_i+x|i\in\{n,\ldots,\infty\}\})=\inf(\{x_i|i\in\{n,\ldots,\infty\}\})+x$$

Hence

$$\begin{aligned}\liminf_{n\to\infty}x_n &= \lim_{n\to\infty}(\inf(\{x_i+x|i\in\{n,\ldots,\infty\}\}))\\ &= \lim_{n\to\infty}(\inf(\{x_i|i\in\{n,\ldots,\infty\}\})+x)\\ &\underset{\text{[theorem: 14.300]}}{=} \lim_{n\to\infty}\inf(\{x_i|i\in\{n,\ldots,\infty\}\})+x\\ &= \liminf_{n\to\infty}x_i+x\end{aligned}$$

6. As $\limsup\limits_{n\to\infty}x_i$ exists we have

$$\forall n\in\{k,\ldots,\infty\}\ \sup(\{x_i|i\in\{n,\ldots,\infty\}\})$$

Using [theorem: 10.24] we have that $\sup(\{x_i+x|i\in\{n,\ldots,\infty\}\})$ exists and

$$\sup(\{x_i+x|i\in\{n,\ldots,\infty\}\})=\sup(\{x_i|i\in\{n,\ldots,\infty\}\})+x.$$

Hence

$$\begin{aligned}\limsup_{n\to\infty}x_n &= \lim_{n\to\infty}(\sup(\{x_i+x|i\in\{n,\ldots,\infty\}\}))\\ &= \lim_{n\to\infty}(\sup(\{x_i|i\in\{n,\ldots,\infty\}\})+x)\\ &\underset{\text{[theorem: 14.300]}}{=} \lim_{n\to\infty}\sup(\{x_i|i\in\{n,\ldots,\infty\}\})+x\\ &= \limsup_{n\to\infty}x_i+x\end{aligned}$$

□

14.10 Complete spaces

Next we define a necessary condition for a sequence to be convergent in a metric or normed space.

Definition 14.323. (Cauchy Condition) *Let $\langle X, d\rangle$ be a metric space, $k \in \mathbb{N}_0$ then a sequence $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq X$ is **Cauchy** if*

$$\forall \varepsilon \in \mathbb{R}^+ \text{ there exists a } N \in \{k,\ldots,\infty\} \text{ such that } \forall n, m \in \mathbb{N} \text{ with } N \leqslant n, m \text{ we have } d(x_n, x_m) < \varepsilon$$

For a normed space the above definition becomes

Definition 14.324. (Cauchy condition) *Let $\langle X, \|\|\rangle$ be a metric space, $k \in \mathbb{N}_0$ then a sequence $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq X$ is **Cauchy** if*

$$\forall \varepsilon \in \mathbb{R}^+ \text{ there exists a } N \in \{k,\ldots,\infty\} \text{ such that } \forall n, m \in \mathbb{N}_0 \text{ with } N \leqslant n, m \text{ we have } \|x_n - x_m\| < \varepsilon$$

Convergence and Cauchy are topological constructs as is show in the following theorem.

Theorem 14.325. *Let X be a set with two equivalent norms $\|\|_1$ and $\|\|_2$ then for a sequence $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq X$ we have*

1. *$\{x_n\}_{n\in\{k,\ldots,\infty\}}$ converges to x using $\|\|_1 \Leftrightarrow \{x_n\}_{n\in\{k,\ldots,\infty\}}$ converges to x using $\|\|_2$*
2. *$\{x_n\}_{n\in\{k,\ldots,\infty\}}$ is Cauchy using $\|\|_1 \Leftrightarrow \{x_n\}_{n\in\{k,\ldots,\infty\}}$ is Cauchy using $\|\|_2$*

Proof. First note that we only have to prove $\Rightarrow$ (as $\Leftarrow$ follows from applying the theorem in the opposite direction. Next as $\|\|_1$ and $\|\|_2$ are equivalent we have by [theorem: 14.115] there exists $M_1, M_2 \in \mathbb{R}^+$ such that $\forall x \in X$ we have $M_1 \cdot \|x\|_1 \leqslant \|x\|_2 \leqslant M_2 \cdot \|x\|_1$. We have then:

1. Let $\varepsilon > 0$ then by convergence in $\|\|_1$ there exists a $N \in \{k,\ldots,\infty\}$ such that $\forall n \geqslant N$ we have $\|x - x_n\|_1 < \frac{\varepsilon}{M_2}$ so that $\|x - x_n\|_2 \leqslant M_2 \cdot \|x - x_n\|_1 < M_2 \cdot \frac{\varepsilon}{M_2} = \varepsilon$
2. Let $\varepsilon > 0$ then by the Cauchy property in $\|\|_1$ there exists a $N \in \{k,\ldots,\infty\}$ such that $\forall n, m \geqslant N$ we have $\|x_n - x_m\|_1 < \frac{\varepsilon}{M_2}$ and thus $\|x_n - x_m\|_2 \leqslant M_2 \cdot \|x_n - x_m\|_1 < M_2 \cdot \frac{\varepsilon}{M_2} = \varepsilon$ □

A Cauchy sequence in a normed space is bounded.

Theorem 14.326. *Let $\langle X, \|\|\rangle$ be a normed space, $k \in \mathbb{N}$ and $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq X$ a Cauchy sequence then there exists a $K \in \mathbb{R}^+$ such that $\forall i \in \{k,\ldots,\infty\}$ we have $\|x_i\| \leqslant K$*

Proof. As $1 \in \mathbb{R}^+$ then exist a $N \in \{k,...,\infty\}$ such that $\forall n, m \in \mathbb{N}_0$ with $N \leqslant n, m$ we have $\|x_n - x_m\| < 1$. Let $M = \max(\max(\{\|x_i\| | i \in \{k,..., N\}\}), \|x_N\| + 1)$ then for $i \in \{k,\ldots,\infty\}$ we have either:

$i \in \{k,\ldots,N\}$. Then $\|x_i\| \leqslant \max(\{\|x_i\| | i \in \{k,\ldots,N\}\}) \leqslant M$

$N < i$. Then $\|x_i\| = \|x_i - x_N + x_N\| \leqslant \|x_i - x_N\| + \|x_N\| < 1 + \|x_N\| \leqslant M$

proving that $\forall i \in \{k,\ldots,N\}$ we have $\|x_i\| \leqslant M$. □

We prove now that the Cauchy condition is indeed necessary for convergence.

Theorem 14.327. *If $\langle X, d\rangle$ is a metric space then every convergent sequence is Cauchy. Likewise if $\langle X, \|\|\rangle$ is a normed space then every convergent sequence is Cauchy.*

Proof. Let $\langle X, d\rangle$ be a metric space and let $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq X$ be a sequence that converges to x then for $\varepsilon \in \mathbb{R}^+$ there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall n \geqslant N$ we have $d(x, x_n) < \frac{\varepsilon}{2}$. So if $n, m \in \mathbb{N}$ with $n, m \geqslant N$ then we have

$$d(x_n, x_m) \leqslant d(x_n, x) + d(x, x_m) < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$$

proving that $\{x_n\}_{n\in\{k,\ldots,\infty\}}$ is Cauchy. Likewise let $\langle X, \|\|\rangle$ be a normed space and let $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq X$ be a sequence that converges to x then for $\varepsilon \in \mathbb{R}^+$ there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall n \geqslant N$ we have $\|x_n - x\| < \frac{\varepsilon}{2}$. So if $n, m \in \mathbb{N}$ with $n, m \geqslant N$ then we have

$$\|x_m - x_n\| = \|x_m - x + x - x_n\| \leqslant \|x_m - x\| + \|x_n - x\| < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$$

proving that $\{x_n\}_{n\in\{k,\ldots,\infty\}}$ is Cauchy. □

Example 14.328. Take $]0,\infty[$ and define $d:]0,\infty[\times]0,\infty[\to \mathbb{R}$ by $d(x, y) = |x - y|$ then

$$\langle]0,\infty[\times]0,\infty[, d\rangle \text{ is a metric space}$$

and further $\left\{\frac{1}{n}\right\}_{n\in\mathbb{N}}$ is Cauchy but does not converges

Proof. As $\langle \mathbb{R}, d_{||}\rangle$ is a metric space and $d=(d_{||})_{|]0,\infty[\times]0,\infty[}$ it follows from [theorem: 14.66] that $\langle]0,\infty[, d\rangle$ is a metric space. As by [example: 14.297] $\left\{\frac{1}{n}\right\}_{n\in\mathbb{N}}$ converges to 0 in $\langle \mathbb{R}, d_{||}\rangle$ it is Cauchy in $\langle \mathbb{R}, d_{||}\rangle$. Hence $\forall \varepsilon \in \mathbb{R}^+$ there exist a $N \in \mathbb{R}^+$ such that $\forall n, m \in \{N, \ldots, \infty\}$ we have $d(x_n, x_m) = d_{||}(x_n, x_m) < \varepsilon$ proving that $\left\{\frac{1}{n}\right\}_{n\in\mathbb{N}}$ is Cauchy in $\langle]0,\infty[, d\rangle$. However as $\left\{\frac{1}{n}\right\}_{n\in\mathbb{N}}$ converges to 0 in $\langle \mathbb{R}, d_{||}\rangle$ and $0 \notin]0,\infty[$ it follows that $\left\{\frac{1}{n}\right\}_{n\in\mathbb{N}}$ does not converges in $\langle]0,\infty[, d\rangle$. □

The above example proves that although every convergent sequence is Cauchy the opposite is not always true. So if we want that Cauchy is a sufficient condition for converging we must state this as a extra property for the metric or the norm.

Definition 14.329. *A metric space $\langle X, d\rangle$ or a normed space $\langle X, \|\|\rangle$ is **complete** if every Cauchy sequence is convergent. A complete normed space is called a **Banach** space.*

Theorem 14.330. *Let $n \in \mathbb{N}, \{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ a family of Banach spaces then if $\|\|_{\max}$ is the maximum norm [see theorem: 14.94] then*

$$\left\langle \prod_{i\in\{1,\ldots,n\}} X_i, \|\|_{\max}\right\rangle \text{ is a Banach space}$$

Proof. Using [theorem: 14.94] we have that $\left\langle \prod_{i\in\{1,\ldots,n\}} X_i, \|\|_{\max}\right\rangle$ is a normed space. Let $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq \prod_{i\in\{1,\ldots,n\}} X_i$ be a Cauchy sequence. Take $\varepsilon \in \mathbb{R}^+$ then there exists a $N \in \{k,\ldots,\infty\}$ such that $\forall k, l \geqslant N$ we have $\max(\{\|\pi_i(x_k - x_l)\|_i | i \in \{1,\ldots,n\}\}) = \|x_k - x_l\|_{\max} < \varepsilon$. Hence $\forall i \in \{1,\ldots,n\}$ we have $\|\pi_i(x_k) - \pi_i(x_l)\|_i = \|\pi_i(x_k - x_l)\|_i < \varepsilon$ which as $\langle X_i, \|\|_i\rangle$ is Banach proves that there exist a $y_i \in X_i$ such that $\lim_{k\to\infty} \pi_i(x_k) = y_i$. In other words given $\varepsilon \in \mathbb{R}^+$ there exist a $N_i \in \{k,\ldots,\infty\}$ such that $\forall k \geqslant N_i$ we have $\|\pi_i(x_k) - y_i\|_i < \varepsilon$. Take $y = (y_1, \ldots, y_n) \in \prod_{i\in\{1,\ldots,n\}} X_i$ then we have that for $k \geqslant \max(\{N_i | i \in \{1,\ldots,n\}\})$ that

$$\|x_k - y\|_{\max} = \max(\{\pi_i(x_k - y) | i \in \{1,\ldots,n\}\}) = \max(\{\pi_i(x_k) - y_i | i \in \{1,\ldots,n\}\}) < \varepsilon$$

proving that $\{x_i\}_{i\in\{k,\ldots,\infty\}}$ converges. □

Next we prove that in every metric space the limit point of $\{x_n | n \in \{k,\ldots,\infty\}\}$ where $\{x_n\}_{n\in\{k,\ldots,\infty\}}$ is a Cauchy sequence. To prove this we first need a little lemma.

Lemma 14.331. *Let $k \in \mathbb{N}_0, \langle X, d\rangle$ be a metric space, $\{x_n\}_{n\in\{k,\ldots,\infty\}} \subseteq X$ a sequence and x a limit point of $\{x_n | n \in \{k,\ldots,\infty\}\}$ then $\forall \varepsilon \in \mathbb{R}^+$, $\forall N \in \{k,\ldots,\infty\}$ there exist a $m > N$ such that $d(x, x_m) < \varepsilon$*

Proof. Let $\varepsilon \in \mathbb{R}^+$ and define

$$A_\varepsilon = \{n \in \{k,\ldots,\infty\} | 0 < d(x, x_i) < \varepsilon\} \subseteq \{k,\ldots,\infty\}$$

Assume that A_ε is finite. As x is a limit point of $\{x_n | n \in \{k,\ldots,\infty\}\}$ and $x \in B_d(x,\varepsilon)$ a open set we have that $B_d(x,\varepsilon) \bigcap ((\{x_n | n \in \{k,\ldots,\infty\}\}) \setminus \{x\}) \neq \varnothing$, hence there exists a $i \in \{k,\ldots,\infty\}$ such that

$$x_i \neq x \Rightarrow 0 < d(x_i, x) \text{ and } d(x, x_i) < \varepsilon$$

proving that

$$A_\varepsilon \neq \varnothing$$

Define $B_\varepsilon = \{d(x, x_n) | n \in A_\varepsilon\} \underset{A_\varepsilon \neq \varnothing}{\Rightarrow} B_\varepsilon \neq \varnothing$ and $f: A_\varepsilon \to B_\varepsilon$ by $f(n) = d(x, x_n)$ is a surjection, as A_ε is assumed to be finite it follows from [theorem: 6.44] that

$$\varnothing \neq B_\varepsilon = \{d(x, x_n) | n \in A_\varepsilon\} \text{ is finite}$$

Hence using [theorem: 6.49]

$$\delta = \min(B_\varepsilon) \text{ exists}$$

As $\delta \in B_\varepsilon$ there exist a $n \in A_\varepsilon$ such that $\delta = d(x, x_n)$ hence

$$0 < \delta = d(x, x_n) < \varepsilon$$

Again using the fact that x is a limit point of $\{x_n | n \in \{k,\ldots,\infty\}\}$ and $x \in B_d(x,\delta)$ there exist a $j \in \{k,\ldots,\infty\}$ such that

$$x_j = x \Rightarrow 0 < d(x, x_j) \text{ and } d(x, x_j) < \delta < \varepsilon$$

hence $j \in A_\varepsilon$ so that $d(x, x_j) \in B_\varepsilon$, as $\delta = \min(B_\varepsilon)$ we have $\delta \leqslant d(x, x_j) < \delta$ leading to the contradiction $\delta < \delta$. So the assumption that A_ε is finite is false proving that

$$A_\varepsilon \text{ is infinite}$$

Assume now that there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n > N$ we have $\varepsilon \leqslant d(x, x_n)$ then $n \notin A_\varepsilon$ hence $A_\varepsilon \subseteq \{k, \ldots, N\} \Rightarrow A_\varepsilon$ is finite which contradicts the fact that A_ε is infinite. So the assumption is wrong and we have that

$$\forall N \in \{k, \ldots, \infty\} \text{ there exist a } n > N \text{ such that } d(x, x_n) < \varepsilon$$

proving the theorem. □

Theorem 14.332. *Let $k \in \mathbb{N}_0$, $\langle X, d\rangle$ a metric space and $\{x_n\}_{n \in \{k, \ldots, \infty\}} \subseteq X$ a Cauchy sequence then if x and y are limit points of $\{x_n | n \in \{k, \ldots, \infty\}\}$ we have that $x = y$.*

Proof. Let x, y be limit points of $\{x_n | n \in \{k, \ldots, \infty\}\}$ and assume that $x \neq y$. As $x \neq y$ we have that $\varepsilon = d(x, y) \in \mathbb{R}^+$. By the Cauchy condition there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall i, j \geqslant N$ we have $d(x_i, x_j) < \frac{\varepsilon}{3}$. Using the previous lemma [lemma: 14.331] there exists $n, m > N$ such that $d(x, x_n) < \frac{\varepsilon}{3}$ and $d(y, x_m) < \frac{\varepsilon}{3}$. Hence

$$\varepsilon = d(x, y) \leqslant d(x, x_n) + d(x_n, y) \leqslant d(x, x_n) + d(x_n, x_m) + d(x_m, y) < \frac{\varepsilon}{3} + \frac{\varepsilon}{3} + \frac{\varepsilon}{3} = \varepsilon$$ □

14.10.1 Examples of complete spaces

First we prove that every compact metric space is complete, to do this we first need a lemma about limit points and sequences.

Theorem 14.333. *Every compact metric space $\langle X, d\rangle$ is complete.*

Proof. Let $\{x_n\}_{n \in \{k, \ldots, \infty\}} \subseteq X$ be a Cauchy sequence in X and consider $S = \{x_n | n \in \{k, \ldots, \infty\}\}$ then for S we must consider the following cases:

***S* is finite.** Assume that $\forall N \in \{k, \ldots, \infty\}$ there exists $i_0, j_0 \geqslant N$ with $x_i \neq x_j$. Define

$$A = \{d(x, y) | (x, y) \in S \times S \wedge x \neq y\} \subseteq \{d(x, y) | (x, y) \in S\}$$

Now $S \times S$ is finite by [theorem: 6.41] and $f: S \times S \to \{d(x, y) | (x, y) \in S\}$ defined by $f(x, y) = d(x, y)$ is a surjection so that by [theorem: 6.44] $\{d(x, y) | (x, y) \in S\}$ is finite and thus that A is finite. Further by the assumption there exist $i, j \geqslant k$ such that $x_i \neq x_j$ proving that $d(x_i, x_j) \in A$ and thus that $A \neq \varnothing$. So $\varepsilon = \min(A)$ exist and $0 < \varepsilon$ [for if $d \in A \Rightarrow \exists x, y \in S$ with $x \neq y \Rightarrow d = d(x, y) > 0$]. As $\{x_n\}_{n \in \{k, \ldots, \infty\}}$ is Cauchy there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall i, j \geqslant N$ we have $d(x_i, x_j) < \varepsilon$. By the assumption there exist a $i_0, j_0 \geqslant N$ such that $x_{i_0} \neq x_{j_0} \Rightarrow d(x_{i_0}, x_{j_0}) \in A$, hence $\varepsilon = \min(S) \leqslant d(x_{i_0}, y_{i_0}) < \varepsilon$ a contradiction. So the assumption must be false meaning that

$$\exists N \in \{k, \ldots, \infty\} \text{ such that } \forall i, j \geqslant N \; x_i = x_j \Rightarrow d(x_i, x_j) = 0$$

or taking $j = N$ and $x = x_N$ we have that

$$\forall i \geqslant N \; d(x_i, x) = 0$$

proving as $\forall \varepsilon \in \mathbb{R}^+ \; 0 < \varepsilon$ that

$$\lim_{n \to \infty} x_n = x$$

***S* is infinite.** Then as $S \subseteq X$ a compact space we have using [theorem: 14.241] and [definition: 14.240] that there exist a limit point for S which because of [theorem: 14.332] is unique. Let's call this unique limit point of S x. Take $\varepsilon > 0$ then by the Cauchy property there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall i, j \geqslant N$ we have $d(x_i, x_j) < \frac{\varepsilon}{2}$. By [lemma: 14.331] there exist a $n > N$ such that $d(x, x_n) < \frac{\varepsilon}{2}$. Hence if $m \geqslant N$ we have that

$$d(x, x_m) \leqslant d(x, x_n) + d(x_n, x_m) < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$$ □

Theorem 14.334. *Let $\langle X, d\rangle$ be a complete space and $A \subseteq X$ where A is closed then $\langle A, d_{|A}\rangle$ is complete.*

Proof. Let $\{x_n\}_{n \in \{k, \ldots, \infty\}} \subseteq A$ be a Cauchy sequence in $\langle A, d_{|A}\rangle$ then given $\varepsilon \in \mathbb{R}^+$ there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n, m \geqslant N$ we have that $d(x_n, x_m) = d_{|A}(x_n, x_m) < \varepsilon$. So $\{x_n\}_{n \in \{k, \ldots, \infty\}}$ is Cauchy in X a complete space, hence $\{x_n\}_{n \in \{k, \ldots, \infty\}}$ converges to $x \in X$ or

$$\forall \varepsilon \in \mathbb{R}^+ \; \exists N \in \{k, \ldots, \infty\} \text{ such that } d(x_n, x) < \varepsilon \tag{14.176}$$

Let $U \in \mathcal{T}_d$ such that $x \in A$ then there exist a $\delta \in \mathbb{R}^+$ such that $x \in B_d(x, \delta) \subseteq U$. By [eq: 14.176] there exist a $N \in \{k, \ldots, \infty\}$ such that $d(x_N, x) < \delta$ hence $x_N \in B_d(x, \varepsilon) \subseteq U$ proving as $x_N \in A$ that $A \bigcap U \neq \varnothing$. So using [theorem: 14.29] it follows that

$$x \in A$$

Hence if $\zeta \in \mathbb{R}^+$ we have by [eq: 14.176] that there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N\ d(x, x_n) < \varepsilon \underset{x_n, x \in A}{\Rightarrow} d_{|A}(x, x_n) = d(x_n, x) < \zeta$ proving that $\{x_n\}_{n \in \{k, \ldots, \infty\}}$ converges in A. □

A very important example of a complete normed space is the set of real numbers with the absolute value norm.

Theorem 14.335. *The normed space $\langle \mathbb{R}, \|\rangle$ is a Banach space.*

Proof. Let $\{x_n\}_{n \in \{k, \ldots, \infty\}} \subseteq \mathbb{R}$ be a Cauchy sequence in $\mathbb{R}$ then by [theorem: 14.326] there exist a $K \in \mathbb{R}^+$ such that $\forall n \in \{k, \ldots, \infty\}$ $|x_n| \leqslant K$ so that

$$\{x_n\}_{n \in \{k, \ldots, \infty\}} \subseteq [-K, K] \tag{14.177}$$

By [theorem: 14.235] is a compact subset of $\mathbb{R}$, hence by definition $[-K, K]$ is a compact space using the subspace topology which by [theorem: 14.109] is generated by the norm $||_{|[-K,K]}$. By the previous theorem [theorem: 14.333] it follows that $\langle [-K, K], \|_{|[-K,K]} \rangle$ is complete. Given $\varepsilon \in \mathbb{R}^+$ we have as $\{x_n\}_{n \in \{k, \ldots, \infty\}}$ is Cauchy a $N \in \{k, \ldots, \infty\}$ such that $\forall i, j \geqslant N$ we have $|x_i - x_j| < \varepsilon \underset{\text{[eq: 14.177]}}{\Rightarrow} |x_i - x_j|_{|[-K,K]} < \varepsilon$ proving that $\{x_n\}_{n \in \{k, \ldots, \infty\}}$ is Cauchy in $\langle [-K, K], \|_{|[-K,K]} \rangle$. Hence there exist a $x \in [-K, K]$ such that $\lim\limits_{n \to \infty} x_n = x$ [using $||_{|[-K,K]}$]. Hence given $\varepsilon \in \mathbb{R}^+$ there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N\ |x_n - x|_{|[-K,K]} < \varepsilon \underset{\text{[eq: 14.177]}}{\Rightarrow} |x_n - x| < \varepsilon$ proving that

$$\{x_n\}_{n \in \{k, \ldots, \infty\}} \text{ converges to } x \text{ using } \langle \mathbb{R}, \|\rangle$$

□

Corollary 14.336. *Let $\|\|$ be a norm on $\mathbb{R}^n$ then $\langle \mathbb{R}^n, \|\|\rangle$ is a Banach space.*

Proof. Let $\|\|_n$ be the maximum norm defined by $\|x\|_n = \max(\{|\pi_i(x)| | i \in \{1, \ldots, n\}\})$ then as $\langle \mathbb{R}, \|\rangle$ is a Banach space by the previous theorem [theorem: 14.335] we have by [theorem: 14.330] that

$$\langle \mathbb{R}^n, \|\|_n \rangle \text{ is a Banach space} \tag{14.178}$$

Now using [theorem: 14.277]

$$\|\|_n \text{ is equivalent with } \|\| \tag{14.179}$$

Let $\{x_i\}_{i \in \{k, \ldots, \infty\}} \subseteq \mathbb{R}^n$ be a Cauchy sequence using $\|\|$ then by [theorem: 14.325] and [eq: 14.179] it follows that $\{x_i\}_{i \in \{k, \ldots, \infty\}}$ is a Cauchy sequence, hence by [eq: 14.178] $\{x_i\}_{i \in \{k, \ldots, \infty\}}$ converges. Finally using [theorem: 14.325] and [eq: 14.179] it follows that

$$\{x_i\}_{i \in \{k, \ldots, \infty\}} \text{ converges in } \langle \mathbb{R}^n, \|\|\rangle$$

proving that $\langle \mathbb{R}^n, \|\|\rangle$ is a Banach space. □

Corollary 14.337. *Every finite dimensional normed vector space over $\mathbb{R}$ is a Banach space*

Proof. Let $\langle X, \|\|_X \rangle$ be a n-dimensional normed vector space then using [theorem: 14.173] there exist a norm $\|\|$ on $\mathbb{R}^n$ and a linear isometric isomorphism $\varphi: X \to \mathbb{R}^n$ using the norms $\|\|_X$ and $\|\|$. Let $\{x_i\}_{i \in \{k, \ldots, \infty\}} \subseteq X$ be a Cauchy sequence in $\langle X, \|\|_X \rangle$. Then given $\varepsilon \in \mathbb{R}^+$ there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall i, j \geqslant N\ \|x_i - x_j\|_X < \varepsilon$. Consider now the sequence $\{\varphi(x_i)\}_{i \in \{k, \ldots, \infty\}} \subseteq \mathbb{R}^n$ then $\|\varphi(x_i) - \varphi(x_j)\| = \|\varphi(x_i - x_j)\| = \|x_i - x_j\|_X < \varepsilon$ proving that $\{\varphi(x_i)\}_{i \in \{k, \ldots, \infty\circ\}}$ is a Cauchy sequence in $\langle \mathbb{R}^n, \|\|\rangle$. As $\langle \mathbb{R}^n, \|\|\rangle$ is a Banach space by [theorem: 14.336] so that $\{\varphi(x_i)\}_{i \in \{k, \ldots, \infty\}}$ converges to a $y \in \mathbb{R}^n$. Hence given $\varepsilon \in \mathbb{R}^+$ there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall m \geqslant N$ we have $\|\varphi(x_m) - y\| < \varepsilon$. Take $x = \varphi^{-1}(y)$ then we have $\|x_n - x\|_X = \|\varphi(x_n - x)\| = \|\varphi(x_n) - \varphi(\varphi^{-1}(y))\| = \|\varphi(x_n) - x\| < \varepsilon$ proving that $\{x_i\}_{i \in \{k, \ldots, \infty\}}$ converges to x. Hence $\langle X, \|\|\rangle$ is a Banach space. □

Corollary 14.338. *The normed space $\langle \mathbb{C}, \|\rangle$ is a Banach space [where $\langle \mathbb{C}, \|\rangle$ is defined in [example: 14.96]*

Proof. To avoid any confusion between the norm on $\mathbb{R}$ and $\mathbb{C}$ we use $||$ for the absolute value norm on $\mathbb{R}$ and $||_c$ for the canonical norm on $\mathbb{C}$. Let $\{z_n\}_{n \in \{k, \ldots, \infty\}} \subseteq \mathbb{C}$ be a Cauchy sequence in $\langle \mathbb{C}, \|_c \rangle$ then $\forall n \in \{k, \ldots, \infty\}$ we have that $z_n = x_n + i \cdot y_n$ where $x_n, y_n \in \mathbb{R}$. Now $\forall n, m \in \{k, \ldots, \infty\}$ we have by [theorem: 10.84 (3)] that

$$|x_m - x_n| = |\mathrm{Re}(z_m - z_n)| < |z_m - z_n|_c \text{ and } |y_m - y_n|_c = |\mathrm{Img}(z_m - z_n)| < |z_m - z_n|_c \tag{14.180}$$

By the Cauchy condition there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N$ we have that $|z_n - z_m|_c < \varepsilon$, combining this with [eqs: 14.180] gives $|x_m - x_n| < \varepsilon \wedge |y_m - y_n| < \varepsilon$. Hence

$$\{x_n\}_{n \in \{k, \ldots, \infty\}}, \{y_n\}_{n \in \{k, \ldots, \infty\}} \text{ are Cauchy in } \langle \mathbb{R}, \|\rangle$$

As by [theorem: 14.335] $\langle \mathbb{R}, \|\rangle$ is complete there exists $x, y \in \mathbb{R}$ such that

$$\lim_{n \to \infty} x_n = x \wedge \lim_{n \to \infty} y_n = y$$

Hence using [theorem: 14.303] it follows that $\{z_n\}_{n\in\{k,\ldots,\infty\}}$ converges to z. □

Theorem 14.339. *Let $\langle X, \|\|_X\rangle$ be a normed space, $\langle Y, \|\|_Y\rangle$ a Banach space then the normed space $\langle L(X,Y), \|\|_{L(X,Y)}\rangle$ [see theorem: 14.182] is a Banach space.*

Proof. Let $\{L_n\}_{n\in\{k,\ldots,\infty\}} \subseteq L(X,Y)$ be a Cauchy sequence. Let $x \in X$ then given $\varepsilon \in \mathbb{R}^+$ there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall n, m \geqslant N$ we have $\|L_n - L_m\|_{L(X,Y)} < \frac{\varepsilon}{\|x\|+1}$. Hence

$$\|L_n(x) - L_m(x)\|_Y = \|(L_n - L_m)(x)\|_Y \leqslant_{\text{[theorem: 14.182}} \|L_n - L_m\|_{L(X,Y)} \cdot \|x\|_X < \frac{\varepsilon}{\|x\|+1} \cdot \|x\| < \varepsilon$$

proving that

$$\{L_n(x)\}_{n\in\{k,\ldots,\infty\}} \text{ is a Cauchy sequence in } \langle Y, \|\|_Y\rangle \tag{14.181}$$

As $\langle Y, \|\|_Y\rangle$ is a Banach space $\lim\limits_{n\to\infty} L_n(x)$ exist, allowing us to define

$$L: X \to Y \text{ by } L(x) = \lim_{n\to\infty} L_n(x) \tag{14.182}$$

Let $x, y \in X$ and $\alpha \in \mathbb{K}$ then we have $\{L_n(x+\alpha\cdot y)\}_{n\in\{k,\ldots,\infty\}} = \{L_n(x) + \alpha\cdot L_n(y)\}_{n\in\{k,\ldots,\infty\}}$. Using [theorems: 14.302, 14.301] $\{L_n(x+\alpha\cdot y)\}_{n\in\{k,\ldots,\infty\}}$ converges and

$$\lim_{n\to\infty} L_n(x+\alpha\cdot y) = \lim_{n\to\infty} L_n(x) + \alpha\cdot \lim_{n\to\infty} L_n(y)$$

proving that

$$L(x+\alpha\cdot y) = L(x) + \alpha\cdot L(y)$$

or that

$$L \in \mathrm{Hom}(X,Y) \tag{14.183}$$

As $\{L_n\}_{n\in\{k,\ldots,\infty\}}$ is Cauchy there exist by [theorem: 14.326] a $K \in \mathbb{R}^+$ such that $\forall n \in \{k,\ldots,\infty\}$ we have $\|L_n\|_{L(X,Y)} \leqslant K$. Hence $\forall n \in \{k,\ldots,\infty\}$ we have for $x \in X$

$$\|L_n(x)\|_Y \leqslant_{\text{[theorem: 14.182}} \|L_n\|_{L(X,Y)} \cdot \|x\|_X \leqslant K \cdot \|x\|_X$$

which by [theorem: 14.305] proves

$$\|L(x)\|_Y = \left\|\lim_{n\to\infty} L_n(x)\right\|_Y \leqslant K \cdot \|x\|_X \tag{14.184}$$

Hence using [eq: 14.183] and [theorem: 14.177] it follows that

$$L \in L(X,Y) \tag{14.185}$$

Let $\varepsilon \in \mathbb{R}^+$ then for $x \in X$ with $\|x\|_X = 1$ we have, as $L(x) = \lim\limits_{n\to\infty} L(x)$, that there exist a $N_x \in \{k,\ldots,\infty\}$ such that

$$\forall n \geqslant N_x \text{ we have } \|L_n(x) - L(x)\| < \frac{\varepsilon}{4}$$

As $\{L_n\}_{n\in\{k,\ldots,\infty\}}$ is Cauchy there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall n, m \geqslant N$ we have $\|L_n - L_m\|_{L(X,Y)} < \frac{\varepsilon}{4}$ hence

$$\|L_n(x) - L_m(x)\|_Y = \|(L_n - L_m)(x)\| \leqslant \|L_n - L_m\|_{L(X,Y)} \cdot \|x\|_X = \|L_n - L_m\|_{L(X,Y)} < \frac{\varepsilon}{4}$$

Let $n \geqslant N$ then we have

$$\begin{aligned}
\|(L_n - L)(x)\|_Y &= \|L_n(x) - L(x)\|_Y \\
&\leqslant \|L_n(x) - L_{\max(N,N_x)} + L_{\max(N,N_x)} - L(x)\|_Y \\
&\leqslant \|L_n(x) - L_{\max(N,N_x)}\|_Y + \|L_{\max(N,N_x)-L(x)}\|_Y \\
&< \frac{\varepsilon}{4} + \frac{\varepsilon}{4} \\
&= \frac{\varepsilon}{2}
\end{aligned}$$

Hence using [theorem: 14.181] it follows that $\|L_n - L\|_{L(X,Y)} < \frac{\varepsilon}{2} < \varepsilon$ proving that

$$\{L_n\}_{n\in\{k,\ldots,\infty\}} \text{ converges to } L \text{ in } \langle L(X,Y), \|\|_{L(X,Y)}\rangle$$

which implies that $\langle L(X,Y), \|\|_{L(X,Y)}\rangle$ is complete and thus a Banach space. □

We have a similar theorem for multilinear mappings.

Theorem 14.340. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\dots,n\}}$ a sequence of normed space, $\langle Y, \|\|_Y\rangle$ a Banach space then the normed space $\langle L(X_1,\dots,X_n;Y), \|\|_{L(X_1,\dots,X_n;Y)}\rangle$ [see theorem: 14.196] is a Banach space.*

Proof. Let $\{L_i\}_{i\in\{k,\dots,\infty\}} \subseteq L(X_1,\dots,X_n;Y)$ be a Cauchy sequence. Let $x=(x_1,\dots,x_n)\in\prod_{l\in\{1,\dots,n\}} X_l$ then given $\varepsilon\in\mathbb{R}^+$ we have that $\exists N\in\{k,\dots,\infty\}$ such that $\forall i,j\geqslant N$ we have

$$\|L_i - L_j\|_{L(X_1,\dots,X_n;Y)} < \frac{\varepsilon}{1+\prod_{l\in\{1,\dots,n\}}\|x_l\|_l}$$

So that

$$\begin{aligned}\|L_i(x)-L_j(y)\|_Y &= \|(L_i-L_j)(x)\|_Y\\ &\leqslant \|L_i-L_j\|_{L(X_1,\dots,X_n;Y)}\cdot\prod_{l\in\{1,\dots,n\}}\|x_l\|_l\\ &< \frac{\varepsilon}{1+\prod_{l\in\{1,\dots,n\}}\|x_l\|_l}\cdot\prod_{l\in\{1,\dots,n\}}\|x_l\|_l\\ &< \varepsilon\end{aligned}$$

which proves that

$$\{L_i(x)\}_{i\in\{1,\dots,n\}} \text{ is a Cauchy sequence in } \langle Y, \|\|_Y\rangle$$

As $\langle Y, \|\|_Y\rangle$ is a Banach space it follows that $\lim_{i\to\infty} L_i(x)$ exist, this allows to define the function

$$L\colon \prod_{i\in\{1,\dots,n\}} X_i \to Y \text{ where } L(x)=\lim_{i\to\infty} L_i(x) \tag{14.186}$$

Let $\alpha\in\mathbb{K}, i\in\{1,\dots,n\}$, $x,y\in X_i$ and $\left(x_1,\dots\underbrace{x+\alpha\cdot y}_{i}\dots,x_n\right)\in\prod_{j\in\{1,\dots,n\}\setminus\{i\}} X_i$ then we have that

$$\left\{L_l\left(x_1,\dots\underbrace{x+\alpha\cdot y}_{i}\dots,x_n\right)\right\}_{l\in\{k,\dots,\infty\}} =$$

$$\left\{L_l\left(x_1,\dots\underbrace{x}_{i}\dots,x_n\right)+\alpha\cdot L_l\left(x_1,\dots\underbrace{y}_{i}\dots,x_n\right)\right\}_{l\in\{k,\dots,\infty\}}$$

Using [theorems: 14.302, 14.301] $\left\{L_l\left(x_1,\dots\underbrace{x+\alpha\cdot y}_{i}\dots,x_n\right)\right\}_{l\in\{k,\dots,\infty\}}$ converges and

$$\lim_{l\to\infty} L_l\left(x_1,\dots\underbrace{x+\alpha\cdot y}_{i}\dots,x_n\right) =$$

$$\lim_{l\to\infty} L_l\left(x_1,\dots\underbrace{x}_{i}\dots,x_n\right)+\alpha\cdot\lim_{l\to\infty} L_l\left(x_1,\dots\underbrace{y}_{i}\dots,x_n\right)$$

proving that

$$L\in\mathrm{Hom}(X_1,\dots,X_n;Y) \tag{14.187}$$

As $\{L_i\}_{i\in\{k,\dots,\infty\}}$ is Cauchy there exist by [theorem: 14.326] a $K\in\mathbb{R}^+$ such that $\forall i\in\{k,\dots,\infty\}$ we have $\|L_i\|_{L(X,Y)}\leqslant K$. Hence $\forall i\in\{k,\dots,\infty\}$ we have for $x=(x_1,\dots,x_n)\in\prod_{j\in\{1,\dots,n\}} X_j$ that

$$\|L_i(x)\|_Y \leqslant \|L_i\|_{L(X_1,\dots,X_n;Y)}\cdot\prod_{j\in\{1,\dots,n\}}\|x_j\|_j \leqslant K\cdot\prod_{j\in\{1,\dots,n\}}\|x_j\|_j$$

which by [theorem: 14.305] proves

$$\|L(x)\|_Y = \left\|\lim_{i\to\infty} L_i(x)\right\|_Y \leqslant K\cdot\prod_{j\in\{1,\dots,n\}}\|x_j\|_j$$

Hence using [eq: 14.187] and [theorem: 14.190] it follows that

$$L\in L(X_1,\dots,X_n;Y) \tag{14.188}$$

Let $\varepsilon\in\mathbb{R}^+$ then for $x=(x_1,\dots,x_n)\in\prod_{i\in\{1,\dots,n\}} X_i$ with $\forall i\in\{1,\dots,n\}$ $\|x_i\|_i=1$ we have by [eq: 14.186] that there exist a $N_x\in\{k,\dots,\infty\}$ such that

$$\forall n\geqslant N_x \text{ we have } \|L_n(x)-L(x)\|_Y < \frac{\varepsilon}{4}$$

Further as $\{L_i\}_{i\in\{k,\ldots,\infty\}}$ is Cauchy there exist a $N\in\{k,\ldots,\infty\}$ such that $\forall m,l\geqslant N$ we have $\|L_m-L_l\|_{L(X_1,\ldots,X_n;Y)}<\frac{\varepsilon}{4}$ so that

$$\begin{aligned}\|L_m(x)-L_l(x)\|_Y &= \|(L_m-L_l)(x)\|_Y\\ &\leqslant \|L_m-L_l\|_{L(X_1,\ldots,X_n;Y)}\cdot\prod_{i\in\{1,\ldots,n\}}\|x_i\|_i\\ &= \|L_m-L_l\|_{L(X_1,\ldots,X_n;Y)}\\ &< \frac{\varepsilon}{4}\end{aligned}$$

Hence if $m\geqslant N$ then we have

$$\begin{aligned}\|L_m(x)-L(x)\|_Y &= \|L_m(x)-L_{\max(N,N_x)}(x)+L_{\max(N,N_x)}(x)-L(x)\|_Y\\ &\leqslant \|L_m(x)-L_{\max(N,N_x)}(x)\|_Y+\|L_{\max(N,N_x)}(x)-L(x)\|_Y\\ &< \frac{\varepsilon}{4}+\frac{\varepsilon}{4}\\ &= \frac{\varepsilon}{2}\end{aligned}$$

which by [theorem: 14.196] proves that $\|L_m-L\|_{L(X_1,\ldots,X_n;Y)}\leqslant\frac{\varepsilon}{2}<\varepsilon$. So $\{L_i\}_{i\in\{k,\ldots,\infty\}}$ converges to L in $\langle L(X_1,\ldots,X_n;Y),\|\|_{L(X_1,\ldots,X_n;Y)}\rangle$ proving that $\langle L(X_1,\ldots,X_n;Y),\|\|_{L(X_1,\ldots,X_n;Y)}\rangle$ is a Banach space. □

Corollary 14.341. *Let $\langle X,\|\|_X\rangle$ be a normed space, $\langle Y,\|\|_Y\rangle$ a Banach space, $n\in\mathbb{N}$ then $\langle L^n(X;Y),\|\|_{L^n(X;Y)}\rangle$ is a Banach space.*

Proof. For $n\in\mathbb{N}$ we have either

$n=1$. By [definition: 14.197] $\langle L^1(X;Y),\|\|_{L^1(X;Y)}\rangle=\langle L(X,Y),\|\|_{L(X,Y)}\rangle$ which is Banach by the [theorem: 14.339].

$1<n$. Then by [definition: 14.197]

$$\langle L^n(X;Y),\|\|_{L^n(X;Y)}\rangle=\left\langle L^n\left(\underbrace{X,\ldots,X}_{n};Y\right),\|\|_{L^n\left(\underbrace{X,\ldots,X}_{n};Y\right)}\right\rangle$$

which is Banach by [theorem: 14.340]. □

14.10.2 Uniform convergence and Bounded functions

Definition 14.342. *Let $\varnothing\neq X$ be a set, $\langle Y,\|\|\rangle$ a normed space then a function*

$$f\colon X\to Y \text{ is bounded if } f(X) \text{ is bounded}$$

In other words, using [theorem: 14.107], $f\colon X\to Y$ is bounded if there exist a $M\in\mathbb{R}^+$ such that $\forall x\in X$ we have $\|f(x)\|\leqslant M$. The set of all bounded functions between X and Y is noted by $\mathcal{B}(X,Y)$ hence

$$\mathcal{B}(X,Y)=\{f\in Y^X\,|\,f\colon X\to Y \text{ is bounded}\}\subseteq Y^X$$

Theorem 14.343. *Let $\varnothing\neq X$ be a set, $\langle Y,\|\|\rangle$ a normed space over the field F then $\langle\mathcal{B}(X,Y),+,\cdot\rangle$ is a sub-space of $\langle Y^X,+,\cdot\rangle$ [see theorem: 11.67]. Hence by [theorem: 11.60] $\langle\mathcal{B}(X,Y),+,\cdot\rangle$ is a vector space.*

Proof. For the neutral element C_0 in $\langle Y^X,+,\cdot\rangle$ we have $\forall x\in X$ that $\|C_0(x)\|=\|0\|=0<1$ so that

$$C_0\in\mathcal{B}(X,Y)\Rightarrow\varnothing\neq\mathcal{B}(X,Y)$$

Further if $f,g\in\mathcal{B}(X,Y)$ and $\alpha\in F$ then there exists $M_1,M_2\in\mathbb{R}^+$ such that $\forall x\in X$ we have $\|f(x)\|\leqslant M_1\wedge\|g(x)\|\leqslant M_2$. Take $M=\max(M_1,M_2,|\alpha|\cdot M_2+1)$ then we have

$$\|(f+\alpha\cdot g)(x)\|=\|f(x)+\alpha\cdot g(x)\|\leqslant\|f(x)\|+\|\alpha\cdot g(x)\|=\|f(x)\|+|\alpha|\cdot\|g(x)\|\leqslant M_1+|\alpha|\cdot M_2\leqslant M$$

proving that $f+\alpha\cdot g\in\mathcal{B}(X,Y)$. □

We define now a norm on $\mathcal{B}(X,Y)$

Theorem 14.344. *Let $\varnothing\neq X$ be a set, $\langle Y,\|\|\rangle$ a normed space over F then $\|\|_\infty$ defined by*

$$\|\|_\infty\colon\mathcal{B}(X,Y)\to\mathbb{R} \text{ by } \|\|_\infty=\sup(\{\|f(y)\|\,|\,y\in X\})$$

is well defined and $\|\|_\infty$ is a norm on $\mathcal{B}(X,Y)$ making $\langle\mathcal{B}(X,Y),\|\|_\infty\rangle$ a normed space. $\|\|_\infty$ is called the supremum norm.

Proof. As $X \neq 0$ there exist a $x \in X$ so that $\varnothing \neq \{\|f(y)\| | y \in X\}$. If $f \in \mathcal{B}(X,Y)$ then there exist a $M \in \mathbb{R}^+$ such that $\forall x \in X$ we have $\|f(x)\| \leqslant M$, hence $\{\|f(y)\| | y \in X\}$ is bounded above. As $\mathbb{R}$ is conditional complete [see theorem: 10.18] $\sup(\{\|f(y)\| | y \in X\})$ exist. Now we have

1. $\forall f \in \mathcal{B}(X,Y)$ we have as $0 \leqslant \|f(x)\|$ $\forall x \in X$ that $0 \leqslant \sup(\|f(y)\| | y \in X)$.
2. $\forall f \in \mathcal{B}(X,Y)$ and $\forall \alpha \in F$ then
$$\{\|(\alpha \cdot f)(y)\| | y \in X\} = \{|\alpha| \cdot \|f(y)\| | y \in X\} = |\alpha| \cdot \{\|f(y)\| | y \in X\}$$
so that
$$\|\alpha \cdot f\|_\infty = \sup(|\alpha| \cdot \{\|f(y)\| | y \in X\}) \underset{[\text{theorem: } 10.22]}{=} |\alpha| \cdot \sup(\{\|f(y)\| | y \in X\}) = |\alpha| \cdot \|f\|_\infty$$
3. If $f, g \in \mathcal{B}(X,Y)$ then
$$\begin{aligned} \|f+g\|_\infty &= \sup(\{\|(f+g)(y)\| | y \in X\}) \\ &= \sup(\{\|f(y)+g(y)\| | y \in X\}) \\ &\leqslant_{[\text{theorem: } 3.78]} \sup(\{\|f(y)\| + \|g(y)\| | y \in X\}) \\ &\leqslant_{[\text{theorem: } 3.78]} \sup(\{\|f(y)\| | y \in X\} + \{\|g(y)\| | y \in X\}) \\ &\underset{[\text{theorem: } 10.23]}{=} \sup(\{\|f(x)\| | x \in X\}) + \sup(\{\|g(x)\| | x \in X\}) \\ &\leqslant \|f\|_\infty + \|g\|_\infty \end{aligned}$$
4. If $\|f\|_\infty = 0$ then $\sup(\{\|f(x)\| | x \in X\}) = 0$ so that $\forall x \in X$ $0 \leqslant \|f(x)\| \leqslant 0 \Rightarrow \|f(x)\| = 0$ proving, as $\|\|$ is a norm, that $f(x) = 0 = C_0(x)$. Hence $f = C_0$. □

We introduce now a stronger version of convergence for a sequence of functions to a normed space.

Definition 14.345. *Let $k \in \mathbb{N}_0, \varnothing \neq X$ be a set, $\langle Y, \|\|\rangle$ a normed space and $\{f_n\}_{n \in \{k,\dots,\infty\}} \subseteq Y^X$ then $\{f_n\}_{n \in \{k,\dots,\infty\}}$* ***converges uniformly*** *to a $f \in Y^X$ if $\forall \varepsilon \in \mathbb{R}$ there exist a $N \in \{k,\dots,\infty\}$ such that $\forall n \geqslant N$ we have $\forall x \in X$ that*
$$\|f_n(x) - f(x)\| < \varepsilon$$

***Note* 14.346.** *The N in the definition is not dependent on the x which would be the case in pointwise convergence. Hence uniform convergence is stronger then pointwise convergence.*

Theorem 14.347. *Let $\langle X, \|\|_X\rangle$ be a normed space, $\langle Y, \|\|_Y\rangle$ a normed space then if $\{f_n\}_{n \in \{k,\dots,\infty\}} \subseteq \mathcal{B}(X,Y)$ is a sequence of continuous functions from X to Y uniformly converging to a function $f: X \to Y$ then f is continuous.*

Proof. Let $x \in X$ and $\varepsilon \in \mathbb{R}^+$ then by uniform convergence that there exist a $N \in \{k,\dots,\infty\}$ such that $\forall n \geqslant N$ we have
$$\forall x \in X \quad \|f_n(x) - f(x)\|_Y < \frac{\varepsilon}{3}$$
As f_N is continuous we have that there exist a $\delta_N \in \mathbb{R}^+$ such that if $\|x-y\|_X < \delta_N$ then
$$\|f_N(x) - f_N(y)\|_Y < \frac{\varepsilon}{3}$$
Let $\|x-y\|_X < \delta_N$ then we have
$$\begin{aligned} \|f(x) - f(y)\|_Y &= \|f(x) - f_N(x) + f_N(x) - f_N(y) + f_N(y) - f(y)\|_Y \\ &\leqslant \|f(x) - f_N(x)\|_Y + \|f_N(x) - f_N(y)\|_Y + \|f_N(y) - f(y)\|_Y \\ &< \frac{\varepsilon}{3} + \frac{\varepsilon}{3} + \frac{\varepsilon}{3} \\ &= \varepsilon \end{aligned}$$
proving by [theorem: 14.128] that f is continuous. □

It turns out that convergence in the supremum norm $\|\|_\infty$ is equal to uniform convergence.

Theorem 14.348. *Let $X \neq \varnothing$ and $\langle Y, \|\|\rangle$ a normed space and $\{f_n\}_{n \in \{k,\dots,\infty\}} \subseteq \mathcal{B}(X,Y)$ then*
$$\lim_{n \to \infty} f_n = f \text{ using } \|\|_\infty \Leftrightarrow \{f_n\}_{n \in \{k,\dots,\infty\}} \text{ converges uniformly to } f$$

Proof.

⇒. Given $\varepsilon \in \mathbb{R}^+$ there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N$

$$\sup(\{\|(f_n - f)(x)\| | x \in X\}) = \|f_n - f\|_\infty < \varepsilon$$

hence $\forall x \in X$ we have

$$\|f_n(x) - f(x)\| \leqslant \sup(\{\|(f_n - f)(x)\| | x \in X\}) < \varepsilon$$

proving uniform convergence.

⇐. Given $\varepsilon > 0$ there exists a $N \in \mathbb{N}$ such that if $n \geqslant N$ we have $\forall x \in X$ that $\|f(x) - f(x)\| < \varepsilon$ proving that ε is a upper bound of $\{\|f_n(x) - f(x)\| | x \in X\}$ so that

$$\|f_n - f\|_\infty = \sup(\{\|f_n(x) - f(x)\| | x \in X\}) < \varepsilon$$

proving that $\lim_{n \to \infty} f_n = f$ □

Theorem 14.349. *Let $X \neq \varnothing$ and $\langle Y, \|\|\rangle$ a Banach space then $\langle \mathcal{B}(X, Y), \|\|_\infty\rangle$ [see theorem: 14.344] is a Banach space.*

Proof. Let $\{f_n\}_{n \in \{k, \ldots, \infty\}} \subseteq \mathcal{B}(X, Y)$ be a Cauchy sequence in $\mathcal{B}(X, Y)$. Let $\varepsilon \in \mathbb{R}^+$ then there exists a $N \in \{k, \ldots, \infty\}$ such that $\forall n, m \geqslant N$ we have

$$\sup(\|f_n(x) - f_m(x)\| x \in X) = \|f_n(x) - f_m(x)\|_\infty < \varepsilon$$

Hence given $x \in X$ we have $\|f_n(x) - f_m(x)\| \leqslant \sup(\|f_n(x) - f_m(x)\| x \in X) < \varepsilon$ proving that $\{f_n(x)\}_{\in \{k, \ldots \infty\}}$ is a Cauchy sequence, hence as Y is complete there exist a unique $\lim_{n \to \infty} f_n(x)$. This allows use to define a function

$$f: X \to Y \text{ by } f(x) = \lim_{n \to \infty} f_n(x) \tag{14.189}$$

Next we prove that f is bounded so that $f \in \mathcal{B}(X, Y)$. Let $x \in X$ then as $1 \in \mathbb{R}^+$ we have by the definition of the limit that there exist a $N_x \in \{k, \ldots, \infty\}$ [depending on x] such that $\forall n \geqslant N_x$ we have $\|f_n(x) - f(x)\| < 1$ so that

$$\|f(x)\| \leqslant \|f_n(x) - f(x)\| + \|f_n(x)\| < 1 + \|f_n(x)\| \leqslant 1 + \sup(\{\|f_n(x)\| | x \in X\}) = 1 + \|f_n\|_\infty$$

hence

$$\forall x \in X \ \exists N_x \in \mathbb{R}^+ \text{ such that } \forall n \geqslant N_x \ \|f(x)\| < 1 + \|f_n\|_\infty \tag{14.190}$$

Further as $\{f_n\}_{n \in \{k, \ldots, \infty\}}$ is Cauchy in $\mathcal{B}(X, Y)$ and $1 \in \mathbb{R}^+$ there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall m \geqslant N \Rightarrow m, N \geqslant N$ we have $\|f_m - f_N\|_\infty < 1$, hence $\|f_m\|_\infty \leqslant \|f_N\|_\infty + \|f_m - f_N\|_\infty < \|f_N\|_\infty + 1$. Summarized

$$\exists N \in \{k, \ldots, \infty\} \text{ such that } \forall m \geqslant N \text{ we have } \|f_m\|_\infty < \|f_N\|_\infty + 1 \tag{14.191}$$

Let $x \in X$ and take $M_x = \max(N, N_x)$ then we have

$$\begin{aligned} \|f(x)\| &\leqslant_{\text{[eq: 14.190]}} 1 + \|f_{M_x}\|_\infty \\ &\leqslant_{\text{[eq: 14.191]}} 1 + 1 + \|f_N\|_\infty \\ &\leqslant M \end{aligned}$$

where $M = 2 + \|f_N\|_\infty$ independent of x, proving that $\|f\|_\infty = \sup(\{\|f(x)\| | x \in X\}) \leqslant M$. Hence we conclude that f is bounded or

$$f \in \mathcal{B}(X, Y) \tag{14.192}$$

Next we must prove that $\lim_{n \to \infty} f_n = f$ using the norm $\|\|_\infty$. Let $\varepsilon \in \mathbb{R}^+$ then for $x \in X$ we have using [eq: 14.189] that there exists a $N_x \in \{k, \ldots, \infty\}$ such that $\forall n \geqslant N_x$ we have $\|f(x) - f_n(x)\| < \frac{\varepsilon}{2}$. Further as $\{f_n\}_{n \in \{k, \ldots, \infty\}}$ is Cauchy [using the norm $\|\|_\infty$] there exist a $N \in \{k, \ldots, \infty\}$ such that $\forall n, m \geqslant N$ we have $\|f_n - f_m\| < \frac{\varepsilon}{2}$. Let $x \in X$ then for $n \geqslant N$ we have $\max(n, N_x) \geqslant N, N_x$ so that

$$\begin{aligned} \|(f_n - f)(x)\| &= \|f_n(x) - f(x)\| \\ &= \|f_n(x) - f_{\max(N, N_x)}(x) + f_{\max(N, N_x)}(x) - f(x)\| \\ &\leqslant \|f_n(x) - f_{\max(N, N_x)}(x)\| + \|f_{\max(N, N_x)}(x) - f(x)\| \\ &\leqslant \|(f_n - f_{\max(N, N_x)})(x)\| + \|f_{\max(N, N_x)}(x) - f(x)\| \\ &\leqslant \sup(\{\|(f_n - f_{\max(N, N_x)})(x)\| | x \in X |\}) + \|f_{\max(N, N_x)}(x) - f(x)\| \\ &= \|f_n - f_{\max(N, N_x)}\|_\infty + \|f_{\max(N, N_x)}(x) - f(x)\| \\ &<_{N, N_x \leqslant \max(N, N_x)} \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \\ &= \varepsilon \end{aligned}$$

which as $x \in X$ was chosen arbitrary proves that $\|f_n - f\|_\infty = \sup(\{\|(f_n - f)(x)\| | x \in X\}) < \varepsilon$. Hence it follows that

$$\lim_{n\to\infty} f_n \to f \text{ using the norm } \|\|_\infty$$ □

14.10.3 Series

Series are a extension of finite sums to infinite sums. Note that in contrast with finite sums infinite sums do not have in general the properties of commutativity and associativity.

Definition 14.350. (Series) *Let $k \in \mathbb{N}_0, \langle X, \|\|\rangle$ be a normed space and $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq X$ a sequence such that $\lim_{n\to\infty}(\sum_{i=k}^{\infty} x_i)$ exist then we say that the **series $\sum_{i=k}^{\infty} x_i$ converges** and note the limit as $\sum_{i=k}^{\infty} x_i$, hence*

$$\sum_{i=k}^{\infty} x_i = \lim_{n\to\infty}\left(\sum_{i=k}^{n} x_i\right)$$

Remark 14.351. To avoid excessive notation instead of saying '$\{x\}_{i\in\{k,\ldots,\infty\}}$ is a sequence such that the series $\sum_{i=k}^{\infty} x_i$ converges' we just says 'the series $\sum_{i=k}^{\infty} x_i$ converges' where the sequence $\{x_i)i \in \{k,\ldots,\infty\}$ is implicit assumed.

A example of a series in $\mathbb{R}$ is the power series, to prove this we first need a little lemma.

Lemma 14.352. *Let $\lambda \in \mathbb{R}\backslash\{1\}$ then if $k \in \mathbb{N}$ and $n \in \mathbb{N}_0$ we have that*

$$\sum_{i=1}^{k} \lambda^{n+(i-1)} = \lambda^n \cdot \frac{1-\lambda^k}{1-\lambda}$$

In particular we have

1. *If $n = 0$ then $\sum_{i=1}^{k} \lambda^{(i-1)} = \frac{1-\lambda^k}{1-\lambda}$*
2. *If $n = 1$ then $\sum_{i=1}^{k} \lambda^{i} = \lambda \cdot \frac{1-\lambda^k}{1-\lambda}$*

Proof. We prove this by induction so let

$$S = \left\{k \in \mathbb{N} | \sum_{i=1}^{k} \lambda^{n+(i-1)} = \lambda^n \cdot \frac{1-\lambda^k}{1-\gamma}\right\}$$

then we have:

$1 \in S$. If $k = 1$ then $\sum_{i=1}^{1} \lambda^{n+(i-1)} = \lambda^n = \lambda^n \cdot \frac{1-\lambda}{1-\lambda} = \lambda^n \cdot \frac{1-\lambda^1}{1-\lambda}$ so that $1 \in S$

$k \in S \Rightarrow k+1 \in S$. Then we have

$$\begin{aligned}
\sum_{i=1}^{k+1} \lambda^{n+(i-1)} &= \left(\sum_{i=1}^{k} \lambda^{n+(i-1)}\right) + \lambda^{n+((k+1)-1)} \\
&= \left(\sum_{i=1}^{k} \lambda^{n+(i-1)}\right) + \lambda^{n+k} \\
&\underset{k\in S}{=} \lambda^n \cdot \frac{1-\lambda^k}{1-\lambda} + \lambda^{n+k} \\
&= \frac{\lambda^n \cdot (1-\lambda^k) + (1-\lambda)\cdot\lambda^{n+k}}{1-\lambda} \\
&= \frac{\lambda^n \cdot (1-\lambda^k + (1-\lambda)\cdot\lambda^{k})}{1-\lambda} \\
&= \frac{\lambda^n \cdot (1-\lambda^k + \lambda^k - \lambda^{k+1})}{1-\lambda} \\
&= \lambda^n \cdot \frac{1-\lambda^{k+1}}{1-\lambda}
\end{aligned}$$

proving that $k+1 \in S$ □

Theorem 14.353. *Let $\lambda \in \mathbb{R}$ with $0 \leqslant \lambda < 1$ then $\sum_{i=1}^{\infty} \lambda^i$ converges and $\sum_{i=1}^{\infty} \lambda^i = \frac{\lambda}{1-\lambda}$*

Proof. Let $k \in \mathbb{N}$ then we have that

$$\begin{aligned}
\left|\sum_{i=1}^{k} \lambda^i - \frac{\lambda}{1-\lambda}\right| &= \left|\sum_{i=1}^{k} \lambda \cdot \lambda^{i-1} - \frac{\lambda}{1-\lambda}\right| \\
&= \left|\lambda \cdot \sum_{i=1}^{k} \lambda^{i-1} - \frac{\lambda}{1-\gamma}\right| \\
&\underset{\text{[theorem: 14.352]}}{=} \left|\lambda \cdot \frac{1-\lambda^k}{1-\gamma} - \frac{\lambda}{1-\lambda}\right| \\
&= \left|\frac{\lambda - \lambda^{k+1} - \lambda}{1-\lambda}\right| \\
&= \left|\frac{-\lambda^{k+1}}{1-\lambda}\right| \\
&= \frac{\lambda^{k+1}}{1-\lambda} \\
&= \frac{\lambda}{1-\lambda} \cdot \lambda^k
\end{aligned}$$

Using [example: 14.296] we have that $\lim_{k\to\infty} \lambda^k = 0$, hence given $\varepsilon \in \mathbb{R}^+$ there exist a $N \in \{1, \ldots, \infty\}$ such that $\forall k \geqslant N\ \lambda^k = |\lambda^k - 0| < \varepsilon \cdot \frac{1-\lambda}{1+\lambda}$ so that $\frac{\lambda}{1-\lambda} \cdot \lambda^k < \frac{\lambda}{1-\lambda} \cdot \frac{1-\lambda}{\lambda+1} \cdot \varepsilon = \frac{\lambda}{1+\lambda} \cdot \varepsilon < \varepsilon$, hence

$$\left|\sum_{i=1}^{k} \lambda^i - \frac{\lambda}{1-\lambda}\right| < \varepsilon$$

proving that

$$\lim_{k\to\infty} \sum_{i=1}^{k} \lambda^i = \frac{\lambda}{1-\lambda}$$

□

If a series is convergent then the terms must tend to zero as is show in the following theorem.

Theorem 14.354. *Let $k \in \mathbb{N}_0$, $\langle X, \|\|\rangle$ be a normed space then if $\sum_{i=k}^{\infty} x_i$ converges then*

1. $\lim_{i\to\infty} x_i = 0$
2. $\exists K \in \mathbb{R}^+$ *such that* $\forall i \in \{k, \ldots, \infty\}$ *we have* $\|x_i\| \leqslant K$

Proof.

1. Let $\varepsilon \in \mathbb{R}^+$. As $\lim_{n\to\infty} \sum_{i=k}^{n} x_i$ exist we have that $\{\sum_{i=k}^{n} x_i\}_{n\in\{k,\ldots,\infty\}}$ is Cauchy so there exist a $N \in \{k, \ldots, \infty\}$ such that $n, m \geqslant \mathbb{N}$ we have that $\|\sum_{i=k}^{n} x_i - \sum_{i=k}^{m} x_i\| < \varepsilon$. In particular we have $\forall n \geqslant N \Rightarrow n+1 \geqslant N$ that $\|x_n - 0\| = \|x_n\| = \|\sum_{i=k}^{n+1} x_i - \sum_{i=k}^{n} x_i\| < \varepsilon$. Hence
$$\lim_{n\to\infty} x_n = 0$$
2. As $\lim_{n\to\infty} x_n$ exist it follows from [theorem: 14.306] that there exist a $K \in \mathbb{R}^+$ such that
$$\forall i \in \{k, \ldots, \infty\} \text{ we have } \|x_i\| \leqslant K$$

□

Proof. Let $\varepsilon \in \mathbb{R}^+$. As $\lim_{n\to\infty} \sum_{i=k}^{n} x_i$ exist we have that $\{\sum_{i=k}^{n} x_i\}_{n\in\{k,\ldots,\infty\}}$ is Cauchy so there exist a $N \in \{k, \ldots, \infty\}$ such that $n, m \geqslant \mathbb{N}$ we have that $\|\sum_{i=k}^{n} x_i - \sum_{i=k}^{m} x_i\| < \varepsilon$. In particular we have $\forall n \geqslant N \Rightarrow n+1 \geqslant N$ that $\|x_n - 0\| = \|x_n\| = \|\sum_{i=k}^{n+1} x_i - \sum_{i=k}^{n} x_i\| < \varepsilon$. Hence

$$\lim_{n\to\infty} x_n = 0$$

□

In a Banach space we have the following sufficient and necessary condition for convergence of a series.

Theorem 14.355. *Let $k \in \mathbb{N}_0, \langle X, \|\|\rangle$ be a Banach space then*

$$\sum_{i=k}^{\infty} x_i \text{ converges} \Leftrightarrow \forall \varepsilon \in \mathbb{R}^+\ \exists N \in \{k, \ldots, \infty\} \text{ such that } \forall n, m \geqslant N \text{ with } n \leqslant m \text{ we have } \left\|\sum_{i=n}^{m} x_i\right\| < \varepsilon$$

Proof. Take $\{s_i\}_{i\in\{k,\ldots,\infty\}}$ defined by $s_i=\sum_{j=k}^{i}x_i$ then

$\Rightarrow$. If $\sum_{i=k}^{\infty}x_i$ converges we have that $\lim\limits_{i\to\infty}s_i$ exists, take $\varepsilon>0$, then using [theorem: 14.327], there exists a $N'\in\{k,\ldots,\infty\}$ such that $\forall n,m\geqslant N'$ we have $\|s_m-s_n\|<\varepsilon$. Take $n,m\geqslant N=N'+1$ with $n\leqslant m$ then $N'\leqslant n-1,m$ and $\|\sum_{i=n}^{m}x_i\|\underset{11.23}{=}\|\sum_{i=k}^{m}x_i-\sum_{i=k}^{n-1}x_i\|=\|s_m-s_{n-1}\|<\varepsilon$.

$\Leftarrow$. Let $\varepsilon>0$ then there exists a $N\in\{k,\ldots,\infty\}$ such that $\forall n,m\geqslant N$ with $n\leqslant m$ we have $\|\sum_{i=n}^{m}x_i\|<\varepsilon$, as $\sum_{i=n+1}^{m}x^i\underset{11.23}{=}\sum_{i=k}^{m}x^i-\sum_{i=k}^{n}x^i=s_m-s_n$ we conclude that $\|s_m-s_n\|=\|\sum_{n+1}^{m}x_i\|<\varepsilon$. From this it follows by definition that $\{s_i\}_{i\in\{k,\ldots,\infty\}}$ is Cauchy and as X is a Banach space and thus complete $\lim\limits_{i\to\infty}s_i$ exists proving that $\sum_{i=k}^{\infty}x_i$ converges. □

Theorem 14.356. *Let $k,l\in\mathbb{N}_0$, $\langle X,\|\|\rangle$ a normed space and $\{x_i\}_{i\in\{k+l,\ldots,\infty\}}\subseteq X$ a sequence in X then we have*

$$\sum_{i=k}^{\infty}x_{i+l}\ \textit{converges}\Leftrightarrow\sum_{i=k+l}^{\infty}x_i\ \textit{converges}$$

Further if $\sum_{i=k}^{\infty}x_{i+l}$ or $\sum_{i=k+l}^{\infty}x_i$ converges then

$$\sum_{i=k}^{\infty}x_{i+l}=\sum_{i=k+l}^{\infty}x_i$$

Proof.

$\Rightarrow$. Let $\varepsilon\in\mathbb{R}^+$. As $\sum_{i=k}^{\infty}x_{i+l}$ converges there exist a $x\in X$ such that there exist a $N'\in\{k,\ldots,\infty\}$ such that $\forall n\geqslant N'$ we have that $\|\sum_{i=k}^{n}x_{i+l}-x\|<\varepsilon$. Hence if we take $N=N'+l\in\{k+l,\ldots,\infty\}$ then if $n\geqslant N$ we have that $n\geqslant N'+l\Rightarrow n-l\geqslant N'$ so that

$$\left\|\sum_{i=k+l}^{n}x_i-x\right\|=\left\|\sum_{i=k}^{n-l}x_{i+l}-x\right\|<\varepsilon.$$

This proves that $\sum_{i=k+l}^{\infty}x_i$ converges to x or

$$\sum_{i=k+l}^{\infty}x_i=x=\sum_{i=k}^{\infty}x_{i+l}$$

$\Leftarrow$. Let $\varepsilon\in\mathbb{R}^+$. As $\sum_{i=k+l}^{\infty}x_i$ converges there exist a $x\in X$ and a $N'\in\{k+l,\ldots,\infty\}$ such that $\forall n\geqslant N'$ we have $\|\sum_{i=k+l}^{n}x_i-x\|<\varepsilon$. Take $N=N'-l\in\{k,\ldots,\infty\}$ then $\forall n\geqslant N$ we have $n+l\geqslant N'$ so that

$$\left\|\sum_{i=k}^{n}x_{i+l}-x\right\|=\left\|\sum_{i=k+l}^{n+l}x_i-x\right\|<\varepsilon$$

proving that $\sum_{i=k}^{\infty}x_{i+l}$ converges to x or

$$\sum_{i=k}^{\infty}x_{i+l}=x=\sum_{i=k+l}^{\infty}x_i$$

□

Theorem 14.357. *Let $k\in\mathbb{N}_0$, $\langle X,\|\|\rangle$ a normed space, $m\in\{k+1,\ldots,\infty\}$ and $\{x_i\}_{i\in\{k,\ldots,n\}}\subseteq X$ then*

$$\sum_{i=k}^{\infty}x_i\ \textit{converges}\Leftrightarrow\sum_{i=m}^{\infty}x_i\ \textit{converges}$$

Further if $\sum_{i=k}^{\infty}x_i$ or $\sum_{i=m}^{\infty}x_i$ converges then

$$\sum_{i=k}^{\infty}x_i=\sum_{i=k}^{m-1}x_i+\sum_{i=m}^{\infty}x_i$$

Proof.

$\Rightarrow$. Let $\varepsilon\in\mathbb{R}^+$. As $\sum_{i=k}^{\infty}x_i$ converges there exist a $x\in X$ and a $N\in\{k,\ldots,\infty\}$ such that $\forall n\geqslant N$ we have $\|\sum_{i=k}^{n}x_i-x\|<\varepsilon$, hence we have for $n\geqslant\max(m,N)$ that

$$\left\|\sum_{i=m}^{n}x_i-\left(x-\sum_{i=k}^{m-1}x_i\right)\right\|=\left\|\sum_{i=m}^{n}x_i+\sum_{i=k}^{m-1}x_i-x\right\|\underset{\text{[theorem: 11.23]}}{=}\left\|\sum_{i=k}^{n}x_i-x\right\|<\varepsilon$$

proving that $\sum_{i=m}^{\infty}x_i$ converges and that $\sum_{i=m}^{\infty}x_i=x-\sum_{i=k}^{m-1}x_i=\sum_{i=k}^{\infty}x_i-\sum_{i=k}^{m-1}x_i$. Hence

$$\sum_{i=k}^{\infty}x_i=\sum_{i=k}^{m-1}x_i+\sum_{i=m}^{\infty}x_i$$

⇐. Let $\varepsilon \in \mathbb{R}^+$. As $\sum_{i=m}^{\infty} x_i$ converges there exist a $x \in X$ and a $N \in \{m, \ldots, \infty\}$ such that $\forall n \geqslant N$ we have $\|\sum_{i=m}^{n} x_i - x\| < \varepsilon$. Then we have

$$\left\|\sum_{i=k}^{n} x_i - \left(\sum_{i=k}^{m-1} x_i + x\right)\right\| = \left\|\sum_{i=k}^{n} x_i - \sum_{i=k}^{m-1} x_i - x\right\| = \left\|\sum_{i=m}^{n} x_i - x\right\| < \varepsilon$$

proving that $\sum_{i=k}^{\infty} x_i$ converges and that

$$\sum_{i=k}^{\infty} x_i = \sum_{i=k}^{m-1} x_i + x = \sum_{i=k}^{m-1} x_i + \sum_{i=m}^{\infty} x_i$$

□

Theorem 14.358. *Let $\langle X, \|\|\rangle$ be a normed space and $\sum_{i=k}^{\infty} x_i$ a convergent space [so that by [theorem: 14.357] $\forall m \in \{k, \ldots, \infty\}$ $\sum_{i=m}^{\infty} x_i$ converges and thus exist] then*

$$\lim_{m \to \infty}\left(\sum_{i=m}^{\infty} x_i\right) = 0$$

Proof. Let $\varepsilon \in \mathbb{R}^+$. As $\sum_{i=k}^{\infty} x_i$ converges there exist a $N \in \{, \ldots, \infty\}$ so that $\forall n \geqslant N$ we have $\|\sum_{i=1}^{n} x_i - x\| < \varepsilon$ where $x = \sum_{i=k}^{\infty} x_i$. Let $m \geqslant N + 1 \Rightarrow m - 1 \geqslant N$ then

$$\left\|\sum_{i=m}^{\infty} x_i - 0\right\| = \left\|\sum_{i=m}^{\infty} x_i\right\| \underset{\text{[theorem: 14.357]}}{=} \left\|\sum_{i=k}^{\infty} x_i - \sum_{i=k}^{m-1} x\right\| = \left\|\sum_{i=k}^{m-1} x_i - x\right\| < \varepsilon$$

proving that $\{\sum_{i=m}^{\infty} x_i\}_{m \in \{k, \ldots, \infty\}}$ converges to 0, Hence

$$\lim_{m \to \infty}\left(\sum_{i=m}^{\infty} x_i\right) = 0$$

□

The sum and scalar product of series is a series.

Theorem 14.359. *Let $\langle X, \|\|\rangle$ be a normed space then we have:*

1. *If $\sum_{i=k}^{\infty} x_i$ and $\sum_{i=k}^{\infty} y_i$ are convergent series then $\sum_{i=k}^{\infty} (x_i + y_i)$ is convergent and*

$$\sum_{i=k}^{\infty} (x_i + y_i) = \sum_{i=k}^{\infty} x_i + \sum_{i=k}^{\infty} y_i$$

2. *If $\sum_{i=k}^{\infty} x_i$ is convergent and $\alpha \in \mathbb{K}$ then $\sum_{i=k}^{\infty} (\alpha \cdot x_i)$ is convergent and*

$$\sum_{i=k}^{\infty} (\alpha \cdot x_i) = \alpha \cdot \sum_{i=k}^{\infty} x_i$$

Proof.

1. As $\sum_{i=k}^{\infty} x_i$ and $\sum_{i=k}^{\infty} y_i$ are convergent

$$\lim_{n \to \infty} \sum_{i=k}^{\infty} x_i \text{ and } \lim_{n \to \infty} \sum_{i=k}^{n} y_i \text{ exists}$$

Hence using [theorem: 14.301] $\lim_{n \to \infty} \sum_{i=k}^{\infty} (x_i + y_i) = \lim_{n \to \infty} (\sum_{i=k}^{n} x_i + \sum_{i=k}^{n} y_i)$ exists and is equal to $\lim_{n \to \infty} \sum_{i=k}^{n} x_i + \lim_{n \to \infty} \sum_{i=k}^{n} y_i$. Hence by definition $\sum_{i=k}^{\infty} (x_i + y_i)$ is convergent and

$$\sum_{i=k}^{\infty} (x_i + y_i) = \sum_{i=k}^{\infty} x_i + \sum_{i=k}^{\infty} y_i$$

2. As $\sum_{i=k}^{\infty} x_i$ is convergent $\lim_{n \to \infty} \sum_{i=k}^{n} x_i$ exist, so that by [theorem: 14.302] $\lim_{n \to \infty} (\sum_{i=k}^{n} \alpha \cdot x_i) = \lim_{n \to \infty} \alpha \cdot (\sum_{i=k}^{n} x_i)$ exist and is equal to $\alpha \cdot \lim_{n \to \infty} \sum_{i=k}^{n} x_i$. Hence by definition $\sum_{i=k}^{\infty} (\alpha \cdot x_i)$ is convergent and

$$\sum_{i=k}^{\infty} (\alpha \cdot x_i) = \alpha \cdot \sum_{i=k}^{\infty} x_i$$

□

Corollary 14.360. *Let $\langle \mathbb{C}, ||\rangle$ be the normed space of complex numbers with the norm $||$ and $\{z_i\}_{i\in\{k,\ldots,\infty\}} \subseteq \mathbb{C}$ then*

$$\sum_{i=k}^{\infty} x_i \text{ converges} \Leftrightarrow \sum_{i=k}^{\infty} \mathrm{Img}(z_i) \text{ and } \sum_{i=k}^{\infty} \mathrm{Re}(z_i) \text{ converges}$$

Further if $\sum_{i=k}^{\infty} z_i$ converges then

$$\mathrm{Img}\left(\sum_{i=k}^{\infty} z_i\right) = \sum_{i=k}^{\infty} \mathrm{Img}(z_i) \text{ and } \mathrm{Re}\left(\sum_{i=k}^{\infty} z_i\right) = \sum_{i=k}^{\infty} \mathrm{Re}(z_i)$$

so that

$$\sum_{i=k}^{\infty} z_i = \sum_{i=k}^{\infty} \mathrm{Re}(z_i) + i \cdot \sum_{i=k}^{\infty} \mathrm{Img}(z_i)$$

Proof.

$\Rightarrow$. Assume that $\sum_{i=k}^{\infty} z_i$ converges to z then given $\varepsilon > 0$ there exists a $N \in \{k,\ldots,\infty\}$ such that $\forall n \in \{N,\ldots,\infty\}$ $|\sum_{i=k}^{n} z_i - z| < \varepsilon$. Now

$$\begin{aligned}
\left|\left(\sum_{i=k}^{n} \mathrm{Re}(z_i)\right) - \mathrm{Re}(z)\right| &= \left|\mathrm{Re}\left(\sum_{i=k}^{n} z_i - z\right)\right| \\
&\leqslant_{[\text{theorem: } 10.84]} \left|\sum_{i=k}^{\infty} z_i - z\right| \\
&< \varepsilon
\end{aligned}$$

proving that

$$\sum_{i=k}^{\infty} \mathrm{Re}(z_i) \text{ converges to } \mathrm{Re}(z) = \mathrm{Re}\left(\sum_{i=k}^{\infty} x_i\right)$$

Similar

$$\begin{aligned}
\left|\left(\sum_{i=k}^{n} \mathrm{Img}(z_i)\right) - \mathrm{Img}(z)\right| &= \left|\mathrm{Img}\left(\sum_{i=k}^{n} z_i - z\right)\right| \\
&\leqslant_{[\text{theorem: } 10.84]} \left|\sum_{i=k}^{\infty} z_i - z\right| \\
&< \varepsilon
\end{aligned}$$

proving that

$$\sum_{i=k}^{\infty} \mathrm{Img}(z_i) \text{ converges to } \mathrm{Img}(z) = \mathrm{Img}\left(\sum_{i=k}^{\infty} x_i\right)$$

$\Leftarrow$. Assume that $\sum_{i=k}^{\infty} \mathrm{Re}(z_i)$ and $\sum_{i=k}^{\infty} \mathrm{Img}(z_i)$ converges. As $\forall i \in \{k,\ldots,\infty\}$ $z_i = \mathrm{Re}(z_i) + i \cdot \mathrm{Img}(z_i)$ it follows from the previous theorem [see theorem: 14.359]] that $\sum_{i=k}^{\infty} z_i$ converges. □

14.10.3.1 Series of non negative numbers

Series are in general not commutative, however series of non negative real numbers (and later absolute convergent series) are commutative. First we look at some equivalences of convergence of series of non negative real numbers

Theorem 14.361. *Let $k \in \mathbb{N}_0$, $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq [0,\infty[$ be a sequence of non negative real numbers then we have the following equivalences:*

1. $\sum_{i=k}^{\infty} x_i = x$ *[in other words $\sum_{i=k}^{\infty} x_i$ converges to x]*
2. $\sup\left(\{\sum_{i=k}^{n} x_i | n \in \{k,\ldots,\infty\}\}\right)$ *exists and* $x = \sup\left(\{\sum_{i=k}^{n} x_i | n \in \{k,\ldots,\infty\}\}\right)$
3. $\sup\left(\{\sum_{i\in K} x_i | K \in \mathcal{P}(\{k,\ldots,\infty\}) \wedge K \text{ is finite }\}\right)$ *exists and*

$$x = \sup\left(\left\{\sum_{i\in K} x_i | K \in \mathcal{P}(\{k,\ldots,\infty\}) \wedge K \text{ is finite }\right\}\right)$$

4. $\forall \varepsilon \in \mathbb{R}^+$ *there exist a* $N \in \{k,\ldots,\infty\}$ *such that* $\forall m \in \mathbb{N}$ *and* $n \geqslant N$ *we have* $\sum_{i=n+1}^{n+m} x_i < \varepsilon$

5. *$\forall \varepsilon \in \mathbb{R}^+$ there exist a finite $K \subseteq \{k, \ldots, \infty\}$ such that $\forall H \subseteq \{k, \ldots, \infty\}$ with H finite and $K \bigcap H = \varnothing$ we have $\sum_{i \in H} x_i < \varepsilon$*

Proof. First if $s \in \{\sum_{i=k}^{n} x_i | n \in \{k, \ldots, \infty\}\}$ then $\exists n \in \{k, \ldots, \infty\}$ so that

$$s = \sum_{i=k}^{n} x_i \underset{\text{[theorem: 11.35]}}{=} \sum_{i \in \{k, \ldots, n\}} x_i \in \left\{ \sum_{i \in K} x_i | K \subseteq \{k, \ldots, \infty\} \wedge K \text{ is finite} \right\}$$

proving that

$$\left\{ \sum_{i=k}^{n} x_i | n \in \{k, \ldots, \infty\} \right\} \subseteq \left\{ \sum_{i \in K} x_i | K \subseteq \{k, \ldots, \infty\} \wedge K \text{ is finite} \right\} \tag{14.193}$$

Next

1 $\Leftrightarrow$ 2. Let $n \in \{k, \ldots, \infty\}$ then $\sum_{i=k}^{n} x_i \leqslant \sum_{i=k}^{n} x_i + x_{n+1} = \sum_{i=k}^{n+1} x_i$, hence $\{\sum_{i=k}^{n}\}_{n \in \{k, \ldots, \infty\}}$ is a increasing sequence. So

$$\begin{aligned}
\sum_{i=k}^{\infty} x_i \text{ exists and } \sum_{i=k}^{\infty} x_i = x & \underset{\text{definition}}{\Leftrightarrow} \\
\lim_{n \to \infty} \sum_{i=k}^{n} x_i \text{ exists } \lim_{n \to \infty} \sum_{i=k}^{n} x_i = x & \underset{\text{[theorem: 14.316]}}{\Leftrightarrow} \\
\sup\left(\left\{ \sum_{i=k}^{n} x_i | n \in \{k, \ldots, \infty\} \right\} \right) \text{ exist and } \sup\left(\left\{ \sum_{i=k}^{n} x_i | n \in \{k, \ldots, \infty\} \right\} \right) = x &
\end{aligned}$$

2 $\Rightarrow$ 3. Let $s \in \{\sum_{i \in K} x_i | K \in \mathcal{P}(\{k, \ldots, \infty\}) \wedge K \text{ is finite }\}$ then there exists a finite $K \subseteq \{k, \ldots, \infty\}$ so that $s = \sum_{i \in K} x_i$. Take $n = \max(K)$ then $K \subseteq \{k, \ldots, m\}$ so that

$$\sum_{i \in K} x_i \leqslant \sum_{i \in K} x_i + \sum_{i \in \{k, \ldots, m\} \setminus K} x_i = \sum_{i \in \{k, \ldots, m\}} x_i = \sum_{i=k}^{m} x_i \leqslant \sup\left(\left\{ \sum_{i=k}^{n} x_i | n \in \{k, \ldots, \infty\} \right\} \right)$$

hence $\{\sum_{i \in K} x_i | K \in \mathcal{P}(\{k, \ldots, \infty\}) \wedge K \text{ is finite }\}$ is bounded above by $\sup(\{\sum_{i=k}^{n} x_i | n \in \{k, \ldots, \infty\}\})$ so that by [theorem: 10.18]

$$\sup\left(\left\{ \sum_{i \in K} x_i | K \in \mathcal{P}(\{k, \ldots, \infty\}) \wedge K \text{ is finite } \right\} \right) \text{ exists} \tag{14.194}$$

and

$$\sup\left\{ \sum_{i \in K} x_i | K \in \mathcal{P}(\{k, \ldots, \infty\}) \wedge K \text{ is finite } \right\} \leqslant \sup\left(\left\{ \sum_{i=k}^{n} x_i | n \in \{k, \ldots, \infty\} \right\} \right) \tag{14.195}$$

Combining [eq: 14.193] with [theorem: 3.77] gives

$$\sup\left(\left\{ \sum_{i=k}^{n} x_i | n \in \{k, \ldots, \infty\} \right\} \right) \leqslant \sup\left\{ \sum_{i \in K} x_i | K \in \mathcal{P}(\{k, \ldots, \infty\}) \wedge K \text{ is finite } \right\}$$

which combined with [eq: 14.195] proves that

$$\sup\left(\left\{ \sum_{i=k}^{n} x_i | n \in \{k, \ldots, \infty\} \right\} \right) = \sup\left(\left\{ \sum_{i \in K} x_i | K \in \mathcal{P}(\{k, \ldots, \infty\}) \wedge K \text{ is finite } \right\} \right)$$

3 $\Rightarrow$ 2. Let $s \in \{\sum_{i=k}^{n} x_i | n \in \{k, ..., \infty\}\}$ then from [eq: 14.193] $s \in \{\sum_{i \in K} x_i | K \in \mathcal{P}(\{k, ..., \infty\}) \wedge K \text{ is finite}\}$ so that $s \leqslant \sup(\{\sum_{i \in K} x_i | K \in \mathcal{P}(\{k, \ldots, \infty\}) \wedge K \text{ is finite}\})$ hence by [theorem: 10.18]

$$\sup\left(\left\{ \sum_{i=k}^{n} x_i | n \in \{k, \ldots, \infty\} \right\} \right) \text{ exists}$$

further as $\{\sum_{i=k}^{n} x_i\}_{n \in \{k, \ldots, \infty\}}$ is increasing we have by [theorem: 14.316] that

$$\sup\left(\left\{ \sum_{i=k}^{n} x_i | n \in \{k, \ldots, \infty\} \right\} \right) = \lim_{n \to \infty} \sum_{i=k}^{n} x_i = \sum_{i=k}^{\infty} x_i$$

1 ⇒ 4. As $\sum_{i=k}^{\infty} x_i$ converges $\lim_{n\to\infty} \sum_{i=k}^{n} x_i$ exists so that by [theorem: 14.327] $\{\sum_{i=k}^{n} x_i\}_{n\in\{k,\ldots,\infty\}}$ is Cauchy. Hence given $\varepsilon \in \mathbb{R}^+$ there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall n,m \geqslant N$ we have $|\sum_{i=k}^{n} x_i - \sum_{i=k}^{m} x_i| < \varepsilon$. So if $m \in \mathbb{N}$ and $n \geqslant N$ then we have $N+m$, $n \geqslant N$ hence

$$\sum_{i=n+1}^{n+m} x_i = \left|\sum_{i=n+1}^{n+m} x_i\right| = \left|\sum_{i=k}^{n+m} x_i - \sum_{i=k}^{n} x_i\right| < \varepsilon$$

4 ⇒ 1. Let $\varepsilon \in \mathbb{R}^+$ then by the hypothesis there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall m \in \mathbb{N}$ and $\forall n \geqslant m$ that $\sum_{i=n+1}^{n+m} x_i < \varepsilon$. Take r, $s \geqslant N$ then without loosing generality we my assume that $s \leqslant r$. If $r = s$ then $|\sum_{i=k}^{r} x_i - \sum_{i=k}^{s} x_i| = 0 < \varepsilon$ and if $s < r$ then

$$\left|\sum_{i=k}^{r} x_i - \sum_{i=k}^{s} x_i\right| = \left|\sum_{i=s+1}^{r} x_i\right| = \sum_{i=s+1}^{r} x_i = \sum_{i=s+1}^{(r-s)+s} x_i <_{0<r-s} \varepsilon$$

proving that $\{\sum_{i=k}^{n} x_i\}_{n\in\{k,\ldots,\infty\}}$ is a Cauchy sequence. As by [theorem: 14.335] $\langle \mathbb{R}, \|\rangle$ is a Banach space hence complete it follows that $\lim_{n\to\infty} \sum_{i=k}^{n} x_i$ exists or that

$$\sum_{i=1}^{\infty} x_i \text{ converges}$$

4 ⇒ 5. Let $\varepsilon \in \mathbb{R}^+$ then by the hypothesis there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall m \in \mathbb{N}$ and $\forall n \geqslant m$ that $\sum_{i=n+1}^{n+m} x_i < \varepsilon$. Take $K = \{k,\ldots,N\}$ then if $H \subseteq \{k,\ldots,\infty\}$ is finite and $K \bigcap H = \varnothing$ we must have that $H \subseteq \{N+1,\ldots,\infty\}$. We must now consider two cases for H:

***H* = ∅.** Then $\sum_{i\in H} x_i = 0 < \varepsilon$

***H* ≠ ∅.** Then $N < \min(H) \leqslant \max(H)$ so that $m = \max(H) - N > 0$ and

$$H \subseteq \{N+1,\ldots,\max(H)\} = \{N+1,\ldots,N+m\}$$

so that

$$\sum_{i\in H} x_i \leqslant \sum_{i\in H} x_i + \sum_{i\in\{N+1,\ldots,N+m\}\setminus H} x_i = \sum_{i\in\{N+1,\ldots,N+m\}} x_i < \varepsilon$$

5 ⇒ 4. Let $\varepsilon > 0$ then there exists a finite $K \subseteq \{k,\ldots,\infty\}$ such that $\forall H \subseteq \{k,\ldots,\infty\}$ with H finite and $K \bigcap H = \emptyset$ we have $\sum_{i\in H} x_i < \varepsilon$. Take $K' = K \bigcup \{k\}$ then $K' \neq \varnothing$ so that $N = \max(K')$ exists. Then $\forall n \geqslant N$ and $m \in \mathbb{N}$ we have

$$K \bigcap \{n+1,\ldots,n+m\} \subseteq K' \bigcap \{n+1,\ldots,n+m\} \underset{\max(K')\leqslant N\leqslant n<n+1}{=} \varnothing$$

hence for $H = \{n+1,\ldots,n+m\}$ we have $K \bigcap H = \varnothing$ so that

$$\sum_{i=n+1}^{n+m} x_i = \sum_{i\in\{n+1,\ldots,n+m\}} x_i = \sum_{i\in H} x_i < \varepsilon$$

□

Corollary 14.362. *Let $k \in \mathbb{N}_0$, $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq [0,\infty[$ be a sequence of non negative real numbers such that $\exists l \in \{k,\ldots,n\}$ with $0 < x_l$ then if $\sum_{i=k}^{\infty} x_i$ converges we have $0 < \sum_{i=k}^{\infty} x_i$.*

Proof. By the previous theorem [theorem: 14.361] it follows that $\sup(\{\sum_{i=k}^{n} x_i | n \in \{k,\ldots,\infty\}\}$ exists and $\sup(\{\sum_{i=k}^{n} x_i | n \in \{k,\ldots,\infty\}\} = \sum_{i=k}^{n} x_i$. As $0 < x_l \leqslant \sup(\{\sum_{i=k}^{n} x_i | n \in \{k,\ldots,\infty\}\}$ it follows that $0 < \sum_{i=k}^{\infty} x_i$. □

We are now ready to prove commutativity of series of positive numbers.

Theorem 14.363. *Let $k \in \mathbb{N}_0$, $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq [0,\infty[$ be a sequence of non negative real numbers and $\beta: \{k,\ldots,\infty\} \to \{k,\ldots,\infty\}$ a bijection then we have*

$$\sum_{i=k}^{\infty} x_i \text{ converges} \Leftrightarrow \sum_{i=k}^{\infty} x_{\beta(i)} \text{ converges}$$

Further if $\sum_{i=k}^{\infty} x_i$ converges then $\sum_{i=k}^{\infty} x_i = \sum_{i=k}^{\infty} x_{\beta(i)}$

Proof. Let $s \in \{\sum_{i\in K} x_i | K \in \mathcal{P}(\{k,\ldots,\infty\}) \wedge K \text{ is finite}\}$ then there exist a finite $K \subseteq \{k,\ldots,\infty\}$ such that $s = \sum_{i\in K} x_i$. Take $L = \beta^{-1}(K)$ then as $\beta: \{k,\ldots,\infty\} \to \{k,\ldots,\infty\}$ is a bijection

$$\beta_{|L}: L \to \beta(L) = \beta(\beta^{-1}(K)) = K \text{ is a bijection}$$

Hence

$$s=\sum_{i\in K}x_i \underset{\text{[theorem: 11.36]}}{=} \sum_{i\in L}x_{\beta_{|L}(i)}=\sum_{i\in L}x_{\beta(i)}$$

As K is finite L must be finite [otherwise as β is a bijection $K=\beta(\beta^{-1}(K))=\beta(L)$ is infinite], hence $s=\sum_{i\in L}x_{\beta(i)}\in\{\sum_{i\in K}x_{\beta(i)}|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\}$ proving that

$$\left\{\sum_{i\in K}x_i|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\right\}\subseteq\left\{\sum_{i\in K}x_{\beta(i)}|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\right\} \tag{14.196}$$

Let $s\in\{\sum_{i\in K}x_{\beta(i)}|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\}$ then there exist a finite $K\subseteq\{k,\ldots,\infty\}$ such that $s=\sum_{i\in K}x_{\beta(i)}$. As $\beta:\{k,\ldots,\infty\}\to\{k,\ldots,\infty\}$ we have that $\beta_{|K}:K\to\beta(K)$ is a bijection. Hence we have

$$s=\sum_{i\in K}x_{\beta(i)}=\sum_{i\in K}x_{\beta_{|K}(i)} \underset{\text{[theorem: 11.36]}}{=} \sum_{i\in\beta(K)}x_i$$

Which as $\beta(K)$ is finite [for K is finite and β is a bijection] means that $s=\sum_{i\in\beta(K)}x_i\in\{\sum_{i\in K}x_i|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\}$. So that

$$\left\{\sum_{i\in K}x_{\beta(i)}|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\right\}\subseteq\left\{\sum_{i\in K}x_i|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\right\}$$

which combined with [eq; 14.196] prove that

$$\left\{\sum_{i\in K}x_i|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\right\}=\left\{\sum_{i\in K}x_{\beta(i)}|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\right\} \tag{14.197}$$

Now we have:

⇒. As $\sum_{i=k}^{\infty}x_i$ converges it follows from [theorem: 14.361] that

$$\sup\left(\left\{\sum_{i\in K}x_i|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\right\}\right) \text{ exists}$$

so that by [eq: 14.197] $\sup\left(\{\sum_{i\in K}x_{\beta(i)}|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\}\right)$ exists, hence using [theorem: 14.361] again it follows that

$$\sum_{i=k}^{\infty}x_{\beta(i)} \text{ converges}$$

Further we have

$$\begin{aligned}\sum_{i=k}^{\infty}x_i &\underset{\text{[theorem: 14.361]}}{=} \sup\left(\left\{\sum_{i\in K}x_i|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\right\}\right)\\ &\underset{\text{[eq: 14.197]}}{=} \sup\left(\left\{\sum_{i\in K}x_{\beta(i)}|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\right\}\right)\\ &\underset{\text{[theorem: 14.361]}}{=} \sum_{i=k}^{\infty}x_{\beta(i)}\end{aligned}$$

⇐. As $\sum_{i=k}^{\infty}x_{\beta(i)}$ converges it follows from [theorem: 14.361] that

$$\sup\left(\left\{\sum_{i\in K}x_{\beta(i)}|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\right\}\right) \text{ exists}$$

so that by [eq: 14.197] $\sup\left(\{\sum_{i\in K}x_i|K\in\mathcal{P}(\{k,\ldots,\infty\})\wedge K \text{ is finite}\}\right)$ exists, hence using [theorem: 14.361] again it follows that

$$\sum_{i=k}^{\infty}x_i \text{ converges}$$

□

Just as commutativity in finite sums allows us to define a more general form of a sum over elements of a finite set [see definition: 11.32] we can use the above theorem to define a infinite sum over a countable set of non negative numbers.

Theorem 14.364. *Let I be a denumerable set [see definition: 6.24], $\{x_i\}_{i\in I}\subseteq[0,\infty[$ a denumerable family of non negative numbers. If there exist a $\beta:\mathbb{N}_0\to I$ such that $\sum_{i=0}^{\infty}x_{\beta(i)}=x$ exist then for every bijection $\alpha:\mathbb{N}_0\to I$ we have that $\sum_{i=0}^{\infty}x_{\alpha(i)}=x$.*

Proof. As $\beta:\mathbb{N}_0\to I$ is a bijection we have that $\beta^{-1}:I\to\mathbb{N}_0$ is a bijection so that $\beta^{-1}\circ\alpha:\mathbb{N}_0\to\mathbb{N}_0$ is a bijection. Hence, as $\sum_{i=0}^{\infty}x_{\beta(i)}=x$, it follows from [theorem: 14.363] that $\sum_{i=0}^{\infty}x_{\beta((\beta^{-1}\circ\alpha)(x))}=x$. As $\forall i\in\mathbb{N}_0$ we have $x_{\beta((\beta^{-1}\circ\alpha)(i))}=x_{\beta(\beta^{-1}(\alpha(i)))}=x_{\alpha(i)}$ it follows that $\sum_{i=0}^{\infty}x_{\alpha(i)}=x$. □

The above theorem ensures that the following definition makes set

Definition 14.365. *Let I be a denumerable set [see definition: 6.24], $\{x_i\}_{i\in I}\subseteq[0,\infty[$ a denumerable family of non negative numbers then we say that*

$$\sum_{i\in I}x_i \text{ converges to } x \text{ or } \sum_{i\in I}x_i=x$$

if there exists a bijection $\beta:\mathbb{N}_0\to[0,\infty[$ and a $x\in\mathbb{R}$ such that $\sum_{i=0}^{\infty}x_{\beta(i)}$ converges to x.

As a countable family is either a finite family or a denumerable family of non negative real number we can combine definitions [definition: 11.32] and [definition: 14.364] to define the sum of a countable family of non negative real numbers.

Definition 14.366. *Let I be a countable set [so by [definition: 6.25] I is finite or denumerable] and $\{x_i\}_{i\in I}\subseteq[0,\infty[$ then we say that $\sum_{i\in I}x_i$ converges if either*

$$I \text{ is finite and then } \sum_{i\in I}x_i=\sum_{i=0}^{n}x_{\beta(i)} \text{ where } \beta:\{0,\dots,n\}\to I \text{ is a bijection [see definition: 11.32]}$$

or

$$I \text{ is denumerable and there exist a } x\in\mathbb{R} \text{ such that } \sum_{i\in I}x_i=x \text{ [see definition: 14.364]}$$

***Note* 14.367.** *In the finite case $\sum_{i\in I}x_i$ is guaranteed to be defined, however in the infinite case convergence is needed to ensure that $\sum_{i\in I}x_i$ exist.*

Example 14.368. If $\{x_i\}_{i\in\varnothing}\subseteq[0,\infty[$ then $\sum_{i\in\varnothing}x_i$ converges to 0

Proof. As $\varnothing$ is finite this follows from [definition: 11.32]. □

Theorem 14.369. *Let I,J be countable sets, $I\subseteq J$ and $\{x_i\}_{i\in J}\subseteq[0,\infty[$ such that $\sum_{i\in J}x_i$ converges then $\sum_{i\in I}x_i$ converges and $\sum_{i\in I}x_i\leqslant\sum_{i\in J}x_i$.*

Proof. For J we have either:

- ***J* is finite.** Then as $I\subseteq J$ I is also finite so that $\sum_{i\in I}x_i,\sum_{i\in J}x_i$ are defined by [theorem: 11.32] hence

$$\sum_{i\in I}x_i\leqslant\sum_{i\in I}x_i+\sum_{i\in J\setminus I}x_i\underset{\text{[theorem: 11.43]}}{=}\sum_{i\in J}x_i$$

- ***J* is denumerable.** By definition there exist a bijection $\beta:\mathbb{N}_0\to J$ such that $\sum_{i=0}^{\infty}x_{\beta(i)}$ converges to a real number x and $\sum_{i\in J}x_i=x=\sum_{i=0}^{\infty}x_{\beta(i)}$. For I we have now either:
  - ***I* is finite.** As $\beta:\mathbb{N}_0\to J$ is a bijection and I is finite we have that $\beta^{-1}(I)\underset{\text{[theorem: 2.69]}}{=}(\beta^{-1})(I)$ is finite [see theorem: 6.45] so that $\beta_{|\beta^{-1}(I)}:\beta^{-1}(I)\to\beta(\beta^{-1}(I))=I$ is a bijection. Hence we have

$$\sum_{i\in I}x_i\underset{\text{[theorem: 11.36]}}{=}\sum_{i\in\beta^{-1}(I)}x_{\beta_{|\beta^{-1}(I)}(i)}=\sum_{i\in\beta^{-1}(I)}x_{\beta(i)}$$

  As $\sum_{i\in I}x_i=\sum_{i\in\beta^{-1}(I)}x_{\beta(i)}\in\sup\left(\{\sum_{i\in K}x_{\beta(i)}|K\in\mathcal{P}(\mathbb{N}_0)\wedge K \text{ is finite}\}\right)$ we have that

$$\sum_{i\in I}x_i\leqslant\sup\left(\left\{\sum_{i\in K}x_{\beta(i)}|K\subseteq\mathcal{P}(\mathbb{N}_0)\wedge K \text{ is finite}\right\}\right)\underset{\text{[theorem: 14.361]}}{=}\sum_{i=0}^{\infty}x_{\beta(i)}=\sum_{i\in J}x_i$$

hence

$$\sum_{i\in I} x_i \leqslant \sum_{i\in J} x_i$$

***I* is denumerable.** Then there exist a a bijection $\alpha\colon \mathbb{N}_0 \to I \subseteq J$. Take a finite $K \subseteq \mathbb{N}_0$ then $\alpha(K)$ is finite and $\alpha(K) \subseteq J$ so that $\beta^{-1}(\alpha(K)) \underset{\text{[theorem: 2.69]}}{=} (\beta^{-1})(\alpha(K))$ is finite [see theorem: 6.45]. Define then the following bijections:

$$\alpha_{|K}\colon K \to \alpha(K) \text{ and } \beta_{|\beta^{-1}(\alpha(K))}\colon \beta^{-1}(\alpha(K)) \to \beta(\beta^{-1}(\alpha(K))) = \alpha(K)$$

Then we have

$$\begin{aligned}
\sum_{i\in K} x_{\alpha(i)} &\underset{\text{[theorem: 11.36]}}{=} \sum_{i\in\alpha(K)} x_i \\
&\underset{\text{[theorem: 11.36]}}{=} \sum_{i\in\beta^{-1}(\alpha(K))} x_{\beta(i)} \\
&\leqslant \sup\left(\left\{\sum_{i\in L} x_{\beta(i)} | L \in \mathcal{P}(\mathbb{N}_0) \wedge L \text{ is finite}\right\}\right) \\
&\underset{\text{[theorem: 14.361]}}{=} \sum_{i=0}^{\infty} x_{\beta(i)} \\
&= \sum_{i\in J} x_i
\end{aligned}$$

Hence $\{\sum_{i\in K} x_{\alpha(i)} | K \in \mathcal{P}(\mathbb{N}_0) \wedge K \text{ is finite}\}$ is bounded above by $\sum_{i\in J} x_i$ and trivially non empty. So by [theorem: 10.18] $\sup(\{\sum_{i\in K} x_{\alpha(i)} | K \in \mathcal{P}(\mathbb{N}_0) \wedge K \text{ is finite}\})$ exist and $\sup(\{\sum_{i\in K} x_{\alpha(i)} | K \in \mathcal{P}(\mathbb{N}_0) \wedge K \text{ is finite}\}) \leqslant \sum_{i\in J} x_i$. So using [theorem: 14.361] it follows that $\sum_{i=0}^{\infty} x_{\alpha(i)}$ exist and

$$\sum_{i=0}^{\infty} x_{\alpha(i)} = \sup\left(\left\{\sum_{i\in K} x_{\alpha(i)} | K \in \mathcal{P}(\mathbb{N}_0) \wedge K \text{ is finite}\right\}\right) \leqslant \sum_{i\in J} x_i$$

Finally using [definition: 14.364] we have that $\sum_{i\in I} x_i = \sum_{i=0}^{\infty} x_{\alpha(i)}$ so that

$$\sum_{i\in I} x_i \leqslant \sum_{i\in J} x_i$$

□

For countable families we have also the following equivalent definition of convergence.

Theorem 14.370. *Let I be a countable set and $\{x_i\}_{i\in I} \subseteq [0,\infty[$ a countable family of non negative real numbers then*

$$\sum_{i\in I} x_i \text{ converges} \Leftrightarrow \sup\left(\left\{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\right\}\right) \text{ exist}$$

Further if $\sum_{i\in I} x_i$ converges then

$$\sum_{i\in I} x_i = \sup\left(\left\{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\right\}\right)$$

Proof. As I is countable we have two possibilities to consider:

***I* is finite.** Then for a finite $K \subseteq I$ we have by [theorem: 14.369] that $\sum_{i\in K} x_i \leqslant \sum_{i\in I} x_i$ so that $\{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\}$ is bounded above by $\sum_{i\in I} x_i$. Hence by [theorem: 10.18] $\sup(\{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\})$ exist and

$$\sup\left(\left\{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\right\}\right) \leqslant \sum_{i\in I} x_i \tag{14.198}$$

As $\sum_{i\in I} x_i$ converges by definition if I is finite we have

$$\sum_{i\in I} x_i \text{ converges} \Leftrightarrow \sup\left(\left\{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\right\}\right) \text{ exist}$$

As I is finite we have clearly $\sum_{i\in I} x_i \in \{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\}$ so that

$$\sum_{i\in I} x_i \leqslant \sup\left(\left\{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\right\}\right)$$

which combined with [eq: 14.198] gives

$$\sum_{i\in I} x_i = \sup\left(\left\{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\right\}\right)$$

***I* is denumerable.** Then there exist a bijection $\beta: \mathbb{N}_0 \to I$. Let $s \in \{\sum_{i\in K} x_{\beta(i)} | K \in \mathcal{P}(\mathbb{N}_0) \wedge K \text{ is finite}\}$ then there exist a finite $K \subseteq \mathbb{N}_0$ such that $s = \sum_{i\in K} x_{\beta(i)}$. As $\beta_{|K}: K \to \beta(K)$ is a bijection we have

$$s = \sum_{i\in K} x_{\beta(i)} = \sum_{i\in K} x_{\beta_{|K}(i)} \underset{\text{[theorem: 11.36]}}{=} \sum_{i\in\beta(K)} x_i$$

which as $\beta(K)$ is finite [see theorem: 6.45] and $\beta(K) \subseteq I$ proves that $s \in \{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\}$ hence

$$\left\{\sum_{i\in K} x_{\beta(i)} | K \in \mathcal{P}(\mathbb{N}_0) \wedge K \text{ is finite}\right\} \subseteq \left\{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\right\} \tag{14.199}$$

Let $s \in \{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\}$ then there exist a finite $K \subseteq I$ such that $s = \sum_{i\in K} x_i$. As $\beta_{|\beta^{-1}(K)}: \beta^{-1}(K) \to \beta(\beta^{-1}(K)) = K$ is a bijection we have

$$s = \sum_{i\in K} x_i \underset{\text{[theorem: 11.36]}}{=} \sum_{i\in\beta^{-1}(K)} x_{\beta_{|\beta^{-1}(K)}(i)} = \sum_{i\in\beta^{-1}(K)} x_{\beta(i)}$$

which as $\beta^{-1}(K) \underset{\text{[theorem: 2.69]}}{=} (\beta^{-1})(K)$ is finite by [theorem: 6.45] and $\beta^{-1}(K) \subseteq \mathbb{N}_0$ proves that $s \in \{\sum_{i\in K} x_{\beta(i)} | K \in \mathcal{P}(\mathbb{N}_0) \wedge K \text{ is finite}\}$. Hence

$$\left\{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\right\} \subseteq \left\{\sum_{i\in K} x_{\beta(i)} | K \in \mathcal{P}(\mathbb{N}_0) \wedge K \text{ is finite}\right\}$$

which combined with [eq: 14.199] proves that

$$\left\{\sum_{i\in K} x_{\beta(i)} | K \in \mathcal{P}(\mathbb{N}_0) \wedge K \text{ is finite}\right\} = \left\{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\right\} \tag{14.200}$$

Finally we have

$$\begin{aligned}
&\sum_{i\in I} x_i \text{ converges to } x \underset{\text{[definition: 14.364]}}{\Leftrightarrow} \\
&\sum_{i=0}^{\infty} x_{\beta(i)} \text{ converges to } x \underset{\text{[theorem: 14.361]}}{\Leftrightarrow} \\
&\sup\left(\left\{\sum_{i\in K} x_{\beta(i)} | K \in \mathcal{P}(\mathbb{N}_0) \wedge K \text{ is finite}\right\}\right) \text{ exists and is equal to } x \underset{\text{[eq: 14.200]}}{\Leftrightarrow} \\
&\sup\left(\left\{\sum_{i\in K} x_i | K \in \mathcal{P}(I) \wedge K \text{ is finite}\right\}\right) \text{ exists and is equal to } x
\end{aligned}$$

□

A trivial example of the use of the above theorem is the following

Example 14.371. Let I be a countable set and $\{x_i\}_{i\in I} \subseteq [0, \infty[$ such that $\forall i \in I\ x_i = 0$ then $\sum_{i=\in I} x_i$ converges to 0.

Proof. If $K \subseteq I$ finite then we have as $\forall i \in K\ x_i = 0$ that $\sum_{i\in K} x_i = 0$ so that $\sup(\{\sum_{i\in K} x_i | K \subseteq I \wedge K \text{ is finite}\}) = 0$ which by the previous theorem proves the example. □

Convergent series of non negative numbers are associative, to prove this we need first a little lemma.

Lemma 14.372. *Let $n \in \mathbb{N}_0$ and $\{A_i\}_{i\in\{0,\ldots,n\}} \subseteq \mathcal{P}(\mathbb{R}) \setminus \{\varnothing\}$ a family of non empty sets of real numbers then if there exist a $s \in \mathbb{R}$ such that $\forall (x_0, \ldots, x_n) \in \prod_{i\in\{0,\ldots,n\}} A_i\ \sum_{i=0}^{n} x_i \leqslant s$ it follows that $\forall i \in \{0, \ldots, n\}\ \sup(A_i)$ exist and $\sum_{i=0}^{n} \sup(A_i) \leqslant s$*

Proof. We prove this by induction so let

$$S=\left\{n\in\mathbb{N}_0|\text{If }\{A_i\}_{i\in\{0,\ldots,n\}}\subseteq\mathcal{P}(\mathbb{R})\setminus\{\varnothing\}\text{ satisfies that for a }s\in\mathbb{R}\text{ with }\forall x\in\prod_{i\in\{0,\ldots,n\}}A_i\text{ we have }\sum_{i=0}^{n}x_i\leqslant s\text{ then we have that }\forall i\in\{0,\ldots,n\}\sup(A_i)\text{ exist and }\sum_{i=0}^{n}\sup(A_i)\leqslant s\right\}$$

then we have:

$0\in S$. Let $y\in A_0$ then $y=(x)\in\prod_{i\in\{0\}}A_i$ so that $x=\sum_{i=0}^{0}y_0\leqslant s$ proving that A_0 is bounded above by s, hence, as also $A_0\neq\varnothing$, it follows from the conditional completeness of $\mathbb{R}$ [see theorem: 10.18] that $\sup(A_0)$ exists and $\sup(A_0)\leqslant s\Rightarrow\sum_{i=0}^{0}\sup(A_i)=\sup(A_0)\leqslant s$. Hence $0\in S$.

$n\in A\Rightarrow n+1\in S$. Let $\{A_i\}_{i\in\{0,\ldots,n+1\}}\subseteq\mathcal{P}(\mathbb{R})\setminus\{\varnothing\}$ and let $s\in\mathbb{R}$ be such that $\forall x\in\prod_{i\in\{0,\ldots,n+1\}}A_i$ we have $\sum_{i=0}^{n+1}x_i\leqslant s$. Let $u\in A_{n+1}$ then we have $\forall x\in\prod_{i\in\{0,\ldots,n\}}A_i$ that $y=(x_0,\ldots,x_n,u)\in\prod_{i\in\{0,\ldots,n+1\}}A_i$ so that $u+\sum_{i=0}^{n}x_i=\sum_{i=0}^{n+1}y_i\leqslant s$, hence

$$\forall x\in\prod_{i\in\{0,\ldots,n\}}A_i\text{ we have }\sum_{i=0}^{n}x_i\leqslant s-u$$

So as $n\in S$ we have that

$$\forall i\in\{0,\ldots,n\}\sup(A_i)\text{ exist and }\sum_{i=0}^{n}\sup(A_i)\leqslant s-u \tag{14.201}$$

From the above it follows that for $u\in A_{n+1}$ $u\leqslant s-\sum_{i=0}^{n}\sup(A)$ proving that A_{n+1} is bounded above by $s-\sum_{i=0}^{n}\sup(A_i)$, as further $\varnothing\neq A_{n+1}$ it follows form [theorem: 10.18] that

$$\sup(A_{n+1})\text{ exist and }\sup(A_{n+1})\leqslant s-\sum_{i=0}^{n}\sup(A_i) \tag{14.202}$$

So by [eqs: 14.201, 14.202] we have

$$\forall i\in\{0,\ldots,n+1\}\sup(A_i)\text{ exist and }\sum_{i=0}^{n+1}\sup(A_i)=\sup(A_{n+1})+\sum_{i=0}^{n}\sup(A_i)\leqslant s$$

proving that $n+1\in S$. □

Lemma 14.373. *Let I be a countable set, $\{x_i\}_{i\in I}\subseteq[0,\infty[$ such that $\sum_{i\in I}x_i$ converges, $n\in\mathbb{N}_0$ and $\{N_i\}_{i\in\{0,\ldots,n\}}\subseteq\mathcal{P}(I)$ such that $\forall i,j\in\{0,\ldots,n\}$ with $i\neq j$ we have $N_i\bigcap N_j=\varnothing$ and $I=\bigcup_{i\in\{0,\ldots,n\}}N_i$ then $\forall i\in\{0,\ldots,n\}$ we have that*

$$\sum_{j\in N_i}x_j\text{ converges}$$

and

$$\sum_{i\in I}x_i=\sum_{i=0}^{n}\left(\sum_{j\in N_i}x_j\right)$$

Proof. As $\forall i\in\{0,\ldots,n\}$ $N_i\subseteq I$ and $\sum_{i\in I}x_i$ converges it follows from [theorem: 14.369] that

$$\forall i\in\{0,\ldots,n\}\sum_{j\in N_i}x_j\text{ converges} \tag{14.203}$$

As $\sum_{i\in I}x_i$ converges it follows from [theorem: 14.370] that $\sup(\{\sum_{i\in K}x_i|K\subseteq I\wedge K\text{ finite}\})$ exist and

$$\sum_{i\in I}x_i=\sup\left(\left\{\sum_{i\in K}x_i|K\subseteq I\wedge K\text{ finite}\right\}\right) \tag{14.204}$$

Let $\varepsilon\in\mathbb{R}^+$ then, as $\sum_{i\in I}x_i-\varepsilon<\sup(\{\sum_{i\in K}x_i|K\subseteq I\wedge K\text{ finite}\})$, there exist a finite $K\subseteq I$ such that $\sum_{i\in I}x_i-\varepsilon<\sum_{i\in K}x_i$ or

$$\sum_{i\in I}x_i<\sum_{i\in K}x_i+\varepsilon \tag{14.205}$$

Now given $i \in \{0,\ldots,n\}$ we have that $N_i \bigcap K$ is finite and as $N_i \bigcap K \subseteq N_i$ it follows from [theorem: 14.369] that

$$\sum_{j \in N_i \bigcap K} x_j \leqslant \sum_{j \in N_i} x_j \tag{14.206}$$

Further as $K \subseteq I$

$$K = I \bigcap K = \left(\bigcup_{i \in \{0,\ldots,n\}} N_i \right) \bigcap K = \bigcup_{i \in \{0,\ldots,n\}} (N_i \bigcap K)$$

and $\forall i, j \in \{0,\ldots,n\}$ with $i \neq j$ we have

$$(N_i \bigcap K) \bigcap (N_j \bigcap K) = (N_i \bigcap N_j) \bigcap K = \varnothing \bigcap K = \varnothing$$

so using [theorem: 11.43] we have

$$\begin{aligned} \sum_{i \in K} x_i &\underset{\text{[theorem: 11.43]}}{=} \sum_{i=0}^{n} \left(\sum_{j \in N_i \bigcap K} x_j \right) \\ &\leqslant_{\text{[eq: 14.206]}} \sum_{i=0}^{n} \left(\sum_{j \in N_i} x_j \right) \end{aligned}$$

Combining the above with [eq: 14.205] results in $\sum_{i \in I} x_i < \sum_{i=0}^{n} (\sum_{j \in N_i} x_j) + \varepsilon$ which as $\varepsilon \in \mathbb{R}^+$ was chosen arbitrary allows us to use [theorem: 10.31] giving

$$\sum_{i \in I} x_i \leqslant \sum_{i=0}^{n} \left(\sum_{j \in N_i} x_j \right) \tag{14.207}$$

Take now $s \in \prod_{i \in \{0,\ldots,n\}} \{\sum_{j \in K} x_j | K \subseteq N_i \wedge K \text{ finite}\}$ then there exist a family of finite sets $\{K_i\}_{i \in \{0,\ldots,n\}}$ with $\forall i \in \{0,\ldots,n\}$ $K_i \subseteq N_i$ [so the sets are finite and pairwise disjoint] and $s_i = \sum_{j \in K} x_j$. Hence

$$\sum_{i=0}^{n} s_i = \sum_{i=0}^{n} \left(\sum_{j \in K_i} x_j \right) \underset{\text{[theorem: 11.43]}}{=} \sum_{j \in \bigcup_{i \in \{0,\ldots,n\}} K_i} x_i \tag{14.208}$$

As $\bigcup_{i \in \{0,\ldots,n\}} K_i \subseteq \bigcup_{i \in \{0,\ldots,n\}} N_i = I$ we have by [theorem: 14.369] as $\sum_{i \in I} x_i$ is convergent that $\sum_{j \in \bigcup_{i \in \{0,\ldots,n\}} K_i} x_i \leqslant \sum_{i \in I} x_i$, hence by [eq: 14.208]

$$\sum_{i=0}^{n} s_i \leqslant \sum_{i \in I} x_i$$

So we can use the previous lemma [lemma: 14.372] proving that

$$\forall i \in \{0,\ldots,n\} \ \sup \left(\sum_{j \in K} x_j | K \subseteq N_i \wedge K \text{ finite} \right) \text{ exist and } \sum_{i=0}^{n} \sup \left(\sum_{j \in K} x_j | K \subseteq N_i \wedge K \text{ finite} \right) \leqslant \sum_{i \in I} x_i$$

Using [theorem: 14.370] we have $\forall i \in \{0,\ldots,n\}$ $\sum_{j \in N_i} x_j = \sup (\sum_{j \in K} x_j | K \subseteq N_i \wedge K \text{ finite})$ which combined with the above proves that

$$\sum_{i=0}^{n} \left(\sum_{j \in N_i} x_j \right) \leqslant \sum_{i \in I} x_i$$

which combined with [eq: 14.207] proves

$$\sum_{i \in I} x_i = \sum_{i=0}^{n} \left(\sum_{j \in N_i} x_j \right)$$

□

Lemma 14.374. *Let I be a countable set, $\{x_i\}_{i \in I} \subseteq [0,\infty[$ such that $\sum_{i \in I} x_i$ converges, $\{N_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{P}(I)$ be such that $\forall i, j \in \mathbb{N}_0$ with $i \neq j$ $N_i \bigcap N_j = \varnothing$ and $I = \bigcup_{i \in \mathbb{N}_0} N_i$ then we have that*

$$\forall i \in \mathbb{N}_0 \ \sum_{j \in N_i} x_j \text{ converges}$$

and

$$\sum_{i=0}^{\infty} \left(\sum_{j \in N_i} x_j \right) \text{ converges and } \sum_{i=0}^{\infty} \left(\sum_{j \in N_i} x_j \right) = \sum_{i \in I} x_i$$

Proof. First as $\forall i \in \mathbb{N}_0\ N_i \subseteq I$ we have by [theorem: 14.369] that

$$\forall i \in \mathbb{N}_0 \sum_{j \in N_i} x_j \text{ converges} \tag{14.209}$$

Let $n \in \mathbb{N}_0$ and define $K_n = \bigcup_{i \in \{0, \ldots, n\}} N_i \subseteq I$ then by [theorem: 14.369] again we have that

$$\forall n \in \mathbb{N}_0 \sum_{i \in K_n} x_i \text{ converges and } \sum_{i \in K_n} x_i \leqslant \sum_{i \in I} x_i \tag{14.210}$$

Further as I is countable it follows by [theorem: 6.71] that $\forall n \in \mathbb{N}_0\ K_n$ is countable and as $\{N_i\}_{i \in \{0, \ldots, n\}}$ is pairwise disjoint it follows from the previous lemma [lemma: 14.373] that

$$\sum_{i=0}^{n} \left(\sum_{j \in N_i} x_j \right) \underset{\text{[lemma: 14.373]}}{=} \sum_{i \in K_n} x_i \leqslant_{\text{[eq: 14.210]}} \sum_{i \in I} x_i$$

so that $\{\sum_{i=0}^{n} (\sum_{j \in N_i} x_j) | n \in \mathbb{N}_0\}$ is bounded above by $\sum_{i \in I} x_i$, hence we have by [theorem 10.18] that $\sup(\{\sum_{i=0}^{n} (\sum_{j \in N_i} x_j) | n \in \mathbb{N}_0\})$ exist and

$$\sup\left(\left\{ \sum_{i=0}^{n} \left(\sum_{j \in N_i} x_j \right) | n \in \mathbb{N}_0 \right\} \right) \leqslant \sum_{i \in I} x_i$$

Using then [theorem: 14.361] we have that

$$\sum_{i=0}^{\infty} \left(\sum_{j \in N_i} x_j \right) \text{ converges and } \sum_{i=0}^{\infty} \left(\sum_{j \in N_i} x_j \right) \leqslant \sum_{i \in I} x_i \tag{14.211}$$

For the opposite equality, let $\varepsilon \in \mathbb{R}^+$ then as $\sum_{i \in I} x_i - \varepsilon < \sum_{i \in I} x_i$ and

$$\sum_{i \in I} x_i \underset{\text{[theorem: 14.370]}}{=} \sup\left(\left\{ \sum_{i \in K} x_i | K \subseteq I \wedge K \text{ is finite} \right\} \right)$$

there exist a finite $K \subseteq I$ such that $\sum_{i \in I} x_i - \varepsilon < \sum_{i \in K} x_i$ or

$$\sum_{i \in I} x_i < \sum_{i \in K} x_i + \varepsilon \tag{14.212}$$

Take now $J = \{i \in \mathbb{N}_0 | K \bigcap N_i \neq \varnothing\} \subseteq \mathbb{N}_0$ so that by [theorem: 6.71] J is countable. If $x \in K$ then as $K = K \bigcap I = K \bigcap (\bigcup_{i \in \mathbb{N}_0} N_i) = \bigcup_{i \in \mathbb{N}_0} (K \bigcap N_i)$ there exist a $i \in \mathbb{N}_0$ such that $x \in K \bigcap N_i \Rightarrow K \bigcap N_i \neq \varnothing$ hence $i \in J$ proving that $x \in \bigcup_{i \in J} (K \bigcap N_i)$. Hence $K \subseteq \bigcup_{i \in J} (K \bigcap N_i)$ which as trivially $\bigcup_{i \in J} (K \bigcap N_i) \subseteq K$ proves that

$$K = \bigcup_{i \in J} (K \bigcap N_i) \tag{14.213}$$

We have now two cases to consider for J:

- $\boldsymbol{J = \varnothing}$**.** Then by [eq: 14.213] $K = \varnothing$ hence $\sum_{i \in K} x_i = 0$ so that by [eq: 14.212] $\sum_{i \in I} x_i < \varepsilon$ which by [theorem: 10.31] proves that

$$\sum_{i \in I} x_i \leqslant 0 \leqslant \sum_{i=0}^{\infty} \left(\sum_{j \in N_i} x_j \right)$$

- $\boldsymbol{J \neq \varnothing}$**.** Assume that J is not finite then as $\{K \bigcap N_i\}_{i \in J}$ is a family of pairwise disjoint non empty sets if follows from [theorem: 6.48] that $K = \bigcup_{i \in J} (K \bigcap N_i)$ is infinite, contradicting the fact that K was chosen to be finite. Hence the assumption is wrong and J is finite and non empty so that by [theorem: 6.49]

$$m = \max(J) \text{ exist}$$

Let $x \in \bigcup_{i \in \{0, \ldots, m\}} (K \bigcap N_i)$ then $\exists i \in \{0, \ldots, m\}$ such that $x \in K \bigcap N_i \Rightarrow K \bigcap N_i \neq \varnothing$ so that $i \in J$ proving that $x \in \bigcup_{i \in J} (K \bigcap N_i) \underset{\text{[eq: 14.95]}}{=} K$ proving that

$$\bigcup_{i \in \{0, \ldots, m\}} (K \bigcap N_i) \subseteq K \tag{14.214}$$

On the other hand if $x \in K$ then by [eq: 14.213] there exist a $i \in J$ such that $x \in K \bigcap N_i$ which as $J \subseteq \{0, \ldots, \max(J)\} = \{0, \ldots, m\}$ proves that $x \in \bigcup_{i \in \{0, \ldots, m\}} (K \bigcap N_i)$ or $K \subseteq \bigcup_{i \in \{0, \ldots, m\}} (K \bigcap N_i)$, combining this with [eq: 14.214] gives

$$K = \bigcup_{i \in \{0, \ldots, m\}} (K \bigcap N_i)$$

As $\{K \bigcap N_i\}_{i \in J}$ is pairwise disjoint we have by the above and [theorem: 11.43] that

$$\begin{aligned}
\sum_{i \in K} x_i &\underset{\text{[theorem: 11.43]}}{=} \sum_{i=0}^{m} \left(\sum_{j \in K \bigcap N_i} x_j \right) \\
&\leqslant_{\text{[theorem: 14.369]}} \sum_{i=0}^{m} \left(\sum_{j \in N_i} x_j \right) \\
&\leqslant \sup \left(\left\{ \sum_{i=0}^{m} \left(\sum_{j \in N_i} x_j \right) | m \in \mathbb{N}_o \right\} \right) \\
&\underset{\text{[theorem: 14.361}}{=} \sum_{i=0}^{\infty} \left(\sum_{j \in N_i} x_j \right)
\end{aligned}$$

So we have

$$\sum_{i \in I} x_i <_{\text{[eq: 14.212]}} \sum_{i \in K} x_i + \varepsilon \leqslant \sum_{i=0}^{\infty} \left(\sum_{j \in N_i} x_j \right) + \varepsilon$$

so that by [theorem: 10.31] we have

$$\sum_{i \in I} x_i \leqslant \sum_{i=0}^{\infty} \left(\sum_{j \in N_i} x_j \right)$$

So in all cases we have $\sum_{i \in I} x_i \leqslant \sum_{i=0}^{\infty} (\sum_{j \in N_i} x_j)$ which combined with [eq: 14.211] it follows that

$$\sum_{i \in I} x_i = \sum_{i=0}^{\infty} \left(\sum_{j \in N_i} x_j \right)$$

□

Finally we are ready to prove the general case of countable families.

Theorem 14.375. *Let I, K be countable sets, $I \neq \varnothing$, $\{K_i\}_{i \in I}$ a countable family of countable sets such that $K = \bigcup_{i \in I} K_i$ and $\forall i, j \in I$ with $i \neq j$ $K_i \bigcap K_j = \varnothing$ and $\{x_i\}_{i \in K} \subseteq [0, \infty[$ a countable family of non negative numbers such that $\sum_{i \in K} x_i$ converges then*

$$\forall i \in I \sum_{j \in K_i} x_j \text{ converges and } \sum_{i \in K} x_i = \sum_{i \in I} \left(\sum_{j \in K_i} x_j \right)$$

Proof. As I is countable we have two possible cases to consider:

***I* is finite.** Then there exists a $n \in \mathbb{N}_0$ and a bijection $\beta: \{0, \ldots, n\} \to I$. Define then

$$\{L_i\}_{i \in \{0, \ldots, n\}} \text{ by } L_i = K_{\beta(i)}$$

then we have

$$K = \bigcup_{i \in I} K_i \underset{\text{[theorem: 2.119]}}{=} \bigcup_{i \in \{0, \ldots, n\}} K_{\beta(i)} = \bigcup_{i \in \{0, \ldots, n\}} L_i$$

Further if $i, j \in \{0, \ldots, n\}$ with $i \neq j$ then as β is a bijection $\beta(i) \neq \beta(j)$ so that $L_i \bigcap L_j = K_{\beta(i)} \bigcap K_{\beta(j)} = \varnothing$. So we can use [lemma: 14.373] giving

$$\forall i \in \{0, \ldots, n\} \sum_{j \in L_i} x_j \text{ converges and } \sum_{i=0}^{n} \left(\sum_{j \in L_i} x_j \right) = \sum_{i \in K} x_i \tag{14.215}$$

Finally $\forall i \in I$ we have that $K_i = K_{\beta(\beta^{-1}(i))} = L_{\beta^{-1}(i)}$ so that

$$\sum_{j \in K_i} x_j = \sum_{j \in L_{\beta^{-1}(i)}} x_j \text{ converges}$$

and

$$\begin{aligned}\sum_{i \in K} x_i &\underset{\text{[eq: 14.215]}}{=} \sum_{i=0}^{n} \left(\sum_{j \in L_i} x_j \right) \\ &= \sum_{i=0}^{n} \left(\sum_{j \in K_{\beta(i)}} x_j \right) \\ &\underset{\text{[definition: 11.32]}}{=} \sum_{i \in I} \left(\sum_{j \in K_i} x_j \right)\end{aligned}$$

***I* is denumerable.** Then there exist a bijection $\beta: \mathbb{N}_0 \to I$. Define then

$$\{L_i\}_{i \in \mathbb{N}_0} \text{ by } L_i = K_{\beta(i)}$$

then we have

$$K = \bigcup_{i \in I} K_i \underset{\text{[theorem: 2.119]}}{=} \bigcup_{i \in \mathbb{N}_0} K_{\beta(i)} = \bigcup_{i \in \mathbb{N}_0} L_i$$

Further if $i, j \in \mathbb{N}_0$ with $i \neq j$ then as β is a bijection $\beta(i) \neq \beta(j)$ so that $L_i \bigcap L_j = K_{\beta(i)} \bigcap K_{\beta(j)} = \varnothing$. So we can use [lemma: 14.374] giving

$$\forall i \in \mathbb{N}_0 \sum_{j \in L_i} x_j \text{ converges and } \sum_{i=0}^{\infty} \left(\sum_{j \in L_i} x_j \right) = \sum_{i \in K} x_i \tag{14.216}$$

Finally $\forall i \in I$ we have that $K_i = K_{\beta(\beta^{-1}(i))} = L_{\beta^{-1}(i)}$ so that

$$\sum_{j \in K_i} x_j = \sum_{j \in L_{\beta^{-1}(i)}} x_j \text{ converges}$$

and

$$\begin{aligned}\sum_{i \in K} x_i &\underset{\text{[eq: 14.216]}}{=} \sum_{i=0}^{\infty} \left(\sum_{j \in L_j} x_j \right) \\ &= \sum_{i=0}^{\infty} \left(\sum_{j \in K_{\beta(i)}} x_j \right) \\ &\underset{\text{[definition: 14.365]}}{=} \sum_{i \in I} \left(\sum_{j \in K_i} x_j \right)\end{aligned}$$

□

14.10.3.2 Absolute Convergent Series

Definition 14.376. (Absolute Convergence) *Let $\langle X, \|\|\rangle$ be a normed space and $\{x_i\}_{i \in \{k, \ldots, \infty\}} \subseteq X$ a sequence then $\sum_{i=k}^{\infty} x_i$ is **absolute convergent** if $\sum_{i=k}^{\infty} \|x_i\|$ is convergent.*

The following theorem shows that in a Banach space every series where the norm of its terms is dominated by the terms of a convergent series is convergent.

Theorem 14.377. (Dominant Convergence) *Let $k \in \mathbb{N}_0, \langle X, \|\|\rangle$ be a Banach space, $\{s_i\}_{i \in \{k, \ldots, \infty\}} \subseteq [0, \infty[$ such that $\sum_{i=k}^{\infty} s_i$ is convergent and $\{x_i\}_{i \in \{k, \ldots, \infty\}} \subseteq X$ satisfies $\forall i \in \{k, \ldots \infty\}$ $\|x_i\| \leqslant s_i$ then*

$$\sum_{i=k}^{\infty} x_i \text{ converges}$$

and

$$\left\| \sum_{i=k}^{\infty} x_i \right\| \leqslant \sum_{i=k}^{\infty} s_i$$

Proof. Let $\varepsilon \in \mathbb{R}^+$ then as $\sum_{i=k}^{\infty} s_i$ converges we have that $\{\sum_{i=k}^{n} s_i\}_{n\in\{k,\ldots,\infty\}}$ convergence, hence by [theorem: 14.327] there exist $N \in \{k,\ldots,\infty\}$ such that $\forall n,m \geqslant N$ we have

$$\left|\sum_{i=k}^{n} s_i - \sum_{i=k}^{m} s_i\right| < \varepsilon$$

For n,m we have the following possible cases to consider:

n = m. Then $\|\sum_{i=k}^{n} x_i - \sum_{i=k}^{m} x_i\| = \|\sum_{i=k}^{n} x_i - \sum_{i=k}^{n} x_i\| = \|0\| = 0 < \varepsilon$

n < m. Then

$$\begin{aligned}
\left\|\sum_{i=k}^{n} x_i - \sum_{i=k}^{m} x_i\right\| &= \left\|\sum_{i=k}^{m} x_i - \sum_{i=k}^{n} x_i\right\| \\
&= \left\|\sum_{i=n+1}^{m} x_i\right\| \\
&\leqslant_{\text{[theorem: 14.86]}} \sum_{i=n+1}^{m} \|x_i\| \\
&\leqslant \sum_{i=n+1}^{m} s_i \\
&= \left|\sum_{i=n+1}^{m} s\right| \\
&= \left|\sum_{i=k}^{m} s_i - \sum_{i=k}^{n} s_i\right| \\
&< \varepsilon
\end{aligned}$$

m < n.

$$\begin{aligned}
\left\|\sum_{i=k}^{n} x_i - \sum_{i=k}^{m} x_i\right\| &= \left\|\sum_{i=n+1}^{m} x_i\right\| \\
&\leqslant_{\text{[theorem: 14.86]}} \sum_{i=n+1}^{m} \|x_i\| \\
&\leqslant \sum_{i=n+1}^{m} s_i \\
&= \left|\sum_{i=n+1}^{m} s\right| \\
&= \left|\sum_{i=k}^{m} s_i - \sum_{i=k}^{n} s_i\right| \\
&< \varepsilon
\end{aligned}$$

Hence in all cases $\|\sum_{i=k}^{n} x_i - \sum_{i=k}^{m} x_i\| < \varepsilon$ proving that $\{\sum_{i=k}^{n} x_i\}_{n\in\{k,\ldots,\infty\}}$ is Cauchy. As $\langle X, \|\|\rangle$ is a Banach space $\lim\limits_{n\to\infty} x_n$ exist so that by definition

$$\sum_{i=k}^{\infty} x_i \text{ converges}$$

Further if $n \in \{k,\ldots,\infty\}$ then we have

$$\left\|\sum_{i=k}^{n} x_i\right\| \leqslant \sum_{i=k}^{n} \|x_i\| \leqslant \sum_{i=k}^{n} s_i$$

Using [theorem: 14.309] it follows that

$$\lim_{n\to\infty}\left\|\sum_{i=k}^{n} x_i\right\| \leqslant \lim_{n\to\infty}\sum_{i=k}^{n} s_n = \sum_{i=k}^{\infty} s_i$$

As by [theorem: 14.315] $\lim_{n\to\infty}\|\sum_{i=k}^{n}x_i\| = \left\|\lim_{n\to\infty}\sum_{i=k}^{n}x_i\right\| \underset{\text{def}}{=} \|\sum_{i=k}^{\infty}x_i\|$ it follows that

$$\left\|\sum_{i=k}^{\infty}x_i\right\| \leqslant \sum_{i=k}^{\infty}s_i$$

□

We have a variant of the dominant convergence theorem where the inequality is strict, this variant will be used in the proof of the open mapping theorem.

Corollary 14.378. *Let $k\in\mathbb{N}_0, \langle X, \|\|\rangle$ be a Banach space, $\{s_i\}_{i\in\{k,\dots,\infty\}}\subseteq[0,\infty[$ such that $\sum_{i=k}^{\infty}s_i$ is convergent and $\{x_i\}_{i\in\{k,\dots,\infty\}}\subseteq X$ a sequence in X such that:*

1. $\forall i\in\{k,\dots\infty\}\ \|x_i\|\leqslant s_i$
2. $\exists n_0\in\{k,\dots,\infty\}$ *such that* $\|x_{n_0}\|<s_{n_o}$

then we have

$$\sum_{i=k}^{\infty}x_i \text{ converges}$$

and

$$\left\|\sum_{i=k}^{\infty}x_i\right\| < \sum_{i=k}^{\infty}s_i$$

Proof. Using [theorem: 14.357] it follows that

$$\sum_{i=n_0+1}^{\infty}s_i \text{ converges and } \sum_{i=k}^{\infty}s_i = \sum_{i=k}^{n_0}s_i + \sum_{i=n_0+1}^{\infty}s_i \tag{14.217}$$

As $\forall i\in\{n_0+1,\dots\infty\}\ \|x_i\|\leqslant s_i$ we can use dominant convergence [theorem: 14.377] that

$$\sum_{i=n_0+1}^{\infty}x_i \text{ converges and } \left\|\sum_{i=n_0+1}^{\infty}x_i\right\| \leqslant \sum_{i=n_0+1}^{\infty}s_i \tag{14.218}$$

So using [theorem: 14.357] we have that

$$\sum_{i=k}^{\infty}x_i \text{ converges and } \sum_{i=k}^{\infty}x_i = \sum_{i=k}^{n_0}x_i + \sum_{i=n_0+1}^{\infty}x_i \tag{14.219}$$

We have also that

$$\begin{aligned}\left\|\sum_{i=k}^{n_0}x_i\right\| &\leqslant \sum_{i=k}^{n_0}\|x_i\| \\ &= \sum_{i=k}^{n_0-1}\|x_i\| + \|x_{n_0}\| \\ &\leqslant \sum_{i=k}^{n_0-1}s_i + \|x_{n_0}\| \\ &< \sum_{i=k}^{n_0-1}s_i + s_{n_0} \\ &= \sum_{i=k}^{n_0}s_i\end{aligned}$$

proving that

$$\left\|\sum_{i=k}^{n_0}x_i\right\| < \sum_{i=k}^{n_0}s_o \tag{14.220}$$

So we have that $\sum_{i=k}^{\infty} x_i$ converges and

$$\begin{aligned}
\left\|\sum_{i=k}^{\infty} x_i\right\| &\underset{\text{[eq: 14.219]}}{=} \left\|\sum_{i=k}^{n_0} x_i + \sum_{i=n_0+1}^{\infty} x_i\right\| \\
&\leqslant \left\|\sum_{i=k}^{n_0} x_i\right\| + \left\|\sum_{i=n_0+1}^{\infty} x_i\right\| \\
&\leqslant_{\text{[eq: 14.218]}} \left\|\sum_{i=k}^{n_0} x_i\right\| + \sum_{i=n_0+1}^{\infty} s_i \\
&<_{\text{[eq: 14.220]}} \sum_{i=k}^{n_0} s_i + \sum_{i=n_0+1}^{\infty} s_i \\
&\underset{\text{[eq: 14.217]}}{=} \sum_{i=k}^{\infty} s_i
\end{aligned}$$

proving

$$\left\|\sum_{i=k}^{\infty} x_i\right\| < \sum_{i=k}^{\infty} s_i$$

□

A consequence of the dominant convergence theorem is that every absolute convergent series is convergent.

Corollary 14.379. *Let $k \in \mathbb{N}_0, \langle X, \|\|\rangle$ be a Banach space and $\sum_{i=k}^{\infty} x_i$ a **absolute convergent series** then $\sum_{i=k}^{\infty} x_i$ converges and $\|\sum_{i=k}^{\infty} x_i\| \leqslant \sum_{i=k}^{\infty} \|x_i\|$*

Proof. As $\sum_{i=k}^{\infty} x_i$ is absolute convergent we have by definition that $\sum_{i=k}^{\infty} \|x_i\|$ converges and as trivially $\forall i \in \{k, \ldots, \infty\}\ \|x_i\| \leqslant \|x_i\|$ it follows from the previous theorem [theorem: 14.377] that $\sum_{i=k}^{\infty} x_i$ converges and that $\|\sum_{i=k}^{\infty} x_i\| \leqslant \sum_{i=k}^{\infty} \|x_i\|$. □

Theorem 14.380. *Let $k \in \mathbb{N}_0, \langle X, \|\|\rangle$ be a normed space and $\{x_i\}_{i \in \{k, \ldots, \infty\}} \subseteq X$ a sequence such that there exist a convergent series $\sum_{i=k}^{\infty} s_i$ with $\forall i \in \{k, \ldots, \infty\}\ \|x_i\| \leqslant s_i$ then $\sum_{i=k}^{\infty} \|x_i\|$ converges [using the normed space $\langle \mathbb{R}, \|\rangle$.*

Proof. As $\{\|x_i\|\}_{i \in \{k, \ldots, \infty\}} \subseteq \mathbb{R}$ is a sequence in the Banach space $\langle \mathbb{R}, \|\rangle$ [see theorem: 14.335] it follows from [theorem: 14.377] that $\sum_{i=k}^{\infty} \|x_i\|$ converges. □

The following theorem show that only in a Banach space convergence and absolute convergence is the same.

Theorem 14.381. *Let $\langle X, \|\|\rangle$ be a normed space then*

$$\langle X, \|\|\rangle \text{ is Banach} \Leftrightarrow \text{every absolute convergent series converges}$$

Proof.

- **⇒.** This follows from [corollary: 14.379]
- **⇐.** Let $\{x_n\}_{n \in \{k, \ldots, \infty\}} \subseteq X$ be a Cauchy sequence. Then $\forall n \in \mathbb{N}$ there exist a $N'_n \in \{k, \ldots, \infty\}$ such that $\forall r, s \geqslant N'_n$ we have $\|x_r - x_s\| < \frac{1}{2^{n+1}}$ define $N_n = \max(N'_n, n)$ then $N_n + 1, N_n \geqslant N'_n$ so that

  $$\|x_{N_n+1} - x_{N_n}\| < \frac{1}{2^{n+1}}$$

  Hence we have found a sequence $\{x_{N_n}\}_{n \in \mathbb{N}} \subseteq X$ such that

  $$\forall n \in \mathbb{N}\ \|x_{N_n+1} - x_{N_n}\| < \frac{1}{2^{n+1}} \text{ and } N_n \geqslant n \tag{14.221}$$

  Define

  $$\{y_i\}_{i \in \mathbb{N}} \text{ by } y_i = \begin{cases} x_{N_1} \text{ if } i = 1 \\ x_{N_i} - x_{N_{i-1}} \text{ if } i \in \{2, \ldots, \infty\} \end{cases}$$

  then we have

  $$\forall i \in \{2, \ldots, \infty\}\ \|y_i\| = \|x_{N_i} - x_{N_{i-1}}\| < \frac{1}{2^{(i-1)+1}} = \frac{1}{2^i} \tag{14.222}$$

Using [theorem: 14.353] $\sum_{i=1}^{\infty}\frac{1}{2^i}$ is convergent so that by [theorem: 14.357] $\sum_{i=2}^{\infty}\frac{1}{2^i}$ converges. Using then [theorem: 14.380] on [eq: 14.222] proves that $\sum_{i=2}^{\infty}\|y_i\|$ converges, further by [theorem: 14.357] we have that $\sum_{i=1}^{\infty}\|y_i\|$ converges. Hence $\{y_i\}_{i\in\mathbb{N}}$ is absolute convergent. By the hypothesis every absolute convergent series converges hence we have that

$$\sum_{i=1}^{\infty} y_i \text{ converges or } \lim_{n\to\infty}\sum_{i=1}^{n} y_i \text{ exist} \tag{14.223}$$

Let $n\in\mathbb{N}$ then we have that

$$\begin{aligned}
\sum_{i=1}^{n} y_i &= \begin{cases} y_1 \text{ if } n=1 \\ y_1+\sum_{i=2}^{n} y_i \text{ if } 1<n \end{cases} \\
&= \begin{cases} x_{N_1} \text{ if } n=1 \\ x_{N_1}+\sum_{i=2}^{n}(x_{N_i}-x_{N_{i-1}}) \text{ if } 1<n \end{cases} \\
&\underset{\text{[theorem: 11.21]}}{=} \begin{cases} x_{N_1} \text{ if } n=1 \\ x_{N_1}+x_{N_n}-x_{N_1} \text{ if } 1<\text{n} \end{cases} \\
&= x_{N_n}
\end{aligned}$$

Combining the above with [eq: 14.223] proves that

$$\{x_{N_i}\}_{i\in\mathbb{N}} \text{ converges to a limit } x \tag{14.224}$$

Take $\varepsilon\in\mathbb{R}^+$ then as $\{x_n\}_{n\in\{k,\ldots,\infty\}}$ is Cauchy there exist a $M_1\in\{k,\ldots,\infty\}$ such that $\forall n,m\geqslant M_1$ we have

$$\|x_n-x_m\|<\frac{\varepsilon}{2}$$

Further as $\lim_{n\to\infty} x_{N_n}=x$ there exist a $M_2\in\mathbb{N}$ such that $\forall n\geqslant M_2$ we have

$$\|x_{N_n}-x\|<\frac{\varepsilon}{2}$$

Let $N=\max(M_1,M_2)$ then if $n\geqslant N$ we have $n\geqslant M_1 \underset{\text{[eq: 14.221]}}{\Rightarrow} N_n\geqslant n\geqslant M_1$ and $n\geqslant M_2$ so that

$$\|x_n-x\|=\|x_n-x_{N_n}+x_{N_n}-x\|\leqslant\|x_n-x_{N_n}\|+\|x_{N_n}-x\|<\frac{\varepsilon}{2}+\frac{\varepsilon}{2}=\varepsilon$$

proving that $\{x_n\}_{n\in\{k,\ldots,\infty\}}$ converges to x. As $\{x_n\}_{n\in\{k,\ldots,\infty\}}$ was a arbitrary Cauchy sequence it follows that $\langle X,\|\|\rangle$ is a Banach space. □

We have the following equivalent definitions for absolute convergent series.

Theorem 14.382. *Let $k\in\mathbb{N}_0,\langle X,\|\|\rangle$ a normed space and $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq X$ a sequence then the following are equivalent:*

1. *$\sum_{i=k}^{\infty}x_i$ is absolute convergent*
2. *$\forall\varepsilon\in\mathbb{R}^+$ there exist a $N\in\{k,\ldots,\infty\}$ such that $\forall m\in\mathbb{N}$ and $\forall n\geqslant N$ we have $\sum_{i=n+1}^{n+m}\|x_i\|<\varepsilon$*
3. *$\forall\varepsilon\in\mathbb{R}^+$ there exist a finite $K\subseteq\{k,\ldots,\infty\}$ such that $\forall H\subseteq\{k,\ldots,\infty\}$ with H finite and $K\bigcap H=\varnothing$ we have $\sum_{i\in H}\|x_i\|<\varepsilon$*

Proof. As $\sum_{i=k}^{\infty}\|x_i\|$ is a series of non negative numbers and absolute convergences of $\sum_{i=k}^{\infty}x_i$ is the same as convergence of $\sum_{i=k}^{\infty}\|x_i\|$ the proof follows from [theorem: 14.361]. □

Lemma 14.383. *Let $k\in\mathbb{N}_0$, $\langle X,\|\|\rangle$ be a Banach space and $\sum_{i=k}^{\infty}x_i$ a absolute convergent series then $\forall\varepsilon\in\mathbb{R}^+$ there exist a finite $K\subseteq\{k,\ldots,\infty\}$ such that*

1. *$\forall L\subseteq\{k,\ldots,\infty\}$ with L finite and $K\bigcap L=\varnothing$ we have $\sum_{i\in L}\|x_i\|<\varepsilon$*
2. *$\forall H\subseteq\{k,\ldots,\infty\}$ with H finite and $K\subseteq H$ we have $\|\sum_{i=k}^{\infty}x_i-\sum_{i\in H}x_i\|<\varepsilon$*

Proof. Let $\varepsilon\in\mathbb{R}^+$. As by [theorem: 14.381] absolute convergence implies convergence we have that $\lim_{n\to\infty}\sum_{i=k}^{n}x_i$ converges to $\sum_{i=k}^{\infty}x_i$, hence there exist a $N\in\{k,\ldots,\infty\}$ so that

$$\forall n\geqslant N \text{ we have } \left\|\sum_{i=k}^{n}x_i-\sum_{i=k}^{\infty}x_i\right\|<\frac{\varepsilon}{2} \tag{14.225}$$

Using absolute convergence and the previous theorem [see theorem: 14.382] there exist a finite $K' \subseteq \{k, \ldots, \infty\}$ such that for every finite $L \subseteq \{k, \ldots, \infty\}$ with $K' \bigcap L = \varnothing$ we have that that $\sum_{i \in L} \|x_i\| < \frac{\varepsilon}{2}$. Take $K = \{k, \ldots, N\} \bigcup K'$ then we have $\{k, \ldots, N\} \subseteq K \subseteq \{k, \ldots, \infty\}$ and for every finite $L \subseteq \{k, \ldots, \infty\}$ with $K \bigcap L = \varnothing$ we have, as $K' \subseteq L$, that $K' \bigcap L \neq \varnothing$ so that $\sum_{i \in L} \|x_i\| < \frac{\varepsilon}{2}$. So we have the existence of a $K \subseteq \{k, \ldots, \infty\}$ such that

$$\{k, \ldots, N\} \subseteq K \wedge \forall L \subseteq \{k, \ldots, \infty\} \text{ with } L \text{ finite and } K \bigcap L = \varnothing \text{ we have } \sum_{i \in L} \|x_i\| < \frac{\varepsilon}{2} \tag{14.226}$$

proving (1).

Take $H \subseteq \{k, \ldots, \infty\}$ with $K \subseteq H \wedge H$ finite. Let $m \underset{\text{is finite}}{=} \max(H)$ so that $H \subseteq \{k, \ldots, m\}$ then

$$\begin{aligned}
\left\| \sum_{i=k}^{\infty} x_i - \sum_{i \in H} x_i \right\| &= \left\| \sum_{i \in H} x_i - \sum_{i=k}^{\infty} x_i \right\| \\
&= \left\| \sum_{i \in \{k, \ldots, m\}} x_i - \sum_{i \in \{k, \ldots, m\} \setminus H} x_i - \sum_{i=k}^{\infty} x_i \right\| \\
&= \left\| \sum_{i=k}^{m} x_i - \sum_{i \in \{k, \ldots, m\} \setminus H} x_i - \sum_{i=k}^{\infty} x_i \right\| \\
&\leqslant \left\| \sum_{i=k}^{m} x_i - \sum_{i=k}^{\infty} x_i \right\| + \left\| \sum_{i \in \{k, \ldots, m\} \setminus H} x_i \right\|
\end{aligned} \tag{14.227}$$

As $\{k, \ldots, m\} \setminus H \subseteq \{k, \ldots, \infty\}$ and

$$K \bigcap (\{k, \ldots, m\} \setminus H) = K \bigcap (\{k, \ldots, m\} \bigcap H^c) = (K \bigcap H^c) \bigcap \{k, \ldots, m\} \underset{K \subseteq H}{=} \varnothing \bigcap \{k, \ldots, m\} = \varnothing$$

so that by [eq: 14.226] we have

$$\left\| \sum_{i \in \{k, \ldots, m\} \setminus H} x_i \right\| < \frac{\varepsilon}{2} \tag{14.228}$$

As $\{k, \ldots, N\} \subseteq K \subseteq H$ we have that $N \leqslant \max(H) = m$ so that by [eq: 14.225] we have

$$\left\| \sum_{i=k}^{m} x_i - \sum_{i=k}^{\infty} x_i \right\| < \frac{\varepsilon}{2} \tag{14.229}$$

combining [eqs: 14.227, 14.228 and 14.229] proves that

$$\left\| \sum_{i=k}^{\infty} x_i - \sum_{i \in H} x_i \right\| < \varepsilon$$

and (2). □

Theorem 14.384. *Let $k \in \mathbb{N}_0, \langle X, \|\| \rangle$ a Banach space and $\sum_{i=k}^{\infty} x_i$ a absolute convergent series then we have:*

1. *If $\beta: \{k, \ldots, \infty\} \to \{k, \ldots, \infty\}$ is a bijection then $\sum_{i=k}^{\infty} x_{\beta(i)}$ is absolute convergent [and by [theorem: 14.381] it follows that $\sum_{i=k}^{\infty} x_{\beta(i)}$ is also convergent]*
2. *If $\alpha, \beta: \{k, \ldots, \infty\} \to \{k, \ldots, \infty\}$ are bijections then $\sum_{i=k}^{\infty} x_{\alpha(i)} = \sum_{i=k}^{\infty} x_{\beta(i)}$*
3. *If $\beta: \{k, \ldots, \infty\} \to \{k, \ldots, \infty\}$ is a bijection then $\sum_{i=k}^{\infty} x_i = \sum_{i=k}^{\infty} x_{\beta(i)}$*

Proof.

1. As $\sum_{i=k}^{\infty} x_i$ is absolute convergent $\sum_{i=k}^{\infty} \|x_i\|$ is a convergent series of non negative real numbers, hence using [theorem: 14.363] $\sum_{i=k}^{\infty} \|x_{\beta(i)}\|$ is also convergent proving that $\sum_{i=k}^{\infty} x_{\beta(i)}$ is absolute convergent.
2. Let $s = \sum_{i=k}^{\infty} x_{\alpha(i)}$ and $t = \sum_{i=k}^{\infty} x_{\beta(i)}$. Assume that $s \neq t$ then $\|s - t\| \in \mathbb{R}^+$. Using [lemma: 14.383] there exists finite K_α, $K_\beta \subseteq \{k, \ldots, \infty\}$ such that for every finite H_α, H_β with $K_\alpha \subseteq H_\alpha$, $K_\beta \subseteq H_\beta$ we have

$$\left\| \sum_{i \in H_\alpha} x_{\alpha(i)} - s \right\| < \frac{\|s - t\|}{4} \wedge \left\| \sum_{i \in H_\beta} x_{\beta(i)} - t \right\| < \frac{\|s - t\|}{4} \tag{14.230}$$

Define now $P_{\alpha\beta}=K_\alpha\bigcup\alpha^{-1}(\beta(K_\beta))$ and $P_{\beta\alpha}=K_\beta\bigcup\beta^{-1}(\alpha(K_\alpha))$. As α and β are bijections and K_α and K_β are finite it follows from [theorems: 2.69, 6.45 and 6.34] that $P_{\alpha\beta}$ and $P_{\beta\alpha}$ are finite and $K_\alpha\subseteq P_{\alpha b}$ and $K_\beta\subseteq P_{\beta\alpha}$ so that by [eq: 14.230]

$$\left\|\sum_{i\in P_{\alpha\beta}}x_{\alpha(i)}-s\right\|<\frac{\|s-t\|}{4}\wedge\left\|\sum_{i\in P_{\beta\alpha}}x_{\beta(i)}-t\right\|<\frac{\|s-t\|}{4}\tag{14.231}$$

Further as $\alpha\colon\{k,\ldots,\infty\}\to\{k,\ldots,\infty\}$ and $\beta\colon\{k,\ldots,\infty\}\to\{k,\ldots,\infty\}$ are bijections we have that

$$\alpha_{|P_{\alpha\beta}}\colon P_{\alpha\beta}\to\alpha(P_{\alpha\beta})=\alpha(K_\alpha)\bigcup\beta(K_\beta)\text{ and }\beta_{|P_{\beta\alpha}}\colon P_{\beta\alpha}\to\beta(P_{\beta\alpha})=\beta(K_\alpha)\bigcup\alpha(K_\alpha)$$

are bijections so that we can apply [theorem: 11.36]

$$\begin{aligned}\sum_{i\in P_{\alpha\beta}}x_{\alpha(i)}&=\sum_{i\in P_{\alpha\beta}}x_{\alpha_{|P_{\alpha\beta}}(i)}\\&\underset{\text{[theorem: 11.36]}}{=}\sum_{i\in\alpha(P_{a\beta})}x_i\\&=\sum_{i\in\alpha(K_\alpha)\bigcup\beta(K_\beta)}x_i\\&=\sum_{i\in\beta(K_\beta)\bigcup\alpha(K_\alpha)}x_i\\&=\sum_{i\in\beta(P_{\beta\alpha})}x_i\\&\underset{\text{[theorem: 11.36]}}{=}\sum_{i\in P_{\beta\alpha}}x_{\beta_{|P_{\alpha\beta}}(i)}\\&=\sum_{i\in P_{\beta\alpha}}x_{\beta(i)}\end{aligned}$$

proving that

$$\sum_{i\in P_{\alpha\beta}}x_{\alpha(i)}=\sum_{i\in P_{\beta\alpha}}x_{\beta(i)}\tag{14.232}$$

Now

$$\begin{aligned}\|s-t\|&\underset{\text{[eq: 14.232]}}{=}\left\|s-\sum_{i\in P_{\alpha\beta}}x_{\alpha(i)}+\sum_{i\in P_{\beta\alpha}}x_{\beta(i)}-t\right\|\\&\leqslant\left\|s-\sum_{i\in P_{\alpha\beta}}x_{\alpha(i)}\right\|+\left\|\sum_{i\in P_{\beta\alpha}}x_{\beta(i)}-t\right\|\\&<_{\text{[eq: 14.231]}}\frac{\|s-t\|}{4}+\frac{\|s-t\|}{4}\\&<\frac{\|s-t\|}{2}\\&<\|s-t\|\end{aligned}$$

a contradiction. So the assumption is incorrect and we must have $s=t$ or

$$\sum_{i=k}^{\infty}x_{\alpha(i)}=\sum_{i=k}^{\infty}x_{\beta(i)}$$

3. As $\mathrm{Id}_{\{k,\ldots,\infty\}}\colon\{k,\ldots,\infty\}\to\{k,\ldots,\infty\}$ is a bijection we have

$$\sum_{i=k}^{\infty}x_{\alpha(i)}\underset{(2)}{=}\sum_{i=k}^{\infty}x_{\mathrm{Id}_{\{k,\ldots,\infty\}}(i)}=\sum_{i=k}^{\infty}x_i$$

□

14.10.4 Properties of complete spaces.

Definition 14.385. *Let $\langle X,d\rangle$ be a metric space then a function $f\colon X\to X$ is a* ***contraction*** *if there exist a $\lambda\in[0,1[$ such that $\forall x,y\in X$ we have $d(f(x),f(y))\leqslant\lambda\cdot d(x,y)$*

Theorem 14.386. *Let $\langle X, d\rangle$ be a metric space and $f: X \to X$ a contraction then f is continuous.*

Proof. As $f: X \to X$ is a contraction there exist a $\lambda \in [0, 1[$ such that

$$\forall x, y \in X \; d(f(x), f(y)) \leqslant \lambda \cdot d(x, y)$$

Let $x \in X$ and $\varepsilon \in \mathbb{R}^+$. If $y \in X$ is such that $d(x, y) < \varepsilon$ then we have

$$d(f(x), f(y)) \leqslant \lambda \cdot d(x, y) < d(x, y) < \varepsilon$$

which by [theorem: 14.127] proves that f is continuous at x. Hence as x was chosen arbitrary $f: X \to X$ is continuous. □

Contractions are special because they guarantee the existence of a fixed point, that is a point that is mapped on itself by the contraction, this is proved in the Banach Fixed Point theorem.

Theorem 14.387. (Banach Fixed Point Theorem) *Let $\langle X, d\rangle$ be a **complete** metric space and $f: X \to X$ a contraction then there exists a **unique** $x_0 \in X$ such that $f(x_0) = x_0$. Further if we define for $n \in \mathbb{N}$ $f^{(n)}$ recursively by*

$$\begin{aligned} f^{(1)} &= f \\ f^{(n+1)} &= f \circ f^{(n)} \end{aligned}$$

then $\forall x \in X$ we have

$$\lim_{n \to \infty} f^{(n)}(x) = x_0$$

Proof. As $f: X \to X$ is a contraction there exist a $\lambda \in [0, 1[$ such that

$$\forall x, y \in X \; d(f(x), f(y)) \leqslant \lambda \cdot d(x, y)$$

As a metric space is non empty there exist a $x \in X$. We prove now by induction that

$$\forall n \in \mathbb{N} \text{ we have } d(f^{(n)}(x), f^{(n+1)}(x)) \leqslant \lambda^n \cdot d(x, f(x)) \tag{14.233}$$

Proof. Define

$$S = \{n \in \mathbb{N} | d(f^{(n)}(x), f^{(n+1)}(x)) \leqslant \lambda^n \cdot d(x, f(x))\}$$

then we have:

$1 \in S$. As

$$d(f^{(1)}(x), f^{(1+1)}(x)) = d(f(x), (f \circ f)(x)) = d(f(x), f(f(x))) \leqslant \lambda \cdot d(x, f(x)) = \lambda^1 \cdot d(x, f(x))$$

it follows that $1 \in S$

$n \in S \Rightarrow n + 1 \in S$. We have

$$\begin{aligned} d(f^{(n+1)}(x), f^{((n+1)+1)}(x)) &= d((f \circ f^{(n)})(x), (f \circ f^{(n+1)})(x)) \\ &= d(f(f^{(n)}(x)), f(f^{(n+1)}(x))) \\ &\leqslant \lambda \cdot d(f^{(n)}(x), f^{(n+1)}(x)) \\ &\leqslant_{n \in S} \lambda \cdot \lambda^n \cdot d(x, f(x)) \\ &= \lambda^{n+1} \cdot d(x, f(x)) \end{aligned}$$

proving that $n + 1 \in S$.

Mathematical induction proves [eq: 14.233]. □

Next we prove by induction that

$$\forall n, k \in \mathbb{N} \text{ we have } d(f^{(n)}(x), f^{(n+k)}(x)) \leqslant \left(\sum_{i=1}^{k} \lambda^{n+(i-1)}\right) \cdot d(x, f(x)) \tag{14.234}$$

Proof. Given $n \in \mathbb{N}$ define

$$T_n = \left\{k \in \mathbb{N} | d(f^{(n)}(x), f^{(n+k)}(x)) \leqslant \left(\sum_{i=1}^{k} \lambda^{n+(i-1)}\right) \cdot d(x, f(x))\right\}$$

then we have:

$1 \in T_n$. We have by [eq: 14.233] that

$$\begin{aligned} d(f^{(n)}(x), f^{(n+1)}(x)) &\leqslant \lambda^n \cdot d(x, f(x)) \\ &= \lambda^{n+(1-1)} \cdot d(x, f(x)) \\ &= \left(\sum_{i=1}^{1} \lambda^{n+(i-1)}\right) \cdot d(x, f(x)) \end{aligned}$$

proving that $1 \in T_n$.

$k \in T_n \Rightarrow k+1 \in T_n$. Then we have:

$$\begin{aligned} d(f^{(n)}(x), f^{(n+(k+1))}(x)) &\leqslant \\ d(f^{(n)}(x), f^{(n+k)}(x)) + d(f^{(n+k)}(x), f^{(n+(k+1))}(x)) &\leqslant_{k \in T_n} \\ \left(\sum_{i=1}^{k} \lambda^{n+(i-1)}\right) \cdot d(x, f(x)) + d(f^{(n+k)}(x), f^{(n+(k+1))}(x)) &\leqslant_{\text{[eq: 14.233]}} \\ \left(\sum_{i=1}^{k} \lambda^{n+(i-1)}\right) \cdot d(x, f(x)) + \lambda^{n+k} \cdot d(x, f(x)) &= \\ \left(\sum_{i=1}^{k} \lambda^{n+(i-1)} + \lambda^{n+k}\right) \cdot d(x, f(x)) &= \\ \left(\sum_{i=1}^{k} \lambda^{n+(i-1)} + \lambda^{n+((k+1)-1)}\right) \cdot d(x, f(x)) &= \\ \left(\sum_{i=1}^{k+1} \lambda^{n+(i-1)}\right) \cdot d(x, f(x)) & \end{aligned}$$

proving that $k+1 \in T_n$.

Mathematical induction proves [eq: 14.234] □

As $\lambda \in [0, 1[$ we have that $\lambda \neq 1$ so that for $k \in \mathbb{N}$

$$\sum_{i=1}^{k} \lambda^{n+(i-1)} \underset{\text{[lemma: 14.352]}}{=} \lambda^n \cdot \frac{1-\lambda^k}{1-\lambda}$$

which combined with [eq: 14.234] proves that

$$\forall k, n \in \mathbb{N} \text{ that } d(f^{(n)}(x), f^{(n+k)}(x)) \leqslant \lambda^n \cdot \frac{1-\lambda^k}{1-\lambda} \cdot d(x, f(x)) < \frac{\lambda^n}{1-\lambda} \cdot d(x, f(x)) \tag{14.235}$$

Let $\varepsilon \in \mathbb{R}^+$ then as $0 \leqslant \lambda < 1$ we have by [theorem: 14.296] that there exist a $N \in \mathbb{N}$ such that $\forall n \geqslant N\ \lambda^n = |\lambda^n - 0| < \frac{\varepsilon}{\frac{1}{1-\lambda} \cdot d(x, f(x))}$. If n, $m \geqslant N$ then we may always assume that $m \geqslant n$ so that

$$\begin{aligned} d(f^{(n)}(x), f^{(m)}(x)) &= d(f^{(n)}(x), f^{(n+(m-n))}(x)) \\ &<_{\text{[eq: 14.235]}} \frac{\lambda^n}{1-\lambda} \cdot d(x, f(x)) \\ &< \frac{\varepsilon}{\frac{1}{1-\lambda} \cdot d(x, f(x))} \cdot \frac{1}{1-\lambda} \cdot d(x, f(x)) \\ &= \varepsilon \end{aligned}$$

This proves that $\{f^{(n)}(x)\}_{n \in \{1, \ldots, \infty\}}$ is Cauchy, as $\langle X, d \rangle$ is complete it follows that

$$\lim_{n \to \infty} f^{(n)}(x) = x_0 \text{ exist} \tag{14.236}$$

As by [theorem: 14.386] $f: X \to X$ is continuous it follows from the above and [theorem: 14.313] that

$$\lim_{n \to \infty} f^{(n+1)}(x) = \lim_{n \to \infty} f(f^{(n)}(x)) = f\left(\lim_{n \to \infty} f^{(n)}(x)\right) = f(x_0) \tag{14.237}$$

So given $\varepsilon \in \mathbb{R}^+$ there exist by [eq: 14.236] a $N_1 \in \mathbb{N}$ such that $\forall n \geqslant N$ we have

$$d(f^{(n)}(x), x_0) < \frac{\varepsilon}{2}$$

and by [eq: 14.237] there exist a $N_2 \in \mathbb{N}$ such that $\forall n \geqslant N_2$ we have

$$d(f^{(n+1)}(x), f(x_0)) < \frac{\varepsilon}{2}$$

Hence if $n \geqslant \max(N_1, N_2+1)$ then we have

$$\begin{aligned} d(f(x_0), x_0) &\leqslant d(f(x_0), f^{(n)}(x)) + d(f^{(n)}(x), x_0) \\ &= d(f^{(n)}(x), f(x_0)) + d(f^{(n)}(x), x_0) \\ &<_{\text{[eq: 14.236]}} d(f^{(n)}(x), f(x_0)) + \frac{\varepsilon}{2} \\ &= d(f^{((n-1)+1)}(x), f(x_0)) + \frac{\varepsilon}{2} \\ &<_{n > N_2+1 \Rightarrow n-1 \geqslant N_2} \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \\ &= \varepsilon \end{aligned}$$

As $\varepsilon \in \mathbb{R}^+$ was chosen arbitrary we can use [theorem: 10.31] on the above giving $d(f(x_0), x_0) = 0$, hence

$$f(x_0) = x_0 \text{ where } \lim_{n \to \infty} f^{(n)}(x) = x_0$$

Finally to prove uniqueness, assume that there exist a $x_1 \in X$ with $x_0 \neq x_1$ such that $f(x_1) = x_1$. As $\lambda < 1$ and $0 < d(x_0, x_1)$ it follows that $\lambda \cdot d(x_1, x_0) < 1 \cdot d(x_1, x_0) = d(x_1, x_o)$, further we have

$$0 < d(x_1, x_0) = d(f(x_1), f(x_0)) \leqslant \lambda \cdot d(x_1, x_0) < d(x_1, x_0)$$

giving the contradiction $d(x_1, x_0) < d(x_1, x_0)$. So our assumption must be wrong proving that x_0 is unique. □

Lemma 14.388. *Let $\langle X, d \rangle$ be a complete metric space and let $\{A_i\}_{i \in \mathbb{N}}$ be a sequence of non empty bounded closed sets such that $\forall i \in \mathbb{N}$ we have $A_{i+1} \subseteq A_i$ and $\lim_{n \to \infty} \operatorname{diam}(A_i) = 0$ then we have that*

$$\bigcap_{i \in \mathbb{N}} A_i \neq \varnothing$$

Proof. As $\{A_i\}_{i \in \mathbb{N}}$ is a family of non empty sets it follows from the Axiom of Choice [see theorem: 3.106] there exist a function x: $\mathbb{N} \to \bigcup_{i \in \mathbb{N}} A_i$ such that $\forall i \in \mathbb{N}$ $x(i) \in A_i$. This defines a family

$$\{x_i\}_{i \in \mathbb{N}} \text{ such that } \forall i \in \mathbb{N} \; x_i \in A_i$$

Let $\varepsilon \in \mathbb{R}^+$ then as $\lim_{n \to \infty} \operatorname{diam}(A_i) = 0$ there exist a $N \in \mathbb{N}$ such that $\forall n \geqslant N$ we have

$$\operatorname{diam}(A_n) = |\operatorname{diam}(A_n) - 0| < \varepsilon$$

If $n, m \geqslant N$ then as $\{A_n\}_{n \in \mathbb{N}}$ is decreasing it follows from [theorem: 14.288] that $A_n \subseteq A_N \wedge A_m \subseteq A_N$ so that $x_n \in A_N \wedge x_m \in A_N$, hence

$$d(x_n, x_m) \leqslant \sup(\{d(x, y) | x, y \in A_N\}) = \operatorname{diam}(A_N) < \varepsilon$$

which proves that

$$\{x_i\}_{i \in \mathbb{N}} \text{ is a Cauchy sequence}$$

As $\langle X, d \rangle$ is complete it follows that

$$y = \lim_{i \to \infty} x_i \text{ exists}$$

Let $n \in \mathbb{N}$, $\varepsilon \in \mathbb{R}^+$. Give $U \in \mathcal{T}$ a open set such that $y \in U$ then by [theorem: 14.64] there exist a $\delta \in \mathbb{R}^+$ such that

$$y \in B_d(y, \delta) \subseteq U$$

As $y = \lim_{i \to \infty} x_i$ there exist a $M \in \mathbb{N}$ such that $\forall m \geqslant M$ we have

$$d(x_m, y) < \delta \text{ or } x_m \in B_d(y, \delta) \subseteq U$$

If $K = \max(n, M)$ then $n \leqslant K$ so that $x_K \in A_K \subseteq A_n$, $M \leqslant K \Rightarrow x_K \in U$ proving that $x_K \in A_n \bigcap U$ or $A_n \bigcap U \neq \varnothing$. Using [theorem: 14.28] we conclude then that $y \in \overline{A_n} \underset{A_n \text{ is closed} \wedge \text{[theorem: 14.25]}}{=} A_n$. So we have proved that $\forall n \in \mathbb{N}$ $y \in A_n$ or $y \in \bigcap_{n \in \mathbb{N}} A_n$, hence

$$\bigcap_{n \in \mathbb{N}} A_n \neq \varnothing$$

□

Theorem 14.389. (Baire Category Theorem)

1. *If $\langle X, \mathcal{T}\rangle$ is a compact Hausdorff topological space then X is a Baire space.*
2. *If $\langle X, d\rangle$ is a complete metric space then X is a Baire space*

See [definition: 14.53] for the definition of a Baire space.

Proof. Let $\{A_n\}_{n\in\mathbb{N}}$ be a countable family of sets in X such that $\forall n\in\mathbb{N}$ A_n is closed and $(A_n)^\circ=\varnothing$ then we must prove that $(\bigcup_{n\in\mathbb{N}} A_n)^\circ=\varnothing$

1. As $\langle X, \mathcal{T}\rangle$ is compact and Hausdorff it follows from [theorem: 14.239] that

$$\langle X, \mathcal{T}\rangle \text{ is regular} \tag{14.238}$$

Let $U_0\in\mathcal{T}$ be a open set such that $U_0\neq\varnothing$. Then we use recursion to construct a family of non empty open sets $\{U_n\}_{n\in\mathbb{N}}\subseteq\mathcal{T}$ such that

$$\forall n\in\mathbb{N} \text{ we have } \varnothing\neq U_n,\ \overline{U}_n\subseteq U_{n-1} \text{ and } \overline{U_n}\bigcap A_n=\varnothing \tag{14.239}$$

Proof. As $(A_1)^0=\varnothing$ we have that $U_0\nsubseteq A_1$ [for if $U_0\subseteq A_1$ then $\varnothing\neq U_0\subseteq(A_1)^\circ=\varnothing$ a contradiction] so there exist a $y\in U_0$ such that $y\notin A_1$. Using the fact that A_1 is closed and X is regular we can use [theorem: 14.211] to find a $U_1\in\mathcal{T}$ such that

$$y\in U_1\Rightarrow U_1\neq\varnothing,\ \overline{U_1}\subseteq U_0 \text{ and } \overline{U_1}\bigcap A_1=\varnothing$$

For the recursion step. Let U_{n-1} a non empty open set, as $(A_n)^\circ=\varnothing$, we have that $U_{n-1}\nsubseteq A_n$ [for if $U_{n-1}\subseteq A_n$ then $\varnothing\neq U_{n-1}\subseteq(A_n)^\circ=\varnothing$ a contradiction], hence there exist a $y\in U_{n-1}$ such that $y\notin A_n$. Using [theorem: 14.211] there exist a $U_n\in\mathcal{T}$ such that

$$y\in U_n\Rightarrow U_n\neq\varnothing,\ \overline{U_n}\subseteq U_{n-1} \text{ and } \overline{U_n}\bigcap A_n=\varnothing$$ □

By construction we have $\forall n\in\mathbb{N}$ that $\overline{U_{n+1}}\subseteq U_n\subseteq\overline{U_n}$. Let I be a finite non empty subset of $\mathbb{N}_0$ then $m=\max(I)$ exist, so $\forall n\in I$ $n\leqslant m$ and we have by [theorem: 14.288] $\overline{U_m}\subseteq\overline{U_n}$ proving that $\overline{U_m}\subseteq\bigcap_{n\in I}\overline{U_n}$. As $\varnothing\neq U_m\subseteq\overline{U_m}$ it follows that $\bigcap_{n\in I}\overline{U_n}\neq\varnothing$ proving that $\{\overline{U_n}\}_{n\in\mathbb{N}}$ has the finite intersection property. As X is compact it follows from [theorem: 14.271]

$$\bigcap_{n\in\mathbb{N}}\overline{U_n}\neq\varnothing \text{ or there exist a } x\in\bigcap_{n\in\mathbb{N}}\overline{U_n}$$

As $1\in\mathbb{N}$ we have $x\in\overline{U_1}\subseteq U_0$, further, as $\forall n\in\mathbb{N}$ $x\in\overline{U_n}\underset{\overline{U_n}\bigcap A_n=\varnothing}{\Rightarrow}x\notin A_n$, it follows that $x\notin\bigcup_{n\in\mathbb{N}}A_n$. Hence we have proved that for every non empty open set U_0 $U_0\nsubseteq\bigcup_{i\in\mathbb{N}}A_i$ which, as $(\bigcup_{n\in\mathbb{N}}A_n)^\circ\subseteq\bigcup_{n\in\mathbb{N}}A_n$, proves that $(\bigcup_{n\in\mathbb{N}}A_n)^\circ=\varnothing$. Hence $\langle X, \mathcal{T}\rangle$ is a Baire space.

2. As $\langle X, d\rangle$ is a metric space it follows from [theorem: 14.208] that

$$\langle X, d\rangle \text{ is regular} \tag{14.240}$$

Let $U_0\in\mathcal{T}$ be a open set such that $U_0\neq\varnothing$. Then we use recursion to construct a family of non empty open sets $\{U_n\}_{n\in\mathbb{N}}\subseteq\mathcal{T}$ such that

$$\forall n\in\mathbb{N} \text{ we have } \varnothing\neq U_n,\ \overline{U}_n\subseteq U_{n-1},\ \overline{U_n}\bigcap A_n=\varnothing,\ U_n \text{ bounded and } \operatorname{diam}(U_n)\leqslant\frac{1}{n} \tag{14.241}$$

Proof. As $(A_1)^0=\varnothing$ we have that $U_0\nsubseteq A_1$ [for if $U_0\subseteq A_1$ then $\varnothing\neq U_0\subseteq(A_1)^\circ=\varnothing$ a contradiction] so there exist a $y\in U_0$ such that $y\notin A_1$. Using the fact that A_1 is closed and X is regular we can use [theorem: 14.211] to find a $V_1\in\mathcal{T}$ such that

$$y\in V_1\Rightarrow V_1\neq\varnothing,\ \overline{V_1}\subseteq U_0 \text{ and } \overline{V_1}\bigcap A_1=\varnothing$$

Take $U_1=V_1\bigcap B_d\big(y,\frac{1}{4}\big)\ni y$ then

$$U_1\subseteq V_1\Rightarrow\overline{U_1}\bigcap A_1\subseteq\overline{V_1}\bigcap A_1=\varnothing \text{ and } \overline{U_1}\subseteq\overline{V_1}\subseteq U_0$$

$$U_1\subseteq B_d\left(y,\frac{1}{2}\right)\Rightarrow\overline{U_1}\subseteq\overline{B_d\left(y,\frac{1}{2}\right)}.$$

Using [example: 14.78] we have that $\overline{B_d\big(y,\frac{1}{2}\big)}$ is bounded with $\operatorname{diam}\big(\overline{B_d\big(y,\frac{1}{2}\big)}\big)\leqslant 2\cdot\frac{1}{2}$, so, as $\overline{U_1}\subseteq\overline{B_d\big(y,\frac{1}{2}\big)}$, it follows that $\overline{U_1}$ is bounded with $\operatorname{diam}(\overline{U_1})\leqslant 1$. Summarized

$$\varnothing\neq U_1,\ \overline{U_1}\subseteq U_0,\ \overline{U_1}\bigcap A_1=\varnothing,\ \overline{U_1} \text{ is bounded and } \operatorname{diam}(\overline{U_1})\leqslant 1$$

For the recursion step, for U_{n-1} a non empty open set, as $(A_n)^\circ = \varnothing$, we have that $U_{n-1} \nsubseteq A_n$ [for if $U_{n-1} \subseteq A_n$ then $\varnothing \neq U_{n-1} \subseteq (A_n)^\circ = \varnothing$ a contradiction], hence there exist a $y \in U_{n-1}$ such that $y \notin A_n$. Using [theorem: 14.211] there exist a $V_n \in \mathcal{T}$ such that

$$y \in V_n \Rightarrow V_n \neq \varnothing,\ \overline{V_n} \subseteq U_{n-1} \text{ and } \overline{V_n} \bigcap A_n = \varnothing$$

Take $U_n = V_n \bigcap B_d\big(y, \frac{1}{2 \cdot n}\big) \ni y$ then

$$U_n \subseteq V_n \Rightarrow \overline{U_n} \bigcap A_n \subseteq \overline{V_n} \bigcap A_n = \varnothing \text{ and } \overline{U_n} \subseteq \overline{V_0} \subseteq U_{n-1}$$

$$U_n \subseteq B_d\left(y, \frac{1}{2 \cdot n}\right) \Rightarrow \overline{U_n} \subseteq \overline{B_d\left(y, \frac{1}{2 \cdot n}\right)}$$

By [example: 14.78] we have that $\overline{B_d\big(y, \frac{1}{2 \cdot n}\big)}$ is bounded with $\operatorname{diam}\big(\overline{B_d\big(y, \frac{1}{2 \cdot n}\big)}\big) \leqslant \frac{2}{2 \cdot n} = \frac{1}{n}$, so, as $\overline{U_n} \subseteq \overline{B_d\big(y, \frac{1}{2 \cdot n}\big)}$, it follows that $\overline{U_n}$ is bounded and $\operatorname{diam}(\overline{U_n}) < \frac{1}{n}$. Summarized

$$\varnothing \neq U_n,\ \overline{U_n} \subseteq U_{n-1},\ \overline{U_n} \bigcap A_n = \varnothing,\ \overline{U_n} \text{ is bounded and } \operatorname{diam}(\overline{U_1}) \leqslant \frac{1}{n}$$ □

Let $\varepsilon \in \mathbb{R}^+$ then by [theorem: 10.30] there exist a $N \in \mathbb{N}$ such that $0 < \frac{1}{N} < \varepsilon$ so if $n \geqslant N$ we have

$$|\operatorname{diam}(\overline{U_n}) - 0| = \operatorname{diam}(\overline{U_n}) \leqslant \frac{1}{n} \leqslant \frac{1}{N} < \varepsilon$$

proving that

$$\lim_{n \to \infty} \operatorname{diam}(\overline{U_n}) = 0$$

Hence as $\forall n \in \mathbb{N}\ \overline{U_{n+1}} \subseteq \overline{U_n}$ and $\varnothing \neq U_n \subseteq \overline{U_n}$ it follows, using [lemma: 14.388], that

$$\bigcap_{n \in \mathbb{N}} \overline{U_n} \neq \varnothing \text{ or there exist a } x \in \bigcap_{n \in \mathbb{N}} \overline{U_n}$$

As $1 \in \mathbb{N}$ we have $x \in \overline{U_1} \subseteq U_0$, further, as $\forall n \in \mathbb{N}\ x \in \overline{U_n} \underset{\overline{U_n} \bigcap A_n = \varnothing}{\Rightarrow} x \notin A_n$, it follows that $x \notin \bigcup_{n \in \mathbb{N}} A_n$. Hence we have proved that for every non empty open set U_0 $U_0 \nsubseteq \bigcup_{i \in \mathbb{N}} A_i$ which, as $(\bigcup_{n \in \mathbb{N}} A_n)^\circ \subseteq \bigcup_{n \in \mathbb{N}} A_n$, proves that $(\bigcup_{n \in \mathbb{N}} A_n)^\circ = \varnothing$. Hence $\langle X, \mathcal{T} \rangle$ is a Baire space. □

Lemma 14.390. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be Banach spaces and $L: X \to Y$ a surjective linear function then we have:*

$$L \text{ is open} \Leftrightarrow \exists \varepsilon \in \mathbb{R}^+ \text{ such that } B_{\|\|_Y}(0, \varepsilon) \subseteq L(B_{\|\|_X}(0, 1))$$

Proof.

⇒. As L is open and $B_{\|\|_X}(0, 1)$ is a open set we have that $L(B_{\|\|_X}(0, 1))$ is a open set, further as $L(0) = 0$ $0 \in L(B_{\|\|_X}(0, 1))$. Hence by [theorem: 14.93] there exist a $\varepsilon \in \mathbb{R}^+$ such that $B_{\|\|_Y}(0, \varepsilon) \subseteq L(B_{\|\|_X}(0, 1))$.

⇐. By the hypothesis there exist a $\varepsilon \in \mathbb{R}^+$ such that

$$B_{\|\|_Y}(0, \varepsilon) \subseteq L(B_{\|\|_X}(0, 1)) \tag{14.242}$$

Let $r \in \mathbb{R}^{+1}$. We use now r to scale [eq: 14.242]. Let $y \in B_{\|\|_Y}(0, r \cdot \varepsilon)$ then $\|y\|_Y < r \cdot \varepsilon$ so that $\left\|\frac{1}{r} \cdot y\right\|_Y = \frac{1}{r} \cdot \|y\|_Y < \frac{1}{r} \cdot r \cdot \varepsilon = \varepsilon$ so that $\frac{1}{r} \cdot y \in B_{\|\|_Y}(0, \varepsilon)$. Hence by [eq: 14.242] there exist a $x \in B_{\|\|_X}(0, 1)$ such that $\frac{1}{r} \cdot y = L(x)$ or $y = r \cdot L(x) = L(r \cdot x)$. As $\|r \cdot x\|_X = r \cdot \|x\|_x < r \cdot 1 = r$ we have $r \cdot x \in B_{\|\|_X}(0, r)$ so that $y = L(r \cdot x) \in L(B_{\|\|_X}(0, r))$. Hence we have that

$$B_{\|\|_Y}(0, r \cdot \varepsilon) \subseteq L(B_{\|\|_X}(0, r)) \tag{14.243}$$

Let $b \in Y$. As L is a surjection there exist a $a \in X$ such that $b = L(a)$. Let $y \in B_{\|\|_Y}(b, r \cdot \varepsilon)$ then $\|y - L(a)\| = \|y - b\|_Y < r \cdot \varepsilon$, hence $y - L(a) \in B_{\|\|_Y}(0, r \cdot \varepsilon)$ so that by [eq: 14.243] we have that $y - L(a) \in L(B_{\|\|_X}(0, r))$. Hence there exist a $x \in B_{\|\|_X}(0, r)$ such that $y - L(a) = L(x)$ or $y = L(x) + L(a) = L(x + a)$. Further $\|(x + a) - a\|_X = \|x\|_X < r$ so that $x + a \in B_{\|\|_X}(a, r)$ proving that $y \in L(B_{\|\|_X}(a, r))$ or

$$B_{\|\|_Y}(b, r \cdot \varepsilon) \subseteq L(B_{\|\|_X}(a, r))$$

Summarized we have

$$\forall b \in Y,\ \forall r \in \mathbb{R}^+ \text{ we have } B_{\|\|_Y}(b, r \cdot \varepsilon) \subseteq L(B_{\|\|_X}(a, r)) \text{ where } b = L(a) \tag{14.244}$$

Let U be a open set in X. Given $y \in L(U)$ there exist a $x \in U$ such that $y = L(x)$. As U is open there exist by [theorem: 14.93] a $\delta \in \mathbb{R}^+$ such that $x \in B_{\|\|_X}(x, \delta) \subseteq U$. Take then in [eq: 14.244] $r = \delta$ and $a = x \Rightarrow b = L(a) = L(x) = y$ then we have

$$y \in B_{\|\|_Y}(y, \delta \cdot \varepsilon) \subseteq L(B_{\|\|_X}(x, \delta)) \subseteq L(U)$$

proving by [theorem: 14.93] that $L(U)$ is open. Hence $L: X \to Y$ is a open mapping □

Lemma 14.391. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be Banach spaces and $L: X \to Y$ a surjective continuous linear function then $\exists \lambda \in \mathbb{R}^+$ such that $B_{\|\|_Y}(0, \lambda) \subseteq L(B_{\|\|_X}(0, 1))$.*

Proof. First by the Baire Category theorem [see theorem: 14.389] we have that

$$\langle Y, \|\|_Y \rangle \text{ is a Baire Space}$$

Let $x \in X$ then by the Archimedean property of $\mathbb{R}$ [see theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $\|x\| < n$ hence $x \in B_{\|\|_X}(0, n) \subseteq \bigcup_{n \in \mathbb{N}} B_{\|\|_X}(0, n)$. Hence $X \subseteq \bigcup_{n \in \mathbb{N}} B_{\|\|_X}(0, n)$ so that

$$Y \underset{L \text{ is surjective}}{=} L(X) \subseteq L\left(\bigcup_{n \in \mathbb{N}} B_{\|\|_X}(0, n)\right) \underset{\text{[theorem: 2.136]}}{=} \bigcup_{n \in \mathbb{N}} L(B_{\|\|_X}(0, n)) \subseteq \bigcup_{n \in \mathbb{N}} \overline{L(B_{\|\|_X}(0, n))} \subseteq Y$$

proving that

$$Y = \bigcup_{n \in \mathbb{N}} \overline{L(B_{\|\|_X}(0, n))} \tag{14.245}$$

If now $\forall n \in \mathbb{N}$ $(\overline{L(B_{\|\|_X}(0, n))})^\circ = \varnothing$ then, as Y is a Baire Space, we have that $(\bigcup_{n \in \mathbb{N}} \overline{L(B_{\|\|_X}(0, n))})^\circ = \varnothing$ hence $Y^\circ = \varnothing$, as Y is open we have by [theorem: 14.15] that $Y = Y^\circ$, so that $Y = \varnothing$ contradicting $0 \in Y$. Hence there exist a $n_0 \in \mathbb{N}$ such that

$$(\overline{L(B_{\|\|_X}(0, n_0))})^\circ \neq \varnothing$$

Now

$$\begin{aligned} \overline{L(B_{\|\|_X}(0, n_0))} &\underset{\text{[theorem: 14.91]}}{=} \overline{L(n_0 \cdot B_{\|\|_x}(0, 1))} \\ &\underset{\text{[theorem: 11.168]}}{=} \overline{n_0 \cdot L(B_{\|\|_X}(0, 1))} \\ &\underset{\text{[theorem: 14.110]}}{=} n_0 \cdot \overline{L(B_{\|\|_X}(0, 1))} \end{aligned}$$

so that we have

$$\varnothing \neq (n_0 \cdot \overline{L(B_{\|\|_X}(0, 1))})^\circ$$

Hence there exist a $v_0' \in Y$ such that $v_0' \in (n_0 \cdot \overline{L(B_{\|\|_X}(0, 1))})^\circ$, using [theorem: 14.93] there exist a $r' \in \mathbb{R}^+$ such that $v_0' \in B_{\|\|_Y}(v_0', r') \subseteq (n_0 \cdot \overline{L(B_{\|\|_X}(0, 1))})^\circ \subseteq n_0 \cdot \overline{L(B_{\|\|_X}(0, 1))}$. Take $r = \frac{r'}{n_0}$ and $v_0 = \frac{1}{n_0} \cdot v_0'$ then if $y \in B_{\|\|_Y}(v_0, r)$ we have

$$\|v_0 - y\|_Y < r = \frac{r'}{n_0}$$

As

$$\frac{1}{n_0} \cdot \|v_0' - n_0 \cdot y\|_Y = \left\| \frac{1}{n_0} \cdot (v_0' - n_0 \cdot y) \right\|_Y = \|v_0 - y\|_Y$$

it follows that $\frac{1}{n_0} \cdot \|v_0' - n_0 \cdot y\|_Y < \frac{r'}{n_0}$ so that $\|v_0' - n_0 \cdot y\|_Y < r'$ hence

$$n_0 \cdot y \in B_{\|\|_Y}(v_0', r') \subseteq n_0 \cdot \overline{L(B_{\|\|_X}(0, 1))} \Rightarrow y \in \overline{L(B_{\|\|_X}(0, 1))}$$

This proves that $B_{\|\|_Y}(v_0, r) \subseteq \overline{L(B_{\|\|_X}(0, 1))}$ or if we take $\delta = \frac{r}{4}$ this results in

$$\exists v_0 \in Y,\ \delta \in \mathbb{R}^+ \text{ such that } v_0 \in B_{\|\|_Y}(v_0, 4 \cdot \delta) \subseteq \overline{L(B_{\|\|_X}(0, 1))} \tag{14.246}$$

As $v_0 \in \overline{L(B_{\|\|_X}(0, 1))}$ we have by [theorem: 14.28] that $B_{\|\|_Y}(v_0, 2 \cdot \delta) \bigcap L(B_{\|\|_X}(0, 1)) \neq \varnothing$. So there exist a $v_1 \in B_{\|\|_Y}(v_0, 2 \cdot \delta) \bigcap L(B_{\|\|_X}(0, 1))$ or

$$\|v_1 - v_0\|_Y < 2 \cdot \delta \text{ and there exist a } u_1 \in B_{\|\|_X}(0, 1) \Rightarrow \|u_1\|_X < 1 \text{ such that } v_1 = L(u_1) \tag{14.247}$$

If $x \in B_{\|\|_Y}(v_1, 2 \cdot \delta)$ then we have

$$\|x - v_0\|_Y \leqslant \|x - v_1\|_Y + \|v_1 - v_0\| < 2 \cdot \delta + 2 \cdot \delta = 4 \cdot \delta$$

so that $x \in B_{\|\|_Y}(v_0, 4 \cdot \delta)$. Hence

$$B_{\|\|_Y}(v_1, 2 \cdot \delta) \subseteq B_{\|\|_Y}(v_0, 4 \cdot \delta) \subseteq \overline{L(B_{\|\|_X}(0,1))} \tag{14.248}$$

Let $v \in B_{\|\|_Y}(0, \delta)$ then $\|(2 \cdot v + v_1) - v_1\|_Y = \|2 \cdot v\|_Y = 2 \cdot \|v\|_Y < 2 \cdot \delta$ so that $2 \cdot v + v_1 \in B_{\|\|_Y}(v_1, 2 \cdot \delta)$ or

$$v + \frac{1}{2} \cdot v_1 = \frac{1}{2} \cdot (2 \cdot v + v_1) \in \frac{1}{2} \cdot B_{\|\|_Y}(v_1, 2 \cdot \delta) \subseteq_{\text{[eq: 14.248]}} \frac{1}{2} \cdot \overline{L(B_{\|\|_X}(0,1))}$$

so that

$$v \in -\frac{1}{2} \cdot v_1 + \frac{1}{2} \cdot \overline{L(B_{\|\|_X}(0,1))}$$

As

$$\begin{aligned}
\frac{1}{2} \cdot \overline{L(B_{\|\|_X}(0,1))} &\underset{\text{[theorem: 14.110]}}{=} \overline{\frac{1}{2} \cdot L(B_{\|\|_X}(0,1))} \\
&\underset{\text{[theorem: 11.168]}}{=} \overline{L\left(\frac{1}{2} \cdot B_{\|\|_X}(0,1)\right)} \\
&\underset{\text{[theorem: 14.91]}}{=} \overline{L\left(B_{\|\|_X}\left(0, \frac{1}{2}\right)\right)}
\end{aligned}$$

it follows, taking account that $v_1 \underset{\text{[eq: 14.247]}}{=} L(u_1)$, that

$$v \in -\frac{1}{2} \cdot L(u_1) + \overline{L\left(B_{\|\|_X}\left(0, \frac{1}{2}\right)\right)}$$

Now

$$\begin{aligned}
-\frac{1}{2} \cdot L(u_1) + \overline{L\left(B_{\|\|_X}\left(0, \frac{1}{2}\right)\right)} &\subseteq_{\text{[theorem: 14.110]}} \overline{-\frac{1}{2} \cdot L(u_1) + L\left(B_{\|\|_X}\left(0, \frac{1}{2}\right)\right)} \\
&\underset{\text{[theorem: 11.168]}}{=} \overline{L\left(-\frac{1}{2} \cdot u_1\right) + L\left(B_{\|\|_X}\left(0, \frac{1}{2}\right)\right)} \\
&\underset{\text{[theorem: 11.168]}}{=} \overline{L\left(-\frac{1}{2} \cdot u_1 + B_{\|\|_X}\left(0, \frac{1}{2}\right)\right)}
\end{aligned}$$

so that

$$v \in \overline{L\left(-\frac{1}{2} \cdot u_1 + B_{\|\|_X}\left(0, \frac{1}{2}\right)\right)}$$

If $x \in -\frac{1}{2} \cdot u_1 - B_{\|\|_X}\left(0, \frac{1}{2}\right)$ then there exist a $y \in B_{\|\|_X}\left(0, \frac{1}{2}\right)$ such that $x = -\frac{1}{2} \cdot u_1 + y$, hence

$$\|x\|_X = \left\|-\frac{1}{2} \cdot u_1\right\|_X + \|y\|_X < \left\|\frac{1}{2} \cdot u_1\right\|_X + \frac{1}{2} <_{\text{[eq: 14.247]}} \frac{1}{2} + \frac{1}{2} = 1$$

proving that $-\frac{1}{2} \cdot u_1 - B_{\|\|_X}\left(0, \frac{1}{2}\right) \subseteq B_{\|\|_X}(0,1)$ so that we have

$$v \in \overline{L(B_{\|\|_X}(0,1))}$$

Therefore as $v \in B_{\|\|_Y}(0, \delta)$ was chosen arbitrary it follows that

$$B_{\|\|_Y}(0, \delta) \subseteq \overline{L(B_{\|\|_X}(0,1))} \tag{14.249}$$

Let $n \in \mathbb{N}$ then we have that

$$\begin{aligned}
B_{\|\|_Y}\left(0, \left(\frac{1}{2}\right)^n \cdot \delta\right) &\underset{\text{[theorem: 14.91]}}{=} \left(\frac{1}{2}\right)^n \cdot B_{\|\|_Y}(0, \delta) \\
&\subseteq_{\text{[eq: 14.249]}} \left(\frac{1}{2}\right)^n \cdot \overline{L(B_{\|\|_X}(0,1))} \\
&\underset{\text{[theorem: 14.110]}}{=} \overline{\left(\frac{1}{2}\right)^n \cdot L(B_{\|\|_X}(0,1))} \\
&\underset{\text{[theorem: 14.91]}}{=} \overline{L\left(B_{\|\|_X}\left(0, \left(\frac{1}{2}\right)^n\right)\right)}
\end{aligned}$$

proving that

$$B_{\|\|_Y}\left(0,\left(\frac{1}{2}\right)^n\cdot\delta\right)\subseteq\overline{L\left(B_{\|\|_X}\left(0,\left(\frac{1}{2}\right)^n\right)\right)} \tag{14.250}$$

Let $y\in B_{\|\|_Y}\left(0,\frac{\delta}{2}\right)$. Then using recursion we construct a sequence $\{x_n\}_{n\in\mathbb{N}}\subseteq X$ such that

$$\forall n\in\mathbb{N}\text{ we have }\left\|y-\sum_{i=1}^{n}L(x_i)\right\|_Y<\left(\frac{1}{2}\right)^{n+1}\cdot\delta\text{ and }\|x_n\|_X<\left(\frac{1}{2}\right)^n \tag{14.251}$$

Proof.

Case 1. As $y\in B_{\|\|_Y}\left(0,\frac{\delta}{2}\right)=B_{\|\|_Y}\left(0,\left(\frac{\delta}{2}\right)^1\right)$ we have by [eq: 14.250] that

$$y\in\overline{L\left(B_{\|\|_X}\left(0,\left(\frac{1}{2}\right)^1\right)\right)}=\overline{L\left(B_{\|\|_X}\left(0,\frac{1}{2}\right)\right)}.$$

Hence as $y\in B_{\|\|_Y}\left(y,\frac{\delta}{4}\right)\in\mathcal{T}_{\|\|_Y}$ we have by [theorem: 14.28] that

$$B_{\|\|_Y}\left(y,\frac{\delta}{4}\right)\bigcap L\left(B_{\|\|_X}\left(0,\frac{1}{2}\right)\right)\neq\varnothing$$

hence there exist a $x_1\in B_{\|\|_X}\left(0,\frac{1}{2}\right)$ such that $\|y-L(x_1)\|_Y<\frac{\delta}{4}$ or

$$\left\|y-\sum_{i=1}^{1}L(x_i)\right\|_Y<\left(\frac{1}{2}\right)^{1+1}\cdot\delta\text{ and }\|x_1\|_X<\left(\frac{1}{2}\right)^1$$

Case n+1. As $\|y-\sum_{i=1}^{n}L(x_i)\|_Y<\left(\frac{1}{2}\right)^{n+1}\cdot\delta$ we have $y-\sum_{i=1}^{n}L(x_i)\in B_{\|\|_Y}\left(0,\left(\frac{1}{2}\right)^{n+1}\cdot\delta\right)$ hence using [eq: 14.250] we have that $y-\sum_{i=1}^{n}L(x_i)\in\overline{L\left(B_{\|\|_X}\left(0,\left(\frac{1}{2}\right)^{n+1}\right)\right)}$. As

$$y-\sum_{i=1}^{n}L(x_i)\in B_{\|\|_Y}\left(y-\sum_{i=1}^{n}L(x_i),\left(\frac{1}{2}\right)^{(n+1)+1}\cdot\delta\right)\in\mathcal{T}_{\|\|_Y}$$

it follows from [theorem: 14.28] that

$$B_{\|\|_Y}\left(y-\sum_{i=1}^{n}L(x_i),\left(\frac{1}{2}\right)^{(n+1)+1}\cdot\delta\right)\bigcap\overline{L\left(B_{\|\|_X}\left(0,\left(\frac{1}{2}\right)^{n+1}\right)\right)}\neq\varnothing$$

Hence there exist a $x_{n+1}\in B_{\|\|_X}\left(0,\left(\frac{1}{2}\right)^{n+1}\right)$ such that

$$\left\|y-\sum_{i=1}^{n}L(x_i)-L(x_{n+1})\right\|_Y<\left(\frac{1}{2}\right)^{(n+1)+1}\cdot\delta$$

or

$$\left\|y-\sum_{i=1}^{n+1}L(x_i)\right\|_Y<\left(\frac{1}{2}\right)^{(n+1)+1}\cdot\delta\text{ and }\|x_{n+1}\|_X<\left(\frac{1}{2}\right)^{n+1}$$

□

As $\forall n\in\mathbb{N}$ $\|x_n\|_X<\left(\frac{1}{2}\right)^n$ [see eq: 14.251], $\sum_{i=1}^{\infty}\left(\frac{1}{2}\right)^n\underset{\text{[theorem: 14.353]}}{=}\frac{1/2}{1-1/2}=1$ [see theorem: 14.353], $\langle X,\|\|_X\rangle$ is a Banach space it follows from the dominant convergence [theorem: 14.378] that

$$x=\sum_{i=1}^{\infty}x_i\text{ exist and }\|x\|<1\text{ so that }x\in B_{\|\|_X}(0,1) \tag{14.252}$$

Further if $\varepsilon\in\mathbb{R}^+$ then by [theorem: 10.64] there exist a $N\in\mathbb{N}$ such that $\left(\frac{1}{2}\right)^N<\frac{\varepsilon}{\delta}$. Let $n\geqslant N$ then we have

$$\left\|\sum_{i=1}^{n}L(x_i)-y\right\|_Y<\left(\frac{1}{2}\right)^{n+1}\cdot\delta<_{\text{[theorem: 10.62]}}\left(\frac{1}{2}\right)^N\cdot\delta<\frac{\varepsilon}{\delta}\cdot\delta=\varepsilon$$

proving that

$$\sum_{i=1}^{\infty} L(x_i) = y \tag{14.253}$$

Now as L is continuous we have using [theorem: 14.312] that

$$\begin{aligned}
L(x) &\underset{\text{[eq: 14.252]}}{=} L\left(\sum_{i=1}^{\infty} x_i\right) \\
&= L\left(\lim_{n\to\infty}\sum_{i=1}^{n} x_i\right) \\
&\underset{\text{[theorem: 14.312]}}{=} \lim_{n\to\infty} L\left(\sum_{i=1}^{n} x_i\right) \\
&= \lim_{n\to\infty}\sum_{i=1}^{n} L(x_i) \\
&= \sum_{i=1}^{\infty} L(x_i) \\
&\underset{\text{[eq: 14.253]}}{=} y
\end{aligned}$$

Which, as $x \in B_{\|\|_X}(0,1)$ [see eq: 14.252], proves that $y \in L(B_{\|\|_X}(0,1))$, hence as $y \in B_{\|\|_Y}\left(0, \frac{\delta}{2}\right)$ was chosen arbitrary this proves that $B_{\|\|_Y}\left(0, \frac{\delta}{2}\right) \subseteq L(B_{\|\|_X}(0,1))$ or if we take $\lambda = \frac{\delta}{2}$ that

$$B_{\|\|_Y}(0,\lambda) \subseteq L(B_{\|\|_X}(0,1))$$

□

We are now finally ready to proof the Open Mapping Theorem stating that every continuous linear surjective mapping between two Banach spaces is open.

Theorem 14.392. (Open Mapping Theorem) *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be Banach spaces and $L: X \to Y$ a surjective continuous linear function then $L: X \to Y$ is a **open mapping**.*

Proof. Using [lemma: 14.391] there exist a $\lambda \in \mathbb{R}^+$ such that

$$B_{\|\|_Y}(0,\lambda) \subseteq L(B_{\|\|_X}(0,1))$$

Applying then [lemma: 14.390] proves that L is open. □

Corollary 14.393. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be Banach spaces and $L: X \to Y$ a continuous linear isomorphism then $L: X \to Y$ is a homeomorphism.*

Proof. As $L: X \to Y$ is a isomorphism it is surjective. Hence as L is continuous and linear if follows from [theorem: 14.392] that $L: X \to Y$ is a open mapping. Hence if U is a open set in X we have for $L^{-1}: Y \to X$ that $(L^{-1})^{-1}(U) \underset{\text{[theorem: 2.69]}}{=} L(U)$ is open. So that $L^{-1}: Y \to X$ is continuous which by the continuity of $L: X \to Y$ proves that $L: X \to Y$ is a homeomorphism. □

14.11 Connected Sets

Definition 14.394. *A topological space $\langle X, \mathcal{T}\rangle$ is **connected** if $\forall U_1, U_2 \in \mathcal{T}$ with $U_1 \bigcap U_2 = \varnothing$ and $X = U_1 \bigcup U_2$ we have that either $U_1 = \varnothing$ or $U_2 = \varnothing$. In other words a topological space is connected if it is not the union of two disconnected non empty sets.*

Definition 14.395. *A topological space is **disconnected** if it is not connected or in other words there exists $U_1, U_2 \in \mathcal{T}$ with $U_1 \neq \varnothing$, $U_2 \neq \varnothing$, $U_1 \bigcap U_2 = \varnothing$ and $X = U_1 \bigcup U_2$.*

Lemma 14.396. *Let A, B, C be classes such that $A \bigcap B = \varnothing$ and $C = A \bigcup B$ then we have:*

1. $A = C \setminus B$
2. $B = C \setminus A$

3. $A \setminus B = A$

Proof.

1. If $x \in A \subseteq A \bigcup B = C \Rightarrow x \in C$ and if $x \in B$ we would have $x \in A \bigcap B = \emptyset$ a contradiction so $x \notin B \Rightarrow x \in C \setminus B \Rightarrow A \subseteq C \setminus B$. If $x \in C \setminus B$ then $x \in C = A \bigcup B$ so $x \in A \vee x \in B$, as $x \notin B$ we must have $x \in A \Rightarrow C \setminus B \subseteq A$.
2. If $x \in B \subseteq A \bigcup B = C \Rightarrow x \in C$ and if $x \in A$ we would have $x \in A \bigcap B = \emptyset$ a contradiction so $x \notin A \Rightarrow x \in C \setminus A \Rightarrow B \subseteq C \setminus A$. If $x \in C \setminus A$ then $x \in C = A \bigcup B$ so $x \in A \vee x \in B$, as $x \notin A$ we must have $x \in B \Rightarrow C \setminus A \subseteq B$.
3. If $x \in A$ then, as $A \bigcap B = \emptyset$, we must have $x \notin B$ so that $x \in A \setminus B$ hence $A \subseteq A \setminus B \subseteq A$ so that $A \setminus B = A$. □

Theorem 14.397. *Let $\langle X, \mathcal{T} \rangle$ be a topological space then the following are equivalent:*

1. *$\varnothing$ and X are the only subsets of X that are open and closed.*
2. *X is connected*
3. *For every pair of closed sets A_1, A_2 with $A_1 \bigcap A_2 = \varnothing$ and $X = A_1 \bigcup A_2$ we have either $A_1 = \varnothing$ or $A_2 = \varnothing$.*

Proof.

1 ⇒ 2. Assume that U_1, U_2 are **disjoint open** sets with $X = U_1 \bigcup U_2$ then by [lemma: 14.396] $U_2 \underset{\text{[lemma: 14.396]}}{=} X \setminus U_1$ so that U_2 is open and closed. According to (1) we must then have that either:

$\boldsymbol{U_2 = \varnothing}$**.** Then $U_1 = \varnothing \vee U_2 = \varnothing$

$\boldsymbol{U_2 = X}$**.** Then $U_1 \underset{\text{[lemma: 14.396]}}{=} X \setminus U_2 = X \setminus X = \varnothing$ so that $U_1 = \varnothing \vee U_2 = \varnothing$

2 ⇒ 3. Assume that we have two **disjoint closed** sets A_1, A_2 with $X = A_1 \bigcup A_2$ then $A_1 \underset{\text{[lemma: 14.396]}}{=} X \setminus A_2$ is open and $A_2 \underset{\text{[lemma: 14.396]}}{=} X \setminus A_1$ is open, so, as X is connected, we must have either $A_1 = \emptyset$ or $A_2 = \emptyset$.

3 ⇒ 1. Let $A \subseteq X$ and A is open and closed then $X \setminus A$ is closed, $A \bigcap (X \setminus A) = \emptyset$ and $X = A \bigcup (X \setminus A)$. By (3) we must have either $A = \emptyset$ or $X \setminus A = \emptyset \Rightarrow A = X$. □

Definition 14.398. *Let $\langle X, \mathcal{T} \rangle$ be a topological space and $A \subseteq X$ then A is connected if $\langle A, \mathcal{T}_{|A} \rangle$ is connected where $\mathcal{T}_{|A} = \{U \bigcap A | U \in \mathcal{T}\}$ is the subspace topology on A.*

Theorem 14.399. *Let $\langle X, \mathcal{T}_X \rangle$ be connected topological space, $\langle Y, \mathcal{T}_Y \rangle$ a topological space and*

$$f: X \to Y \text{ a continuous function}$$

then

$$f(X) \text{ is a connected subset of } Y$$

Proof. We proves this by contradiction. So assume that $f(X)$ is not connected then there exist open sets $V_1, V_2 \in \mathcal{T}_Y$ with $V_1 \bigcap f(X) \neq \varnothing$, $V_2 \bigcap f(X) \neq \varnothing$, $(V \bigcap f(X)) \bigcap (V \bigcap f(X)) = \varnothing$ and $(V_1 \bigcap f(X)) \bigcup (V_2 \bigcap f(X)) = f(X)$. As f is continuous we have by [theorem: 14.131] that

$$U_1 = f^{-1}(V_1) \in \mathcal{T}_X \text{ and } U_2 = f^{-1}(V_2) \in \mathcal{T}_Y \tag{14.254}$$

As $V_1 \bigcap f(X)$, $V_2 \bigcap f(X) \neq \varnothing$ there exists a $y_1 \in V_1 \bigcap f(X)$ and a $y_2 \in V_2 \bigcap f(X)$. Hence there exist $x_1, x_2 \in X$ such that $f(x_1) = y_1 \in V_1$ and $f(x_2) = y_2 \in V_2$ so that $x_1 \in f^{-1}(V_1) = U_1$ and $x_2 \in f^{-1}(V_2) = U_2$, hence

$$U_1 \neq \varnothing \text{ and } U_2 \neq \varnothing \tag{14.255}$$

Let $x \in X$ then $f(x) \in f(X) = (V_1 \bigcap f(X)) \bigcup (V_2 \bigcap f(X)) = V_1 \bigcup V_2$ so that

$$x \in f^{-1}(V_1 \bigcup V_2) \underset{\text{[theorem: 2.95]}}{=} f^{-1}(V_1) \bigcup f^{-1}(V_2) = U_1 \bigcup U_2 \subseteq X$$

proving

$$X = U_1 \bigcup U_2 \tag{14.256}$$

Further if $x \in U_1 \bigcap U_2 = f^{-1}(V_1) \bigcap f^{-1}(V_2)$ then $f(x) \in V_1 \bigcap V_2$ which as $f(x) \in f(X)$ results in $f(x) \in (V_1 \bigcap f(X)) \bigcap (V_2 \bigcap f(X)) = \varnothing$ a contradiction hence we must have that

$$U_1 \bigcap U_2 = \varnothing \tag{14.257}$$

Combining [eqs: 14.254, 14.255 and 14.257] we conclude that X is not connected contradicting the fact that X was assumed to be connected. Hence the assumption that $f(X)$ is not connected is wrong and we must have that $f(X)$ is connected. □

A very important example of a connected subset of $\mathbb{R}$ is the closed interval (later we will show that every generalized interval is connected).

Lemma 14.400. *Let $\langle\mathbb{R},\|\rangle$ be the normed space of real numbers then $\forall a,b\in\mathbb{R}$ with $a\leqslant b$ we have that $[a,b]$ is connected.*

Proof. Note that $[a,b]=\left[\frac{a+b}{2}-\frac{b-a}{2},\frac{a+b}{2}+\frac{b-x}{2}\right]=\overline{B\left(\frac{a+b}{2},\frac{a-b}{2}\right)}$ which is a closed set in $\mathcal{T}_{||}$ by [theorem: 14.65]. Let $A\subseteq[a,b]$ be a closed set in the subspace topology $(\mathcal{T}_{||})_{|[a,b]}$ then there exist by [theorem: 14.17] a closed set A' in $\mathcal{T}_{||}$ such that $A=A'\bigcap[a,b]$ which is then closed in $\mathcal{T}_{||}$. Hence it follows that

$$\text{every closed set in } (\mathcal{T}_{||})_{|[a,b]} \text{ is closed in } \mathcal{T}_{||} \tag{14.258}$$

We proceed now by contradiction. So assume that $[a,b]$ is not connected. Then by [theorem: 14.397] there exists sets $A_1,A_2\subseteq[a,b]$ such that A_1,A_2 are closed in $(\mathcal{T}_{||})_{|[a,b]}$, hence also closed in $\mathcal{T}_{||}$, $A_1\neq\varnothing$, $A_2\neq 0$, $A_1\bigcap A_2=\varnothing$ and $[a,b]=A_1\bigcup A_2$. We can always assume that $b\in A_2$ [otherwise switch A_1 and A_2]. As $A_1\subseteq A_1\bigcup A_2=[a,b]$ it follows that A_1 is bounded above by b which together with $A_1\neq\varnothing$ allows us to use the conditional completeness of $\mathbb{R}$ [see theorem: 10.18] proving that

$$c=\sup(A_1) \text{ exist}$$

Let $U\in\mathcal{T}_{||}$ such that $c\in U$ then there exist a $\varepsilon\in\mathbb{R}^+$ with $c\in]c-\varepsilon,c+\varepsilon[=B_{||}(c,\varepsilon)\subseteq U$. As $c-\varepsilon<c=\sup(A_1)$ there exist a $c'\in A_1$ such that $c-\varepsilon<c'\leqslant c<c+\varepsilon$ so that

$$c'\in]c-\varepsilon,c+\varepsilon[\bigcap A_1=B_{||}(c,\varepsilon)\bigcap A_1\subseteq U\bigcap A_1\Rightarrow U\bigcap A_1\neq\varnothing \tag{14.259}$$

proving by [theorem: 14.29] and the fact that A_1 is closed that

$$c\in A_1 \tag{14.260}$$

As $c\in A_1\subseteq[a,b]$ we have $a\leqslant c<b$ or

$$]c,b]\subseteq[a,b] \tag{14.261}$$

Assume that $x\in]c,b]\bigcap A_1$ then $c<x$ and $x\leqslant\sup(A_1)=c$ giving the contradiction $x<c$, hence $]c,b]\bigcap A_1=\varnothing$. Combining this with [eq: 14.261] results in

$$]c,b]\subseteq[a,b]\setminus A_1=\left(A_1\bigcup A_2\right)\setminus A_1\underset{\text{[lemma: 14.396]}}{=}A_2$$

As $c\in A_1$, $b\in A_2$, $A_1\bigcap A_2=\varnothing$ we have that $c\neq b$ which as b is a upper bound of A_1 proves

$$c<b\Rightarrow 0<b-c$$

Let $U\in\mathcal{T}_{\|\|}$ such that $c\in U$ then there exist a $\varepsilon\in\mathbb{R}^+$ such that $c\in]c-\varepsilon,c+\varepsilon[\subseteq U$. Take $\delta=\min(b-c,\varepsilon)>0$ then we have $c<c+\frac{\delta}{2}<c+\delta\leqslant c+b-c=b$ so that $c+\frac{\delta}{2}\in]c,b]\subseteq A_2$ and as $c-\varepsilon<c<c+\frac{\delta}{2}\leqslant c+\frac{\varepsilon}{2}<c+\varepsilon$ we have that $c+\frac{\delta}{2}\in]c-\varepsilon,c+\varepsilon[\bigcap A_2\subseteq U\bigcap A_2$ proving that $U\bigcap A_2\neq\varnothing$. Using [theorem: 14.29] it follows that $c\in A_2$ which combined with [eq: 14.260] gives $c\in A_1\bigcap A_2$ contradicting $A_1\bigcap A_2\underset{\text{[eq: 14.259]}}{=}\varnothing$. Hence the assumption that $[a,b]$ is not connected is wrong so that we must have that $[a,b]$ is connected. □

Actually it turns out that the only connected sets in $[a,b]$ are generalized intervals [see definition: 3.140 and theorem: 3.143].

Theorem 14.401. *Let $\langle\mathbb{R},\|\rangle$ be the normed spaces of real numbers and $I\subseteq\mathbb{R}$ then we have*

$$I \text{ is connected} \Leftrightarrow I \text{ is a generalized interval}$$

Proof.

- **⇒.** We prove this by contradiction. So assume that I is a connected set but not a generalized interval. As $\langle\mathbb{R},\leqslant\rangle$ is conditional complete we have by [theorem: 3.141] that there exists $x,y\in I$ such that $]x,y[\not\subseteq I$. Hence there exist a $z\in]x,y[$ such that $z\in\mathbb{R}\setminus I$. Now as $I\subseteq\mathbb{R}=]-\infty,z[\bigcup\{z\}\bigcup]z,\infty[$ and $z\notin I$ it follows that $I\subseteq]-\infty,z[\bigcup]z,\infty[$ so that

$$I\subseteq\left(]-\infty,z[\bigcap I\right)\bigcup\left(]z,\infty[\bigcap I\right) \tag{14.262}$$

  We have also

$$\left(]-\infty,z[\bigcap I\right)\bigcap\left(]z,\infty[\bigcap I\right)=I\bigcap\left(]-\infty,z[\bigcap]z,\infty[\right)=I\bigcap\varnothing=\varnothing \tag{14.263}$$

As $x,y\in I$ and $z\in\,]x,y[\,\Rightarrow x<z<y\Rightarrow x\in\,]-\infty,z[\bigcap I\wedge y\in\,]z,\infty[\bigcap I$ it follows that

$$]-\infty,z[\bigcap I\neq\varnothing \text{ and }]z,\infty[\bigcap I\neq\varnothing \tag{14.264}$$

Finally using [theorem: 14.100] we have that $]-\infty,z[\,\in\mathcal{T}_{||}$ and $]z,\infty[\,\in\mathcal{T}_{||}$ so that

$$]-\infty,z[\bigcap I\in(\mathcal{T}_{||})_{|I} \text{ and }]z,\infty[\bigcap I\in(\mathcal{T}_{||})_{|I} \tag{14.265}$$

Hence using [eqs: 14.262, 14.263, 14.264 and 14.265] it follows that I is not connected contradicting the hypothesis that I is connected. So our assumption that I is not a generalized interval is wrong, proving that is indeed a generalized interval.

$\Leftarrow$. We prove this also by contradiction. So assume that I is a generalized interval that is not connected. Then there exists open sets $U_1,U_2\in\mathcal{T}_{||}$ such that $(U_1\bigcap I)\neq\varnothing=(U_2\bigcap I)$, $I=(U_1\bigcap I)\bigcup(U_2\bigcap I)$ and $(U_1\bigcap I)\bigcap(U_2\bigcap I)=\varnothing$. Then there exists $x\in U_1\bigcap I$ and a $y\in U_2\bigcap I$. As $(U_1\bigcap I)\bigcap(U_2\bigcap I)=\varnothing$ it follows that $x\neq y$ and we can always assume that $x<y$ [if $y<x$ interchange x and y]. As I is a generalized interval we have by [theorem: 3.140] that $[x,y]\subseteq I$. So that

$$\begin{aligned}[x,y] &= [x,y]\bigcap I\\ &= [x,y]\bigcap\big((U_1\bigcap I)\bigcup(U_2\bigcap I)\big)\\ &= \big([x,y]\bigcap U_1\bigcap I\big)\bigcup\big([x,y]\bigcap U_2\bigcap I\big)\\ &= \big([x,y]\bigcap U_1\big)\bigcup\big([x,y]\bigcap U_2\big)\end{aligned}$$

or

$$[x,y]=\big([x,y]\bigcap U1\big)\bigcup\big([x,y]\bigcap U_2\big) \tag{14.266}$$

Further as $[x,y]\subseteq I$ we have $([x,y]\bigcap U1)\bigcap([x,y]\bigcap U_2)\subseteq(I\bigcap U_1)\bigcap(I\bigcap U_2)=\varnothing$ proving that

$$\big([x,y]\bigcap U1\big)\bigcap\big([x,y]\bigcap U_2\big)=\varnothing \tag{14.267}$$

Further as $x\in U_1\bigcap I\Rightarrow x\in U_1\underset{x\in[x,y]}{\Rightarrow}x\in U_1\bigcap[x,y]$ and $y\in U_2\bigcap I\Rightarrow y\in U_2\underset{y\in[x,y]}{\Rightarrow}y\in U_2\bigcap[x,y]$ we have

$$U_1\bigcap[x,y]\neq\varnothing \text{ and } U_2\bigcap[x,y]\neq\varnothing \tag{14.268}$$

Finally by definition we have that

$$U_1\bigcap[x,y]\in(\mathcal{T}_{||})_{|[x,y]} \text{ and } U_2\bigcap[x,y]\in(\mathcal{T}_{||})_{|[x,y]} \tag{14.269}$$

From [eqs: 14.266, 14.267, 14.268 and [eq: 14.269] it follows that $[x,y]$ is not connected contradicting the fact that by [lemma: 14.400] $[x,y]$ is connected. Hence the assumption that I is not connected is wrong so that I must be connected. □

A important consequence of the fact that generalized intervals in $\mathbb{R}$ are connected is the Intermediate Value Theorem. First we need a little lemma proving that the image of a closed interval of a continuous real function on the interval is again a closed interval.

Lemma 14.402. *Let $\langle\mathbb{R},\|\rangle$ be the normed spaces of real numbers, $a,b\in\mathbb{R}$ with $a\leqslant b$ and*

$$f:[a,b]\to\mathbb{R} \text{ a continuous function}$$

then there exist $c,d\in\mathbb{R}$ such that

$$f([a,b])=[c,d]$$

So there exists $x,y\in[a,b]$ such that $c=f(x)$ and $d=f(y)$ and $\forall z\in[a,b]\;\; f(x)\leqslant f(z)\leqslant f(y)$

Proof. Using Heine Borell [theorem: 14.235] it follows that $[a,b]$ is a compact set. As $f:[a,b]\to\mathbb{R}$ is continuous it follows from [theorem: 14.232] that

$$f([a,b]) \text{ is compact}$$

As compact sets in $\mathbb{R}$ are closed and bounded [see theorem: 14.236] it follows that

$$f([a,b]) \text{ is closed and bounded}$$

As $[a,b]$ is connected [see lemma: 14.400] we have, using [theorem: 14.399] by the continuity of f that

$$f([a,b]) \text{ is connected}$$

Hence using the previous theorem [theorem: 14.401] it follows that

$$f([a,b]) \text{ is a generalized interval}$$

As $f([a,b])$ is closed and not empty it follows from [theorem: 14.102] that

$$f([a,b]) \text{ is either } [c,d],\ ]-\infty,c] \text{ or } [c,\infty[$$

By [example: 14.108] $]-\infty,c]$ and $[c,\infty[$ are unbounded while $[c,d]$ is bounded, hence we have that

$$f([a,b]) = [c,d]$$ □

Theorem 14.403. (Intermediate Value Theorem) *Let $\langle \mathbb{R}, \|\rangle$ be the normed space of real numbers, $a,b \in \mathbb{R}$ with $a \leqslant b$ and $f: [a,b] \to \mathbb{R}$ a continuous function then we have:*

1. *If $y \in \mathbb{R}$ satisfies $f(a) < y < f(b)$ then there exist a $x \in [a,b]$ such that $y = f(x)$.*
2. *If $y \in \mathbb{R}$ satisfies $f(b) < y < f(a)$ then there exist a $x \in [a,b]$ such that $y = f(x)$.*

Proof. Using [lemma: 14.402] we have that $f([a,b]) = [c,d]$, hence $f(a), f(b) \in [c,d]$. Let $y \in \mathbb{R}$ then we have:

- $\boldsymbol{f(a) < y < f(b)}$**.** Then $y \in [f(a), f(b)]$ and $f(a) < f(b)$ where $f(a), f(b) \in [c,d]$. As $[c,d]$ is a generalized interval it follows from [theorem: 3.140] that $[f(a), f(b)] \subseteq [c,d] = f([a,b])$. Hence $y \in f([a,b])$ so there exist a $x \in [a,b]$ such that $y = f(x)$.
- $\boldsymbol{f(b) < y < f(a)}$**.** Then $y \in [f(b), f(a)]$ and $f(b) < f(a)$ where $f(a), f(b) \in [c,d]$. As $[c,d]$ is a generalized interval it follows from [theorem: 3.140] that $[f(b), f(a)] \subseteq [c,d] = f([a,b])$. Hence $y \in f([a,b])$ so there exist a $x \in [a,b]$ such that $y = f(x)$. □

Chapter 15
Integration in Banach spaces

There are many ways to define integrals of functions, Riemann integrals, Lebesgue Integrals, Gauge Integrals, etc ... In this chapter we define a extension of the classic Riemann Darboux integral to functions whose range is a Banach space. Lebesgue and Gauge Integrals (like Henstock integrals) are more general, however to prove later the Fundamental Theorem of Calculus later we must define integrals before we introduce the concept of differentiation. For this reason we define Riemann integrals here and more general forms of integration in later chapters.

First we introduce the concept of partitioning a closed interval in sub intervals with no gaps. The way to do this is by specifying a ordered family of boundary point for the sub intervals. For example the interval $[1,12]$ can be partitioned in the following way:

$$[1,12]=[1,4]\bigcup[4,8]\bigcup[8,12]$$

by the family $\{t_i\}_{i\in\{1,\ldots,4\}}$ where

$$\begin{aligned} t_1 &= 1 \\ t_2 &= 4 \\ t_3 &= 8 \\ t_4 &= 12 \end{aligned}$$

We use underscores to show the index of the boundary points of the sub intervals. Hence we use the following notation.

$$[1,12]=[1_1,4_2]\bigcup[4_2,8_3]\bigcup[8_3,12_4]$$

This is the idea of the following definition.

Definition 15.1. *Let $a,b\in\mathbb{R}$ with $a<b$ then a family $\{t_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{R}$ is a* ***partition of*** $[\boldsymbol{a},\boldsymbol{b}]$ *if $n\in\mathbb{N}\setminus\{1\}$, $t_1=a$, $t_n=b$ and $\forall i\in\{1,\ldots,n-1\}$ we have $t_i<t_{i+1}$.*

Note 15.2. The strict inequality $a<b$ is needed for if $a=b$ we would have the contradiction $a=t_1<t_2=b$.

Lemma 15.3. *If $n\in\mathbb{N}\setminus\{1\}$ and $\{t_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{R}$ such that $\forall i\in\{1,\ldots,n-1\}$ $t_i<t_{i+1}$ then we have*

1. *$\forall i,j\in\{1,\ldots,n\}$ with $i<j$ that $t_i<t_j$*
2. $\min(\{t_i|i\in\{1,\ldots,n\}\})=t_1$
3. $\max(\{t_i|i\in\{1,\ldots,n\}\})=t_n$

Proof.

1. We use induction to prove this, so given $i\in\{1,\ldots,n-1\}$ define

$$S_{n,i}=\{k\in\mathbb{N}|\text{If } i+k\leqslant n \text{ then } t_i<t_{i+k}\}$$

then we have:

$1\in S_{n,i}$. If $i+1\leqslant n$ then $i\in\{1,\ldots,n-1\}$ and by definition $i_i<t_{i+1}$ so that

$k\in S_{n,i}\Rightarrow k+1\in S_{n,i}$. If $i+(k+1)\leqslant n$ then $i+k\leqslant n-1$ so that $i+k\in\{1,\ldots,n-1\}$, hence $t_{i+k}<i_{i+(k+1)}$ by definition. As $k\in S_{n,i}$ and $i+k\leqslant i+(k+1)\leqslant n$ we have $t_i<t_{i+k}$ so that $t_i<t_{i+(k+1)}$. Proving that $k+1\in S_{n,i}$.

Using induction we have that $\mathcal{S}_{n,i}=\mathbb{N}$. So if $i,j\in\{1,\ldots,n\}$ with $i<j$ then $k=j-i\in\mathbb{N}\in\mathcal{S}_{n,i}$ and $i+k=j\leqslant n$ so that $t_i<t_{i+k}=t_j$.

2. If $x\in\{t_i|i\in\{1,\ldots,n\}\}$ then there exist a $i\in\{1,\ldots,n\}$ such that $x=t_i$. As $1\leqslant i$ it follows then from (1) that $t_1\leqslant x$ which, as $t_1\in\{t_i|i\in\{1,\ldots,n\}\}$, proves that $t_1=\min(\{t_i|i\in\{1,\ldots,n\}\})$.
3. If $x\in\{t_i|i\in\{1,\ldots,n\}\}$ then there exist a $i\in\{1,\ldots,n\}$ such that $x=t_i$. As $i\leqslant n$ it follows then from (1) that $x\leqslant t_n$ which, as $t_n\in\{t_i|i\in\{1,\ldots,n\}\}$, proves that $t_n=\max(\{t_i|i\in\{1,\ldots,n\}\})$. □

Theorem 15.4. *Let $a,b\in\mathbb{R}$ with $a<b$ and $\{t_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{R}$ a partition of $[a,b]$ then we have:*

1. *$\forall i,j\in\{1,\ldots,n\}$ with $i<j$ we have $t_i<t_j$*
2. *$\forall i\in\{1,\ldots,n\}$ we have $t_i\in[a,b]$*
3. *If $t_i=t_j$ then $i=j$*
4. *If $i\in\{1,\ldots,n-1\}$ and $k\in\{1,\ldots,n\}$ such that $t_k\in[t_i,t_{i+1}]$ then $k=i$ or $k=i+1$*
5. *$\forall i\in\{1,\ldots,n-1\}$ we have $\forall k\in\{1,\ldots,n\}$ we have $t_k\notin]t_i,t_{i+1}[$*

Proof.

1. This follows from [lemma: 15.3].
2. If $i\in\{1,\ldots,n\}$ then we have either:

   $\boldsymbol{i=1}$**.** Then we have $t_i=a\in[a,b]$

   $\boldsymbol{i=n}$**.** Then we have $t_i=b\in[a,b]$

   $\boldsymbol{i\in\{2,\ldots,n-1\}}$**.** Then we have by (1) $a=t_1<t_i<t_n=b$ so that $t_i\in[a,b]$
3. If $t_i=t_j$ then if $i\neq j$ we have either $i<j$ or $j<i$ we have by (1) that $t_i<t_j$ or $t_j<t_i$ contradicting $t_i=t_k$. So we must have $i=j$.
4. If $t_k\in[t_i,t_{i+1}]$ then $t_i\leqslant t_k\leqslant t_{i+1}$. If now $k<i$ then using (1) we have $t_k<t_i$ contradicting $t_i\leqslant t_k$, if $i+1<k$ we have using (1) $t_{i+1}<t_k$ contradicting $t_k\leqslant t_{i+1}$. So we must have $i\leqslant k\leqslant i+1$ which means $i=k$ or $k=i+1$.
5. Assume that $t_k\in]t_i,t_{i+1}[$ then $t_i<t_k<t_{i+1}$. For k we have either:

   $\boldsymbol{k\leqslant i}$**.** Then by (1) we have $t_k\leqslant t_i$ contradicting $t_i<t_k$.

   $\boldsymbol{i<k}$**.** Then $i+1\leqslant k$ so that by (1) we have $t_{i+1}\leqslant t_k$ contradicting $t_k<t_{i+1}$. □

The reason for the name partition of a interval is that is can be used to divide the interval in a union of sub intervals.

Theorem 15.5. *Let $a,b\in\mathbb{R}$ with $a<b$ and $\{t_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{R}$ a partition of $[a,b]$ then we have that*

1. *$[a,b[=\bigcup_{i\in\{1,\ldots,n-1\}}[t_i,t_{i+1}[$ and $\forall i,j\in\{1,\ldots,n-1\}$ with $i\neq j$ we have $[t_i,t_{i+1}[\bigcap[t_j,t_{j+1}[=\varnothing$*
2. *$[a,b]=\bigcup_{i\in\{1,\ldots,n-1\}}[t_i,t_{i+1}]$*

Proof.

1. Let $i\in\{1,\ldots,n-1\}$ then by [theorem: 15.4] we have $t_i\in[a,b]$ so that $a\leqslant t_i<t_{i+1}\leqslant t_n=b$. If $x\in[t_i,t_{i+1}[$ then $t_i\leqslant x<t_{i+1}$ so that $a\leqslant x<b$ or $x\in[a,b[$. Hence $[t_i,t_{i+1}[\subseteq[a,b[$ so that
$$\bigcup_{i\in\{1,\ldots,n-1\}}[t_i,t_{i+1}[\subseteq[a,b[\tag{15.1}$$
   For the opposite inequality, let $x\in[a,b[$ then $a\leqslant x<b$. Define $M_x=\{i\in\{1,\ldots,n-1\}|t_i\leqslant x\}$ then, as $M_x\subseteq\{1,\ldots,n-1\}$ M_x is finite, further as $t_1=a\leqslant x$ we have $1\in M_x$ so that $M_x\neq\varnothing$. Hence $m=\max(M_x)$ exist. As $m\in M_x$ we have that $t_m\leqslant x$. Now for m we have either:

   $\boldsymbol{m=n-1}$**.** Then $m+1=n$ and as $x<b$ we have $t_m\leqslant x<b=t_{m+1}$ so that
$$x\in[t_m,t_{m+1}[\subseteq\bigcup_{i\in\{1,\ldots,n-1\}}[t_i,t_{i+1}[$$

   $\boldsymbol{m<n-1}$**.** If $t_{m+1}\leqslant x$ then, as $m+1\in\{1,\ldots,n-1\}$ we have $m+1\in M_x$ so that $m\leqslant\max(M_x)=m$ leading to the contradiction $m<m$. Hence we must have $x<t_{m+1}$ so that $t_m\leqslant x<t_{m+1}$ or
$$x\in[t_m,t_{m+1}[\subseteq\bigcup_{i\in\{1,\ldots,n-1\}}[t_i,t_{i+1}[$$

   So we have that $[a,b[\subseteq\bigcup_{i\in\{1,\ldots,n-1\}}[t_i,t_{i+1}[$ which combined with [eq: 15.1] proves
$$[a,b]=\bigcup_{i\in\{1,\ldots,n-1\}}[t_i,t_{i+1}[$$

Let $i, j \in \{1, \ldots, n-1\}$ with $i \neq j$ then we my assume that without loosing generality that $i < j$ [if not exchange i, j]. Let $x \in [t_i, t_{i+1}[\bigcap [t_j, t_{j+1}[$ then $t_i \leqslant x < t_{i+1}$ and $t_j \leqslant x < t_{j+1}$. As $i < j \Rightarrow t+1 \leqslant j$ so that $t_{i+1} \leqslant t_j$, hence $x < t_{i+1} \leqslant t_j \leqslant x$ giving the contradiction $x < x$. So we must have that

$$[t_i, t_{i+1}[\bigcap [t_i, t_{j+1}[= \varnothing$$

2. Let $i \in \{1, \ldots, n-1\}$ then by [theorem: 15.4] we have $t_i \in [a, b]$ so that $a \leqslant t_i < t_{i+1} \leqslant t_n = b$. If $x \in [t_i, t_{i+1}]$ then $t_i \leqslant x \leqslant t_{i+1}$ so that $a \leqslant x \leqslant b$ or $x \in [a, b]$. Hence $[t_i, t_{i+1}] \subseteq [a, b]$ so that

$$\bigcup_{i \in \{1, \ldots, n-1\}} [t_i, t_{i+1}] \subseteq [a, b] \tag{15.2}$$

For the opposite inequality, let $x \in [a, b]$ then $a \leqslant x \leqslant b$. Define $M_x = \{i \in \{1, \ldots, n-1\} | t_i \leqslant x\}$ then, as $M_x \subseteq \{1, \ldots, n-1\}$ M_x is finite, further as $t_1 = a \leqslant x$ we have $1 \in M_x$ so that $M_x \neq \varnothing$. Hence $m = \max(M_x)$ exist. As $m \in M_x$ we have that $t_m \leqslant x$. Now for m we have either:

$m = n - 1$. Then $m + 1 = n$ and as $x \leqslant b$ we have $t_m \leqslant x \leqslant b = t_{m+1}$ so that

$$x \in [t_m, t_{m+1}] \subseteq \bigcup_{i \in \{1, \ldots, n-1\}} [t_i, t_{i+1}]$$

$m < n - 1$. If $t_{m+1} \leqslant x$ then, as $m + 1 \in \{1, \ldots, n-1\}$ we have $m + 1 \in M_x$ so that $m \leqslant \max(M_x) = m$ leading to the contradiction $m < m$. Hence we must have $x < t_{m+1}$ so that $t_m \leqslant x < t_{m+1}$ or

$$x \in [t_m, t_{m+1}[\subseteq [t_m, t_{m+1}] \subseteq \bigcup_{i \in \{1, \ldots, n-1\}} [t_i, t_{i+1}]$$

So we have that $[a, b] \subseteq \bigcup_{i \in \{1, \ldots, n-1\}} [t_i, t_{i+1}]$ which combined with [eq: 15.2] proves

$$[a, b] = \bigcup_{i \in \{1, \ldots, n-1\}} [t_i, t_{i+1}]$$

□

If we have two partitions of a interval then we can always find a partition that is 'composed' than the two partitions. With finer we mean that the boundary points of this partition is based on the boundary points of the two given partitions.

$\mathcal{P}_1 = [1_1, 4_2] \bigcup [4_2, 8_3] \bigcup [8_3, 12_4]$, boundary points $\{1_1, 4_2, 8_3, 12_4\}$
$\mathcal{P}_2 = [1_1, 2_2] \bigcup [2_2, 5_3] \bigcup [5_3, 6_4] \bigcup [6_4, 12_5]$, boundary points $\{1_1, 2_2, 5_3, 6_4,, 12_5\}$

then the following partition can be based on the boundary points of $\mathcal{P}_1$ and $\mathcal{P}_2$

$\mathcal{P} = [1_1, 2_2] \bigcup [2_2, 4_3] \bigcup [4_3, 5_4] \bigcup [5_4, 6_5] \bigcup [6_5.8_6] \bigcup [8_6, 12_7]$, boundary points

$$\{1_1, 2_2, 4_3, 5_4, 6_5, 8_6, 12_7\} = \{1_1, 4_2, 8_3, 12_4\} \bigcup \{1_1, 2_2, 5_3, 6_4, 12_5\}$$

It will turn out that there only exist a such partition that satisfies this condition about the boundary points. Although intuitively such a partition exist and is unique, proving this is rather elaborate. This is done in the next two lemmas. This partition $\mathcal{P}$ based on $\mathcal{P}_1$ and $\mathcal{P}_2$ is noted as $\mathcal{P}_1 \square \mathcal{P}_2$

Lemma 15.6. *Let $a, b \in \mathbb{R}$ with $a < b$ and $\mathcal{P}_1 = \{t_i^{(1)}\}_{i \in \{1, \ldots, n_1\}} \subseteq \mathbb{R}$, $\mathcal{P}_2 = \{t_i^{(2)}\}_{i \in \{1, \ldots, n_2\}} \subseteq \mathbb{R}$ two partitions of $[a, b]$ then there exist a partition $\mathcal{P} = \{t_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R}$ such that*

$$\{t_i | i \in \{1, \ldots, n\}\} = \{t_i^{(1)} | i \in \{1, \ldots, n_1\}\} \bigcup \{t_i^{(2)} | i \in \{1, \ldots, n_2\}\}$$

Proof. Define $P = \{t_i^{(1)} | i \in \{1, \ldots, n_1\}\} \bigcup \{t_i^{(2)} | i \in \{1, \ldots, n_2\}\}$ then as $\{t_i^{(1)} | i \in \{1, \ldots, n_1\}\}$, $\{t_i^{(2)} | i \in \{1, \ldots, n_2\}\}$ are finite [using [theorem: 6.46] we have by [theorem: 6.34] that P is finite. Hence there exist a $n \in \mathbb{N}$ and a bijection $\beta: \{1, \ldots, n\} \to P$ which defines a family $\{\beta(i)\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R}$. Using [theorem: 6.54] there exist a bijection $\alpha: \{1, \ldots, n\} \to \{1, \ldots, n\}$ such that $\forall i \in \{1, \ldots, n-1\}$ we have $\beta(\alpha(i)) \leqslant \beta(\alpha(i+1))$. If $\beta(\alpha(i)) = \beta(\alpha(i+1)) \underset{\beta \text{ is injective}}{\Rightarrow} \alpha(i) = \alpha(i+1) \underset{\alpha \text{ is injective}}{\Rightarrow} i = i+1$ a contradiction, so we must have that $\beta(\alpha(i)) < \beta(\alpha(i+1))$. Hence if we define

$$\{t_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R} \text{ by } t_i = (\beta \circ \alpha)(i) = \beta(\alpha(i))$$

Then

$$\forall i \in \{1, \ldots, n-1\}\ t_i < t_{i+1} \tag{15.3}$$

If $t \in \{t_i | i \in \{1, \ldots, n\}\}$ then there exist a a $i \in \{1, \ldots, n\}$ such that $t = t_i = \beta(\alpha(i)) \in P$. Further if $x \in P$ then as $\beta \circ \alpha \colon \{1, \ldots, n\} \to P$ is a bijection there exist a $i \in \{1, \ldots, n\}$ such that $x = (\beta \circ \alpha)(i) = t_i \in \{t_i | i \in \{1, \ldots, n\}\}$. Hence we have

$$\{t_i | i \in \{1, \ldots, n\}\} = P = \left\{t_i^{(1)} | i \in \{1, \ldots, n_1\}\right\} \bigcup \left\{t_i^{(2)} | i \in \{1, \ldots, n_2\}\right\} \tag{15.4}$$

Using the above we have

$$\begin{aligned}
t_1 &\underset{\text{[lemma: 15.3]}}{=} \\
\min\left(\{t_i | i \in \{1, \ldots, n\}\}\right) &\underset{\text{[eq: 15.4]}}{=} \\
\min\left(\left\{t_i^{(1)} | i \in \{1, \ldots, n_1\}\right\} \bigcup \left\{t_i^{(2)} | i \in \{1, \ldots, n_2\}\right\}\right) &\underset{\text{[theorem: 3.66]}}{=} \\
\min\left(\min\left(\left\{t_i^{(1)} | i \in \{1, \ldots, n_1\}\right\}\right), \min\left(\left\{t_i^{(2)} | i \in \{1, \ldots, n_2\}\right\}\right)\right) &\underset{\text{[lemma: 15.3]}}{=} \\
\min\left(\left\{t_1^{(1)}, t_1^{(2)}\right\}\right) &= \\
\min\left(\{a\}\right) &= \\
a & \\
t_n &\underset{\text{[lemma: 15.3]}}{=} \\
\max\left(\{t_i | i \in \{1, \ldots, n\}\}\right) &\underset{\text{[eq: 15.4]}}{=} \\
\max\left(\left\{t_i^{(1)} | i \in \{1, \ldots, n_1\}\right\} \bigcup \left\{t_i^{(2)} | i \in \{1, \ldots, n_2\}\right\}\right) &\underset{\text{[theorem: 3.66]}}{=} \\
\max\left(\max\left(\left\{t_i^{(1)} | i \in \{1, \ldots, n_1\}\right\}\right), \max\left(\left\{t_i^{(2)} | i \in \{1, \ldots, n_2\}\right\}\right)\right) &\underset{\text{[lemma: 15.3]}}{=} \\
\max\left(\left\{t_{n_1}^{(1)}, t_{n_2}^{(2)}\right\}\right) &= \\
\max\left(\{b\}\right) &=
\end{aligned}$$

so that $a = t_1$ and $b = t_n$ which combined with [eqs: 15.3] proves that

$$\{t_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R} \text{ is a partition of } [a, b]$$

□

Lemma 15.7. *Let $a, b \in \mathbb{R}$ with $a < b$, $\mathcal{P}_1 = \left\{t_i^{(1)}\right\}_{i \in \{1, \ldots, n_1\}} \subseteq \mathbb{R}$, $\mathcal{P}_2 = \left\{t_i^{(2)}\right\}_{i \in \{1, \ldots, n_2\}} \subseteq \mathbb{R}$ two partitions of $[a, b]$ then if $\mathcal{P} = \{t_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R}$ and $Q = \{s_i\}_{i \in \{1, \ldots, m\}} \subseteq \mathbb{R}$ are two partitions of $[a, b]$ such that*

$$\{t_i | i \in \{1, \ldots, n\}\} = \left\{t_i^{(1)}\right\}_{i \in \{1, \ldots, n_1\}} \bigcup \left\{t_i^{(2)} | i \in \{1, \ldots, n_2\}\right\} = \{s_i | i \in \{1, \ldots, m\}\}$$

then $\mathcal{P} = Q$.

Proof. Define the functions

$$s \colon \{1, \ldots, n\} \to \{s_i | i \in \{1, \ldots, n\}\} \text{ by } s(i) = s_i \text{ and } t \colon \{1, \ldots, m\} \to \{t_i | i \in \{1, \ldots, m\}\} \text{ by } t(i) = t_i$$

then these functions are bijective [injectivity follows from [see theorem: 15.4 (3)] and surjectivity from the definition of the functions]. As $\{s_i | i \in \{1, \ldots, n\}\} = \{t_i | i \in \{1, \ldots, m\}\}$ it follows that we have the bijection

$$t^{-1} \circ s \colon \{1, \ldots, n\} \to \{1, \ldots, m\}$$

from which it follows that

$$n = m$$

Next we use induction to prove that the above functions are equal. So define

$$S = \{k \in \mathbb{N} | \text{If } k \in \{1, \ldots, n\} \text{ then } \forall i \in \{1, \ldots, k\} \text{ we have } s_i = t_i\}$$

then we have:

$1 \in S$. This follows from the fact that $s_1 = a = t_1$.

$\boldsymbol{k \in S \Rightarrow k+1 \in S}$. Assume that $s_{k+1} \neq t_{k+1}$ then we have either:

$\boldsymbol{s_{k+1} < t_{k+1}}$. As $\{s_i | i \in \{1,\ldots,n\}\} = \{t_i | i \in \{1,\ldots,n\}\}$ there exist a $l \in \{1,\ldots,n\}$ such that

$$s_{k+1} = t_l \tag{15.5}$$

So that $t_l = s_{k+1} < t_{k+1}$ from which it follows that $l < k+1$ [otherwise $t_{k+1} \leqslant t_l$], hence we have that $l \leqslant k$. As $k \in S$ we have that

$$s_l = t_l$$

Hence using [eq: 15.5] on the above it follows that $s_{k+1} = s_l$ from which it follows by [theorem: 15.4 (3)] that $k+1 = l$ so that we have by [eq: 15.5] that $s_{k+1} = t_{k+1}$ contradicting $s_{k+1} < t_{k+1}$.

$\boldsymbol{t_{k+1} < s_{k+1}}$. As $\{s_i | i \in \{1,\ldots,n\}\} = \{t_i | i \in \{1,\ldots,n\}\}$ there exist a $l \in \{1,\ldots,n\}$ such that

$$t_{k+1} = s_l \tag{15.6}$$

So that $s_l < t_{k+1} < s_{k+1}$ from which it follows that $l < k+1$ [otherwise $s_{k+1} \leqslant s_l$], hence we have that $l \leqslant k$. As $k \in S$ we have that

$$s_l = t_l$$

Hence using [eq: 15.6] it follows that $t_{k+1} = t_k$, using [theorem: 15.4 (3)] it follows that $k+1 = l$ and using [eq: 15.6] this results in $s_{k+1} = t_{k+1}$ which contradicts $t_{k+1} < s_{k+1}$.

As we have a contradiction in both cases the assumption must be wrong, hence we have that $s_{k+1} = t_{k+1}$, proving that $k+1 \in S$. □

Combing the two above lemmas gives the following theorem.

Theorem 15.8. *Let $a, b \in \mathbb{R}$ with $a < b$ and $\mathcal{P}_1 = \{t_i^{(1)}\}_{i \in \{1,\ldots,n_1\}} \subseteq \mathbb{R}$, $\mathcal{P}_2 = \{t_i^{(2)}\}_{i \in \{1,\ldots,n_2\}} \subseteq \mathbb{R}$ two partitions of $[a,b]$ then there exist a **unique** partition $\mathcal{P} = \{t_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathbb{R}$ such that*

$$\{t_i | i \in \{1,\ldots,n\}\} = \{t_i^{(1)} | i \in \{1,\ldots,n_1\}\} \bigcup \{t_i^{(2)} | i \in \{1,\ldots,n_2\}\}$$

*This **unique** partition is noted as $\mathcal{P}_1 \square \mathcal{P}_2$*

Proof. This follows from [lemma: 15.6] and [lemma: 15.7]. □

Consider the following two partitions of $[1,12]$

$\mathcal{P}_1 = [1_1, 4_2] \bigcup [4_2, 8_3] \bigcup [8_3, 12_4]$, boundary points $\{1_1, 4_2, 8_3, 12_4\}$
$\mathcal{P}_2 = [1_1, 2_2] \bigcup [2_2, 5_3] \bigcup [5_3, 6_4] \bigcup [6_4, 12_5]$, boundary points $\{1_1, 2_2, 5_3, 6_4, 12_5\}$

and the 'combined' partition

$\mathcal{P}_1 \square \mathcal{P}_2 = [1_1, 2_2] \bigcup [2_2, 4_3] \bigcup [4_3, 5_4] \bigcup [5_4, 6_5] \bigcup [6_5.8_6] \bigcup [8_6, 12_7]$, boundary points

$$\{1_1, 2_2, 4_3, 5_4, 6_5, 8_6, 12_7\} = \{1_1, 4_2, 8_3, 12_4\} \bigcup \{1_1, 2_2, 5_3, 6_4, 12_5\}$$

Note that for every sub interval I in $\mathcal{P}_1 \square \mathcal{P}_2$ we can find a sub interval in $\mathcal{P}_1$ that contains I and a sub interval in $\mathcal{P}_2$ that contains I. Actually we can find a function $I_{\mathcal{P}_1}$ that maps the index of the first boundary point of I to the index of the first boundary point of the containing sub interval in $\mathcal{P}_1$ and a function $I_{\mathcal{P}_2}$ that map the index of the first boundary point of I to index of the first boundary point of the containing sub interval in $\mathcal{P}_2$.

For $\mathcal{P}_1 \square \mathcal{P}_2$ and $\mathcal{P}_1$ we have:

$$\begin{aligned}
[1_1, 2_2], [2_2, 4_3] \subseteq [1_1, 4_2] \quad &\Rightarrow \quad I_{\mathcal{P}_1}(1) = 1 \\
& \quad I_{\mathcal{P}_1}(2) = 1 \\
[4_3, 5_4], [5_4, 6_5], [6_5.8_6] \subseteq [4_2, 8_3] \quad &\Rightarrow \quad I_{\mathcal{P}_1}(3) = 2 \\
& \quad I_{\mathcal{P}_1}(4) = 2 \\
& \quad I_{\mathcal{P}_1}(5) = 2 \\
[8_6, 12_7] \subseteq [8_3, 12_4] \quad &\Rightarrow \quad I_{\mathcal{P}_1}(6) = 3
\end{aligned}$$

For $\mathcal{P}_1 \sqcup \mathcal{P}_2$ and $\mathcal{P}_1$ we have:

$$\begin{aligned}
[1_1, 2_2] \subseteq [1_1, 2_2] \quad &\Rightarrow \quad I_{\mathcal{P}_2}(1) = 1 \\
[2_2, 4_3], [4_3, 5_4] \subseteq [2_2, 5_3] \quad &\Rightarrow \quad I_{\mathcal{P}_2}(2) = 2 \\
& \qquad\quad\; I_{\mathcal{P}_2}(3) = 2 \\
[5_4, 6_5] \subseteq [5_3, 6_4] \quad &\Rightarrow \quad I_{\mathcal{P}_2}(4) = 3 \\
[6_5, 8_6], [8_6, 12_7] \subseteq [6_4, 12_5] \quad &\Rightarrow \quad I_{\mathcal{P}_2}(5) = 4 \\
& \qquad\quad\; I_{\mathcal{P}_2}(6) = 4
\end{aligned}$$

Hence we have that

$$I_{\mathcal{P}_1}\colon \{1, \ldots, 7-1\} \to \{1, \ldots, 4-1\} \text{ is surjective}$$

$$I_{\mathcal{P}_3}\colon \{1, \ldots, 7-1\} \to \{1, \ldots, 5-1\} \text{ is surjective}$$

Further we have

$$\begin{aligned}
I_{\mathcal{P}_1}^{-1}(\{1\}) = \{1\} \quad &= \quad \{1, \ldots, 1\} \\
I_{\mathcal{P}_1}^{-1}(\{2\}) = \{3, 4, 5\} \quad &= \quad \{3, \ldots, 5\} \\
I_{\mathcal{P}_1}^{-1}(\{3\}) = \{6\} \quad &= \quad \{6, \ldots, 6\}
\end{aligned}$$

$$\begin{aligned}
I_{\mathcal{P}_2}^{-1}(\{1\}) = \{1\} \quad &= \quad \{1, \ldots, 1\} \\
I_{\mathcal{P}_2}^{-1}(\{2\}) = \{2, 3\} \quad &= \quad \{2, \ldots, 3\} \\
I_{\mathcal{P}_2}^{-1}(\{3\}) = \{4\} \quad &= \quad \{4, \ldots, 4\} \\
I_{\mathcal{P}_2}^{-1}(\{4\}) = \{5, 6\} \quad &= \quad \{5, \ldots, 6\}
\end{aligned}$$

so that

$$\begin{aligned}
I_{\mathcal{P}_1}^{-1}(\{1\}), I_{\mathcal{P}_1}^{-1}(\{2\}), I_{\mathcal{P}_1}^{-1}(\{3\}) \quad &\text{are pairwise disjoint} \\
I_{\mathcal{P}_2}^{-1}(\{1\}), I_{\mathcal{P}_2}^{-1}(\{2\}), I_{\mathcal{P}_2}^{-1}(\{3\}), I_{\mathcal{P}_2}^{-1}(\{4\}), \quad &\text{are pairwise disjoint}
\end{aligned}$$

The exact proof of the above in general is done in the following two lemmas.

Lemma 15.9. *Let $a, b \in \mathbb{R}$ with $a < b$ and $\mathcal{P}_1 = \{t_i^{(1)}\}_{i \in \{1, \ldots, n_1\}} \subseteq \mathbb{R}$, $\mathcal{P}_2 = \{t_i^{(2)}\}_{i \in \{1, \ldots, n_2\}} \subseteq \mathbb{R}$ two partitions of $[a, b]$, let $\mathcal{P}_1 \sqcup \mathcal{P}_2 = \{t_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R}$ then we have that*

$$\forall i \in \{1, \ldots, n-1\} \text{ there exist a } \textbf{\textit{unique}}\ i_{\mathcal{P}_1} \in \{1, \ldots, n_1 - 1\} \text{ and a } \textbf{\textit{unique}}\ i_{\mathcal{P}_2} \in \{1, \ldots, n_2 - 1\}$$

such that

$$[t_i, t_{i+1}] \subseteq \left[t_{i_{\mathcal{P}_1}}^{(1)}, t_{i_{\mathcal{P}_1}+1}^{(1)}\right] \text{ and } [t_i, t_{i+1}] \subseteq \left[t_{i_{\mathcal{P}_1}}^{(2)}, t_{i_{\mathcal{P}_1}+1}^{(2)}\right]$$

This allows us to define two functions

$$I_{\mathcal{P}_1}\colon \{1, \ldots, n-1\} \to \{1, \ldots, n_1\} \text{ by } I_{\mathcal{P}_1}(i) = i_{\mathcal{P}_1}$$

$$I_{\mathcal{P}_2}\colon \{1, \ldots, n-1\} \to \{1, \ldots, n_2\} \text{ by } I_{\mathcal{P}_2}(i) = i_{\mathcal{P}_2}$$

such that

$$[t_i, t_{i+1}] \subseteq \left[t_{I_{\mathcal{P}_1}(i)}^{(1)}, t_{I_{\mathcal{P}_1}(i)+1}^{(1)}\right] \text{ and } [t_i, t_{i+1}] \subseteq \left[t_{I_{\mathcal{P}_1}(i)}^{(2)}, t_{I_{\mathcal{P}_1}(i)+1}^{(2)}\right]$$

Proof. We prove this for $i_{\mathcal{P}_1}$ [the proof for $i_{\mathcal{P}_2}$ is exact the same as this proof by exchanging 1 with 2]. Let $i \in \{1, \ldots, n-1\}$ then we have

$$t_i \neq t_n = b = t_n^{(1)} = t_n^{(2)} \text{ so that } t_i \neq t_n^{(1)} \text{ and } t_i \neq t_n^{(2)}$$

Define $B = \left\{j \in \{1, \ldots, n_1\} | t_j^{(1)} \leqslant t_i\right\} \subseteq \{1, \ldots, n_1\}$ then as $t_1^{(1)} = a \leqslant t_i$ we have $1 \in B$ so that $B \neq \varnothing$. As B is finite $m = \max(B) \in \{1, \ldots, n_1\}$ exist. If $m = n_1$ then $b = t_{n_1}^{(1)} = t_m^{(1)} \leqslant t_i$ which as $t_i \neq b$ is a contradiction. Hence we must have that $m \neq n_1$ so that

$$m \in \{1, \ldots, n_1 - 1\} \tag{15.7}$$

As $m=\max(B)$ we have $m+1\notin B$ so that $t_i<t^{(1)}_{m+1}$ and, as $m\in B$, we have $t^{(1)}_m\leqslant t_i$ or

$$t^{(1)}_m\leqslant t_i<t^{(1)}_{m+1} \tag{15.8}$$

By [theorem: 15.8] there exist a $l\in\{1,\ldots,n\}$ such that

$$t^{(1)}_{m+1}=t_l \tag{15.9}$$

Assume that $t^{(1)}_{m+1}<t_{i+1}$, then by the above and [eq: 15.8] we have $t_i<t_l<t_{i+1}$ so that $t_l\in\left]t_i,t_{i+1}\right[$ which is impossible by [theorem: 15.4 (5)]. Hence the assumption is wrong and we must have $t_{i+1}\leqslant t^{(1)}_{m+1}$. Combining this with [eq: 15.8] gives $t^{(1)}_m\leqslant t_i<t_{i+1}\leqslant t^{(1)}_{m+1}$ or $[t_i,t_{i+1}]\subseteq\left[t^{(1)}_m,t^{(1)}_{m+1}\right]$. So if we take $i_{\mathcal{P}_1}=m$ then we have

$$i_{\mathcal{P}_1}\in\{1,\ldots,n_1-1\}\text{ and }[t_i,t_{i+1}]\subseteq\left[t^{(1)}_{i_{\mathcal{P}_1}},t^{(1)}_{i_{\mathcal{P}_1}+1}\right]$$

This proves existence, next we prove uniqueness. So assume that there exist a $k\in\{1,\ldots,n_1-1\}$ such that $[t_i,t_{i+1}]\subseteq\left[t^{(1)}_k,t^{(1)}_{k+1}\right]$. Assume that $k\neq i_{\mathcal{P}_1}$ then we have two cases to consider:

$\boldsymbol{k<i_{\mathcal{P}_1}}$. Then $t^{(1)}_k<t^{(1)}_{i_{\mathcal{P}_1}}\leqslant t_i<t_{i+1}\leqslant t^{(1)}_{k+1}$ so that $t^{(1)}_{i_{\mathcal{P}_1}}\in\left]t^{(1)}_k,t^{(1)}_{k+1}\right[$ which is impossible by [theorem: 15.4 (5)].

$\boldsymbol{i_{\mathcal{P}_1}<k}$. Then $t^{(1)}_{i_{\mathcal{P}_1}}<t^{(1)}_k\leqslant t_i<t_{i+1}\leqslant t^{(1)}_{i_{\mathcal{P}_1}}$ so that $t^{(1)}_k\in\left]t^{(1)}_{i_{\mathcal{P}_1}},t^{(i)}_{i_{\mathcal{P}_1}+1}\right[$ which is impossible by [theorem: 15.4 (5)].

So as in all cases we have a contradiction the assumption must be wrong. Hence $k=i_{\mathcal{P}_1}$ which proves uniqueness. □

Lemma 15.10. *Let $a,b\in\mathbb{R}$ with $a<b$ and $\mathcal{P}_1=\left\{t^{(1)}_i\right\}_{i\in\{1,\ldots,n_1\}}\subseteq\mathbb{R}$, $\mathcal{P}_2=\left\{t^{(2)}_i\right\}_{i\in\{1,\ldots,n_2\}}\subseteq\mathbb{R}$ two partitions of $[a,b]$, let $\mathcal{P}_1\square\mathcal{P}_2=\{t_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{R}$ then for the functions*

$$I_{\mathcal{P}_1}\colon\{1,\ldots,n-1\}\to\{1,\ldots,n_1-1\}$$

$$I_{\mathcal{P}_2}\colon\{1,\ldots,n-1\}\to\{1,\ldots,n_2-1\}$$

functions such that

$$\forall i\in\{1,\ldots,n-1\}\text{ we have }[t_i,t_{i+1}]\subseteq\left[t^{(1)}_{I_{\mathcal{P}_1}(i)},t^{(1)}_{I_{\mathcal{P}_1}(i)+1}\right]\text{ and }\left[t^{(2)}_{I_{\mathcal{P}_2}(i)},t^{(2)}_{I_{\mathcal{P}_2}(i)+1}\right]$$

[who exist by [lemma: 15.9]] we have that:

1.
   a. $I_{\mathcal{P}_1}\colon\{1,\ldots,n-1\}\to\{1,\ldots,n_1-1\}$ *is surjective*
   b. $I_{\mathcal{P}_2}\colon\{1,\ldots,n-1\}\to\{1,\ldots,n_{12}-1\}$ *is surjective*

   and $I_{\mathcal{P}_2}\colon\{1,\ldots,n-1\}\to\{1,\ldots,n_2-1\}$ *are surjective.*
2.
   a. $\forall i\in\{1,\ldots,n_1-1\}$ $I^{-1}_{\mathcal{P}_1}(\{i\})=\left\{m^{(1)}_i,\ldots,M^{(1)}_i\right\}$ *where* $t_{m^{(1)}_i}=t^{(1)}_i$ *and* $t_{M^{(1)}_i+1}=t^{(1)}_{i+1}$
   b. $\forall i\in\{1,\ldots,n_2-1\}$ $I^{-1}_{\mathcal{P}_2}(\{i\})=\left\{m^{(2)}_i,\ldots,M^{(2)}_i\right\}$ *where* $t_{m^{(2)}_i}=t^{(2)}_i$ *and* $t_{M^{(2)}_i+1}=t^{(2)}_{i+1}$
3.
   a. $\forall i,j\in\{1,\ldots,n_1-1\}$ *with* $i\neq j$ *we have* $I^{-1}_{\mathcal{P}_1}(\{i\})\bigcap I^{-1}_{\mathcal{P}_1}(\{j\})=\varnothing$
   b. $\forall i,j\in\{1,\ldots,n_2-1\}$ *with* $i\neq j$ *we have* $I^{-1}_{\mathcal{P}_2}(\{i\})\bigcap I^{-1}_{\mathcal{P}_2}(\{j\})=\varnothing$

Proof.

1.
   a. Let $k\in\{1,\ldots,n_1-1\}$ then for $t^{(1)}_k$ there exist by [theorem: 15.8] there exist a $i\in\{1,\ldots,n\}$ such that $t^{(1)}_k=t_i$. As $k<n_1$ we have that $t^{(1)}_k<t^{(1)}_n=b$ so that $t_i\neq b$ proving that $i\neq n$ or

$$i\in\{1,\ldots,n-1\}\text{ and }t_i=t^{(1)}_k \tag{15.10}$$

Assume that $t_{k+1}^{(1)} < t_{i+1}$. By [theorem: 15.8] there exist a $j \in \{1, \ldots, n\}$ such that $t_j = t_{k+1}^{(1)}$. Then we have $t_i = t_k^{(1)} < t_{k+1}^{(1)} = t_j = t_{k+1}^{(1)} < t_{i+1}$ or $t_j \in]t_I, t_{I+1}[$, which is impossible by [theorem: 15.4 (5)], so that assumption must be wrong and we must have $t_{i+1} \leqslant t_{k+1}^{(1)}$, combining this with [eq: 15.10] results in $t_k^{(1)} = t_i < t_{i+1} \leqslant t_{k+1}^{(1)}$ or $[t_i, t_{i+1}] \subseteq \left[t_k^{(1)}, t_{k+1}^{(1)}\right]$. This proves that $k = I_{\mathcal{P}_1}(i)$ and thus surjectivity.

b. This is similar as the proof of (1.a) by replacing 1 by 2 in the proof.

2.

a. Let $i \in \{1, \ldots, n_1 - 1\}$ then, as $I_{\mathcal{P}_1}$ is surjective we have that $\varnothing = I_{\mathcal{P}_1}^{-1}(\{i\}) \subseteq \{1, \ldots, n-1\}$. Hence then minimum and maximum exist, take

$$m_i^{(1)} = \min\left(I_{\mathcal{P}_1}^{-1}(\{i\})\right) \text{ and } M_i^{(1)} = \max\left(I_{\mathcal{P}_1}^{-1}(\{i\})\right) \tag{15.11}$$

By the definition of min , max we have

$$I_{\mathcal{P}_1}^{-1}(\{i\}) \subseteq \left\{m_i^{(1)}, \ldots, M_i^{(1)}\right\} \text{ and } m_i^{(1)}, M_i^{(1)} \in I_{\mathcal{P}_1}^{-1}(\{i\}) \tag{15.12}$$

If $k \in \left\{m_i^{(1)}, \ldots, M_i^{(1)}\right\}$ then $m_i^{(1)} \leqslant k \leqslant M_i^{(1)} \Rightarrow k+1 \leqslant M_i^{(1)}$ so that

$$t_{m_i^{(1)}} \leqslant t_k \text{ and } t_{k+1} \leqslant t_{M_i^{(1)}+1} \tag{15.13}$$

As we have $m_i^{(1)}, M_i^{(1)} \in I_{\mathcal{P}_1}^{-1}(\{i\})$ it follows that $I_{\mathcal{P}_1}\left(m_i^{(1)}\right) = i = I_{\mathcal{P}_1}\left(M_i^{(1)}\right)$ so that $\left[t_{m_i^{(1)}}, t_{m_i^{(1)}+1}\right] \subseteq \left[t_i^{(1)}, t_{i+1}^{(1)}\right]$ and $\left[t_{M_i^{(1)}}, t_{M_i^{(1)}+1}\right] \subseteq \left[t_i^{(1)}, t_{i+1}^{(1)}\right]$ so that

$$t_i^{(1)} \leqslant t_{m_i^{(1)}} \leqslant t_k < t_{k+1} \leqslant t_{M_i^{(1)}+1} \leqslant t_{i+1}^{(1)} \text{ and } t_i^{(1)} \leqslant t_{M_i^{(1)}} < t_{M_i^{(1)}+1} \leqslant t_{i+1}^{(1)} \tag{15.14}$$

or $[t_k, t_{k+1}] \subseteq \left[t_i^{(1)}, t_{i+1}^{(1)}\right]$, hence $I_{\mathcal{P}_1}(k) = i$ or $k \in I_{\mathcal{P}_1}^{-1}(\{i\})$. So we have proved that $\left\{m_i^{(1)}, \ldots, M_i^{(1)}\right\} \subseteq I_{\mathcal{P}_1}^{-1}(\{i\})$, combining this with [eq: 15.12] gives

$$I_{\mathcal{P}_1}^{-1}(\{i\}) = \left\{m_i^{(1)}, \ldots, M_i^{(1)}\right\} \tag{15.15}$$

Assume that $t_i^{(1)} < t_{m_i^{(1)}}$. By [theorem: 15.8] there exist a $l \in \{1, \ldots, n\}$ such that

$$t_l = t_i^{(1)}$$

giving $t_l < t_{m_i^{(1)}}$, resulting in

$$l < m_i^{(1)}, \tag{15.16}$$

hence $l + 1 < m_i^{(1)} + 1$. From this it follows that

$$t_i^{(1)} = t_l < t_{l+1} < t_{m^{(1)}+1} \leqslant_{\text{[eq: 15.14]}} t_{i+1}^{(1)}$$

So that $[t_l, t_{l+1}] \subseteq \left[t_i^{(1)}, t_{i+1}^{(1)}\right]$ proving that $I_{\mathcal{P}_1}(l) = i$ or $l \in I_{\mathcal{P}_1}^{-1}(\{i\}) = \left\{m_i^{(1)}, \ldots, M_i^{(1)}\right\}$, hence

$$m_i^{(1)} \leqslant l <_{\text{[eq: 15.16]}} m_i^{(1)}$$

a contradiction. From this we conclude that the assumption is wrong, so $t_{m_i^{(1)}} \leqslant t_i^{(1)}$, combining this with [eq: 15.14] proves that

$$t_{m_i^{(1)}} = t_i^{(1)} \tag{15.17}$$

Assume that $t_{M_i^{(1)}+1} < t_{i+1}^{(1)}$. By [theorem: 15.8] there exist a $k \in \{1, \ldots, n\}$ such that

$$t_k = t_{i+1}^{(1)}$$

giving $t_{M_k^{(1)}+1} < t_k$ so that resulting in $M_k^{(1)} + 1 < k$ or

$$M_k^{(1)} < k - 1 \tag{15.18}$$

so that

$$t_i^{(1)} \leqslant_{\text{[eq: 15.14]}} t_{M_k^{(1)}} < t_{k-1} < t_k = t_{i+1}^{(1)}$$

So that $[t_{k-1},t_k]\subseteq\left[t_i^{(1)},t_{i+1}^{(1)}\right]$ proving that $I_{\mathcal{P}_1}(k-1)=i$ or $k-1\in I_{\mathcal{P}_1}^{-1}(\{i\})=\left\{m_i^{(1)},\ldots,M_i^{(1)}\right\}$ hence $k-1\leqslant M_i^{(1)}<_{[\text{eq: 15.18}]}k-1$ a contradiction. Hence the assumption must be wrong and we have $t_{i+1}^{(1)}\leqslant t_{M_{i+1}^{(1)}}$, combining this with [eq: 15.14] gives

$$t_{M_{i+1}^{(1)}}=t_{i+1}^{(1)} \tag{15.19}$$

Finally (2.a) is proved by [eqs: 15.15, 15.17 and 15.19].

b. This is similar as the proof of (2.a) by replacing 1 by 2 in the proof.

3.

a. Let $i,j\in\{1,\ldots,n_1-1\}$ with $i\neq j$. Assume that $k\in I_{\mathcal{P}_1}^{-1}(\{i\})\bigcap I_{\mathcal{P}_1}^{-1}(\{j\})$ then $I_{\mathcal{P}_1}(\{k\})=i$ and $I_{\mathcal{P}_1}(\{k\})=j$ so that by the definition of a function we have $i=j$ a contradiction. Hence $I_{\mathcal{P}_1}^{-1}(\{i\})\bigcap I_{\mathcal{P}_1}^{-1}(\{j\})=\varnothing$.

b. This is similar as the proof of (3.a) by replacing 1 by 2 in the proof. □

To be able to define a integral of a function on a closed interval we need a limiting process where the length of the intervals in the partitions become smaller and smaller so that more details of the function are used in the calculation of the integral. To quantify this we introduce a norm of a partition. Beware this norm is unrelated to norms on normed spaces.

Definition 15.11. *Let $a,b\in\mathbb{R}$ with $a<b$ and $\mathcal{P}=\{t_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{R}$ a partition of $[a,b]$ then the **norm** of the partition noted as $\mu(\mathcal{P})$ is defined by*

$$\mu(\mathcal{P})=\max\left(\{|t_{i+1}-t_i||i\in\{1,\ldots,n-1\}\}\right)\underset{t_i<t_{i+1}}{=}\max\left(\{t_{i+1}-t_i|i\in\{1,\ldots,n-1\}\}\right)$$

Definition 15.12. *Let $a,b\in\mathbb{R}$ with $a<b$ and $\mathcal{P}=\{t_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{R}$ a partition of $[a,b]$ then a **tag** on $\mathcal{P}$ is a family $\{s_i\}_{i\in\{1,\ldots,n-1\}}\subseteq\mathbb{R}$ such that $\forall i\in\{1,\ldots,n-1\}$ we have $s_i\in[t_i,t_{i+1}]$.*
*A **tagged partition** on $[a,b]$ is a pair of a partition on the partition. So a tagged partition is a pair*

$$\langle\{t_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{R},\{s_i\}_{i\in\{1,\ldots,n-1\}}\subseteq\mathbb{R}\rangle$$

such that:

1. *$n\in\mathbb{N}\setminus\{1\}$*
2. *$\forall i\in\{1,\ldots,n-1\}$ we have $t_i<t_{i+1}$ and $s_i\in[t_i,t_{i+1}]$*
3. *$t_1=a$ and $t_2=b$*

The norm of a tagged partition is the norm of the partition of the tagged partition in other words if

$$\langle\{t_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{R},\{s_i\}_{i\in\{1,\ldots,n-1\}}\subseteq\mathbb{R}\rangle$$

is a tagged partition then

$$\mu(\langle\{t_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{R},\{s_i\}_{i\in\{1,\ldots,n-1\}}\subseteq\mathbb{R}\rangle)=\mu(\{t_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{R})$$

Theorem 15.13. *Let $a,b\in\mathbb{R}^+$ with $a<b$, $\varepsilon\in\mathbb{R}^+$ then there exist a tagged partition $\mathbb{P}$ on $[a,b]$ such that $\mu(\mathbb{P})<\varepsilon$*

Proof. Using [theorem: 10.30] there exist a $N\in\mathbb{N}$ such that $\frac{1}{N}<\frac{\varepsilon}{b-a}$ and take $\delta=\frac{b-a}{N}$. Then we have $\frac{b-a}{N}=(b-a)\cdot\frac{1}{N}<(b-a)\cdot\frac{\varepsilon}{b-a}=\varepsilon$ so that

$$\delta<\varepsilon \tag{15.20}$$

Define now

$$\{t_i\}_{i\in\{1,\ldots,N+1\}}\text{ by }t_i=a+(i-1)\cdot\delta\text{ and }\{s_i\}_{i\in\{1,\ldots,N+1\}}\text{ by }s_i=t_i$$

then $\forall i\in\{1,\ldots,(N+1)-1\}$ we have

$$s_i\in[t_i,t_{i+1}]$$

and

$$t_i=a+(i-1)\cdot\delta<a+(i-1)\cdot\delta+\delta=a+((i+1)-1)\cdot\delta=t_{i+1}$$

and

$$t_{i+1}-t_i=a+((i+1)-1)\cdot\delta-(a+(i-1)\cdot\delta)=\delta<\varepsilon$$

so that

$$\mu(\{t_i\}_{i\in\{1,\ldots,N+1\}}) = \max(\{t_{i+1}-t_i | i\in\{1,\ldots,(N+1)-1\}\}) = \max(\{\delta\}) = \delta < \varepsilon$$

Further

$$t_1 = a + (1-1)\cdot\delta = a \text{ and } t_{N+1} = a + ((N+1)-1)\cdot\delta = a + N\cdot\delta = a + \frac{b-a}{N}\cdot N = b$$

Hence

$$\mathbb{P} = \langle \{t_i\}_{i\in\{1,\ldots,N+1\}}, \{s_i\}_{i\in\{1,\ldots,N+1\}}\rangle$$

is a tagged partition on $[a,b]$ with $\mu(\mathbb{P}) < \varepsilon$. □

We are now ready to define a Riemann sum that will be used to approximate the integral of a function.

Definition 15.14. *Let $a,b\in\mathbb{R}$ with $a<b$, $\mathbb{P} = \langle \{t_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathbb{R}, \{s_i\}_{i\in\{1,\ldots,n-1\}} \subseteq \mathbb{R}\rangle$ a tagged partition on $[a,b]$, $\langle X, \|\|\rangle$ a normed space and $f\colon [a,b]\to X$ a function then the* ***Riemann sum of f using the tagged partition*** $\mathbb{P}$ *noted ans $\mathcal{S}(f,\mathbb{P})$ is defined by*

$$\mathcal{S}(f,\mathbb{P}) = \sum_{i=1}^{n-1} (t_{i+1}-t_i)\cdot f(s_i)$$

Theorem 15.15. *Let $a,b\in\mathbb{R}$ with $a<b$, $\mathbb{P} = \langle \{t_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathbb{R}, \{s_i\}_{i\in\{1,\ldots,n-1\}} \subseteq \mathbb{R}\rangle$ a tagged partition on $[a,b]$, $\alpha\in\mathbb{K}$ and $f\colon [a,b]\to X$, $g\colon [a,b]\to X$ functions then*

$$\mathcal{S}(\alpha\cdot f+g,\mathbb{P}) = \alpha\cdot\mathcal{S}(f,\mathbb{P}) + \mathcal{S}(g,\mathbb{P})$$

Proof. We have

$$\begin{aligned}
\mathcal{S}(\alpha\cdot f+g,\mathbb{P}) &= \sum_{i=1}^{n-1} (t_{i+1}-t_i)\cdot(\alpha\cdot f+g)(s_i) \\
&= \sum_{i=1}^{n-1} (t_{i+1}-t_i)\cdot(\alpha\cdot f(s_i)+g(s_i)) \\
&= \sum_{i=1}^{n-1} (\alpha\cdot(t_{i+1}-t_i)\cdot f(s_i) + (t_{i+1}-t_i)\cdot g(s_i)) \\
&= \alpha\cdot\sum_{i=1}^{n-1} (t_{i+1}-t_i)\cdot f(s_i) + \sum_{i=1}^{n-1} (t_{i+1}-t_i)\cdot g(s_i) \\
&= \alpha\cdot\mathcal{S}(f,\mathbb{P}) + \mathcal{S}(g,\mathbb{P})
\end{aligned}$$

□

Theorem 15.16. *Let $a,b\in\mathbb{R}$ with $a<b$, $\mathbb{P} = \langle \{t_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathbb{R}, \{s_i\}_{i\in\{1,\ldots,n-1\}} \subseteq \mathbb{R}\rangle$ a tagged partition on $[a,b]$. $\langle \mathbb{R}, \|\rangle$ the normed space of real numbers and $f\colon [a,b]\to\mathbb{R}$, $g\colon [a,b]\to\mathbb{R}$ functions such that $\forall x\in[a,b]$ we have $f(x)\leqslant g(x)$ then $\mathcal{S}(f,\mathbb{P})\leqslant\mathcal{S}(g,\mathbb{P})$*

Proof. As $\forall i\in\{1,\ldots,n\}$ we have $0\leqslant t_{i+1}-t_i$, $f(s_i)\leqslant g(s_i)$ it follows that $f(s_i)\cdot(t_{i+1}-t_i)\leqslant g(s_i)\cdot(t_{i+1}-t_i)$ so that $\mathcal{S}(f,\mathbb{P}) = \sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot f(s_i) = \sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot g(s_i) = \mathcal{S}(g,\mathbb{P})$. □

Lemma 15.17. *Let $a,b\in\mathbb{R}$ with $a<b$,*

$$\mathbb{P}_1 = \left\langle \left\{t_i^{(1)}\right\}_{i\in\{1,\ldots,n_1\}} \subseteq \mathbb{R}, \left\{s_i^{(1)}\right\}_{i\in\{1,\ldots,n_1-1\}}\right\rangle$$

$$\mathbb{P}_2 = \left\langle \left\{t_i^{(2)}\right\}_{i\in\{1,\ldots,n_2} \subseteq \mathbb{R}, \left\{s_i^{(2)}\right\}_{i\in\{1,\ldots,n_2-1\}}\right\rangle$$

tagged partitions on $[a,b]$, $\langle X, \|\|\rangle$ a normed space and

$$f\colon [a.b]\to X \text{ a function}$$

then for

$$\mathcal{P} = \{t_i\}_{i\in\{1,\ldots,n\}} \text{ defined by } \mathcal{P} = \left\{t_i^{(1)}\right\}_{i\in\{1,\ldots,n_1\}} \square \left\{t_i^{(1)}\right\}_{i\in\{1,\ldots,n_2}$$

we have:

1. $S(f,\mathbb{P}_1)=\sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot f\left(s^{(1)}_{I_{\mathcal{P}_1}(i)}\right)$
2. $S(f,\mathbb{P}_2)=\sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot f\left(s^{(2)}_{I_{\mathcal{P}_2}(i)}\right)$
3. $S(f,\mathbb{P}_1)-S(f,\mathbb{P}_2)=\sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot\left(f\left(s^{(1)}_{I_{\mathcal{P}_1}(i)}\right)-f\left(s^{(2)}_{I_{\mathcal{P}_2}(i)}\right)\right)$

where

$$I_{\mathcal{P}_1}\colon\{1,\ldots,n-1\}\to\{1,\ldots,n_1-1\}\ \textit{and}\ I_{\mathcal{P}_2}\colon\{1,\ldots,n-1\}\to\{1,\ldots,n_2-1\}$$

are the functions defined in lemmas [lemma: 15.9] and [lemma: 15.10].

Proof.

1. As $\{1,\ldots,n_1-1\}=\bigcup_{k\in\{1,\ldots,n_1-1\}}\{k\}$ we have

$$\begin{aligned}\{1,\ldots,n-1\} &= I^{-1}_{\mathcal{P}_1}(\{1,\ldots,n_1-1\})\\ &= I^{-1}_{\mathcal{P}_1}\left(\bigcup_{k\in\{1,\ldots,n_1-1\}}\{k\}\right)\\ &\underset{\text{[theorem: 2.136]}}{=} \bigcup_{k\in\{1,\ldots,n_1-1\}} I^{-1}_{\mathcal{P}_1}(\{k\})\end{aligned}$$

and by [lemma: 15.10] we have

$$\forall i,j\in\{1,\ldots,n_1-1\}\text{ with } i\neq j \text{ we have } I^{-1}_{\mathcal{P}_1}(\{i\})\bigcap I^{-1}_{\mathcal{P}_1}(\{j\})=\varnothing$$

allowing us to apply [theorem: 11.43] in the following.

$$\begin{aligned}\sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot f\left(s^{(1)}_{I_{\mathcal{P}_1}(i)}\right) &= \sum_{i\in\{1,\ldots,n-1\}}(t_{i+1}-t_i)\cdot f\left(s^{(1)}_{I_{\mathcal{P}_1}(i)}\right)\\ &= \sum_{i\in\bigcup_{k\in\{1,\ldots,n_1-1\}}I^{-1}_{\mathcal{P}_1}(\{k\})}(t_{i+1}-t_i)\cdot f\left(s^{(1)}_{I_{\mathcal{P}_1}(i)}\right)\\ &\underset{\text{[theorem: 11.43]}}{=} \sum_{k=1}^{n_1-1}\left(\sum_{i\in I^{-1}_{\mathcal{P}_1}(\{k\})}(t_{i+1}-t_i)\cdot f\left(s^{(1)}_{I_{\mathcal{P}_1}(i)}\right)\right)\\ &= \sum_{k=1}^{n_1-1}\left(\sum_{i\in I^{-1}_{\mathcal{P}_1}(\{k\})}(t_{i+1}-t_i)\cdot f\left(s^{(1)}_{k}\right)\right)\\ &= \sum_{k=1}^{n_1-1}\left(\sum_{i\in I^{-1}_{\mathcal{P}_1}(\{k\})}(t_{i+1}-t_i)\right)\cdot f\left(s^{(1)}_{k}\right)\\ &\underset{\text{[lemma: 15.10]}}{=} \sum_{k=1}^{n_1-1}\left(\sum_{i\in\{m^{(1)}_k,\ldots,M^{(1)}_k\}}(t_{i+1}-t_i)\right)\cdot f\left(s^{(1)}_{k}\right)\\ &= \sum_{k=1}^{n_1-1}\left(\sum_{i\in m^{(1)}_k}^{M^{(1)}_k}(t_{i+1}-t_i)\right)\cdot f\left(s^{(1)}_{k}\right)\\ &\underset{\text{[theorem: 11.21]}}{=} \sum_{k=1}^{n_1-1}\left(t_{M^{(1)}_k+1}-t_{m^{(1)}_k}\right)\cdot f\left(s^{(1)}_{k}\right)\\ &\underset{\text{[lemma: 15.10]}}{=} \sum_{k=1}^{n_1-1}\left(t^{(1)}_{k+1}-t^{(1)}_{k}\right)\cdot f\left(s^{(1)}_{k}\right)\\ &= \mathcal{S}(f,\mathbb{P}_1)\end{aligned}$$

2. The proof is similar to the proof of (1) just replace 1 with 2.

3. We have that

$$\begin{aligned} S(f,\mathbb{P}_1)-S(f,\mathbb{P}_2) &\underset{(1,2)}{=} \sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot f\big(s^{(1)}_{I_{\mathcal{P}_1}(i)}\big)-\sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot f\big(s^{(2)}_{I_{\mathcal{P}_2}(i)}\big) \\ &= \sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot\big(f\big(s^{(1)}_{I_{\mathcal{P}_1}(i)}\big)-f\big(s^{(2)}_{I_{\mathcal{P}_2}(i)}\big)\big) \end{aligned}$$

□

Lemma 15.18. *Let $a,b\in\mathbb{R}$ with $a<b$, $\langle X,\|\|\rangle$ a normed space and*

$$f:[a.b]\to X \text{ a continuous function}$$

then for every $\varepsilon\in\mathbb{R}^+$ there exist a $\delta\in\mathbb{R}^+$ such that for every two tagged partitions $\mathbb{P}_1$, $\mathbb{P}_2$ on $[a,b]$ with $\mu(\mathbb{P}_1)<\delta$ and $\mu(\mathbb{P}_2)<\delta$ we have $\|\mathcal{S}(f,\mathbb{P}_1)-\mathcal{S}(f,\mathbb{P}_2)\|<\varepsilon$

Proof. As $[a,b]$ is compact [see theorem: 14.235] and f is continuous we can use [theorem: 14.244] that f is uniform continuous on $[a,b]$. So there exist a $\delta'\in\mathbb{R}^+$ such that

$$\forall x,x'\in[a,b] \text{ with } |x-x'|< \text{ we have } \|f(x)-f(x')\|<\frac{\varepsilon}{b-a} \tag{15.21}$$

Take $\delta=\frac{\delta'}{2}$ and let

$$\mathbb{P}_1=\big\langle\big\{t^{(1)}_i\big\}_{i\in\{1,\dots,n_1\}}\subseteq\mathbb{R},\big\{s^{(1)}_i\big\}_{i\in\{1,\dots,n_1-1\}}\big\rangle$$

$$\mathbb{P}_2=\big\langle\big\{t^{(2)}_i\big\}_{i\in\{1,\dots,n_2\}}\subseteq\mathbb{R},\big\{s^{(2)}_i\big\}_{i\in\{1,\dots,n_2-1\}}\big\rangle$$

be two tagged partitions on $[a,b]$ such that $\mu(\mathbb{P}_1)<\delta$ and $\mu(\mathbb{P}_2)<\delta$. Consider

$$\mathcal{P}=\{t_i\}_{i\in\{1,\dots,n\}} \text{ defined by } \mathcal{P}=\big\{t^{(1)}_i\big\}_{i\in\{1,\dots,n_1\}}\bigsqcup\big\{t^{(1)}_i\big\}_{i\in\{1,\dots,n_2}$$

then we have by [lemma: 15.17] that

$$\|\mathcal{S}(f,\mathbb{P}_1)-\mathcal{S}(f,\mathbb{P}_2)\|=\left\|\sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot\big(f\big(s^{(1)}_{I_{\mathcal{P}_1}(i)}\big)-f\big(s^{(2)}_{I_{\mathcal{P}_2}(i)}\big)\big)\right\| \tag{15.22}$$

Let $i\in\{1,\dots,n-1\}$ then by [lemma: 15.9] $t_i\in[t_i,t_{i+1}]\subseteq\Big[t^{(1)}_{I_{\mathcal{P}_1}(i)},t^{(1)}_{I_{\mathcal{P}_1}(i)+1}\Big]\bigcap\Big[t^{(2)}_{I_{\mathcal{P}_2}(i)},t^{(2)}_{I_{\mathcal{P}_2}(i)+1}\Big]$ so that

$$t^{(1)}_{I_{\mathcal{P}_1}(i)}\leqslant t_i\leqslant t^{(1)}_{I_{\mathcal{P}_1}(i)+1} \text{ and } t^{(2)}_{I_{\mathcal{P}_2}(i)}\leqslant t_i\leqslant t^{(2)}_{I_{\mathcal{P}_2}(i)+1}$$

Further we have $s^{(1)}_{I_{\mathcal{P}_1}(i)}\in\Big[t^{(1)}_{I_{\mathcal{P}_1}(i)},t^{(1)}_{I_{\mathcal{P}_1}(i)+1}\Big]$ and $s^{(2)}_{I_{\mathcal{P}_2}(i)}\in\Big[t^{(2)}_{I_{\mathcal{P}_2}(i)},t^{(2)}_{I_{\mathcal{P}_2}(i)+1}\Big]$ so that

$$t^{(1)}_{I_{\mathcal{P}_1}(i)}\leqslant s^{(1)}_{I_{\mathcal{P}_1}(i)}\leqslant t^{(1)}_{I_{\mathcal{P}_1}(i)+1} \text{ and } t^{(2)}_{I_{\mathcal{P}_2}(i)}\leqslant s^{(2)}_{I_{\mathcal{P}_2}(i)}\leqslant t^{(2)}_{I_{\mathcal{P}_2}(i)+1}$$

So $s^{(1)}_{I_{\mathcal{P}_1}(i)}-t_i\leqslant t^{(1)}_{I_{\mathcal{P}_1}(i)+1}-t^{(1)}_{I_{\mathcal{P}_1}(i)}\leqslant\mu(\mathbb{P}_1)<\delta$ and $t_i-s^{(1)}_{I_{\mathcal{P}_1}(i)}\leqslant t^{(1)}_{I_{\mathcal{P}_1}(i)+1}-t^{(1)}_{I_{\mathcal{P}_1}(i)}\leqslant\mu(\mathbb{P}_1)<\delta$ proving that

$$\big|s^{(1)}_{I_{\mathcal{P}_1}(i)}-t_i\big|<\delta$$

Also we have $s^{(2)}_{I_{\mathcal{P}_2}(i)}-t_i\leqslant t^{(2)}_{I_{\mathcal{P}_2}(i)+1}-t^{(2)}_{I_{\mathcal{P}_2}(i)}\leqslant\mu(\mathbb{P}_2)<\delta$ and $t_i-s^{(2)}_{I_{\mathcal{P}_2}(i)}\leqslant t^{(2)}_{I_{\mathcal{P}_2}(i)+1}-t^{(2)}_{I_{\mathcal{P}_2}(i)}\leqslant\mu(\mathbb{P}_2)<\delta$ proving

$$\big|s^{(2)}_{I_{\mathcal{P}_2}(i)}-t_i\big|<\delta$$

So that

$$\big|s^{(1)}_{I_{\mathcal{P}_1}(i)}-s^{(2)}_{I_{\mathcal{P}_2}(i)}\big|\leqslant\big|s^{(1)}_{I_{\mathcal{P}_1}(i)}-t_i\big|+\big|t_i-s^{(2)}_{I_{\mathcal{P}_2}(i)}\big|<\delta+\delta=2\cdot\delta=\delta'$$

Hence by [eq: 15.21] it follows that

$$\big\|f\big(s^{(1)}_{I_{\mathcal{P}_1}(i)}\big)-f\big(s^{(2)}_{I_{\mathcal{P}_2}(i)}\big)\big\|<\frac{\varepsilon}{b-a} \tag{15.23}$$

Now

$$\begin{aligned}
\left\|\sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot\left(f\left(s^{(1)}_{I_{\mathcal{P}_1}(i)}\right)-f\left(s^{(2)}_{I_{\mathcal{P}_2}(i)}\right)\right)\right\| &\leqslant \\
\sum_{i=1}^{n-1}\left\|(t_{i+1}-t_i)\cdot\left(f\left(s^{(1)}_{I_{\mathcal{P}_1}(i)}\right)-f\left(s^{(2)}_{I_{\mathcal{P}_2}(i)}\right)\right)\right\| &= \\
\sum_{i=1}^{n-1}\left(|t_{i+1}-t_i|\cdot\left\|\left(f\left(s^{(1)}_{I_{\mathcal{P}_1}(i)}\right)-f\left(s^{(2)}_{I_{\mathcal{P}_2}(i)}\right)\right)\right\|\right) &<_{\text{[eq: 15.23]}} \\
\sum_{i=1}^{n-1}|t_{i+1}-t_i|\cdot\frac{\varepsilon}{b-a} &= \\
\frac{\varepsilon}{b-a}\cdot\sum_{i=1}^{n-1}|t_{i+1}-t_i| &=_{t_i<t_{i+1}} \\
\frac{\varepsilon}{b-a}\cdot\sum_{i=1}^{n-1}(t_{i+1}-t_i) &=_{\text{[theorem: 11.21]}} \\
\frac{\varepsilon}{b-a}\cdot(t_n-t_1) &= \\
\frac{\varepsilon}{b-a}\cdot(b-a) &= \\
\varepsilon &=
\end{aligned}$$

□

Lemma 15.19. *Let $a,b\in\mathbb{R}$ with $a<b$, $\langle X,\|\|\rangle$ a normed space and $f:[a,b]\to X$ a function and $I_1,I_2\in X$ satisfying:*

1. *$\forall\varepsilon\in\mathbb{R}^+$ there exist a $\delta\in\mathbb{R}^+$ such that for every tagged partition $\mathbb{P}$ on $[a,b]$ with $\mu(\mathbb{P})<\delta$ we have $\|I_1-\mathcal{S}(f,\mathbb{P})\|<\varepsilon$*
2. *$\forall\varepsilon\in\mathbb{R}^+$ there exist a $\delta\in\mathbb{R}^+$ such that for every tagged partition $\mathbb{P}$ on $[a,b]$ with $\mu(\mathbb{P})<\delta$ we have $\|I_2-\mathcal{S}(f,\mathbb{P})\|<\varepsilon$*

then we have that $I_1=I_2$.

Proof. Assume that $I_1\neq I_2$ then we have $\varepsilon=\|I_1-I_2\|\in\mathbb{R}^+$. By (1),(2) there exist $\delta_1,\delta_2\in\mathbb{R}^+$ such that for every tagged partition $\mathbb{P}_1$ with $\mu(\mathbb{P}_1)<\delta_1$ and for every tagged partition $\mathbb{P}_2$ with $\mu(\mathbb{P}_2)<\delta_2$ we have $\|I_1-\mathcal{S}(f,\mathbb{P}_1)\|<\frac{\varepsilon}{2}$ and $\|I_2-\mathcal{S}(f,\mathbb{P}_2)\|<\frac{\varepsilon}{2}$. Using [theorem: 15.13] there exist a partition $\mathbb{P}$ such that $\mu(\mathbb{P})<\min(\delta_1,\delta_2)$, so that we have

$$\|I_1-\mathcal{S}(f,\mathbb{P})\|<\frac{\varepsilon}{2}\text{ and }\|I_1-\mathcal{S}(f,\mathbb{P})\|<\frac{\varepsilon}{2}$$

so that

$$\varepsilon=\|I_1-I_2\|\leqslant\|I_1-\mathcal{S}(f,\mathbb{P})\|+\|\mathcal{S}(f,\mathbb{P})-I_2\|<\frac{\varepsilon}{2}+\frac{\varepsilon}{2}=\varepsilon$$

which is a contradiction. Hence the assumption that $I_1\neq I_2$ is wrong and we must have $I_1=I_2$.

□

We are now ready for the definition of a Riemann Integrable function and the Riemann Integral of this function.

Definition 15.20. *Let $a,b\in\mathbb{R}$ with $a<b$, $\langle X,\|\|\rangle$ then a function $f:[a,b]\to X$ is **Riemann Integrable** if there exist a $I\in X$ such that $\forall\varepsilon\in\mathbb{R}$ there exist a $\delta\in\mathbb{R}^+$ such that for every tagged partition $\mathbb{P}$ on $[a,b]$ with $\mu(\mathbb{P})<\varepsilon$ we have $\|I-\mathcal{S}(f,\mathbb{P})\|<\varepsilon$. If f is Riemann Integrable then by [lemma: 15.19] I is unique. We call this I [if it exist] the **Riemann integral** of f and not this as $\int_a^b f$. The set of graphs of Riemann Integrable function is noted by $\mathcal{R}[[a,b],X]$ in other words:*

$$\mathcal{R}([a,b],X)=\{f\in X^{[a,b]}|f:[a,b]\to X\text{ is Riemann Integrable}\}$$

The integral $\int_a^b$ is then a function from $\mathcal{R}[[a,b],X]$ to X defined by

$$\int_a^b:\mathcal{R}[[a,b],X]\to X\text{ where }\left(\int_a^b\right)(f)=\int_a^b f$$

Note 15.21. Another notation that you find in the literature is $\int_a^b f(x)\mathrm{dx}$ instead of $\int_a^b f$. One benefit of this notation is if there is a expression to calculate the value of a function based on a expression. For example instead of using

$$f\colon \mathbb{R}\to\mathbb{R} \text{ is defined by } f(x)=\frac{\cos(x)+1}{x+1}$$

and then referring to the integral using

$$\int_a^b f$$

we can simple use

$$\int_a^b \frac{\cos(x)+1}{x+1}dx$$

Also if we have a function $f\colon [a,b]\times Y\to\mathbb{R}$ by $f(t,x)=\cos(t)\cdot x$ and then defining for a $x\in Y$

$$g_x\colon [a,b]\to\mathbb{R} \text{ by } g_x(t)=f(t,x)=\cos(t).x$$

so that we can talk about $\int_a^b g_x$ we can simplify this by

$$\int_a^b \cos(t)\cdot x\,dt$$

Example 15.22. Let $a,b\in\mathbb{R}$ such that $a<b$, $\langle X,\|\|\rangle$ a normed space, $x\in X$ then

$$C_x\colon [a,b]\to X \text{ defined by } C_x(i)=x$$

is Riemann Integrable and

$$\int_a^b C_x=(b-a)\cdot x$$

Proof. Let $\varepsilon\in\mathbb{R}^+$ and let $\mathbb{P}=\langle\{t_i\}_{i\in\{1,\ldots,n\}},\{s_i\}_{i\in\{1,\ldots,n-1\}}\rangle$ be any tagged partition on $[a,b]$ with $\mu(\mathbb{P})<1$ then we have:

$$\begin{aligned}
\mathcal{S}(f,\mathbb{P}) &= \sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot C_x(s_i)\\
&= \sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot x\\
&= \left(\sum_{i=1}^{n-1}(t_{i+1}-t_i)\right)\cdot x\\
&\underset{\text{[theorem: 11.10}}{=} (t_n-t_1)\cdot x\\
&= (b-a)\cdot x
\end{aligned}$$

so that

$$\|S(f,\mathbb{P})-(b-a)\cdot x\|=0<\varepsilon$$

Hence C_x is Riemann Integrable and $\int_a^b C_x=(b-a)\cdot x$

□

Lemma 15.23. *Let $a,b\in\mathbb{R}$ with $a<b$ then there exist a sequence $\{\mathbb{P}_i\}_{i\in\mathbb{N}}$ of tagged partitions on $[a,b]$ such that*

$$\lim_{i\to\infty}\mu(\mathbb{P}_i)=0$$

Proof. Let $k\in\mathbb{N}$ and define

$$\{t^{(k)}\}_{i\in\{1,\ldots,k+1\}} \text{ by } t_i^{(k)}=a+(i-1)\cdot\frac{b-a}{k} \text{ and } \{s_i^{(k)}\}_{i\in\{1,\ldots,k\}} \text{ by } s_i^{(k)}=t_i^{(k)}$$

allowing us to define

$$\mathbb{P}=\left\langle\{t^{(k)}\}_{i\in\{1,\ldots,k+1\}},\{s_i^{(k)}\}_{i\in\{1,\ldots,k\}}\right\rangle$$

Let $i\in\{1,\ldots,(k+1)-1\}$ then we have

$$t_i^{(k)}=a+(i-1)\cdot\frac{b-a}{k}<a+(i-1)\cdot\frac{b-a}{k}+\frac{b-a}{k}=a+((i+1)-i)\cdot\frac{b-a}{k}=t_{i+1}^{(k)}$$

and

$$t_{i+1}^{(k)} - t_i^{(k)} = a + ((i+1)-i)\cdot\frac{b-a}{k} - \left(a + (i-1)\cdot\frac{b-a}{k}\right) = \frac{b-a}{k}$$

and

$$s_i^{(k)} \subseteq \left[t_{i+1}^{(k)} - t_i^{(k)}\right]$$

So that

$$\mu(\{t^{(k)}\}_{i\in\{1,\dots,k+1\}}) = \max\left(\left\{t_{i+1}^{(k)} - t_i^{(k)} | i \in \{\{1,\dots,(k+1)-1\}\}\right\}\right) = \max\left(\left\{\frac{b-a}{k}\right\}\right) = \frac{b-a}{k}$$

Hence $\forall k \in \mathbb{N}$ we have that $\mathbb{P}_k$ is a tagged partition on $[a,b]$ and

$$\lim_{k\to\infty}\mu(\mathbb{P}_k) = \lim_{k\to\infty}\frac{b-a}{k} \underset{\text{[theorem: 14.302]}}{=} (b-a)\cdot\lim_{k\to\infty}\frac{1}{k} \underset{\text{[example: 14.297]}}{=} 0$$

□

Theorem 15.24. *Let $a,b\in\mathbb{R}$ with $a<b$, $\langle X,\|\|\rangle$ a normed space and $f:[a,b]\to X$ a* ***continuous*** *function then the following are equivalent:*

1. *f is Riemann Integrable with integral $\int_a^b f$*
2. *There exist a $I\in X$ such that for every sequence of tagged partitions $\{\mathbb{P}_i\}_{i\in\mathbb{N}}$ with*

$$\lim_{i\to\infty}\mu(\mathbb{P}_i) = 0$$

we have

$$\lim_{i\to\infty}\mathcal{S}(f,\mathbb{P}_i) = I$$

Furthermore we have $I = \int_a^b f$

Proof.

1 ⇒ 2. Let $\varepsilon\in\mathbb{R}^+$ then as f is Riemann Integrable with integral $\int_a^b f$ there exist a $\delta\in\mathbb{R}^+$ such that for any tagged partition on $[a,b]$ with $\mu(\mathbb{P})<\delta$ we have $\left\|\mathcal{S}(f,\mathbb{P}) - \int_a^b f\right\| < \varepsilon$. Let $\{\mathbb{P}_i\}_{i\in\mathbb{N}}$ be a family of tagged partitions on $[a,b]$ such that $\lim_{i\to\infty}\mu(\mathbb{P}_i) = 0$. Then there exist a $N\in\mathbb{N}$ such that $\forall n \geqslant N$ we have $\mu(\mathbb{P}_n) = |\mu(\mathbb{P}_n) - 0| < \delta$ so that $\left\|\mathcal{S}(f,\mathbb{P}_n) - \int_a^b f\right\| < \varepsilon$ which proves that

$$\lim_{n\to\infty} S(f,\mathbb{P}_n) = \int_a^b f$$

2 → 1. Using [lemma: 15.231] there exists a sequence $\{\mathbb{P}_i\}_{i\in\mathbb{N}}$ of tagged partitions on $[a,b]$ such that $\lim_{i\to\infty}\mu(\mathbb{P}_i) = 0$. Then by the hypothesis we have that there exist a $I\in X$ such that

$$\lim_{i\to\infty}\mathcal{S}(f,\mathbb{P}_i) = I$$

Let $\varepsilon\in\mathbb{R}^+$ then there exist a $N_1\in\mathbb{N}$ such that

$$\forall n \geqslant N_1 \text{ we have } \|\mathcal{S}(f,\mathbb{P}_n) - I\| < \frac{\varepsilon}{2}$$

Using [lemma: 15.18] there exist a $\delta\in\mathbb{R}^+$ such that for every two partitions $\mathbb{P}'$, $\mathbb{P}''$ on $[a,b]$ with $\mu(\mathbb{P}')<\delta$ and $\mu(\mathbb{P}'')<\delta$ we have

$$\|\mathcal{S}(f,\mathbb{P}') - \mathcal{S}(f,\mathbb{P}'')\| < \frac{\varepsilon}{2} \tag{15.24}$$

As $\lim_{i\to\infty}\mu(\mathbb{P}_i)$ there exist a $N_2\in\mathbb{N}$ such that $\forall n \geqslant N_2$ we have that

$$\mu(\mathbb{P}_n) = |\mu(\mathbb{P}_n) - 0| < \delta \tag{15.25}$$

Take $N = \max(N_1, N_2)$. Let $\mathbb{P}$ be a partition on $[a,b]$ with $\mu(\mathbb{P})<\delta$ then

$$\begin{aligned}
\|\mathcal{S}(f,\mathbb{P}) - I\| &= \|\mathcal{S}(f,\mathbb{P}) - \mathcal{S}(f,\mathbb{P}_N) + \mathcal{S}(f,\mathbb{P}_N) - I\| \\
&\leqslant \|\mathcal{S}(f,\mathbb{P}) - \mathcal{S}(f,\mathbb{P}_N)\| + \|\mathcal{S}(f,\mathbb{P}_N) - I\| \\
&<_{N>N_2\wedge\text{[eqs: 15.24, 15.25]}} \frac{\varepsilon}{2} + \|\mathcal{S}(f,\mathbb{P}_N) - I\| \\
&<_{N>N_1} \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \\
&= \varepsilon
\end{aligned}$$

proving that f is Riemann Integrable and by uniqueness [see lemma: 15.19] that $\int_a^b f = I$. □

We show now that every continuous function from $[a,b]$ to a Banach space is Riemann Integrable.

Theorem 15.25. *Let $a,b\in\mathbb{R}$ with $a<b$, $\langle X,\|\|\rangle$ a Banach space and $f:[a,b]\to X$ a continuous function then f is Riemann Integrable. In other words we have $\mathcal{C}([a,b],X)\subseteq\mathcal{R}([a,b],X)$.*

Proof. Let $\{\mathbb{P}_i\}_{i\in\mathbb{N}}$ be a sequence of tagged partitions on $[a,b]$ with $\lim_{i\to\infty}\mu(\mathbb{P}_i)=0$. Let $\varepsilon\in\mathbb{R}^+$ then by [lemma: 15.18] there exist a $\delta\in\mathbb{R}^+$ such that for any two tagged partitions $\mathbb{P}$, $\mathbb{P}$ with $\mu(\mathbb{P})<\delta$ and $\mu(\mathbb{P}')<\delta$ we have

$$\|\mathcal{S}(f,\mathbb{P})-\mathcal{S}(f,\mathbb{P}')\|<\varepsilon \tag{15.26}$$

As $\lim_{i\to\infty}\mu(\mathbb{P}_i)=0$ there exist a $N\in\mathbb{N}$ such that $\forall n\geqslant N$ we have $\mu(\mathbb{P}_n)=|\mu(\mathbb{P}_n)-0|<\delta$. So if $n,m\geqslant\mathbb{N}$ we have $\mu(\mathbb{P}_n)<\delta$ and $\mu(\mathbb{P}_m)<\delta$, so that by [eq: 15.26] $\|\mathcal{S}(f,\mathbb{P}_n)-\mathcal{S}(f,\mathbb{P}_m)\|<\varepsilon$. This proves that $\{\mathcal{S}(f,\mathbb{P}_i)\}_{i\in\mathbb{N}}$ is a Cauchy sequence in X. As X is a Banach space

$$\lim_{i\to\infty}S(f,\mathbb{P}_i)\text{ exist}$$

Hence by [theorem: 15.24] it follows that f is Riemann Integrable. □

Theorem 15.26. *Let $a,b\in\mathbb{R}$ with $a<b$, $\langle\mathbb{R},\|\rangle$ the normed space of the real numbers and*

$$f,g\in\mathcal{C}([a,b],\mathbb{R})\ \textit{[so that by [theorem: 15.25] } f,g\textit{ are Riemann Integrable] such that } \forall x\in[a,b]\textit{ we have } f(x)\leqslant g(x)$$

then we have

$$\int_a^b f\leqslant\int_a^b g$$

Proof. Using [lemma: 15.231] there exists $\{\mathbb{P}_i\}_{i\in\mathbb{N}}$ such that $\lim_{i\to\infty}\mu(\mathbb{P}_i)=0$. Using [theorem: 15.16] we have

$$\forall i\in\mathbb{N}\ S(f,\mathbb{P}_i)\leqslant S(g,\mathbb{P}_i) \tag{15.27}$$

Further we have using [theorem: 15.24] that

$$\begin{aligned}\int_a^b f &\underset{\text{[theorem: 15.24]}}{=} \lim_{i\to\infty}\mathcal{S}(f,\mathbb{P}_i)\\ &\leqslant_{\text{[eq: 15.27] and [theorem: 14.311]}} \lim_{i\to\infty}\mathcal{S}(g,\mathbb{P}_i)\\ &\underset{\text{[theorem: 15.24]}}{=} \int_a^b g\end{aligned}$$

□

Up to now we have always assumed that $a<b$ in the definition of the Riemann integral, we remove now this restriction by extending the definition of the Riemann integral.

Definition 15.27. *Let $a,b\in\mathbb{R}$ with $a\leqslant b$, $\langle X,\|\|\rangle$ a normed space and $f:[a,b]\to X$ is Riemann Integrable with integral $\int_a^b f$ if*

1. *If $a<b$ then we use [definition: 15.20]*
2. *If $a=b$ then f is Riemann Integrable and $\int_a^b f=0$*

The set of Riemann Integrable function graphs between is noted again by $\mathcal{R}([a,b],X)$ so that

$$\mathcal{R}([a,b],X)=\begin{cases}X^{[a,b]}\ \textit{if } a=b\\ \{f\in X^{[a,b]}|f:[a,b]\to X\textit{ is Riemann Integrable as defined in [definition: 15.20]}\}\end{cases}$$

We show now that $\int_a^b$ is a linear mapping.

Theorem 15.28. *Let $a,b\in\mathbb{R}$ with $a\leqslant b$, $\langle X,\|\|\rangle$ a normed space then*

$$\int_a^b:\mathcal{R}([a,b],X)\to X\textit{ is a linear mapping}$$

In other words If $\alpha\in\mathbb{K}$ and $f,g\in\mathcal{R}([a,b],X)$ then we have that $\alpha\cdot f+g\in\mathcal{R}([a,b],X)$ and

$$\int_a^b(\alpha\cdot f+g)=\alpha\cdot\int_a^b f+\int_a^b g$$

Proof. We have to consider the following cases for a, b.

$\boldsymbol{a = b}$**.** Then by definition $\alpha \cdot f + g \in \mathcal{R}([a,b], X)$ and

$$\int_a^b (\alpha \cdot f + g) = 0 = 0 + 0 = \alpha \cdot \int_a^b f + \int_a^b g$$

$\boldsymbol{a < b}$**.** Let $\varepsilon \in \mathbb{R}^+$ then as f, g are integrable there exists $\delta_1, \delta_2 \in \mathbb{R}^+$ such that for every tagged partition $\mathbb{P}'$ on $[a,b]$ with $\mu(\mathbb{P}') < \delta_1$ we have

$$\left\| S(f, \mathbb{P}') - \int_a^b f \right\| < \frac{\varepsilon}{2 \cdot (1 + |\alpha|)} \tag{15.28}$$

and for every tagged partition $\mathbb{P}''$ on $[a,b]$ with $\mu(\mathbb{P}'') < \delta_2$ we have

$$\left\| S(f, \mathbb{P}'') - \int_a^b f \right\| < \frac{\varepsilon}{2} \tag{15.29}$$

Let now $\mathbb{P}$ be a tagged partition on $[a,b]$ such that $\mu(\mathbb{P}) < \min(\delta_1, \delta_2)$ then we have

$$\begin{aligned}
\left\| \mathcal{S}(\alpha \cdot f + g, \mathbb{P}) - \alpha \cdot \int_a^b f - \int_a^b g \right\| &\underset{\text{[theorem: 15.15]}}{=} \\
\left\| \alpha \cdot \mathcal{S}(f, \mathbb{P}) + \mathcal{S}(g, \mathbb{P}) - \alpha \cdot \int_a^b f - \int_a^b g \right\| &\leqslant \\
\left\| \alpha \cdot \mathcal{S}(f, \mathbb{P}) - \alpha \cdot \int_a^b f \right\| + \left\| \mathcal{S}(g, \mathbb{P}) - \int_a^b g \right\| &= \\
|\alpha| \cdot \left\| \mathcal{S}(f, \mathbb{P}) - \int_a^b f \right\| + \left\| \mathcal{S}(g, \mathbb{P}) - \int_a^b g \right\| &<_{\text{[eqs: 15.28,15.29]}} \\
|\alpha| \cdot \frac{\varepsilon}{2 \cdot (1 + |\alpha|)} + \frac{\varepsilon}{2} &< \\
\frac{\varepsilon}{2} + \frac{\varepsilon}{2} &= \\
\varepsilon &
\end{aligned}$$

Which proves that $\alpha \cdot f + g$ is Riemann integrable and that

$$\int_a^b (\alpha \cdot f + g) = \alpha \cdot \int_a^b f + \int_a^b g$$

□

Theorem 15.29. *Let $a, b \in \mathbb{R}$ with $a \leqslant b$, $\langle X, \|\|\rangle$ a Banach space and $f: [a,b] \to X$ a function then we have:*

1. *If $f \in \mathcal{R}([a,b], X)$ then $\forall L \in L(X, \mathbb{R})$ we have that $L \circ f$ is integrable and $\int_a^b (L \circ f) = L\left(\int_a^b f\right)$*
2. *If f is continuous [so that by [theorem: 15.25] f is Riemann integrable] then $\|f\|: [a.b] \to \mathbb{R}$ defined by $\|f\|(x) = \|f(x)\|$ is Riemann integrable and $\left\|\int_a^b f\right\| \leqslant \int_a^b \|f\|$*
3. *If $x \in X$ then $C_x: [a,b] \to X$ by $C_x(i) = x$ is Riemann integrable and $\int_a^b C_x = (b-a) \cdot x$*
4. *If f is continuous [hence by [theorem: 15.25] Riemann integrable] and $m \in \mathbb{R}$ such that $\forall x \in [a,b]$ we have $\|f(x)\| \leqslant m$ then*

$$\left\| \int_a^b f \right\| \leqslant m \cdot (b-a)$$

Proof. We have to look at the following cases for a, b:

$\boldsymbol{a = b}$**.** Then we have:

1. By definition $L \circ f$ is Riemann integrable and

$$\int_a^b (L \circ f) = 0 = L(0) = L\left(\int_a^b f\right)$$

2. By definition $\|f\|$ is Riemann integrable and

$$\int_a^b \|f\| = 0 = \|0\| = \left\| \int_a^b f \right\|$$

3. By definition C_x is Riemann integrable and
$$\int_a^b C_x = 0 = 0 \cdot x = (b-a) \cdot x$$
4. By definition f is Riemann integrable and
$$\left\| \int_a^b f \right\| = \|0\| = m \cdot 0 = m \cdot (b-a)$$

a < b.

1. Let $\mathbb{P} = \langle \{t_i\}_{i \in \{1,\dots,n\}}, \{s_i\}_{i \in \{1,\dots,n-1\}} \rangle$ be any tagged partition on $[a,b]$ then we have:
$$\begin{aligned} \mathcal{S}(L \circ f, \mathbb{P}) &= \sum_{i=1}^{n-1} (t_{i+1} - t_i) \cdot (L \circ f)(s_i) \\ &= \sum_{i=1}^{n-1} (t_{i+1} - t_i) \cdot L(f(s_i)) \\ &\underset{L \in L(X,\mathbb{R})}{=} L\left(\sum_{i=1}^{n-1} (t_{i+1} - t()) \cdot f(s_i) \right) \\ &= L(\mathcal{S}(f, \mathbb{P})) \end{aligned} \tag{15.30}$$
Let $\varepsilon \in \mathbb{R}^+$. As $L \in L(X,\mathbb{R})$ L is continuous, hence there exist a $\delta' \in \mathbb{R}^+$ such that if $\|x\| = \|x - 0\| < \delta'$ then
$$|L(x)| < \varepsilon \tag{15.31}$$
As f is Riemann integrable there exist a $\delta \in \mathbb{R}^+$ such that for every tagged partition $\mathbb{P}$ on $[a,b]$ with $\mu(\mathbb{P}) < \delta$ we have $\left\| \mathcal{S}(f,\mathbb{P}) - \int_a^b f \right\| < \delta'$. So
$$\begin{aligned} \left| \mathcal{S}(L \circ f, \mathbb{P}) - L\left(\int_a^b f \right) \right| &\underset{\text{[eq: 15.30]}}{=} \left| L(\mathcal{S}(f,\mathbb{P})) - L\left(\int_a^b f \right) \right| \\ &= \left| L\left(\mathcal{S}(f,\mathbb{P}) - \int_a^b f \right) \right| \\ &< \underset{\text{[eq: 15.31]}}{} \varepsilon \end{aligned}$$
proving that $L \circ f$ is Riemann integrable and that
$$\int_a^b (L \circ f) = L\left(\int_a^b f \right)$$

2. By [example: 14.152] $\|\|: X \to \mathbb{R}$ is continuous, hence as $\|f\| = \|\| \circ f$, it follows from [theorem: 14.139] it follows that
$$\|f\|: [a,b] \to \mathbb{R} \text{ is continue}$$
Hence using [theorem: 15.25] it follows that
$$\|f\| \text{ is Riemann integrable}$$
Let $\mathbb{P} = \langle \{t_i\}_{i \in \{1,\dots,n\}}, \{s_i\}_{i \in \{1,\dots,n-1\}} \rangle$ be any tagged partition on $[a,b]$ then we have that
$$\begin{aligned} \|\mathcal{S}(f,\mathbb{P})\| &= \left\| \sum_{i=1}^{n-1} (t_{i+1} - t_i) \cdot f(s_i) \right\| \\ &\leqslant \sum_{i=1}^{n-1} \|(t_{i+1} - t_i) \cdot f(s_i)\| \\ &= \sum_{i=1}^{n-1} |t_{i+1} - t_i| \cdot \|f(s_i)\| \\ &\underset{t_i < t_{i+1}}{=} \sum_{i=1}^{n-1} (t_{i+1} - t_i) \cdot \|f(s_i)\| \\ &= \mathcal{S}(\|f\|, \mathbb{P}) \end{aligned} \tag{15.32}$$

Let $\{\mathbb{P}_i\}_{i\in\mathbb{N}}$ be a sequence of tagged partitions on $[a,b]$ such that $\lim_{i\to\infty}\mu(\mathbb{P}_i)=0$. As $\|f\|$ is continuous and Riemann integrable it follows from [theorem: 15.24] that

$$\lim_{i\to\infty}\mathcal{S}(\|f\|,\mathbb{P}_i) \text{ exist and } \lim_{i\to\infty}\mathcal{S}(\|f\|,\mathbb{P}_i)=\int_a^b\|f\| \tag{15.33}$$

As also f is continuous and Riemann integrable it follows from [theorem: 15.24] that

$$\lim_{i\to\infty}\mathcal{S}(f,\mathbb{P}_i) \text{ exist and } \lim_{i\to\infty}\mathcal{S}(f,\mathbb{P}_i)=\int_a^b f \tag{15.34}$$

By [eq: 15.32] we have that $\forall i\in\mathbb{N}$ that $\|S(f,\mathbb{P}_i)\|\leqslant S(\|f\|,\mathbb{P}_i)$ so that we can apply [theorem: 14.307] together with [eqs: 15.33, 15.34] gives

$$\left\|\int_a^b f\right\|=\left\|\lim_{i\to\infty}\mathcal{S}(f,\mathbb{P}_i)\right\|\leqslant\lim_{i\to\infty}\mathcal{S}(\|f\|,\mathbb{P}_i)=\int_a^b\|f\|$$

3. This follows from [example: 15.22].
4. Let $\mathbb{P}=\langle\{t_i\}_{i\in\{1,\dots,n\}},\{s_i\}_{i\in\{1,\dots,n-1\}})\rangle$ be any tagged partition on $[a,b]$. then we have:

$$\begin{aligned}
\|\mathcal{S}(f,\mathbb{P})\| &= \left\|\sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot f(s_i)\right\| \\
&\leqslant \sum_{i=1}^{n-1}\|(t_{i+1}-t_i)\cdot f(s_i)\| \\
&= \sum_{i=1}^{n-1}|t_{i+1}-t_i|\cdot\|f(s_i)\| \\
&\underset{t_i<t_i}{=} \sum_{i=1}^{n-1}(t_{i+1}-t_i)\cdot\|f(s_I)\| \\
&\leqslant \sum_{i=1}^{n-1}((t_{i+1}-t_i)\cdot m) \\
&= \left(\sum_{i=1}^{n-1}(t_{i+1}-t_i)\right)\cdot m \\
&\underset{\text{[theorem: 11.10]}}{=} (t_n-t_1)\cdot m \\
&= (b-a)\cdot m
\end{aligned}$$

proving that

$$\|\mathcal{S}(f,\mathbb{P})\|\leqslant(b-a)\cdot m \tag{15.35}$$

Let $\{\mathbb{P}_i\}_{i\in\mathbb{N}}$ be a sequence of tagged partitions on $[a,b]$ with $\lim_{i\to\infty}\mu(\mathbb{P}_i)$ then as f is continuous we have that

$$\lim_{i\to\infty}\mathcal{S}(f,\mathbb{P}_i)=\int_a^b f$$

exist. Using the above together with [eq: 15.35] allows us to apply [theorem: 14.305] giving

$$\left\|\int_a^b f\right\|=\left\|\lim_{i\to\infty}\mathcal{S}(f,\mathbb{P}_i)\right\|\leqslant(b-a)\cdot m$$

□

Lemma 15.30. *Let $a,b\in\mathbb{R}$ with $a\leqslant b$, $c\in\,]a,b[$, $\mathbb{P}_1=\left\langle\left\{t_i^{(1)}\right\}_{i\in\{1,\dots,n_1\}},\left\{s_i^{(1)}\right\}_{i\in\{1,\dots,n_1-1\}}\right\rangle$ a tagged partition on $[a,c]$ and $\mathbb{P}_2=\left\langle\left\{t_i^{(2)}\right\}_{i\in\{1,\dots,n_2\}},\left\{s_i^{(2)}\right\}_{i\in\{1,\dots,n_2-1\}}\right\rangle$ a tagged partition on $[c,b]$ then for $\mathbb{P}_1\bigsqcup\mathbb{P}_2$ defined by*

$$\mathbb{P}_1\bigsqcup\mathbb{P}_2=\langle\{t_i\}_{i\in\{1,\dots,n_1+n_2-1\}},\{s_i\}_{i\in\{1,\dots,n_1+n_2-2\}}\rangle$$

where

$$\forall i\in\{1,\dots,n_1+n_2-1\} \text{ we have } t_i=\begin{cases} t_i^{(1)} & \text{if } i\in\{1,\dots,n_1-1\} \\ t_{i-n_1+1}^{(2)} & \text{if } i\in\{n_1,\dots,n_1+n_2-1\}\end{cases}$$

and

$$\forall i \in \{1,\dots,n_1+n_2\} \text{ we have } s_i = \begin{cases} s_i^{(1)} & \text{if } i \in \{1,\dots,n_1-1\} \\ s_{i-n_1+1}^{(2)} & \text{if } i \in \{n_1,\dots,n_1+n_2-2\} \end{cases}$$

then we have:

1. $\mathbb{P}_1 \bigsqcup \mathbb{P}_2$ *is a tagged partition on* $[a,b]$
2. $\mu(\mathbb{P}_1 \bigsqcup \mathbb{P}_2) = \max(\mu(\mathbb{P}_1), \mu(\mathbb{P}_2))$
3. *If* $\langle X, \|\|\rangle$ *is a normed space and* $f:[a,b] \to X$ *a function then*

$$\mathcal{S}\big(f, \mathbb{P}_1 \bigsqcup \mathbb{P}_2\big) = \mathcal{S}[f_{|[a,c}, \mathbb{P}_1] + \mathcal{S}[f_{[c,b]}, \mathbb{P}_2]$$

Proof.

1. First we have that

$$t_1 = t_1^{(1)} = a \tag{15.36}$$

Second, using [definition: 15.12] $1 < n_2 \Rightarrow 0 \leqslant n_2 - 1$ we have $n_1 = n_1 \leqslant n_1 + n_2 - 1$, so that

$$t_{n_1+n_2-1} = t^{(2)}_{(n_1+n_2-1)-n_1+1} = t^{(2)}_{n_2} = b \tag{15.37}$$

Third for $i \in \{1,\dots,n_1+n_2-2\}$ we have either:

$\boldsymbol{i \in \{1,\dots,n_1-2\}}$**.** Then

$$t_i = t_i^{(1)} < t_{i+1}^{(1)} \underset{i<n_1-2\leqslant n_1-1}{=} t_{i+1}$$

and

$$s_i = s_i^{(1)} \in \big[t_i^{(1)}, t_{i+1}^{(1)}\big] \underset{i<n_1-2\leqslant n_1-1}{=} [t_i, t_{i+1}]$$

$\boldsymbol{i = n_1 - 1}$**.** Then

$$t_i = t_{n_1-1} = t^{(1)}_{n_1-1} < t^{(1)}_{n_1} = c = t_1^{(2)} = t^{(2)}_{n_1-n_1+1} = t_{n_1} = t_{i+1}$$

and as

$$s_{n_1-1} = s^{(1)}_{n_1-1} \in \big[t^{(1)}_{n_1-1}, t^{(1)}_{n_1}\big] = \big[t_{n_1-1}, t^{(1)}_{n_1}\big] = [t_{n_1-1}, c] = \big[t_{n_1-1}, t_1^{(2)}\big] = [t_{n_1-1}, t_{n_1}]$$

we have

$$s_i \in [t_i, t_{i+1}]$$

$\boldsymbol{i \in \{n_1,\dots,n_1+n_2-2\}}$**.** Then

$$t_i = t^{(2)}_{i-n_1+1} < t^{(2)}_{(i+1)-n_1+1} = t_{i+1}$$

and

$$s_i = s^{(2)}_{i-n_1+1} \in \big[t^{(2)}_{i-n_1+1}, t^{(2)}_{(i+1)-n_1+1}\big] = [t_i, t_{i+1}]$$

Hence in all cases we have

$$t_i < t_{i+1} \text{ and } s_i \in [t_i, t_{i+1}] \tag{15.38}$$

So using [eqs: 15.36, 15.37 and 15.38] it follows that

$$\mathbb{P}_1 \bigsqcup \mathbb{P}_2 \text{ is a tagged partition on } [a,b]$$

2. Note that

$$\begin{aligned}
\{t_{i+1} - t_i | i \in \{1,\dots,n_1+n_2-2\}\} &= \\
\{t_{i+1} - t_i | i \in \{1,\dots,n_1-2\}\} \bigcup \{t_{i+1} - t_i | i \in \{n_1-1\}\} \bigcup \{t_{i+1} - t_i | i \in \{n_1,\dots,n_1+n_2-2\}\} &= \\
\{t^{(1)}_{i+1} - t^{(1)}_i | i \in \{1,\dots,n_1-2\}\} \bigcup \{t^{(2)}_1 - t^{(1)}_{n_1-1}\} \bigcup \{t^{(2)}_{(i+1)-n_1+1} - t^{(2)}_{i-n_1+1} | i \in \{n_1,\dots,n_1+n_2-2\}\} &= \\
\{t^{(1)}_{i+1} - t^{(1)}_i | i \in \{1,\dots,n_1-2\}\} \bigcup \{c - t^{(1)}_{n_1-1}\} \bigcup \{t^{(2)}_{(i+1)-n_1+1} - t^{(2)}_{i-n_1+1} | i \in \{n_1,\dots,n_1+n_2-2\}\} &= \\
\{t^{(1)}_{i+1} - t^{(1)}_i | i \in \{1,\dots,n_1-2\}\} \bigcup \{t^{(1)}_{n_1} - t^{(1)}_{n_1-1}\} \bigcup \{t^{(2)}_{(i+1)-n_1+1} - t^{(2)}_{i-n_1+1} | i \in \{n_1,\dots,n_1+n_2-2\}\} &= \\
\{t^{(1)}_{i+1} - t^{(1)}_i | i \in \{1,\dots,n_1-1\}\} \bigcup \{t^{(2)}_{(i+1)-n_1+1} - t^{(2)}_{i-n_1+1} | i \in \{n_1,\dots,n_1+n_2-2\}\} &= \\
\{t^{(1)}_{i+1} - t^{(1)}_i | i \in \{1,\dots,n_1-1\}\} \bigcup \{t^{(2)}_{i+1} - t^{(2)}_i | i \in \{1,\dots,n_2-1\}\}
\end{aligned}$$

so that

$$\begin{aligned}
\mu\big(\mathbb{P}_1 \bigsqcup \mathbb{P}_2\big) &= \\
\max\left(\{t_{i+1}-t_i | i\in\{1,\dots,n_1+n_2-2\}\}\right) &= \\
\max\left(\left\{t^{(1)}_{i+1}-t^{(1)}_i | i\in\{1,\dots,n_1-1\}\right\}\bigcup\left\{t^{(2)}_{i+1}-t^{(2)}_i | i\in\{1,\dots,n_2-1\}\right\}\right) &= \\
\max\left(\max\left(\left\{t^{(1)}_{i+1}-t^{(1)}_i | i\in\{1,\dots,n_1-1\}\right\}\right), \max\left(\left\{t^{(2)}_{i+1}-t^{(2)}_i | i\in\{1,\dots,n_2-1\}\right\}\right)\right) &= \\
\max\left(\mu(\mathbb{P}_1), \mu(\mathbb{P}_2)\right) &\quad \text{[theor:3.66]}
\end{aligned}$$

3. We have

$$\begin{aligned}
\mathcal{S}(f,\mathbb{P}) &= \\
\sum_{i=1}^{n_1+n_2-2}(t_{i+1}-t_i)\cdot f(s_i) &= \\
\sum_{i=1}^{n_1-2}(t_{i+1}-t_i)\cdot f(s_i)+\sum_{i=n_1-1}^{n_1-1}(t_{i+1}-t_i)\cdot f(s_i)+\sum_{i=n_1}^{n_1+n_2-2}(t_{i+1}-t_i)\cdot f(s_i) &= \\
\sum_{i=1}^{n_1-2}\left(t^{(1)}_{i+1}-t^{(1)}_i\right)\cdot f\left(s^{(1)}_i\right)+(t_{n_1}-t_{n_1-1})\cdot f(s_{n_1-1})+\sum_{i=n_1}^{n_1+n_2-2}\left(t^{(2)}_{(i+1)-n_1+1}-t^{(2)}_{i-n_1+1}\right)\cdot f\left(s^{(2)}_{i-n_1+1}\right) &= \\
\sum_{i=1}^{n_1-2}\left(t^{(1)}_{i+1}-t^{(1)}_i\right)\cdot f\left(s^{(1)}_i\right)+\left(t^{(2)}_1-t^{(1)}_{n_1-1}\right)\cdot f\left(s^{(1)}_{n_1-1}\right)+\sum_{i=1}^{n_2-1}\left(t^{(2)}_{i+1}-t^{(2)}_i\right)\cdot f\left(s^{(2)}_i\right) &= \\
\sum_{i=1}^{n_1-2}\left(t^{(1)}_{i+1}-t^{(1)}_i\right)\cdot f\left(s^{(1)}_i\right)+\left(c-t^{(1)}_{n_1-1}\right)\cdot f\left(s^{(1)}_{n_1-1}\right)+\sum_{i=1}^{n_2-1}\left(t^{(2)}_{i+1}-t^{(2)}_i\right)\cdot f\left(s^{(2)}_i\right) &= \\
\sum_{i=1}^{n_1-2}\left(t^{(1)}_{i+1}-t^{(1)}_i\right)\cdot f\left(s^{(1)}_i\right)+\left(t^{(1)}_{n_1}-t^{(1)}_{n_1-1}\right)\cdot f\left(s^{(1)}_{n_1-1}\right)+\sum_{i=1}^{n_2-1}\left(t^{(2)}_{i+1}-t^{(2)}_i\right)\cdot f\left(s^{(2)}_i\right) &= \\
\sum_{i=1}^{n_1-1}\left(t^{(1)}_{i+1}-t^{(1)}_i\right)\cdot f\left(s^{(1)}_i\right)+\sum_{i=1}^{n_2-1}\left(t^{(2)}_{i+1}-t^{(2)}_i\right)\cdot f\left(s^{(2)}_i\right) &= \\
\sum_{i=1}^{n_1-1}\left(t^{(1)}_{i+1}-t^{(1)}_i\right)\cdot f_{|[a,c]}\left(s^{(1)}_i\right)+\sum_{i=1}^{n_2-1}\left(t^{(2)}_{i+1}-t^{(2)}_i\right)\cdot f_{|[c,b]}\left(s^{(2)}_i\right) &= \\
\mathcal{S}(f_{|[a,c]},\mathbb{P}_1)+\mathcal{S}(f_{|[c,b]},\mathbb{P}_2) &
\end{aligned}$$

□

We prove now a theorem that will be critical to prove later the Fundamental Theorem of Calculus.

Theorem 15.31. *Let $a,b\in\mathbb{R}$ with $a\leqslant b$, $c\in[a,b]$, $\langle X,\|\|\rangle$ a Banach space and $f\in\mathcal{C}([a,b],X)$ [so that by [theorem: 15.25 is Riemann integrable] then*

$$f_{|a,c}\colon[a,c]\to X,\ f_{|[c,b]}\colon[c,b]\to X \text{ are Riemann integrable}$$

and

$$\int_a^b f=\int_a^c f_{|[a,c]}+\int_c^b f_{|[c,b]}$$

***Note* 15.32.** *To simplify notation we use the convention that if $f\in\mathcal{C}([a,b],X)$ and $x\in[a,b]$ that $\int_a^x f$ is the same as $\int_a^x f_{|[a,x]}$ and $\int_x^b f$ is the same as $\int_x^b f_{|[x,b]}$. So that we can write*

$$\int_a^b f=\int_a^c f+\int_c^b f$$

where the theorem ensures that $\int_a^c f$, $\int_c^b f$ exist and are well defined.

Proof. We have the following cases to consider for a,b,c:

a = b. Then by definition we have that f, $f_{|[a,c]}$, $f_{|[c,b]}$ are Riemann integrable and

$$\int_a^b f=0=0+0=\int_a^c f_{|[a,c]}+\int_c^b f_{|[c,b]}$$

$\boldsymbol{a<b\wedge a=c}$. Then $f_{|[a,c]}$ is Riemann integrable by definition, $[c,b]=[a,b]$ and

$$\int_a^b f=0+\int_a^b f=0+\int_c^b f_{|c,b}=\int_a^c f_{|[a,c]}+\int_c^b f_{|c,b}$$

$\boldsymbol{a<b\wedge b=c}$. Then $f_{|[b,c]}$ is Riemann integrable by definition, $[a,c]=[a,b]$ and

$$\int_a^b f=\int_a^c f_{|[a,c]}=\int_a^c f_{|[a,c]}+0=\int_a^c f_{|[a,c]}+\int_c^b f_{|[c,b]}$$

$\boldsymbol{a<c<b}$. As $f\colon[a,b]\to X$ is continuous it follows from [theorem: 14.134] that $f_{|[a,c]}\colon[a,c]\to X$ and $f_{|[c,b]}\colon[c,b]\to X$ are continuous. Using [theorem: 15.25] we conclude that $f_{|[a,c]}$ and $f_{|[c,b]}$ are Riemann integrable. By [lemma: 15.231] there exists a sequence of tagged partitions $\left\{\mathbb{P}_i^{(1)}\right\}_{i\in\mathbb{N}}$ on $[a,c]$ and a sequence of tagged partitions $\left\{\mathbb{P}_i^{(2)}\right\}_{i\in\mathbb{N}}$ on $[c,b]$ such that

$$\lim_{i\to\infty}\mu\left(\mathbb{P}_i^{(1)}\right)=0 \text{ and } \lim_{i\to\infty}\mu\left(\mathbb{P}_i^{(2)}\right)=0$$

Let $\varepsilon\in\mathbb{R}^+$ then there exists $N_1,N_2\in\mathbb{N}$ such that for $n\geqslant N_1$ we have

$$\mu(\mathbb{P}_n^1)=\left|\mu\left(\mathbb{P}_n^{(1)}\right)-0\right|<\varepsilon \text{ and } \mu\left(\mathbb{P}_n^{(2)}\right)=\left|\mu\left(\mathbb{P}_n^{(2)}\right)-0\right|<\varepsilon$$

So if $n\geqslant\max(N_1,N_2)$

$$\left|\mu\left(\mathbb{P}_n^{(1)}\bigsqcup\mathbb{P}_n^{(2)}\right)-0\right|=\mu\left(\mathbb{P}_n^{(1)}\bigsqcup\mathbb{P}_n^{(2)}\right)=\max\left(\mu\left(\mathbb{P}_n^{(1)}\right),\max\left(\mu\left(\mathbb{P}_n^{(2)}\right)\right)\right)<\varepsilon$$

which proves that

$$\lim_{i\to\infty}\mu\left(\mathbb{P}_n^{(1)}\bigsqcup\mathbb{P}_n^{(2)}\right)=0$$

Now using [theorem: 15.24] and the fact that f, $f_{|[a,c]}$ and $f_{[c,b]}$ are Riemann integrable and continuous, it follows that

$$\lim_{i\to\infty}\mathcal{S}\left(f,\mathbb{P}_i^{(1)}\bigsqcup\mathbb{P}_i^{(2)}\right),\ \lim_{i\to\infty}\mathcal{S}\left(f_{|[a,c]},\mathbb{P}_i^{(1)}\right) \text{ and } \lim_{i\to\infty}\mathcal{S}\left(f_{|[c,b]},\mathbb{P}_i^{(2)}\right) \text{ exists} \tag{15.39}$$

and

$$\int_a^b f=\lim_{i\to\infty}\mathcal{S}\left(f,\mathbb{P}_i^{(1)}\bigsqcup\mathbb{P}_i^{(2)}\right),\int_a^c f_{|[a,c]}=\lim_{i\to\infty}\mathcal{S}\left(f_{|[a,c]},\mathbb{P}_i^{(1)}\right),\int_c^b f_{|[c,b]}=\lim_{i\to\infty}\mathcal{S}\left(f_{|[c,b]},\mathbb{P}_i^{(2)}\right) \tag{15.40}$$

Further we have $\forall i\in\mathbb{N}$ that

$$\mathcal{S}\left(f,\mathbb{P}_i^{(1)}\bigcup\mathbb{P}_i^{(2)}\right)\underset{\text{[lemma: 15.30]}}{=}\mathcal{S}\left(f_{|[a,b]},\mathbb{P}_i^{(1)}\right)+\mathcal{S}\left(f_{|[c,b]},\mathbb{P}_i^{(2)}\right) \tag{15.41}$$

Finally using [theorem: 14.301] together with [eqs: 15.39, 15.40 and 15.41] proves that

$$\int_a^b f=\int_a^c f_{|[a,c]}+\int_c^b f_{|[c,b]}$$

□

Chapter 16
Differentiation in Normed spaces

16.1 Fréchet differentiability

In this subsection we introduce the Fréchet differential of a function, which is a extension of the derivative of a function. To avoid evaluating a function outside it's domain the following definition is introduced.

Definition 16.1. *Let $\langle X, \|\|\rangle$ be a normed space, $U \subseteq X$ and $x \in U$ then*

$$U_x = \{h \in X | x + h \in U\}$$

***Note* 16.2.** *Note as $x + 0 = x \in U$ we have*

$$0 \in U_x$$

The following is a equivalent definition for U_x.

Theorem 16.3. *Let $\langle X, \|\|\rangle$ be a normed space, $U \subseteq X$ and $x \in U$ then*

$$U_x = -x + U = U - x$$

where

$$-x + U = \{-x + u | i \in U\} \text{ and } U - x = \{u - x | u \in U\}$$

Proof. We have

$$\begin{aligned} h \in U_x &\Leftrightarrow x + h \in U \\ &\Leftrightarrow \exists u \in U \text{ with } x + h = u \\ &\Leftrightarrow \exists u \in U \text{ with } h = (-x) + u \\ &\Leftrightarrow h \in (-x) + U \\ h \in (-x) + U &\Leftrightarrow \exists u \in U \text{ with } h = (-x) + u \\ &\Leftrightarrow \exists u \in U \text{ with } h = u + (-x) \\ &\Leftrightarrow h \in U + (-x) \end{aligned}$$

□

Theorem 16.4. *Let $\langle X, \|\|\rangle$ be a normed space, $x \in X$ and $\delta \in \mathbb{R}^+$ then $B_{\|\|}(0, \delta) = B_{\|\|}(x, \delta)_x$.*

Proof.

$$\begin{aligned} x \in B_{\|\|}(x, \delta)_x &\Leftrightarrow x + h \in B_{\|\|}(x, \delta) \\ &\Leftrightarrow x \in X \wedge \|(x + h) - x\| < \delta \\ &\Leftrightarrow x \in X \wedge \|h\| < \delta \\ &\Leftrightarrow h \in B_{\|\|}(0, \delta) \end{aligned}$$

□

16.1.1 Limit of a function

First we introduce the concept of the limit of a function at a point.

Definition 16.5. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces, $U \subseteq X$, $x \in X$ and $f: U \to Y$ a function then we say that **f converges to y at x** if $\forall \varepsilon \in \mathbb{R}^+$ there exist a $\delta \in \mathbb{R}^+$ such that $\forall z \in U$ with $0 < \|x - z\|_X < \delta$ we have $\|f(z) - y\|_Y < \varepsilon$.*

Note 16.6. As $0<\|x-z\|_X$ we have that $x\neq z$, so in the above definition we never evaluate f at x, hence x must not be part of the domain f.

We show now that the y in the above is unique in a normed space (not in pseudo normed spaces).

Lemma 16.7. *Let $\langle X,\|\|_X\rangle$, $\langle Y,\|\|_Y\rangle$ be normed spaces, $U\subseteq X$, $x\in X$ and $f:U\to Y$ a function such that f converges to y_1 and y_2 at x then $y_1=y_2$.*

Proof. Assume that $y_1\neq y_2$ then $\|y_1-y_2\|_Y\in\mathbb{R}^+$. As f converges to y_1 and y_2 at x there exist $\delta_1,\delta_2\in\mathbb{R}^+$ such that $\forall z\in U$ with $0<\|x-z\|_X<\delta_1$ we have $\|f(z)-y_1\|_Y<\frac{\|y_1-y_2\|_Y}{2}$ and $\forall z\in U$ with $\|x-z\|_X<\delta_2$ we have $\|f(z)-y_2\|_Y<\frac{\|y_1-y_2\|_Y}{2}$. So if $z\in U$ satisfies $0<\|x-z\|_X<\min(\delta_1,\delta_2)$ then

$$\|y_1-y_2\|_Y\leqslant\|y_1-f(z)\|_Y+\|f(z)-y_2\|_Y<\frac{\|y_1-y_2\|_Y}{2}+\frac{\|y_1-y_2\|_Y}{2}=\|y_1-y_2\|_Y$$

giving the contradiction $\|y_1-y_2\|_Y<\|y_1-y_2\|_Y$. So we must have that $y_1=y_2$. □

The above lemma ensure that the following definition is well defined.

Definition 16.8. *Let $\langle X,\|\|_X\rangle$, $\langle Y,\|\|_Y\rangle$ be normed spaces, $U\subseteq X$, $x\in X$ and $f:U\to Y$ a function so that f converges to $y\in Y$ at x then this **unique** y [see lemma: 16.7] is noted as*

$$\lim_{\substack{z\to x\\ U}} f(z)$$

In other words if we say that

$$\lim_{\substack{z\to x\\ U}} f(z)=y \text{ exists [or converges]}$$

then $\forall\varepsilon\in\mathbb{R}^+$ there exist a $\delta\in\mathbb{R}^+$ such that $\forall z\in U$ with $0<\|x-z\|_X<\delta$ we have $\|f(z)-y\|_Y<\varepsilon$.

We have the following characterization for continuity **at a point in its domain**.

Theorem 16.9. *Let $\langle X,\|\|_X\rangle$, $\langle Y,\|\|_Y\rangle$ be normed spaces, $U\subseteq X$, $x\in U$ and $f:U\to Y$ a function then*

$$f \text{ is continuous at } x \Leftrightarrow \lim_{\substack{z\to x\\ U}} f(z)=f(x)$$

Proof. This follows from [definition: 16.8] and [theorem: 14.129] □

16.1.2 Classical derivative of a function

In this subsection we introduce the calculus concepts of differentiability and derivative. First we need a little lemma to ensure that the derivative of a function is unique.

Lemma 16.10. *Let $\langle\mathbb{K},\|\rangle$ be the normed space of real or complex numbers, $U\subseteq\mathbb{K}$ a open set, $x\in U$, $\langle Y,\|\|\rangle$ a normed space and $f:U\to Y$ a function. Assume that there exists y_1, y_2 such that*

$$\forall\varepsilon\in\mathbb{R}^+\ \exists\delta_1\in\mathbb{R}^+ \text{ such that } \forall h\in U_x \text{ with } 0<|h|<\delta_1 \text{ we have } \left\|\frac{f(x+h)-f(x)}{h}-y_1\right\|<\varepsilon$$

$$\forall\varepsilon\in\mathbb{R}^+\ \exists\delta_2\in\mathbb{R}^+ \text{ such that } \forall h\in U_x \text{ with } 0<|h|<\delta_2 \text{ we have } \left\|\frac{f(x+h)-f(x)}{h}-y_2\right\|<\varepsilon$$

then

$$y_1=y_2$$

Proof. As $U_x\underset{\text{[eq: 16.3]}}{=}(-x)+U$ is open [see theorem: 14.110] and $0\in U_x$ there exist a $\rho\in\mathbb{R}^+$ such that $0\in B_{\|\|_X}(0,\rho)\subseteq U_x$. Assume that $y_1\neq y_2$ then $\|y_1-y_2\|\in\mathbb{R}^+$ hence there exists $\delta_1,\delta_2\in\mathbb{R}^+$ such that

$$\forall\varepsilon\in\mathbb{R}^+\ \exists\delta_1\in\mathbb{R}^+ \text{ such that } \forall h\in U_x \text{ with } 0<|h|<\delta_1 \text{ we have } \left\|\frac{f(x+h)-f(x)}{h}-y_1\right\|<\frac{\|y_1-y_2\|}{2}$$

$$\forall\varepsilon\in\mathbb{R}^+\ \exists\delta_2\in\mathbb{R}^+ \text{ such that } \forall h\in U_x \text{ with } 0<|h|<\delta_2 \text{ we have } \left\|\frac{f(x+h)-f(x)}{h}-y_2\right\|<\frac{\|y_1-y_2\|}{2}$$

Take $h_0 = \frac{\min(\rho, \delta_1, \delta_2)}{2} \in \mathbb{R}^+$ then $h_0 \in B_{\|\|_X}(0, \rho) \subseteq U_x$ and $0 < |h_0| < \delta_1, \delta_2$ so that

$$\begin{aligned}
\|y_1 - y_2\| &= \left\| \frac{f(x+h_0) - f(x)}{h_0} - y_2 - \left(\frac{f(x+h_0) - f(x)}{h_0} - y_1 \right) \right\| \\
&\leqslant \left\| \frac{f(x+h_0) - f(x)}{h_0} - y_2 \right\| + \left\| \frac{f(x+h_0) - f(x)}{h_0} - y_1 \right\| \\
&< \frac{\|y_2 - y_1\|}{2} + \frac{\|y_2 - y_1\|}{2} \\
&= \|y_1 - y_2\|
\end{aligned}$$

which is a contradiction. So the assumption $y_1 \neq y_2$ is wrong and we must have $y_1 = y_2$. □

Note 16.11. The above proof of [lemma: 16.10] requires that U is a open set. Hence, as [lemma: 16.10] is used in the definition below of the derivative to ensure uniqueness of the derivative at a point, the domain of functions with a derivative must be open.

Definition 16.12. *Let $\langle \mathbb{K}, \|\| \rangle$ be the normed space of real or complex numbers, a open set $U \subseteq \mathbb{K}$, $x \in U$, $\langle Y, \|\| \rangle$ a normed space and f: $U \to Y$ a function. Then **f has a derivative at x** if there exist a $y \in Y$ such that*

$$\forall \varepsilon \in \mathbb{R}^+ \ \exists \delta \in \mathbb{R}^+ \text{ so that } \forall h \in U_x \text{ with } 0 < |h| < \delta \quad \left\| \frac{f(x+h) - f(x)}{h} - y \right\| < \varepsilon$$

*Using [lemma: 16.10] this y is unique and it is called the **derivative of f at x** and noted by f'_x. In other words if f has a derivative f'_x then we have:*

$$\forall \varepsilon \in \mathbb{R}^+ \ \exists \delta \in \mathbb{R}^+ \text{ such that } \forall h \in U_x \text{ with } 0 < |h| < \delta \text{ we have } \left\| \frac{f(x+h) - f(x)}{h} - f'(x) \right\| < \varepsilon$$

The above is what is called the $\varepsilon - \delta$ definition of the derivative of a function. We use this because it is easier to construct exact proofs about derivatives without having to rely on limits in the proofs. However there is a equivalent definition (used in many books) based on limits.

Theorem 16.13. *Let $\langle \mathbb{K}, \|\| \rangle$ be the normed space of real [complex numbers], a open set $U \subseteq \mathbb{K}$, $x \in U$, $\langle Y, \|\| \rangle$ a normed space and f: $U \to Y$ a function then we have*

$$\begin{gathered}
f \text{ has a derivative } f'(x) \text{ at } x \\
\Updownarrow \\
\lim_{h \xrightarrow{U_x \setminus \{0\}} 0} \frac{f(x+h) - f(x)}{h} = f'(x) \text{ exist}
\end{gathered}$$

***Note* 16.14.** *Here $\lim\limits_{h \xrightarrow{U_x \setminus \{0\}} 0} \frac{f(x+h) - f(x)}{h}$ is a shorthand for $\lim\limits_{h \xrightarrow{U_x \setminus \{0\}} 0} \Delta(h)$ where*

$$\Delta(h): U_x \setminus \{0\} \to Y \text{ is defined by } \Delta(h) = \frac{f(x+h) - f(x)}{h}$$

Proof.

⇒. Let $\varepsilon \in \mathbb{R}^+$. As f has a derivative f'_x at x there exist a $\delta \in \mathbb{R}^+$ such that $\forall h \in U_x$ with $0 < |h| < \delta$ we have

$$\left\| \frac{f(x+h) - f(x)}{h} - f'_x \right\| < \varepsilon \tag{16.1}$$

Define now

$$\Delta: U_x \setminus \{0\} \to Y \text{ by } \Delta(h) = \frac{f(x+h) - f(x)}{h}$$

then if $h \in U_x \setminus \{0\}$ and $0 < |h| = |0 - h| < \delta$ we have

$$\|\Delta(h) - f'_x\| = \left\| \frac{f(x+h) - f(x)}{h} - f'_x \right\| <_{\text{[eq: 16.1]}} \varepsilon$$

proving that

$$\lim_{h \xrightarrow{U_x \setminus \{0\}}} \Delta(h) = f'_x$$

⇐. Let $\varepsilon \in \mathbb{R}^+$. As for

$$\Delta: U_x \setminus \{0\} \to Y \text{ by } \Delta(h) = \frac{f(x+h) - f(x)}{h}$$

we have that

$$\lim_{h \xrightarrow{U_x \setminus \{0\}}} \Delta(h) = L \text{ exists}$$

there exist a $\delta \in \mathbb{R}^+$ such that if $h \in U_x$ and $0 < |0-h| < \delta$ that

$$\|\Delta(h) - L\| = \left\| \frac{f(x+h) - f(x)}{h} - L \right\| < \varepsilon$$

Hence if $h \in U_x$ with $0 < |h| < \delta$ we have that $\left\| \frac{f(x+h)-f(x)}{h} - L \right\| < \varepsilon$ proving that f has a derivative $f'_x = L$. □

Example 16.15. Let $\langle \mathbb{K}, \|\rangle$ be the normed space of real or complex numbers, $\langle X, \|\|\rangle$ a normed space, $x \in X$ then

$$(*\cdot x): \mathbb{K} \to X \text{ defined by } (*\cdot x)(t) = t \cdot x$$

has a derivative at every $t \in \mathbb{R}$ with $(*\cdot x)'_x = x$

Proof. Let $\varepsilon \in \mathbb{R}^+$ then for $0 < |h| < 1$ we have

$$\left\| \frac{(*,\cdot x)(t+h) - (*,\cdot x)(t)}{h} - x \right\| = \left\| \frac{(t+h)\cdot x - t \cdot x}{h} - x \right\| = \left\| \frac{h \cdot x}{h} - x \right\| = 0 < \varepsilon$$

so that $(*\cdot x)$ has x as its derivative at t. □

Note 16.16. We use f'_x to note the derivative of f at x. Many books use instead the notation $f'_{|x}$ or $f'(x)$. The problem with $f'_{|x}$ is that it can be confused with the restriction of a function f' to x and $f'(x)$ can also be confused with the value of a function f' at x. The derivative is however not a function but a value of Y. If f has a derivative at every x in U then we can define a function

$$f': U \to Y \text{ by } f'(x) = f'_x$$

So using the notation convention of this book we can make a distinction between the derivative at a point, which is a value of Y, and the derivative **function** which only exist if a derivative exist at every point in U. If the derivative function exist then by its definition $f'(x) = f'_x$.

If we want to extend the definition of a derivative of a function on $U \subseteq \mathbb{K}$ to a function whose domain is a open subset of a normed space we run in the following problem. If $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ are normed spaces, $U \subseteq X$ a open set, $x \in U$ and $f: U \to Y$ a function then as $f(x+h) - f(x) \in Y$ and $h \in X$ the quotient $\frac{f(x+h)-f(x)}{h}$ is not defined so that $\left\| \frac{f(x+h)-f(x)}{h} - f'(x) \right\|_Y$ is ill-defined. To solve this, note that in the case where $\langle X, \|\|_X\rangle = \langle \mathbb{K}, \|\rangle$ we can multiply both sides of $\left\| \frac{f(x+h)-f(x)}{h} - f'(x) \right\| < \varepsilon$ by $|h|$ to get

$$|h| \cdot \left\| \frac{f(x+h) - f(x)}{h} - f'(x) \right\| < \varepsilon \cdot |h|$$

Then as

$$\begin{aligned} |h| \cdot \left\| \frac{f(x+h) - f(x)}{h} - f'(x) \right\| &= \left\| h \cdot \left(\frac{f(x+h) - f(x)}{h} - f'(x) \right) \right\| \\ &= \|f(x+h) - f(x) - f'(x) \cdot h\| \end{aligned}$$

we have

$$\|f(x+h) - f(x) - f'(x) \cdot h\| < \varepsilon \cdot |h|$$

Define $L: \mathbb{K} \to Y$ by $L(h) = f'(x) \cdot h$ then by [example: 14.186] we have that $L \in L(\mathbb{K}, Y)$ hence we can rewrite the above as

$$\|f(x+h) - f(x) - L(h)\| < \varepsilon \cdot |h|$$

This can extended to more general cases where the normed spaces is $\langle X, \|\|_X\rangle$ instead of $\langle \mathbb{K}, \|\rangle$ if we change the above expression in

$$\|f(x+h) - f(x) - L(h)\|_Y < \varepsilon \cdot \|h\|_X$$

This is the idea behind Fréchet differentiability of a function which is covered in the next subsection.

16.1.3 Fréchet differential of a function

We are now ready to define the Fréchet differentiability of a function. First we need a lemma that ensures that the differential of a function [if it exist] is unique.

Lemma 16.17. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces, U a open set in X , $x \in U$, $f: U \to Y$ a function and $L_1, L_2 \in L(X, Y)$ such that*

$$\forall \varepsilon \in \mathbb{R}^+ \ \exists \delta \in \mathbb{R}^+ \text{ such that } \forall h \in U_x \text{ with } \|h\|_X < \delta \text{ we have } \|f(x+h) - f(x) - L_1(h)\|_Y \leqslant \varepsilon \cdot \|h\|_X$$

and

$$\forall \varepsilon \in \mathbb{R}^+ \ \exists \delta \in \mathbb{R}^+ \text{ such that } \forall h \in U_x \text{ with } \|h\|_X < \delta \text{ we have } \|f(x+h) - f(x) - L_2(h)\|_Y \leqslant \varepsilon \cdot \|h\|_X$$

then we have that

$$L_1 = L_2$$

Proof. Assume that $L_1 \neq L_2$ then there exist a $h_0 \in X$ such that $L_1(h_0) \neq L_2(h_0)$ hence we have that

$$\varepsilon = \|L_1(h_0) - L_2(h_0)\|_Y \in \mathbb{R}^+$$

Now using the hypothesis there exists $\delta_1, \delta_2 \in \mathbb{R}^+$ such that

$$\forall k \in U_x \text{ with } \|k\|_X < \delta_1 \text{ we have } \|f(x+k) - f(x) - L_1(k)\|_Y \leqslant \frac{\varepsilon}{2 \cdot (\|h_0\|_X + 1)} \cdot \|k\|$$

and

$$\forall k \in U_x \text{ with } \|k\|_X < \delta_2 \text{ we have } \|f(x+k) - f(x) - L_2(k)\|_Y \leqslant \frac{\varepsilon}{2 \cdot (\|h_0\|_X + 1)} \cdot \|k\|$$

As $U_x \underset{\text{[eq: 16.3]}}{=} (-x) + U$ is open [see theorem: 14.110] and $0 \in U_x$ there exist a $\delta_3 \in \mathbb{R}^+$ such that $0 \in B_{\|\|_X}(0, \delta_3) \subseteq U_x$. Take $\delta = \min(\delta_1, \delta_2, \delta_3)$ and define $h_1 = \frac{\delta}{(\|h\|_X + 1)} \cdot h_0$ then

$$\|h_1\|_X = \left\| \frac{\delta}{(\|h_0\|_X + 1)} \cdot h_0 \right\|_X = \delta \cdot \frac{\|h_0\|_X}{\|h_0\|_X + 1} < \delta \leqslant \delta_1, \delta_2, \delta_3$$

so that $h_1 \in U_x$ and

$$\begin{aligned}
\frac{\delta}{\|h_0\|_X + 1} \cdot \|L_1(h_0) - L_2(h_0)\|_Y &= \left\| \frac{\delta}{\|h_0\|_X + 1} \cdot L_1(h_0) - \frac{\delta}{\|h_0\|_X + 1} \cdot L_2(h_0) \right\|_Y \\
&= \left\| L_1\left(\frac{\delta}{\|h_0\|_X + 1} \cdot h_0 \right) \right\|_Y + \left\| L_2\left(\frac{\delta}{\|h_0\|_X + 1} \cdot h_0 \right) \right\|_Y \\
&= \|L_1(h_1) - L_2(h_1)\|_Y \\
&= \|f(x+h_1) - f(x) - L_2(h_1) - (f(x+h_1) - f(x) - L_1(h_1))\|_Y \\
&\leqslant \|f(x+h_1) - f(x) - L_2(h_1)\|_Y + \|f(x+h_1) - f(x) - L_1(h_1)\|_Y \\
&\leqslant \frac{\varepsilon}{2 \cdot (\|h_0\|_X + 1)} \cdot \|h_1\|_X + \frac{\varepsilon}{2 \cdot (\|h_0\|_X + 1)} \cdot \|h_1\|_X \\
&= \frac{\varepsilon}{\|h_0\|_X + 1} \cdot \|h_1\|_X \\
&= \frac{\varepsilon}{\|h_0\|_X + 1} \cdot \left\| \frac{\delta}{(\|h_0\|_X + 1)} \cdot h_0 \right\|_X \\
&= \frac{\varepsilon}{\|h_0\|_X + 1} \cdot \frac{\delta}{(\|h_0\|_X + 1)} \cdot \|h_0\|_X
\end{aligned}$$

so that

$$\|L_1(h_0) - L_2(h_0)\|_Y \leqslant \frac{\varepsilon}{\|h_0\|_X + 1} \cdot \|h_0\|_X < \varepsilon = \|L_1(h) - L_2(h)\|_Y$$

a contradiction. So we must have

$$L_1 = L_2$$

□

Definition 16.18. (Fréchet differentiability) *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces, a open set $U \subseteq X$ and $x \in U$ then a function*

$$f: U \to Y$$

is Fréchet differentiable at x if there exist a $L \in L(X, Y)$ such that $\forall \varepsilon \in \mathbb{R}^+$ there exist a $\delta \in \mathbb{R}^+$ such that $\forall h \in U_x$ with $\|h\|_X < \delta$ we have

$$\|f(x+h) - f(x) - L(h)\|_Y \leqslant \varepsilon \cdot \|h\|_X$$

*If f is Fréchet differentiable then by [lemma: 16.17] the above L is **unique** and is called the **Fréchet differential of f at x** and noted by $D_x f$. In other words f is Fréchet differentiable at x if there exist a*

$$D_x f \in L(X, Y)$$

such that

$$\forall \varepsilon \in \mathbb{R}^+ \ \exists \delta \in \mathbb{R}^+ \text{ such that } \forall h \in U_x \text{ with } \|h\|_X \text{ we have } \|f(x+h) - f(x) - D_x f(h)\|_Y \leqslant \varepsilon \cdot \|h\|_X$$

Note 16.19. Note the uniqueness of the Fréchet differential is guaranteed by [lemma: 16.17] whose proof depends on the crucial fact that U is open. Hence the requirement that U must be open in the previous definition.

Definition 16.20. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces, $U \subseteq X$ a open set, $A \subseteq U$ then a function $f: U \to Y$ is* ***Fréchet differentiable on A*** *if $\forall x \in A$ we have that f is Fréchet differentiable at x.*

Note 16.21. First note that $D_x f$ is a element of $L(X, Y)$ hence a continuous linear function from X to so that for $h \in X$ we have that $D_x f(h) \in Y$. In many texts about differentiation the notation $Df(x)$ is used for the Fréchet differential at x this again suggest that the differential at x is the value of a function Df that is not yet defined. If however f is differentiable on a subset A of U then we can define the function

$$Df: A \to L(X, Y) \text{ by } Df(x) = D_x f$$

that maps every point of A to a continuous linear mapping between X and Y. In this book we want to keep these two things separate in notation. Hence we use $Df(x)$ only if f is Fréchet differentiable on a set and not if f is Fréchet at a single point. If Df is defined on A and $x \in A$ then $Df(x) \in L(X, Y)$ so that given a $h \in X$ we have that $(Df(x))(h) \in Y$, to simplify notation we note this as $Df(x)(h)$. This is part of a more general notation convention used where the function application associates to the left for example $((f(x))(y))(z)$ is noted as $f(x)(y)(z)$.

Example 16.22. Let $\langle X, \|\| \rangle$ be a normed space, U a open set then $\forall x \in U$ we have that $\mathrm{Id}_U: U \to X$ is Fréchet differentiable at x and $D_x \mathrm{Id}_U = \mathrm{Id}_X$. So if we define

$$D\mathrm{Id}_X: X \to L(X, X) \text{ by } D\mathrm{Id}_U(x) = D_x \mathrm{Id}_U$$

then

$$D\mathrm{Id}_U = C_{\mathrm{Id}_x}$$

Proof. Let $\varepsilon \in \mathbb{R}^+$ then we have for $h \in U_x$ that

$$\|\mathrm{Id}_U(x+h) - \mathrm{Id}_U(x) - \mathrm{Id}_X(h)\| = \|x + h - x - h\| = \|0\| = 0 < \varepsilon \cdot \|h\|$$ □

Although Fréchet differentiability and the differential is defined using norms, the definition is actually dependent on the topology generated by the norms. This is expressed in the following theorem.

Theorem 16.23. *Let X, Y be vector spaces over $\mathbb{K}$ with equivalent norms $\|\|_{X_1}, \|\|_{X_2}$ on X and $\|\|_{Y_1}$, $\|\|_{Y_2}$ on Y, $U \subseteq X$ a open set [using the topology $\mathcal{T}_{\|\|_{X_1}} \underset{\text{norms are equivalent}}{=} \mathcal{T}_{\|\|_{X_2}}$], $x \in X$ and*

$$f: X \to Y \text{ is a Fréchet differentiable function with differential } D_x f \text{ using } \|\|_{X_1} \text{ and } \|\|_{Y_1}$$

then

$$f: X \to Y \text{ is a Fréchet differentiable function with differential } D_x f \text{ using } \|\|_{X_2} \text{ and } \|\|_{Y_2}$$

Proof. As the norms are equivalent we have by [theorem: 14.115] there exists $\alpha_X, \alpha_Y, \beta_X, \beta_Y \in \mathbb{R}^+$ such that $\forall x \in X$ and $\forall y \in Y$ we have

$$\alpha_X \cdot \|x\|_{X_2} \leqslant \|x\|_{X_1} \leqslant \beta_X \cdot \|x\|_{X_2} \text{ and } \alpha_Y \cdot \|y\|_{Y_1} \leqslant \|y\|_{Y_2} \leqslant \beta_Y \cdot \|y\|_{Y_1}$$

Let $\varepsilon \in \mathbb{R}^+$ then there exist a $\delta' \in \mathbb{R}^+$ such that $\forall h \in U_x$ with $\|h\|_{X_1} < \delta'$ we have

$$\|f(x+h) - f(x) - D_x f\|_{Y_1} \leqslant \frac{\varepsilon}{\beta_Y \cdot \beta_X} \cdot \|h\|_{X_1}$$

Take $\delta = \frac{\delta'}{\beta_X}$ then $\forall h \in U_x$ with $\|h\|_{X_2} < \delta$ we have $\|h\|_{X_1} \leqslant \beta_X \cdot \|h\|_{X_2} < \delta \cdot \beta_X = \delta'$ so that from the above we have

$$\begin{aligned} \|f(x+h) - f(x) - D_x f\|_{Y_1} &\leqslant \frac{\varepsilon}{\beta_Y \cdot \beta_X} \cdot \|h\|_{X_1} \\ &\leqslant \frac{\varepsilon}{\beta_Y \cdot \beta_X} \cdot \beta_X \cdot \|h\|_{X_2} \\ &= \frac{\varepsilon}{\beta_Y} \cdot \|h\|_{X_2} \end{aligned}$$

so that

$$\|f(x+h)-f(x)-D_x f(h)\|_{Y_2} \leqslant \beta_Y \cdot \|f(x+h)-f(x)-D_x f(h)\|_{Y_1} \leqslant \beta_Y \cdot \frac{\varepsilon}{\beta_Y} \cdot \|h\|_{X_2} = \varepsilon \cdot \|h\|_{X_2}$$

This together with the fact $D_x f$ is also a continuous linear function between X and Y using the norms $\|\|_{X_2}$, $\|\|_{Y_2}$ [because the norms are equivalent] proves that f is Fréchet differentiable at x with differential $D_x f$ using the norms $\|\|_{X_2}$, $\|\|_{Y_2}$. □

Differentiability of a function at a point is a local property it only depends on the function values for a arbitrary open neighborhood of this point not on the domain of the function.

Theorem 16.24. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces, $U \subseteq X$ a open set, $x \in U$ and $f: U \to Y$ a function, $V \subseteq U$ a open subset of U such that $x \in V$ then we have*

$$f \text{ is Fréchet differentiable at } x \text{ with differential } D_x f$$

$$\Updownarrow$$

$$f_{|V} \text{ is Fréchet differentiable at } x \text{ with differential } D_x f_{|V}$$

further if f or $f_{|V}$ is Fréchet differentiable at x then $D_x f = D_x f_{|V}$.

Proof.

⇒. Let $\varepsilon \in \mathbb{R}^+$. As f is Fréchet differentiable at x with differential $D_x f$ there exist a $\delta \in \mathbb{R}^+$ such that $\forall h \in U_x$ with $\|h\|_X < \delta$ we have $\|f(x+h)-f(x)-D_x f\|_Y \leqslant \varepsilon \cdot \|h\|_X$. Let $h \in V_x$ with $\|h\|_X < \delta$ then $x+h \in V \subseteq U$, so that $h \in U_x$. Hence we have

$$\|f_{|V}(x+h)-f_{|V}(x)-D_x f(h)\|_Y \underset{x+h,x\in V}{=} \|f(x+h)-f(x)-D_x f(h)\|_Y \leqslant \varepsilon \cdot \|h\|_X$$

proving that $f_{|V}$ is Fréchet differentiable with differential $D_x f$. Hence $D_x f = D_x f_{|V}$.

⇐. Let $\varepsilon \in \mathbb{R}^+$. As $x+0 = x \in V$ we have that $0 \in V_x$ which is open [see theorem: 14.110] so that there exists a $\delta_1 \in \mathbb{R}^+$ such that $0 \in B_{\|\|_X}(0, \delta_1) \subseteq V_x$. Further, as $f_{|V}$ is Fréchet differentiable at x with differential $D_x f_V$, there exist a $\delta_2 \in \mathbb{R}^+$ such that $\forall h \in V_x$ with $\|h\|_X < \delta_2$ we have $\|f_{|V}(x+h)-f_{|V}(x)-D_x f_{|V}(h)\|_Y \leqslant \varepsilon \cdot \|h\|_{|X}$. Take $\delta = \min(\delta_1, \delta_2)$ then if $h \in U_x$ with $\|h\|_X < \delta$ we have $\|h\|_X < \delta_1$ so that $h \in B_{\|\|_X}(0, \delta_1) \subseteq V_x$ and $\|h\|_X < \delta_2$, hence we have

$$\|f(x+h)-f(x)-D_x f_{|V}(h)\|_Y \underset{x,x+h\in V}{=} \|f_{|V}(x+h)-f_{|V}(x)-D_x f_{|V}(h)\|_Y \leqslant \varepsilon \cdot \|h\|_X$$

This proves that f is Fréchet differentiable with differential $D_x f_{|V}$. Hence $D_x f = D_x f_{|V}$. □

Corollary 16.25. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces, V_1, V_2 open sets in X, $x \in V_1 \bigcap V_2$, $f: V_1 \to Y$, $g: V_2 \to Y$ such that there exist a open set W with $x \in W \subseteq V_1 \bigcap V_2$ and $\forall y \in W$ we have $f(y) = g(y)$. Then if f is Fréchet differentiable at x it follows that g is also Fréchet differentiable at x and $D_x f = D_x g$.*

Proof. As $\forall y \in W$ we have that $f(y) = g(y)$ it follows that $f_{|W} = g_{|W}$. As f is Fréchet differentiable at x it follows from [theorem: 16.24] that $f_{|W}$ is Fréchet differentiable at x with $D_x f = D_x f_{|W} \underset{f_{|W}=g_{|W}}{=} D g_{|W}(x)$. Hence using [theorem: 16.24] again it follows that g is Fréchet differentiable at x with $D_x g = D_x g_{|W} = D_x f$. □

Example 16.26. Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$, $y \in Y\, U$ a open set in X then $\forall x \in U$ we have that

$$C_y: U \to Y \text{ defined by } C_y(x) = y$$

is Fréchet differentiable at x and $D_x C_y = C_0$ where $C_0: X \to Y$ is defined by $C_0(z) = 0$. AS C_0 is the neutral element in $L(X, Y)$ we can also note C_0 as 0 [not to be confused with $0 \in Y$ or $0 \in X$]

Proof. Let $x \in U$ and $\varepsilon \in \mathbb{R}^+$ then for $h \in U_x$

$$\|C_y(x+h)-C_y(x)-C_0(h)\|_Y = \|y-y-0\|_Y = 0 < \varepsilon \cdot \|h\|_X$$ □

Example 16.27. Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$, $L \in L(X, Y)$ then $\forall x \in X$ we have that

$$L \text{ is Fréchet differentiable at } x \text{ with differential } D_x L = L$$

Proof. Let $x \in X$ and $\varepsilon \in \mathbb{R}^+$ then we have

$$\|L(x+h)-L(x)-L(h)\|_Y = \|L(x)+L(h)-L(x)-L(h)\|_Y = \|0\|_Y = 0 < \varepsilon \cdot \|h\|$$ □

We look now at some alternative definitions of Fréchet differentiability. First we need a definition of a ε-mapping.

Definition 16.28. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces, $U \subseteq X$ a open set and $0 \in U$ then a **ε-mapping** is a function $\varepsilon: U \to Y$ which is continuous at $0 \in U$ [using the subspace topology on U] and satisfies $\varepsilon(0) = 0$.*

Theorem 16.29. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces, $U \subseteq X$ a open set, $x \in U$ and $f: U \to Y$ a function then the following are equivalent.*

1. *f is Fréchet differentiable at x*
2. *There exist a $L \in L(X, Y)$ and a ε-mapping $\varepsilon: U_x \to Y$ such that $\forall h \in U_x$ we have*
$$f(x+h) - f(x) - L(h) = \|h\|_X \cdot \varepsilon(h)$$
3. *There exist a $L \in L(X, Y)$ such that $\forall \varepsilon \in \mathbb{R}^+$ $\exists \delta \in \mathbb{R}^+$ such that $\forall h \in U_x$ with $0 < \|h\|_X < \delta$ we have*
$$\frac{\|f(x+h) - f(x) - L(h)\|_Y}{\|h\|_X} < \varepsilon$$
4. *There exist a $L \in L(X, Y)$ such that*
$$\lim_{\substack{y \to x \\ U \setminus \{x\}}} \frac{\|f(y) - f(x) - L(y-x)\|_Y}{\|y-x\|_X} = 0$$
5. *There exist a $L \in L(X, Y)$ such that $\forall \{h_i\}_{i \in \mathbb{N}} \subseteq U_x$ with $\forall i \in \mathbb{N}$ $0 < \|h_i\|_X$ and $\lim_{i \to \infty} h_i = 0$ we have*
$$\lim_{n \to \infty} \frac{\|f(x+h_i) - f(x) - L(h_i)\|_Y}{\|h_i\|_X} = 0$$

further if either 1,2,3,4,5 is true then $L = D_x f$.

Proof.

1 ⇒ 2. Let $L = D_x f \in L(X, Y)$ and define
$$\varepsilon: U_x \to Y \text{ by } \varepsilon(h) = \begin{cases} 0 \text{ if } h = 0 \\ \frac{f(x+h) - f(x) - L(h)}{\|h\|_X} \text{ if } h \in U_x \setminus \{0\} \end{cases}$$
then we have $\forall h \in U_x$ that
$$\begin{aligned} \|h\|_X \cdot \varepsilon(h) &= \begin{cases} 0 \text{ if } h = 0 \\ f(x+h) - f(x) - L(h) \text{ if } h \in U_x \setminus \{0\} \end{cases} \\ &= \begin{cases} f(x+0) - f(x) - L(0) \text{ if } h = 0 \\ f(x+h) - f(x) - L(h) \text{ if } h \in U_x \setminus \{0\} \end{cases} \\ &= f(x+h) - f(x) - L(h) \end{aligned}$$
proving that
$$\forall h \in U_x \text{ we have } f(x+h) - f(x) - L(h) = \|h\|_X \cdot \varepsilon(h)$$
Rest us to prove that ε is continuous at 0. Let $\zeta \in \mathbb{R}^+$. As f is Fréchet differentiable there exist a $\delta \in \mathbb{R}^+$ such that $\forall h \in U_x$ with $\|h\|_X < \delta$ we have
$$\|f(x+h) - f(x) - D_x f(h)\|_Y < \zeta \cdot \|h\|_X$$
Hence we have
$$\begin{aligned} \|\varepsilon(h) - \varepsilon(0)\|_Y &= \|\varepsilon(h)\|_Y \\ &= \left\| \begin{cases} \|0\|_Y < \zeta \text{ if } h = 0 \\ \frac{\|f(x+h) - f(x) - Df(x)(h)\|_Y}{\|h\|_X} < \zeta \text{ if } h \in U_x \setminus \{0\} \end{cases} \right\|_Y \\ &< \zeta \end{aligned}$$
which by [theorem: 14.129] proves that ε is continuous at 0 in the subspace topology of U_x.

2 ⇒ 3. Let $L \in L(X, Y)$ and $\varepsilon: U_x \to Y$ a ε-mapping such that $\forall h \in U_x$
$$f(x+h) - f(x) - L(h) = \|h\|_X \cdot \varepsilon(h)$$

Take $\zeta \in \mathbb{R}^+$. As $\varepsilon: U_x \to Y$ is continuous we can use [theorem: 14.129] to find a $\delta \in \mathbb{R}^+$ such that $\forall h \in U_x$ with $\|h\|_X = \|h-0\|_X < \delta$ we have $\|\varepsilon(h)\|_Y = \|\varepsilon(h) - \varepsilon(0)\|_Y < \zeta$. Hence if $0 < \|h\|_X < \delta$ then

$$\frac{\|f(x+h) - f(x) - L(h)\|_Y}{\|h\|_X} = \frac{\|h\|_X \cdot \varepsilon(h)}{\|h\|_X} = \varepsilon(h) < \zeta$$

3 ⇒ 1. Let $L \in L(X,Y)$ be such that $\forall \varepsilon \in \mathbb{R}^+$ there exist a $\delta \in \mathbb{R}^+$ so that $\forall h \in U_x$ with $0 < \|h\|_X < \delta$ we have

$$\frac{\|f(x+h) - f(x) - L(h)\|_Y}{\|h\|_X} < \varepsilon$$

Now $\forall h \in U_x$ with $\|h\|_X < \delta$ we have two cases to consider:

$\|h\|_X = 0$. Then $h = 0$ and

$$\|f(x+h) - f(x) - L(h)\|_Y = \|f(x+0) - f(x) - L(0)\|_Y = \|0\|_Y = \varepsilon \cdot 0 = \varepsilon \cdot \|h\|_X$$

$0 < \|h\|_X$. Then

$$\|f(x+h) - f(x) - L(h)\|_Y = \|h\|_X \cdot \frac{\|f(x+h) - f(x) - L(h)\|_Y}{\|h\|_X} < \|h\|_X \cdot \varepsilon = \varepsilon \cdot \|h\|_x$$

so that in all cases we have

$$\|f(x+h) - f(x) - L(h)\|_Y \leqslant \varepsilon \cdot \|h\|_X$$

Hence f is Fréchet differentiable at x with differential L or $L = D_x f$.

3 ⇒ 4. Let $L \in L(X,Y)$ be such that $\forall \varepsilon \in \mathbb{R}^+$ there exist a $\delta \in \mathbb{R}^+$ so that $\forall h \in U_x$ with $0 < \|h\|_X < \delta$ we have

$$\frac{\|f(x+h) - f(x) - L(h)\|_Y}{\|h\|_X} < \varepsilon \tag{16.2}$$

Define then

$$F: U \setminus \{x\} \to \mathbb{R} \text{ by } F(y) = \frac{\|f(y) - f(x) - L(y-x)\|_Y}{\|y-x\|_X}$$

Let $y \in U \setminus \{x\} \Rightarrow y - x \in U_x$ with $0 < \|y-x\| < \delta$ then we have

$$|F(y) - 0| = \frac{\|f(y) - f(x) - L(y-x)\|_Y}{\|y-x\|_X} = \frac{\|f(x+(y-x)) - f(x) - L(y-x)\|_Y}{\|(y-x)\|_X} <_{\text{[eq 16.2]}} \varepsilon$$

proving that

$$\lim_{\substack{y \to x \\ U_x}} \frac{\|f(y) - f(x) - L(y-x)\|_Y}{\|y-x\|_X} \underset{\text{notation}}{=} \lim_{\substack{y \to x \\ U \setminus \{x\}}} F(y) = 0$$

4 ⇒ 3. Let $L \in L(X,Y)$ be such that for $F: U \setminus \{0\} \to Y$ defined by $F(y) = \frac{\|f(y) - f(x) - L(y-x)\|_Y}{\|y-x\|_X}$ we have

$$\lim_{\substack{y \to x \\ U \setminus \{x\}}} F(y) = 0$$

Take $\varepsilon \in \mathbb{R}^+$ then as $\lim_{\substack{y \to x \\ U \setminus \{x\}}} F(y) = 0$ there exist a $\delta \in \mathbb{R}^+$ such that $\forall y \in U \setminus \{x\}$ with $0 < \|x-y\|_X < \delta$ we have that

$$\frac{\|f(y) - f(x) - L(y-x)\|_Y}{\|y-x\|_X} = |F(y) - 0| < \varepsilon$$

Hence if $h \in U_x$ with $0 < \|h\|_X < \delta$ we have, if we take $y = x + h$, that $0 < \|y-x\|_X < \delta$ and $y \in U \setminus \{x\}$ so that

$$\frac{\|f(x+h) - f(x) - L(h)\|_Y}{\|h\|_X} = \frac{\|f(y) - f(x) - L(y-x)\|_Y}{\|y-x\|_X} < \varepsilon$$

3 ⇒ 5. Let $\{h_i\}_{i \in \mathbb{N}} \subseteq U_x$ be a sequence with $\forall i \in \mathbb{N}\ 0 < \|h_i\|_X$ such that $\lim_{i \to \infty} h_i = 0$. Take $\varepsilon \in \mathbb{R}^+$ then by (3) there exist a $L \in L(X,Y)$ and a $\delta \in \mathbb{R}^+$ such that $\forall h \in U_x$ with $0 < \|h\|_X < \delta$ we have

$$\frac{\|f(x+h) - f(x) - L(h)\|_Y}{\|h\|_X} < \varepsilon$$

As $\lim_{i \to \infty} h_i = 0$ there exist a $N \in \mathbb{N}$ such that $\forall n \geqslant N$ we have that $0 < \|h_n\|_X = \|h_n - 0\|_X < \delta$, so that

$$\left| \frac{\|f(x+h_n) - f(x) - L(h_n)\|_Y}{\|h_n\|_X} - 0 \right| = \frac{\|f(x+h_n) - f(x) - L(h_n)\|_Y}{\|h_n\|_X} < \varepsilon$$

This proves that

$$\lim_{i\to\infty}\frac{\|f(x+h_i)-f(x)-L(h_i)\|_Y}{\|h_i\|_X}=0$$

5 ⇒ 3. Assume that (3) is false. Then given a $L\in L(X,Y)$ there exist a $\varepsilon_0\in\mathbb{R}^+$ such that $\forall\delta\in\mathbb{R}^+$ there exist a $h\in U_x$ with $0<\|h\|_X<\delta$ such that

$$\frac{\|f(x+h)-f(x)-L(h)\|_Y}{\|h\|_X}>\varepsilon_0$$

Using [theorem: 3.107] it follows that $\forall n\in\mathbb{N}$ we have, as $\frac{1}{n}\in\mathbb{R}^+$, that there exist a $h_n\in U_x$ with $0<\|h_n\|_X<\frac{1}{n}$ such that

$$\frac{\|f(x+h_n)-f(x)-L(h_n)\|_Y}{\|h_n\|_X}>\varepsilon_0 \tag{16.3}$$

Now using [example: 14.297] together with [theorem: 14.299] it follows that

$$\lim_{n\to\infty}h_n=0$$

Hence by (5) we have

$$\lim_{n\to\infty}\frac{\|f(x+h_n)-f(x)-L(h_n)\|_Y}{\|h_n\|_X}=0$$

So there exist a $N\in\mathbb{N}$ such that

$$\frac{\|f(x+h_N)-f(x)-L(h_N)\|_Y}{\|h_N\|_X}<\varepsilon_0$$

contradicting [eq: 16.3]. Hence the assumption is wrong and (3) follows. □

Using the fact that differentiability is a local property we can restate the above theorem as follows.

Corollary 16.30. *Let $\langle X,\|\|_X\rangle$, $\langle Y,\|\|_Y\rangle$ be normed spaces, $U\subseteq X$ a open set, $x\in U$ and $f:U\to Y$ a function then the following are equivalent:*

1. *f is Fréchet differentiable at x*
2. *There exist $L\in L(X,Y)$, a $\delta\in\mathbb{R}^+$ such that $B_{\|\|_X}(x,\delta)\subseteq U$ and a ε-mapping $\varepsilon:B_{\|\|_X}(0,\delta)\to Y$ such that*

$$\forall h\in B_{\|\|_X}(0,\delta)\ \ f(x+h)-f(x)-L(h)=\|h\|_X\cdot\varepsilon(h)$$

Further if (1) or (2) is true then $D_xf=L$

Proof.

1 ⇒ 2. As U is open and $x\in U$ there exist a $\delta\in\mathbb{R}^+$ such that $x\in B_{\|\|_X}(x,\delta)\subseteq U$. Using the locality of differentiability [see theorem: 16.24] it follows that $f_{|B_{\|\|_x}(x,\delta)}$ is Fréchet differentiable at x and $D_xf=D_xf_{|B_{\|\|_X}(x,\delta)}$. Using the previous theorem [theorem: 16.29] there exist a ε-mapping

$$\varepsilon:(B_{\|\|_X}(x,\delta))_x\underset{\text{[theorem: 16.4]}}{=}B_{\|\|_X}(0,\delta)\to Y$$

such that $\forall h\in(B_{\|\|_X}(x,\delta))_x\underset{\text{[theorem: 16.4]}}{=}B_{\|\|_X}(0,\delta)$ we have

$$\begin{aligned}f(x+h)-f(x)-D_xf(h)&=f_{|B_{\|\|_X}(x,\delta)}(x+h)-f_{|B_{\|\|_X}(x.\delta)}(x)-D_xf_{|B_{\|\|_X}(x,\delta)}(h)\\&=\|h\|_X\cdot\varepsilon(h)\end{aligned}$$

2 ⇒ 1. As $\varepsilon:B_{\|\|_X}(0,\delta)\underset{\text{[theorem: 16.4]}}{=}(B_{\|\|_X}(x,\delta))_x\to Y$ is a ε-mapping such that

$$\forall h\in B_{\|\|_X}(0,\delta)\underset{\text{[theorem: 16.4]}}{=}(B_{\|\|_X}(x,\delta))_x$$

we have

$$f_{|B_{\|\|_X}(x,\delta)}(x+h)-f_{|B_{\|\|_X}(x.\delta)}(x)-L(h)=f(x+h)-f(x)-L(h)=\|h\|_X\cdot\varepsilon(h)$$

it follows from [theorem: 16.29] that $f_{|B_{\|\|_X}(x,\delta)}$ is Fréchet differentiable at x with $L=D_xf_{|B_{\|\|_X}(x,\delta)}$. Using the locality of differentiability [see theorem: 16.24] it follows that f is differentiable at x with $D_xf=D_xf_{|B_{\|\|_X}(x,\delta)}=L$.

□

A function that is Fréchet differentiable at x is continuous at x as proved in the next theorem.

Theorem 16.31. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces, $U \subseteq X$ a open set, $x \in U$ and $f: U \to Y$ a function that is Fréchet differentiable at x then f is continuous at x.*

Proof. Let $\varepsilon \in \mathbb{R}^+$. As f is Fréchet differentiable at x there exist a $\delta_1 \in \mathbb{R}^+$ such that $\forall h \in U_x$ with $\|h\|_X < \delta$ we have

$$\|f(x+h) - f(x) - D_x f(h)\|_Y \leqslant \frac{\varepsilon}{2} \cdot \|h\|_X \tag{16.4}$$

As $D_x f \in L(X, Y)$ we have [see theorem: 14.182] that

$$\forall h \in X \;\; \|D_x f(h)\|_Y \leqslant \|D_x f\|_{L(X,Y)} \cdot \|h\|_X \tag{16.5}$$

Define now $\delta = \min\left(\delta_1, 1, \frac{\varepsilon}{2 \cdot (\|D_x f\|_{L(X,Y)} + 1)}\right) \in \mathbb{R}^+$ then for every $y \in U$ with $\|y - x\|_X < \delta$ we have $y - x \in U_x$ [as $(y-x) + x = y \in U$] and $\|y - x\|_X \leqslant \delta_1, 1, \frac{\varepsilon}{2 \cdot \|D_x f\|_{L(X,Y)} + 1}$. Using [eq: 16.4] we have

$$\begin{aligned}
\|f(y) - f(x) - D_x f(y-x)\|_Y &= \|f(x + (y-x)) - f(x) - D_x f(y-x)\|_Y \\
&\leqslant \frac{\varepsilon}{2} \cdot \|y - x\|_X \\
&\leqslant \frac{\varepsilon}{2}
\end{aligned}$$

and by [eq: 16.5] it follows that

$$\|D_x f(y-x)\|_Y \leqslant \|D_x f\|_{L(X,Y)} \cdot \|y - x\|_X \leqslant \|D_x f\|_{L(X,Y)} \cdot \frac{\varepsilon}{2 \cdot (\|D_x f\|_{L(X,Y)} + 1)} < \frac{\varepsilon}{2}$$

Hence we have $\forall y \in U$ with $\|y - x\|_X < \delta$ that

$$\begin{aligned}
\|f(y) - f(x)\|_Y &= \|f(y) - f(x) - D_x f(y-x) + D_x f(y-x)\|_Y \\
&\leqslant \|f(y) - f(x) - D_x f(y-x)\|_Y + \|D_x f(y-x)\|_Y \\
&< \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \\
&= \varepsilon
\end{aligned}$$

So by [theorem: 14.129] it follows that f is continuous at x. □

We look now at the relation between the Fréchet differential of a function and the derivative of a function.

Theorem 16.32. *Let $\langle \mathbb{K}, \|\rangle$ be the normed space of real or complex numbers, $\langle Y, \|\|\rangle$ a normed space, $U \subseteq \mathbb{K}$ a open set, $x \in U$ and $f: U \to X$ a function then we have*

$$f \text{ has a derivative } f'_x \text{ at } x$$

$$\Updownarrow$$

$$f \text{ is Fréchet differentiable at } x \text{ with Fréchet differential } D_x f$$

Further if f'_x or $D_x f$ exist then

$$f'_x = D_x f(1)$$

and

$$\forall h \in \mathbb{K} \text{ we have } D_x f(h) = h \cdot f'_x$$

Proof.

⇒. Define $L: \mathbb{K} \to Y$ by $L(h) = h \cdot f'(x)$ then by [example: 14.186]

$$L \in L(\mathbb{K}, Y)$$

Let $\varepsilon \in \mathbb{R}^+$ then by [definition: 16.12] there exist a $\delta \in \mathbb{R}^+$ such that for $0 < |h| < \delta$ we have

$$\left\| \frac{f(x+h) - f(x)}{h} - f'_x \right\| < \varepsilon \tag{16.6}$$

Let $h \in U_x$ with $|h| < \delta$ then we have either:

$|h| = 0$. Then $h = 0$ so that

$$\|f(x+h) - f(x) - L(h)\| = \|f(x) - f(x) - 0 \cdot f'_x\| = \|0\| = 0 = \varepsilon \cdot |0| = \varepsilon \cdot |h|$$

$0<|h|$. Then $h\neq 0$ so that

$$\begin{aligned}\|f(x+h)-f(x)-L(h)\| &= \|f(x+h)-f(x)-h\cdot f'_x\|\\ &= \left\|h\cdot\frac{f(x+h)-f(x)}{h}-h\cdot f'_x\right\|\\ &= \left\|h\cdot\left(\frac{f(x+h)-f(x)}{h}-f'_x\right)\right\|\\ &= |h|\cdot\left\|\frac{f(x+h)-f(x)}{h}-f'_x\right\|\\ &<_{[\text{eq: }16.6]} \varepsilon\cdot|h|\end{aligned}$$

So in all cases we have

$$\|f(x+h)-f(x)-L(h)\|\leqslant\varepsilon\cdot|h|$$

proving that f is Fréchet differentiable at x with the Fréchet differential L, hence D_xf is defined by

$$D_xf(h)=h\cdot f'_x \text{ so that } f'_x=D_xf(1)$$

$\Leftarrow$. Take $f'_x=D_xf(1)$ and let $\varepsilon\in\mathbb{R}^+$. Then as f is Fréchet differentiable at x with Fréchet differential D_xf there exist a $\delta\in\mathbb{R}^+$ such that

$$\|f(x+h)-f(x)-D_xf(h)\|\leqslant\frac{\varepsilon}{2}\cdot|h| \tag{16.7}$$

Let $h\in U_x$ be such that $0<|h|<\delta$ then we have

$$\begin{aligned}\left\|\frac{f(x+h)-f(x)}{h}-f'_x\right\| &= \left\|\frac{f(x+h)-f(x)}{h}-D_xf(1)\right\|\\ &= \left\|\frac{f(x+h)-f(x)-h\cdot D_xf(1)}{h}\right\|\\ &= \left\|\frac{f(x+h)-f(x)-D_xf(h\cdot 1)}{h}\right\|\\ &= \left\|\frac{f(x+h)-f(x)-D_xf(h)}{h}\right\|\\ &= \frac{1}{|h|}\cdot\|f(x+h)-f(x)-D_xf(h)\|\\ &\leqslant_{[\text{eq: }16.7]} \frac{1}{|h|}\cdot\frac{\varepsilon}{2}\cdot|h|\\ &= \frac{\varepsilon}{2}\\ &< \varepsilon\end{aligned}$$

Proving that f has a derivative $f'_x=D_xf(1)$. □

We prove now that the existence of a derivative is a local property.

Corollary 16.33. *Let $\langle\mathbb{K},\|\rangle$ be the normed space of real (or complex numbers), $\langle X,\|\|\rangle$ a normed space, U,V two open sets in $\mathbb{K}$, $x\in U\bigcap V$ and $f:U\to X$, $g:V\to X$ two functions such that there exist a open set W with $x\in W\subseteq U\bigcap V$ and $\forall y\in W\ f(y)=g(y)$. Then if f has a derivative f'_x at x it follows that g has also a derivative at z and that $f'_x=g'_x$.*

***Note* 16.34.** *In the special case of $V\subseteq U$ and $g=f_{|V}$ this reduces to the following. If f has a derivative f'_x at x then $f_{|V}$ has a derivative at x and $f'_x=(f_{|V})'_x$.*

***Note* 16.35.** *In the special case of $U\subseteq V$ and $f=g_{|U}$ this reduces to the following. If $g_{|U}$ has a derivative $(g_{|U})'_x$ at x then g has also a derivative at x and $(g_{|U})'_x=f'_x$.*

Proof. As f is has a derivative at x it follows from [theorem: 16.32] that f is Fréchet differentiable at x and $f'_x=D_xf(1)$. Using [corollary: 16.25] it follows that g is Fréchet differentiable at x and $D_xg=D_xf$. Hence using [theorem: 16.32] again it follows that g has a derivative at x and $g'_x=D_xg(1)=D_xf(1)=f'_x$. □

Example 16.36. Let $\langle \mathbb{K}, \|\rangle$ be the normed space of real (or complex) numbers, U a open set in $\mathbb{K}$, $\langle X, \|\|\rangle$ a normed space, $x \in X$ and $C_x: U \to X$ defined by $C_x(t) = x$ then $\forall t \in U$ C_x has a derivative and $(C_x)'_t = 0$.

Proof. Let $t \in U$. Using [example: 16.26] C_x is Fréchet differentiable at t with $D_t C_x = C_0$. Hence using [theorem: 16.32] C_x has a derivative at t and $(C_x)'_t = C_0(1) = 0$. □

Example 16.37. Let $\langle \mathbb{K}, \|\rangle$ be the normed space of real (or complex) numbers, U a open set in $\mathbb{K}$ then $\forall t \in U$ Id_U has a derivative at t and $(\mathrm{Id}_U)'_t = 1$

Proof. Let $t \in U$. Using [example: 16.22] Id_U is Fréchet differentiable at t with $D_t(\mathrm{Id}_U) = \mathrm{Id}_U$. Hence using [theorem: 16.32] Id_U has a derivative at t with $(\mathrm{Id}_U)'_t = \mathrm{Id}_U(1) = 1$. □

16.1.4 Properties of the Fréchet differential

Theorem 16.38. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces, $U \subseteq X$ a open set, $x \in U$ then we have:*

1. *If $f: U \to Y$ is Fréchet differentiable at x and $g: U \to Y$ is Fréchet differentiable at x then*
$$f + g: U \to Y \text{ is Fréchet differentiable with Fréchet differential } D_x(f+g) = D_x f + D_x g$$
2. *If $f: U \to Y$ is Fréchet differentiable at x and $\alpha \in \mathbb{K}$ then*
$$\alpha \cdot f: U \to Y \text{ is Fréchet differentiable at } x \text{ with Fréchet differential } D_x(\alpha \cdot f) = \alpha \cdot D_x f$$

Proof.

1. Let $\varepsilon \in \mathbb{R}^+$. As f, g are Fréchet differentiable at x there exist δ_1, δ_2 such that
$$\forall h \in U_x \text{ with } \|h\|_x < \delta_1 \text{ we have } \|f(x+h) - f(x) - D_x f(h)\|_Y \leqslant \frac{\varepsilon}{2} \cdot \|h\|_X$$
$$\forall h \in U_x \text{ with } \|h\|_x < \delta_2 \text{ we have } \|g(x+h) - g(x) - D_x g(h)\|_Y \leqslant \frac{\varepsilon}{2} \cdot \|h\|_X$$
As $D_x f$, $D_x g \in L(X, Y)$ we have by [theorem: 14.176] that $D_x f + D_x g \in L(X, Y)$. Further if $h \in U_x$ with $\|h\|_X < \min(\delta_1, \delta_2)$ then we have
$$\begin{aligned}
\|(f+g)(x+h) - (f+g)(x) - (D_x f + D_X g)(h)\|_Y &= \\
\|f(x+h) + g(x+h) - f(x) - g(x) - (D_x f(h) + D_x g(h))\|_Y &\leqslant \\
\|f(x+h) - f(x) - D_x f(h)\|_Y + \|g(x+h) - g(x) - D_x g(h)\|_Y &\leqslant \\
\frac{\varepsilon}{2} \cdot \|h\|_X + \frac{\varepsilon}{2} \cdot \|h\|_Y &= \\
\varepsilon \cdot \|h\|_X &
\end{aligned}$$
proving that $f + g$ is Fréchet differentiable at x with Fréchet differential
$$D_x(f+g) = D_x f + D_x g$$
2. Let $\varepsilon \in \mathbb{R}^+$. As f is Fréchet differentiable at x there exist a $\delta \in \mathbb{R}^+$ such that
$$\forall h \in U_x \text{ with } \|h\|_x < \delta_1 \text{ we have } \|f(x+h) - f(x) - D_x f(h)\|_Y \leqslant \frac{\varepsilon}{|\alpha| + 1} \cdot \|h\|_X$$
As $D_x f \in L(X, Y)$ it follows from [theorem: 14.176] that $\alpha \cdot D_x f \in L(X, Y)$. Further if $h \in U_x$ with $\|h\|_X < \delta$ then we have
$$\begin{aligned}
\|(\alpha \cdot f)(x+h) - (\alpha \cdot f)(x) - (\alpha \cdot D_x f)(h)\|_Y &= \\
\|\alpha \cdot f(x+h) - \alpha \cdot f(x) - \alpha \cdot D_x f(h)\|_Y &= \\
\|\alpha \cdot (f(x+h) - f(x) - D_x f(h))\|_Y &= \\
|\alpha| \cdot \|f(x+h) - f(x) - D_x f(h)\|_Y &\leqslant \\
|\alpha| \cdot \frac{\varepsilon}{|\alpha| + 1} \cdot \|h\|_X &< \\
\varepsilon \cdot \|h\|_X &
\end{aligned}$$
proving that $\alpha \cdot f$ is Fréchet differentiable at x with Fréchet differential $\alpha \cdot D_x f$. □

We introduce now the most important rule for Fréchet differentiation.

Theorem 16.39. (Chain Rule) *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle, \langle Z, \|\|_Z\rangle$ be normed spaces, $U \subseteq X$ a open set in X, $x \in U$, $V \subseteq Y$ a open set in Y, $f: U \to Y$, $g: V \to Z$ functions such that $f(U) \subseteq V$, f is Fréchet differentiable at x and g is Fréchet differentiable at $f(x)$ then*

$$g \circ f: U \to Z \text{ is Fréchet differentiable at } x$$

and

$$D_x(g \circ f) = D_{f(x)}g \circ D_x f$$

Proof. As f is Fréchet differentiable at x we have by [theorem: 16.29] that there exist a ε-mapping $\varepsilon_f: U_x \to Y$ such that

$$\forall h \in U_x \text{ we have } f(x+h) - f(x) - D_x f(h) = \|h\|_X \cdot \varepsilon_f(h) \tag{16.8}$$

Further as g is Fréchet differentiable at $f(x)$ we can use [theorem: 16.29] again, giving a ε-mapping $\varepsilon_g: V_{f(x)} \to Z$ satisfying

$$\forall k \in V_{f(x)} \text{ we have } g(f(x)+k) - g(f(x)) - D_{f(x)}g(k) = \|k\|_Y \cdot \varepsilon_g(k) \tag{16.9}$$

Let $h \in U_x$. As $(f(x+h) - f(x)) + f(x) = f(x+h) \in f(U) \subseteq V$ we have that $f(x+h) - f(x) \in V_{f(x)}$, combining this with [eq: 16.9] gives

$$\begin{aligned}
\|f(x+h) - f(x)\|_Y \cdot \varepsilon_g(f(x+h) - f(x)) &\underset{\text{[eq: 16.9]}}{=} \\
g(f(x) + (f(x+h) - f(x))) - g(f(x)) - D_{f(x)}g(f(x+h) - f(x)) &= \\
g(f(x+h)) - g(f(x)) - D_{f(x)}g(f(x+h) - f(x)) &\underset{\text{[eq: 16.8]}}{=} \\
g(f(x+h)) - g(f(x)) - D_{f(x)}g(\|h\|_X \cdot \varepsilon_f(h) + D_x f(h)) &= \\
g(f(x+h)) - g(f(x)) - D_{f(x)}g(\|h\|_X \cdot \varepsilon_f(h)) - D_{f(x)}\, g(D_x f(h)) &= \\
(g \circ f)(x+h) - (g \circ f)(x) - D_{f(x)}g(\|h\|_X \cdot \varepsilon_f(h)) - (D_{f(x)}\, g \circ D_x f)(h) &
\end{aligned}$$

proving that

$$\begin{aligned}
(g \circ f)(x+h) - (g \circ f)(x) - (D_{f(x)}\, g \circ D_x f)(h) &= \\
\|f(x+h) - f(x)\|_Y \cdot \varepsilon_g(f(x+h) - f(x)) + D_{f(x)}\, g(\|h\|_X \cdot \varepsilon_f(h)) &= \\
\|f(x+h) - f(x)\|_Y \cdot \varepsilon_g(f(x+h) - f(x)) + \|h\|_X \cdot D_{f(x)}g(\varepsilon_f(h)) &
\end{aligned} \tag{16.10}$$

The next logical step is to find a ε-mapping $\zeta: U_x \to Y$ such that

$$\zeta(h) \cdot \|h\|_x = \|f(x+h) - f(x)\|_Y \cdot \varepsilon_g(f(x+h) - f(x)) + \|h\|_X \cdot D_{f(x)}g(\varepsilon_f(h))$$

because we can then use [theorem: 16.29] to finish the proof. So define

$$\zeta: U_x \to Y \text{ by } \begin{cases} \frac{\|f(x+h) - f(x)\|_Y \cdot \varepsilon_g(f(x+h) - f(x))}{\|h\|_X} + D_{f(x)}g(\varepsilon_f(h)) \text{ if } h \in U_x \setminus \{0\} \\ 0 \text{ if } h = 0 \end{cases}$$

Then for $h \in U_x$ we have either:

$h = 0$. Then

$$\begin{aligned}
\|f(x+h) - f(x)\|_Y \cdot \varepsilon_g(f(x+h) - f(x)) + \|h\|_X \cdot D_{f(x)}g(\varepsilon_f(h)) &= \\
\|f(x+0) - f(x)\|_Y \cdot \varepsilon_g(f(x+0) - f(x)) + \|0\|_X \cdot D_{f(x)}g(\varepsilon_f(0)) &= \\
0 &= \\
0 \cdot \zeta(0) &= \\
\|h\|_X \cdot \zeta(h) &
\end{aligned}$$

$h \neq 0$. Then

$$\begin{aligned}
\|f(x+h) - f(x)\|_Y \cdot \varepsilon_g(f(x+h) - f(x)) + \|h\|_X \cdot D_{f(x)}g(\varepsilon_f(h)) &= \\
\|h\|_X \cdot \frac{\|f(x+h) - f(x)\|_Y \cdot \varepsilon_g(f(x+h) - f(x)) + \|h\|_X \cdot D_{f(x)}g(\varepsilon_f(h))}{\|h\|_X} &= \\
\|h\|_X \cdot \left(\frac{\|f(x+h) - f(x)\|_Y \cdot \varepsilon_g(f(x+h) - f(x))}{\|h\|_X} + D_{f(x)}g(\varepsilon_f(h)) \right) &= \\
\|h\|_X \cdot \zeta(h) &
\end{aligned}$$

Combining the above with [eq: 16.10] gives us the desired

$$(g \circ f)(x+h) - (g \circ f)(x) - (D_{f(x)}g \circ D_x f)(h) = \|h\|_X \cdot \zeta(h) \tag{16.11}$$

Next we must prove that ζ is continuous at 0. Let $\varepsilon \in \mathbb{R}^+$. As ε_f is a ε-mapping, it is continuous at 0. So by [theorem: 14.129] there exist a $\delta_f \in \mathbb{R}^+$ such that if $h \in U_x$ with $\|h\|_X < \delta_f$ then

$$\|\varepsilon_f(h)\|_Y < 1 \tag{16.12}$$

So if additional $0 < \|h\|_X$ we have

$$\begin{aligned}
\frac{\|f(x+h) - f(x)\|_Y}{\|h\|_X} &\underset{\text{[eq: 16.8]}}{=} \frac{\|\|h\|_X \cdot \varepsilon_f(h) + D_x f(h)\|_Y}{\|h\|_X} \\
&\leqslant \frac{\|\|h\|_X \cdot \varepsilon_f(h)\|_Y + \|D_x f(h)\|_Y}{\|h\|_X} \\
&= \frac{\|h\|_X \cdot \|\varepsilon_f(h)\|_Y + \|D_x f(h)\|_Y}{\|h\|_X} \\
&\leqslant \frac{\|h\|_X \cdot \|\varepsilon_f(h)\|_Y + \|D_x f\|_{L(X,Y)} \cdot \|h\|_X}{\|h\|_X} \\
&= \|\varepsilon_f(h)\|_Y + \|D_x f\|_{L(X,Y)} \\
&\underset{\text{[eq: 16.12]}}{<} 1 + \|D_x f\|_{L(X,Y)}
\end{aligned}$$

hence

$$\forall h \in U_x \text{ with } 0 < \|h\|_X < \delta_f \text{ we have that } \frac{\|f(x+h) - f(x)\|_Y}{\|h\|_X} < 1 + \|D_x f\|_{L(X,Y)} \tag{16.13}$$

As ε_g is a ε-mapping it is continuous at 0. So by [theorem: 14.129] there exist a $\delta_g \in \mathbb{R}^+$ such that

$$\forall k \in V_{f(x)} \text{ with } \|k\|_Y < \delta_g \text{ we have } \|\varepsilon_g(k)\|_Z < \frac{\varepsilon}{2 \cdot (1 + \|D_x f\|_{L(X,Y)})} \tag{16.14}$$

As f is Fréchet differentiable at x we have by [theorem: 16.31] that f is continuous at x, hence there exist by [theorem: 14.129] a $\delta_1 \in \mathbb{R}^+$ such that $\forall y \in U$ with $\|y - x\|_X < \delta_1$ we have $\|f(y) - f(x)\|_Y < \delta_g$. So if $h \in U_x$ with $\|h\|_X < \delta_1$ we have $x + h \in U$ and $\|(x+h) - x\|_X = \|h\|_X < \delta_1$ so that $\|f(x+h) - f(x)\|_Y < \delta_g$ which by [eq: 16.14] results in $\|\varepsilon_g(f(x+h) - f(x))\|_Z < \frac{\varepsilon}{2 \cdot (1 + \|D_x f\|_{L(X,Y)})}$. Summarized

$$\forall h \in U_x \text{ with } \|h\|_X < \delta_1 \text{ we have } \|\varepsilon_g(f(x+h) - f(x))\|_Z < \frac{\varepsilon}{2 \cdot (1 + \|D_x f\|_{L(X,Y)})}$$

Combining this with [eq: 16.13] we have $\forall h \in U_x$ with $0 < \|h\|_X < \min(\delta_1, \delta_f)$ that

$$\begin{aligned}
\frac{\|f(x+h) - f(x)\|_Y}{\|h\|_X} \cdot \|\varepsilon_g(f(x+h) - f(x))\|_Z &\leqslant \\
(1 + \|D_x f\|_{L(X,Y)}) \cdot \|\varepsilon_g(f(x+h) - f(x))\|_Z &< \\
(1 + \|D_x f\|_{L(X,Y)}) \cdot \frac{\varepsilon}{2 \cdot (1 + \|D_x f\|_{L(X,Y)})} &= \\
\frac{\varepsilon}{2}
\end{aligned}$$

or

$$\forall h \in U_x \text{ with } 0 < \|h\|_X < \min(\delta_1, \delta_f) \ \|\varepsilon_g(f(x+h) - f(x))\|_Z \cdot \frac{\|f(x+h) - f(x)\|_Y}{\|h\|_X} < \frac{\varepsilon}{2} \tag{16.15}$$

As $\varepsilon_f : U_x \to Y$ is a ε-mapping is is continuous at 0, so by [theorem: 14.129] there exist a $\delta_2 \in \mathbb{R}^+$ such that $\forall h \in U_x$ with $\|h\|_X < \delta_2$ we have $\|\varepsilon_f(h)\|_Y < \frac{\varepsilon}{2 \cdot (1 + \|_{f(x)} g\|_{L(Y,Z)})}$. Hence

$$\begin{aligned}
\|D_{f(x)} g(\varepsilon_f(h))\|_Z &\leqslant \|D_{f(x)} g\|_{L(Y,Z)} \cdot \|\varepsilon_f(h)\|_Y \\
&\leqslant \|D_{f(x)} g\|_{L(Y,Z)} \cdot \frac{\varepsilon}{2 \cdot (1 + \|D_{f(x)} g\|_{L(Y,Z)})} \\
&< \frac{\varepsilon}{2}
\end{aligned}$$

In other words

$$\forall h \in U_x \text{ with } \|h\|_X < \delta_2 \text{ we have } \|D_{f(x)} g(\varepsilon_f(h))\|_Z < \frac{\varepsilon}{2} \tag{16.16}$$

Take now $\delta = \min(\delta_f, \delta_1, \delta_2)$ and $h \in U_x$ with $\|h\|_X = \|h - 0\|_X < \delta$ then we have either:

$h = 0$. Then $\|\zeta(h) - 0\|_Z = \|\zeta(0)\|_Z = \|0\|_Z < \varepsilon$

$\boldsymbol{h \neq 0}$**.** Then $0 < \|h\|_X < \delta_f, \delta_1, \delta_2$ so that

$$\begin{aligned}
\|\zeta(h) - 0\|_Z &= \|\zeta(h)\|_Z \\
&= \left\| \frac{\|f(x+h) - f(x)\|_Y \cdot \varepsilon_g(f(x+h) - f(x))}{\|h\|_X} + D_{f(x)}g(\varepsilon_f(h)) \right\|_Z \\
&\leqslant \left\| \frac{\|f(x+h) - f(x)\|_Y \cdot \varepsilon_g(f(x+h) - f(x))}{\|h\|_X} \right\|_Z + \|D_{f(x)}g(\varepsilon_f(h))\|_Z \\
&= \frac{\|f(x+h) - f(x)\|_Y}{\|h\|_X} \cdot \|\varepsilon_g(f(x+h) - f(x))\|_Z + \|D_{f(x)}g(\varepsilon_f(h))\|_Z \\
&<_{[\text{eq: } 16.15]} \frac{\varepsilon}{2} + \|D_{f(x)}g(\varepsilon_f(h))\|_Z \\
&<_{[\text{eq: } 16.16]} \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \\
&= \varepsilon
\end{aligned}$$

So we have in all cases that $\|\zeta(h) - 0\|_Z < \varepsilon$ which as $\varepsilon \in \mathbb{R}^+$ was chosen arbitrary proves that ζ is continuous at 0. As also $\zeta(0) = 0$ it follows by definition that $\zeta: U_x \to Z$ is a ε-mapping. Hence as by [eq: 16.11] $(g \circ f)(x+h) - (g \circ f)(x) - (D_{f(x)}g \circ D_x f)(h) = \|h\|_X \cdot \zeta(h)$ it follows from [theorem: 16.29] that

$$g \circ f \text{ is Fréchet differentiable with differential } D_x(g \circ f) = D_{f(x)}g \circ D_x f$$ □

The following corollary is needed later to extend the chain rule to higher order differentials

Corollary 16.40. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle, \langle Z, \|\|_Z \rangle$ be normed spaces, $U, W \subseteq X$ a open sets in X with $x \in W \subseteq U$, $V \subseteq Y$ a open set in Y, $f: U \to Y$, $g: V \to Z$ functions such that $f(W) \subseteq V$, f is Fréchet differentiable at x and g is Fréchet differentiable at $f(x)$ then*

$$g \circ f: U \to Z \text{ is Fréchet differentiable at } x$$

and

$$D_x(g \circ f) = D_{f(x)}g \circ D_x f$$

Proof. As $x \in W \subseteq U$ and f is Frétchet differentiable at x it follows from [theorem: 16.24] that $f_{|W}$ is Frétchet differentiable at x with $D_x f_{|W} = D_x f$. As $f_{|W}(W) = f(W) \subseteq V$ it follows from the chain rule [theorem: 16.39] $g \circ f_{|W}$ is Fréchet differentiable at x with

$$D_x(g \circ f_{|W}) = D_{f_{|W}(x)}g \circ D_x f_{|W} = D_{f(x)}g \circ D_x f$$

As $g \circ f_{|W} \underset{[\text{theorem: } 2.89]}{=} (g \circ f)_{|W}$ it follows that $(g \circ f)_{|W}$ is Fréchet differentiable at x with $D_x(g \circ f)_{|W} = D_{f(x)}g \circ D_x f$. Finally using [theorem: 16.24] again it follows that

$$g \circ f \text{ is Fréchet differentiable at } x \text{ with } D_x(g \circ f) = D_x(g \circ f)_{|W} = D_{f(x)}g \circ D_x f$$ □

Corollary 16.41. *Let $\langle X, \|\| \rangle$ be a normed space, $\langle \mathbb{K}, \|\| \rangle$ the normed space of real or complex numbers, $U \subseteq \mathbb{K}$ a open set in $\mathbb{K}$, $x \in U$ $V \subseteq \mathbb{K}$ a open set in $\mathbb{K}$, $f: U \to \mathbb{K}$ a function and $g: V \to X$ functions such that $f(U) \subseteq V$, f has a derivative f'_x at x and g has a derivative $g'_{f(x)}$ at $f(x)$. Then $g \circ f: U \to Y$ has a derivative at x and*

$$(g \circ f)'_x = f'_x \cdot g'_{f(x)}$$

Proof. Using [theorem: 16.32] it follows that f is Fréchet differentiable at x and g is Fréchet differentiable at $f(x)$. Using the Chain Rule [theorem: 16.39] we have that $g \circ f$ is Fréchet differentiable at x. Hence, using [theorem: 16.32], we have that $g \circ f$ has a derivative at x. Further we have

$$\begin{aligned}
(g \circ f)'_x &\underset{[\text{theorem: } 16.32]}{=} (D_x(g \circ f) \circ D_x f)(1) \\
&\underset{[\text{theorem: } 16.39]}{=} (D_{f(x)}g \circ D_x f)(1) \\
&= D_{f(x)}g(D_x f(1)) \\
&\underset{[\text{theorem: } 16.32]}{=} D_{f(x)}g(f'_x) \\
&\underset{[\text{theorem: } 16.32]}{=} f'_x \cdot g'_{f(x)}
\end{aligned}$$

□

Corollary 16.42. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle, \langle Z, \|\|_Z\rangle$ be normed spaces, $U \subseteq X$ a open set in X, $x \in U$, $f: U \to Y$ a function that is Fréchet differentiable at x and $L \in L(Y, Z)$ then*

$$L \circ f: U \to X \text{ is Fréchet differentiable at } x$$

and

$$D_x(L \circ f) = L \circ D_x f$$

Proof. Using [example: 16.27] L is Fréchet differentiable at $f(x)$ and $D_{f(x)}L = L$. Hence using [theorem: 16.39] $L \circ f$ is Fréchet differentiable at x and

$$D_x(L \circ f) = D_{f(x)}L \circ D_x f = L \circ D_x f$$

□

16.1.5 Partial differentials

Definition 16.43. *Let $n \in \mathbb{N} \setminus \{1\}$, $\{X_i\}_{i \in [1, \dots, n]}$ a finite family of sets, $x \in \prod_{i \in \{1, \dots, n\}} X_i$, $i \in \{1, \dots, n\}$, $t \in X_i$ then $I^{[i,x]}: X_i \to \prod_{i \in \{1, \dots, n\}} X_i$ is defined by*

$$I^{[i,x]}(t) = \left(x_1, \dots \underbrace{t}_{i} \dots, x_n\right)$$

or more formally

$$(I^{[i,x]}(t))_j = \begin{cases} t \text{ if } j = i \\ x_j \text{ if } j \in \{1, \dots, n\} \setminus \{i\} \end{cases}$$

***Note* 16.44.** *$I^{[i,x]}$ is not a function because we do not specify the domain, codomain. This is*

Lemma 16.45. *Let $n \in \mathbb{N} \setminus \{1\}$, $\{\langle X_i, \|\|_i\rangle\}_{i \in [1, \dots, n]}$ be a finite family of normed spaces, $\left\langle \prod_{j \in \{1, \dots, n\}} X_j, \|\|_{\max}\right\rangle$ the product space equipped with the maximum norm [see theorem: 14.94] then we have $\forall i \in \{1, \dots, n\}$ that:*

1. *Then $I^{[i,0} \in L\left(X_i, \prod_{j \in \{1, \dots, n\}} X_i\right)$ and $\forall t \in X_i$ we have $\|t\|_i = \|I^{[i,0]}(t)\|_{\max}$*
2. *If $x = (x_1, \dots, x_n) \in \prod_{j \in \{1, \dots, n\}} X_j$ then $I^{[i,x]}(x_i) = x$*
3. *If $x = (x_1, \dots, x_n) \in \prod_{j \in \{1, \dots, n\}} X_j$ then $x = \sum_{i=1}^n I^{[i,0]}(x_i)$*
4. *If $x = (x_1, \dots, x_n) \in \prod_{j \in \{1, \dots, n\}} X_j$, U a open set in X_i then $(I^{[i,x]})_{|U}$ is Fréchet differentiable on U with $\forall t \in U$ $D_t(I^{[i,x]})_{|U} = I^{[i,0]}$.*
5. *If $x = (x_1, \dots, x_n) \in \prod_{j \in \{1, \dots, n\}} X_j$, U a open set in X_i then $(I^{[i,x]})_{|U}$ is continuous.*
6. *$\forall i, k \in \{1, \dots, n\}$, $\forall t \in X_i$ we have $(I^{[i,0]}(t))_k = \delta_{i,k} \cdot t$*

Proof.

1. Let $r, s \in X_i$, $\alpha \in \mathbb{K}$ then

$$\begin{aligned} I^{[i,0]}(r + \alpha \cdot s) &= \left(0 \dots \underbrace{r + \alpha \cdot s}_{i} \dots 0\right) \\ &= \left(0 \dots \underbrace{r}_{i} \dots 0\right) + \alpha \cdot \left(0 \dots \underbrace{s}_{i} \dots 0\right) \\ &= I^{[i,0]}(r) + \alpha \cdot I^{[i,0]}(s) \\ &= L(r) + \alpha \cdot L(s) \end{aligned}$$

proving that

$$L \in \mathrm{Hom}\left(X_i, \prod_{j \in \{1, \dots, n\}} X_j\right)$$

Further if $t \in X_i$ then for $j \in \{1, \dots, n\}$ we have

$$\pi_j(I^{[i,0]}(t)) = \pi_j\left(\left(0, \dots \underbrace{t}_{j}\right) \dots, 0\right) = \begin{cases} t \text{ if } j = i \\ 0_j \text{ if } j \in \{1, \dots, n\} \setminus \{i\} \end{cases} \tag{16.17}$$

so that

$$\begin{aligned}
\|I^{[i,0]}(t)\|_{\max} &= \max\left(\{\|\pi_j(I^{[i,0]}(t))\|_j | j\in\{1,\ldots,n\}\}\right)\\
&= \max\left(\{\|\pi_j(I^{[i,0]}(t))\|_j | j\in\{1,\ldots,n\}\setminus\{i\}\}\bigcup\{\|\pi_j(I^{[i,0]}(t))\|_j | j\in\{i\}\}\right)\\
&= \max\left(\{\|0_j\|_j\}\bigcup\{\|t\|_i\}\right)\\
&= \max\left(\{0,\|t\|_i\}\right)\\
&= \|t\|_i
\end{aligned}$$

proving that

$$\|I^{[i,0]}(t)\|_{\max} = \|t\|_i = 1\cdot\|t\|_i$$

Hence by [theorem: 14.177] it follows that

$$I^{[i,0]}\in L\left(X_i,\prod_{j\in\{1,\ldots,n\}}X_j\right)$$

2. This follows from $I^{[x,i]}(x)=\left(x_1,\ldots\underbrace{x_i}_{i}\ldots,x_n\right)=x$

3. Let $x\in\prod_{j\in\{1,\ldots,n\}}X_j$ and $j\in\{1,\ldots,n\}$ then

$$\begin{aligned}
\left(\sum_{i=1}^{n}I^{[i,0]}(x_i)\right)_j &= \left(\sum_{i\in\{1,\ldots,n\}}I^{[i,0]}(x_i)\right)_j\\
&= \pi_j\left(\sum_{i\in\{1,\ldots,n\}}I^{[i,0]}(x_i)\right)\\
&= \sum_{i\in\{1,\ldots,n\}}\pi_j(I^{[i,0]}(x_i))\\
&= \sum_{i\in\{1,\ldots,n\}\setminus\{j\}}\pi_j(I^{[i,0]}(x_i))+\sum_{i\in\{j\}}\pi_j(I^{[i,0]}(x_i))\\
&= 0+x_j\\
&= x_j
\end{aligned}$$

proving that

$$x=\sum_{i=1}^{n}I^{[i,0]}(x_i)$$

4. Let $x\in\prod_{j\in\{1,\ldots,n\}}X_j$ and $t\in U$. Let $\varepsilon\in\mathbb{R}^+$ then we have $\forall h\in X_i=(X_i)_x$ that

$$\begin{aligned}
\|(I^{[i,x]})_{|U}(t+h)-(I^{[i,x]})_{|U}(t)-I^{[i,0]}(h)\|_{\max} &=\\
\|I^{[i,x]}(t+h)-I^{[i,x]}(t)-I^{[i,0]}(h)\|_{\max} &=\\
\|(x_1,\ldots,x_{i-1},t+h,x_i,\ldots,x_n)-(x_1,\ldots,x_{i-1},t,x_{i+1},\ldots,x_n)-I^{[i,0]}(h)\|_{\max} &=\\
\|(0_1,\ldots,0_{i-1},h,0_{i+1},\ldots,0_n)-I^{[i,0]}(h)\|_{\max} &=\\
\|(0_1,\ldots,0_{i-1},h,0_{i+1},\ldots,0_n)-(0_1,\ldots,0_{i-1},h,0_{i+1},\ldots,0_n)\|_{\max} &=\\
\|(0_1,\ldots,0_n)\|_{\max} &=\\
0 &<\\
\varepsilon\cdot\|h\|_i &
\end{aligned}$$

which together with (1) proves that

$$(I^{[i,x]})_{|U}\text{ is Fréchet differentiable at }t\text{ with differential }D_tI^{[i,x]}=I^{[i,0]}$$

5. Let $x\in\prod_{j\in\{1,\ldots,n\}}X_j$ then by (4) we have that $(I^{[i,x]})_{|U}$ is Fréchet differentiable at t and using [theorem: 16.31] it follows then that $I^{[i,x]}$ is continuous at t. Hence $I^{[i,x]}$ is continuous mapping between X_i and $\prod_{j\in\{1,\ldots,n\}}X_j$.

6. Let $i \in \{1,\dots,n\}$ and $t \in X_i$ then we have for $k \in \{1,\dots,n\}$

$$(I^{[i,0]}(t))_k = \left(0,\dots\underbrace{t}_{i}\dots 0\right)_k = \delta_{i,k}\cdot t$$

□

Definition 16.46. *Let $n \in \mathbb{N}\setminus\{1\}$, $\{X_i\}_{i\in[1,\dots,n]}$ be a finite family of sets, $U \subseteq \prod_{j\in\{1,\dots,n\}} X_j$, $x \in U$, Y a set, $i \in \{1,\dots,n\}$ and $f\colon U \to Y$ a function then, as $(I^{[i,x]})^{-1}(U) = X \bigcap (I^{[i,x]})^{-1}(U)$, we can use [theorem: 2.28] to define the function*

$$f^{[i,x]}\colon (I^{[i,x]})^{-1}(U) \to Y \text{ by } f^{[i,x]} = f \circ I^{[i,x]}$$

So $\forall t \in (I^{[i,x]})^{-1}(U)$ we have

$$f^{[i,x]}(t) = (f \circ I^{[i,x]})(t) = f(I^{[i,x]}(t)) = f\left(x_1,\dots\underbrace{t}_{i}\dots,x_n\right)$$

We are now ready to define the partial differential of a multi-parameter function.

Definition 16.47. *Let $n \in \mathbb{N}\setminus\{1\}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\dots,n\}}$ a finite family of normed spaces, $\langle Y, \|\|\rangle$ a normed space, $\left\langle \prod_{j\in\{1,\dots,n\}} X_j, \|\|_{\max}\right\rangle$ the product space equipped with the maximum norm [see theorem: 14.94], $U \subseteq \prod_{j\in\{1,\dots,n\}} X_j$ a open set, $x \in U$, $i \in \{1,\dots,n\}$ and*

$$f\colon U \to Y \text{ a function}$$

then

$$f \text{ is } i\text{-partial differentiable at } x \text{ with } i\text{-partial differential } D_{x,i}f$$

if

$$f^{[i,x]}\colon (I^{[i,x]})^{-1}(U) \to Y \text{ is Fréchet differentiable at } x_i \text{ and } D_{x,i}f = D_{x_i}f^{[i,x]} \in X_i$$

where

$$f^{[i,x]} = f \circ f \circ I^{[i,x]}$$

***Note* 16.48.** *Using [lemma: 16.45] $I^{[i,x]}(x_i) = x \in U$ and $I^{[i,x]}$ is continuous, hence $(I^{[i,x]})^{-1}(U)$ is open and $x_i \in (I^{[i,x]})^{-1}(U)$ which is required for the Fréchet differentiation definition.*

***Note* 16.49.** *As $X_i \bigcap (I^{[i,x]})^{-1}(U) = (I^{[i,x]})^{-1}(U)$ it follows from [theorem: 2.80] that*

$$f^{[i,x]} = f \circ I^{[i,x]} = f \circ (I^{[i,x]})_{|(I^{[i,x]})^{-1}(U)}$$

so that we can rephrase the condition for i-partial differentiability as follows:

$$f \text{ is } i\text{-partial differentiable at } x \text{ with } i\text{-partial differential } D_{x,i}f$$

if we have

$$f \circ (I^{[i,x]})_{|(I^{[i,x]})^{-1}(U)}\colon (I^{[i,x]})^{-1}(U) \to Y \text{ is Fréchet differentiable at } x$$

with

$$D_{x,i}f = D_{x_i}(f \circ (I^{[i,x]})_{|(I^{[i,x]})^{-1}(U)})$$

It turns out that partial differentiability is a local property.

Theorem 16.50. *Let $n \in \mathbb{N}\setminus\{1\}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\dots,n\}}$ a finite family of normed spaces, $\langle Y, \|\|\rangle$ a normed space, $\left\langle \prod_{j\in\{1,\dots,n\}} X_j, \|\|_{\max}\right\rangle$ the product space equipped with the maximum norm [see theorem: 14.94], $U \subseteq \prod_{j\in\{1,\dots,n\}} X_j$ a open set, $x = (x_1,\dots,x_n) \in U$, $i \in \{1,\dots,n\}$ and*

$$f\colon U \to Y \text{ a function}$$

then for V a open set with $x \in V \subseteq U$ we have

$$f \text{ is } i\text{-partial differentiable at } x$$

$$\Updownarrow$$

$$f_{|V} \text{ is } i\text{-partial differentiable at } x$$

Further if f or $f_{|V}$ is i-partial differentiable at x then $D_{x,i}f = D_{x,i}f_{|V}$.

Proof. For $t \in V_{[i,x]}$ we have that

$$\begin{aligned}(f_{|V})^{[i,x]}(t) &= f_{|V}\Big(x_1 \ldots \underbrace{t}_{i} \ldots x_n\Big)\\ &= f\Big(x_1 \ldots \underbrace{t}_{i} \ldots x_n\Big)\\ &= f^{[i,x]}(t)\end{aligned}$$

so that

$$(f_{|V})^{[i,x]} = (f^{[i,x]})_{|V_{[i,x]}} \tag{16.18}$$

Further we have

$$x_i \in V_{[i,x]} = (I^{[i,x]})^{-1}(V) \subseteq (I^{[i,x]})^{-1}(U) = U_{[i,x]}$$

Hence we have:

⇒. If f is i-partial differentiable at x with i-partial differential $D_{x,i}f$ then by definition $f^{[i,x]}$ is Fréchet differentiable at x_i and $D_{x,i}f = D_{x_i}f^{[i,x]}$. Using [theorem: 16.24] it follows that $(f^{[i,x]})_{|V_{[i,x]}}$ is Fréchet differentiable at x_i and $D_{x_i}(f^{[i,x]})_{|V_{[i,x]}} = D_{x_i}f^{[i,x]}$. Hence using [eq: 16.18] $(f_{|V})^{[i,x]}$ is Fréchet differentiable at x_i with $D_{x_i}(f_{|V})^{[i,x]} = D_{x_i}f^{[i,x]}$ or using the definition of partial differentiation

$$f_{|V} \text{ is } i\text{-partial differentiable at } x \text{ and } D_{x,i}f_{|V} = D_{x,i}f$$

⇐. If $f_{|V}$ is i-partial differentiable at x with i-partial differential $D_{x,i}f_{|V}$ then by definition $(f_{|V})^{[i,x]}$ is Fréchet differentiable at x_i and $D_{x,i}(f_{|V}) = D_{x_i}(f_{|V})^{[i,x]}$. Using [eq: 16.18] we have that $(f^{[i,x]})_{|V_{[i,x]}}$ is Fréchet differentiable at x_i and

$$D_{x,i}f_{|V} = D_{x_i}(f_{|V})^{[i,x]} = D_{x_i}(f^{[i,x]})_{|V_{[i,x]}}$$

Using [theorem: 16.24] again it follows that $f^{[i,x]}$ is Fréchet differentiable at x_i with $D_{x_i}(f^{[i,x]})_{|V_{[i,x]}} = D_{x_i}f^{[i,x]}$. Hence by definition

$$f \text{ is partial differentiable at } x \text{ and } D_{x,i}f_{|V} = D_{x,i}f$$

□

Corollary 16.51. *Let $n \in \mathbb{N}\backslash\{1\}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ a finite family of normed spaces, $\langle Y, \|\|\rangle$ a normed space, $\langle \prod_{j\in\{1,\ldots,n\}} X_j, \|\|_{\max}\rangle$ the product space equipped with the maximum norm [see theorem: 14.94], $U, V \subseteq \prod_{j\in\{1,\ldots,n\}} X_j$ open sets, $x = (x_1, \ldots, x_n) \in U \bigcap V$, $i \in \{1, \ldots, n\}$ and*

$$f: U \to Y,\ g: V \to Y$$

two functions such that there exist a open set $W \subseteq U \bigcap V$ with $x \in W$ and $\forall y \in W$ that $f(y) = g(y)$. Then if f is i-partial differentiable at x we have that g is i-partial differentiable at x and $D_{x,i}f = D_{i,y}g$.

Proof. As $\forall y \in W$ we have that $f(y) = g(y)$ it follows that $f_{|W} = g_{|W}$. As f is i-partial differentiable at x it follows from [theorem: 16.50] that $f_{|W}$ is i-partial differentiable at x with $D_{x,i}f = D_{x,i}f_{|W} \underset{f_{|W}=g_{|W}}{=} Dg_{|W}(x)$. Hence using [theorem: 16.50] again it follows that g is i-partial differentiable at x with $D_{x,i}g = D_{x,i}g_{|W} = D_{x,i}f$. □

Fréchet differentiability of a multi-parameter function implies partial differentiability.

Theorem 16.52. *Let $n \in \mathbb{N}\backslash\{1\}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ a finite family of normed spaces, $\langle Y, \|\|\rangle$ a normed space, $\langle \prod_{j\in\{1,\ldots,n\}} X_j, \|\|_{\max}\rangle$ the product space equipped with the maximum norm [see theorem: 14.94], $U \subseteq \prod_{j\in\{1,\ldots,n\}} X_j$ a open set, $x \in U$ and $f: U \to Y$ a function that is Fréchet differentiable at x then $\forall i \in \{1, \ldots, n\}$ f is i-partial differentiable at x with i-partial differential*

$$D_{x,i}f = D_x f \circ I^{[i,0]}$$

Further we have

$$D_x f = \sum_{i=1}^{n} (D_{x,i}f \circ \pi_i)$$

In other words $\forall h \in \prod_{i\in\{1,\ldots,n\}} X_i$ we have

$$D_x f(h) = \sum_{i=1}^{n} D_{x,i}f(h_i)$$

Proof. Using [lemma: 16.45] it follows that

$$I^{[i,x]}: X_i \to \prod_{j \in \{1,\dots,n\}} X_j \text{ is Fréchet differentiable at } x_i \text{ with } D_x I^{[i,x]} \underset{\text{[lemma: 16.45]}}{=} I^{[i,0]}$$

As $(I^{[i,x]})^{-1}(U)$ is open we can use [theorem: 16.24] to prove that

$$(I^{[i,x]})_{|(I^{[i,x]})^{-1}(U)}: (I^{[i,x]})^{-1}(U) \to \prod_{j \in \{1,\dots,n\}} X_j \text{ is Fréchet differentiable at } x_i$$

with

$$D_{x_i}(I^{[i,x]})_{|(I^{[i,x]})^{-1}(U)} = D_{x_i} I^{[i,x]} \underset{\text{[lemma: 16.45]}}{=} I^{[i,0]} \tag{16.19}$$

Further, as $f: U \to Y$ is Fréchet differentiable at $x = I^{[i,x]}(x_i)$ and

$$I^{[i,x]}((I^{[i,x]})^{-1}(U)) \subseteq_{\text{[theorem: 2.25]}} U$$

we can use the Chain Rule [theorem: 16.39] so that

$$f \circ (I^{[i,x]})_{|(I^{[i,x]})^{-1}(U)} \text{ is differentiable at } x_i$$

with

$$\begin{aligned}
D_{x_i}(f \circ (I^{[i,x]})_{|(I^{[i,x]})^{-1}(U)}) &= D_{x_i}(f \circ (I^{[i,x]})_{|(I^{[i,x]})^{-1}(U)}) \\
&= D_{(I^{[i,x]})_{|(I^{[i,x]})^{-1}(U)}(x_i)} f \circ D_{x_i}(I^{[i,x]})_{|(I^{[i,x]})^{-1}(U)} \\
&= D_{I^{[i,x]}(x_i)} f \circ D_{x_i}(I^{[i,x]})_{|(I^{[i,x]})^{-1}(U)} \\
&\underset{\text{[lemma: 16.45]}}{=} D_x f \circ D_{x_i}(I^{[i,x]})_{|(I^{[i,x]})^{-1}(U)} \\
&\underset{\text{[eq: 16.19]}}{=} D_x f \circ I^{[i,0]}
\end{aligned}$$

Hence by [note: 16.49] it follows that

$$f \text{ is } i\text{-partial differentiable at } x \text{ with } D_{x,i} f(x) = D_x f \circ I^{[i,0]} \tag{16.20}$$

Further if $h \in \prod_{j \in \{1,\dots,n\}} X_j$ we have

$$\begin{aligned}
D_x f(h) &\underset{\text{[lemma: 16.45]}}{=} D_x f\left(\sum_{i=1}^n I^{[i,0]}(h_i)\right) \\
&= \sum_{i=1}^n D_x f(I^{[i,0]}(h_i)) \\
&= \sum_{i=1}^n (D_x f \circ I^{[i,0]})(h_i) \\
&\underset{\text{[eq: 16.20]}}{=} \sum_{i=1}^n D_{x,i} f(h_i) \\
&= \sum_{i=1}^n D_{x,i} f(\pi_i(h)) \\
&= \sum_{i=1}^n (D_{x,i} f \circ \pi_i)(h) \\
&= \left(\sum_{i=1}^n (D_{x,i} f \circ \pi_i)\right)(h)
\end{aligned}$$

so that we have

$$D_x f = \sum_{j=1}^n (D_{x,i} f \circ \pi_i)$$

□

Example 16.53. Let $n \in \mathbb{N} \setminus \{1\}$, $\{\langle X_i, \|\|_i \rangle\}_{i \in \{1,\ldots,n\}}$ a finite family of normed spaces, $\langle Y, \|\| \rangle$ a normed space, $\left\langle \prod_{j \in \{1,\ldots,n\}} X_j, \|\|_{\max} \right\rangle$ the product space equipped with the maximum norm [see theorem: 14.94], $U \subseteq \prod_{j \in \{1,\ldots,n\}} X_j$ a open set, $x \in U$ and $y \in Y$ then $\forall i \in \{1,\ldots,n\}$ we have that the constant function

$$C_y : U \to Y \text{ defined by } C_y(x) = y$$

has a i-partial differential at x with

$$D_{y,i} C_i = C_0$$

where

$$C_0 : X_i \to Y \text{is defined by } C_0(h) = 0$$

Proof. By [example: 16.26] C_y is Fréchet differentiable at x with $D_x C_y = C_0$ where

$$C_0 : X \to Y \text{ is defined by } X_0(x) = 0$$

Hence using [theorem: 16.52] we have $\forall i \in \{1,\ldots,n\}$ that C_y has a i-partial derivative with

$$D_{x,i} C_y = C_0 \circ I^{[i,0]} = C_0$$

[because $\forall h \in X_i$ $(C_0 \circ I^{[i,0]})(h) = C_0(I^{[i,0]}(h)) = 0$]. □

Note 16.54. Although Fréchet differentiability of a multi parameter function implies that all the partial differentials exist the opposite is not true as the following example proves.

Example 16.55. Define

$$f : \mathbb{R}^2 \to \mathbb{R} \text{ by } f(x,y) = \begin{cases} \frac{x \cdot y}{x^2 + y^2} \text{ if } (x,y) \in \mathbb{R}^2 \setminus \{(0,0)\} \\ 0 \text{ if } (x,y) = (0,0) \end{cases}$$

then f is not Fréchet differentiable at $(0,0)$ however f is 1-partial and 2-partial differentiable at $(0,0)$

Proof. Let $\varepsilon = \frac{1}{4}$, $\delta \in \mathbb{R}^+$ and consider $z = \left(\frac{\delta}{2}, \frac{\delta}{2}\right)$ then we have

$$\|z\|_{\max} = \max\left(\left\{\left|\frac{\delta}{2}\right|, \left|\frac{\delta}{2}\right|\right\}\right) = \frac{\delta}{2} < \delta$$

However

$$\begin{aligned} |f(z) - f(0,0)| &\underset{(\delta,\delta) \neq (0,0)}{=} \left| \frac{\frac{\delta}{2} \cdot \frac{\delta}{2}}{\left(\frac{\delta}{2}\right)^2 + \left(\frac{\delta}{2}\right)^2} - 0 \right| \\ &= \left|\frac{1}{2}\right| \\ &> \varepsilon \end{aligned}$$

which proves that f is not continuous at $(0,0)$. So f can not be Fréchet differentiable at $(0,0)$ because Fréchet differentiable functions are continuous [see theorem: 16.31]. However we have that

$$f^{[1,(0,0)]}(t) = f(t,0) = \begin{cases} \frac{t \cdot 0}{t^2 + 0^2} \text{ if } (t,0) \neq (0,0) \\ 0 \text{ if } (t,0) = 0 \end{cases} = 0 = C_0(t)$$

$$f^{[2,(0,0)]}(t) = f(t,0) = \begin{cases} \frac{0 \cdot t}{0^2 + t^2} \text{ if } (t,0) \neq (0,0) \\ 0 \text{ if } (t,0) = 0 \end{cases} = 0 = C_0(t)$$

proving that

$$f^{[1,[(0,0)]]} = C_0 = f^{[2,[(0,0)]]}$$

By [example: 16.26] $f^{[1,[(0,0)]]}$, $f^{[2,[(0,0)]]}$ are Fréchet differentiable at 0 with $D_0 f^{[1,[(0,0)]]} = C_0 = D_0 f^{[2,[(0,0)]]}$. Hence f is is 1-partial and 2-partial differentiable at $(0,0)$ with

$$D_{(0,0),1} f = C_0 = D_{(0,0),2} f$$

□

As the partial differential is based on the Fréchet differential of $f \circ (I^{[i,x]})_{|(I^{[i,x]})^{-1}(U)}$ many properties of the Fréchet differential also applies.

Theorem 16.56. *Let $n \in \mathbb{N} \setminus \{1\}$, $\{\langle X_i, \|\|_i \rangle\}_{i \in \{1,\dots,n\}}$ a finite family of normed spaces, $\left\langle \prod_{j \in \{1,\dots,n\}} X_j, \|\|_{\max} \right\rangle$ the product space equipped with the maximum norm [see theorem: 14.94], $\langle Y, \|\| \rangle$ a normed space, $U \subseteq \prod_{i \in \{1,\dots,n\}} X_i$ a open set, $x \in U$ and $i \in \{1,\dots,n\}$ then we have:*

1. *If $f: U \to Y$ and $g: U \to Y$ are functions that are i-partial differentiable at x then*
$$f + g: U \to Y$$
is i-partial differentiable at x with
$$D_{x,i}(f+g) = D_{x,i}f + D_{x,i}g$$
2. *If $\alpha \in \mathbb{K}$ and $f: U \to Y$ is a function that is i-partial differentiable at x then*
$$\alpha \cdot f: U \to Y$$
is i-partial differentiable at x with
$$D_{x,i}(\alpha \cdot f) = \alpha \cdot D_{x,i}f$$
3. *If $f: X \to Y$ is such that $f \circ I^{[i,x]} \in L(X_i, Y)$ then f is i-partial differentiable and*
$$D_{x,i}f = f \circ I^{[i,x]}$$

Proof.

1. As f, g are i-partial differentiable at x we have by definition that $f \circ I^{[i,x]}$ and $g \circ I^{[i,x]}$ are Fréchet differentiable at x_i with
$$D_{x,i}f = D_{x_i}(f \circ I^{[i,x]}) \text{ and } D_{x,i}g = D_{x_i}(g \circ I^{[i,x]}) \tag{16.21}$$
Using [theorem: 16.38] we have that
$$f \circ I^{[i,x]} + g \circ I^{[i,x]} \text{ is Fréchet differentiable at } x_i$$
with
$$D_{x_i}(f \circ I^{[i,x]} + g \circ I^{[i,x]}) = D_{x_i}(f \circ I^{[i,x]}) + D_{x_i}(g \circ I^{[i,x]})$$
As $(f+g) \circ I^{[i,x]} = f \circ I^{[i,x]} + g \circ I^{[i,x]}$ it follows that $f+g$ is Fréchet differentiable at x_i with
$$D_{x_i}((f+g) \circ I^{[i,x]}) = D_{x_i}(f \circ I^{[i,x]}) + D_{x_i}(g \circ I^{[i,x]}) \underset{\text{[eq: 16.21]}}{=} D_{x,i}f + D_{x,i}g$$
Hence by definition
$$f + g \text{ is } i\text{-partial differentiable with } D_{x,i}(f+g)(x) = D_{x,i}f(x) + D_{x,i}g$$
2. As f is i-partial differentiable we have by definition that $f \circ I^{[i,x]}$ is Fréchet differentiable at x_i with
$$D_{x,i}f = D_{x_i}(f \circ I^{[i,x]}) \tag{16.22}$$
Using [theorem: 16.38] we have that
$$\alpha \cdot (f \circ I^{[i,x]}) \text{ is Fréchet differentiable at } x_i$$
with
$$D_{x_i}(\alpha \cdot (f \circ I^{[i,x]})) = \alpha \cdot D_{x_i}(f \circ I^{[i,x]})$$
As $(\alpha \cdot f) \circ I^{[i,x]} = \alpha \cdot (f \circ I^{[i,x]})$ it follows that $\alpha \cdot f$ is Fréchet differentiable at x_i with
$$D_{x_i}((\alpha f) \circ I^{[i,x]}) = \alpha \cdot D_{x_i}(f \circ I^{[i,x]}) \underset{\text{[eq: 16.22]}}{=} \alpha \cdot D_{x,i}f$$
Hence by definition
$$\alpha \cdot f \text{ is } i\text{-partial differentiable with } D_{x,i}(\alpha \cdot f) = \alpha \cdot D_{x,i}f$$
3. As $f \circ I^{[i,x]} \in L(X_i, Y)$ we have by [example: 16.27] that $f \circ I^{[i,x]}$ is Fréchet differentiable at x_i with $D_{x_i}(f \circ I^{[i,x]}) = f \circ I^{[i,x]}$. Hence by definition we have that
$$f \text{ is } i\text{-partial differentiable at } x \text{ with } D_{x,i}f(x) = f \circ I^{[i,x]}$$
□

We have the following version of the chain rule for partial differentiation.

Theorem 16.57. *Let $n \in \mathbb{N}\backslash\{1\}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\dots,n\}}$ a finite family of vector spaces, $\left\langle \prod_{i\in\{1,\dots,n\}} X_i, \|\|_{\max}\right\rangle$ the product space equipped with the maximum norm [see theorem: 14.94], $\langle Y, \|\|_Y\rangle$, $\langle Z, \|\|_Z\rangle$ normed spaces, $U \subseteq \prod_{i\in\{1,\dots,n\}} X_i$ a open set in $\prod_{i\in\{1,\dots,n\}} X_i$, $V \subseteq Y$ a open set in Y, $x \in X$,*

$$f: U \to Y \text{ a function differentiable at } x \text{ such that } f(U) \subseteq V$$

and

$$g: V \to Z \text{ a function differentiable at } f(x)$$

then

$$\forall i \in \{1,\dots,n\} \ g \circ f \text{ is } i\text{-partial differentiable at } x$$

and

$$D_{x,i}(g \circ f) = D_{f(x)}g \circ D_{x,i}f$$

Proof. Using the Chain Rule [theorem: 16.39] it follows that

$$g \circ f: U \to Z$$

is differentiable at x with

$$D_x(g \circ f) = D_{f(x)}g \circ D_x f \tag{16.23}$$

Hence, using [theorem: 16.52] it follows that $g \circ f$ is i-partial differentiable at x with i-partial differential

$$D_{x,i}(g \circ f) = D_x(g \circ f) \circ I^{[i,0]}$$

Substituting [eq: 16.23] in the above gives

$$\begin{aligned} D_{x,i}(g \circ f) &= (D_{f(x)}g \circ D_x f) \circ I^{[i,0]} \\ &= D_{f(x)}g \circ (D_x f \circ I^{[i,0]}) \\ &\underset{\text{[theorem: 16.52]}}{=} D_{f(x)}g \circ D_{x,i}f \end{aligned}$$

proving that

$$D_{x,i}(g \circ f) = D_{f(x)}g \circ D_{x,i}f \tag{16.24}$$ □

Next we define the partial derivative of a multi-parameter function.

Definition 16.58. *Let $n \in \mathbb{N}\backslash\{1\}$, $\langle \mathbb{K}^n, \|\|_n\rangle$ the vector space $\mathbb{K}^n$ equipped with the maximum norm $\|\|_n$, $\langle X, \|\|\rangle$ a normed space, $U \subseteq \mathbb{K}^n$ a open set in $\mathbb{K}^n$, $x \in U$, $i \in \{1,\dots,n\}$ and*

$$f: U \to X \text{ a function}$$

*then f has a **i-partial derivative at x** noted by $\partial_{x,i}f(x) \in X$ if $f \circ I^{[i,x]}$ has a derivative at x_i, the **i-partial derivative at x** is defined by*

$$\partial_{x,i}f(x) = (f \circ (I^{[i,x]})_{|U_{[i,x]}})'_{x_i} \in X$$

Using [definitions: 16.43 and 16.12] this is equivalent with

$$\forall \varepsilon \in \mathbb{R}^+ \text{ there exist a } \delta \in \mathbb{R}^+ \text{ such that } \forall h \in (U_{[i,x]})_{x_i} \text{ with } 0 < |h| < \delta \text{ we have}$$

$$\begin{aligned} \left\| \frac{f\left(x_1, \dots \underbrace{x_i + h}_{i} \dots, x_n\right) - f(x_1,\dots,x_n)}{h} - \partial_{x,i}f \right\| &= \\ \left\| \frac{f(I^{[i,x]}(x+h)) - f(I^{[i,x]}(x))}{} - \partial_{x,i}f \right\| &= \\ \left\| \frac{(f \circ I^{[i,x]})(x+h) - (f \circ I^{[i,x]})(x)}{h} - \partial_{x,i}f(x) \right\| &< \varepsilon \end{aligned}$$

We have the following equivalent definition for the partial derivative of a function.

Theorem 16.59. *Let $n \in \mathbb{N} \setminus \{1\}$, $\langle \mathbb{K}^n, \|\|_n \rangle$ the vector space $\mathbb{K}^n$ equipped with the maximum norm $\|\|_n$, $\langle X, \|\| \rangle$ a normed space, $U \subseteq \mathbb{K}^n$ a open set in $\mathbb{K}^n$, $x \in U$, $i \in \{1, \ldots, n\}$ and*

$$f: U \to X \text{ a function}$$

then

$$f \text{ has a } i\text{-partial derivative at } x \Leftrightarrow f \text{ has a } i\text{-partial differential at } x$$

Further if f has a i-partial derivative or differential at x then

$$\partial_{x,} f(x) = D_{x,i} f(1)$$

and

$$\forall h \in \mathbb{K} \text{ we have } D_{x,i} f(h) = h \cdot \partial_{x,i} f$$

Proof.

$\Rightarrow$. As f has a i-partial derivative at x $f \circ I^{[i,x]}$ has a derivative at x_i. Using [theorem: 16.32] it follows that $f \circ I^{[i,x]}$ is Fréchet differentiable at x_i, hence by definition

$$f \text{ is } i\text{-partial differentiable at } x$$

Further by [theorem: 16.32] we have also

$$(f \circ I^{[i,x]})'_{x_i} = D_{x_i}(f \circ I^{[i,x]})(1)$$

and

$$\forall h \in \mathbb{K} \; D_{x_i}(f \circ I^{[i,x]}) = h \cdot (f \circ I^{[i,x]})'_{x_i}$$

As $\partial_{x,i} f \underset{\text{def}}{=} (f \circ I^{[i,x]})'_{x_i}$ and $D_{x,i} f \underset{\text{def}}{=} D_{x_i}(f \circ I^{[i,x]})$ we have

$$\partial_{x,i} f = D_{x,i} f(1) \text{ and } \forall h \in \mathbb{K} \text{ that } D_{x,i} f(h) = h \cdot \partial_{x,i} f$$

$\Leftarrow$. As f has a i-partial differential at x $f \circ I^{[i,x]}$ is Fréchet differentiable at x_i. Using [theorem: 16.32] it follows that $f \circ I^{[i,x]}$ has a derivative at x_i and thus by definition that f has a i-partial derivative at x. □

Using the above definition it is easy to prove that partial derivatives are local.

Corollary 16.60. *Let $n \in \mathbb{N} \setminus \{1\}$, $\langle \mathbb{K}^n, \|\|_n \rangle$ the vector space $\mathbb{K}^n$ equipped with the maximum norm $\|\|_n$, $\langle X, \|\| \rangle$ a normed space, U, $V \subseteq \mathbb{K}^n$ open sets in $\mathbb{K}^n$, $x \in U \bigcap V$, $i \in \{1, \ldots, n\}$ and*

$$f: U \to Y \text{ and } g: V \to Y$$

functions such that there exist a open set W with $x \in W \subseteq U \bigcap V$ and $\forall y \in W$ $f(y) = g(y)$ Then if f has a i-partial derivative at x g has also a i-partial derivative at x and $\partial_{x,i} f = \partial_{x,i} g$.

Proof. As f has a i-partial derivative at x it follows from [theorem: 16.59] that f has a i-partial differential at x and $\partial_{x,i} f = D_{x,i} f(1)$. As partial differentiation is local [see theorem: 16.51] it follows that g has a i-partial differential at x and $D_{x,i} f = D_{x,i} g$. Hence using [theorem: 16.59] again g has a i-partial derivative at x and $\partial_{x,i} g = D_{x,i} g(1) = D_{x,i} f(1) = \partial_{x,i} g$. □

We can rephrase [theorem: 16.52] as follows for partial derivatives.

Theorem 16.61. *Let $n \in \mathbb{N} \setminus \{1\}$, $\langle \mathbb{K}^n, \|\|_n \rangle$ the vector space $\mathbb{K}^n$ equipped with the maximum norm $\|\|_n$, $\langle X, \|\| \rangle$ a normed space, $U \subseteq \mathbb{K}^n$ a open set in $\mathbb{K}^n$, $x \in U$ and*

$$f: U \to X \text{ a function that is Fréchet differentiable at } x$$

then we have:

1. *$\forall i \in \{1, \ldots, n\}$ f has a i-partial derivative $\partial_{x,i} f$ at x and $D_{x,i} f \in L(\mathbb{K}, X)$ is defined by*

$$D_{x,i} f(h) = h \cdot \partial_{x,i} f$$

so that

$$\partial_{x,i} f = D_{x,i} f(1)$$

2. *Let $\{e_1, \ldots, e_n\}$ be the canonical basis on $\mathbb{K}^n$ defined by $(e_i)_j = \delta_{i,j}$ [see theorem: 11.165] then*

$$\forall i \in \{1, \ldots, n\} \text{we have } \partial_{x,i} f = D_x f(e_i)$$

and

$$\forall h \in \mathbb{K}^n \text{ we have } D_x f(h) = \sum_{i=1}^{n} h_i \cdot \partial_{x,i} f$$

If we use matrix notation where

$$h = \begin{pmatrix} h_1 \\ \vdots \\ h_n \end{pmatrix} \in \mathcal{M}_{n,1} \text{ is a column vector}$$

and

$$\partial_x f(x) = \begin{pmatrix} \partial_{x,1} f & \dots & \partial_{x,n} f \end{pmatrix} \text{ is a row vector}$$

then it follows that we can write this using matrix notation as

$$D_x f(h) = \partial_x f \cdot h$$

Proof.

1. As f is Fréchet differentiable at x it follows from [theorem: 16.52] that $\forall i \in \{1, \dots, n\}$ is i-partial differentiable at x. Using the previous theorem [theorem: 16.59] we conclude that f has a i-partial derivative and

$$D_{x,i} f(h) = h \cdot \partial_{x,i} f$$

and

$$\partial_{x,i} f = D_{x,i} f(1)$$

2. We have for $i, j \in \{1, \dots, n\}$ that

$$(I^{[i,0]}(1))_j = \left(0, \dots, 0, \underbrace{1}_{i}, 0, \dots, 0\right)_j = \delta_{i,j} = (e_i)_j$$

or

$$I^{[i,0]}(1) = e_i \tag{16.25}$$

so that

$$\begin{aligned} \partial_{x,i} f &\underset{\text{[theorem: 16.59]}}{=} D_{x,i} f(1) \\ &\underset{\text{[theorem: 16.52]}}{=} (D_x f \circ I^{[i,0]})(1) \\ &= D_x f(I^{[i,0]}(1)) \\ &\underset{\text{[eq: 16.25]}}{=} D_x f(e_i) \end{aligned}$$

proving that

$$\forall i \in \{1, \dots, n\} \ \partial_{x,i} f = D_{x,i} f(e_i)$$

Further give $h \in \mathbb{K}^n$ we have

$$\begin{aligned} D_x f(h) &\underset{\text{[theorem: 16.52]}}{=} \sum_{i=1}^{n} D_{x,i} f(h_i) \\ &\underset{(1)}{=} \sum_{i=1}^{n} h_i \cdot \partial_{x,i} f \end{aligned}$$

□

After examining the differentiation of a multi-parameter function we look now at differentiation of vector functions [functions that maps to a product of normed spaces].

Definition 16.62. *Let $n \in \mathbb{N} \setminus \{1\}$, X a set, $\{X_i\}_{i \in \{1, \dots, n\}}$ a finite family of sets and $\{f_i\}_{i \in \{1, \dots, n\}}$ a family such that $f_i \in X_i^X$ then we define the following function*

$$(f_1, \dots, f_n)_* : X \to \prod_{i \in \{1, \dots, n\}} X_i \text{ by } (f_1, \dots, f_n)_*(x) = (f_1(x), \dots, f_n(x))$$

Note 16.63. We use the notation $(f_1, \dots, f_n)_*$ so that we don't confuse the above function with the tuple $(f_1, \dots, f_n)$ which is a element of $\prod_{i \in \{1, \dots, n\}} X_i^X$ and not a function from X to $\prod_{i \in \{1, \dots, n\}} X_i$.

Theorem 16.64. *Let $n \in \mathbb{N}\backslash\{1\}$, $\langle X, \|\|\rangle$ a normed space, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ a finite family of normed spaces, $\left\langle \prod_{i\in\{1,\ldots,n\}} X_i, \|\|_{\max}\right\rangle$ the product space equipped with the maximum norm [see theorem: 14.94] and $\{L_i\}_{i\in\{1,\ldots,n\}}$ a family such that $\forall i \in \{1,\ldots,n\}$ $L_i \in L(X, X_i)$ then*

$$(L_1, \ldots, L_n)_* \in L\left(X, \prod_{i\in\{1,\ldots,n\}} X_i\right)$$

and

$$\|(L_1, \ldots, L_n)_*\|_{L(X, \prod_{i\in\{1,\ldots,n\}} X_i)} \leqslant \max\left(\{\|L_i\|_{L(X,X_i)} | i \in \{1, \ldots, n\}\}\right)$$

Proof. Let $x, y \in X$ and $\alpha \in \mathbb{K}$ then $\forall i \in \{1, \ldots, n\}$ we have

$$\begin{aligned}
((L_1, \ldots, L_n)_*(x + \alpha \cdot y))_i &= (L_1(x + \alpha \cdot y), \ldots, L_i(x + \alpha \cdot y))_i \\
&= L_i(x + \alpha \cdot y) \\
&\underset{L_i \in L(X,X_i)}{=} L_i(x) + \alpha \cdot L_i(y) \\
&= (L_1(x), \ldots, l_n(x))_i + \alpha \cdot (L_1(y), \ldots, L_n(y))_i \\
&= ((L_1, \ldots, L_n)_*(x))_i + (\alpha \cdot (L_1, \ldots, L_n)_*(y))_i \\
&= ((L_1, \ldots, L_n)_*(x) + \alpha \cdot (L_1, \ldots, L_n)_*(y))_i
\end{aligned}$$

proving that $(L_1, \ldots, L_n)_*(x + \alpha \cdot y) = (L_1, \ldots, L_n)_*(x) + \alpha \cdot (L_1, \ldots, L_n)_*(y)$. Hence

$$(L_1, \ldots, L_n)_* \in \mathrm{Hom}\left(X, \prod_{i\in\{1,\ldots,n\}} X_i\right)$$

Further if $x \in X$ then we have

$$\begin{aligned}
\|(L_1, \ldots, L_n)_*(x)\|_{\max} &= \|(L_1(x), \ldots, L_n(x))\|_{\max} \\
&= \max\left(\{\|L_i(x)\|_i | i \in \{1, \ldots, n\}\}\right) \\
&\leqslant \max\left(\{\|L_i\|_{L(X,X_i)} \cdot \|x\| | i \in \{1, \ldots, n\}\}\right) \\
&\leqslant_{[\text{theorem: } 10.27]} \max\left(\{\|L_i\|_{L(X,X_i)} | i \in \{1, \ldots, n\}\}\right) \cdot \|x\|
\end{aligned}$$

proving by [theorem: 14.177] that

$$(L_1, \ldots, L_n)_\star \in L\left(X, \prod_{i\in\{1,\ldots,n\}} X_i\right)$$

and by [theorem: 14.184]

$$\|(L_1, \ldots, L_n)_*\|_{L(X, \prod_{i\in\{1,\ldots,n\}} X_i)} \leqslant \max\left(\{\|L_i\|_{L(X,X_i)} | i \in \{1, \ldots, n\}\}\right)$$

□

Theorem 16.65. *Let $n \in \mathbb{N}\backslash\{1\}$, X a set and $\{X_i\}_{i\in\{1,\ldots,n\}}$ a family of sets and*

$$f : X \to \prod_{i\in\{1,\ldots,n\}} X_i \text{ a function}$$

then

$$f = (\pi_1 \circ f, \ldots, \pi_n \circ f)_*$$

Proof. Let $x \in X$ then we have $\forall i \in \{1, \ldots, n\}$ that

$$(f(x))_i = \pi_i(f(x)) = (\pi_i \circ f)(x)$$

so that

$$f(x) = ((\pi_i \circ f)(x), \ldots, (\pi_n \circ f)(x)) = (\pi_1 \circ f, \ldots, \pi_n \circ f)_*(x)$$

proving that

$$f = (\pi_1 \circ f, \ldots, \pi_n \circ f)_*$$

□

Theorem 16.66. *Let $n \in \mathbb{N}_0\backslash\{1\}$, $\langle X, \|\|\rangle$ be a normed space, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ a family of normed spaces, $\left\langle \prod_{i\in\{1,\ldots,n\}} X_i, \|\|_{\max}\right\rangle$ the normed product space equipped with the maximum norm [see theorem: 14.94], $U \subseteq X$ a open set in X, $x \in U$ and*

$$f : U \to \prod_{i\in\{1,\ldots,n\}} X_i \text{ a function}$$

then we have

$$f \text{ is Fréchet differentiable at } x \Leftrightarrow \forall i \in \{1,\dots,n\}\ \pi_i \circ f \text{ is Fréchet differentiable at } x$$

Further if f is Fréchet differentiable at x then

$$\forall i \in \{1,\dots,n\}\ \pi_i \circ D_x f = D_x(\pi_i \circ f)$$

or in other words

$$D_x f = (D_x(\pi_1 \circ f),\dots,D_x(\pi_n \circ f))_*$$

Proof.

⇒. Let $\varepsilon \in \mathbb{R}^+$. As f is differentiable at x there exist a $\delta \in \mathbb{R}^+$ such that $\forall h \in U_x$ with $\|h\| < \delta$ we have

$$\|f(x+h) - f(x) - D_x f(h)\|_{\max} \leqslant \varepsilon \cdot \|h\| \tag{16.26}$$

Let $i \in \{1,\dots,n\}$ then we have $\forall h \in U_x$ with $\|h\| < \delta$

$$\begin{aligned}
\|(\pi_i \circ f)(x+h) - (\pi_i \circ f)(x) - (\pi_i \circ D_x f)(h)\|_i &= \\
\|(\pi_i(f(x+h))) - \pi_i(f(x)) - \pi_i(D_x f(h))\|_i &= \\
\|\pi_i(f(x+h) - f(x) - D_x f(h))\|_i &\leqslant \\
\max(\{\|\pi_i(f(x+h) - f(x) - D_x f(h))\|_i | i \in \{1,\dots,n\}\}) &\underset{\text{def}}{=} \\
\|f(x+h) - f(x) - D_x f(h)\|_{\max} &\leqslant_{[\text{eq: } 16.26]} \\
\varepsilon \cdot \|h\| &
\end{aligned}$$

proving that

$$\pi_i \circ f \text{ is differentiable at } x \text{ with } D_x(\pi_i \circ f) = \pi_i \circ D_x f$$

⇐. Let $\varepsilon \in \mathbb{R}^+$. Let $i \in \{1,\dots,n\}$ then as $\pi_i \circ f$ is differentiable at x there exist a $\delta_i \in \mathbb{R}^+$ so that $\forall h \in U_x$ with $\|h\| < \delta_i$ we have $\|(\pi_i \circ f)(x+h) - (\pi_i \circ f)(x) - D_x(\pi_i \circ f)(h)\|_i \leqslant \varepsilon \cdot \|h\|$ so that

$$\max(\{\|(\pi_i \circ f)(x+h) - (\pi_i \circ f)(x) - D_x(\pi_i \circ f)(h)\|_i | i \in \{1,\dots,n\}\}) \leqslant \varepsilon \cdot \|h\| \tag{16.27}$$

If $h \in U_x$ satisfies $\|h\| < \max(\{\delta_i | i \in \{1,\dots,n\}\})$ then we have

$$\begin{aligned}
\|f(x+h) - f(x) - (D_x(\pi_1 \circ f),\dots,D_x(\pi_n \circ f))_*(h)\|_{\max} &= \\
\max(\{\pi_i(f(x+h) - f(x) - (D_x(\pi_1 \circ f),\dots,D_x(\pi_n \circ f))_*(h)) | i \in \{1,\dots,n\}\}) &= \\
\max(\{\pi_i(f(x+h) - f(x) - (D_x(\pi_1 \circ f)(h),\dots,D_x(\pi_n \circ f)(h))) | i \in \{1,\dots,n\}\}) &= \\
\max(\{\pi_i(f(x+h)) - \pi_i(f(x)) - \pi_i((D_x(\pi_1 \circ f)(h),\dots,D_x(\pi_n \circ f)(h))) | i \in \{1,\dots,n\}\}) &= \\
\max(\{\pi_i(f(x+h)) - \pi_i(f(x)) - D_x(\pi_i \circ f)(h) i \in \{1,\dots,n\}\}) &= \\
\max(\{(\pi_i \circ f)(x+h) - (\pi_i \circ f)(x) - D_x(\pi_i \circ f)(h) i \in \{1,\dots,n\}\}) &\leqslant \\
\varepsilon \cdot \|h\| &
\end{aligned}$$

proving, as by [theorem: 16.64] $(D_x(\pi_1 \circ f),\dots,D_x(\pi_n \circ f))_* \in L\big(X, \prod_{i \in \{1,\dots,n\}} X_i\big)$, that

$$f \text{ is Fréchet differentiable at } x \text{ with } D_x f = (D_x(\pi_1 \circ f),\dots,D_x(\pi_n \circ f))_*$$

□

Corollary 16.67. *Let $n \in \mathbb{N}_0 \setminus \{1\}$, $\langle X, \|\|_X \rangle$ be a normed space, $\{\langle Y_i, \|\|_i \rangle\}_{i \in \{1,\dots,n\}}$ a family of normed spaces, $\big\langle \prod_{i \in \{1,\dots,n\}} Y_i, \|\|_{\max} \big\rangle$ the normed spaces equipped with the maximum norm [see theorem: 14.94], $\langle Z, \|\|_Z \rangle$ a normed space, $U \subseteq X$ a open set in X, $x \in U$, $V \subseteq \prod_{i \in \{1,\dots,n\}} Y_i$ a open set in $\prod_{i \in \{1,\dots,n\}} Y_i$ and*

$$f: U \to \prod_{i \in \{1,\dots,n\}} Y_i \text{ and } g: V \to Z$$

functions such that

$$f(U) \subseteq V,\ f \text{ Fréchet differentiable at } x \text{ and } g \text{ Fréchet differentiable at } f(x)$$

[so that by the Chain Rule [see theorem: 16.39] $g \circ f$ is differentiable at x] then we have

$$D_x(g \circ f) = \sum_{i=1}^{n} (D_{f(x),i} g \circ D_x(\pi_i \circ f))$$

Proof. Let $h \in X$ then

$$\begin{aligned}
D_x(g \circ f)(h) &\underset{\text{[theorem: 16.39]}}{=} (D_{f(x)}\, g \circ D_x\, f)(h) \\
&= D_{f(x)}\, g(D_x f(h)) \\
&\underset{\text{[theorem: 16.52]}}{=} \sum_{i=1}^{n} D_{f(x),i} g((D_x\, f(h))_i) \\
&= \sum_{i=1}^{n} D_{f(x),i} g(\pi_i(D_x f(h))) \\
&= \sum_{i=1}^{n} D_{f(x),i} g((\pi_i \circ D_x f)(h)) \\
&\underset{\text{[theorem: 16.66]}}{=} \sum_{i=1}^{n} D_{f(x),i} g((D_x(\pi_i \circ f))(h)) \\
&= \sum_{i=1}^{n} (D_{f(x),i} g \circ D_x(\pi_i \circ f))(h) \\
&= \left(\sum_{i=1}^{n} (D_{f(x),i} g \circ D_x(\pi_i \circ f)) \right)(h)
\end{aligned}$$

proving that

$$D_x(g \circ f) = \sum_{i=1}^{n} (D_{f(x),i} g \circ D_x(\pi_i \circ f))$$

□

We can now look at the differentiability of functions between $\mathbb{K}^n$ and $\mathbb{K}^m$.

Theorem 16.68. (Jacobian matrix) *Let $n, m \in \mathbb{N} \setminus \{1\}$, $\langle \mathbb{K}^n, \|\|_n \rangle$, $\langle \mathbb{K}^m, \|\|_m \rangle$ two normed spaces [based on the maximum norms) over the field $\mathbb{K}$, $U \subseteq \mathbb{K}^n$ a open set in $\mathbb{K}^n$, $x \in U$ and*

$$f: U \to \mathbb{K}^m \text{ a function that is Fréchet differentiable at } x$$

then $\forall i \in \{1, \ldots, n\}$, $\forall j \in \{1, \ldots, m\}$ we have that $\pi_j \circ f: U \to \mathbb{K}$ has a i-partial derivative and

$$\forall h \in \mathbb{K}^n \text{ we have } (D_x f(h))_j \underset{\text{def}}{=} \pi_j(D_x f(h)) = \sum_{i=1}^{n} \partial_{x,i}(\pi_j \circ f) \cdot h_i$$

If we define the following matrices

$$h = \begin{pmatrix} h_1 \\ \vdots \\ h_n \end{pmatrix} \in \mathcal{M}_{n,1}(\mathbb{K})$$

and

$$D_x f(h) = \begin{pmatrix} (D_x f(h))_1 \\ \vdots \\ (D_x f(h))_m \end{pmatrix} \in \mathcal{M}_{m,1}(\mathbb{K})$$

and

$$\left[\frac{\partial(f_1, \ldots, f_m)}{\partial(1, \ldots, n)} \right]_x = \begin{pmatrix} \partial_{x,1}(\pi_1 \circ f) & \ldots & \partial_{x,n}(\pi_1 \circ f) \\ \vdots & \ddots & \vdots \\ \partial_{x,1}(\pi_m \circ f) & \ldots & \partial_{x,n}(\pi_m \circ f) \end{pmatrix} \in \mathcal{M}_{m,n}(\mathbb{K})$$

or

$$\forall i \in \{1, \ldots, m\}, \forall j \in \{1, \ldots, n\} \text{ we have } \left(\left[\frac{\partial(f_1, \ldots, f_m)}{\partial(1, \ldots, n)} \right]_x \right)_{i,j} = \partial_{x,j}(\pi_i \circ f)$$

then we can express the Fréchet differential of f at x as the following matrix product

$$D_x f(h) = \left[\frac{\partial(f_1, \ldots, f_m)}{\partial(1, \ldots, n)} \right]_x \cdot h$$

The matrix $\left[\frac{\partial(f_1,\ldots,f_m)}{\partial(1,\ldots,n)}\right]_x$ *is called the* ***Jacobian matrix of f at x****. Further if* $E=\{e_1,\ldots,e_n\}$ *defined by* $(e_i)_j=\delta_{i,j}$ *is the canonical basis of* $\mathbb{K}^n$ *and* $F=\{f_1,\ldots,f_m\}$ *defined by* $(f_i)_j=\delta_{i,j}$ *is the canonical basis of* $\mathbb{K}^m$ *then*

$$\left[\frac{\partial(f_1,\ldots,f_m)}{\partial(1,\ldots,n)}\right]_x=\mathcal{M}(D_xf;E,F)\ \textit{[see definition: 11.333]}$$

Proof. Let $i\in\{1,\ldots,n\}$ and $j\in\{1,\ldots,m\}$. As f is Fréchet differentiable at x it follows from [theorem: 16.66] that $\pi_j\circ f:U\to\mathbb{K}$ is Fréchet differentiable at x with

$$D_x(\pi_j\circ f)=\pi_j\circ D_xf \tag{16.28}$$

Hence using [theorem: 16.61] $\pi_j\circ f$ has a partial derivative at x with

$$D_x(\pi_j\circ f)(h)=\sum_{i=1}^n h_i\cdot\partial_{x,i}(\pi_j\circ f) \tag{16.29}$$

Further for $h\in\mathbb{K}^n$ we have

$$\begin{aligned}(D_xf(h))_j &= \pi_j(D_xf(h))\\ &= (\pi_j\circ D_xf)(h)\\ &\underset{\text{[eq: 16.28]}}{=} D_x(\pi_j\circ f)(h)\\ &\underset{\text{[eq: 16.29]}}{=} \sum_{i=1}^n h_i\cdot\partial_{x,i}(\pi_j\circ f)\\ &\underset{\partial_{x,i}(\pi_j\circ f)\in\mathbb{K}}{=} \sum_{i=1}^n \partial_{x,i}(\pi_j\circ f)\cdot h_i\end{aligned}$$

proving that

$$(D_xf(h))_j=\sum_{i=1}^n \partial_{x,i}(\pi_j\circ f)\cdot h_i \tag{16.30}$$

Next for the matrix notation we have for $j\in\{1,\ldots,m\}$ that

$$\begin{aligned}\left(\left[\frac{\partial(f_1,\ldots,f_m)}{\partial(1,\ldots,n)}\right]_x\cdot h\right)_j &= \begin{pmatrix}\partial_{x,1}(\pi_1\circ f) & \ldots & \partial_{x,n}(\pi_1\circ f)\\ \vdots & \ddots & \vdots\\ \partial_{x,1}(\pi_m\circ f) & \ldots & \partial_{x,n}(\pi_m\circ f)\end{pmatrix}\cdot\begin{pmatrix}h_1\\ \vdots\\ h_n\end{pmatrix}\\ &= \sum_{i=1}^n\left(\left[\frac{\partial(f_1,\ldots,f_n)}{\partial(1,\ldots,n)}\right]_x\right)_{i,j}\cdot h_i\\ &= \sum_{i=1}^n \partial_{x,i}(\pi_j\circ f)\cdot h_i\\ &\underset{\text{[eq: 16.30]}}{=} (D_xf(h))_j\\ &= \begin{pmatrix}(D_xf(h))_1\\ \vdots\\ (D_xf(h))_m\end{pmatrix}_j\end{aligned}$$

so that

$$\left[\frac{\partial(f_1,\ldots,f_n)}{\partial(1,\ldots,n)}\right]_x\cdot h\ =\ D_xf(h)$$

Finally if $i\in\{1,\ldots,n\}$, $j\in\{1,\ldots,m\}$ that we have by [definition: 11.333] that for $i\in\{1,\ldots,n\}$ and

$$\begin{aligned}(D_xf(e_i))_j &= \left(\sum_{k=1}^m \mathcal{M}(D_xf;E,F)_{k,i}\cdot f_k\right)_j\\ &= \sum_{k=1}^m \mathcal{M}(D_xf;E,F)_{k,i}\cdot(f_k)_j\\ &= \sum_{k=1}^m \mathcal{M}(D_xf;E,F)_{k,i}\cdot\delta_{k,j}\\ &= \mathcal{M}(D_xf;E,F)_{j,i}\end{aligned}$$

Further we have

$$\begin{aligned}(D_xf(e_i))_j &\underset{\text{[eq: 16.30]}}{=} \sum_{k=1}^{n} \partial_{x,k}(\pi_j \circ f)\cdot(e_i)_k \\ &= \sum_{k=1}^{n} \partial_{x,k}(\pi_j \circ f)\cdot\delta_{i,k} \\ &= \partial_{x,i}(\pi_j \circ f) \\ &= \left(\left[\ \frac{\partial(f_1,\dots,f_m)}{\partial(1,\dots,n)}\ \right]_x\right)_{j,i}\end{aligned}$$

so that

$$\mathcal{M}(D_xf;E,F)_{j,i} = \left(\left[\ \frac{\partial(f_1,\dots,f_m)}{\partial(1,\dots,n)}\ \right]_x\right)_{j,i}$$

or

$$\mathcal{M}(D_xf;E,F) = \left[\ \frac{\partial(f_1,\dots,f_m)}{\partial(1,\dots,n)}\ \right]_x$$

□

Lemma 16.69. *Let $\langle X_1, \|\|_1\rangle$, $\langle X_2, \|\|_2\rangle$ and $\langle Y, \|\|_Y\rangle$ be normed spaces and $\langle X_1\cdot X_2, \|\|_{\max}\rangle$ the normed space of the product $X_1\cdot X_2$ with the maximum norm $\|\|_{\max}$, $L\in L(X_1,X_2;Y)$ [a bi-linear continuous mapping], $x=(x_1,x_2)\in X_1\cdot X_2$ then L is differentiable at x and*

$$D_xL = D_{(x_1,x_2)}L = L(x_1,*) + L(*,x_2)$$

where

$$L(x_1,*): X_1\cdot X_2 \to Y \text{ is defined by } L(x_1,\star)(h) = L(x_1,*)(h_1,h_2) = L(x_1,h_2)$$

and

$$L(*,x_2): X_1\cdot X_2 \to Y \text{ is defined by } L(\star,x_2)(h) = L(*,x_2)(h_1,h_2) = L(h_1,x_2)$$

Proof. First we prove that $L(x_1,*)+L(*,x_2)$ is linear. So let $(h_1,h_2),(g_1,g_2)\in X_1\cdot X_2$ and $\alpha\in\mathbb{K}$ then we have

$$\begin{aligned}(L(x_1,*)+L(*,x_2))((h_1,h_2)+\alpha\cdot(g_1,g_2)) &= \\ (L(x_1,*)+L(*,x_2))(h_1+\alpha\cdot g_1, h_2+\alpha\cdot g_2) &= \\ L(x_1,h_2+\alpha\cdot g_2)+L(h_1+\alpha\cdot g_1,x_2) &= \\ L(x_1,h_2)+\alpha\cdot L(x_1,g_2)+L(h_1,x_2)+\alpha\cdot L(g_1,x_2) &= \\ L(x_1,h_2)+L(h_1,x_2)+\alpha\cdot(L(x_1,g_2)+L(g_1,x_2)) &= \\ (L(x_1,*)+L(*,x_2))(h_1,h_2)+\alpha\cdot((L(x_1,*)+L(*,x_2))(g_1,g_2))\end{aligned}$$

Hence we have that

$$L(x_1,*)+L(*,x_2)\in \mathrm{Hom}(X_1,X_2;Y) \tag{16.31}$$

Next we prove that $L(x_1,*)+L(*,x_2)$ is continuous. So let $(h_1,h_2)\in X_1\cdot X_2$ with

$$\|h_1\|_1 = 1 = \|h_2\|_2 \tag{16.32}$$

then we have

$$\begin{aligned}\|(L(x_1,*)+L(*,x_2))(h_1,h_2)\|_Y &= \\ \|L(x_1,h_2)+L(h_1,x_2)\|_Y &\leqslant \\ \|L(x_1,h_2)\|_Y+\|L(h_1,x_2)\|_Y &\leqslant_{\text{[theorem: 14.196]}} \\ \|L\|_{L(X_1,X_2;Y)}\cdot\|x_1\|_1\cdot\|h_2\|_2+\|L\|_{L(X_1,X_2;Y)}\cdot\|x_2\|_2\cdot\|h_2\|_1 &=_{\text{[eq: 16.32]}} \\ \|L\|_{L(X_1,X_2;Y)}\cdot\|x_1\|_1+\|L\|_{L(X_1,x_2;Y)}\cdot\|x_2\|_2 &\end{aligned}$$

proving by [theorem: 14.190] that $L(x_1,*)+L(*,x_2)$ is continuous, combining this with [eq: 16.31] results in

$$L(x_1,*)+L(*,x_2)\in L(X_1,X_2;Y) \tag{16.33}$$

Finally Let $\varepsilon\in\mathbb{R}^+$ and take $\delta=\frac{\varepsilon}{\|L\|_{L(X_1,X_2;Y)}+1}\in\mathbb{R}^+$ then, if $(h_1,h_2)\in X_1\cdot X_2=(X_1\cdot X_2)_x$ and $\|(h_1,h_2)\|_{\max}<\delta$, we have

$$\|h_1\|_1, \|h_2\|_2 \leqslant \max\left(\{\|h_i\|_i | i\in\{1,2\}\}\right) = \|(h_1,h_2)\|_{\max} < \delta \tag{16.34}$$

and

$$\begin{aligned}
\|L((x_1,x_2)+(h_1,h_2))-L(x_1,x_2)-(L(x_1,*)+L(*,x_2))(h_1,h_2)\|_Y &= \\
\|L(x_1+h_1,x_2+h_2)-L(x_1,x_2)-L(x_1,h_2)-L(h_1,x_2)\|_Y &= \\
\|L(x_1,x_2+h_2)+L(h_1,x_2+h_2)-L(x_1,x_2)-L(x_1,h_2)-L(h_1,x_2)\|_Y &= \\
\left\|\underbrace{L(x_1,x_2)}_{1}+\underbrace{L(x_1,h_2)}_{2}+\underbrace{L(h_1,x_2)}_{3}+L(h_1,h_2)-\underbrace{L(x_1,x_2)}_{1}-\underbrace{L(x_1,h_2)}_{2}-\underbrace{L(h_1,x_2)}_{3}\right\|_Y &= \\
\|L(h_1,h_2)\|_Y &\leqslant_{[\text{theorem: } 14.196]} \\
\|L\|_{L(X_1,X_2;Y)}\cdot\|h_1\|_1\cdot\|h_2\|_2 &<_{[\text{eq: } 16.34]} \\
\|L\|_{L(X_1,X_2;Y)}\cdot\frac{\varepsilon}{\|L\|_{L(X_1,x_2;Y)}+1}\cdot\|h_2\|_2 &< \\
\varepsilon\cdot\|h_2\|_2 &\leqslant_{[\text{eq: } 16.34]} \\
\varepsilon\cdot\|(h_1,h_2)\|_{\max}
\end{aligned}$$

proving that

$$L \text{ is Fréchet differentiable at } x \text{ with } D_xL=L(x_1,*)+L(*,x_2)$$

□

We use the above lemma to prove that the product of differentiable functions is differentiable.

Corollary 16.70. *Let $\langle X,\|\|_X\rangle$ be a normed space, $\langle\mathbb{K},||\rangle$, $U\subseteq\mathbb{K}$ open with $x\in U$ and*

$$f:U\to\mathbb{K} \text{ and } g:U\to\mathbb{K} \text{ functions that are Fréchet differentiable at } x$$

then

$$g\cdot f:U\to\mathbb{K} \text{ defined by } (g\cdot f)(x)=g(x)\cdot f(x)$$

is Fréchet differentiable at x with

$$D_x(g\cdot f)=f(x)\cdot D_xg+g(x)\cdot D_xf$$

where $f(x)\cdot D_xg+g(x)\cdot D_xf$ is defined by

$$(f(x)\cdot D_xg+g(x)\cdot D_xf)(k)=f(x)\cdot D_x\,g(k)+g(x)\cdot D_xg(k)$$

Proof. Define the function

$$L:\mathbb{K}^2\to\mathbb{K} \text{ by } L(x,y)=x\cdot y$$

Let $x,y,z,\alpha\in\mathbb{K}$ then we have

$$\begin{aligned}
L(x,y+\alpha\cdot z) &= x\cdot(y+\alpha\cdot z)=x\cdot y+\alpha\cdot(y\cdot z)=L(x,y)+\alpha\cdot L(y,z) \\
L(x+\alpha\cdot y,z) &= (x+\alpha\cdot y)\cdot z=x\cdot z+\alpha\cdot(y\cdot z)=L(x,z)+\alpha\cdot(L(y,z))
\end{aligned}$$

proving that L is multilinear or

$$L\in\operatorname{Hom}\Big(\underbrace{\mathbb{K},\ldots,\mathbb{K}}_{2};Y\Big) \tag{16.35}$$

Further if $h=(h_1,h_2)\in\mathbb{K}^2$ with $|h_1|=|h_2|=1$ then we have

$$|L(h)|=|L(h_1,h_2)|=|h_1\cdot h_2|=|h_1|\cdot|h_2|=1$$

proving by [theorem: 14.190] that L is continuous, hence combined with [eq: 16.35] it follows that $L\in L\Big(\underbrace{\mathbb{K},\ldots,\mathbb{K}}_{2};Y\Big)$. Using the previous lemma [lemma: 16.69] it follows that

$$\forall y=(y_1,y_2)\in\mathbb{K}^2 \; L \text{ is differentiable at } y \text{ with } D_{(y_1,y_2)}L=L(y_1,*)+L(*,y_2) \tag{16.36}$$

Define

$$h:U\to\mathbb{K}^2 \text{ by } h(x)=(g(x),f(x))$$

then $\pi_1\circ h=g$ and $\pi_2\circ h=g$. As f, g are Fréchet differentiable at x it follows that $\pi_1\circ h$, $\pi_2\circ h$ are Fréchet differentiable at x with $D_x(\pi_1\circ h)=D_xg$ and $D_x(\pi_2\circ h)=D_xf$. So we can use [theorem: 16.66] giving

$$h \text{ is Fréchet differentiable at } x \text{ with } \pi_1\circ D_xh=D_xg \text{ and } \pi_2\circ D_xh=D_xf\wedge D_xh \tag{16.37}$$

Now $\forall y \in U$ we have

$$(L \circ h)(x) = (L(h(x))) = L(g(x), f(x)) = g(x) \cdot f(x) = (g \cdot f)(x)$$

proving that

$$L \circ h = g \cdot f$$

Using the Chain Rule [see theorem: 16.39] on [eqs: 16.36 and 16.37] we have that $L \circ h$ is Fréchet differentiable at x so that

$$g \cdot f \text{ is Fréchet differentiable at } x$$

and $\forall k \in X$ we have

$$\begin{aligned}
D_x(g \cdot f)(k) &= D_x(L \circ h)(k) \\
&= (D_{h(x)} L \circ D_x h)(k) \\
&= D_{h(x)} L(D_x h(k)) \\
&= D_{(g(x), f(x))} L(D_x h(k)) \\
&\underset{\text{[theorem: 16.66]}}{=} D_{(g(x), f(x))} L((D_x(\pi_1 \circ h), D_x(\pi_2 \circ h))_*(k)) \\
&\underset{\text{[eq: 16.37]}}{=} D_{(g(x), f(x))} L((D_x g, D_x f)_*(k)) \\
&= D_{(g(x), f(x))} L(D_x g(k), D_x f(k)) \\
&\underset{\text{[eq: 16.36]}}{=} (L(g(x), *) + L(*, f(x)))(D_x g(k), D_x f(k)) \\
&= L(g(x), D_x f(k)) + L(D_x g(k), f(x)) \\
&= g(x) \cdot D_x f(k) + (D_x g(k)) \cdot f(x) \\
&= g(x) \cdot D_x f(k) + f(x) \cdot D_x g(k) \\
&= (g(x) \cdot D_x f)(k) + (f(x) \cdot D_x g)(k) \\
&= (g(x) \cdot D_x f + f(x) \cdot D_x g)(k)
\end{aligned}$$

proving that

$$D_x(g \cdot f) = g(x) \cdot D_x f + f(x) \cdot D_x g$$ □

If we apply the above for $X = \mathbb{K}$ we retrieve the calculus product rule of derivatives.

Corollary 16.71. *Let $\langle \mathbb{K}, \| \rangle$ be the normed space of real (complex) numbers, $U \subseteq \mathbb{K}$ a open set, $x \in U$ and $f: U \to \mathbb{K}$ and $g: U \to \mathbb{K}$ are functions that have a derivative at x then $g \cdot f$ has a derivative at x and*

$$(g \cdot f)'_x = g(x) \cdot f'_x + f(x) \cdot g'_x$$

Proof. Using [theorem: 16.32] we have that f, g are Fréchet differentiable at x and

$$f'_x = D_x f(1) \text{ and } g'_x = D_x g(1)$$

By the previous corollary [corollary: 16.70] it follows that

$$g \cdot f \text{ is Fréchet differentiable at } x \text{ and } D_x(g \cdot f) = g(x) \cdot D_x f + f(x) \cdot D_x g \tag{16.38}$$

We can use [theorem: 16.32] again, giving that

$$g \cdot f \text{ has a derivative at } x$$

and

$$\begin{aligned}
(g \cdot f)'_x &= D_x(g \cdot f)(1) \\
&\underset{\text{[eq: 16.38]}}{=} (g(x) \cdot D_x f + f(x) \cdot D_x g)(1) \\
&= g(x) \cdot D_x f(1) + f(x) \cdot D_x g(1) \\
&= g(x) \cdot f'_x + f(x) \cdot g'_x
\end{aligned}$$

□

Theorem 16.72. *Let $\langle \mathbb{K}, \|\rangle$ be the normed space of real (complex) numbers, $x \in \mathbb{K}\setminus\{0\}$ [a open set] we have that*

$$\left(\frac{1}{*}\right): \mathbb{K}\setminus\{0\} \to \mathbb{K} \text{ defined by } \left(\frac{1}{*}\right)(x) = \frac{1}{x}$$

has a derivative at x with

$$\left(\frac{1}{*}\right)'_x = -\frac{1}{x^2}$$

Proof. Let $\varepsilon \in \mathbb{R}^+$. Then we have for $h \in (\mathbb{K}\setminus\{0\})_x$ with

$$\begin{aligned}
\frac{\frac{1}{x+h} - \frac{1}{x}}{h} - \left(-\frac{1}{x^2}\right) &= \frac{\frac{1}{x+h} - \frac{1}{x}}{h} + \frac{1}{x^2} \\
&= \frac{\frac{x-x-h}{(x+h)\cdot x}}{h} + \frac{1}{x^2} \\
&= \frac{\frac{-h}{(x+h)\cdot x}}{h} + \frac{1}{x^2} \\
&= \frac{-1}{(x+h)\cdot x} + \frac{1}{x^2} \\
&= \frac{-x+(x+h)}{(x+h)\cdot x^2} \\
&= \frac{h}{x^2\cdot(x+h)}
\end{aligned} \tag{16.39}$$

Take now $\delta = \min\left(\frac{\varepsilon}{2}\cdot|x|^3, \frac{|x|}{2}\right) \in \mathbb{R}^+$ [as $x \neq 0$] then we have for $h \in (\mathbb{K}\setminus\{0\})_x$ with $0 < |h| < \delta$ that

$$|h| < \frac{|x|}{2} < |x| \Rightarrow 0 < |x| - |h| \text{ and } \frac{|x|}{2} = |x| - \frac{|x|}{2} < |x| - |h| \Rightarrow \frac{1}{|x|-|h|} < \frac{2}{|x|} \tag{16.40}$$

so that

$$|x| = |x+h-h| \leqslant |x+h| + |h| \Rightarrow |x| - |h| < |x+h| \underset{\text{[eq: 16.40]}}{\Rightarrow} \frac{1}{|x+h|} < \frac{1}{|x|-|h|} < \frac{2}{|x|} \tag{16.41}$$

and

$$|h| < \frac{\varepsilon}{2}\cdot|x|^3 \tag{16.42}$$

Hence we have

$$\begin{aligned}
\left|\frac{\frac{1}{x+h} - \frac{1}{x}}{h} - \left(-\frac{1}{x^2}\right)\right| &\underset{\text{[eq: 16.39]}}{=} \left|\frac{h}{x^2\cdot(x+h)}\right| \\
&= \frac{|h|}{|x|^2\cdot|x+h|} \\
&<_{\text{[eq: 16.41]}} \frac{|h|\cdot 2}{|x|^2\cdot|x|} \\
&= \frac{|h|\cdot 2}{|x|^3} \\
&<_{\text{[eq: 16.42]}} \frac{\varepsilon\cdot|x|^3}{2\cdot|x|^3} \\
&= \varepsilon
\end{aligned}$$

which proves that

$$\left(\frac{1}{*}\right) \text{ has a derivative at } x \text{ and } \left(\frac{1}{*}\right)'_x = -\frac{1}{x^2}$$

□

Theorem 16.73. *We have*

1. *If $n \in \mathbb{N}$ then $\forall x \in \mathbb{K}$*

$$(\cdot)^n: \mathbb{K} \to \mathbb{K} \text{ defined by } (\cdot)^n(x) = x^n$$

has a derivative at x and

$$((\cdot)^n)'_x = n\cdot(\cdot)^{n-1}(x)$$

or in a shorter notation

$$(x^n)'_x = n \cdot x^{n-1}$$

2. *If $z \in \{-n | n \in \mathbb{N}\}$ then $\forall x \in \mathbb{K} \setminus \{0\}$ [a open subset of $\mathbb{K}$] then*

$$(\cdot): \mathbb{K} \setminus \{0\} \to \mathbb{K} \text{ defined by } (\cdot)^z(x) = \frac{1}{x^{(-z)}}$$

has a derivative at x and

$$((\cdot)^z)'_x = z \cdot (\cdot)^{z-1}$$

or in a shorter notation

$$(x^{-n})'_x = -n \cdot x^{-(n+1)} = -n \cdot x^{-n-1}$$

Proof.

1. We use induction to prove this by induction so given $x \in \mathbb{K}$ define

$$S = \{n \in \mathbb{N} | (\cdot)^n \text{ is calculus differentiable at } x \text{ and } ((\cdot)^n)'_x = n \cdot (\cdot)^{n-1}(x)\}$$

then we have:

$1 \in S$. If $n = 1$ then $(\cdot)^n = (\cdot)^1 = \mathrm{Id}_{\mathbb{K}}$ so that by [theorem: 16.22] $(\cdot)^1$ is Fréchet differentiable at x with $D(\cdot)^1(x) = \mathrm{Id}_{\mathbb{K}}$. Using [theorem: 16.32] it follows that

$$(\cdot)^1 \text{ has a derivative at } x \text{ and}$$

and

$$((\cdot)^1)'_x = D_x(\cdot)^1(1) = \mathrm{Id}_{\mathbb{K}}(1) = 1 = 1 \cdot (\cdot)^0(x) = 1 \cdot (\cdot)^{1-1}(x)$$

proving that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Given $y \in X$ we have

$$(\cdot)^{n+1}(x) = x^{n+1} = x \cdot x^n = \mathrm{Id}_X(x) \cdot (\cdot)^n(x)$$

so that

$$(\cdot)^{n+1} = \mathrm{Id}_{\mathbb{K}} \cdot (\cdot)^n$$

As $n \in S$ we have that $(\cdot)^n$ has a derivative at x with

$$((\cdot)^n)'_x = n \cdot (\cdot)^{n-1}(x).$$

So $(\cdot)^{n+1}$ is the product of two functions that have a derivative at x, hence by [corollary: 16.71] we have that

$$(\cdot)^{n+1} \text{ has a derivative at } x$$

and

$$\begin{aligned}
((\cdot)^{n+1})'_x &= (\mathrm{Id}_{\mathbb{K}} \cdot (\cdot)^n)'_x \\
&= \mathrm{Id}_{\mathbb{K}}(x) \cdot ((\cdot)^n)'_x + (\cdot)^n(x) \cdot (\mathrm{Id}_{\mathbb{K}})'_x \\
&= x \cdot n \cdot x^{n-1} + x^n \cdot 1 \\
&= n \cdot x^n + 1 \cdot x^n \\
&= (n+1) \cdot x^n \\
&= (n+1) \cdot x^{(n+1)-1} \\
&= (n+1) \cdot (\cdot)^{(n+1)-1}(x)
\end{aligned}$$

proving that $n+1 \in S$.

2. Let $z = -n \in \{-n | n \in \mathbb{N}\}$ then for every $y \in \mathbb{K} \setminus \{0\}$ we have

$$\left(\left(\frac{1}{*}\right) \circ (\cdot)^n\right)(y) = \left(\frac{1}{*}\right)((\cdot)^n(y)) = \left(\frac{1}{*}\right)(y^n) = \frac{1}{y^n} = \frac{1}{y^{-z}} = (\cdot)^z(y) \tag{16.43}$$

So $(\cdot)^z$ is the composition of $\left(\frac{1}{*}\right)$ and $(\cdot)^n$ where these functions have a derivative at x and

$$((\cdot)^n)'_x = n \cdot x^{n-1} \text{ and } \left(\frac{1}{\cdot}\right)'_x \underset{\text{[eq: 16.72]}}{=} -\frac{1}{x^2} \tag{16.44}$$

Hence using [theorem: 16.41] we have that $(\cdot)^z$ has a derivative at x and

$$\begin{aligned}
((\cdot)^z)'_x &= \left(\left(\frac{1}{*}\right)\circ(\cdot)^n\right)'_x \\
&\underset{\text{[theorem: 16.41]}}{=} ((\cdot)^n)'_x\cdot\left(\frac{1}{*}\right)'_{(\cdot)^n(x)} \\
&\underset{\text{[eq: 16.44]}}{=} n\cdot x^{n-1}\cdot\frac{-1}{((\cdot)^n(x))^2} \\
&= n\cdot x^{n-1}\cdot -\frac{1}{x^{2\cdot n}} \\
&= -n\cdot x^{n-1}\cdot\frac{1}{x^{n-1}\cdot x^{2\cdot n-(n-1)}} \\
&= -n\cdot\frac{1}{x^{n+1}} \\
&= z\cdot\frac{1}{x^{n+1}} \\
&= z\cdot(\cdot)^{-(n+1)}(x) \\
&= z\cdot(\cdot)^{z-1}(x)
\end{aligned}$$

□

Theorem 16.74. *Let Let $\langle\mathbb{K},\|\rangle$ be the normed space of real (complex) numbers, $U\subseteq\mathbb{K}$ a open set, $x\in U$ and $f:U\to\mathbb{K}$ and $g:U\to\mathbb{K}$ are functions such that $\forall x\in U\ g(x)\neq 0$, f has a derivative at x and g has a derivative at x then the function*

$$\frac{f}{g}:U\to\mathbb{K} \text{ defined by } \frac{f}{g}(x)=\frac{f(x)}{g(x)}$$

has a derivative at x and

$$\left(\frac{f}{g}\right)'=\frac{f'_x\cdot g(x)-g'_x\cdot f(x)}{(g(x))^2}$$

Proof. Let $x\in U$. As $g:U\to\mathbb{K}$ has a derivative g'_x at x, $g(U)\subseteq\mathbb{K}\setminus\{0\}$ and $\left(\frac{1}{\star}\right):\mathbb{K}\setminus\{0\}\to\mathbb{K}$ has a derivative at $g(x)$ [see theorem: 16.72] it follows from the chain rule [see theorem: 16.41] that

$$\left(\left(\frac{1}{*}\right)\circ g\right):U\to\mathbb{K}$$

has a derivative at x with

$$\left(\left(\frac{1}{*}\right)\circ g\right)'_x=\left(\frac{1}{*}\right)'_{g(x)}\cdot g'_x\underset{\text{[theorem: 16.72]}}{=}-\frac{1}{(g(x))^2}\cdot g'_x \tag{16.45}$$

Using the above and the fact that f has also a derivative at x it follow from the product rule [theorem: 16.71] that $f\cdot\left(\left(\frac{1}{*}\right)\circ g\right)$ has a derivative at x and

$$\begin{aligned}
\left(f\cdot\left(\left(\frac{1}{*}\right)\circ g\right)\right)'_x &= f'_x\cdot\left(\left(\frac{1}{*}\circ g\right)(x)\right)+f(x)\cdot\left(\left(\frac{1}{*}\right)\circ g\right)'_x \\
&= f'_x\cdot\frac{1}{g(x)}+f(x)\cdot\left(\left(\frac{1}{*}\right)\circ g\right)'_x \\
&\underset{\text{[eq: 16.45]}}{=} f'_x\cdot\frac{1}{g(x)}+f(x)\cdot\left(-\frac{1}{(g(x))^2}\right)\cdot g'_x \\
&= \frac{f'_x}{g(x)}-f(x)\cdot\frac{g'_x}{(g(x))^2} \\
&= \frac{f'_x\cdot g(x)-f(x)\cdot g'_x}{(g(x))^2}
\end{aligned}$$

Finally we have $\forall t\in\mathbb{K}$ that $\left(f\cdot\left(\left(\frac{1}{*}\right)\circ g\right)\right)(t)=f(t)\cdot\left(\frac{1}{*}\right)(g(t))=f(t)\cdot\frac{1}{g(t)}=\left(\frac{f}{g}\right)(t)$ proving that $\frac{f}{g}=f\cdot\left(\left(\frac{1}{*}\right)\circ g\right)$, hence

$$\left(\frac{f}{g}\right)'_x=\frac{f'_x\cdot g(x)-f(x)\cdot g'_x}{(g(x))^2}$$

□

16.2 Higher order differentials

16.2.1 Linear mappings to linear mappings

The idea of higher order differentiation looks simple, just differentiate the function that maps a point to it's differential, but it actually rather complex. If a function $f:U\to Y$ is Fréchet differentiable on U then $\forall x\in U\ D_xf\in L(X,Y)$ exist so that we can define the function

$$Df:U\to L(X,Y)\text{ by }(Df)(x)=D_xf$$

and ask if that function is Fréchet differentiable at $x\in U$. If so then $D_x(Df)\in L(X,L(X,Y))$ is defined to be the second order differential of f noted as D_x^2f. Proceeding in this way we can define the third order differential D_x^3fat x and so on. There is however a problem, if we look at the types of the differentials we have

$$\begin{aligned}D_xf &\in L(X,Y)\\ D_x^2f &\in L(X,L(X,Y))\\ D_x^3f &\in L(X,L(X,L(X,Y)))\\ &\dots\end{aligned}$$

So we have to learn to work with sets like $L(X,L(X,Y))$, $L(X,L(X,Y))\dots$. Evaluating the higher order differentials is rather elaborated because we have to use

$$\begin{aligned}(Df(x))(y) &\in Y\\ ((D^2f(x))(y_1))(y_2) &\in Y\\ (((D^3f(x))(y_1))(y_2))(y_3) &\in Y\\ &\dots\end{aligned}$$

It would be nicer if the higher order differentials are multi-linear functions so that we have

$$\begin{aligned}D_xf(y) &\in Y\\ D_x^2f(y_1,y_2) &\in Y\\ D_x^3f(y_1,y_2,y_3) &\in Y\\ &\dots\\ D_x^nf(y_1,\dots,y_n) &\in Y\end{aligned}$$

To be able to do this we must do the following identifications

$$\begin{aligned}L(X,L(X,Y)) &\text{ is identified with } L^2(X;Y)\\ L(X,L(X,L(X,Y))) &\text{ is identified with } L^3(X;Y)\\ &\dots\end{aligned}$$

where the identification maintains linearity, continuity and the norm. This is the focus of this section. First we need some recursive definitions.

Definition 16.75. *Let $n\in\mathbb{N}$, $\langle X,\|\|_X\rangle$, $\langle Y,\|\|_Y\rangle$ normed spaces then we define $L_n(X;Y)$ recursively as follows.*

$$L_n(X;Y) = \begin{cases} L(X,Y) & \text{if } n=1\\ L(X,L_{n-1}(X;Y)) & \text{if } 1<n\end{cases}$$

Example 16.76. Using the above definition we have

$$\begin{aligned}L_1(X;Y) &= L(X,Y)\\ L_2(X;Y) &= L(X,L_1(X;Y))\\ &= L(X,L(X,Y))\\ L_3(X;Y) &= L(X,L_2(X;Y))\\ &= L(X,L(X,L(X,Y)))\\ \dots\ \dots &\ \dots\\ L_n(X;Y) &= L(X,L(X,\dots(L(X,Y))))\end{aligned}$$

Lemma 16.77. *Let $n, m \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ normed spaces then*

$$L_{n+m}(X;Y) = L_m(X; L_n(X;Y))$$

Proof. We prove this by induction, so define

$$S_n = \{m \in \mathbb{N} | \text{If } \langle X, \|\| \rangle \text{ is a normed space then } L_{n+m}(X;Y) = L_m(X; L_n(X;Y))\}$$

then we have:

$\boldsymbol{1 \in S_n}$. As $L_{n+1}(X;Y) \underset{\text{def}}{=} L(X, L_n(X;Y)) \underset{\text{def}}{=} L_1(X; L_n(X;Y))$ it follows that $1 \in S_n$.

$\boldsymbol{m \in S_n \Rightarrow m+1 \in S_n}$. We have

$$\begin{aligned} L_{n+(m+1)}(X;Y) &= L_{(n+m)+1}(X;Y) \\ &= L(X, L_{n+m}(X;Y)) \\ &\underset{m \in S_n}{=} L(X, L_m(X; L_n(X;Y))) \\ &\underset{\text{def}}{=} L_{m+1}(X, L_n(X;Y)) \end{aligned}$$

proving that $m+1 \in S$. □

Corollary 16.78. *Let $n \in \mathbb{N} \setminus \{1\}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ normed spaces then*

$$L_n(X;Y) = L_{n-1}(X; L_1(X;Y)) \underset{L_1(X;Y)=L(X,Y)}{=} L_{n-1}(X; L(X,Y))$$

Proof. We have

$$\begin{aligned} L_n(X;Y) &= L_{(n-1)+1}(X;Y) \\ &\underset{n-1 \in \mathbb{N} \wedge [\text{lemma: } 16.77]}{=} L_{n-1}(X; L_1(X;Y)) \end{aligned}$$

□

We want now to show that $L_n(X;Y)$ is isometric to $L^n(X;Y)$, first we show how elements of $L_n(X;Y)$ can act on tuples of elements of X.

Definition 16.79. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ normed spaces, $L \in L_n(X;Y)$, $m \in \{1, \ldots, n\}$ and $x = (x_1, \ldots, x_m) \in X^m$ then we define $L(x_1 : \ldots : x_m)$ recursively as*

$$L(x_1 : \ldots : x_m) = \begin{cases} L(x_1) \text{ if } m = 1 \\ (L(x_1))(x_2 : \ldots : x_m) \text{ if } 1 < m \leqslant n \end{cases}$$

***Note* 16.80.** *This is well defined as for $1 < m \leqslant n$ we have that $1 < n$ so that*

$$L \in L_n(X;Y) = L(X, L_{n-1}(X;Y)) \text{ hence } L(x_1) \in L_{n-1}(X;Y)$$

Example 16.81. Let $n = 4$ then for $L \in L_4(X;Y) = L(X, L_3(X;Y))$ we have

$$\begin{aligned} L(x_1 : \ldots : x_4) &= (L(x_1))(x_2 : \ldots x_4) \text{ where } L(x_1) \in L_3(X;Y) = L(X, L_2(X;Y)) \\ &= ((L(x_1))(x_2))(x_3 : \ldots : x_4) \text{ where } (L(x_1))(x_2) \in L_2(X;Y) = L(X, L_1(X;Y)) \\ &= (((L(x_1))(x_2))(x_3))(x_4 : \ldots : x_4) \text{ where } ((L(x_1))(x_2))(x_3) \in L_1(X;Y) = L(X,Y) \\ &= (((L(x_1))(x_2))(x_3))(x_4) \in Y \\ L(x_1 : \ldots : x_3) &= (L(x_1))(x_2 : \ldots : x_3) \text{ where } L(x_1) \in L_3(X;Y) = L(x, L_2(X;Y)) \\ &= ((L(x_1))(x_2))(x_3 : \ldots : x_3) \text{ where } (L(x_1))(x_2) \in L_2(X;Y) = L(X, L_1(X;Y)) \\ &= ((L(x_1))(x_2))(x_3) \in L_1(X;Y) \end{aligned}$$

The above example suggests the following theorem that also ensures that [definition: 16.79] is valid.

Lemma 16.82. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ normed spaces, $L \in L_n(X;Y)$, $m \in \{1, \ldots, n\}$ and $x = (x_1, \ldots, x_m) \in X^m$ then we have*

$$L(x_1 : \ldots : x_m) \in \begin{cases} Y \text{ if } m = n \\ L_{n-m}(X;Y) \text{ if } m < n \end{cases}$$

Proof. We use induction to prove this so define

$$S=\left\{n\in\mathbb{N}|\text{If } m\in\{1,\dots,n\} \text{ then } \forall L\in L_n(X;Y) \text{ we have } \forall(x_1,\dots,x_m)\in X^m \text{ that } L(x_1:\dots:x_m)\in\left\{\begin{array}{l} Y \text{ if } m=n \\ L_{n-m}(X;Y) \text{ if } m<n\end{array}\right\}\right.$$

then we have:

$1\in S$. If $m\in\{1,\dots,1\}=\{1\}$ then $m=1=n$. Let $L\in L_1(X;Y)=L(X,Y)$ then we have for every $(x_1)\in X^1$ that $L(x_1:\dots:x_1)=L(x_1)\in Y$. Proving that $1\in S$.

$n\in S\Rightarrow n+1\in S$. Let $L\in L_{n+1}(X;Y)$ then for $m\in\{1,\dots,n+1\}$ we have for m either:

$m=1$. As $L_{n+1}(X;Y)=L(X,L_n(X;Y))$ and $L(x_1:\dots:x_m)=L(x_1:\dots:x_1)=L(x_1)$ it follows that

$$L(x_1:\dots:x_m)\in L_n(X;Y)=L_{(n+1)-m}(X;Y)$$

$m=n+1$. Given $(x_1,\dots,x_{n+1})\in X^m=X^{n+1}$ we have, as $L_{n+1}(X;Y)=L(x,L_n(X;Y))$, that $L(x_1)\in L_n(X;Y)$. As $n\in S$, $(x_2,\dots,x_{n+1})\in X^n$ it follows that

$$(L(x_1))(x_2:\dots:x_{n+1})\in Y$$

hence

$$L(x_1:\dots:x_m)\underset{m=n+1}{=}L(x_1:\dots:x_{n+1})=(L(x_1))(x_2:\dots:x_{n+1})\in Y$$

proving as $m\not<n+1$ that

$$L(x_1:\dots:x_m)\in\left\{\begin{array}{l} Y \text{ if } m=n+1 \\ L_{(n+1)-m}(X;Y) \text{ if } m<n+1\end{array}\right.$$

$m\in\{2,\dots,n\}$. Given $(x_1,\dots,x_m)\in X^m$ we have, as $L_{n+1}(X;Y)=L(X,L_n(X;Y))$, that $L(x_1)\in L_n(X;Y)$. As $n\in S$, $(x_2,\dots,x_m)\in X^{m-1}$ and $1\leqslant m-1<n$ it follows that

$$(L(x_1))(x_2:\dots:x_m)\in L_{n-(m-1)}(X;Y)=L_{(n+1)-m}(X;Y)$$

hence

$$L(x_1:\dots:x_m)=(L(x_1))(x_2:\dots:x_m)\in L_{(n+1)-m(X;Y)}$$

proving as $1<m<n+1$

$$L(x_1:\dots:x_m)\in\left\{\begin{array}{l} Y \text{ if } m=n+1 \\ L_{(n+1)-m}(X;Y) \text{ if } m<n+1\end{array}\right.$$

So in all cases we have

$$\forall(x_1,\dots,x_m) \text{ that } L(x_1:\dots:x_m)\in\left\{\begin{array}{l} Y \text{ if } m=n+1 \\ L_{(n+1)-m}(X;Y) \text{ if } m<n+1\end{array}\right.$$

proving that $n+1\in S$. □

In case $X=\mathbb{K}$ we have a simpler expression for $L(x_1:\dots:x_n)$.

Theorem 16.83. *Let $n\in\mathbb{N}$, $\langle X,\|\|\rangle$ a normed space, $L\in L_n(\mathbb{K};X)$ and $x=(x_1,\dots,x_n)\in\mathbb{K}^n$ then we have*

$$L(x_1:\dots:x_n)=\left(\prod_{i=1}^n x_i\right)\cdot L\left(\underbrace{1:\dots:1}_{n}\right)$$

Proof. We prove this by induction, so define

$$S=\left\{n\in\mathbb{N}|\text{If } L\in L_n(\mathbb{K};X) \text{ and } (x_1,\dots,x_n)\in\mathbb{K}^n \text{ then } L(x_1:\dots:x_n)=\left(\prod_{i=1}^n x_i\right)\cdot L\left(\underbrace{1:\dots:1}_{n}\right)\right\}$$

then we have:

$1\in S$. If $L\in L_1(\mathbb{K};X)=L(\mathbb{K},X)$ then for $(x_1)\in\mathbb{K}^1$ we have

$$L(x_1:\dots:x_1)=L(x_1)=L(x_1\cdot 1)\underset{L\in L(\mathbb{K},X)}{=}x_1\cdot L(1)=\left(\prod_{i=1}^1 x_i\right)\cdot L\left(\underbrace{1:\dots:1}_{1}\right)$$

proving that $1 \in S$.

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$. If $L \in L_{n+1}(\mathbb{K}; X) = L(\mathbb{K}, L_n(\mathbb{K}; X))$ then we have for $(x_1, \ldots, x_{n+1}) \in \mathbb{K}^n$ that $L(x_1) \in L_n(\mathbb{K}; X)$. So as $n \in S$ and $(x_2, \ldots, x_{n+1}) \in \mathbb{K}^n$ we have

$$\begin{aligned} L(x_1)(x_2 : \ldots : x_{n+1}) &= \left(\prod_{i=2}^{n+1} x_i\right) \cdot (L(x_1))\left(\underbrace{1 : \ldots : 1}_{n}\right) \\ &\underset{L \in L(X, L_n(\mathbb{K}; X))}{=} \left(\prod_{i=2}^{n+1} x_i\right) \cdot x_1 \cdot (L(1))\left(\underbrace{1 : \ldots : 1}_{n}\right) \\ &= \left(\prod_{I=1}^{n+1} x_i\right) \cdot (L(1))\left(\underbrace{1 : \ldots : 1}_{n}\right) \\ &= \left(\prod_{i=1}^{n+1} x_i\right) \cdot L\left(\underbrace{1 : \ldots : 1}_{n+1}\right) \end{aligned}$$

proving that

$$L(x_1 : \ldots : x_{n+1}) = L(x_1)(x_2 : \ldots : x_{n+1}) = L\left(\underbrace{1 : \ldots : 1}_{n+1}\right) \cdot \prod_{i=1}^{n} x_i$$

hence

$$n+1 \in S$$

□

Lemma 16.84. *Let $n \in \mathbb{N} \setminus \{1\}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ normed spaces and $L \in L_n(X; Y)$ then for $(x_1, \ldots, x_n) \in X^n$ we have*

$$L(x_1 : \ldots : x_n) = (L(x_1 : \ldots : x_{n-1}))(x_n)$$

Proof. We use induction to prove this, so define

$$S = \{n \in \{2, \ldots, n\} | \text{If } L \in L_n(X; Y) \text{ then for } (x_1, \ldots, x_n) \in X^n \text{ we have } L(x_1 : \ldots : x_n) = (L(x_1 : \ldots : x_{n-1}))(x_n)\}$$

then we have:

$\boldsymbol{2 \in S}$. If $L \in L_2(X; Y) = L(X, L_1(X; Y)) = L(X, L(X, Y))$ then for $(x_1, x_2) \in X^2$ we have

$$L(x_1 : \ldots : x_2) = (L(x_1))(x_2 : \ldots : x_2) = (L(x_1))(x_2) = (L(x_1 : \ldots : x_1))(x_2) = (L(x_1 : \ldots : x_{2-1}))(x_2)$$

proving that $2 \in S$.

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$. Let $L \in L_{n+1}(X; Y)$ then for $(x_1, \ldots, x_{n+1}) \in X^{n+1}$ we have, as $L_{n+1}(X; Y) = L(X, L_n(X; Y))$, that $L(x_1) \in L_n(X; Y)$. As $n \in S$ and $(x_2, \ldots, x_n) \in X^n$ we have that

$$(L(x_1))(x_2 : \ldots : x_{n+1}) = ((L(x_1))(x_2 : \ldots : x_n))(x_{n+1}) = (L(x_1 : \ldots : x_n))(x_{n+1})$$

so that

$$L(x_1 : \ldots : x_{n+1}) = (L(x_1))(x_2 : \ldots : x_{n+1}) = (L(x_1 : \ldots : x_n))(x_{n+1})$$

proving that

$$n+1 \in S$$

□

Lemma 16.85. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ normed spaces, $\alpha \in \mathbb{K}$, L_1, $L_2 \in L_n(X; Y)$ then $\forall (x_1, \ldots, x_n) \in X^n$ we have*

$$(L_1 + \alpha \cdot L_2)(x_1 : \ldots : x_n) = L_1(x_1 : \ldots : x_n) + \alpha \cdot L_2(x_1 : \ldots : x_n)$$

Proof. The proof is by induction, so let

$$S = \{n \in \mathbb{N} | \forall \alpha \in \mathbb{K}, \forall L_1, L_2 \in L_n(X; Y) \text{ we have } \forall (x_1, \ldots, x_n) \in X^n \text{ that } (L_1 + \alpha \cdot L_2)(x_1 : \ldots : x_n) = L_1(x_1 : \ldots : x_n) + \alpha \cdot L_2(x_1 : \ldots : x_n)\}$$

then we have:

$1 \in S$. Take $\alpha \in \mathbb{K}$, $L_1, L_2 \in L_1(X;Y) = L(X,Y)$ then we have for $(x_1) \in X^1$ that

$$\begin{aligned}(L_1 + \alpha \cdot L_2)(x_1 : \ldots : x_1) &= (L_1 + \alpha \cdot L_2)(x_1) \\ &\underset{\text{pointwise definition}}{=} L_1(x) + \alpha \cdot L_2(x_1) \\ &= L_1(x_1 : \ldots : x_1) + \alpha \cdot L_2(x_1 : \ldots : x_1)\end{aligned}$$

proving that $1 \in S$

$n \in S \Rightarrow n+1 \in S$. Take $\alpha \in \mathbb{K}$, $L_1, L_2 \in L_{n+1}(X;Y) = L(X, L_n(X;Y))$ so that

$$(L_1 + \alpha \cdot L_2)(x_1) \underset{\text{pointwise definition}}{=} L_1(x_1) + \alpha \cdot L_2(x_1)$$

hence

$$\begin{aligned}(L_1 + \alpha \cdot L_2)(x_1 : \ldots : x_n) &= ((L_1 + \alpha \cdot L_2)(x_1))(x_2 : \ldots : x_n) \\ &= (L_1(x_1) + \alpha \cdot L_2(x_1))(x_2 : \ldots : x_n) \qquad (16.46)\end{aligned}$$

As $L_1(x_1), L_2(x_1) \in L_n(X;Y)$ and $n \in S$ it follows that

$$\begin{aligned}(L_1(x_1) + \alpha \cdot L_2(x_1))(x_2 : \ldots : x_n) &= (L_1(x_1))(x_2 : \ldots : x_n) + \alpha \cdot (L_2(x_1))(x_2 : \ldots : x_n) \\ &= L_1(x_1 : \ldots : x_n) + \alpha \cdot L_2(x_1 : \ldots : x_n)\end{aligned}$$

which combined with [eq: 16.46] proves that

$$(L_1 + \alpha \cdot L_2)(x_1 : \ldots : x_n) = L_1(x_1 : \ldots : x_n) + \alpha \cdot L_2(x_1 : \ldots : x_n)$$

Hence we have that

$$n+1 \in S$$

□

Lemma 16.86. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ normed spaces and $L \in L_n(X;Y)$, $i \in \{1, \ldots, n\}$ then for $i \in \{1, \ldots, n\}$ we have for $\left(x_1, \ldots \underbrace{r + \alpha \cdot t}_{i} \ldots, x_n\right) \in X^n$ that*

$$L\left(x_1 : \ldots \underbrace{r + \alpha \cdot t}_{i} \ldots : x_n\right) = L\left(x_1 : \ldots \underbrace{r}_{i} \ldots : x_n\right) + \alpha \cdot L\left(x_1 : \ldots \underbrace{t}_{i} \ldots : x_n\right)$$

Proof. We use mathematical induction for the proof, so let

$S = \left\{ n \in \mathbb{N} | \text{If } L \in L_n(X;Y) \text{ then } \forall i \in \{1, \ldots, n\} \text{ we have for } \left(x_1, \ldots \underbrace{r + \alpha \cdot t}_{i} \ldots, x_n\right) \in X^n \text{ that } L\left(x_1, \ldots \underbrace{r + \alpha \cdot t}_{i} \ldots, x_n\right) = L\left(x_1, \ldots \underbrace{r}_{i} \ldots, x_n\right) + \alpha \cdot L\left(x_1, \ldots \underbrace{t}_{i} \ldots, x_n\right) \right\}$

then we have:

$1 \in S$. Let $L \in L_1(X;Y) = L(X,Y)$ then if $i \in \{1, \ldots, 1\} = \{1\}$ we have $i = 1$ and given

$$(r + \alpha \cdot t) = \left(x_1, \ldots \underbrace{r + \alpha \cdot t}_{1} \ldots, x_1\right) \in X^1$$

that

$$\begin{aligned}L\left(x_1, \ldots \underbrace{r + \alpha \cdot t}_{i} \ldots : x_n\right) &= \\ L(r + \alpha \cdot t) &\underset{L \in L(X,Y)}{=} \\ L(y) + \alpha \cdot L(z) &= \\ L\left(x_1, \ldots \underbrace{r}_{i} \ldots : x_n\right) + \alpha \cdot L\left(x_1, \ldots \underbrace{t}_{i} \ldots : x_n\right)\end{aligned}$$

proving that $1 \in S$.

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$. Let $L \in L_{n+1}(X;Y) = L(X, L_n(X;Y))$ and take $i \in \{1, \ldots, n+1\}$ then we have either:

$\boldsymbol{i=1}$. Then for $\left(x_1, \ldots \underbrace{r+\alpha \cdot t}_{1} \ldots, x_{n+1}\right) \in X^{n+1}$ we have

$$\begin{aligned}
L\left(x_1, \ldots \underbrace{r+\alpha \cdot t}_{1} \ldots : x_{n+1}\right) &= \\
L(r+\alpha \cdot t : x_2 : \ldots : x_{n+1}) &= \\
(L(r+\alpha \cdot t))(x_2 : \ldots : x_{n+1}) &\underset{L \in L(X, L_n(X;Y))}{=} \\
(L(r)+\alpha \cdot L(t))(x_2 : \ldots : x_{n+1}) &\underset{\text{[lemma: 16.85]}}{=} \\
(L(r))(x_2 : \ldots : x_{n+1}) + \alpha \cdot L(t)(x_2 : \ldots : x_{n+1}) &= \\
L(r : x_2 : \ldots : x_{n+1}) + \alpha \cdot L(t : x_2 : \ldots : x_{n+1}) &= \\
L\left(x_1 : \ldots \underbrace{r}_{i} \ldots : x_{n+1}\right) + \alpha \cdot L\left(x_1 : \ldots \underbrace{s}_{i} \ldots : x_{n+1}\right) &
\end{aligned}$$

proving that in this case that

$$n+1 \in S$$

$\boldsymbol{i \in \{2, \ldots, n+1\}}$. Then for $\left(x_1 \ldots \underbrace{r+\alpha \cdot t}_{1} \ldots x_{n+1}\right) \in X^{n+1}$ we have $\left(x_2 \ldots \underbrace{r+\alpha \cdot t}_{i-1} \ldots x_{n+1}\right) \in X^n$ which as $L(x_1) \in L_n(X;Y)$ and $n \in S$ results in

$$\begin{aligned}
L\left(x_1, \ldots \underbrace{r+\alpha \cdot t}_{i} \ldots, x_{n+1}\right) &= \\
(L(x_1))\left(x_2 : \ldots \underbrace{r+\alpha \cdot t}_{i-1} \ldots : x_n\right) & \\
(L(x_1))\left(x_2 : \ldots \underbrace{r}_{i-1} \ldots : x_n\right) + \alpha \cdot (L(x_1))\left(x_2 : \ldots \underbrace{s}_{i-1} \ldots : x_n\right) &= \\
L\left(x_1 : \ldots \underbrace{r}_{i} \ldots : x_n\right) + \alpha \cdot L(x_1 : \ldots \underbrace{t}_{i} \ldots : x_n) &=
\end{aligned}$$

so that in this case we have also

$$n+1 \in S$$

So in all cases we have

$$n+1 \in S$$

□

Lemma 16.87. *Let $n \in \mathbb{N}$, $\langle X, \|\|\rangle$, $\langle Y, \|\|_Y\rangle$ normed spaces, $L \in L_n(X;Y)$ and $(x_1, \ldots, x_n) \in X^n$ [so that by [lemma: 16.82] $L(x_1 : \ldots : x_n) \in Y$] then*

$$\|L(x_1 : \ldots : x_n)\|_Y \leqslant \|L\|_{L_n(X;Y)} \cdot \prod_{i=1}^{n} \|x_i\|_X$$

Proof. We prove this by induction, so define

$$S = \left\{ n \in \mathbb{N} | \text{If } L \in L_n(X;Y) \text{ then } \forall (x_1, \ldots, x_n) \in X^n \text{ we have } \|L(x_1 : \ldots : x_n)\|_Y \leqslant \|L\|_{L_n(X;Y)} \cdot \prod_{i=1}^{n} \|x_i\|_X \right\}$$

then we have:

$\boldsymbol{1 \in S}$. If $L \in L_1(X;Y) = L(X,Y)$ then $\forall (x_1) \in X^1$ we have

$$\|L(x_1 : \ldots : x_1)\|_Y = \|L(x_1)\|_Y \leqslant \|L\|_{L(X,Y)} \cdot \|x_1\|_X = \|L\|_{L_1(X;Y)} \cdot \|x_1\|_X = \|L\|_{L_1(X;Y)} \cdot \prod_{i=1}^{1} \|x_i\|$$

proving that $1 \in S$.

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$. Let $L \in L_{n+1}(X;Y) = L(X, L_n(X;Y))$ and $(x_1, \ldots, x_{n+1}) \in X^n$ then, as $L(x_1) \in L_n(X;Y)$, $(x_2, \ldots, x_{n+1}) \in X^n$ and $n \in S$, it follows that

$$\|L(x_1)(x_2 : \ldots : x_{n+1})\|_Y \leqslant \|L(x_1)\|_{L_n(X;Y)} \cdot \prod_{i=1}^{n} \|x_{i+1}\|_X = \|L(x_i)\|_{L_n(X;Y)} \cdot \prod_{i=2}^{n+1} \|x_i\|_X \tag{16.47}$$

Next we have

$$\begin{aligned}\|L(x_1:\ldots:x_{n+1})\|_Y &= \|(L(x_1))(x_2:\ldots:x_{n+1})\|_Y \\ &\leqslant_{[\text{eq: } 16.47]} \|L(x_i)\|_{L_n(X;Y)} \cdot \prod_{i=2}^{n+1} \|x_i\|_X \\ &\leqslant \|L\|_{L_{n+1}(X;Y)} \cdot \|x_1\|_X \cdot \prod_{i=2}^{n+1} \|x_i\|_X \\ &\leqslant \|L\|_{L_{n+1}(X;Y)} \cdot \prod_{i=1}^{n+1} \|x_i\|_X\end{aligned}$$

proving that

$$n+1 \in S$$

□

Lemma 16.88. *Let $n \in \mathbb{N}$, $\langle X, \|\|\rangle$, $\langle Y, \|\|_Y\rangle$ normed spaces, $L_1, L_2 \in L_n(X;Y)$ such that $\forall (x_1,\ldots,x_n) \in X^n$ we have $L_1(x_1:\ldots:x_n) = L_2(x_1:\ldots:x_n)$ then $L_1 = L_2$.*

Proof. We use induction to prove this, so define

$$S = \{n \in \mathbb{N} | \text{If } L_1, L_2 \in L_n(X;Y) \text{ satisfies } \forall (x_1,\ldots,x_n)\ L_1(x_1:\ldots:x_n) = L_2(x_1:\ldots:x_n) \text{ then } L_1 = L_2\}$$

then we have:

$1 \in S$. Let $L_1, L_2 \in L_1(X;Y) = L(X,Y)$ be such that $\forall (x_1) \in X^1$ we have $L_1(x_1:\ldots:x_1) = L_2(x_1:\ldots:x_1)$. Then $\forall x \in X$ we have for $y = (x) \in X^1$ [so that $y_1 = x$] that

$$L_1(x) = L_1(y_1) = L_1(y_1:\ldots:y_1) = L_2(y_1:\ldots:y_1) = L_2(y_1) = L_2(x)$$

proving that $L_1 = L_2$, hence $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $L_1, L_2 \in L_{n+1}(X;Y) = L(X, L_n(X;Y))$ such that

$$\forall x = (x_1,\ldots,x_{n+1}) \in X^{n+1}\ L_1(x_1:\ldots:x_{n+1}) = L_2(x_1:\ldots:x_{n+1})$$

Let $y \in X$ then $L_1(y), L_2(y) \in L_n(X;Y)$ and $\forall (x_1,\ldots,x_n) \in X^n$ we have

$$L_1(y)(x_1:\ldots:x_n) = L_1(y:x_1:\ldots:x_n) = L_2(y:x_1:\ldots:x_n) = L_2(y)(x_1:\ldots:x_n)$$

which as $n \in S$ proves that $L_1(y) = L_2(y)$. As y is chosen arbitrary we conclude that $L_1 = L_2$ proving

$$n+1 \in S$$

□

Lemma 16.89. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ normed spaces an $L \in L_n(X;Y)$. If $\forall (x_1,\ldots,x_n) \in X^n$ we have that $\|L(x_1:\ldots:x_n)\|_Y \leqslant M \cdot \prod_{i=1}^n \|x_i\|_X$ then it follows that*

$$\|L\|_{L_n(X;Y)} \leqslant M$$

Proof. We prove this by induction, so let

$$S = \left\{ n \in \mathbb{N} | \text{If } L \in L_n(X;Y) \text{ satisfies } \forall (x_1,\ldots,x_n) \in X^n\ \|L(x_1:\ldots:x_n)\|_Y \leqslant M \cdot \prod_{i=1}^n \|x_i\|_X \text{ then } \|L\|_{L_n(X;Y)} \leqslant M \right\}$$

then we have:

$1 \in S$. Let $L \in L_1(X;Y) = L(X,Y)$ such that $\forall (x_1) \in X^n$ we have $\|L(x_1:\ldots:x_1)\|_Y \leqslant M \cdot \prod_{i=1}^1 \|x_i\|_X$. Then given $y \in X$ we have for $x = (y) \in X^1$ that

$$\|L(y)\|_Y = \|L(x_1)\|_Y = \|L(x_1:\ldots:x_1)\|_Y \leqslant M \cdot \prod_{i=1}^1 \|x_i\|_X = M \cdot \|y\|_X$$

so that by [definition: 14.181] $\|L\|_{L_1(X;Y)} = \|L\|_{L(X,Y)} \leqslant M$ proving that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $L \in L_{n+1}(X;Y) = L(X, L_n(X;Y))$ such that $\forall (x_1,\ldots,x_{n+1}) \in X^{n+1}$ we have

$$\|L(x_1:\ldots:x_{n+1})\|_Y \leqslant M \cdot \prod_{i=1}^{n+1} \|x_i\|_X$$

Fix $x \in X$ then $\forall (y_1, \ldots, y_n) \in X^n$ we have

$$\|(L(x))(y_1 : \ldots : y_n)\|_Y = \|L(x : y_1 : \ldots : y_n)\|_Y \leqslant M \cdot \|x\|_X \cdot \prod_{i=1}^{n} \|y_i\|_X = (M \cdot \|x\|_X) \cdot \prod_{i=1}^{n} \|y_i\|_X$$

As $n \in S$ and $L(x) \in L_n(X;Y)$ it follows that $\|L(x)\|_{L_n(X;Y)} \leqslant M \cdot \|x\|_X$. Hence by [definition: 14.181] it follows that $\|L\|_{L_{n+1}(X;Y)} \leqslant M$ proving

$$n+1 \in S$$

□

Lemma 16.90. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ normed spaces and $L \in L^n(X;Y)$ then there exist a $K \in L_n(X;Y)$ such that $\forall (x_1, \ldots, x_n) \in X^n$ we have $K(x_1 : \ldots : x_n) = L(x_1, \ldots, x_n)$*

Proof. We use induction to prove this so let

$$S = \{n \in \mathbb{N} | \text{If } L \in L^n(X;Y) \text{ then there exist a } K \in L_n(X;Y) \text{ such that } \forall (x_1, \ldots, x_n) \in X^n \text{ we have } K(x_1 : \ldots : x_n) = L(x_1, \ldots, x_n)\}$$

then we have:

$1 \in S$. If $L \in L^1(X;Y)$ then as $L^1(X;Y) = L(X,Y) = L_1(\text{XlY})$ we have that $L \in L_1(X;Y)$ so if we take $K = L$ then we have $K \in L_1(X;Y)$ and for $(x_1) \in X^1$ we have $K(x_1 : \ldots : x_1) = L(x_1) = L(x_1, \ldots, x_1)$. So we have that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $L \in L^{n+1}(X;Y)$. Take $x \in X$ and define

$$L_x : X^n \to Y \text{ by } L_x(x_1, \ldots, x_n) = L(x, x_1, \ldots, x_n)$$

If $i \in \{1, \ldots, n\}$ and $\left(x_1, \ldots \underbrace{r + \alpha \cdot t}_{i} \ldots, x_n\right) \in X^n$ then

$$\begin{aligned}
L_x\left(x_1, \ldots \underbrace{r + \alpha \cdot t}_{i} \ldots, x_n\right) &= \\
L\left(x, x_1, \ldots \underbrace{r + \alpha \cdot t}_{i+1} \ldots, x_n\right) &= \text{[lemma: 16.86]} \\
L\left(x, x_1, \ldots \underbrace{r}_{i+1} \ldots, x_n\right) + \alpha \cdot L\left(x, x_1, \ldots \underbrace{t}_{i+1} \ldots, x_n\right) &= \\
L_x\left(x_1, \ldots \underbrace{r}_{i} \ldots, x_n\right) + \alpha \cdot L_x\left(x_1, \ldots \underbrace{s}_{i} \ldots, x_n\right) &
\end{aligned}$$

proving that

$$L_x \in \text{Hom}^n(X;Y) \tag{16.48}$$

Let $(x_1, \ldots, x_n) \in X^n$ then for $(y_1, \ldots, y_{n+1})$ defined by $y_i = \begin{cases} x \text{ if } i = 1 \\ x_{i-1} \text{ if } i \in \{2, \ldots, n+1\} \end{cases}$

$$\begin{aligned}
\|L_x(x_1, \ldots, x_n)\|_Y &= L(x, x_1, \ldots, x_n) \\
&= L(y_1, \ldots, y_{n+1}) \\
&\leqslant_{L \in L^{n+1}(X;Y)} \|L\|_{L^{n+1}(X;Y)} \cdot \prod_{i=1}^{n+1} \|y_i\|_X \\
&= \|L\|_{L^{n+1}(X;Y)} \cdot \|y_1\|_X \cdot \prod_{i=2}^{n+1} \|y_i\|_X \\
&= \|L\|_{L^{n+1}(X;Y)} \cdot \|x\|_X \cdot \prod_{i=2}^{n+1} \|x_{i-1}\|_X \\
&= (\|x\|_X \cdot \|L\|_{L^{n+1}(X;Y)}) \cdot \prod_{i=1}^{n} \|x_i\|_X
\end{aligned}$$

proving by [theorem: 14.190] and [eq: 16.48] that L_x is continuous. Hence

$$L_x \in L^n(X;Y) \tag{16.49}$$

As $n \in S$ there exist a $K_x \in L_n(X;Y)$ such that $\forall (x_1,\ldots,x_n) \in X^n$ we have

$$K_x(x_1:\ldots:x_n) = L_x(x_1,\ldots,x_n) = L(x,x_1,\ldots,x_n) \tag{16.50}$$

This allows us to define

$$K: X \to L_n(X;Y) \text{ where } K(x) = K_x$$

then by [eq: 16.50] we have that for $(x_1,\ldots,x_{n+1}) \in X^{n+1}$

$$K(x_1)(x_2:\ldots:x_{n+1}) = K_{x_1}(x_2:\ldots:x_1) = L(x_1,\ldots,x_{n+1}) \tag{16.51}$$

If $x,y \in X$ and $\alpha \in \mathbb{K}$ then we have $\forall (x_1,\ldots,x_n) \in X^n$ that

$$\begin{aligned}
K(x+\alpha\cdot y)(x_1:\ldots:x_n) &\underset{\text{[eq: 16.51]}}{=} L(x+\alpha\cdot y,x_1,\ldots,x_n) \\
&\underset{L\in L^{n+1}(X;Y)}{=} L(x,x_1,\ldots,x_n)+\alpha\cdot L(y,x_1,\ldots,x_n) \\
&\underset{\text{[eq: 16.51]}}{=} K(x)(x_1:\ldots:x_n)+\alpha\cdot K(y)(x_1:\ldots:x_n) \\
&\underset{\text{[lemma: 16.85]}}{=} (K(x)+\alpha\cdot K(y))(x_1:\ldots:x_n)
\end{aligned}$$

which by [lemma: 16.88] proves that

$$K(x+\alpha\cdot y) = K(x)+\alpha\cdot K(y)$$

Hence we have that

$$K \in \mathrm{Hom}(X, L_n(X;Y)) \tag{16.52}$$

Let $x \in X$ then we have for $(y_1,\ldots,y_n) \in X^n$ that

$$\begin{aligned}
\|K(x)(y_1:\ldots:y_n)\|_Y &= \|K_x(y_1:\ldots:y_n)\|_Y \\
&\underset{\text{[eq: 16.51]}}{=} \|L(x,y_1,\ldots,y_n)\|_Y \\
&\leqslant_{L\in L^n(X;Y)} \|L\|_{L^{n+1}(X;Y)}\cdot\|x\|_X\cdot\prod_{i=1}^n \|y_i\|_X \\
&= (\|L\|_{L^{n+1}(X;Y)}\cdot\|x\|_X)\cdot\prod_{i=1}^n \|y_i\|_X
\end{aligned}$$

which as $K(x) \in L_n(X;Y)$ proves using [lemma: 16.89] that

$$\|K(x)\|_{L_n(X;Y)} \leqslant \|L\|_{L^{n+1}(X;Y)}\cdot\|x\|_X$$

Hence using [eq: 16.52] together with [theorem: 14.177] proves that K is continuous or

$$K \in L(X, L_n(X;Y)) = L_{n+1}(X;Y)$$

further

$$K(x_1:\ldots:x_{n+1}) = K(x_1)(x_2:\ldots:x_{n+1}) \underset{\text{[eq: 16.51]}}{=} L(x_1,\ldots,x_{n+1})$$

The above proves that

$$n+1 \in S$$

□

We are now ready to define the identification mapping between $L_n(X;Y)$ and $L^n(X;Y)$.

Theorem 16.91. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ normed spaces, then*

$$\mathcal{I}_{n,X,Y}: L_n(X;Y) \to L^n(X;Y) \textit{ where } \mathcal{I}_{n,X,Y}(L): X^n \to Y \textit{ is defined by}$$

$$(\mathcal{I}_{n,X,Y}(L))(x_1,\ldots,x_n) = L(x_1:\ldots:x_n)$$

is a linear isometric isomorphism. In other words

1. *$\forall L \in L_n(X;Y)$ $\mathcal{I}_{n,X,Y}(L) \in L^n(X;Y)$ so that $\mathcal{I}_{n,X,Y}: L_n(X;Y) \to L^n(X;Y)$ is a function*
2. *$\mathcal{I}_{n,X,Y}: L_n(X;Y) \to L^n(X;Y)$ is a bijection.*

3. $\forall L_1, L_2 \in L_n(X;Y)$ *and* $\alpha \in \mathbb{K}$ *we have* $\mathcal{I}_{n,X,Y}(L_1 + \alpha \cdot L_2) = \mathcal{I}_{n,X,Y}(L_1) + \alpha \cdot \mathcal{I}_{n,X,Y}(L_2)$
4. $\forall L \in L_n(X:Y)$ *we have* $\|L\|_{L_n(X;Y)} = \|\mathcal{I}_{n,X,Y}(L)\|_{L^n(X;Y)}$

***Note* 16.92.** *If* $n=1$ *then as* $\forall (x_1) \in X^1$ *we have* $\mathcal{I}_{1,X,Y}(L)(x_1) = L(x_1 : \ldots : x_1) = L(x_1)$ *and* $L^1(X;Y) = L(X,Y) = L_1(X;Y)$ *it follows that*

$$\mathcal{I}_{1,X,Y} = \mathrm{Id}_{L(X,Y)}$$

***Note* 16.93.** *If* $K \in L^n(X;Y)$ *then we have* $K = \mathcal{I}_{n,X,Y}((\mathcal{I}_{n,X,Y})^{-1}(K))$ *so that for* $x \in X^n$ *we have*

$$K(x_1, \ldots, x_n) = \mathcal{I}_{n,X,Y}((\mathcal{I}_{n,X,Y})^{-1}(K))(x_1, \ldots, x_n) = (\mathcal{I}_{n,X,Y})^{-1}(K)(x_1 : \ldots : x_n)$$

proving that

$$\forall x \in X^n \ (\mathcal{I}_{n,X,Y})^{-1}(K)(x_1 : \ldots : x_n) = K(x_1, \ldots, x_n)$$

Proof. We have

1. Let $L \in L_n(X;Y)$ then for $i \in \{1, \ldots, n\}$ and $\left(x_1, \ldots \underbrace{r + \alpha \cdot t}_{i} \ldots, x_n\right) \in X^n$ we have

$$\begin{aligned}
\mathcal{I}_{n,X,Y}(L)\left(x_1, \ldots \underbrace{r + \alpha \cdot t}_{i} \ldots, x_n\right) &= \\
L\left(x_1 : \ldots \underbrace{r + \alpha \cdot t}_{i} \ldots : x_n\right) &= \text{[lemma: 16.86]} \\
L\left(x_1 : \ldots \underbrace{r}_{i} \ldots : x_n\right) + \alpha \cdot L\left(x_1 : \ldots \underbrace{t}_{i} \ldots : x_n\right) &= \\
\mathcal{I}_{n,X,Y}(L)\left(x_1, \ldots \underbrace{r}_{i} \ldots, x_n\right) + \alpha \cdot \mathcal{I}_{n,X,Y}(L)\left(x_1, \ldots \underbrace{s}_{i} \ldots, x_n\right)
\end{aligned}$$

proving that

$$\mathcal{I}_{n,X,Y}(L) \in \mathrm{Hom}^n(X;Y) \text{ [see definition: 11.257]} \tag{16.53}$$

Further if $(x_1, \ldots, x_n) \in X^n$ then we have:

$$\begin{aligned}
\|\mathcal{I}_{n,X,Y}(L)(x_1, \ldots, x_n)\|_Y &= \|L(x_1 : \ldots : x_n)\|_Y \\
&\leqslant_{\text{[lemma: 16.87]}} \|L\|_{L_n(X;Y)} \cdot \prod_{i=1}^{n} \|x_i\|
\end{aligned}$$

Using then [theorems: 14.190 and 14.196] it follows that

$$\mathcal{I}_{n,X,Y}(L) : X^n \to Y \text{ is continuous and } \|\mathcal{I}_{n,X,Y}(L)\|_{L^n(X;Y)} \leqslant \|L\|_{L_n(X;Y)} \tag{16.54}$$

Combining the above with [eq: 16.53] proves that

$$\mathcal{I}_{n,X,Y}(L) \in L^n(X;Y)$$

so that

$$\mathcal{I}_{n,X,Y} : L_n(X;Y) \to L^n(X;Y) \text{ is a well defined function}$$

2. To prove bijectivity we have to prove:

   injectivity. Let $L_1, L_2 \in L_n(X;Y)$be such that $\mathcal{I}_{n,X,Y}(L_1) = \mathcal{I}_{n,X,Y}(L_2)$. Then $\forall (x_1, \ldots, x_n) \in X^n$ we have

$$L_1(x_1 : \ldots : x_n) = \mathcal{I}_{n,X,Y}(L_1)(x_1, \ldots, x_n) = \mathcal{I}_{n,X,Y}(L_2)(x_1, \ldots, x_n) = L_2(x_1 : \ldots : x_n)$$

   Using [lemma: 16.88] it follows that $L_1 = L_2$ proving injectivity.

   surjectivity. Let $L \in L^n(X;Y)$ then using [lemma: 16.90] there exist a $K \in L_n(X;Y)$ such that $\forall (x_1, \ldots, x_n) \in X^n$ we have $K(x_1 : \ldots : x_n) = L(x_1, \ldots, x_n)$. Hence

$$\mathcal{I}_{n,X,Y}(K)(x_1, \ldots, x_n) = K(x_1 : \ldots : x_n) = L(x_1, \ldots, x_n)$$

   proving that $\mathcal{I}_{n,X,Y}(K) = L$ and thus surjectivity.

3. Let $L_1, L_2 \in L_n(X;Y)$ and $\alpha \in \mathbb{K}$ then $\forall (x_1,\dots,x_n) \in X^n$ we have

$$\begin{aligned}
\mathcal{I}_{n,X,Y}(L_1+\alpha\cdot L_2)(x_1,\dots,x_n) &= \\
(L_1+\alpha\cdot L_2)(x_1:\dots:x_n) &\underset{\text{[lemma: 16.85]}}{=} \\
L_1(x_1:\dots:x_n)+\alpha\cdot L_2(x_1:\dots:x_n) &= \\
\mathcal{I}_{n,X,Y}(L_1)(x_1,\dots,x_n)+\alpha\cdot\mathcal{I}_{n,X,Y}(L_2)(x_1,\dots,x_n) &= \\
(\mathcal{I}_{n,X,Y}(L_1)+\alpha\cdot\mathcal{I}_{n,X,Y}(L_2))(x_1,\dots,x_n) &=
\end{aligned}$$

proving that

$$\mathcal{I}_{n,X,Y}(L_1+\alpha\cdot L_2)=\mathcal{I}_{n,X,Y}(L_1)+\alpha\cdot\mathcal{I}_{n,X,Y}(L_2)$$

4. Let $L \in L_n(X;Y)$ then by [eq: 16.54] we have that

$$\|\mathcal{I}_{n,X,Y}(L)\|_{L^n(X;Y)} \leqslant \|L\|_{L_n(X;Y)} \tag{16.55}$$

For the opposite inequality, let $(x_1,\dots,x_n) \in X^n$ then

$$\|L(x_1:\dots:x_n)\|_Y = \|\mathcal{I}_{n,X,Y}(L)(x_1,\dots,x_n)\|_Y \leqslant \|\mathcal{I}_{n,X,Y}(L)\|_{L^n(X;Y)}\cdot\prod_{i\in 1}^{n}\|x_i\|_X$$

so that by [lemma: 16.89] it follows that

$$\|L\|_{L_n(X;Y)} \leqslant \|\mathcal{I}_{n,X,Y}(L)\|_{L^n(X;Y)}$$

which combined with [eq: 16.55] proves that

$$\|L\|_{L_n(X;Y)} = \|\mathcal{I}_{n,X,Y}(L)\|_{L^n(X;Y)}$$

□

16.2.2 Higher order Fréchet differentiation

16.2.2.1 Definition of higher order differentials

We are now ready to define higher order Fréchet differentiation and higher order derivation.

Definition 16.94. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X\rangle$ and $\langle Y, \|\|_Y\rangle$ be normed spaces, U a open set in X, $x \in U$ and $f: U \to Y$ a function then f is n-times Fréchet differentiable at x with differential $D_x^{[n]}f(x) \in L_n(X;Y)$ if we have for n*

$n=1$. *then f must be Fréchet differentiable at x and $D^{[1]}f$ is defined by*

$$D_x^{[1]}f = D_x f \in L(X,Y) = L_1(X;Y)$$

$1<n$. *then there must exist a open set V in X with $x \in V \subseteq U$ such that $\forall y \in V$ f is $(n-1)$-times differentiable at y and the function*

$$D^{[n-1]}f: V \to L_{n-1}(X;Y) \text{ defined by } D^{[n-1]}f(y) = D_y^{[n-1]}f$$

is Fréchet differentiable at x and $D_x^{[n]}f$ is defined by

$$D_x^{[n]}f = D_x(D^{[n-1]}f) \in L(X, L_{n-1}(X;Y)) = L_n(X;Y)$$

***Note* 16.95.** *In the case $1<n$ we must ensure that $D_x(D^{[n-1]})$ does not depended on the choice of V otherwise this is not a valid definition. This is ensured by the locality of differentials [see corollary: 16.25].*

Just as the Fréchet differentiation is local [see theorem: 16.24] higher order Fréchet differentiation is local.

Theorem 16.96. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X\rangle$ and $\langle Y, \|\|_Y\rangle$ be normed spaces, U a open set in X, $x \in U$, V a open set with $x \in V \subseteq U$ and $f: U \to Y$ a function then we have*

$$f \text{ is } n\text{-times differentiable at } x$$

$$\Updownarrow$$

$$f_{|V} \text{ is } n\text{-times differentiable at } x$$

Further if f or $f_{|V}$ is n-times differentiable at x then $D_x^{[n]}f_{|V} = D_x^{[n]}f$.

Proof.

$\Rightarrow$. We prove this by induction so let

$S=\{n\in\mathbb{N}|\text{If } f \text{ is } n\text{-times differentiable at } x\in U \text{ then for every open } V \text{ with } x\in V\subseteq U \text{ we have that } f_{|V} \text{ is } n\text{-times differentiable at } x \text{ and } D_x^{[n]}f_{|V}=D_x^{[n]}f\}$

then we have:

$1\in S$. If f is 1-times differentiable at $x\in U$ and V a open set with $x\in V\subseteq U$ then by definition f is Fréchet differentiable at x and $D_x^{[1]}f=D_xf$. Using [theorem: 16.24] $f_{|V}$ is Fréchet differentiable at x and $D_xf_{|V}=D_xf$. Hence $f_{|V}$ is 1-times differentiable at x and $D_x^{[1]}f_{|V}=D_xf_{|V}=D_xf=D_x^1f$. From this it follows that $1\in S$.

$n\in S\Rightarrow n+1\in S$. If f is $(n+1)$-times differentiable at x and V is a open set with $x\in V\subseteq U$. Then there exist a open set W with $x\in W\subseteq U$ such that $\forall y\in W$ we have that f is n-times differentiable at y and the function

$$D^{[n]}f\colon W\to L_n(X;Y) \text{ defined by } D^{[n]}f(y)=D_y^{[n]}f \tag{16.56}$$

is Fréchet differentiable at x and

$$D_x^{[n+1]}f=D_x(D^{[n]}f) \tag{16.57}$$

Take $V'=W\bigcap V$ then V' is open, $x\in V'\subseteq V\subseteq U$ and $\forall y\in V'$ we have, as $y\in W$, that f is n-times differentiable at y. As $n\in S$ it follows that $f_{|V}$ is n-times differentiable at y with

$$D_y^{[n]}f_{|V}=D_y^{[n]}f \tag{16.58}$$

So we can define the function

$$D^{[n]}f_{|V}\colon V'\to L_n(X;Y) \text{ where } D^{[n]}f_{|V}(y)=D_y^{[n]}f_{|V} \tag{16.59}$$

which, as $\forall y\in V'$ we have $D^{[n]}f_{|V}(y)=D_y^{[n]}f_{|V}\underset{\text{[eq: 16.58]}}{=}D_y^{[n]}f=D^{[n]}f(y)$, proves that

$$D^{[n]}f_{|V}=(D^{[n]}f)_{|V'} \tag{16.60}$$

As $D^{[n]}f$ is Fréchet differentiable at x it follows from [theorem: 16.24] that $(D^{[n]}f)_{|V'}$ is Fréchet differentiable at x and

$$D_x((D^{[n]}f)_{|V'})\underset{\text{[theorem: 16.24]}}{=}D_x(D^{[n]}f)\underset{\text{[eq: 16.57]}}{=}D_x^{[n+1]}f \tag{16.61}$$

So, as $D^{[n]}f_{|V}\underset{\text{[eq: 16.60]}}{=}(D^{[n]}f)_{|V'}$, it follows that $D^{[n]}f_{|V}$ is Fréchet differentiable at x and

$$D_x(D^{[n]}f_{|V})=D_x(D^{[n]}f)_{|V'}\underset{\text{[eq: 16.61]}}{=}D_x^{[n+1]}f$$

Hence by definition we have that

$$f_{|V} \text{ is } (n+1)\text{-times differentiable at } x \text{ with } D_x^{[n+1]}f_{|V}=D_x^{[n+1]}f$$

proving that

$$n+1\in S$$

$\Leftarrow$. We prove this by induction on n, so let

$S=\{n\in\mathbb{N}|\text{If } f\colon U\to Y \text{ is a function and there exist a open } V \text{ with } x\in V\subseteq U \text{ such that } f_{|V}\colon V\to Y \text{ is } n\text{-times differentiable at } x \text{ then } f\colon U\to Y \text{ is } n\text{-times differentiable at } x \text{ and } D_x^{[n]}f=D_x^{[n]}f_{|V}\}$

then we have:

$1\in S$. If $f_{|V}$ is 1-times differentiable at $x\in V\subseteq U$ then by definition $f_{|V}$ is Fréchet differentiable at x and $D_x^{[1]}f_{|V}=D_x f_{|V}$. Using [theorem: 16.24] it follows that f is Fréchet differentiable at x and $D_xf=D_xf_{|V}$. Hence f is 1-times differentiable at x and $D_x^{[1]}f(x)=D_x^{[1]}f_{|V}$. This proves that $1\in S$.

$n\in S\Rightarrow n+1\in S$. If V is a open set with $x\in V\subseteq U$ such that $f_{|V}\colon V\to Y$ is $[n+1]$-times differentiable at x then there exist a open set W with $x\in W\subseteq V$ such that $\forall y\in W\subseteq V$ $f_{|V}$ is n-times differentiable at x and the function

$$D^{[n]}f_{|V}\colon W\to L_n(X;Y) \text{ defined by } D^{[n]}f_{|V}(x)=D_x^{[n]}f_{|V}$$

is Fréchet differentiable at x and

$$D_x^{[n+1]}f_{|V} = D_x(D^{[n]}f_{|V}) \tag{16.62}$$

As $n \in S$ we have $\forall y \in W$ that f is n-times differentiable at y and that

$$D_y^{[n]}f = D_y^{[n]}f_{|V} \tag{16.63}$$

Hence for the function defined by

$$D^{[n]}f: W \to L_n(X;Y) \text{ where } D^{[n]}f(y) = D_y^{[n]}f$$

we have $\forall y \in Y\, D^{[n]}f(y) = D_y^{[n]}f \underset{\text{[eq: 16.63]}}{=} D_y^{[n]}f_{|V} = D^{[n]}f_{|V}(y)$ proving that

$$D^{[n]}f = D^{[n]}f_{|V}.$$

Hence $D^n f$ is Fréchet differentiable at x and

$$D_x^{[n+1]}f \underset{\text{def}}{=} D_x(D^{[n]}f) = D_x(D^{[n]}f_{|V}) \underset{\text{[eq: 16.62]}}{=} D_x^{[n+1]}f_{|V}$$

proving

$$n+1 \in S$$

□

Definition 16.97. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X\rangle, \langle Y, \|\|_Y\rangle$ be normed spaces, U a open set in X, $A \subseteq U$ then a function $f: U \to X$ is* ***n-times differentiable on A*** *if $\forall x \in A$ we have that f is n-times differentiable at x.*

***Note* 16.98.** *Clearly if $B \subseteq A$ then f is n-times differentiable on B*

Theorem 16.99. *Let $n \in \mathbb{N}\setminus\{1\}$, $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces, U, V open sets in X such that $V \subseteq U$ then we have for $f: U \to Y$ that*

f is n-times differentiable on V

$$\Updownarrow$$

f is $(n-1)$-times differentiable on V and the function
$D^{[n-1]}f: V \to L_{n-1}(X;Y)$ defined by $D^{[n-1]}f(x) = D_x^{[n-1]}f$
is Fréchet differentiable on V

Further if f is n-times differentiable on V then $\forall x \in V$ we have that $D_x^{[n]}f = D_x(D^{[n-1]}f)$. So if we define

$$D_y^{[n]}f: V \to L_n(X;Y) \text{ by } D^{[n]}f(x) = D_x^{[n]}f$$

$$D(D^{[n-1]}f): V \to L_n(X;Y) \text{ by } D(D^{n-1}f)(x) = D_x(D^{[n-1]}f)$$

then

$$D^{[n]}f = D(D^{[n-1]}f)$$

Proof.

⇒. Let $x \in V$ then as $1 < n$ we have that there exist a open U_x with $x \in U_x \subseteq U$ such that $\forall y \in U_x$ f is n-times differentiable at y and the function

$$D_{U_x}^{[n-1]}f: U_x \to L_{n-1}(X;Y) \text{ where } D_{U_x}^{[n-1]}f(y) = D_y^{[n-1]}f \tag{16.64}$$

is Fréchet differentiable at x with

$$D_x\big(D_{U_x}^{[n-1]}f\big) = D_x^{[n]}f \tag{16.65}$$

As $x \in U_x$ we have also that f is $(n-1)$-times differentiable at x proving that

$$f \text{ is } (n-1)\text{-times differentiable on } V$$

and we can define the function

$$D^{[n-1]}f: V \to L_{n-1}(X;Y) \text{ where } D^{[n-1]}f(x) = D_x^{[n-1]}f \tag{16.66}$$

Given $x \in V$ let $V_x = U_x \bigcap V$ then as $D_{U_x}^{[n-1]}f$ is Fréchet differentiable at $x \in V_x$ it follows from [theorem: 16.24] that $\big(D_{U_x}^{[n-1]}f\big)_{|V_x}$ is Fréchet differentiable at x with

$$D_x\big(\big(D_{U_x}^{[n-1]}f\big)_{|V_x}\big) = D_x\big(D_{U_x}^{[n-1]}f\big) \underset{\text{[eq: 16.65]}}{=} D_x^{[n]}f \tag{16.67}$$

Further let $y \in V_x \subseteq U$ then

$$\left(D_{U_x}^{[n-1]} f\right)_{|V_x}(y) = D_{U_x}^{[n-1]} f(y) \underset{\text{[eq: 16.64]}}{=} D_y^{[n-1]} f \underset{y \in U \wedge \text{[eq: 16.66]}}{=} D^{[n-1]} f(y) \underset{y \in V_x}{=} (D^{[n-1]} f)_{|V_x}(y)$$

proving that

$$\left(D_{U_x}^{[n-1]} f\right)_{|V_x} = (D^{[n-1]} f)_{|V_x}$$

Hence we have by [eqs: 16.67] that $(D^{[n-1]} f)_{|V_x}$ is Fréchet differentiable at x with

$$D_x (D^{[n-1]} f)_{|V_x} = D_x^{[n]} f$$

Using [theorem: 16.24] again we have that

$$D^{[n-1]} f \text{ is Fréchet differentiable at } x \text{ with } D_x(D^{[n-1]} f) = D_x^{[n]} f$$

Hence as $x \in V$ was chosen arbitrary we have that

$$D^{[n-1]} f \text{ is Fréchet differentiable on } U \text{ with } \forall x \in V\, D_x(D^{[n-1]} f) = D_x^{[n]} f$$

$\Leftarrow$. Let $x \in V$ then $x \in V \subseteq V$ and by the hypothesis $\forall y \in V\, f$ is $(n-1)$-times differentiable on y and the function $D^{[n-1]} f : V \to L_{n-1}(X; Y)$ is differentiable at x with $D_x^{[n]} f = D_x(D^{n-1} f)$. Hence by definition f is n-times differentiable at x. As $x \in U$ was chosen arbitrary it follows that

$$f \text{ is } n\text{-times differentiable on } V$$ □

Definition 16.100. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces, U a open set in X then*

$$f : U \to Y \text{ is } \infty\text{-times differentiable at } x \in U \text{ if } \forall n \in \mathbb{N}\ f \text{ is } n\text{-times differentiable at } x$$

and

$$f : U \to Y \text{ is } \infty\text{-times differentiable on } U \text{ if } \forall n \in \mathbb{N}\ f \text{ is } n\text{-times differentiable on } U$$

16.2.2.2 Higher order differentials as multi-linear mappings

The problem with $D_x^{[n]} f$ is that it is a element of $L_n(X; Y)$ so that for example

$$D_x^{[3]} f \in L(X, L(X, L(X, Y)))$$

and we have to deal with expressions like $\left(\left(D_x^{[3]} f(h_1)\right)(h_2)\right)(h_3)$. Lucky we can use [theorem: 16.91] to turn $D^{[n]} f(x)$ in a a multilinear mapping.

Definition 16.101. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$ and $\langle Y, \|\|_Y \rangle$ be normed spaces, U a open set in X, $x \in U$ and $f : U \to Y$ a function that is n-times differentiable at x then*

$$D_x^n f = \mathcal{I}_{n,X,Y}\left(D_x^{[n]} f\right) \in L^n(X; Y)$$

Note 16.102. Using [theorem: 16.91] we have that $D_x^1 f = D_x^{[1]} f = D_x f$ and for $n \in \mathbb{N}$

$$D_x^n f(h_1, \ldots, h_n) = D_x^{[n]} f[h_1 : \ldots : h_n].$$

We use in general $D_x^{[n]} f$ because the proofs are simpler, however if we have to calculate the n-the differential we can use $D_x^n f$.

16.2.2.3 Functions that are C^n at a point or C^n on a set

Definition 16.103. *Let $n \in \mathbb{N}_0$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ normed spaces, U a open set in X, $x \in U$ and $f : U \to Y$ a function then f is C^n at x if for n we have*

$n = 0$. *$f : U \to Y$ is continuous at x.*

$n \in \mathbb{N}$. *There exist a open set V with $x \in V \subseteq U$ such that f is n-times differentiable on V and the function*

$$D^{[n]} f : V \to L_n(X; Y) \text{ defined by } D^{[n]} f(y) = D_y^{[n]} f$$

is continuous at x

***Note* 16.104.** *As $x \in V$ it follows from the above that if f is C^n at x then f is n-times differentiable at x.*

Definition 16.105. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ normed spaces, U a open set in X, $x \in U$ and $f: U \to Y$ a function then f is C^∞ at x if $\forall n \in \mathbb{N}_0$ f is C^n at x.*

Just as with n-times differentiability C^n is a local property.

Theorem 16.106. *Let $n \in \mathbb{N}_0$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ normed spaces, U, V open sets in X with $x \in V \subseteq \mathrm{UU}$, $f: U \to Y$ a function then*

$$f \text{ is } C^n \text{ at } x$$
$$\Updownarrow$$
$$f_{|V} \text{ is } C^n \text{ at } x$$

Proof.

$\Rightarrow$. For n we have either:

$n = 0$. Then by definition $f: U \to Y$ is continuous at x and using [theorem: 14.134] it follows that $f_{|V}: V \to Y$ is continuous at x.

$n \in \mathbb{N}$. Then there exist a open set W with $x \in W \subseteq U$ such that f is n-times differentiable on W and the function

$$D^{[n]} f: W \to L_n(X; Y) \text{ defined by } D^{[n]} f(y) = D_y^{[n]} f \tag{16.68}$$

is continuous at x. Take $Z = W \bigcap V$ a open set then $x \in Z \subseteq V$. Let $y \in Z \subseteq W$ then f is n-times differentiable at y, hence by [theorem: 16.96] $f_{|V}$ is n-times differentiable at y with

$$D_y^{[n]} f_{|V} = D_y^{[n]} f \tag{16.69}$$

So $f_{|V}$ is n-times differentiable on Z and for the function

$$D^{[n]} f_{|V}: Z \to L_n(X; Y) \text{ defined by } D^{[n]} f_{|V}(y) = D_y^{[n]} f_{|V} \tag{16.70}$$

we have $\forall y \in Z$ that $D^{[n]} f_{|V}(y) \underset{\text{[eq: 16.70]}}{=} D_y^{[n]} f_{|V} \underset{\text{[eq: 16.69]}}{=} D_y^{[n]} f \underset{\text{[eq: 16.68]}}{=} D^{[n]} f(y)$ so that $D^{[n]} f_{|V} = (D^n f)_{|Z}$. As $D^{[n]} f$ is continuous at x it follows from [theorem: 14.134] that $D^{[n]} f_{|V}$ is continuous are x. Hence using the definition of C^n it follows that $f_{|V}$ is C^n at x.

$\Leftarrow$. For n we have either:

$n = 0$. As $f_{|V}$ is C^0 at x $f_{|V}$ is continuous at x. As V is open it follows from [theorem: 14.135] that f is continuous at x hence f is C^0 at x.

$n \in \mathbb{N}$. As $f_{|V}$ is C^n at x there exist a open set W with $x \in W \subseteq V \subseteq U$ such that $f_{|V}$ is n-times differentiable on W and

$$D^{[n]} f_{|V}: W \to L(X, Y) \text{ defined by } D^{[n]} f_{|V}(y) = D_y^{[n]} f_{|V} \text{ is continuous at } x$$

Let $y \in W$ then $f_{|V}$ is n-times differentiable at y hence, using [theorem: 16.96] f is n-times differentiable at y and $D_y^{[n]} f_{|V} = D_y^{[n]} f$. So for

$$D^{[n]} f: W \to L(X, Y) \text{ defined by } D^{[n]} f(y) = D_y^{[n]} f$$

we have that

$$D^{[n]} f = D^{[n]} f_{|V}$$

hence $D^{[n]} f$ is continuous at x, proving that f is C^n at x. □

Every ∞-times differentiable function is C^∞ as is proved in the following theorem.

Theorem 16.107. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces, U a open set in X, $x \in U$ and $f: U \to Y$ a function then*

$$f \text{ is } \infty\text{-times differentiable at } x$$
$$\Updownarrow$$
$$f \text{ is } C^\infty \text{ at } x$$

Proof.

⇒. As f is 1-times differentiable at x it follows from [theorem: 16.31] that f is continuous at x proving that

$$f \text{ is } C^0 \text{ at } x$$

Let $n \in \mathbb{N}$ then as f is ∞-times differentiable at x f is $(n+1)$-differentiable at x. Hence there exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ f is n-times differentiable at y [hence f is n-times differentiable on V] and

$$D^{[n]}f: V \to L_n(X;Y) \text{ defined by } D^{[n]}f(y) = D_y^{[n]}f$$

is Fréchet differentiable at x. Using [theorem: 16.31] it follows that $D^{[n]}f$ is continuous at x. Hence we have by definition that

$$f \text{ is } C^n \text{ at } x$$

So $\forall n \in \mathbb{N}_0$ we have that f is C^n at x proving that f is C^∞ at x.

⇐. Let $n \in \mathbb{N}$ then as f is C^∞ at x f is C^n at x. Hence by definition there exist a open set V with $V \subseteq U$ such that $\forall y \in V$ f is n-times differentiable at y. As $x \in V$ it follows that f is n-times differentiable at x. As $n \in \mathbb{N}$ was chosen arbitrary it follows that f is ∞-times differentiable at x. □

Definition 16.108. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces, $n \in \mathbb{N}_0 \bigcup \{\infty\}$, U a open set in X, $A \subseteq U$ then* ***f is C^n on A*** *if $\forall y \in A$ f is C^n at y.*

Theorem 16.109. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces, $n \in \mathbb{N}$, U, V open sets in X such that $V \subseteq U$ and $f: U \to Y$ a function then*

$$f \text{ is } C^n \text{ on } V$$
$$\Updownarrow$$
$$f \text{ is } n\text{-times differentiable on } V \text{ and } D^{[n]}f: V \to L_n(X;Y) \text{ where } D^{[n]}f(x) = D_x^{[n]}f \text{ is continuous}$$

Proof.

⇒. Let $x \in V$ then, as f is C^n on V f is C^n at x. Hence there exist a open set set W_x with $x \in W_x \subseteq U$ such that f is n-times differentiable on W_x and

$$D_{W_x}^{[n]}f: W_x \to L_n(X;Y) \text{ defined by } D_{W_x}^{[n]}f(y) = D_y^{[n]}f \text{ is continuous at } x \tag{16.71}$$

As $\forall x \in V$ $\exists W_x$ open with $x \in W_x \subseteq U$ and f is n-times differentiable on W_x it follows that f is n-times differentiable at x, hence

$$f \text{ is } n\text{-times differentiable on } V$$

and we can define

$$D^{[n]}f: V \to L_n(X;Y) \text{ defined by } D^{[n]}f(y) = D_y^{[n]}f \tag{16.72}$$

Let $x \in V$ then for $V_x = W_x \bigcap V$ we have using [theorem: 14.134]] that

$$\left(D_{W_x}^{[n]}f\right)_{|V_x} \text{ is continuous at } x$$

Further as $\forall y \in W_x$ $\left(D_{W_x}^{[n]}\right)_{|V_x}(y) = D_{W_x}^{[n]}f(y) \underset{\text{[eq: 16.71]}}{=} D_y^{[n]}f \underset{\text{[eq: 16.72]}}{=} D^{[n]}f(y) = (D^{[n]}f)_{|V_x}(y)$ it follows that

$$\left(D_{W_x}^{[n]}\right)_{|V_x} = (D^{[n]}f)_{|V_x}$$

so that

$$(D^{[n]}f)_{|V_x} \text{ is continuous at } x$$

As V_x is open [because W_x, V are open] it follows from [theorem: 14.135] that $D^{[n]}f$ is continuous at x. As $x \in V$ was chosen arbitrary if follows that

$$D^{[n]}f \text{ is a continuous function}$$

⇐. Let $x \in V$ then by the hypothesis V is n-times differentiable on V and

$$D^{[n]}f: V \to L_n(X;Y) \text{ defined by } D^{[n]}f(y) = D_y^{[n]}f \text{ is continuous}$$

hence $D^{[n]}f$ is continuous at x. So by definition f is C^n at x. As $x \in V$ was chosen arbitrary it follows that

$$D^{[n]}f \text{ is continuous on } V$$ □

Next we examine the relation between function that are C^1 at a point and derivatives at a point, first we need a little lemma.

Lemma 16.110. *Let $\langle \mathbb{K}, \|\rangle$ be the normed space of the real (complex) numbers, $\langle X, \|\|\rangle$ a normed space over $\mathbb{K}$, U a open set in $\mathbb{K}$, $x \in U$ and*

$$f: U \to L(\mathbb{K}, X) \text{ a function}$$

then if we define

$$f(*)(1): U \to X \text{ by } (f(*)(1))(y) = f(y)(1)$$

then we have

$$f \text{ is continuous at } x \Leftrightarrow f(*)(1) \text{ is continuous at } x$$

Proof.

⇒. Let $x \in U$ and $\varepsilon \in \mathbb{R}^+$. As f is continuous at x there exist a $\delta \in \mathbb{R}^+$ such that if $y \in U$ with $|y - x| < \delta$ then we have $\|f(y) - f(x)\|_{L(\mathbb{K},X)} < \varepsilon$. Then we have

$$\begin{aligned} \|(f(*)(1))(y) - (f(\star)(1))(x)\| &= \|f(y)(1) - f(x)(1)\| \\ &= \|(f(x) - f(y))(1)\| \\ &\leqslant \|f(x) - f(y)\|_{L(\mathbb{K},X)} \cdot |1| \\ &= \|f(x) - f(y)\|_{L(\mathbb{K},X)} \\ &< \varepsilon \end{aligned}$$

proving continuity of $f(*)(1)$ at x.

⇐. Let $x \in U$ and $\varepsilon \in \mathbb{R}^+$ then $f(*)(1)$ is continuous at x by the hypothesis Hence there exist a $\delta \in \mathbb{R}^+$ such that for $y \in U$ with $|y - x| < \delta$ we have

$$\|(f(*)(1))(y) - (f(\star)(1))(x)\| < \varepsilon$$

then we have for $r \in \mathbb{K}$ that

$$\begin{aligned} \|(f(y) - f(x))(r)\| &= \|(f(y) - f(x))(r \cdot 1)\| \\ &= \|r \cdot (f(y) - f(x))(1)\| \\ &= |r| \cdot \|(f(y) - f(x))(1)\| \\ &= |r| \cdot \|f(y)(1) - f(x)(1)\| \\ &= |r| \cdot \|(f(*)(1))(y) - (f(*)(1))(x)\| \\ &< \varepsilon \cdot |r| \end{aligned}$$

so that by [theorem: 14.184] we have $\|f(y) - f(x)\|_{L(\mathbb{K},X)|} < \varepsilon$, hence f is continuous at x. □

Theorem 16.111. *Let $\langle \mathbb{K}, \|\rangle$ be the normed space of the real (complex) numbers, $\langle X, \|\|\rangle$ a normed space, U a open set in $\mathbb{K}$, $x \in U$ and $f: U \to X$ a function then the following are equivalent:*

1. *f is C^1 at x*
2. *There exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ f has a derivative f'_y and*

$$f': V \to X \text{ defined by } f'(y) = f'_y$$

is continuous at x. Further $f' = (D^{[1]}f)(\star)(1)$ where

$$D^{[1]}f: V \to L(\mathbb{K}, X) \text{ is defined by } D^{[1]}f(x) = D^{[1]}_x f = D_x f$$

Proof.

1 ⇒ 2. As f is C^1 at x there exist a open set V such that f is 1-times differentiable on V [hence Fréchet differentiable on V] and the function

$$D^{[1]}f: V \to L_1(\mathbb{K}; Y) = L(\mathbb{K}, Y) \text{ defined by } D^{[1]}f(y) = D^{[1]}_y f \underset{\text{def}}{=} D_y f \text{ is continuous at } x$$

Let $y \in V$ then by [theorem: 16.32] it follows that f has a derivative at x with $f'_y = D_y f(1)$, hence we can define

$$f' : V \to Y \text{ by } f'(y) = f'_y$$

Further if $y \in V$ then

$$((D^{[1]}f)(\star)(1))(y) = ((D^{[1]}f)(y))(1) = D^{[1]}_y f(1) = f'_y = f'(y)$$

which proves that

$$(D^{[1]}f)(*)(1) = f'$$

As $D^{[1]}f$ is continuous at x it follows from [lemma: 16.110] that $(D^{[1]}f)(*)(1)$ is continuous at x or using the above that f' is continuous at x.

2 ⇒ 1. By the hypothesis there exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ f has a derivative f'_y and the function

$$f' : V \to Y \text{ defined by } f'(y) = f'_y \text{ is continuous at } x$$

Let $y \in V$ then using [theorem: 16.32] it follows that f is Fréchet differentiable at y [hence 1-times differentiable at y] and $D^{[1]}_y f(1) = D_y f(1) = f'_y$. Hence we can define the function

$$D^{[1]}_y f : V \to L(\mathbb{K}, Y) = L_1(\mathbb{K}; Y) \text{ by } D^{[1]}f(y) = D^{[1]}_y f$$

Let $y \in V$ then $((D^{[1]}f)(\star)(1))(y) = ((D^{[1]}f)(y))(1) = D^{[1]}_y f(1) = f'_y = f'(y)$ so that

$$(D^{[1]}f)(*)(1) = f'$$

As f' is continuous at x it follows that $(D^{[1]}f)(*)(1)$ is continuous at x and using [lemma: 16.110] that

$$D^{[1]}f \text{ is continuous at } x$$

□

We have the following extension of the above theorem about sets that are C^1 on a set.

Theorem 16.112. *Let $\langle \mathbb{K}, \|\rangle$ be the normed space of the real (complex) numbers, $\langle X, \|\|\rangle$ a normed space, U, V open sets in $\mathbb{K}$ with $V \subseteq U$ and $f : U \to X$ a function then we have*

$$f \text{ is } C^1 \text{ on } V$$
$$\Updownarrow$$
$$\forall x \in V \; f'_y \text{ exists and } f' : V \to X \text{ defined by } f'(x) = f'_x \text{ is a continuous function}$$

Proof.

⇒. Using [theorem: 16.109] it follows that f is 1-times differentiable on V and the function defined by

$$D^{[1]}f : V \to L_1(\mathbb{K}; X) = L(\mathbb{K}, X) \text{ where } D^{[1]}f(x) = D^{[1]}_x f \text{ is continuous}$$

Hence if $x \in V$ then f is 1-times differentiable at x [hence Fréchet differentiable at x] so that by [theorem: 16.32] f'_x exists and $f'_x = D_x f(1)$. So we can define the function

$$f' : V \to X \text{ by } f'(x) = f'_x$$

If $x \in V$ then $((D^{[1]}f)(\star)(1))(x) = ((D^{[1]}f)(x))(1) = D^{[1]}_x f(1) = f'_x = f'(x)$ so that

$$f' = (D^{[1]}f)(\star)$$

As $D^{[1]}f$ is a continuous function hence continuous at every $x \in V$ it follows from [lemma: 16.110] f' is continuous at every $x \in V$ which proves that

$$f' \text{ is continuous}$$

⇐. By the hypothesis we have that $\forall x \in V$ that f'_x exists and that the function defined by

$$f' : V \to X \text{ where } f'(x) = f'_x \text{ is a continuous function}$$

Let $x \in V$ then as f'_x exists it follows from [theorem: 16.32] that f is Fréchet differentiable at x, hence 1-times differentiable at x with $f'_x = D_x f = D_x^{[1]} f$. Hence we can define

$$D_x f: V \to L_1(\mathbb{K}; X) \text{ by } D^{[1]} f(x) = D_x^{[1]} f$$

Further given $x \in V$ we have

$$((D^{[1]} f)(\star)(1))(x) = ((D^{[1]} f)(x))(1) = D_x^{[1]} f(1) = f'_x = f'(x)$$

proving that

$$f' = (D^{[1]} f)(\star)$$

As f' is continuous $(D^{[1]} f)(\star)$ is continuous and using [lemma: 16.110] it follows that $D^{[1]} f$ is continuous at every $x \in V$. So $D^{[1]} f$: $V \to L_1(X; X)$ is a continuous function. Applying then [theorem: 16.109] proves that

$$f \text{ is } C^1 \text{ on } V$$

□

16.2.2.4 Higher order derivatives

Just as we have higher order differentiation we have also higher order derivatives.

Definition 16.113. *Let $n \in \mathbb{N}$, $\langle \mathbb{K}, \|\rangle$ be the normed space of real (complex) numbers based on the norm $||$, $\langle X, \|\|\rangle$ a normed space, U a open set in $\mathbb{K}$, $x \in U$ and $f: U \to X$ a function then f has a n-the derivative $f^{(n)} \in Y$ at x if for*

- ***$n = 1$.*** *f has a derivative at x and we define $f_x^{(1)}$ by $f_x^{(1)} = f'_x$*
- ***$1 < n$.*** *there exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ we have that f has a $(n-1)$-the derivative $f_y^{(n-1)}$ and the function*

$$f^{(n-1)}: V \to X \text{ defined by } f^{(n-1)}(y) = f_y^{(n-1)}$$

has a derivative at x. Then the n-the derivative $f_x^{(n)}$ at x is then defined to be

$$f_x^{(n)} = (f^{(n-1)})'_x$$

Let's examine now the relation between n-times differentiability and the existence of the n-the derivative. First we need a little lemma.

Lemma 16.114. *Let $n \in \mathbb{N}$, $\langle X, \|\|\rangle$ be a normed space, $\langle \mathbb{K}, \|\rangle$ the normed space of real (complex) numbers based on the canonical norm $||$ and $L \in L_n(\mathbb{K}; X)$ then*

$$\|L\|_{L_n(\mathbb{K};X)} \leqslant \left\| L\left(\underbrace{1:\ldots:1}_{n}\right) \right\|$$

Proof. As usually we prove this by induction on n, so define

$$S = \left\{ n \in \mathbb{N} | \text{If } L \in L_n(\mathbb{K}; X) \text{ then } \|L\|_{L_n(\mathbb{K};Y)} \leqslant \left\| L\left(\underbrace{1:\ldots:1}_{n}\right) \right\| \right\}$$

then we have:

- ***$1 \in S$.*** If $L \in L_1(\mathbb{K}; X) = L(\mathbb{K}, X)$ then if $x \in X^1$ satisfies $|x| = 1$ we have

$$\|L(x)\| = \|L(x \cdot 1)\| = \|x \cdot L(1)\| = |x| \cdot \|L(1)\| = \left\| L\left(\underbrace{1:\ldots:1}_{1}\right) \right\| \tag{16.73}$$

Further

$$\begin{aligned} \|L\|_{L_1(\mathbb{K};X)} &= \|L\|_{L(\mathbb{K},X)} \\ &\underset{\text{[theorem: 14.184]}}{=} \inf(\{M \in \mathbb{R}^+ | \forall x \in \mathbb{K} \text{ with } |x| = 1 \text{ we have } \|L(x)\| \leqslant M\}) \\ &\leqslant_{\text{[eq: 16.73]}} \left\| L\left(\underbrace{1:\ldots:1}_{1}\right) \right\| \end{aligned}$$

proving that $1 \in S$.

- ***$n \in S \Rightarrow n+1 \in S$.*** If $L \in L_{n+1}(\mathbb{K}; X) = L(\mathbb{K}, L_n(\mathbb{K}; X))$ then $L(1) \in L_n(\mathbb{K}; X)$. As $n \in S$ we have that

$$\|L(1)\|_{L_n(\mathbb{K};X)} \leqslant \left\| L(1)\left(\underbrace{1:\ldots:1}_{n}\right) \right\| = \left\| L\left(\underbrace{1:\ldots:1}_{n+1}\right) \right\| \tag{16.74}$$

If $x \in \mathbb{K}$ such that $|x| = 1$ then as $L \in L(\mathbb{K}, L_n(\mathbb{K}; X))$ we have $L(x) \in L_n(\mathbb{K}; X)$ so that

$$\begin{aligned} \|L(x)\|_{L_n(\mathbb{K};X)} &= \|L(x \cdot 1)\|_{L_n(\mathbb{K};X)} \\ &= \|x \cdot L(1)\|_{L_n(\mathbb{K};X)} \\ &= |x| \cdot \|L(1)\|_{L_n(\mathbb{K};X)} \\ &= \|L(1)\|_{L_n(\mathbb{K};X)} \\ &\leqslant_{[\text{eq: } 16.74]} \left\| L\left(\underbrace{1:\ldots:1}_{n+1}\right) \right\| \end{aligned} \tag{16.75}$$

Further we have

$$\begin{aligned} \|L\|_{L_{n+1}(\mathbb{K};X)} &= \\ \|L\|_{L(\mathbb{K}, L_n(\mathbb{K};X))} &\underset{[\text{theorem: } 14.184]}{=} \\ \inf(\{M \in \mathbb{R}^+ | \forall x \in \mathbb{K} \text{ with } |x| = 1 \text{ we have } \|L(x)\|_{L_n(\mathbb{K};X)} \leqslant M\}) &\leqslant_{[\text{eq: } 16.75} \\ \left\| L\left(\underbrace{1:\ldots:1}_{n+1}\right) \right\| \end{aligned}$$

Hence we have

$$n + 1 \in S$$

□

Theorem 16.115. *Let $n \in \mathbb{N}$, $\langle \mathbb{K}, \|\rangle$ be the normed space of real (complex) numbers based on the norm $||$, $\langle X, \|\|\rangle$ a normed space, U a open set in $\mathbb{K}$, $x \in U$ and $f: U \to X$ a function then*

$$f \text{ is } n\text{-times differentiable at } x$$

$$\Updownarrow$$

$$f \text{ has a } n\text{-the derivative at } x$$

Further if f is n-times differentiable at x or f has a n-the derivative at x then

$$f_x^{(n)} = D_x^{[n]} f\left(\underbrace{1:\ldots:1}_{n}\right) \underset{[\text{definition: } 16.101]}{=} D_x^n f\left(\underbrace{1, \ldots, 1}_{n}\right)$$

Proof.

⇒. We prove this by induction so define

$$S = \left\{ n \in \mathbb{N} | \text{If } f \text{ is } n\text{-times differentiable at } x \text{ then } f \text{ has a } n\text{-the derivative at } x \text{ and } f_x^{(n)} = D_x^{[n]} f\left(\underbrace{1:\ldots:1}_{n}\right) \right\}$$

then we have:

$n = 1$. If f is 1-times differentiable at x then by definition f is Fréchet differentiable at x and $D_x^{[1]} f = D_x f$. Using [theorem: 16.32], f has a derivative at x and

$$f'_x = D_x f(1) = D_x f\left(\underbrace{1:\ldots:1}_{1}\right) = D_x^{[1]} f\left(\underbrace{1:\ldots:1}_{n}\right)$$

Hence by definition f has a 1-the derivative at x with $f_x^{(1)} = f'_x = D_x^{[1]} f\left(\underbrace{1:\ldots:1}_{n}\right)$ proving that $1 \in S$.

$1 < n$. If f is $(n+1)$-times differentiable at x then there exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ f is n-times differentiable at x and the function

$$D^{[n]} f: V \to L_n(\mathbb{K}; X) \text{ defined by } D^{[n]} f(y) = D_y^{[n]} f$$

is Fréchet differentiable at x. Let $\varepsilon \in \mathbb{R}^+$ then by the Fréchet differentiability at x there exist a $\delta \in \mathbb{R}^+$ such that $\forall h \in V_x$ with $|h| < \delta$ we have

$$\|D^{[n]} f(x+h) - D^{[n]} f(x) - (D_x(D^{[n]} f))(h)\|_{L_n(X;Y)} \leqslant \frac{\varepsilon}{2} \cdot |h| < \varepsilon \cdot |h| \tag{16.76}$$

Further we have

$$D_x^{[n+1]} f = D_x(D^{[n]} f) \in L(\mathbb{K}, L_n(\mathbb{K}, X)) = L_{n+1}(\mathbb{K}; X) \tag{16.77}$$

As $n \in S$ we have, as $\forall y \in V$ is f n-times differentiable at y, that

$$f \text{ has a } n\text{-the derivative at } y \text{ with } f_y^{(n)} = D_y^{[n]} f\left(\underbrace{1:\ldots:1}_{n}\right) \tag{16.78}$$

So we can define the function

$$f^{(n)}: V \to X \text{ by } f^{(n)}(y) = f_y^{(n)}$$

Then for $h \in V_x$ with $0 < |h| < \delta$ we have

$$\begin{aligned}
\left\| f^{(n)}(x+h) - f^{(n)}(x) - h \cdot D_x^{[n+1]} f\left(\underbrace{1:\ldots:1}_{n+1}\right) \right\| &= \\
\left\| f^{(n)}(x+h) - f^{(n)}(x) - h \cdot \left(D_x^{[n+1]} f(1)\right)\left(\underbrace{1:\ldots:1}_{n}\right) \right\| &= \\
\left\| f^{(n)}(x+h) - f^{(n)}(x) - \left(D_x^{[n+1]} f(h)\right)\left(\underbrace{1:\ldots:1}_{n}\right) \right\| & \\
\left\| f_{x+h}^{(n)} - f_x^{(n)} - \left(D_x^{[n+1]} f(h)\right)\left(\underbrace{1:\ldots:1}_{n}\right) \right\| &\underset{\text{[eq: 16.78]}}{=} \\
\left\| D_{x+h}^n f\left(\underbrace{1:\ldots:1}_{n}\right) - D_x^n f\left(\underbrace{1:\ldots:1}_{n}\right) - D_x^{[n+1]} f(h)\left(\underbrace{1:\ldots:1}_{n}\right) \right\| &\underset{\text{[lemma: 16.85]}}{=} \\
\left\| \left(D_{x+h}^n f - D_x^n f - D_x^{[n+1]} f(h)\right)\left(\underbrace{1:\ldots:1}_{n}\right) \right\| &\leqslant \\
\left\| D_{x+h}^n f - D_x^n f - D_x^{[n+1]} f(h) \right\|_{L_n(\mathbb{K};X)} \cdot \prod_{i=1}^{n} |1| &= \\
\left\| D_{x+h}^n f - D_x^n f - D_x^{[n+1]} f(h) \right\|_{L_n(\mathbb{K};X)} &= \\
\left\| D^n f(x+h) - D^n f(x) - D_x^{[n+1]} f(h) \right\|_{L_n(\mathbb{K};X)} &\underset{\text{[eq: 16.77]}}{=} \\
\| D^n f(x+h) - D^n f(x) - D_x(D^{[n]} f)(h) \|_{L_n(\mathbb{K};X)} &\underset{\text{[eq: 16.76]}}{<} \\
\varepsilon \cdot |h| &
\end{aligned}$$

hence we have

$$\begin{aligned}
\left\| \frac{f^{(n)}(x+h) - f^{(n)}(x)}{h} - D_x^{[n+1]} f\left(\underbrace{1:\ldots:1}_{n+1}\right) \right\| &= \\
\left\| \frac{f^{(n)}(x+h) - f^{(n)}(x) - h \cdot D_x^{[n+1]} f\left(\underbrace{1:\ldots:1}_{n+1}\right)}{h} \right\| &= \\
\frac{\left\| f^{(n)}(x+h) - f^{(n)}(x) - h \cdot D_x^{[n+1]} f\left(\underbrace{1:\ldots:1}_{n+1}\right) \right\|}{|h|} &< \\
\varepsilon &
\end{aligned}$$

proving that $f^{(n)}: V \to Y$ has a derivative at x with

$$(f^{(n)})'_x = D_x^{[n+1]} f\left(\underbrace{1:\ldots:1}_{n+1}\right)$$

So by definition f has a $(n+1)$-the derivative $f_x^{(n+1)} = (f^{(n)})'_x = D_x^{[n+1]} f\left(\underbrace{1:\ldots:1}_{n+1}\right)$ proving that

$$n+1 \in S$$

⇐. We use induction to prove this, so define

$$S=\left\{n\in\mathbb{N}|\text{If } f \text{ has a } n\text{-the derivative at } x \text{ then } f \text{ is } n\text{-times differentiable at } x \text{ with } f_x^{(n)}=D_x^{[n]}f\left(\underbrace{1:\ldots:1}_{n}\right)\right\}$$

then we have:

$1\in S$. If f has a 1-the derivative at x then f has a derivative at x, hence by [theorem: 16.32] f is Fréchet differentiable at x [hence 1-times differentiable at x] and

$$f_x^{(1)}=f'_x=D_xf(1)=D_x^{[1]}\left(\underbrace{1:,\ldots,:1}_{1}\right)$$

proving that $1\in S$.

$n\in S\Rightarrow n+1\in S$. If f has a $(n+1)$-the derivative $f^{(n+1)}(x)$ at x then, as $1<n+1$, there exist a open set V with $x\in V\subseteq U$ such that $\forall y\in V$ f has a n-the derivative $f_y^{(n)}$ at y and that

$$f^{(n)}:V\to Y \text{ defined by } f^{(n)}(y)=f_y^{(n)}$$

has a derivative at x and

$$f_x^{(n+1)}=(f^{(n)})'_x \tag{16.79}$$

Let $\varepsilon\in\mathbb{R}^+$ then by the above there exist a $\delta\in\mathbb{R}^+$ such that $\forall h\in V_x$ with $0<|h|<\delta$ we have

$$\left\|\frac{f^{(n)}(x+h)-f^{(n)}(x)}{h}-f_x^{(n+1)}\right\|<\varepsilon \tag{16.80}$$

As $n\in S$ we have that f is n-times differentiable at every $y\in V$ and $f_y^{(n)}=D_y^{[n]}f\left(\underbrace{1:\ldots:1}_{n}\right)$. So for

$$D^{[n]}f:V\to L_n(X;Y) \text{ defined by } D^{[n]}f(y)=D_y^{[n]}f$$

we have $\forall y\in V$ that $D^{[n]}f(y)\left(\underbrace{1:\ldots:1}_{n}\right)=f_y^{(n)}$. Hence

$$\left\|\frac{D^{[n]}f(x+h)\left(\underbrace{1:\ldots:1}_{n}\right)-D^{[n]}f(x)\left(\underbrace{1:\ldots:1}_{n}\right)-h\cdot f_x^{(n+1)}}{h}\right\| =$$

$$\left\|\frac{f^{(n)}(x+h)-f^{(n)}(x)}{h}-f_x^{(n+1)}\right\| <_{\text{[eq: 16.80]}} \varepsilon$$

After multiplying by $|h|$ and taking in account that

$$\left\|D^{[n]}f(x+0)\left(\underbrace{1,\ldots,1}_{n}\right)-D^{[n]}f(x)\left(\underbrace{1,\ldots,1}_{n}\right)-0\cdot f_x^{(n+1)}\right\|=\|0\|=0\leqslant\varepsilon\cdot|0|$$

it follows that $\forall h\in V_x$ with $|h|<\delta$ we have

$$\left\|D^{[n]}f(x+h)\left(\underbrace{1:\ldots:1}_{n}\right)-D^{[n]}f(x)\left(\underbrace{1:\ldots:1}_{n}\right)-h\cdot f_x^{(n+1)}\right\|\leqslant\varepsilon\cdot|h| \tag{16.81}$$

Define

$$L'_x:\mathbb{K}^n\to Y \text{ by } L'_x(k)=f_x^{(n+1)}\cdot\prod_{i=1}^{n}k_i$$

then

$$L'_x\left(\underbrace{1,\ldots,1}_{n}\right)=f^{(n+1)}(x) \tag{16.82}$$

and by [example: 14.191] we have that $L'_x\in L^n(\mathbb{K};X)$, define

$$L_x=\mathcal{I}_{n,\mathbb{K},X}^{-1}(L'_x)\in L_n(\mathbb{K};X) \text{ so that } h\cdot L_x\in L_n(\mathbb{K};X)$$

then we have by [theorem: 16.91] that

$$L_x\left(\underbrace{1:\ldots:1}_{n}\right) = L'_x\left(\underbrace{1,\ldots,1}_{n}\right) \underset{\text{[eq: 16.82]}}{=} f_x^{[n+1]} \tag{16.83}$$

Define

$$K_x\colon \mathbb{K} \to L^n(\mathbb{K};Y) \text{ by } K_x(h) = h \cdot L_x \tag{16.84}$$

then by [example: 14.186]

$$K_x \in L(\mathbb{K}, L_n(\mathbb{K};X)) = L_{n+1}(\mathbb{K};X)$$

Further

$$\begin{aligned}
\|D^{[n]}f(x+h) - D^{[n]}f(x) - K_x(h)\|_{L_n(\mathbb{K};X)} &\leqslant_{\text{[lemma: 16.114]]}} \\
\left\|(D^{[n]}f(x+h) - D^{[n]}f(x) - K_x(h))\left(\underbrace{1:\ldots:1}_{n}\right)\right\| &\underset{\text{[lemma: 16.85]}}{=} \\
\left\|D^{[n]}f(x+h)\left(\underbrace{1:\ldots:1}_{n}\right) - D^{[n]}f(x)\left(\underbrace{1:\ldots:1}_{n}\right) - K_x(h)\left(\underbrace{1:\ldots:1}_{n}\right)\right\| &\underset{\text{[eq: 16.84]}}{=} \\
\left\|D^{[n]}f(x+h)\left(\underbrace{1:\ldots:1}_{n}\right) - D^{[n]}f(x)\left(\underbrace{1:\ldots:1}_{n}\right) - h \cdot L_x\left(\underbrace{1:\ldots:1}_{n}\right)\right\| &\underset{\text{[eq: 16.83]}}{=} \\
\left\|D^{[n]}f(x+h)\left(\underbrace{1:\ldots:1}_{n}\right) - D^{[n]}f(x)\left(\underbrace{1:\ldots:1}_{n}\right) - h \cdot f_x^{[n+1]}\right\| &<_{\text{[eq: 16.81]}} \\
\varepsilon \cdot |h|
\end{aligned}$$

proving that $D^{[n]}f$ is Fréchet differentiable at x and that $D_x(D^{[n]}f) = K_x$. Hence

$$f \text{ is } (n+1)\text{-times differentiable at } x \text{ with } D_x^{[n+1]}f = K_x$$

Further we have

$$\begin{aligned}
D_x^{[n+1]}f\left(\underbrace{1:\ldots:1}_{n+1}\right) &= K_x\left(\underbrace{1:\ldots:1}_{n+1}\right) \\
&= K_x(1)\left(\underbrace{1:\ldots:1}_{n}\right) \\
&\underset{\text{[eq: 16.84]}}{=} 1 \cdot L_x\left(\underbrace{1:\ldots:1}_{n}\right) \\
&= L_x\left(\underbrace{1:\ldots:1}_{n}\right) \\
&\underset{\text{[eq: 16.83]}}{=} f_x^{(n+1)}
\end{aligned}$$

so that we have

$$n+1 \in S$$

□

Definition 16.116. *Let $n \in \mathbb{N}$, $\langle \mathbb{K}, \|\rangle$ be the normed space of real (complex) numbers based on the norm $||$, $\langle X, \|\|\rangle$ a normed space, U a open set in $\mathbb{K}$ then $f\colon U \to X$ has a n-the derivative on U if $\forall x \in U$ f has a n-the derivative at x.*

Theorem 16.117. *Let $n \in \mathbb{N}$, $\langle \mathbb{K}, \|\rangle$ be the normed space of real (complex) numbers based on the norm $||$, $\langle X, \|\|\rangle$ a normed space, U a open set in X and $f\colon U \to X$ a function then the following are equivalent:*

1. *f has a n-the derivative on U.*
2. *For n we have:*

   $n = 1$. *$\forall x \in U$ f has a derivative at x and $f^{(1)}(x) = f'_x$.*

   $1 < n$. *$\forall x \in U$ f has a $(n-1)$-the derivative at x and the function*

$$f^{(n-1)}\colon U \to Y \text{ defined by } (f^{(n-1)})(x) = f_x^{(n-1)}$$

has a derivative at x with $f_x^{(n)} = (f^{(n-1)})'_x$ for every $x \in U$.

Proof.

$1 \Rightarrow 2$. For $n \in \mathbb{N}$ we must consider two cases:

$n = 1$. Then, as $\forall x \in U$ f has a 1-derivative at x, it follows from [definition: 16.113] that f has a derivative at x with $f_x^{(1)} = f'_x$.

$1 < n$. Let $x \in U$ then there exist by [definition: 16.113] a open set V_x with $x \in V_x \subseteq U$ such that $\forall y \in V_x$ f has a $(n-1)$-the derivative at y and the function

$$f_{V_x}^{(n-1)}: V_x \to Y \text{ defined by } \left(f_{V_x}^{(n-1)}\right)(y) = f_y^{(n-1)}$$

has a derivative at x with $f_x^{(n)} = \left(f_{V_x}^{(n-1)}\right)'_x$. If $x \in U$ then as $x \in V_x \subseteq U$ it follows that f has a $(n-1)$-the derivative at x and we can define

$$f^{(n-1)}: U \to Y \text{ by } (f^{(n-1)})(x) = f_x^{(n-1)}$$

Let $y \in V_x$ then $(f^{(n-1)})_{|V_x}(y) = f^{(n-1)}(y) = f_y^{(n-1)} = f_{V_x}^{(n-1)}(y)$ so that $(f^{(n-1)})_{|V_x} = f_{V_x}^{(n-1)}$, hence $(f^{(n-1)})_{|V_x}$ has a derivative at x. So by [theorem: 16.33] $f^{(n-1)}$ has a derivative at x and $(f^{(n-1)})'_x = ((f^{(n-1)})_{|V_x})'_x = \left(f_{V_x}^{(n-1)}\right)'_x = f_x^{(n)}$.

$2 \Rightarrow 1$. For $n \in \mathbb{N}$ we must consider two cases:

$n = 1$. As $\forall x \in U$ f has a derivative at x it follows by [definition: 16.113] that f has a 1-the derivative at x, hence f has a 1-the derivative on U.

$1 < n$. Let $x \in U$ then by taking $V = U$ so that $x \in V \subseteq U$ we have by the hypothesis combined with [definition: 16.113] that f has a n-the derivative at x. Hence as $x \in U$ was chosen arbitrary f has a n-the derivative on U. □

16.2.2.5 Properties of higher order differentiation

Theorem 16.118. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ normed spaces, U a open set in X, $x \in U$ and*

$$f: U \to Y$$

a function that is n-times differentiable at x then $\forall m \in \{1, \ldots, n\}$ f is m-times differentiable at x.

Proof. We proceed by induction so define

$$S_n = \{k \in \mathbb{N}_0 | \text{If } k < n \text{ then } f \text{ is } (n-k)\text{-times Fréchet differentiable at } x\}$$

then we have:

$0 \in S_n$. Then $n - k = n - 0 = n$ which as f is n-times Fréchet differentiable at x prove that $0 \in S_n$.

$k \in S_n \Rightarrow k + 1 \in S_n$. If $k + 1 < n$ we have $k < n$ so as $k \in S_n$ it follows that f is $(n-k)$-times differentiable at x. As $k + 1 < n \Rightarrow 1 < n - k$ there exist a open V such that $x \in V \subseteq U$ and $\forall y \in V$ f is $((n-k)-1)$-times differentiable at y, in particular f is $((n-k)-1)$-times differentiable at x. As $n - (k+1) = (n-k) - 1$ it follows that $k + 1 \in S_n$.

By mathematical induction it follows that $S_n = \mathbb{N}_0$, hence if $m \in \{1, \ldots, n\}$ then $k = n - m \in \mathbb{N}_0 = S_n$ and $k = n - m < n$ so that f is $(n-k)$-times differentiable at x or as $n - k = n - (n - m) = m$ f is m-times differentiable at x. □

We have a similar theorem for functions that are C^n at a point.

Theorem 16.119. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be two normed spaces, a open set $U \subseteq X$, $x \in U$, $n \in \mathbb{N}_0$ and*

$$f: U \to Y \text{ a function that is } C^n \text{ at } x$$

then $\forall m \in \{0, \ldots, n\}$ we have that f is C^m at x.

Proof. For $n \in \mathbb{N}_0$ we have either:

$n = 0$. Then $\{0, \ldots, n\} = \{0\}$, hence if $m \in \{0, \ldots, n\}$ we have $m = n = 0$ which as f is C^n at x proves that f is C^m at x.

$0 < n$. Then for $m \in \{0, \ldots, n\}$ we have either:

$m = n$. Than as f is C^n at x f is C^m at x.

$m<n$. Then for m we have either:

$m=0$. As f is C^n at x it follows that f is n-times differentiable at x [see note: 16.104]. From $0<n\Rightarrow 1\leqslant n$ it follows using [theorem: 16.118] that f is 1-times differentiable at x. Hence f is Fréchet differentiable at x so that by [theorem: 16.31] f is continuous at x or f is C^0 at x.

$1\leqslant m$. As f is C^n at x it follows that f is n-times differentiable at x [see note: 16.104]. Further from $1\leqslant m<n$ it follows that $m+1\in\{1,\dots,n\}$. Hence by [theorem: 16.118] f is $(m+1)$-times differentiable at x. So there exist a open set V with $x\in V\subseteq U$ such that $\forall y\in V$ f is m-times differentiable at y and the function

$$D^{[m]}f\colon V\to L_m(X;Y) \text{ defined by } D^{[m]}f(y)=D_y^{[m]}f$$

is Fréchet differentiable at x. Using theorem [theorem: 16.31] it follows that $D^{[m]}f$ is continuous at x. Hence we have that f is C^m at x. □

Theorem 16.120. *Let $n,m\in\mathbb{N}$, $\langle X,\|\|_X\rangle$, $\langle Y,\|\|_Y\rangle$, U,V open sets in X with $V\subseteq U$ and $f\colon U\to Y$ a function that is C^{n+m} on V [hence by [theorem: 16.119] is also C^n on V] so that the following functions are well defined*

$$D^{[n+m]}f\colon V\to L_{n+m}(X;Y) \text{ where } D^{[n+m]}f(x)=D_x^{[n+m]}f$$

$$D^{[n]}f\colon V\to L_n(X;Y) \text{ where } D^{[n]}f(x)=D_x^{[n]}f$$

then $D^{[n]}f$ is C^m on V and for

$$D^{[m]}(D^{[n]}f)\colon V\to L_m(X;L_n(X;Y)) \text{ defined by } D^{[m]}(D^{[n]}f)(x)=D_x^{[m]}(D^{[n]}f)$$

we have $D^{[m]}(D^{[n]}f)=D^{[n+m]}f$

Note 16.121. $L_m(X;L_n(X;Y))\underset{\text{[lemma: 16.77]}}{=}L_{n+m}(X;Y)$

Proof. We prove this by induction on m, so let $n\in\mathbb{N}$

$S_n=\Big\{m\in\mathbb{N}|$If $f\colon U\to Y$ is C^{n+m} on V then $D^{[n]}f\colon V\to L_n(X;Y)$ defined by $D^{[n]}f(x)=D_x^{[n]}f$ is C^m on V and for $D^{[n+m]}f\colon V\to L_{n+m}(X;Y)$ defined by $D^{[n+m]}f(x)=D_x^{[n+m]}f$ we have $D^{[n+m]}f=D^{[m]}(D^{[n]}f)$ where $D^{[m]}(D^{[n]}f)\colon V\to L_m(X;L_n(X;Y))\underset{\text{[lemma: 16.77]}}{=}L_{n+m}(X;Y)$ is defined by $D^{[m]}(D^{[n]}f)(x)=D_x^{[m]}(D^{[n]}f)\Big\}$

then we have:

$1\in S_n$. If f is C^{n+1} on V then by [theorem: 16.119] f is $(n+1)$-times differentiable on V and

$$D^{[n+1]}f\colon V\to L_{n+1}(X;Y) \text{ defined by } D^{[n+1]}f(x)=D_x^{[n+1]}f \text{ is continuous} \tag{16.85}$$

Using [theorem: 16.99] it follows that f is n-times differentiable on V and

$$D^{[n]}f\colon V\to L_n(X;Y) \text{ defined by } D^{[n]}f(x)=D_x^{[n]}f$$

is Fréchet differentiable on V [hence 1-times differentiable on V] and that $\forall x\in V$ we have

$$D_x^{[1]}(D^{[n]}f)\underset{\text{def}}{=}D_x(D^{[n]}f)=D_x^{[n+1]}f=D^{[n+1]}f(x) \tag{16.86}$$

Hence if we define

$$D^{[1]}(D^{[n]}f)\colon V\to L_n(X;Y) \text{ by } D^{[1]}(D^{[n]}f)(x)=D_x^{[1]}(D^{[n]}f)$$

then $\forall x\in V$ we have $D^{[1]}(D^{[n]}f)(x)=D_x^{[1]}(D^{[n]}f)\underset{\text{[eq: 16.86]}}{=}D^{[n+1]}f(x)$ proving that

$$D^{[1]}(D^{[n]}f)=D^{[n+1]}f$$

As $D^{[n+1]}f$ is continuous [see eq: 16.85] it follows that $D^{[1]}(D^{[n]}f)$ is continuous, hence we have that

$$D^{[n]}f \text{ is } C^1 \text{ on } V \text{ and } D^{[1]}(D^{[n]}f)=D^{[n+1]}f$$

which proves that $1\in S_n$.

$\boldsymbol{m \in S_n \Rightarrow m+1 \in S_n}$. If f is $C^{n+(m+1)}$ on V then by [theorem: 16.119] f is $(n+m)+1$ differentiable on V and

$$D^{[(n+m)+1]}f: V \to L_{n+m+1}(X;Y) \text{ by } D^{[(n+m)+1]}f(x) = D_x^{[(n+m)+1]}f \text{ is continuous} \tag{16.87}$$

Using [theorem: 16.99] it follows that f is $(n+m)$-times differentiable on V and

$$D^{[n+m]}f: V \to L_{n+m}(X;Y) \text{ where } D^{[n+m]}f(x) = D_x^{[n+m]}f$$

is Fréchet differentiable on V [hence 1-times differentiable on V] and $\forall x \in V$

$$D_x^{[1]}(D^{[n+m]}) \underset{\text{def}}{=} D_x(D^{[n+m]}f) = D_x^{[(n+m)+1]}f = D^{[(n+m)+1]}f(x) \tag{16.88}$$

Hence if we define

$$D^{[1]}(D^{[n+m]}f): V \to L_{n+m+1}(X;Y) \text{ where } D^{[1]}(D^{[n+m]}f)(x) = D_x^{[1]}(D^{[n+m]}f)$$

then we have $\forall x \in V$ that $D^{[1]}(D^{[n+m]}f)(x) = D_x^{[1]}(D^{[n+m]}f) \underset{\text{[eq: 16.88]}}{=} D^{[(n+m)+1]}f(x)$ proving that

$$D^{[1]}(D^{[n+m]}f) = D^{[(n+m)+1]}f \tag{16.89}$$

As f is C^{n+m} on V and $m \in S$ it follow that

$$D^{[n]}f: V \to L_n(X;Y) \text{ defined by } D^{[n]}f(x) = D_x^{[n]}f \text{ is } C^m \text{ on } V$$

and for

$$D^{[m]}(D^{[n]}f): V \to L_{n+m}(X;Y) \text{ defined by } D^{[m]}(D^{[n]}f)(x) = D_x^{[m]}(D^{[n]}f)$$

we have

$$D^{[n+m]}f = D^{[m]}(D^{[n]}f) \tag{16.90}$$

As $D^{[n+m]}f$ is 1-times differentiable on V it follows from the above that $D^{[m]}(D^{[n]}f)$ is 1-times differentiable on V. In other words $\forall x \in V\, D^{[m]}(D^{[n]}f)$ is Fréchet differentiable at x, hence by definition we have that $D^{[n]}f$ is $(m+1)$-times differentiable with $D_x^{[m+1]}(D^{[n]}f) = D_x(D^{[m]}(D^{[n]}f))$. So if we define

$$D^{[m+1]}(D^{[n]}f): V \to L_{n+m+1}(X;Y) \text{ by } D^{[m+1]}(D^{[n]}f)(x) = D_x^{[m+1]}(D^{[n]}f)$$

then $\forall x \in V$ we have

$$\begin{aligned} D^{[m+1]}(D^{[n]}f)(x) &= D_x(D^{[m]}(D^{[n]}f)) \\ &= D_x^{[1]}(D^{[m]}(D^{[n]}f)) \\ &\underset{\text{[eq: 16.90]}}{=} D_x^{[1]}(D^{[n+m]}f) \\ &= D^{[1]}(D^{[n+m]}f)(x) \end{aligned}$$

so that

$$D^{[m+1]}(D^{[n]}f) = D^{[1]}(D^{[n+m]}f) \underset{\text{[eq: 16.89]}}{=} D^{[(n+m)+1]}f$$

As $D^{[(n+m)+1]}f$ is continuous [see eq: 16.87] it follows that $D^{[m+1]}(D^{[n]}f)$. So we have proved that $D^{[n]}f$ is C^{m+1} on V and $D^{[m+1]}(D^{[n]}f) = D^{[n+(m+1)]}f$ proves that

$$n+1 \in S_n$$

□

The following theorem will be essential in proofs by induction.

Theorem 16.122. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be two normed spaces, a open set $U \subseteq X$, $x \in U$, $n \in \mathbb{N}\backslash\{1\}$ then the following are equivalent:*

1. *f is n-times differentiable at x*
2. *There exit a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ f is 1-times differentiable at y and*

$$D^{[1]}f: V \to L_1(X;Y) = L(X,Y) \text{ defined by } D^{[1]}f(y) = D_y^{[1]}f$$

is $(n-1)$-times differentiable at x. Further we have $D_x^{[n]}f = D_x^{[n-1]}(D^{[1]}f)$.

***Note* 16.123.** *As $\forall y \in V\ D_y^{[1]} f = D_y f$ we can say that the following are equivalent*

1. *f is n-times Fréchet differentiable at x*
2. *There exit a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ f is Fréchet differentiable at y and*

$$Df: V \to L_1(X;Y) = L(X,Y) \text{ defined by } Df(y) = D_y f$$

is $(n-1)$-times Fréchet differentiable at x. Further we have $D_x^{[n]} f = D_x^{[n-1]}(Df)$.

Proof.

$1 \Rightarrow 2$. We prove this by induction on n, so define

$S = \{n \in \{2, \ldots, \infty\} | \text{If } f: U \to Y$ is n-times Fréchet differentiable at $x \in U$, Uopen in X then there exist a open V with $x \in V \subseteq U$ such that $\forall y \in V$ f is 1-times Fréchet differentiable at y and $D^{[1]} f: V \to L_1(X;Y)$ defined by $(D^{[1]} f)(y) = D^{[1]} f(x)$ is $(n-1)$-times Fréchet differentiable at x. Further we have $D_x^{[n]} f = D_x^{[n-1]}(D^{[1]} f)\}$

then we have:

$2 \in S$. If $f: U \to Y$ is 2-times Fréchet differentiable at $x \in U$, U open in X then there exist a open set $V \subseteq X$ with $x \in V \subseteq U$ such that $\forall y \in V$ f is 1-times Fréchet differentiable at y and

$$D^{[1]} f: V \to L_1(X;Y) \text{ defined by } D^{[1]} f(y) = D_y^{[1]} f$$

is Fréchet differentiable at x and

$$D_x^{[2]} f = D_x(D^{[1]} f)$$

Hence we have by definition that $D^{[1]} f$ is 1-times differentiable at x and that $D^{[2]} f(x) = D_x^{[1]}(D^{[1]} f)$ proving that $2 \in S$.

$n \in S \Rightarrow n+1 \in S$. If f is $(n+1)$-times Fréchet differentiable at x it follows that there exist a open V in X with $x \in V \subseteq U$ such that $\forall y \in V$ f is n-times Fréchet differentiable and the function

$$D^{[n]} f: V \to L_n(X;Y) \text{ defined by } D^{[n]} f(y) = D_y^{[n]} \text{ is Fréchet differentiable at } x \tag{16.91}$$

and

$$D_x^{[n+1]} f = D_x(D^{[n]} f) \tag{16.92}$$

As $n \in S$ we have that $\forall y \in V$ there exist a open set W_y with $y \in W_y \subseteq V$ such that $\forall z \in W_y$ f is 1-times differentiable at y and the function

$$D_{W_y}^{[1]} f: W_y \to L_1(X;Y) \text{ defined by } D_{W_y}^{[1]} f(z) = D_z^{[1]} f \tag{16.93}$$

is $[n-1]$-times differentiable at y and

$$D_y^{[n]} f = D_y^{[n-1]}\left(D_{W_y}^{[1]} f\right) \tag{16.94}$$

As $\forall y \in V$ we have $y \in W_y$ so it follows that f is 1-times differentiable at y and we can define the function

$$D^{[1]} f: V \to L_1(X;Y) \text{ where } D^{[1]} f(y) = D_y^{[1]} f$$

Then, as $\forall z \in W_y$ we have $D_{W_y}^{[1]} f(z) \underset{\text{[eq: 16.93]}}{=} D_z^{[1]} f = D^{[1]} f(z)$, it follows that

$$\forall y \in V\ D_{W_y}^{[1]} f = (D^{[1]} f)_{|W_y} \tag{16.95}$$

Hence, as $D_{W_y}^{[1]} f$ is $(n-1)$-times differentiable at y with $D_y^{[n-1]}\left(D_{W_y}^{[1]} f\right) \underset{\text{[eq: 16.94]}}{=} D_y^{[n]} f$, it follows that $(D^{[1]} f)_{|W_y}$ is $(n-1)$-times differentiable at y and

$$D_y^{[n-1]}(D^{[1]} f)_{|W_y} \underset{\text{[eq: 16.95]}}{=} D_y^{[n-1]}\left(D_{W_y}^{[1]} f\right) = D_y^{[n]} f$$

Using the locality of higher order differentiation [see theorem: 16.96] it follows that $\forall y \in V\ D^{[1]} f$ is $(n-1)$-times differentiable at y and $D_y^{[n-1]}(D^{[1]} f) = D_y^{[n]} f$. Hence if we define

$$D^{[n-1]}(D^1 f): V \to L_{n-1}(X; L_1(X;Y)) \text{ by } (D^{[n-1]}(D^1 f))(y) = D_y^{[n-1]}(D^{[1]} f)$$

it follows that $D^{[n-1]}(D^1 f) = D^{[n]} f$. So using [eqs: 16.91 and 16.92] it follows that $D^{[n-1]}(D^1 f)$ is Fréchet differentiable at x and

$$D_x^{[n+1]} f = D_x(D^{[n-1]}(D^{[1]} f))$$

Hence we have by definition that $D^1 f$ is n-times differentiable at x with $D_x^{n+1} f = D_x^{[n]}(D^{[1]} f)$. This proves as $(n+1)-1=n$ that

$$n+1 \in S$$

2 ⇒ 1. We use recursion to prove this. So define:

$S = \{n \in \{2, \ldots, \infty\} |$If for $f: U \to Y$ there exist a open V with $x \in V \subseteq U$ such that $\forall y \in V$ f is 1-times differentiable at y and $D^{[1]} f: V \to L_1(X; Y)$ defined by $D^{[1]} f(y) = D_y^{[1]} f$ is $(n-1)$-times differentiable at x then f is n-times differentiable at x and $D_x^{[n-1]}(D^{[1]} f) = D_x^{[n]} f\}$

then we have:

$2 \in S$. Let V be a open set with $x \in V \subseteq U$ such that $\forall y \in V$ we have that f is 1-times differentiable at y and

$$D^{[1]} f: V \to L_1(X; Y) \text{ defined by } D^{[1]} f(y) = D_y^{[1]} f$$

is $2-1=1$-times differentiable at x. Then $D^{[1]} f$ is Fréchet differentiable at x and $D_x^{[1]}(D^{[1]} f) = D_x(D^{[1]} f)$ hence by definition f is 2-times differentiable at x and

$$D_x^{[2]} f = D_x(D^{[1]} f) = D_x^{[1]}(D^{[1]} f)$$

So we have that $2 \in S$.

$n \in S \Rightarrow n+1 \in S$. First as $n \in S \subseteq \{2, \ldots, \infty\}$ it follows that $1 < n$. Let V be a open set such that $x \in V \subseteq U$ and $\forall y \in V$ f is 1-times differentiable at y and

$$D^{[1]} f: V \to L_1(X; Y) \text{ defined by } (D^{[1]} f)(y) = D^{[1]} f(y)$$

is n-times differentiable at x. Then, as $1 < n$, there exist a open W with $x \in W \subseteq V$ such that $\forall y \in W$ $D^{[1]} f$ is $(n-1)$-times differentiable at y and

$$D^{[n-1]}(D^{[1]} f): W \to L(X, L_{n-1}(X; Y)) \text{ defined by } D^{[n-1]}(D^{[1]} f)(y) = D_y^{[n-1]}(D^{[1]} f)$$

is Fréchet differentiable at x and

$$D_x^{[n]}(D^{[1]} f) = D_x(D^{[n-1]}(D^{[1]} f)) \tag{16.96}$$

As $\forall y \in W \subseteq V$ f is 1-times differentiable and $D^{[1]} f$ is $(n-1)$-times differentiable at y we have, as $n \in S$, that f is n-times differentiable at y and

$$D_y^{[n]} f = D_y^{[n-1]}(D^{[1]} f) \tag{16.97}$$

Hence we have for

$$D^{[n]} f: W \to L_n(X; Y) \text{ defined by } D^{[n]} f(y) = D_y^{[n]} f$$

that $\forall y \in W$ $D^{[n]} f(y) = D_y^{[n]} f \underset{\text{[eq: 16.97]}}{=} D_y^{[n-1]}(D^{[1]} f) = D^{[n-1]}(D^{[1]} f)(y)$ proving that

$$D^{[n]} f = D^{[n-1]}(D^{[1]} f) \tag{16.98}$$

so that $D^{[n]} f$ is Fréchet differentiable at x [because $D^{[n-1]}(D^{[1]} f)$ is Fréchet differentiable at x] and

$$D_x(D^{[n]} f) \underset{\text{[eq: 16.98]}}{=} D_x(D^{[n-1]}(D^{[1]} f)) \underset{\text{[eq: 16.96]}}{=} D_x^{[n]}(D^{[1]} f)$$

Hence we have by definition that f is $(n+1)$-times differentiable at x with

$$D_x^{[n+1]} f = D_x(D^{[n]} f) = D_x^{[n]}(D^{[1]})$$

which proves that $n+1 \in S$. □

Corollary 16.124. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be two normed spaces, a open set $U \subseteq X$, $x \in U$ and $f: U \to Y$ a function then we have*

$$\begin{gathered} f \text{ is } C^n \text{ at } x \\ \Updownarrow \\ \exists V \text{ open with } x \in V \subseteq U \text{ such that } f \text{ is 1-times differentiable on } V \\ \text{and } D^{[1]}f: V \to L_1(X;Y) = L(X,Y) \text{ defined by } D^{[1]}f(y) = D_y^{[1]}f \\ \text{is } C^{[n-1]} \text{ at } x \end{gathered}$$

Proof.

$\Rightarrow$. For n we have the following cases to consider:

$n = 1$. As f is C^1 at x there exist a open set V with $x \in V \subseteq U$ such that f is 1-times differentiable on V and the function

$$D^{[1]}f: V \to L_1(X;Y) \text{ defined by } D^{[1]}f(y) = D_y^{[1]}f$$

is continuous at x. Hence $D^{[1]}f$ is C^0 at x.

$1 < n$. As f is C^n at x there exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ f is n-times differentiable at y and the function

$$D^{[n]}f: V \to L_n(X;Y) \text{ defined by } D^{[n]}f(y) = D_y^{[n]}f \text{ is continuous at } x \tag{16.99}$$

Let $y \in V$ then by the previous theorem [theorem: 16.122] there exist a open U_y with $y \in U_y \subseteq U$ such that $\forall z \in U_y$ we have that f is 1-times differentiable at z and the function

$$D_{U_y}^{[1]}f: U_y \to L_1(X;Y) = L(X,Y) \text{ defined by } D_{U_y}^{[1]}f(z) = D_z^{[1]}f \tag{16.100}$$

is $(n-1)$-times differentiable at y with $D_y^{[n]}f = D_y^{[n-1]}\left(D_{U_y}^{[1]}f\right)$. Let $y \in V$ then as $y \in U_y$ we have that f is 1-times differentiable at y so we can define the function

$$D^{[1]}f: V \to L_1(X;Y) = L(X,Y) \text{ where } D^{[1]}f(y) = D_y^{[1]}f \tag{16.101}$$

For $y \in V$ take $V_y = U_y \bigcap V$ then by [theorem: 16.96] $\left(D_{U_y}^{[1]}f\right)_{|V_y}$ is $(n-1)$-times differentiable at y and

$$D_y^{[n]}\left(D_{U_y}^{[1]}f\right)_{|V_y} = D_y^{[n-1]}\left(D_{U_y}^{[1]}f\right) = D_y^{[n]}f \tag{16.102}$$

Let $z \in V_y$ then $\left(D_{U_y}^{[1]}f\right)_{|V_y}(z) = D_{U_y}^{[1]}f(z) \underset{\text{[eq: 16.100]}}{=} D_z^{[1]}f \underset{\text{[eq: 16.101]}}{=} D^{[1]}f(y)$ proving that

$$(D^{[1]}f)_{|V_y} = \left(D_{U_y}^{[1]}f\right)_{|V_y}$$

Hence $(D^{[1]}f)_{|V_y}$ is $(n-1)$-times differentiable at y and

$$D_y^{[n-1]}((D^{[1]}f)_{|V_y}) \underset{\text{[eq: 16.102]}}{=} D_y^{[n]}f$$

Using [theorem: 16.96] again it follows that $D^{[1]}f$ is $(n-1)$-times differentiable at y with $D_y^{[n-1]}(D^{[1]}f) = D_y^{[n]}f$.So for

$$D^{[n-1]}(D^{[1]}f): V \to L_n(X;Y) \text{ defined by } D^{[n-1]}(D^{[1]}f)(y) = D_y^{[n-1]}(D^{[1]}f)$$

we have that $D^{[n-1]}(D^{[1]}f)(y) = D_y^{[n-1]}(D^{[1]}f) = D_y^{[n]}f \underset{\text{[eq: 16.99]}}{=} D^{[n]}f(y)$ or as $y \in V$ was chosen arbitrary that

$$D^{[n-1]}(D^{[1]}f) = D^{[n]}f$$

As $D^{[n]}f$ is continuous at x it follows from the above that $D^{[n-1]}(D^{[1]}f)$ is continuous at x. From this we conclude that $D^{[1]}f$ is C^{n-1} at x.

$\Leftarrow$. For $n \in \mathbb{N}$ we have two possible cases:

$n = 1$. By the hypothesis there exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ f is 1-times differentiable at y and

$$D^{[1]}f: V \to L_1(X;Y) \text{ defined by } D^{[1]}f(y) = D_y^{[1]}f$$

is C^0 at x. Hence $D^{[1]}f$ is continuous at x which by definition means that f is C^1 at x.

$1 < n$. By the hypothesis there exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ f is 1-times differentiable at y and

$$D^{[1]}f: V \to L_1(X;Y) \text{ defined by } D^{[1]}f(y) = D_y^{[1]}f \text{ is } C^{n-1} \text{ at } x$$

Hence there exist a open set W with $x \in W \subseteq V$ such that $D^{[1]}f$ is $(n-1)$-times differentiable on W and the function

$$D^{[n-1]}(D^{[1]}f): W \to L_n(X;Y) \text{ defined by } D^{[n-1]}(D^{[1]}f)(y) = D_y^{[n-1]}(D^{[1]}f) \tag{16.103}$$

is continuous at x. Let $y \in W$ then, as $D^{[1]}f$ $(n-1)$-times differentiable at y, it follows from [theorem: 16.122] that f is n-times differentiable at y and

$$D_y^{[n]}f = D_y^{[n-1]}(D^{[1]}f) \tag{16.104}$$

So if we define

$$D^{[n]}f: W \to L_n(X;Y) \text{ by } D^{[n]}f(y) = D_y^{[n]}f$$

then we have for $y \in W$ that

$$D^{[n]}f(y) = D_y^{[n]}f \underset{\text{[eq: 16.104]}}{=} D_y^{[n-1]}(D^{[1]}f) \underset{\text{[eq: 16.103]}}{=} D^{[n-1]}(D^{[1]}f)(y)$$

proving that

$$D^{[n]}f = D^{[n-1]}(D^{[1]}f)$$

Hence as $D^{[n-1]}(D^{[1]}f)$ is continuous at x it follows that $D^{[n]}f$ is continuous at x. So we conclude that f is C^n at x. □

Corollary 16.125. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be two normed spaces, U, V open sets in X with $x \in V \subseteq U$ and $f: U \to Y$ a function then we have*

$$\begin{gathered} f \text{ is } C^n \text{ on } V \\ \Updownarrow \\ f \text{ is 1-times differentiable on } V \text{ and} \\ D^{[1]}f: U \to L_1(X;Y) = L(X,Y) \text{ defined by } D^{[1]}f(x) = D_x^{[1]}f \text{ is } C^{n-1} \text{ on } V \end{gathered}$$

Proof.

$\Rightarrow$. Let $x \in V$ then f is C^n at x and by the previous corollary [corollary: 16.124] there exist a open V_x with $x \in V_x \subseteq U$ such that f is 1-times differentiable on V_x and

$$D_{V_x}^{[1]}f: V_x \to L_1(X;Y) = L(X,Y) \text{ defined by } D_{V_x}^{[1]}f(y) = D_y^{[1]}f \text{ is } C^{n-1} \text{ at } x$$

Hence f is 1-times differentiable on V [as $\forall x \in V$ $x \in V_x$] and we can define

$$D^{[1]}f: V \to L_1(X;Y) = L(X,Y) \text{ by } D^{[1]}f(y) = D_y^{[1]}f$$

Let $x \in V$ and take $y \in V_x$ then $D_{V_X}^{[1]}f(y) = D_y^{[1]}f = D^{[1]}f(x) \underset{y \in V_x}{=} (D^{[1]}f)_{|V_x}(y)$ proving that

$$(D^{[1]}f)_{|V_x} = D_{V_X}^{[1]}f$$

hence as $D_{V_x}^{[1]}f$ is C^{n-1} at x it follows that $(D^{[1]}f)_{|V_x}$ is C^{n-1} at x. Using locality [see theorem: 16.106] that $D^{[1]}f$ is C^{n-1} at x. As $x \in V$ was chosen arbitrary it follows that $D^{[1]}f$ is C^{n-1} on V.

$\Leftarrow$. By the hypothesis f is 1-times differentiable on V and

$$D^{[1]}f: V \to L_1(X;Y) = L(X,Y) \text{ defined by } D^{[1]}f(y) = D_y^{[1]}f \text{ is } C^{n-1} \text{ on } V$$

Hence if $x \in V$ then by [corollary: 16.124] f is C^n at x. As $x \in V$ was chosen arbitrary it follows that f is C^n on V. □

Just as the Fréchet differential is linear [see theorem: 16.38] we have the same for higher order differentials and derivatives.

Theorem 16.126. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ normed spaces, U a open set in X, $x \in U$ then we have:*

1. *If $f: U \to Y$, $g: U \to Y$ are functions such that f, g are n-times differentiable at $x \in U$ then $f + g$ is n-times differentiable at x and $D_x^{[n]}(f+g) = D_x^{[n]}f + D_x^{[n]}g$.*

2. *If $k \in \mathbb{N}$ and $\{f_i: U \to Y\}_{i \in \{1,\ldots,k\}}$ is a family of functions such that $\forall i \in \{1,\ldots,k\}$ f_i is n-times differentiable at $x \in U$ then $\sum_{i=1}^k f_i$ is n-times differentiable at and*
$$D_x^{[n]}\left(\sum_{i=1}^k f_i\right) = \sum_{i=1}^k D_x^{[n]} f$$
3. *If $\alpha \in \mathbb{K}$, $f: U \to Y$ is a function that is n-times differentiable at x then $\alpha \cdot f$ is n-times differentiable at x and $D_x^{[n]}(\alpha \cdot f) = \alpha \cdot D_x^{[n]} f$.*
4. *If $f: U \to Y$, $g: U \to Y$ are functions that are C^n at x then $f+g$ is C^n at x.*
5. *If $k \in \mathbb{N}$ and $\{f_i: U \to Y\}_{i \in \{1,\ldots,k\}}$ is a family of functions such that $\forall i \in \{1,\ldots,k\}$ f^i is is C^n at x then $\sum_{i=1}^k f_i$ is C^n at x*
6. *If $\alpha \in \mathbb{K}$, $f: U \to Y$ is C^n at x then $\alpha \cdot f$ is C^n at x.*

Proof.

1. We use induction on n to prove this, so let

   $S = \{n \in \mathbb{N} | \text{If } f, g: U \to Y \text{ are } n\text{-times differentiable at } x \in U \text{ where } U \text{ is open in } X \text{ then } f+g \text{ is } n\text{-times differentiable at } x \text{ and } D_x^{[n]}(f+g) = D_x^{[n]} f + D_x^{[n]} g\}$

   then we have:

   $1 \in S$. If $f, g: U \to Y$ are 1-times differentiable at x then f, g are Fréchet differentiable at $x \in U$ and $D_x^{[1]} f = D_x f$, $D_x^{[1]} g = D_x g$. Using [theorem: 16.38] it follows that $f+g$ is Fréchet differentiable at x [hence 1-times differentiable at x] and
   $$D_x^{[1]}(f+g) = D_x(f+g) = D_x f + D_x g = D_x^{[1]} f + D_x^{[1]} g$$
   Hence we have $1 \in S$.

   $n \in S \Rightarrow n+1 \in S$. If f, g are $(n+1)$-times differentiable at x and $1 < n+1$ then there exist open sets V_1, V_2 with $x \in V_1 \subseteq U$, $x \in V_2 \subseteq U$ such that $\forall y \in V_1$ f is n-times differentiable at y and $\forall y \in V_2$ g is n-times differentiable at x. Further we have that
   $$D^{[n]} f: V_1 \to L_n(X;Y) \text{ defined by } D^{[n]} f(y) = D_y^{[n]} f$$
   and
   $$D^{[n]} g: V_2 \to L_n(X;Y) \text{ defined by } D^{[n]} g(y) = D_y^n g$$
   are differentiable at x with $D_x^{[n+1]} f = D_x(D^{[n]} f)$ and $D_x^{[n+1]} g = D_x(D^{[n]} g)$. Take $V = V_1 \bigcap V_2$ then if $y \in V \subseteq U$ we have $\forall y \in V_1 \bigcap V_2$ that f, g are n-times differentiable at y. As $n \in S$ it follows that $f+g$ is n-times differentiable at y and $D_y^{[n]}(f+g) = D_y^{[n]} f + D_y^{[n]} g$. This allows us to define
   $$D^{[n]}(f+g): V \to L_n(X;Y) \text{ where } D^{[n]}(f+g)(y) = D_y^{[n]}(f+g)$$
   and $\forall y \in V$ we have that
   $$\begin{aligned}(D^{[n]}(f+g))(y) &= D_y^{[n]}(f+g) \\ &= D_y^{[n]} f + D_y^{[n]} g \\ &= D^{[n]} f(y) + D^{[n]} g(y) \\ &= (D^{[n]} f)_{|V}(y) + (D^{[n]} g)_{|V}(y)\end{aligned}$$
   proving that
   $$D^{[n]}(f+g) = (D^{[n]} f)_{|V} + (D^n g)_{|V} \tag{16.105}$$
   As $D^{[n]} f$, $D^{[n]} g$ are Fréchet differentiable at x and $x \in V_1 \bigcap V_2 = V$ it follows from [theorem: 16.24] that $(D^{[n]} f)_{|V}$, $(D^{[n]} g)_{|V}$ are Fréchet differentiable at x with
   $$D_x(D^{[n]} f)_{|V} = D_x(D^{[n]} f) \text{ and } D_x(D^{[n]} g)_{|V} = D_x(D^{[n]} g)$$
   Using [theorem: 16.38] $(D^{[n]} f)_{|V} + (D^n g)_{|V}$ is Fréchet differentiable at x with
   $$\begin{aligned}D_x((D^{[n]} f)_{|V} + (D^n g)_{|V}) &= D_x(D^{[n]} f)_{|V} + D_x(D^{[n]} g)_{|V} \\ &= D_x(D^{[n]} f) + D_x(D^{[n]} f)\end{aligned} \tag{16.106}$$

Which as $D^{[n]}(f+g) \underset{[\text{eq } 16.105]}{=} (D^{[n]}f)_{|V} + (D^n g)_{|V}$ proves that $D^{[n]}(f+g)$ is Fréchet differentiable at x, hence by definition $f+g$ is $(n+1)$-times differentiable at x. Further we have

$$\begin{aligned} D_x^{[n+1]}(f+g) &\underset{\text{def}}{=} D_x(D^{[n]}(f+g)) \\ &= D_x((D^{[n]}f)_{|V} + (D^n g)_{|V}) \\ &= D_x(D^{[n]}f) + D_x(D^{[n]}f) \\ &= D_x^{[n+1]}f + D_x^{[n+1]}g \end{aligned}$$

proving that

$$n+1 \in S$$

2. We prove this by induction on k, so define

$$S = \left\{ k \in \mathbb{N} | \text{If } \{f_i | U \to Y\}_{i \in \{1,\ldots,k\}} \text{ is a family of } n\text{-times differentiable functions at } x \text{ then } \sum_{i=1}^{k} f_i \text{ is } n\text{-times differentiable at } x \text{ with } D_x^{[n]}\left(\sum_{i=1}^{k} f_i\right) = \sum_{i=1}^{k} D_x^{[n]} f \right\}$$

then we have:

$1 \in S$. If $\{f_i | U \to Y\}_{i \in \{1\}}$ is a family of n-times differentiable at x then as $\sum_{i=1}^{1} f_i = f_1$ and it follows that $\sum_{i=1}^{1} f_i$ is n-times differentiable at x, further

$$D_z^{[n]}\left(\sum_{i=1}^{1} f_i\right) = D_x^{[n]} f_1 = \sum_{i=1}^{1} D_x^{[n]} f_i$$

So it follows that $1 \in S$.

$k \in S \Rightarrow k+1 \in S$. Let $\{f_i : U \to Y\}_{i \in \{1,\ldots,k+1\}}$ be a family of n-times differentiable functions at x then we have as $k \in S$ that $\sum_{i=1}^{k} f_i$ is n-times differentiable at x with $D_x^{[n]}(\sum_{i=1}^{k} f_i) = \sum_{i=1}^{k} D_x^{[n]} f_i$. As also f_{k+1} is n-times differentiable at x it follows from (1) that $\sum_{i=1}^{k+1} f_i = (\sum_{i=1}^{k} f_i) + f_{k+1}$ is n-times differentiable at x with

$$\begin{aligned} D_x^{[n]}\left(\sum_{i=1}^{k+1} f_i\right) &= D_x^{[n]}\left(\sum_{i=1}^{k} f_i + f_{k+1}\right) \\ &\underset{(1)}{=} D_x^{[n]}\left(\sum_{i=1}^{k} f_i\right) + D_x^{[n]} f_{k+1} \\ &\underset{n \in S}{=} \sum_{i=1}^{k} D_x^{[n]} f_i + D_x^{[n]} f_{k+1} \\ &= \sum_{i=1}^{k+1} D_x^{[n]} f_i \end{aligned}$$

proving that

$$n+1 \in S$$

3. We use induction on n, so let

$$S = \left\{ n \in \mathbb{N} | \text{If } f : U \to Y \text{ is } n\text{-times differentiable at } x \in U \text{where } U \text{ is open in } X \text{ then } \alpha \cdot f \text{ is } n\text{-times differentiable at } x \text{ and } D_x^{[n]}(\alpha \cdot f) = \alpha \cdot D_x^{[n]} f \right\}$$

then we have:

$1 \in S$. If $f : U \to Y$ is 1-times differentiable at x then f is Fréchet differentiable at x and $D_x^{[1]} f = D_x f$. Using [theorem: 16.38] it follows that $\alpha \cdot f$ is Fréchet differentiable at x and $D_x(\alpha \cdot f) = \alpha \cdot D_x f$. Hence $\alpha \cdot f$ is 1-times differentiable and

$$D_x^1(\alpha \cdot f) = D_x(\alpha \cdot f) = \alpha \cdot D_x f = \alpha \cdot D_x^{[1]} f$$

proving that $1 \in S$.

$n \in S = n+1 \in S$. If $f: U \to Y$ is $(n+1)$-times differentiable at x then, as $1 < n+1$, there exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ f is n-times differentiable at y and

$$D^n f: V \to L_n(X;Y) \text{ defined by } D^{[n]}f(y) = D_y^{[n]}f$$

is Fréchet differentiable at x, further $D_x^{[n+1]}f$ is defined to be $D_x(D^{[n]}f)$. As $n \in S$ it follows that $\forall y \in V$ $\alpha \cdot f$ is n-times differentiable at y and

$$D_y^{[n]}(\alpha \cdot f) = \alpha \cdot D_y^{[n]}f \tag{16.107}$$

So if we define

$$D^{[n]}(\alpha \cdot f): V \to L_n(X;Y) \text{ by } D^n(\alpha \cdot f)(y) = D_y^{[n]}(\alpha \cdot f)$$

we have $\forall y \in V$ that $D^n(\alpha \cdot f)(y) = D_y^{[n]}(\alpha \cdot f) \underset{\text{[eq: 16.107]}}{=} \alpha \cdot D_y^{[n]}f = \alpha \cdot D^{[n]}f(y)$ proving

$$D^{[n]}(\alpha \cdot f) = \alpha \cdot D_y^{[n]}f \tag{16.108}$$

As $D^n f$ is Fréchet differentiable at x it follows form [theorem: 16.38] that $\alpha \cdot D^{[n]}f$ is Fréchet differentiable at x with $D_x(\alpha \cdot D^{[n]}f) = \alpha \cdot D_x(D^{[n]}f) = \alpha \cdot D_x^{[n+1]}f$. Hence by [eq: 16.108] $D^{[n]}(\alpha \cdot f)$ is Fréchet differentiable at x with

$$D_x(D^{[n]}(\alpha \cdot f)) = \alpha \cdot D_x^{[n+1]}f$$

proving that $\alpha \cdot f$ is $(n+1)$-times differentiable at x with

$$D_x^{[n+1]}(\alpha \cdot f) \underset{\text{def}}{=} D_x(D^{[n]}(\alpha \cdot f)) = \alpha \cdot D_x^{[n+1]}f$$

So we conclude that

$$n+1 \in S$$

4. If $f: U \to Y$ and $g: U \to Y$ are C^n at $x \in U$ then we have two cases to consider for n:

   $n = 0$. Then f, g continuous at x, and applying [theorem: 14.145] proves that $f+g$ is continuous at x. Hence $f+g$ is C^0 at x.

   $1 < n$. Then there exists open sets V_f, V_g with $x \in V_f, V_g \subseteq U$ such that $\forall y \in V_y$ f is n-times differentiable at y, $\forall y \in V_g$ g is n-times differentiable at y and

$$D^{[n]} f: V_f \to L_n(X;Y) \text{ defined by } D^{[n]}f(y) = D_y^{[n]}f$$

$$D^{[n]} g: V_g \to L_n(X;Y) \text{ defined by } D^{[n]}g(y) = D_y^{[n]}g$$

   are continuous at x. Take $V = V_f \bigcap V_g$ then $\forall y \in V \subseteq V_f, V_g$ we have by (1) that $\forall y \in V$ $f+g$ is n-times differentiable at y and that $D_y^{[n]}(f+g) = D_y^{[n]}f + D_y^{[n]}g$. So if we define

$$D^{[n]}(f+g): V \to L_n(X;Y) \text{ by } D^{[n]}(f+g)(y) = D_y^{[n]}(f+g)$$

   it follows that $\forall y \in V$

$$\begin{aligned} D^{[n]}(f+g)(y) &= D_y^{[n]}(f+g) \\ &= D_y^{[n]}f + D_y^{[n]}g \\ &= D^{[n]}f(y) + D^{[n]}g(y) \\ &\underset{y \in V}{=} (D^{[n]}f)_{|V}(y) + (D^{[n]}g)(y) \\ &= ((D^{[n]}f)_{|V} + (D^{[n]}g)_{|V})(y) \end{aligned}$$

   so that

$$D^{[n]}(f+g) = (D^{[n]}f)_{|V} + (D^{[n]}g)_{|V}$$

   By [theorems: 14.145, 14.134] $(D^{[n]}f)_{|V} + (D^{[n]}g)_{|V}$ is continuous at x, so that $D^{[n]}(f+g)$ is continuous at x. Hence $f+g$ is C^n at x.

5. We use induction to prove this. So let

$$S = \left\{ k \in \mathbb{N} | \{f_i: U \to Y\}_{i \in \{1,\ldots,k\}} \text{ are function that are } C^n \text{ at } x \text{ then } \sum_{i=1}^{k} f_i \text{ is } C^n \text{ at } x \right\}$$

then we have:

$1 \in S$. As $\sum_{i=1}^{k} f_i = f_1$ and f_1 is C^n at x it follows that $\sum_{i=1}^{1} f_i$ is C^n at x.

$k \in S \Rightarrow k+1 \in S$. Let $\{f_i : U \to Y\}_{i \in \{1,\ldots,k\}}$ be a family of functions that are C^n at x. As $k \in S$ $\sum_{i=1}^{k} f_i$ is C^n at x and clearly f_{k+1} is C^n at x so by (4) $f_{k+1} + \sum_{i=1}^{k} f_i$ is C^n at x. Finally as $\sum_{i=1}^{k+1} f_i = f_{k+1} + \sum_{i=1}^{k} f_i$ it follows that $\sum_{i=1}^{k+1} f_i$ is C^n at x which prove that $k+1 \in S$.

6. As f is C^n at x there exist a open V with $x \in V \subseteq U$ such that $\forall y \in V$ f is n-times differentiable at y and that the function

$$D^{[n]} f : V \to L_n(X;Y) \text{ defined by } D^{[n]} f(y) = D_y^{[n]} f$$

is continuous at x. Using (3) we have that $\forall y \in V$ $(\alpha \cdot f)$ is n-times differentiable at y and $D^{[n]}(\alpha \cdot f)(y) = \alpha \cdot D^{[n]} f(y)$. Hence if we define

$$D^{[n]}(\alpha \cdot f) : V \to L_n(X;Y) \text{ by } D^{[n]}(\alpha \cdot f)(y) = D_y^{[n]}(\alpha \cdot f)$$

then

$$D^{[n]}(\alpha \cdot f) = \alpha \cdot D^{[n]} f$$

Hence, as by [theorem: 14.145] $\alpha \cdot D^{[n]} f$ is continuous at x, it follows that $D^{[n]}(\alpha \cdot f)$ is continuous, proving that $\alpha \cdot f$ is C^n at x. □

Corollary 16.127. *Let $n \in \mathbb{N}$ $\langle \mathbb{K}, \|\rangle$ the normed space of real (complex) numbers using the norm $||$, $\langle X, \|\|\rangle$ a normed space, U a open set in $\mathbb{K}$ and $x \in U$ then we have:*

1. *If $f : U \to Y$, $g : U \to Y$ have a n-the derivative at x then $f+g$ has a n-the derivative at x and*

$$(f+g)_x^{(n)} = f_x^{(n)} + g_x^{(n)}$$

2. *If $\alpha \in \mathbb{K}$ and $f : U \to Y$ has a n-the derivative at x then $\alpha \cdot f$ has a n-the derivative x and $(\alpha \cdot f)_x^{(n)} = \alpha \cdot f_x^{(n)}$.*

Proof.

1. If $f : U \to Y$, $g : U \to Y$ have a n-the derivative at x then by [theorem: 16.115] f, g are n-times differentiable at x and $f_x^{(n)} = D^{[n]} f(x)\left(\underbrace{1:\ldots:1}_{n}\right)$, $g_x^{(n)} = D^{[n]} g(x)\left(\underbrace{1:\ldots:1}_{n}\right)$. Using [theorem: 16.126] $f+g$ is n-times differentiable at x with $D_x^{[n]}(f+g) = D_x^{[n]} f + D_x^{[n]} g$. Hence by [theorem: 16.115] $f+g$ has a n-the derivative at x with

$$\begin{aligned}
(f+g)_x^{(n)} &= D_x^{[n]}(f+g)\left(\underbrace{1:\ldots:1}_{n}\right) \\
&= \left(D_x^{[n]} f + D_x^{[n]} g\right)(1:\ldots:1) \\
&\underset{\text{[lemma: 16.85]}}{=} D_x^{[n]} f\left(\underbrace{1:\ldots:1}_{n}\right) + D_x^{[n]} g\left(\underbrace{1:\ldots:1}_{n}\right) \\
&= f_x^{[n]} + g_x^{[n]}
\end{aligned}$$

2. As f has a n-the derivative at x it follows by [theorem: 16.115] that f is n-times differentiable at x and that $f_x^{(n)} = D_x^{[n]} f\left(\underbrace{1:\ldots:1}_{n}\right)$.

Using [theorem: 16.126] it follows that $\alpha \cdot f$ is n-times differentiable at x with $D_x^{[n]}(\alpha \cdot f) = \alpha \cdot D_x^{[n]} f$. Hence using [theorem: 16.115] again $\alpha \cdot f$ has a n-the derivative at x with

$$\begin{aligned}
(\alpha \cdot f)_x^{(n)} &= D_x^{[n]}(\alpha \cdot f)\left(\underbrace{1:\ldots:1}_{n}\right) \\
&= \left(\alpha \cdot D_x^{[n]} f\right)\left(\underbrace{1:\ldots:1}_{n}\right) \\
&\underset{\text{[lemma: 16.85]}}{=} \alpha \cdot D_x^{[n]} f\left(\underbrace{1:\ldots:1}_{n}\right) \\
&= \alpha \cdot f_x^{[n]}
\end{aligned}$$

□

16.2.2.6 Examples of ∞-times differentiable functions

We show now some example of ∞-times differentiable functions or equivalent functions that are C^∞ [see theorem: 16.107].

Example 16.128. Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces, U a open set in X and $y \in Y$ then the constant function $C_y: U \to Y$ defined by $C_y(x) = y$ is ∞-times differentiable for every $x \in U$ [hence by [theorem: 16.107] C_y is C^∞ on U]. Furthermore $\forall n \in \mathbb{N}$, $\forall x \in U$ we have that $D_x^{[n]} C_y = 0_n$ where $0_n \in L_n(X;Y)$ is the neutral element in $L_n(X;Y)$.

Proof. We prove this by induction on n, so define

$$S = \left\{ n \in \mathbb{N} | C_y: U \to Y \text{ is } n\text{-times differentiable with } \forall x \in U \; D_x^{[n]} C_y = 0_n \right\}$$

then we have:

$1 \in S$. Let $x \in U$, $\varepsilon \in \mathbb{R}^+$ then for $h \in U_x$ with $|h| < 1$ we have that

$$\|C_y(x+h) - C_y(h) - 0_1(h)\|_Y = \|y - y - 0\|_Y = \|0\|_Y = 0 \leqslant \varepsilon \cdot \|h\|_X$$

proving that C_y is Fréchet differentiable at x with $D_x f = 0_1$. Hence by definition f is 1-times differentiable with $D_x^{[1]} f = 0_1$ proving that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. As $n \in S$ it follows that $\forall x \in U$ C_0 is n-times differentiable with

$$D_x^{[n]} C_y = 0_n \in L_n(X;Y). \tag{16.109}$$

Allowing us to define

$$D^{[n]} C_y: U \to L_n(X;Y) \text{ by } D^{[n]} C_y(x) = D_x^{[n]} C_y = 0_n$$

Let $\varepsilon \in \mathbb{R}^+$ then for $h \in U_x$ with $|h| < 1$ we have

$$\begin{aligned} \|(D^{[n]} C_y)(x+h) - (D^{[n]} C_n)(x) - 0_{n+1}(h)\|_{L_n(X;Y)} &\underset{\text{[eq: 16.109]}}{=} \|0_n - 0_n - 0_{n+1}(h)\|_{L_n(X;Y)} \\ &= \|0_n\|_{L_n(X;y)} \\ &= 0 \\ &\leqslant \varepsilon \cdot \|h\|_x \end{aligned}$$

proving that $D^{[n]} C_y$ is Fréchet differentiable at x with $D_x(D^{[n]} C_y) = 0_{n+1}$. Hence f is $(n+1)$-times differentiable at x with $D_x^{[n+1]} C_y = 0_{n+1}$. □

Example 16.129. Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces and $L \in L(X,Y)$ then we have:

1. L is ∞-times differentiable on X [hence by [theorem: 16.107] L is C^∞ on X]
2. $\forall n \in \mathbb{N}$ we have $\forall x \in X$ that

$$D_x^{[n]} L = \begin{cases} L \text{ if } n = 1 \\ 0_n \text{ if } 1 < n \end{cases}$$

Proof. For $n \in \mathbb{N}$ we have either:

$n = 1$. Then by [example: 16.27] we have that L is Fréchet differentiable at $x \in X$ with $D_x f = L$. So by definition L is 1-times differentiable at x and $D^{[1]} f(x) = L$.

$1 < n$. We proceed by induction, so let

$$S = \left\{ n \in \{2, \ldots, \infty\} | L \text{ is n-times differentiable at } x \in X \text{ with } D_x^{[n]} L = 0_n \right\}$$

then we have:

$2 \in S$. As L is 1-times differentiable with $D^{[1]} L(x) = L$ for every $x \in X$ it follows that for

$$D^{[1]} L: X \to L_1(X;Y) \text{ defined by } D^{[1]} L(x) = D_x^{[1]} L = D_x L = L$$

we have $D^{[1]} L = C_L$. Hence using [example: 16.128] it follows that $D^{[1]} L$ is 1-times differentiable (hence Fréchet differentiable) at x where $D_x(D^{[1]} L) = D_x^{[1]}(D^{[1]} L)$ is the neutral element in $L_1(X, L_1(X;Y)) = L_2(X;Y)$, or in other words $D_x(D^{[1]} L) = 0_2$. So L is 2-times differentiable at x with $D^{[2]} L(x) = 0_2$ proving that $2 \in S$.

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$. As $n \in S$ it follows that $\forall x \in X$ L is n-times differentiable at x and that $D_x^{[n]}L = 0_n$. Hence if we define

$$D^{[n]}L: X \to L_n(X;Y) \text{ by } D^{[n]}L(x) = D_x^{[n]}L = 0_n$$

it follows that $D^{[n]}L = C_{0_n}$. Using [example: 16.128] it follows then that $\forall x \in X$ $D^{[n]}L$ is 1-times differentiable (hence Fréchet differentiable) at x and that $D_x(D^{[n]}L) = D_x^{[1]}(D^{[n]}L)$ is the neutral element of $L_1(X; L_n(X;Y)) = L_{n+1}(X;Y)$. Hence L is $(n+1)$-times differentiable at x and $D_x^{[n+1]}L = D_x(D^{[n]}L) = 0_{n+1}$ proving that

$$n+1 \in S$$

□

Example 16.130. Let $\langle X, \|\|\rangle$ be a normed space, U a open set in X then $\mathrm{Id}_U: U \to X$ is C^∞ on X.

Proof. Using [theorem: 14.185] $\mathrm{Id}_X \in L(X,X)$ so that by [theorem: 16.129] Id_X is C^∞ on X. Finally from [theorem: 16.106] it follows that Id_U is C^∞ on X. □

Example 16.131. Let $\langle \mathbb{K}, \|\rangle$ be the normed space of real (complex) numbers, $\langle X, \|\|\rangle$ a normed space over $\mathbb{K}$, U a open set in $\mathbb{K}$, x, $y \in X$ then for

$$\varphi: U \to X \text{ where } \varphi(t) = t \cdot x + y$$

we have that φ is C^∞ on U and $\forall t \in U$ we have that $D_t^{[1]}f = L$ where $L: U \to X$ is defined by $L(r) = r \cdot x$. So by [theorem: 16.115] we have that φ has a derivative for every $t \in U$ with $\varphi'_t = D_t^{[1]}(1) = L(1) = x$.

Proof. Define $L: \mathbb{K} \to X$ by $L(r) = r \cdot x$ then by [example: 14.186] it follows that $L \in L(\mathbb{K}, X)$. Let $t \in U$ then given $\varepsilon \in \mathbb{R}^+$ we have for $h \in U_x$ with $|h| < 1$ that

$$\|\varphi(t+h) - \varphi(t) - L(h)\| = \|(t+h) \cdot x + y - (t \cdot x + y) - h \cdot x\| = \|h \cdot x - h \cdot x\| = \|0\| \leqslant \varepsilon \cdot |h|$$

proving that φ is Fréchet differentiable at t with $D_t\varphi = L$. Hence φ is 1-times differentiable on U with $D_1^{[1]}\varphi = L$. So if we define

$$D^{[1]}\varphi: U \to L_1(X;Y) \text{ by } D^{[1]}\varphi(t) = D_t^{[1]}\varphi$$

then $D^{[1]}\varphi = C_L$ a constant function. As a constant function is continuous it follows that φ is C^1 on U. Further as a constant function is of C^∞ on U [see example: 16.128] if follows that $D^1\varphi$ is C^∞ on U hence by [theorem: 16.124] it follows that φ is C^∞ on U. □

Example 16.132. Let $k \in \mathbb{N} \setminus \{1\}$, $\{\langle X_i, \|\|_i\rangle\}_{i \in \{1,\ldots,k\}}$ a finite family of normed spaces, $\langle Y, \|\|\rangle$ a normed space, $i \in \{1,\ldots,k\}$, $x \in \prod_{j \in \{1,\ldots,k\}} X_j$ then

$$I^{[i,x]}: X_i \to \prod_{j \in \{1,\ldots,k\}} X_j \text{ defined by } I^{[i,x]}(t) = \left(x_1, \ldots \underbrace{t}_{i} \ldots, x_n\right) \text{ [see definition: 16.43]}$$

is ∞-times differentiable at $t \in X_i$ [hence C^∞ at t]. Further $\forall n \in \mathbb{N}$

$$D_x^{[n]}I^{[i,x]}(x) = \begin{cases} I^{[i,0]} \text{ if n=1} \\ 0_n \text{ if } 1 < n \end{cases}$$

Proof. Let $x \in \prod_{j \in \{1,\ldots,k\}} X_j$ and $i \in \{1,\ldots,k\}$. If $t \in X_i$ then

$$\begin{aligned}
\left(I^{[i,0]} + C_{\left(x_1, \ldots \underbrace{0}_{i} \ldots, x_n\right)}\right)(t) &= I^{[i,0]}(t) + C_{(x_1,\ldots,x_{i-1},0,x_{i+1},\ldots,x_n)}(t) \\
&= \left(0, \ldots, \underbrace{t}_{i}, \ldots, 0_i\right) + (x_1, \ldots \underbrace{0}_{} \ldots, x_n) \\
&= \left(x_1, \ldots \underbrace{t}_{i} \ldots, x_n\right) \\
&= I^{[i,x]}(t)
\end{aligned}$$

so that

$$I^{[i,x]} = I^{[i,0]} + C_{\left(x_1, \ldots \underbrace{0}_{i} \ldots, x_n\right)}$$

By [lemma: 16.45] $I^{[i,0]} \in L\big(X_i, \prod_{j\in\{1,\dots,k\}} X_j\big)$ so that by [examples: 16.129 and 16.128] $I^{[i,0]}$ and $C_{\left(x_1,\dots\underbrace{0}_{i}\dots,x_n\right)}$ are ∞-times differentiable at $t \in X_i$. Hence using [theorem: 16.126] it follows that

$$I^{[i,x]} \text{ is } \infty\text{-times differentiable at } t$$

and $\forall n \in \mathbb{N}$ we have

$$D_t^{[n]} I^{[i,x]} = D_t^{[n]} I^{[i,0]} + D_t^{[n]} C_{\left(x_1,\dots\underbrace{0}_{i}\dots,x_n\right)} \underset{\text{[example: 16.128]}}{=} D_t^{[n]} I^{[i,0]} \tag{16.110}$$

If $n \in \mathbb{N}$ then we have either:

$n = 1$. Then by [example: 16.129] and $I^{[i,0]} \in L\big(X_i, \prod_{j\in\{1,\dots,k\}} X_j\big)$ $D^{[1]} I^{[i,0]}(t) = I^{[i,0]}$

$1 < n$. Then by [example: 16.129] and $I^{[i,0]} \in L\big(X_i, \prod_{j\in\{1,\dots,k\}} X_j\big)$ $D^{[1]} I^{[i,0]}(t) = 0_n$ □

Example 16.133. Let $\langle X, \|\|\rangle$ be a normed space, $x \in X$ then for the translation function τ_x defined by

$$\tau_x : X \to X \text{ where } \tau_x(y) = x + y$$

we have that:

1. τ_x is ∞-times differentiable at $y \in Y$ [hence C^∞ at y]
2. $\forall n \in \mathbb{N}$, $\forall y \in X$ we have

$$D_y^{[n]} \tau_x = \begin{cases} \mathrm{Id}_X \text{ if } n = 1 \\ 0_n \text{ if } 1 < n \end{cases}$$

Proof. Let $x \in X$ then $\forall y \in X$ we have $(\mathrm{Id}_X + C_x)(y) = \mathrm{Id}_X(y) + C_x(y) = y + x = \tau_x(y)$ proving that

$$\tau_x = \mathrm{Id}_X + C_x$$

As $\mathrm{Id}_X \in L(X, X)$ [see example: 14.175] we have by [example: 16.129] that Id_X is ∞-times differentiable, further by [example: 16.128] we have that C_x is ∞-times differentiable. Using [theorem: 16.126] it follows that τ_x is ∞-times differentiable and

$$D_y^{[n]} \tau_x = D_y^{[n]} \mathrm{Id}_X + D_y^{[n]} C_x \underset{\text{[example: 16.128]}}{=} D_y^{[n]} \mathrm{Id}_X + 0_n = D_y^{[n]} \mathrm{Id}_X$$

Hence using [example: 16.129] it follows that

$$D_y^{[n]} \tau_x = \begin{cases} \mathrm{Id}_X \text{ if } n = 1 \\ 0_n \text{ if } 1 < n \end{cases}$$ □

Example 16.134. Let $k \in \mathbb{N}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\dots,k\}}$ be a finite family of normed spaces, $i \in \{1,\dots,k\}$ then the projection map π_i: $\prod_{j\in\{1,\dots,k\}} X_j \to X_i$ is ∞-times differentiable at $x \in \prod_{j\in\{1,\dots,k\}} X_j$ [hence C^∞ at x] and $\forall n \in \mathbb{N}$ we have

$$D_t^{[n]} \pi_i = \begin{cases} \pi_i \text{ if } n = 1 \\ 0_n \text{ if } 1 < n \end{cases}$$

Proof. As by [theorem: 14.187] $\pi_i \in L\big(\prod_{j\in\{1,\dots,k\}} X_j, X_i\big)$ the proof follows from [example: 16.129]. □

Theorem 16.135. *Let $\langle X_1, \|\|_1\rangle$, $\langle X_2, \|\|_2\rangle$ and $\langle Y, \|\|\rangle$ be normed spaces, $\langle X_1 \cdot X_2, \|\|_{\max}\rangle$ the normed space based on $X_1 \cdot X_2$ using the maximum norm and $L \in L(X_1, X_2; Y)$ be a bi-linear mapping then $\forall x = (x_1, x_2) \in X_1 \cdot X_2$ we have*

1. *L is ∞-times differentiable at x [hence L is C^∞ at x]*
2. *$D_x^{[1]} L \underset{x=(x_1,x_2)}{=} D_{(x_1,x_2)}^{[1]} L = L(x_1, *) + L(*, x_2)$ where*

$$L(x_1, *) + L(*, x_2) : X_1 \cdot X_2 \to Y \text{ is defined by } (L(x_1, *) + L(*, x_2))(r, s) = L_1(x_1, s) + L(r, x_2)$$

3. *$D_x^{[2]} L \underset{x=(x_1,x_2)}{=} D_{(x_1,x_2)}^{[2]} L = D^{[1]} L$ where*

$$D^{[1]} L : X_1 \cdot X_2 \to L_2(X_1 \cdot X_2, L(X_1 \cdot X_2; Y)) \text{ is defined by } (D^{[1]} L)(x_1, x_2) = D_{(x_1,x_2)}^{[1]} L$$

4. *If $n \in \{3, \dots . \infty\}$ then $D^{[n]} L(x_1, x_2) = 0_n$*

***Note* 16.136.** *As L is ∞-times differentiable at x and C^∞ at x for every x in $X_1 \cdot X_2$ it follows that L is ∞-times differentiable on $X_1 \cdot X_2$ and C^∞ on $X_1 \cdot X_2$.*

Proof. For $n \in \mathbb{N}$ we have either:

$n = 1$. Using [lemma: 16.69] L is Fréchet differentiable at (x_1, x_2) with

$$D_{(x_1,x_2)} L = L(x_1, *) + L(*, x_2)$$

hence L is 1-times differentiable and $D^{[1]}_{(x_1,x_2)} L = L(x_1, *) + L(*, x_2)$

$n = 2$. Define

$$D^{[1]}L \colon X_1 \cdot X_2 \to L(X_1 \cdot X_2, Y) \text{ by } D^{[1]}L(x_1, x_2) = D^{[1]}_{(x_1,x_2)} L = L(x_1, *) + L(*, x_2)$$

If $(x_1, x_2), (y_1, y_2) \in X_1 \cdot X_2$,, $\alpha \in \mathbb{K}$ then for every $(r, s) \in X_1 \cdot X_2$ we have

$$\begin{aligned}
D^{[1]}L((x_1, x_2) + \beta \cdot (y_1, y_2))(r, s) &= D^{[1]}L(x_1 + \beta \cdot y_1, x_2 + \beta \cdot y_2)(r, s) \\
&= (L(x_1 + \beta \cdot y_1, *) + L(*, x_2 + \beta \cdot y_2))(r, s) \\
&= L(x_1 + \beta \cdot y_1, s) + L(r, x_2 + \beta \cdot y_2) \\
&= L(x_1, s) + \beta \cdot L(y_1, s) + L(r, x_2) + \beta \cdot L(r, y_2) \\
&= (L(x_1, s) + L(r, x_2)) + \beta \cdot (L(y_1, s) + L(r, y_2)) \\
&= D^{[1]}L(x_1, x_2)(r, s) + \beta \cdot D^{[1]}L(y_1, y_2)(r, s) \\
&= (D^{[1]}L(x_1, x_2) + D^{[1]}L(y_1, Y_2))(r, s)
\end{aligned}$$

proving that

$$D^{[1]}L((x_1, x_2) + \beta \cdot (y_1, y_2)) = D^{[1]}L(x_1, x_2) + D^{[1]}L(y_1, Y_2)$$

Hence we have that

$$D^{[1]}L \text{ is linear} \tag{16.111}$$

Further we have that $\forall (x_1, x_2), (r, s) \in X_1 \cdot X_2$

$$\begin{aligned}
\|D^{[1]}L(x_1, x_2)(r, s)\| &= \\
\|L(x_1, s) + L(r, x_2)\| &\leqslant \\
\|L(x_1, s)\| + \|L(r, x_2)\| &\leqslant_{\text{[theorem: 14.190]}} \\
\|L\|_{L(X_1,X_2;Y)} \cdot \|x\|_1 \cdot \|s\|_2 + \|L\|_{L(X_1,X_2;Y)} \cdot \|r\|_1 \cdot \|x_2\|_2 &\leqslant \\
\|L\|_{L(X_1,X_2;Y)} \cdot (\|x\|_1 \cdot \|s\|_2 + \|r\|_1 \cdot \|x_2\|_2) &\leqslant \\
\|L\|_{L(X_1,X_2;Y)} \cdot (\|x\|_1 \cdot \max(\|r\|_1, \|s\|_2) + \|x_2\| \cdot \max(\|r\|_1, \|s\|_2)) &= \\
\|L\|_{L(X_1,X_2;Y)} \cdot (\|x_1\|_1 + \|x_2\|_2) \cdot \max(\|r\|_1, \|s\|_2) &= \\
\|L\|_{L(X_1,X_2;Y)} \cdot (\|x_1\|_1 + \|x_2\|_2) \cdot \|(r, s)\|_{\max} &\leqslant \\
\|L\|_{L(X_1,X_2;Y)} \cdot (\max(\|x_1\|_1, \|x_2\|_2) + \max(\|x_1\|_1, \|x_2\|_2)) \cdot \|(r, s)\|_{\max} &= \\
\|L\|_{L(X_1,X_2;Y)} \cdot 2 \cdot \max(\|x_1\|_1, \|x_2\|_2) \cdot \|(r, s)\|_{\max} &= \\
(2 \cdot \|L\|_{L(X_1,X_2;Y)} \cdot \|(x_1, x_2)\|_{\max}) \cdot \|(r, s)\|_{\max} &
\end{aligned}$$

proving, as $D^{[1]}L(x_1, x_2) \in L(X_1 \cdot X_2, Y)$, by [definition: 14.181] that

$$\|D^{[1]}L(x_1, x_2)\|_{L(X_1 \cdot X_2, Y)} \leqslant 2 \cdot \|L\|_{L(X_1,X_2;Y)} \cdot \|(x_1, x_2)\|_{\max}$$

so that by [theorem: 14.190] it follows that

$$D^{[1]}L \in L(X_1 \cdot X_2, L(X_1 \cdot X_2, Y)) = L_2(X_1 \cdot X_2; Y) \tag{16.112}$$

Using [example: 16.27] it follows that $D^{[1]}L$ is differentiable at $(x_1, x_2) \in X_1 \cdot X_2$ with $D_{(x_1,x_2)}(D^{[1]}L) = D^{[1]}L$, hence it follows that

$$L \text{ is 2-times differentiable at } (x_1, x_2) \text{ and } D^{[2]}_{(x_1,x_2)} L = D^{[1]}L \tag{16.113}$$

$n \in \{3, \ldots, n\}$. We use induction on n to proceed, so define

$$S = \left\{ n \in \{3, \ldots, \infty\} | L \text{ is } n\text{-times differentiable at } (x_1, x_2) \in X_1 \cdot X_2 \text{ and } D^{[n]}_{(x_1,x_2)} L = 0_n \right\}$$

then we have:

$3 \in S$. Define

$$D^{[2]}f: X_1 \cdot X_2 \to L_2(X_1 \cdot X_2; Y) \text{ by } D^{[2]}f(x_1, x_2) = D^{[2]}_{(x_1,x_2)}f$$

then by [eq: 16.113] $D^{[2]}f = C_{D^{[1]}f}$. Hence using [example: 16.26] it follows that $D^{[2]}f$ is differentiable at $(x_1, x_2) \in X_1 \cdot X_2$ with $D_{(x_1,x_2)}(D^{[2]}f) = 0_3$. So by definition L is 3-times differentiable at (x_1, x_2) with $D^{[3]}_{(x_1,x_2)}L = 0_3$.

$n \in S \Rightarrow n+1 \in S$. As $n \in S$ it follows that $\forall (x_1, x_2) \in X_1 \cdot X_2$ L is n-times differentiable at x and that $D^{[n]}_{(x_1,x_2)}L(x) = 0_n$. Hence if we define

$$D^{[n]}L: X_1 \cdot X_2 \to L_n(X_1 \cdot X_2; Y) \text{ by } (D^{[n]}L)(x_1, x_2) = D^{[n]}_{(x_1,x_2)}L = 0_n$$

it follows that $D^{[n]}L = C_{0_n}$. Using [example: 16.128] it follows then that $\forall (x_1, x_2) \in X_1 \cdot X_2$ $D^{[n]}L$ is 1-times differentiable (hence Fréchet differentiable) at x and that $D_{(x_1,x_2)}(D^{[n]}L) = D^{[1]}_{(x_1,x_2)}(D^{[n]}L)$ is the neutral element of $L_1(X_1 \cdot X_2; L_n(X_1 \cdot X_2; Y)) = L_{n+1}(X_1 \cdot X_2; Y)$. Hence L is $(n+1)$-times differentiable at x and $D^{[n+1]}_{(x_1,x_n)}L = D_{(x_1,x_2)}(D^{[n]}L) = 0_{n+1}$ proving that $n+1 \in S$. □

16.2.2.7 The chain rule for higher order derivatives

The purpose of this section is to prove that the composition of n-times differentiable functions is again n-times differentiable. As a preparation for this goal we need to prove and state some supporting lemma's.

Lemma 16.137. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$, $\langle Z, \|\|_Z \rangle$ be normed spaces, $L \in L(Y, Z)$ then if we define*

$$(L \circ *): L(X, Y) \to L(X, Z) \text{ by } (L \circ *)(T) = L \circ T$$

we have that

$$(L \circ *) \in L(L(X, Y), L(X, Z))$$

Proof. First note that if $L \in L(Y, Z)$ and $T \in L(X, Y)$ then by [theorem: 14.188] $L \circ T \in L(X, Z)$ so that $(* \circ L)$ is indeed a function between $L(X, Y)$ and $L(X, Z)$. Next we need to prove linearity. Let $T_1, T_2 \in L(X, Y)$, $\alpha \in \mathbb{K}$ then for $z \in X$ we have

$$\begin{aligned}
((L \circ *)(T_1 + \alpha \cdot T_2))(z) &= (L \circ (T_1 + \alpha \cdot T_2))(z) \\
&= L((T_1 + \alpha \cdot T_2)(z)) \\
&= L(T_1(z) + \alpha \cdot T_2(z)) \\
&= L(T_1(z)) + \alpha \cdot L(T_2(z)) \\
&= (L \circ T_1)(z) + \alpha \cdot (L \circ T_2)(z) \\
&= ((L \circ T_1) + \alpha \cdot (L \circ T_2))(z) \\
&= ((L \circ *)(T_1) + \alpha \cdot (L \circ *)(T_2))(z)
\end{aligned}$$

proving that $(L \circ *)(T_1 + \alpha \cdot T_2) = (L \circ *)(T_1) + \alpha \cdot (L \circ *)(T_2)$ or

$$(L \circ *) \in \mathrm{Hom}(L(X, Y), L(X, Z))$$

As for continuity. Let $T \in L(X, Y)$ then as $L \in L(Y, Z)$ we have by [theorem: 14.188] that

$$\|(L \circ *)(T)\|_{L(X,Z)} = \|L \circ T\|_{L(X,Z)} \leqslant \|L\|_{L(Y,Z)} \cdot \|T\|_{L(X,Y)}$$

which proves by [theorem: 14.177] that

$$(L \circ *) \in L(L(X, Y), L(X, Z))$$ □

Lemma 16.138. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$, $\langle Z, \|\|_Z \rangle$ normed spaces, U a open set in X, $x \in U$ $f: U \to Y$ is a function that is n-times differentiable at x then $L \circ f$ is n-times differentiable at x.*

Proof. We use induction to prove this, so define

$S = \{n \in \mathbb{N} | \text{If } \langle X, \|\|_X \rangle, \langle Y, \|\|_Y \rangle, \langle Z, \|\|_Z \rangle$ are normed spaces, U a open set in X, $x \in U$, $f: U \to Y$ is n-times differentiable at x and $L \in L(Y, Z)$ then $L \circ f$ is n-times differentiable at $x\}$

then we have:

$1 \in S$. If f is 1-times differentiable at x then f is Fréchet differentiable at x. Hence if $L \in L(Y, Z)$ we have by [corollary: 16.42] that $L \circ f$ is Fréchet differentiable at x, hence by definition 1-times differentiable at x, which proves that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $f: U \to Y$ be $(n+1)$ differentiable at x and let $L \in L(Y, Z)$. Using the fact that $1 < n+1$ together with [theorem: 16.122] there exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ f is 1-times differentiable at y [hence Fréchet differentiable at y] and

$$D^{[1]}f: V \to L(X, Y) \text{ defined by } D^{[1]}f(y) = D_y^{[1]}f \underset{\text{def}}{=} D_y f \tag{16.114}$$

is n-times differentiable at x. As f is Fréchet differentiable at $y \in U$ we can use [corollary: 16.42] to prove that $L \circ f$ is Fréchet differentiable at y and $D_y(L \circ f) = L \circ D_y f$, so by definition

$$L \circ f \text{ is 1-times differentiable at } y \in U \text{ and } D_y^{[1]}(L \circ f) = L \circ D_y^{[1]}f \tag{16.115}$$

So we can define

$$D^{[1]}(L \circ f): U \to L(X, L(X, Z)) \text{ by } D^{[1]}(L \circ f)(y) = D_y^{[1]}(L \circ f) \tag{16.116}$$

Take now $(L \circ *) \in L(L(X, Y), L(X, Z))$ defined by $(L \circ *)(T) = L \circ T$ [see lemma: 16.137]. Let $y \in V$ then

$$\begin{aligned}
((L \circ *) \circ D^1 f)(y) &= (L \circ *)(D^{[1]}f(y)) \\
&= (L \circ *)\left(D_y^{[1]}f\right) \\
&= L \circ D_y^{[1]}f \\
&\underset{\text{[eq: 16.115]}}{=} D_y^{[1]}(L \circ f) \\
&\underset{\text{[eq: 16.116]}}{=} D^{[1]}(L \circ f)(y)
\end{aligned}$$

which proves that

$$(L \circ *) \circ D^1 f = D^{[1]}(L \circ f) \tag{16.117}$$

As $D^{[1]}f$ is n-times differentiable at x, $(L \circ *) \in L(L(X, Y), L(X, Z))$ and $n \in S$ it follows that $(L \circ *) \circ D^{[1]}f$ is n-times differentiable at x, hence, using [eq: 16.117], it follows that $D^{[1]}(L \circ f)$ is n-times differentiable at x. Using [eq: 16.115] together with [theorem: 16.122] proves that $L \circ f$ is $(n+1)$-times differentiable at x. So

$$n+1 \in S$$

□

We use a similar proof for the following lemma.

Lemma 16.139. *Let $n \in \mathbb{N}_0$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$, $\langle Z, \|\|_Z \rangle$ be normed spaces, U a open set in X, $x \in U$, $f: U \to Y$ is a function that is C^n at x and $L \in L(Y, Z)$ then $L \circ f$ is C^n at x.*

Proof. For $n \in \mathbb{N}_0$ we have either:

$n = 0$. As f is C^0 at x, f is continuous at x, hence, as L is continuous, $L \circ f$ is continuous at x [see theorem 14.139], so it follows that $L \circ f$ is C^0 at x.

$n \in \mathbb{N}$. We use induction to prove this, so define

$S = \{n \in \mathbb{N} | \text{If } \langle X, \|\|_X \rangle, \langle Y, \|\|_Y \rangle, \langle Z, \|\|_Z \rangle$ are normed spaces, U a open set in X, $x \in U$, $f: U \to Y$ is C^n at x and $L \in L(Y, Z)$ then $L \circ f$ is C^n at $x\}$

then we have:

$1 \in S$. If f is C^1 at x there exist a open set V with $x \in V \subseteq U$ such that f is n-times differentiable on V [hence Fréchet differentiable at x] and the function

$$D^{[1]}f: V \to L(X, Y) \text{ defined by } D^{[1]}f(y) = D_y^{[1]}f \tag{16.118}$$

is continuous at x. Let $y \in V$ then as f is Fréchet differentiable at y it follows from [corollary: 16.42] that $L \circ f$ is Fréchet differentiable at y [hence 1-times differentiable at y] and

$$D_y^{[1]}(L \circ f) = D_y(L \circ f) = L \circ D_y f = L \circ D_y^{[1]}f \tag{16.119}$$

So $L \circ f$ is 1-times differentiable on V and we can define the function

$$D^{[1]}(L \circ f): V \to L(X, Z) \text{ by } D^{[1]}(L \circ f)(y) = D_y^{[1]}(L \circ f) \tag{16.120}$$

Let $y \in V$ then

$$\begin{aligned}((L \circ *) \circ D^{[1]} f)(y) &= (L \circ *)(D^{[1]} f(y)) \\ &= L \circ D^{[1]} f(y) \\ &\underset{\text{[eq: 16.118]}}{=} L \circ D_y^{[1]} f \\ &\underset{\text{[eq: 16.119]}}{=} D_y^{[1]}(L \circ f) \\ &\underset{\text{[eq: 16.120]}}{=} D^{[1]}(L \circ f)(y)\end{aligned}$$

proving that

$$(L \circ *) \circ D^{[1]} f = D^{[1]}(L \circ f)$$

As $D^{[1]} f$ is continuous at x and $(L \circ *)$ is continuous by [lemma: 16.137] it follows that $D^{[1]}(L \circ f)$ is continuous at x. So $L \circ f$ is C^1 at x which proves that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. If f is C^{n+1} at x then by [theorem: 16.124] there exist a open set V with $x \in V \subseteq U$ such that f is 1-times differentiable on V [hence Fréchet differentiable on V] and the function

$$D^{[1]} f: V \to L(X, Y) \text{ defined by } D^{[1]} f(y) = D_y^{[1]} f \text{ is } C^n \text{ on } V \tag{16.121}$$

Let $y \in V$ then as f is Fréchet differentiable at y it follows from [corollary: 16.42] that $L \circ f$ is Fréchet differentiable at y [hence 1-times differentiable at y] and

$$D_y^{[1]}(L \circ f) = D_y(L \circ f) = L \circ D_y f = L \circ D_y^{[1]} f \tag{16.122}$$

Define

$$D^{[1]}(L \circ f): V \to L(X, Z) \text{ by } D^{[1]}(L \circ f)(y) = D_y^{[1]}(L \circ f) \tag{16.123}$$

then

$$\begin{aligned}((L \circ *) \circ D^{[1]} f)(y) &= (L \circ *)(D^{[1]} f(y)) \\ &= L \circ D^{[1]} f(y) \\ &\underset{\text{[eq: 16.121]}}{=} L \circ D_y^{[1]} f \\ &\underset{\text{[eq: 16.122]}}{=} D_y^{[1]}(L \circ f) \\ &\underset{\text{[eq: 16.123]}}{=} D^{[1]}(L \circ f)(y)\end{aligned}$$

proving that

$$(L \circ *) \circ D^{[1]} f = D^{[1]}(L \circ f) \tag{16.124}$$

As $D^{[1]} f: V \to L(X, Y)$ is C^n at x and $(L \circ *) \in L(L(X, Y), L(X, Z))$ [see lemma: 16.137] and $n \in S$ it follows that $(L \circ *) \circ D^{[1]} f$ is C^n at x. Combining this with the above [eq: 16.124] proves that $D^{[1]}(L \circ f)$ is C^n at x. Applying then [theorem: 16.124] it follows that $L \circ f$ is C^{n+1} at x proving that

$$n+1 \in S$$

□

Lemma 16.140. *Let $n \in \mathbb{N}$, $\langle X, \|\|\rangle$ a normed space, $\{\langle Y_i, \|\|_i\rangle\}_{i \in \{1, \ldots, n\}}$ a finite family of normed spaces then if we define [see lemma: 16.64]*

$$\mathcal{K}: \prod_{i \in \{1, \ldots, n\}} L(X, Y_i) \to L\left(X, \prod_{i \in \{1, \ldots, n\}} Y_i\right) \text{ by } \mathcal{K}(L_1, \ldots, L_n) = (L_1, \ldots, L_n)_*$$

we have

$$\mathcal{K} \in L\left(\prod_{i \in \{1, \ldots, n\}} L(X, Y_i), L\left(X, \prod_{i \in \{1, \ldots, n\}} Y_i\right)\right)$$

where $\left\langle \prod_{i \in \{1, \ldots, n\}} L(X, Y_i), \|\|_{\max}\right\rangle$ is the normed space with the maximum norm $\|\|_{\max}$ defined to be $\|(L_1, \ldots, L_n)\|_{\max} = \max\left(\{\|L_i\|_{L(X, Y_i)} | i \in \{1, \ldots, n\}\}\right)$

Proof. Let $\alpha \in \mathbb{K}$, $(L_1, \dots, L_n)$, $(K_1, \dots, K_n) \in \prod_{i \in \{1, \dots, n\}} L(X, Y_i)$ then we have for $x \in X$ that

$$\begin{aligned}
\mathcal{K}((L_1, \dots, L_n) + \alpha \cdot (K_1 \dots, K_n))(x) &= \mathcal{K}((L_1 + \alpha \cdot K_1, \dots, L_n + \alpha \cdot K_n))(x) \\
&= (L_1 + \alpha \cdot K_1, \dots, L_n + \alpha \cdot K_n)_*(x) \\
&= ((L_1 + \alpha \cdot K_1)(x), \dots, (L_n + \alpha \cdot K_n)(x)) \\
&= (L_1(x) + \alpha \cdot K_1(x), \dots, L_n(x) + \alpha \cdot K_n(x)) \\
&= (L_1(x), \dots, L_n(x)) + \alpha \cdot (K_1(x), \dots, K_n(x)) \\
&= (L_1, \dots, L_n)_*(x) + \alpha \cdot (K_1, \dots, K_n)_*(x) \\
&= \mathcal{K}(L_1, \dots, L_n)(x) + \alpha \cdot \mathcal{K}(K_1, \dots, K_n)(x) \\
&= (\mathcal{K}(L_1, \dots, L_n) + \alpha \cdot \mathcal{K}(K_1, \dots, K_n))(x)
\end{aligned}$$

proving that $\mathcal{K}((L_1, \dots, L_n) + \alpha \cdot (K_1 \dots, K_n)) = \mathcal{K}(L_1, \dots, L_n) + \alpha \cdot \mathcal{K}(K_1, \dots, K_n)$. So we have

$$\mathcal{K} \in \mathrm{Hom}\left(\prod_{i \in \{1, \dots, n\}} L(X, Y_i), L\left(X, \prod_{i \in \{1, \dots, n\}} Y_i\right)\right)$$

Let $(L_1, \dots, L_n) \in \prod_{i \in \{1, \dots, n\}} L(X, Y_i)$ then we have that

$$\begin{aligned}
\|\mathcal{K}((L_1, \dots, L_n))\|_{L(X, \prod_{i \in \{1, \dots, n\}} Y_i)} &= \|(L_1, \dots, L_n)_*\|_{L(X, \prod_{i \in \{1, \dots, n\}} Y_i)} \\
&\leqslant_{\text{[lemma: 16.64]}} \max\left(\{\|L_i\|_{L(X, Y_i)} | i \in \{1, \dots, n\}\}\right) \\
&= \|(L_1, \dots, L_n)\|_{\max}
\end{aligned}$$

proving that

$$\mathcal{K} \in L\left(\prod_{i \in \{1, \dots, n\}} L(X, Y_i), L\left(X, \prod_{i \in \{1, \dots, n\}} Y_i\right)\right)$$

□

Theorem 16.141. *Let $n \in \mathbb{N}$, $k \in \mathbb{N}$, $\langle X, \|\|\rangle$ a normed space, $\{\langle Y_i, \|\|_i\rangle\}_{i \in \{1, \dots, k\}}$ a finite family of normed spaces, $U \subseteq X$, $x \in U$ and $f: U \to \prod_{i \in \{1, \dots, n\}} Y_i$ then we have*

f is n-times differentiable at x

$$\Updownarrow$$

$\forall i \in \{1, \dots, k\}$ we have $\pi_i \circ f$ is n-times differentiable at x

Proof.

$\Rightarrow$. Using [example: 14.187] it follows that $\forall i \in \{1, \dots, k\}$ $\pi_i \in L(X, Y_i)$. So, as f is n-times differentiable at x, it follows from [lemma: 16.138] that $\pi_i \circ f$ is n-times differentiable at x.

$\Leftarrow$. We use induction to prove this, so let

$$S = \left\{ n \in \mathbb{N} | \text{Let } \langle X, \|\|\rangle \text{ be a normed space, } \{\langle Y_i\rangle, \|\|_i\}_{i \in \{1, \dots, k\}} \text{ be normed spaces , } x \in U \text{ a open set in } X \text{ and } f: U \to \prod_{j \in \{1, \dots, n\}} Y_j \right.$$

a function such that $\forall i \in \{1, \dots, k\}$ $\pi_i \circ f$ is n-times differentiable at x then f is n-times differentiable at $x\}$

then we have:

$1 \in S$. As $\forall i \in \{1, \dots, k\}$ $\pi_i \circ f$ is 1-times differentiable at x it follows that $\pi_i \circ f$ is Fréchet differentiable at x. Hence using [theorem: 16.66] f is Fréchet differentiable at x proving that f is 1-times differentiable at x. So we conclude that $1 \in S$.

$n \in S \Rightarrow n + 1 \in S$. Let $i \in \{1, \dots, k\}$ then as $\pi_i \circ f$ is $(n+1)$-times differentiable it follows from [theorem: 16.122] that there exist a open set V_i with $x \in V_i \subseteq U$ such that $\forall y \in V_i$ $\pi_i \circ f$ is 1-times differentiable at y and

$$D^{[1]}_{V_i}(\pi_i \circ f): V_i \to L(X, Y_i) \text{ defined by } D^{[1]}_{V_i}(\pi_i \circ f)(y) = D^{[1]}_y(\pi_i \circ f)$$

is n-times differentiable at x. Using the locality of differentiability [see theorem: 16.96] it follows that for $V = \bigcap_{j \in \{1, \dots, k\}} V_j \subseteq U$ $x \in V$ and

$$D^{[1]}(\pi_i \circ f): V \to L(X, Y_i) \text{ defined by } D^{[1]}(\pi_i \circ f)(y) = D^{[1]}_y(\pi_i \circ f)$$

is n-times differentiable at x. Now for

$$(D^{[1]}(\pi_1 \circ f), \ldots, D^{[1]}(\pi_k \circ f))_* : V \to \prod_{i \in \{1, \ldots, k\}} L(X, Y_i) \tag{16.125}$$

defined by [see definition: 16.62]

$$(D^{[1]}(\pi_1 \circ f), \ldots, D^{[1]}(\pi_k \circ f))_*(y) = (D^{[1]}(\pi_1 \circ f)(y), \ldots, D^{[1]}(\pi_k \circ f)(y))$$

we have for $y \in V$, $i \in \{1, \ldots, k\}$ that

$$\begin{aligned}
(\pi_i \circ (D^{[1]}(\pi_1 \circ f), \ldots, D^{[1]}(\pi_k \circ f))_*)(y) &= \\
\pi_i((D^{[1]}(\pi_1 \circ f), \ldots, D^{[1]}(\pi_k \circ f))_*(y)) &= \\
\pi_i((D^{[1]}(\pi_1 \circ f))(y), \ldots, (D^{[1]}(\pi_k \circ f))(y)) &= \\
(D^{[1]}(\pi_i \circ f))(y) &
\end{aligned}$$

proving that $\pi_i \circ (D^{[1]}(\pi_1 \circ f), \ldots, D^{[1]}(\pi_k \circ f))_* = D^{[1]}(\pi_i \circ f)$. Hence, as $D^{[1]}(\pi_i \circ f)$ is n-times differentiable at x, we have proved that $\forall i \in \{1, \ldots, k\}$

$$\pi_i \circ (D^{[1]}(\pi_1 \circ f), \ldots, D^{[1]}(\pi_k \circ f))_* : V \to L(X, Y_i)$$

is n-times differentiable at x. As $n \in S$ it follows that

$$(D^{[1]}(\pi_1 \circ f), \ldots, D^{[1]}(\pi_k \circ f))_* \text{ is } n\text{-times differentiable at } x \tag{16.126}$$

As $\forall i \in \{1, \ldots, k\}$ $\pi_i \circ f$ is 1-times differentiable at $y \in V$ it follows that $\pi_i \circ f$ is Fréchet differentiable at y, hence using [theorem: 16.66] f is Fréchet differentiable at y and

$$D_y^{[1]} f = D_y f = (D_y(\pi_1 \circ f), \ldots, D_y(\pi_k \circ f))_* \in L\left(X, \prod_{i \in \{1, \ldots, k\}} Y_i\right) \tag{16.127}$$

allowing us to define

$$D^{[1]} f : V \to L\left(X, \prod_{i \in \{1, \ldots, k\}} Y_i\right) \text{ by } D^{[1]} f(y) = D_y^{[1]} f$$

Using $\mathcal{K} : \prod_{i \in \{1, \ldots, k\}} L(X, Y_i) \to L\left(X, \prod_{i \in \{1, \ldots, k\}} Y_i\right)$ defined in [lemma: 16.140] we have that for $y \in V$

$$\begin{aligned}
(\mathcal{K} \circ (D^{[1]}(\pi_1 \circ f), \ldots, D^{[1]}(\pi_k \circ f))_*)(y) &= \\
\mathcal{K}((D^{[1]}(\pi_1 \circ f), \ldots, D^{[1]}(\pi_k \circ f))_*(y)) &= \\
\mathcal{K}\,(D^{[1]}(\pi_1 \circ f)(y), \ldots, D^{[1]}(\pi_k \circ f)(y)) &= \\
(D^{[1]}(\pi_1 \circ f)(y), \ldots, D^{[1]}(\pi_k \circ f)(y))_* &= \\
\left(D_y^{[1]}(\pi_1 \circ f), \ldots, D_y^{[1]}(\pi_k \circ f)\right)_* &= \\
(D_y(\pi_1 \circ f), \ldots, D_y(\pi_k \circ f))_* &\underset{\text{[eq: 16.127}}{=} \\
D_y^{[1]} f &= \\
(D^{[1]} f)(y) &
\end{aligned}$$

which proves that

$$D^{[1]} f = \mathcal{K} \circ (D^{[1]}(\pi_1 \circ f), \ldots, D^{[1]}(\pi_k \circ f))_*$$

As $(D^{[1]}(\pi_1 \circ f), \ldots, D^{[1]}(\pi_k \circ f))_*$ is n-times differentiable at x by [eq: 16.126], it follows from [lemmas: 16.140, 16.139] that $D^{[1]} f$ is n-times differentiable at x. Hence using [theorem: 16.122] it follows that

$$f \text{ is } (n+1)\text{-times differentiable at } x$$

proving that

$$n + 1 \in S$$

□

We can use a similar proof for C^n differentiability. To simplify this proof we fist prove the following lemma:

Lemma 16.142. *Let $n, k \in \mathbb{N}$, $\langle X, \|\|\rangle$ a normed space, $\{\langle Y_i, \|\|_i\rangle\}_{i \in \{1, \ldots, k\}}$ a finite family of normed spaces, U a open set U in X, $x \in U$ and $\{f_i : U \to Y_i\}_{i \in \{1, \ldots, n\}}$ a family of functions that are C^n at x then there exist a open set V with $x \in V \subseteq U$ such that $\forall i \in \{1, \ldots, n\}$ f_i is 1-times differentiable on V and $D^{[1]} f_i : V \to L(X, Y_i)$ defined by $D^{[1]} f(y) = D_y^{[1]} f$ is C^{n-1} at x.*

Proof. Let $i \in \{1, \dots, n\}$ then as f_i is C^n it follows from [theorem: 16.124] that there exist a open set V_i with $x \in V_i \subseteq U$ such that f_i is 1-times differentiable on V_i and the function

$$D^{[1]}_{V_i} f_i \colon V_i \to L(X, Y_i) \text{ defined by } D^{[1]}_{V_i} f(y) = D^{[1]}_y f \text{ is } C^{n-1} \text{ at } x$$

Take $V = \bigcap_{i \in \{1, \dots, n\}} V_i$ then $x \in V \subseteq U$. Let $i \in \{1, \dots, n\}$ then $\forall y \in V$ we have $y \in V_i$ so that f_i is 1-times differentiable at y. Define then the function

$$D^{[1]} f \colon V \to L(X, Y_i) \text{ by } D^{[1]} f(y) = D^{[1]}_y f$$

Then $\forall y \in V \subseteq V_i$ we have $D^{[1]} f(y) = D^{[1]}_y f = D^{[1]}_{V_i} f(y)$ which proves that

$$D^{[1]} f = \left(D^{[1]}_{V_i} f\right)_{|V}$$

As $D^{[1]}_{V_i} f$ is C^{n-1} at x it follows from [theorem: 16.106] that $\left(D^{[1]}_{V_i} f\right)_{|V}$ is C^{n-1} at x, hence $D^{[1]} f$ is C^{n-1} at x. □

Theorem 16.143. *Let $n \in \mathbb{N}_0$, $k \in \mathbb{N}$, $\langle X, \|\|\rangle$ a normed space, $\{\langle Y_i, \|\|_i\rangle\}_{i \in \{1, \dots, k\}}$ a finite family of normed spaces, a open set $U \subseteq X$, $x \in U$ and $f \colon U \to \prod_{i \in \{1, \dots, n\}} Y_i$ a function then we have*

$$f \text{ is } C^n \text{ at } x$$
$$\Updownarrow$$
$$\forall i \in \{1, \dots, k\} \text{ we have } \pi_i \circ f \text{ is } C^n \text{ at } x$$

Proof.

- **⇒.** Using [example: 14.187] it follows that $\forall i \in \{1, \dots, k\}$ $\pi_i \in L\left(\prod_{i \in \{1, \dots, n\}} Y_i, Y_i\right)$. So, as f is C^n at x, it follows from [lemma: 16.139] that $\pi_1 \circ f$ is C^n at x.
- **⇐.** If $n = 0$ then $\forall i \in \{1, \dots, k\}$ $\pi_i \circ f$ is C^0 at x so that $\pi_i \circ f$ is continuous at x, using [theorem: 14.141] it follows that f is continuous at x proving that f is C^0 at x. Hence we just have to prove the remaining case where $n \in \mathbb{N}$. For this we will use induction so define

$$S = \Bigg\{ n \in \mathbb{N} | \text{If } \langle X, \|\|\rangle \text{ is a normed space, } \{\langle Y_i\rangle, \|\|_i\}_{i \in \{1, \dots, k\}} \text{ a family of normed spaces , } U \text{ a open set in } X, x \in U \text{ and } f \colon U \to \prod_{j \in \{1, \dots, n\}} Y_j \text{ a function such that } \forall i \in \{1, \dots, k\} \ \pi_i \circ f \text{ is } C^n \text{ at } x \text{ then } f \text{ is } C^n \text{ at } x \Bigg\}$$

then we have:

$1 \in S$. Using [lemma: 16.142] there exist a open set V with $x \in V \subseteq U$ such that $\forall i \in \{1, \dots, k\}$ $\pi_i \circ f$ is 1-times differentiable on V [hence Fréchet differentiable on V] and the function

$$D^{[1]}(\pi_i \circ f) \colon V \to L(X, Y_i) \text{ defined by } D^{[1]}(\pi_i \circ f)(y) = D^{[1]}_y(\pi_i \circ f) \tag{16.128}$$

is C^0 at x hence continuous at x. Let $y \in V$ then using [theorem 16.66] it follows that f is Fréchet differentiable at f [hence f is 1-times differentiable at y] and $D_y f = (D_y(\pi_1 \circ f), \dots, D_y(\pi_k \circ f))_*$ allowing us to define the function

$$D^{[1]} f \colon V \to L\left(X, \prod_{i \in \{1, \dots, k\}} Y_y\right) \text{ by } D^{[1]} f(y) = D^{[1]}_y f \underset{\text{def}}{=} D_y f \tag{16.129}$$

that satisfies

$$\forall y \in V \ D^{[1]}{}_y f = \left(D^{[1]}_y(\pi_1 \circ f), \dots, D^{[1]}_y(\pi_k \circ f)\right)_* \tag{16.130}$$

Using $\mathcal{K} \colon \prod_{i \in \{1, \dots, k\}} L(X, Y_i) \to L\left(X, \prod_{i \in \{1, \dots, k\}} Y_i\right)$ defined in [lemma: 16.140] we have for $y \in V$ that

$$\begin{aligned}
(\mathcal{K} \circ (D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_*)(y) &= \\
\mathcal{K}((D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_*(y)) &= \\
\mathcal{K}(D^{[1]}(\pi_1 \circ f)(y), \dots, D^{[1]}(\pi_k \circ f)(y)) &\underset{\text{[eq: 16.128]}}{=} \\
\mathcal{K}\left(D^{[1]}_y(\pi_1 \circ f), \dots, D^{[1]}_y(\pi_k \circ f)\right) &= \\
\left(D^{[1]}_y(\pi_1 \circ f), \dots, D^{[1]}_y(\pi_k \circ f)\right)_* &\underset{\text{[eq: 16.130]}}{=} \\
D^{[1]}_y f &\underset{\text{[eq: 16.129]}}{=} \\
D^{[1]} f(y) &
\end{aligned}$$

proving that

$$D^{[1]}f = \mathcal{K} \circ (D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_* \tag{16.131}$$

Let $i \in \{1, \dots, n\}$ then $\forall y \in V$ we have

$$\begin{aligned}(\pi_i \circ (D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_*)(y) &= \\ \pi_i((D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_*(y)) &= \\ \pi_i((D^{[1]}(\pi_1 \circ f)(y), \dots, D^{[1]}(\pi_k \circ f)(y))) &= \\ D^{[1]}(\pi_i \circ f)(y)\end{aligned}$$

proving that

$$\pi_i \circ (D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_* = D^{[1]}(\pi_i \circ f)$$

As $D^{[1]}(\pi_i \circ f)$ is continuous at x it follows that $\pi_i \circ (D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_*$ is continuous at x. As $\mathcal{K}$ is continuous [see lemma: 16.140] we conclude from [eq: 16.131] that $D^{[1]}f$ is continuous at x. So f is C^1 at x

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$**.** Let $i \in \{1, \dots, k\}$ then as $\pi_i \circ f$ is C^{n+1} at x it follows from [lemma: 16.142] that there exist a open set V with $x \in V \subseteq U$ such that $\pi_i \circ f$ is 1-times differentiable on V and the function

$$D^{[1]}(\pi_i \circ f): V \to L(X, Y_i) \text{ defined by } D^{[1]}(\pi_i \circ f)(y) = D^{[1]}_y(\pi_i \circ f) \text{ is } C^n \text{ at } x \tag{16.132}$$

Consider now the function [see definition: 16.62]

$$(D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_*: V \to \prod_{i \in \{1, \dots, k\}} L(X, Y_i)$$

defined by

$$(D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_*(z) = (D^{[1]}(\pi_1 \circ f)(z), \dots, D^{[1]}(\pi_k \circ f)(z))$$

then we have $\forall i \in \{1, \dots, k\}$ that $\forall z \in V$

$$\begin{aligned}(\pi_i \circ (D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_*)(z) &= \\ \pi_i((D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_*(z)) &= \\ \pi_i\,(D^{[1]}(\pi_1 \circ f)(z), \dots, D^{[1]}(\pi_k \circ f)(z)) &= \\ D^{[1]}(\pi_i \circ f)(z)\end{aligned}$$

proving that

$$\pi_i \circ (D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_* = D^{[1]}(\pi_i \circ f)$$

so that $\pi_i \circ (D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_*$ is C^n at x. As $n \in S$ it follows that

$$(D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_* \text{ is } C^n \text{ at } x \tag{16.133}$$

Let $y \in V$ then as $\pi_i \circ f$ is 1-time differentiable at y it is Fréchet differentiable at y and it follows from [theorem: 16.66] that f if Fréchet differentiable at y with $D_y f = (D_y(\pi_1 \circ f), \dots, D_y(\pi_k \circ f))_*$. Hence we have that f is 1-times differentiable on V and for the function

$$D^{[1]}f: V \to L\left(X, \prod_{i \in \{1, \dots, k\}} Y_i\right) \text{ where } D^{[1]}f(y) = D^{[1]}_y f \tag{16.134}$$

we have

$$\forall y \in V \text{ that } D^{[1]}f(y) = D^{[1]}_y f = \left(D^{[1]}_y(\pi_1 \circ f), \dots, D^{[1]}_y(\pi_k \circ f)\right)_* \tag{16.135}$$

Using $\mathcal{K}: \prod_{i \in \{1, \dots, k\}} L(X, Y_i) \to L\left(X, \prod_{i \in \{1, \dots, k\}} Y_i\right)$ defined in [lemma: 16.140] we have that for $y \in V$

$$\begin{aligned}(\mathcal{K} \circ (D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_*)(y) &= \\ \mathcal{K}((D^{[1]}(\pi_1 \circ f), \dots, D^{[1]}(\pi_k \circ f))_*(y)) &= \\ \mathcal{K}((D^{[1]}(\pi_1 \circ f)(y), \dots, D^{[1]}(\pi_k \circ f)(y))) &= \\ (D^{[1]}(\pi_1 \circ f)(y), \dots, D^{[1]}(\pi_k \circ f)(y))_* &\underset{\text{[eq: 16.132]}}{=} \\ \left(D^{[1]}_y(\pi_1 \circ f), \dots, D^{[1]}_y(\pi_k \circ f)\right)_* &\underset{\text{[eq: 16.135]}}{=} \\ (D^{[1]}f)(y)\end{aligned}$$

proving that

$$D^{[1]}f = \mathcal{K} \circ (D^{[1]}(\pi_1 \circ f), \ldots, D^{[1]}(\pi_k \circ f))_* \tag{16.136}$$

As by [eq: 16.133] $(D^{[1]}(\pi_1 \circ f), \ldots, D^{[1]}(\pi_k \circ f))_*$ is C^n at x we have by [lemmas: 16.139, 16.140] that $\mathcal{K} \circ (D^{[1]}(\pi_1 \circ f), \ldots, D^{[1]}(\pi_k \circ f))_*$ is C^n at x, hence $D^{[1]}f$ is $C^{[n]}$ at x. Applying then [theorem: 16.124] proves that f is C^{n+1} at x, hence

$$n+1 \in S$$

□

Lemma 16.144. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$, $\langle Z, \|\|_Z \rangle$ be normed spaces then*

$$(\circ): L(Y,Z) \cdot L(X,Y) \to L(X,Z) \text{ defined by } (\circ)(L,K) = L \circ K$$

is ∞-times differentiable on $L(Y,Z) \cdot L(X,Y)$. Further using [theorem: 16.107] $(\circ)$ is C^∞ on $L(Y,Z) \cdot L(X,Y)$.

Proof. Using [theorem: 14.200] we have that $(\circ) \in L((Y,Z), L(X,Y); L(X,Z))$ so that by [lemma: 16.135] $(\circ)$ is ∞-times differentiable at every $x \in X$. □

Theorem 16.145. (General Chain Rule) *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$, $\langle Z, \|\|_Z \rangle$ be normed spaces, U a open set in X, $x \in U$, V a open set in Y and $f: U \to Y$, $g: V \to Z$ functions such that $f(U) \subseteq V$, f is n-times differentiable on x and g is n-times differentiable on $f(x)$ then*

$$g \circ f: U \to Y \text{ is } n\text{-times differentiable at } x$$

Proof. We prove this by induction on n, so define

$S = \{n \in \mathbb{N} | \text{If } \langle X, \|\|_X \rangle, \langle Y, \|\|_Y \rangle, \langle Z, \|\|_Z \rangle$ are normed spaces, U a open set in X, $x \in U$, V a open set in Y, $f: U \to Y$, $g: V \to Z$ such that $f(U) \subseteq V$, f is n-times differentiable at x and g is n-times differentiable at $f(x)$ then $g \circ f$ is n-times differentiable at $x\}$

then we have:

$1 \in S$. As f is 1-times differentiable at x and g is 1-times differentiable at $f(x)$ we have by definition that f is Fréchet differentiable at x and g is Fréchet differentiable at $f(x)$. So using the chain rule [theorem: 16.39] it follows that $g \circ f$ is Fréchet differentiable at x. Hence $g \circ f$ is 1-times differentiable at x.

$n \in S \Rightarrow n+1 \in S$. As f is $(n+1)$-times differentiable, it follows from [theorem: 16.118] that

$$f \text{ is } n\text{-times differentiable at } x \tag{16.137}$$

and using [theorem: 16.122] that there exist a open V_1 in X with $x \in V_1 \subseteq U$ such that $\forall y \in V_1$ we have that f is 1-times differentiable at y and that the function

$$D^{[1]}_{V_1} f: V_1 \to L(X,Y) \text{ defined by } D^{[1]}_{V_1} f(y) = D^{[1]}_y f \underset{\text{def}}{=} D_y f \text{ is } n\text{-times differentiable at } x$$

Likewise, as g is $(n+1)$-times differentiable at $f(x)$ there exist a open set V_2 with $f(x) \in V_2 \subseteq V$ such that $\forall z \in V_2$ g is 1-times differentiable at z and that the function

$$D^{[1]}g: V_2 \to L(Y,Z) \text{ where } D^{[1]}g(z) = D^{[1]}_z g \underset{\text{def}}{=} D_x g \text{ is } n\text{-times differentiable at } f(x) \tag{16.138}$$

As f is Fréchet differentiable at x [because f is 1-times differentiable at x] f is by [theorem: 16.31] continuous at x, hence as $f(x) \in V_2$ there exist a open U' with $x \in U'$ such that $f(U') \subseteq V_2$. Take $W = V_1 \bigcap U'$ then $x \in W \subseteq U$ and $f(W) \subseteq f(U') \subseteq V_2$. For the function

$$D^{[1]}f: W \to L(X,Y) \text{ defined by } D^{[1]}f(y) = D^{[1]}_y f = D_y f$$

we have that $D^{[1]}f = \left(D^{[1]}_{V_1} f\right)_{|W}$ so that by [theorem: 16.96]

$$D^{[1]}f \text{ is } n\text{-times differentiable at } x \tag{16.139}$$

As $\forall y \in W$ $y \in V_1$, $f(y) \in f(W) \subseteq V_2$, f is 1-times differentiable at y [hence Fréchet differentiable at y] and g is 1-times differentiable at $f(y)$ [hence Fréchet differentiable at $f(y)$] it follows from [theorem: 16.40] that $g \circ f$ is Fréchet differentiable at y [hence 1-times differentiable at y] with

$$D^{[1]}_y(g \circ f) = D_y(g \circ f) = D_{f(y)} g \circ D_y f = D^{[1]}_{f(y)} g \circ D^{[1]}_y f$$

This allows us to define

$$D^{[1]}(g\circ f)\colon W\to L(X,Z) \text{ by } D^{[1]}(g\circ f)(y)=D^{[1]}_y(g\circ f)=D^{[1]}_{f(y)}g\circ D^{[1]}_y f \tag{16.140}$$

Define

$$h\colon W\to L(Y,Z)\cdot L(X,Y) \text{ by } h(y)=\left(D^{[1]}_{f(y)}g, D^{[1]}_y f\right)$$

then we have for $y\in W$ that

$$\begin{array}{rcl}(\pi_1\circ h)(y) & = & \pi_1(h(y))\\ & = & \pi_1\left(\left(D^{[1]}_{f(y)}g, D^{[1]}_y f\right)\right)\\ & = & D^{[1]}_{f(y)}g\\ & \underset{\text{[eq: 16.138]}}{=} & D^{[1]}g(f(y))\\ & \underset{y\in W}{=} & D^{[1]}g(f_{|W}(y))\\ & = & ((D^{[1]}g)\circ f_{|W})(y)\end{array}$$

and

$$(\pi_2\circ h)(y)=\pi_2(h(y))=\pi_2\left(\left(D^{[1]}_{f(y)}g, D^{[1]}_y f\right)\right)=D^{[1]}_y f=D^{[1]}f(y)$$

proving that

$$\pi_1\circ h=(D^{[1]}g)\circ f_{|W} \text{ and } \pi_2\circ h=D^{[1]}f$$

By [eq: 16.137] f is n-times differentiable at x so that, using [theorem: 16.96], $f_{|W}$ is n-times differentiable at x, further by [eq: 16.138] $D^{[1]}g$ is n-times differentiable at $f(x)$. So using the fact that $n\in S$ it follows that $(D^{[1]}g)\circ f_{|W}$ is n-times differentiable at x which proves that $\pi_1\circ h$ is n-times differentiable at x. As by [eq: 16.139] $D_1 f=\pi_2\circ h$ is n-times differentiable at x it follows that $\pi_1\circ h$ and $\pi_2\circ h$ are n-times differentiable at x. Combining this with [theorem: 16.141] proves that

$$h \text{ is } n\text{-times differentiable at } x \tag{16.141}$$

Let $y\in W$ then

$$\begin{array}{rcl}((\circ)\circ h)(y) & = & (\circ)(h(y))\\ & = & (\circ)\left(D^{[1]}_{f(y)}g, D^{[1]}_y f\right)\\ & = & D^{1}_{f(y)}g\circ D^{[1]}_y f\\ & \underset{\text{[eq: 16.140]}}{=} & D^{[1]}(g\circ f)(y)\end{array}$$

which proves that

$$D^{[1]}(g\circ f)=(\circ)\circ h$$

As by [lemma: 16.144] $(\circ)$ is n-times differentiable on $L(Y,Z)\cdot L(X,Y)$ and h is n-times differentiable on x it follows from $n\in S$ that $(\circ)\circ h$ is n-times differentiable at x. Hence $D^{[1]}(g\circ f)$ is n-times differentiable at x. Using then [theorem: 16.122] proves that $g\circ f$ is $(n+1)$-times differentiable at x so that

$$n+1\in S$$

□

As a application of the General Chain Rule we prove that the product of functions that are n-times differentiable are n-times differentiable.

Theorem 16.146. *Let $n\in\mathbb{N}$, $\langle X,\|\|\rangle$ be a normed space, $\langle\mathbb{K},\|\rangle$ be the normed space of real (complex) numbers, U a open set in X, $x\in U$ and $f\colon U\to\mathbb{K}$, $g\colon U\to\mathbb{K}$ functions that are n-times differentiable at x then*

$$f\cdot g\colon U\to\mathbb{K}$$

is n-times differentiable at x.

Proof. Define

$$\varphi\colon U\to\mathbb{K}\cdot\mathbb{K} \text{ by } \varphi(x)=(f(x),g(x))$$

then we have for $x \in U$ that

$$\begin{aligned}(\pi_1 \circ \varphi)(x) &= \pi_1(\varphi(x)) \\ &= \pi_1((f(x), g(x))) \\ &= f(x) \\ (\pi_2 \circ \varphi)(x) &= \pi_2(\varphi(x)) \\ &= \pi_2((f(x), g(x))) \\ &= g(x)\end{aligned}$$

proving that

$$\pi_1 \circ \varphi = f \text{ and } \pi_2 \circ \varphi = g$$

Using [theorem: 16.141] and the fact f, g are n-times differentiable it follows that

$$\varphi \text{ is } n\text{-times differentiable at } x$$

Consider the function

$$(\cdot): \mathbb{K} \times \mathbb{K} \to \mathbb{K} \text{ by } (\cdot)(r, s) = r \cdot s$$

then we have for $r, s, t, \alpha \in \mathbb{K}$ that

$$(\cdot)(r + \alpha \cdot s, t) = (r + \alpha \cdot s) \cdot t = r \cdot t + \alpha \cdot (s \cdot t) = (\cdot)(r, t) + \alpha \cdot (\cdot)(s, t)$$

and

$$(\cdot)(r, s + \alpha \cdot t) = r \cdot (s + \alpha \cdot t) = r \cdot s + \alpha \cdot (r \cdot t) = (\cdot)(r, s) + \alpha \cdot (\cdot)(r, t)$$

proving that

$$(\cdot) \in \mathrm{Hom}(\mathbb{K}, \mathbb{K}; \mathbb{K})$$

Further we have for $r, s \in \mathbb{K}$ that

$$|(\cdot)(r, s)| = |r \cdot s| = |r| \cdot |t|$$

proving by [theorem: 14.190] that $(\cdot) \in L(\mathbb{K}, \mathbb{K}; \mathbb{K})$. Hence by [theorem: 16.135]

$$(\cdot) \text{ is } \infty\text{-times differentiable on } \mathbb{K}$$

Let $x \in U$ then

$$\begin{aligned}((\cdot) \circ \varphi)(x) &= (\cdot)(\varphi(x)) \\ &= (\cdot)(f(x), g(x)) \\ &= f(x) \cdot g(x) \\ &= (f \cdot g)(x)\end{aligned}$$

proving that $(\cdot) \circ \varphi = f \cdot g$. So using the generalized chain rule [theorem: 16.145] it follows that

$$f \cdot g \text{ is } n\text{-times differentiable at } x$$

□

We can use the same proof technique as is used in the General Chain Rule to prove that the composition of functions that are C^n is C^n.

Theorem 16.147. *Let $n \in \mathbb{N}_0$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$, $\langle Z, \|\|_Z \rangle$ be normed spaces, U a open set in X, $x \in U$, V a open set in Y and $f: U \to Y$, $g: V \to Z$ functions such that $f(U) \subseteq V$, f is C^n at x and g is C^n at $f(x)$ then $g \circ f$ is C^n at x.*

Proof. If $n = 0$ then, as f is C^0 at x and g is C^0 at $f(x)$, we have that f is continuous at x and g is continuous at $f(x)$. Using [theorem: 14.139] it follows that $g \circ f$ is continuous at x, hence C^0 at x. This proves the theorem for the case $n = 0$ and we are left with proving the theorem for the case $n \in \mathbb{N}$. We do this by induction so define

$$S = \{n \in \mathbb{N} | \text{If } \langle X, \|\|_X \rangle, \langle Y, \|\|_Y \rangle, \langle Z, \|\|_Z \rangle \text{ are normed spaces, } U \text{ a open set in } X, x \in U, \ V \text{ a open set in } Y, \ f: U \to Y, \ g: V \to Z \text{ such that } f(U) \subseteq V, \ f \text{ is } C^n \text{ at } x \text{ and g is } C^n \text{ at } f(x) \text{ then } g \circ f \text{ is } C^n \text{ at } x\}$$

then we have:

$1 \in S$. As f is C^1 at x there exist a open set W_1 with $x \in W_1 \subseteq U$ such that f is 1-times differentiable on W_1 [hence Fréchet differentiable on W_1] and the function

$$D^{[1]}f: W_1 \to L(X, Y) \text{ defined by } D^{[1]}f(y) = D^{[1]}_y f \text{ is continuous at } x \tag{16.142}$$

As g is C^1 at $f(x)$ there exist a open set W_2 with $f(x) \in W_2 \subseteq V$ such that g is 1-times differentiable on W_2 [hence Fréchet differentiable on W_2] and the function

$$D^{[1]}g: W_2 \to L(Y, Z) \text{ defined by } D^{[1]}g(y) = D^{[1]}_y g \text{ is continuous at } f(x) \tag{16.143}$$

As f is C^1 at x we have by [theorem: 16.119] that f is C^0 at x hence

$$f \text{ is continuous at } x \tag{16.144}$$

So there exist a open set W_3 such that $x \in W_3$ and $f(W_3) \subseteq W_2$. Take $W = W_1 \bigcap W_3$ then $x \in W$ and $f(W) \subseteq W_2$. Let $y \in W$ then, as f is Fréchet differentiable at y [because $W \subseteq W_2$] and g is Fréchet differentiable at $f(y)$ [because $f(y) \in W_2$], it follows from [theorem: 16.40] that $g \circ f$ is Fréchet differentiable at y with $D_y(g \circ f) = D_{f(y)}g \circ D_y f$. So $g \circ f$ is Fréchet differentiable on W hence 1-times differentiable on W and for the function

$$D^{[1]}(g \circ f): W \to L(X, Z) \text{ defined by } D^{[1]}(g \circ f)(y) = D_y(g \circ f) \tag{16.145}$$

we have

$$\forall y \in W \text{ that } D^{[1]}(g \circ f)(y) = D_{f(y)}g \circ D_y f \tag{16.146}$$

Define the function

$$h: W \to L(Y, Z) \cdot L(X, Y) \text{ by } h(y) = \left(D^{[1]}_{f(y)}g, D^{[1]}_y f\right)$$

then we have for $y \in W$ that

$$\begin{aligned}
(\pi_1 \circ h)(y) &= \pi_1(h(y)) \\
&= \pi_1\left(D^{[1]}_{f(y)}g, D^{[1]}_y f\right) \\
&= D^{[1]}_{f(y)}g \\
&\underset{\text{[eq: 16.143]}}{=} D^{[1]}g(f(y)) \\
&\underset{y \in W}{=} D^{[1]}g(f_{|W}(y)) \\
&= ((D^{[1]}g) \circ f_{|W})(y) \\
(\pi_2 \circ h)(y) &= \pi_2(h(y)) \\
&= \pi_2\left(D^{[1]}_{f(y)}g, D^{[1]}_y f\right) \\
&= D^{[1]}_y f \\
&\underset{\text{[eq: 16.142]}}{=} D^{[1]}f(y) \\
&\underset{y \in W}{=} (D^{[1)}f)_{|W}(y)
\end{aligned}$$

which proves that

$$\pi_1 \circ h = (D^{[1]}g) \circ f_{|W}) = \text{ and } \pi_2 \circ h = (D^{[1]}f)_{|W}$$

As f is continuous at x [see eq: 16.144] it follows from [theorem: 14.134] that $f_{|W}$ is continuous at x, further using [eq: 16.143] $D^{[1]}g$ is continuous at $f(x)$ so it follows from [theorem: 14.139] that $(D^{[1]}g) \circ f_{|W}$ is continuous at x, hence $\pi_1 \circ h$ is continuous at x. Further by [eq: 16.142] $D^{[1]}f$ is continuous at x hence $(D^{[1]}f)_{|W}$ is continuous at x proving that $\pi_2 \circ h$ is continuous at x. So using [theorem: 14.141] we conclude that

$$h \text{ is continuous at } x \tag{16.147}$$

Let $y \in V$ then

$$\begin{aligned}
((\circ) \circ h)(y) &= (\circ)(h(y)) \\
&= (\circ)\left(D^{[1]}_{f(y)}g, D^{[1]}_y f\right) \\
&= D^{[1]}_{f(y)}g \circ D^{[1]}_y f \\
&\underset{\text{[eq: 16.146]}}{=} D^{[1]}(g \circ f)(y) \\
&\underset{y \in W}{=} (D^{[1]}(g \circ f))_{|W}(y)
\end{aligned}$$

which proves that

$$(\circ) \circ h = (D^{[1]}(g \circ f))_{|W}$$

By [lemma: 16.144] $(\circ)$ is continuous and by [eq: 16.147] h is continuous at x so that $(\circ)\circ h$ is continuous at x or using the above that $(D^{[1]}(g\circ f))_{|W}$ is continuous at x. Applying then [theorem: 14.135] it follows that $D^{[1]}(g\circ f)$ is continuous at x. Hence $g\circ f$ is C^1 at x which proves that $1\in S$.

$\boldsymbol{n\in S\Rightarrow n+1\in S}$**.** As f is C^{n+1}at x it follows from [theorem: 16.124] that there exist a open set $W_1\subseteq U$ such that f is 1-times differentiable on W_1 [hence Fréchet differentiable on W_1] and

$$D^{[1]}f\colon W_1\to L(X,Y)\text{ defined by }D^{[1]}f(y)=D^{[1]}_y f\text{ is }C^n\text{ at }x \tag{16.148}$$

Likewise as g is C^{n+1} at $f(x)$ it follows that there exist a open set W_2 with $f(x)\in W_2\subseteq V$ such that g is 1-times differentiable on W_2 and

$$D^{[1]}g\colon W_2\to L(Y,Z)\text{ defined by }D^{[1]}g(y)=D^{[1]}_y g\text{ is }C^n\text{ at }x \tag{16.149}$$

As f is C^{n+1} at x f is C^0 at x hence

$$f\text{ is continuous at }x \tag{16.150}$$

So there exist a open set W_3 with $x\in W_3$ such that $f(W_3)\subseteq W_2$. Take $W=W_3\bigcap W_1$ then $x\in W$ and $f(W)\subseteq W_2$. Let $y\in W$ then, as f is Fréchet differentiable at y [because $W\subseteq W_2$] and g is Fréchet differentiable at $f(y)$ [because $f(y)\in W_2$], it follows from [theorem: 16.40] that $g\circ f$ is Fréchet differentiable at y with $D_y(g\circ f)=D_{f(y)}g\circ D_y f$. So $g\circ f$ is 1-times differentiable on W and for the function

$$D^{[1]}(g\circ f)\colon W\to L(X,Z)\text{ defined by }D^{[1]}(g\circ f)(y)=D_y(g\circ f) \tag{16.151}$$

we have

$$\forall y\in W\text{ that }D^{[1]}(g\circ f)(y)=D_{f(y)}g\circ D_y f \tag{16.152}$$

Define

$$h\colon W\to L(Y,Z)\cdot L(X,Y)\text{ by }h(y)=\left(D^{[1]}_{f(y)}g,D^{[1]}_y f\right)$$

then we have for $y\in W$ that

$$\begin{array}{rcl}
(\pi_1\circ h)(y) & = & \pi_1(h(y))\\
 & = & \pi_1\left(\left(D^{[1]}_{f(y)}g,D^{[1]}_y f\right)\right)\\
 & = & D^{[1]}_{f(y)}g\\
 & \underset{\text{[eq: 16.149]}}{=} & D^{[1]}g(f(y))\\
 & \underset{y\in W}{=} & D^{[1]}g(f_{|W}(y))\\
 & = & ((D^{[1]}g)\circ f_{|W})(y)\\
(\pi_2\circ h)(y) & = & \pi_2(h(y))\\
 & = & \pi_2\left(\left(D^{[1]}_{f(y)}g,D^{[1]}_y f\right)\right)\\
 & = & D^{[1]}_y f\\
 & \underset{\text{[eq: 16.148]}}{=} & D^{[1]}f(y)\\
 & \underset{y\in W}{=} & (D^{[1]}f)_{|W}(y)
\end{array}$$

which proves that

$$(\pi_1\circ h)=(D^{[1]}g)\circ f_{|W}\text{ and }\pi_2\circ h=(D^{[1]}f)_{|W} \tag{16.153}$$

As f is C^{n+1} at x we have by [theorem: 16.119] that$f$ is C^n at x. Next using [theorem: 16.106] it follows that $f_{|W}$ is C^n at x. Further by [eq: 16.149] $D^{[1]}g$ is C^n at x. Hence using the fact that $n\in S$ we conclude that $(D^{[1]}g)\circ f_{|W}$ is C^n at x proving that

$$\pi_1\circ h\text{ is }C^n\text{ at }x$$

By [eq: 16.148] $D^{[1]}f$ is C^n at x therefore, using [theorem: 16.106] it follows that $(D^{[1]}f)_{|W}$ is C^n at x which proves that

$$\pi_2\circ h\text{ is }C^n\text{ at }x$$

Using the above together with [lemma: 16.143] it follows that

$$h\text{ is }C^n\text{ at }x \tag{16.154}$$

Let $y \in W$ then we have

$$\begin{aligned}((\circ)\circ h)(y) &= (\circ)(h(y))\\ &= (\circ)\big(\big(D^{[1]}_{f(y)}g, D^{[1]}_{y}f\big)\big)\\ &= D^{[1]}_{f(y)}g \circ D^{[1]}_{y}f\\ &\underset{\text{[eq: 16.152]}}{=} D^{[1]}_{y}(g\circ f)\\ &\underset{\text{[eq: 16.151]}}{=} D^{[1]}(g\circ f)(y)\\ &\underset{y\in W}{=} (D^{[1]}(g\circ f))_{|W}(y)\end{aligned}$$

proving that

$$D^{[1]}(g\circ f)_{|W} = (\circ)\circ h$$

Now using [lemma: 16.144] $(\circ)$ is C^n on $L(Y,Z)\cdot L(X,Y)$ and by [eq: 16.154] h is C^n at x. Using $n \in S$ again it follows that $(\circ)\circ h$ is C^n at x, hence $(D^{[1]}(g\circ f))_{|W}$ is C^n at x. Applying then [theorem: 16.106] proves that $D^{[1]}(g\circ f)$ is C^n at x which by [theorem: 16.124] proves that $g\circ f$ is C^{n+1} so that

$$n+1 \in S$$

□

As a application of the General Chain Rule we prove that the product of functions that are n-times differentiable are n-times differentiable.

Theorem 16.148. *Let $n \in \mathbb{N}_0$, $\langle X, \|\|\rangle$ be a normed space, $\langle \mathbb{K}, \|\rangle$ be the normed space of real (complex) numbers, U a open set in X, $x \in U$ and $f: U \to X$, $g: U \to X$ functions that are C^n at x then*

$$f\cdot g: U \to \mathbb{K}$$

is C^n at x.

Proof. For $n \in \mathbb{N}_0$ we have two cases to consider:

$n = 0$. Then f, g are continuous at x so that by [theorem: 14.147] $f\cdot g$ is continuous at x, hence C^0 at x.

$n \in \mathbb{N}$. Define

$$\varphi: U \to \mathbb{K}\cdot\mathbb{K} \text{ by } \varphi(x) = (f(x), g(x))$$

then we have for $x \in U$ that

$$\begin{aligned}(\pi_1\circ\varphi)(x) &= \pi_1(\varphi(x))\\ &= \pi_1((f(x), g(x)))\\ &= f(x)\\ (\pi_2\circ\varphi)(x) &= \pi_2(\varphi(x))\\ &= \pi_2((f(x), g(x)))\\ &= g(x)\end{aligned}$$

proving that

$$\pi_1\circ\varphi = f \text{ and } \pi_2\circ\varphi = g$$

Using [lemma: 16.143] and the fact f, g are C^n at x it follows that

$$\varphi \text{ is } C^n \text{ at } x$$

Consider the function

$$(\cdot): \mathbb{K}\times\mathbb{K} \to \mathbb{K} \text{ by } (\cdot)(r,s) = r\cdot s$$

then we have for $r, s, t, \alpha \in \mathbb{K}$ that

$$(\cdot)(r+\alpha\cdot s, t) = (r+\alpha\cdot s)\cdot t = r\cdot t + \alpha\cdot(s\cdot t) = (\cdot)(r,t) + \alpha\cdot(\cdot)(s,t)$$

and

$$(\cdot)(r, s+\alpha\cdot t) = r\cdot(s+\alpha\cdot t) = r\cdot s + \alpha\cdot(r\cdot t) = (\cdot)(r,s) + \alpha\cdot(\cdot)(r,t)$$

proving that

$$(\cdot) \in \mathrm{Hom}(\mathbb{K}, \mathbb{K}; \mathbb{K})$$

Further we have for $r, s \in \mathbb{K}$ that

$$|(\cdot)(r,s)| = |r \cdot s| = |r| \cdot |t|$$

proving by [theorem: 14.190] that $(\cdot) \in L(\mathbb{K}, \mathbb{K}; \mathbb{K})$. Hence by [theorem: 16.135]

$$(\cdot) \text{ is } C^\infty \text{ on } \mathbb{K}$$

Let $x \in U$ then

$$\begin{aligned}((\cdot) \circ \varphi)(x) &= (\cdot)(\varphi(x)) \\ &= (\cdot)(f(x), g(x)) \\ &= f(x) \cdot g(x) \\ &= (f \cdot g)(x)\end{aligned}$$

proving that $(\cdot) \circ \varphi = f \cdot g$. So using the chain rule [see theorem: 16.147] it follows that

$$f \cdot g \text{ is } C^n \text{ at } x$$

□

16.3 Intermediate value and main value theorems

16.3.1 Derivatives, extremums, concavity, and convexity

Definition 16.149. *Let $\langle X, \|\|\rangle$ be a normed space, $\langle \mathbb{R}, \|\rangle$ be the normed space of real numbers, U a open set in X and $f: U \to \mathbb{R}$ then*

1. *$x \in U$ is a **local weak minimum of f** if there exist a $\delta \in \mathbb{R}^+$ such that $B_{\|\|}(x, \delta) \subseteq U$ and $\forall y \in B_{\|\|}(x, \delta)$ $f(x) \leqslant f(y)$.*
2. *$x \in U$ s a **local weak maximum of f** if there exist a $\delta \in \mathbb{R}^+$ such that $B_{\|\|}(x, \delta) \subseteq U$ and $\forall y \in B_{\|\|}(x, \delta)$ $f(y) \leqslant f(x)$.*

*A **local weak minimum** or **local weak maximum** of f is called a **local extremum**.*

Theorem 16.150. *Let $\langle \mathbb{R}, \|\rangle$ be the normed space of real numbers, U a open set in $\mathbb{R}$ and*

$$f: U \to \mathbb{R}$$

a function with a local extremum x then if f has a derivative at x it follows that $f'(x) = 0$.

Proof. If x is a local extremum of f then we have either:

x is a local weak minimum. Then there exist a $\delta \in \mathbb{R}^+$ such that $]x - \delta, x + \delta[\subseteq U$ and $\forall y \in]x - \delta, x + \delta[$ we have $f(x) \leqslant f(y)$. Assume that $f'(x) \neq 0$ then we have either:

$0 < f'(x)$. As $f'(x) \in \mathbb{R}^+$ there exist a $\delta_{f'(x)} \in \mathbb{R}^+$ such that

$$\forall h \in U_x \text{ with } 0 < |h| < \delta_{f'(x)} \text{ we have } \left| \frac{f(x+h) - f(x)}{h} - f'(x) \right| < f'(z) \tag{16.155}$$

Let $k = \frac{\min(\delta, \delta_{f'(x)})}{2} \in \mathbb{R}^+$ then $0 < |-k| = k < \delta, \delta_{f'(x)}$ so that $x - \delta < x - k < x + \delta$ or $x - k \in]x - \delta, x + \delta[$ so that

$$f(x) \leqslant f(x-k) \Rightarrow 0 \leqslant f(x-k) - f(x) \Rightarrow 0 \leqslant -\left(\frac{f(x-k) - f(x)}{-k} \right) \tag{16.156}$$

As $x - k \in]x - \delta, x + \delta[\subseteq U$ we have that $-k \in U_x$ so that by [eq: 16.155]

$$\left| \frac{f(x-k) - f(x)}{-k} - f'(x) \right| < f'(x)$$

combining this with [eq: 16.156]

$$f'(x) \leqslant f'(x) - \frac{f(x-k) - f(x)}{-k} \leqslant \left| \frac{f(x-k) - f(x)}{-k} - f'(x) \right| < f'(x)$$

leading to the contradiction $f'(x) < f'(x)$.

$f'(x) < 0$. As $-f'(x) \in \mathbb{R}^+$ there exist $\delta_{-f'(x)} \in \mathbb{R}^+$ such that we have

$$\forall h \in U_x \text{ with } 0 < |h| < \delta_{-f'(x)} \text{ we have } \left| \frac{f(x+h) - f(x)}{h} - f'(x) \right| < -f'(x) \tag{16.157}$$

Let $k=\frac{\min(\delta,\delta_{-f'(x)})}{2}\in\mathbb{R}^+$ then $0<|k|=k<\delta,\delta_{-f'(x)}$ so that $x-\delta<x<x+k<x+\delta$ or $x+k\in]x-\delta,x+\delta[$ so that

$$f(x)\leqslant f(x+k)\Rightarrow 0\leqslant f(x+k)-f(x)\Rightarrow 0\leqslant\frac{f(x+k)-f(x)}{k} \tag{16.158}$$

As $x+k\in]x-\delta,x+\delta[\subseteq U$ we have that $k\in U_x$ so that by [eq: 16.157]

$$\left|\frac{f(x+k)-f(x)}{k}-f'(x)\right|<-f'(x)$$

Hence using [eq: 16.158]

$$-f'(x)\leqslant -f'(x)+\frac{f(x+k)-f(x)}{k}\leqslant\left|\frac{f(x+k)-f(x)}{k}-f'(x)\right|<-f'(x)$$

leading to the contradiction $-f'(x)<-f'(x)$.

As in all case we have a contradiction the assumption is wrong, hence we must have that

$$f'(x)=0.$$

x is a local weak maximum. Then there exist a $\delta\in\mathbb{R}^+$ such that $]x-\delta,x+\delta[\subseteq U$ and $\forall y\in]x-\delta,x+\delta[$ we have $f(y)\leqslant f(x)$. Assume that $f'(x)\neq 0$ then we have either:

$0<f'(x)$. As $f'(x)\in\mathbb{R}^+$ there exist a $\delta_{f'(x)}\in\mathbb{R}^+$ such that

$$\forall h\in U_x \text{ with } 0<|h|<\delta_{f'(x)} \text{ we have } \left|\frac{f(x+h)-f(x)}{h}-f'(x)\right|<f'(x) \tag{16.159}$$

Let $k=\frac{\min(\delta,\delta_{f'(x)})}{2}\in\mathbb{R}^+$ then $0<|k|=k<\delta,\delta_{f'(x)}$ so that $x-\delta<x<x+k<x+\delta$ or $x+k\in]x-\delta,x+\delta[$ so that

$$f(x+k)\leqslant f(x)\Rightarrow 0\leqslant -(f(x+k)-f(x))\Rightarrow 0\leqslant -\frac{f(x+k)-f(x)}{k} \tag{16.160}$$

As $x+k\in]x-\delta,x+\delta[\subseteq U$ we have that $k\in U_x$ so that by [eq: 16.159]

$$\left|\frac{f(x+k)-f(x)}{k}-f'(x)\right|<f'(x)$$

Hence using [eq: 16.160]

$$f'(x)\leqslant f'(x)-\frac{f(x+k)-f(x)}{k}\leqslant\left|\frac{f(x+k)-f(x)}{k}-f'(x)\right|<f'(x)$$

leading to the contradiction $f'(x)<f'(x)$.

$f'(x)<0$. As $-f'(x)\in\mathbb{R}^+$ there exist a $\delta_{-f'(x)}\in\mathbb{R}^+$ such that

$$\forall h\in U_x \text{ with } 0<|h|<\delta_{-f'(x)} \text{ so that } \left|\frac{f(x+h)-f(x)}{h}-f'(x)\right|<-f'(x) \tag{16.161}$$

Let $k=\frac{\min(\delta,\delta_{f'(x)})}{2}$ then $0<|-k|=k<\delta,\delta_{-f'(x)}$ so that $x-\delta<x-k<x<x+\delta$ or $x-k\in]x-\delta,x+\delta[$ so that

$$f(x-k)\leqslant f(x)\Rightarrow 0\leqslant -(f(x-k)-f(x))\Rightarrow 0\leqslant\frac{f(x-k)-f(x)}{-k} \tag{16.162}$$

As $x-k\in]x-\delta,x+\delta[\subseteq U$ we have that $-k\in U_x$ so that by [eq: 16.161]

$$\left|\frac{f(x-k)-f(x)}{-k}-f'(x)\right|<-f'(x)$$

Hence using [eq: 16.162]

$$-f'(x)\leqslant -f'(x)+\frac{f(x-k)-f(x)}{-k}\leqslant\left|\frac{f(x-k)-f(x)}{-k}-f'(x)\right|<-f'(x)$$

leading to the contradiction that $-f'(x)<-f'(x)$

As in all case we have a contradiction the assumption is wrong, hence we must have that

$$f'(x)=0.$$

□

Theorem 16.151. (Rolle's theorem) *Let $\langle\mathbb{R},\|\rangle$ be the normed space of real numbers, $a,b\in\mathbb{R}$ with $a<b$ and $f\in\mathcal{C}([a,b],\mathbb{R})$, the set of continuous functions between $[a,b]$ and $\mathbb{R}$ [see definition: 14.130], such that $f(a)=f(b)$ and $f_{|]a,b[}$ has a derivative at every $x\in]a,b[$ [or equivalent $f_{|]a,b[}$ is Fréchet differentiable on $]a,b[$] then there exist a $\zeta\in]a,b[$ such that $(f_{|]a,b[})'_\zeta=0$.*

Figure 16.1.

Proof. Take $k=f(a)=f(b)$. As f is continuous on $[a,b]$ we can use [theorem: 14.402] to find $c,d\in\mathbb{R}$ such that

$$f([a,b])=[c,d]$$

Hence as $a\in[a,b]$ it follows that $k=f(a)\in[c,d]$ so that $c\leqslant k\leqslant d$ and we have the following cases to consider:

c = d = k. Then $\forall x\in[a,b]$ we have $f(x)\in[k,k]=\{k\}$ so that $f_{]]a,b[}=C_k$. As $a<b$ there exist a $\zeta\in]a,b[$ and we have for ζ

$$(f_{]]a,b[})'_\zeta \underset{\text{[theorem: 16.32]}}{=} D_\zeta C_k(1) \underset{\text{[theorem: 16.26]}}{=} C_0(1)=0$$

c < k. As $f([a,b])=[c,d]$ there exist a $\zeta\in[a,b]$ such that $f(\zeta)=c<k=f(a)=f(b)$ so that $\zeta\neq a,b$, from which it follows that $\zeta\in]a,b[$. As $]a,b[$ is open there exist a $\delta\in\mathbb{R}^+$ such that $\zeta\in B_{||}(\zeta,\delta)\subseteq]a,b[$. Further $\forall x\in B_{||}(\zeta,\delta)$ we have $f(x)\in f([a,b])=[c,d]$ so that $f(\zeta)=c\leqslant f(x)$ which proves that ζ is a local weak minimum of $f_{]]a,b[}$. Hence using [theorem: 16.150] it follows that $(f_{]a,b[})'_\zeta=0$.

k < d. As $f([a,b])=[c,d]$ there exist a $\zeta\in[a,b]$ such that $f(\zeta)=d>k=f(a)=f(b)$ so that $\zeta\neq a,b$ from which it follows that $\zeta\in]a,b[$. As $]a,b[$ is open there exist a $\delta\in\mathbb{R}^+$ such that $\zeta\in B_{||}(\zeta,\delta)\subseteq]a,b[$. Further $\forall x\in B_{||}(\zeta,\delta)$ we have $f(x)\in f([a,b])=[c,d]$ so that $f(x)\leqslant d=f(\zeta)$ which proves that ζ is a local weak maximum of $f_{]]a,b[}$. Hence using [theorem: 16.150] it follows that $(f_{]a,b[})'_\zeta=0$. □

Theorem 16.152. (Lagrange's Mean Value theorem) *Let $\langle\mathbb{R},\|\rangle$ be the normed space of real numbers, $a,b\in\mathbb{R}$ with $a<b$ and $f\in\mathcal{C}([a,b],\mathbb{R})$ such that $f_{]]a,b[}$ has a derivative at every $x\in]a,b[$ [or equivalent $f_{]]a,b[}$ is Fréchet differentiable at $]a,b[$] then there exist a $\xi\in]a,b[$ such that*

$$f(b)-f(a)=(f_{]]a,b[})'_\zeta\cdot(b-a)$$

Figure 16.2.

Proof. As $a<b$ we can define

$$g\colon[a,b]\to\mathbb{R} \text{ by } g(x)=f(x)-\left(f(a)+\frac{f(b)-f(a)}{b-a}\cdot(x-a)\right)$$

then by [examples: 14.132, 14.133] and [theorems: 14.145, 14.134] it follows that

$$g\in\mathcal{C}([a,b],\mathbb{R})$$

Further using [examples: 16.26, 16.22] and [theorems: 16.32, 16.38, 16.24] it follows that

$$\forall x \in]a,b[\ g \text{ is Fréchet differentiable at } x$$

Now

$$\begin{aligned} g(a) &= f(a) - \left(f(a) + \frac{f(b)-f(a)}{b-a} \cdot (a-a) \right) = f(a) - f(a) = 0 \\ g(b) &= f(b) - \left(f(a) + \frac{f(b)-f(a)}{b-a} \cdot (b-a) \right) = f(b) - f(a) + f(b) - f(a) = 0 \end{aligned}$$

so we can apply Rolle's theorem [theorem: 16.151] to find a $\zeta \in]a,b[$ such that

$$(g_{|]a,b[})'_\zeta = 0$$

As

$$(g_{|]a,b[})'_\zeta = (f_{|]a,b[})'_\zeta - \frac{f(b)-f(a)}{b-a}$$

it follows that

$$f(b) - f(a) = (f_{|]a,b[})'_\zeta \cdot (b-a)$$

□

Corollary 16.153. *Let $\langle \mathbb{R}, \|\rangle$ be the normed space of real numbers, U a open set in $\mathbb{R}$, $a,b \in \mathbb{R}$ with $a<b$ such that $[a,b] \subseteq U$ and $f: U \to \mathbb{R}$ a function that has a derivative at every $x \in U$ [or equivalently is Fréchet differentiable at every $x \in U$] then there exist a $\xi \in]a,b[$ such that*

$$f(b) - f(a) = f'_\zeta \cdot (b-a)$$

Proof. Let $x \in U$ then, as f has a derivative at every $x \in U$, it follows from [theorem: 16.32] that f is Fréchet differentiable at x, hence continuous at x [see theorem: 16.31] proving that f is continuous. Hence using [theorem: 14.136]

$$f_{|[a,b]}: [a,b] \to \mathbb{R} \text{ is continuous or } f_{|[a.b]} \in \mathcal{C}([a,b],\mathbb{R})$$

Further as $]a,b[\subseteq [a,b] \subseteq U$ it follows from the locality of the differential [see theorem: 16.24] that $\forall x \in]a,b[$ we have that $f_{|]a,b[}$ is Fréchet differentiable at x and $D_x(f_{]a,b[}) = D_x f$. As $f_{|]a,b[} = (f_{|[a,b]|})_{|]a,b[}$ it follows that

$$\forall x \in]a,b[\text{ we have that } (f_{|[a,b]})_{|]a,b[} \text{ is Fréchet differentiable at } x \text{ and } D_x((f_{|[a,b]|})_{|]a,b[}) = D_x f$$

Further using [theorem: 16.32] on the above it follows that

$$\forall x \in]a,b[\text{ we have that } (f_{|[a,b]})_{|]a,b[} \text{ has a derivative at } x \text{ and } ((f_{|[a,b]|})_{|]a,b[})'_x = f'_x \tag{16.163}$$

By Lagrange's theorem [theorem: 16.152] there exist a $\zeta \in]a,b[$ such that

$$f_{|[a,b]}(b) - f_{|[a,b]}(a) = ((f_{|[a,b]|})_{|]a,b[})'_\zeta \cdot (b-a) \tag{16.164}$$

Hence

$$\begin{aligned} f(b) - f(a) &\underset{a,b \in [a,b]}{=} f_{|[a,b]}(b) - f_{|[a,b]}(a) \\ &\underset{\text{[eq: 16.164]}}{=} ((f_{|[a,b]|})_{|]a,b[})'_\zeta \cdot (b-a) \\ &\underset{\text{[eq: 16.163]}}{=} f'_\zeta \cdot (b-a) \end{aligned}$$

□

Corollary 16.154. *Let $\langle \mathbb{R}, \|\rangle$ be the normed space of the real numbers, U a open set in $\mathbb{R}$, I a generalized interval [see definition: 3.140] such that $I \subseteq U$ and*

$$f: U \to \mathbb{R}$$

a function that has a derivative f'_x at every point $x \in U$ [or equivalently is Fréchet differentiable on U] then we have:

1. *If $\forall t \in I \ 0 < f'_t$ then f is strictly increasing on I*
2. *If $\forall t \in I \ 0 \leqslant f'_t$ then f is increasing on I.*
3. *If $\forall t \in I \ f'_t < 0$ then f is strictly decreasing on I.*
4. *If $\forall t \in I \ f'_t \leqslant 0$ then f is decreasing on I.*

Proof. Let $x, y \in I$ with $x < y$ then as I is a generalized interval [see definition: 3.140] it follows that $[x, y] \subseteq I \subseteq U$, hence by the previous corollary [corollary: 16.153] there exist a $\zeta \in]x, y[$ such that $f(y) - f(x) = f'_\zeta \cdot (x - y)$. Summarized we have

$$\forall x, y \in I \text{ with } x < y \text{ there exist a } \zeta \in]x, y[\text{ such that } f(y) - f(x) = f'_\zeta \cdot (y - x) \tag{16.165}$$

So we have that

1. If $\forall t \in I\ 0 < f'_t$ it follows that $0 < f'_\zeta$ so that, as $x < y$, $0 < f'_\zeta \cdot (y - x) \underset{\text{[eq: 16.165]}}{=} f(y) - f(x)$ so that $f(x) < f(y)$. Hence f is strictly increasing.
2. If $\forall t \in I\ 0 \leqslant f'_t$ it follows that $0 \leqslant f'_\zeta$ so that, as $x < y$, $0 \leqslant f'_\zeta \cdot (y - x) \underset{\text{[eq: 16.165]}}{=} f(y) - f(x)$ so that $f(x) \leqslant f(y)$. Hence f is increasing.
3. If $\forall t \in I\ f'_t < 0$ it follows that $f'_\zeta < 0$ so that, as $x < y$, $0 > f'_\zeta \cdot (y - x) \underset{\text{[eq: 16.165]}}{=} f(y) - f(x)$ so that $f(x) > f(y)$. Hence f is strictly decreasing.
4. If $\forall t \in I\ f'_t \leqslant 0$ it follows that $f'_\zeta \leqslant 0$ so that, as $x < y$, $0 \geqslant f'_\zeta \cdot (y - x) \underset{\text{[eq: 16.165]}}{=} f(y) - f(x)$ so that $f(x) \geqslant f(y)$. Hence f is decreasing. □

Definition 16.155. *Let $\langle \mathbb{R}, \|\rangle$ be the normed space of the real numbers, $U \subseteq \mathbb{R}$, $a, b \in \mathbb{R}$ with $a < b$ and $[a, b] \subseteq U$ and*

$$f : U \to \mathbb{R}$$

a function then we say:

1. *f is convex on $[a, b]$ if $\forall x \in [a, b]$ we have*
$$f(x) \leqslant \frac{f(a) \cdot (b - x) + f(b) \cdot (x - a)}{b - a} = f(a) + \frac{f(b) - f(a)}{b - a} \cdot (x - a)$$
2. *f is concave on $[a, b]$ if $\forall x \in [a, b]$ we have*
$$f(a) + \frac{f(b) - f(a)}{b - a} \cdot (x - a) = \frac{f(a) \cdot (b - x) + f(b) \cdot (x - a)}{b - a} \leqslant f(x)$$

In other words a function is concave on a interval if the function curve lies below the line connecting $(a, f(a))$ and $(b, f(b))$ and convex on a interval if the function curve lies above the line connecting $(a, f(a))$ and $(b, f(b))$.

Figure 16.3.

Theorem 16.156. *Let $\langle \mathbb{R}, \|\rangle$ be the normed space of the real numbers, $U \subseteq \mathbb{R}$, $a, b \in \mathbb{R}$ with $a < b$ and $[a, b] \subseteq U$ then we have:*

1. $$f \text{ is convex on } [a, b]$$
$$\Updownarrow$$
$$\forall \alpha, \beta \in [0, \infty[\text{ with } \alpha + \beta = 1 \text{ we have } f(\alpha \cdot a + \beta \cdot b) \leqslant \alpha \cdot f(a) + \beta \cdot f(b)$$
2. $$f \text{ is concave on } [a, b]$$
$$\Updownarrow$$
$$\forall \alpha, \beta \in \mathbb{R}^+ \text{ with } \alpha + \beta = 1 \text{ we have } \alpha \cdot f(a) + \beta \cdot f(b) \leqslant f(\alpha \cdot a + \beta \cdot b)$$

Proof.

1.

⇒. Let $x=\alpha\cdot a+\beta\cdot b$ then we have

$$\begin{aligned}
x &= \alpha\cdot a+\beta\cdot b\\
&= \alpha\cdot a+(1-\alpha)\cdot b\\
&= \alpha\cdot(a-b)+b\\
&\leqslant_{(a-b)<0\wedge 0\leqslant\alpha\Rightarrow\alpha\cdot(a-b)\leqslant 0} 0+b\\
&= b
\end{aligned}$$

$$\begin{aligned}
x &= \alpha\cdot a+\beta\cdot b\\
&= (1-\beta)\cdot a+\beta\cdot b\\
&= a+\beta\cdot(b-a)\\
&\geqslant_{0<b-a\wedge 0\leqslant\beta\Rightarrow\beta\cdot(b-a)\geqslant 0} a+0\\
&= a
\end{aligned}$$

So that

$$x\in[a,b]$$

As f is convex on $[a,b]$ we have that

$$\begin{aligned}
f(\alpha\cdot a+\beta\cdot b) &= f(x)\\
&\leqslant \frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}\\
&= \frac{f(a)\cdot(b-\alpha\cdot a-\beta\cdot b)+f(b)\cdot(\alpha\cdot a+\beta\cdot b-a)}{b-a}\\
&= \frac{f(a)\cdot((1-\beta)\cdot b-\alpha\cdot a)+f(b)\cdot((\alpha-1)\cdot a+\beta\cdot b)}{b-a}\\
&= \frac{f(a)\cdot(\alpha\cdot b-\alpha\cdot a)+f(b)\cdot(-\beta\cdot a+\beta\cdot b)}{b-a}\\
&= \frac{f(a)\cdot\alpha\cdot(b-a)+f(b)\cdot\beta\cdot(b-a)}{b-a}\\
&= \alpha\cdot f(a)+\beta\cdot f(b)
\end{aligned}$$

⇐. Let $x\in[a,b]$ then $\alpha=\frac{b-x}{b-a}\in[0,\ldots,\infty[$ and $\beta=\frac{x-a}{b-a}\in[0,\ldots,\infty[$ and

$$\alpha+\beta=\frac{b-x}{b-a}+\frac{x-a}{b-a}=\frac{b-a}{b-a}=1$$

so that

$$f(\alpha\cdot a+\beta\cdot b)\leqslant\alpha\cdot f(a)+\beta\cdot f(b) \tag{16.166}$$

Further

$$\begin{aligned}
\alpha\cdot a+\beta\cdot b &= \frac{b-x}{b-a}\cdot a+\frac{x-a}{b-a}\cdot b\\
&= \frac{(b-x)\cdot a+(x-a)\cdot b}{b-a}\\
&= \frac{b\cdot a-x\cdot a+x\cdot b-a\cdot b}{b-a}\\
&= \frac{x\cdot(b-a)}{b-a}=x\\
\alpha\cdot f(a)+\beta\cdot f(b) &= \frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}
\end{aligned}$$

So substituting the above in [eq: 16.166] proves that $f(x)\leqslant\frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}$ so that f is convex.

2.

$\Rightarrow$. Let $x=\alpha\cdot a+\beta\cdot b$ then we have

$$\begin{aligned}
x &= \alpha\cdot a+\beta\cdot b\\
&= \alpha\cdot a+(1-\alpha)\cdot b\\
&= \alpha\cdot(a-b)+b\\
&\leqslant_{(a-b)<0\wedge 0\leqslant\alpha\Rightarrow\alpha\cdot(a-b)\leqslant 0} 0+b\\
&= b
\end{aligned}$$

$$\begin{aligned}
x &= \alpha\cdot a+\beta\cdot b\\
&= (1-\beta)\cdot a+\beta\cdot b\\
&= a+\beta\cdot(b-a)\\
&\geqslant_{0<b-a\wedge 0\leqslant\beta\Rightarrow\beta\cdot(b-a)\geqslant 0} a+0\\
&= a
\end{aligned}$$

So that

$$x\in[a,b]$$

As f is concave on $[a,b]$ we have that

$$\begin{aligned}
f(\alpha\cdot a+\beta\cdot b) &= f(x)\\
&\geqslant \frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}\\
&= \frac{f(a)\cdot(b-\alpha\cdot a-\beta\cdot b)+f(b)\cdot(\alpha\cdot a+\beta\cdot b-a)}{b-a}\\
&= \frac{f(a)\cdot((1-\beta)\cdot b-\alpha\cdot a)+f(b)\cdot((\alpha-1)\cdot a+\beta\cdot b)}{b-a}\\
&= \frac{f(a)\cdot(\alpha\cdot b-\alpha\cdot a)+f(b)\cdot(-\beta\cdot a+\beta\cdot b)}{b-a}\\
&= \frac{f(a)\cdot\alpha\cdot(b-a)+f(b)\cdot\beta\cdot(b-a)}{b-a}\\
&= \alpha\cdot f(a)+\beta\cdot f(b)
\end{aligned}$$

$\Leftarrow$. Let $x\in[a,b]$ then $\alpha=\frac{b-x}{b-a}\in[0,\ldots,\infty[$ and $\beta=\frac{x-a}{b-a}\in[0,\ldots,\infty[$ and

$$\alpha+\beta=\frac{b-x}{b-a}+\frac{x-a}{b-a}=\frac{b-a}{b-a}=1$$

so that

$$f(\alpha\cdot a+\beta\cdot b)\geqslant\alpha\cdot f(a)+\beta\cdot f(b) \tag{16.167}$$

Further

$$\begin{aligned}
\alpha\cdot a+\beta\cdot b &= \frac{b-x}{b-a}\cdot a+\frac{x-a}{b-a}\cdot b\\
&= \frac{(b-x)\cdot a+(x-a)\cdot b}{b-a}\\
&= \frac{b\cdot a-x\cdot a+x\cdot b-a\cdot b}{b-a}\\
&= \frac{x\cdot(b-a)}{b-a}=x\\
\alpha\cdot f(a)+\beta\cdot f(b) &= \frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}
\end{aligned}$$

So substituting the above in [eq: 16.167] proves that $f(x)\geqslant\frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}$ so that f is concave.

$\square$

The next theorem shows the relation between the second derivative and convexity and concavity.

Theorem 16.157. *Let $\langle\mathbb{R},\|\rangle$ be the normed space of real numbers, U a open set in $\mathbb{R}$, $a,b\in\mathbb{R}$ with $a<b$ and $[a,b]\subseteq U$, $f:U\to\mathbb{R}$ a function such that f has a 2-the derivative on U then*

1. *If $\forall x\in]a,b[\ 0\leqslant f_x^{(2)}$ then f is convex on $[a,b]$.*
2. *If $\forall x\in]a,b[\ f_x^{(2)}\leqslant 0$ then f is concave on $[a,b]$.*

Proof. Let $x\in[a,b]$ then we have either

$\boldsymbol{x=a}$**.** Then $\frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}=f(a)=f(x)$. As this result is independent of the sign of $f''(x)$ we have

$$\begin{cases}\frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}\geqslant f(x)\text{ if }\forall x\in]a,b[\ f^{(2)}\geqslant 0\\ \frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}\leqslant f(x)\text{ if }\forall x\in]a,b[\ f^{(2)}(x)\leqslant 0\end{cases}$$

$\boldsymbol{x=b}$**.** Then $\frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}=f(b)=f(x)$. As this result is independent of the sign of $f''(x)$ we have

$$\begin{cases}\frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}\geqslant f(x)\text{ if }f^{(2)}(x)\geqslant 0\\ \frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}\leqslant f(x)\text{ if }f^{(2)}(x)\leqslant 0\end{cases}$$

$\boldsymbol{x\in]a,b[}$**.** Then

$$\frac{x-a}{b-a}+\frac{b-x}{b-a}=\frac{x-a+b-x}{b-a}=1$$

so by multiplying both sides by $f(x)$ we have $f(x)=\frac{x-a}{b-a}\cdot f(x)+\frac{b-x}{b-a}\cdot f(x)$ so that

$$\begin{aligned}\frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}-f(x)&=\\ \frac{b-x}{b-a}\cdot f(a)+\frac{x-a}{b-a}\cdot f(b)-\frac{x-a}{b-a}\cdot f(x)-\frac{b-x}{b-a}\cdot f(x)&=\\ \frac{(x-a)}{b-a}\cdot(f(b)-f(x))-\frac{b-x}{b-a}\cdot(f(x)-f(a))&=\\ \frac{(x-a)\cdot(b-x)}{b-a}\cdot\frac{f(b)-f(x)}{b-x}-\frac{(b-x)\cdot(x-a)}{b-a}\cdot\frac{f(x)-f(a)}{x-a}&=\\ \frac{(x-a)\cdot(b-x)}{b-a}\cdot\left(\frac{f(b)-f(x)}{b-x}-\frac{f(x)-f(a)}{x-a}\right)&\end{aligned}\tag{16.168}$$

As $\forall x\in U$ f has a 2-the derivative it follows from [theorem: 16.117] that f has a derivative at every $x\in U$ and the function

$$f':U\to\mathbb{R}\text{ defined by }f'(x)=f'_x\text{ has a derivative at every }x\in U\text{ and }\forall x\in U\ f_x^{(2)}=(f')'_x\tag{16.169}$$

As $[a,x],[x,b]\subseteq[a,b]\subseteq U$ we can apply Lagrange's theorem [corollary: 16.153] on $f_{|[a,b]}$ to find $y_1\in]a,x[,\ y_2\in]x,b[$ such that

$$f(x)-f(a)=f'_{y_1}\cdot(x-a)\text{ and }f(b)-f(x)=f'_{y_2}\cdot(b-x)\tag{16.170}$$

Combining [eq: 16.168] and [eq: 16.170] gives

$$\frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}-f(x)=\frac{(x-a)\cdot(b-x)}{b-a}\cdot(f'(y_2)-f'(y_1))\tag{16.171}$$

As $y_1\in]a,x[,\ y_2\in]x,b[$ we have $a<y_1<x<y_2<b$ so that $y_1<y_2$ and $[y_1,y_2]\subseteq[a,b]\subseteq U$. Hence using [eq: 16.169] we can apply Lagrange's theorem [theorem: 16.153] on f' to find a $z\in]y_1,y_2[$ such that

$$f'(y_2)-f'(y_1)=(f^{(1)})'_z\cdot(y_2-y_1)=f_z^{(2)}\cdot(y_2-y_1)$$

substituting this in [eq: 16.171] gives

$$\frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a}-f(x)=\frac{(x-a)\cdot(b-x)}{b-a}\cdot f^{(2)}(z)$$

Now as $x \in [a,b]$ we have that $\frac{(x-a)\cdot(b-x)}{b-a} \geqslant 0$ so that

$$\begin{cases} \frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a} \geqslant f(x) \text{ if } \forall x \in]a,b[\ f^{(2)}(x) \geqslant 0 \\ \frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a} \leqslant f(x) \text{ if } \forall x \in]a,b[\ f^{(2)}(x) \leqslant 0 \end{cases}$$

So in all cases we have $\begin{cases} \frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a} \geqslant f(x) \text{ if } \forall x \in]a,b[\ f^{(2)}(x) \geqslant 0 \\ \frac{f(a)\cdot(b-x)+f(b)\cdot(x-a)}{b-a} \leqslant f(x) \text{ if } \forall x \in]a,b[\ f^{(2)}(x) \leqslant 0 \end{cases}$ proving that

1. If $\forall x \in]a,b[\ 0 \leqslant f^{(2)}(x)$ then f is convex on $[a,b]$
2. If $\forall x \in]a,b[\ f^{(2)}(x) \leqslant 0$ then f is concave on $[a,b]$ □

We show now how the concept of convexity or concavity on a interval allows us to determine if we have a minimum or maximum.

Theorem 16.158. *Let $\langle \mathbb{R}, \|\rangle$ be the normed space of real numbers, U a open set in $\mathbb{R}$, $f: U \to \mathbb{R}$ a function such that $f^{(2)}$ exist on U x_0 a local extremum of f then we have:*

1. *If there exist a open set V with $x_0 \in V \subseteq U$ such that $\forall x \in V\ f^{(2)}(x) \geqslant 0$ then x_0 is a local weak minimum.*
2. *If there exist a open set V with $x_0 \in V \subseteq U$ such that $\forall x \in V\ f^{(2)}(x) \leqslant 0$ then x_0 is a local weak maximum..*

Proof. As f has a 2-the derivative on U it follows from [theorem: 16.117] that $\forall x \in U$ f has a 1-the derivative at x and the function

$$f': U \to X \text{ defined by } f'(x) = f'_x$$

has a derivative at every $x \in U$ exist and $f^{(2)}_x = (f')'_x$. As x_0 is a extremum it follows from [theorem: 16.150] that

$$f'(x_0) = 0 \tag{16.172}$$

1. As V is open there exists a $\delta > 0$ such that $]x_0 - \delta, x_0 + \delta[\subseteq V$ hence

   $$\forall x \in]x_0 - \delta, x_0 + \delta[\text{ we have } f^{(2)}(x) \geqslant 0$$

   Using [corollary: 16.154] it follows that f' is increasing on $]x_0 - \delta, x_0 + \delta[$, hence we have

   $$\forall x \in]x_0 - \delta, x_0]\ f'(x) \leqslant f'(x_0) \underset{\text{[eq: 16.172]}}{=} 0 \text{ and } \forall x \in [x_0, x_0 + \delta[\ 0 \underset{\text{[eq: 16.172]}}{=} f'(x_0) \leqslant f'(x)$$

   So using [corollary: 16.154] f is decreasing on $]x_0 - \delta, x_0] \Rightarrow \forall x \in]x_0 - \delta, x_0]$ we have $f(x) \geqslant f(x_0)$ and f is increasing on $[x_0, x_0 + \delta[\Rightarrow \forall x \in [x_0, x_o + \delta[$ we have $f(x_0) \leqslant f(x)$. Hence

   $$\forall x \in]x_0 - \delta, x_0 + \delta[\text{ we have } f(x_0) \leqslant f(x) \text{ or } x_0 \text{ is a local weak minimum.}$$

2. As V is open there exists a $\delta > 0$ such that $]x_0 - \delta, x_0 + \delta[\subseteq V$ hence

   $$\forall x \in]x_0 - \delta, x_0 + \delta[\text{ we have } f^{(2)}(x) \leqslant 0$$

   So using [corollary: 16.154] it follows that f' is decreasing on $]x_0 - \delta, x_0 + \delta[$, hence we have

   $$\forall x \in]x_0 - \delta, x_0]\ 0 \underset{\text{[eq: 16.172]}}{=} f'(x_0) \leqslant f'(x) \text{ and } \forall x \in [x_0, x_0 + \delta[\ f'(x) \leqslant f'(x_0) \underset{\text{[eq: 16.172]}}{=} 0$$

   So using [corollary: 16.154] f is increasing on $]x_0 - \delta, x_0] \Rightarrow \forall x \in]x_0 - \delta, x_0]$ we have $f(x_0) \geqslant f(x)$ and f is decreasing on $[x_0, x_0 + \delta[\Rightarrow \forall x \in [x_0, x_o + \delta[$ we have $f(x) \leqslant f(x_0)$. Hence

   $$\forall x \in]x_0 - \delta, x_0 + \delta[\text{ we have } f(x) \leqslant f(x_0) \text{ or } x_0 \text{ is a local weak maximum.}$$ □

Actually we can extend the above to a maximum and minimum on a interval instead of a local weak minimum or local weak maximum.

Theorem 16.159. *Let $\langle \mathbb{R}, \|\rangle$ be the normed space of real numbers, U a open set in X, $a, b \in U$ with $a \leqslant b$, $[a,b] \subseteq U$, $f: U \to \mathbb{R}$ a function such that f has a 2-the derivative on U and that there exist a $x_0 \in [a,b]$ with $f'(x_0) = 0$ then we have:*

1. *If $\forall x \in U\ 0 \leqslant f^{(2)}(x)$ then $\forall x \in [a,b]\ f(x_0) \leqslant f(x)$ [in other words $f(x_0)$ is the minimum of $f([a,b])$.*
2. *If $\forall x \in U\ 0 \leqslant f^{(2)}(x)$ then $\forall x \in [a,b]\ f(x_0) \leqslant f(x)$ [in other words $f(x_0)$ is the maximum of $f([a,b])$.*

Proof. If $a=b$ then $[a,b]=\{x_0\}$ and the theorem is trivial true. So we must only prove the theorem for the case $a<b$.

1. From the previous theorem [theorem:16.158] it follows that x_0 is a local weak minimum of f hence there exist a $\delta\in\mathbb{R}^+$ such that

$$\forall x\in\,]x_0-\delta,x_0+\delta[\text{ we have } f(x_0)\leqslant f(x) \tag{16.173}$$

Assume that there exist a $y\in[a,b]$ such that $f(y)<f(x_0)$ then $y\neq x_0$, so we have either:

$y<x_0$. Then $\max(x_0-\delta,y)<x_0$ so there exist a $z\in\mathbb{R}$ such that $x_0-\delta,y<z<x_0$ hence by [eq: 16.173] we have

$$f(x_0)\leqslant f(z) \tag{16.174}$$

Further using [theorem: 16.157] f is convex on $[y,x_0]$ so that

$$f(z)\leqslant\frac{f(y)\cdot(x_0-z)+f(x_0)\cdot(z-y)}{x_0-y} \tag{16.175}$$

As $0<x_0-z$ and by assumption $f(y)<f(x_0)$ it follows that

$$f(y)\cdot(x_0-z)<f(x_0)\cdot(x_0-z) \tag{16.176}$$

Hence we have

$$\begin{aligned}
f(x_0) &= \frac{f(x_0)\cdot(x_0-y)}{x_0-y}\\
&= \frac{f(x_0)\cdot(x_0-z+z-y)}{x_0-y}\\
&= \frac{f(x_0)\cdot(x_0-z)+f(x_0)\cdot(z-y)}{x_0-y}\\
&>_{\text{[eq: 16.176]}} \frac{f(y)\cdot(x_0-z)+f(x_0)\cdot(z-y)}{x_0-y}\\
&\geqslant_{\text{[eq: 16.175]}} f(z)\\
&\geqslant_{\text{[eq: 16.174]}} f(x_0)
\end{aligned}$$

leading to the contradiction $f(x_0)>f(x_0)$.

$x_0<y$. Then $x_0<\min(y,x_0+\delta)$ so there exist a $z\in\mathbb{R}$ such that $x_0<z<y,x_0+\delta$ hence by [eq: 16.173] we have

$$f(x_0)\leqslant f(z) \tag{16.177}$$

Further using [theorem: 16.157] f is convex on $[x_0,y]$ so that

$$f(z)\leqslant\frac{f(x_0)\cdot(y-z)+f(y)\cdot(z-x_0)}{y-x_0} \tag{16.178}$$

As $0<z-x_0$ and $f(y)<f(x_0)$ [by assumption] we have

$$f(y)\cdot(z-x_0)<f(x_0)\cdot(z-x_0) \tag{16.179}$$

Hence we have

$$\begin{aligned}
f(x_0) &= \frac{f(x_0)\cdot(y-x_0)}{(y-x_0)}\\
&= \frac{f(x_0)\cdot(y-z+z-x_0)}{(y-x_0)}\\
&= \frac{f(x_0)\cdot(y-z)+f(x_0)\cdot(z-x_0)}{(y-x_0)}\\
&>_{\text{[eq: 16.179]}} \frac{f(x_0)\cdot(y-z)+f(y)\cdot(z-x_0)}{(y-x_0)}\\
&\geqslant_{\text{[eq: 16.178]}} f(z)\\
&\geqslant_{\text{[eq: 16.177]}} f(x_0)
\end{aligned}$$

leading to the contradiction $f(x_0)>f(x_0)$.

As in all cases we have a contradiction the assumption must be false, so it follows that

$$\forall x\in[a,b] \text{ we have } f(x_0)\leqslant f(x)$$

2. From the previous theorem [theorem:16.158] it follows that x_0 is a local weak maximum of f hence there exist a $\delta \in \mathbb{R}^+$ such that

$$\forall x \in]x_0 - \delta, x_0 + \delta[\text{ we have } f(x) \leqslant f(x_0) \tag{16.180}$$

Assume that there exist a $y \in [a, b]$ such that $f(x_0) < f(y)$ then we can not have $y = x_0$, hence we must consider the following cases:

$y < x_0$. Then $\max(x_0 - \delta, y) < x_0$ so there exist a $z \in \mathbb{R}$ with $x_0 - \delta, y < z < x_0$. Applying [eq: 16.180] gives

$$f(z) \leqslant f(x_0) \tag{16.181}$$

Further using [theorem: 16.157] f is concave on $[y, x_0]$ so that

$$\frac{f(y) \cdot (x_0 - z) + f(x_0) \cdot (z - y)}{x_0 - y} \leqslant f(z) \tag{16.182}$$

As $0 < x_0 - z$ and by the assumption $f(x_0) < f(y)$ it follows that

$$f(x_0) \cdot (x_0 - z) < f(y) \cdot (x_0 - z) \tag{16.183}$$

Hence we have

$$\begin{aligned}
f(x_0) &= \frac{f(x_0) \cdot (x_0 - y)}{x_0 - y} \\
&= \frac{f(x_0) \cdot (x_0 - z + z - y)}{x_0 - y} \\
&= \frac{f(x_0) \cdot (x_0 - z) + f(x_0) \cdot (z - y)}{x_0 - y} \\
&<_{\text{[eq: 16.183]}} \frac{f(y) \cdot (x_0 - z) + f(x_0) \cdot (z - y)}{x_0 - y} \\
&\leqslant_{\text{[eq: 16.182]}} f(z) \\
&\leqslant_{\text{[eq: 16.181]}} f(x_0)
\end{aligned}$$

leading to the contradiction $f(x_0) < f(x_0)$.

$x_0 < y$. Then $x_0 < \min(y, x_0 + \delta)$ so there exist a $z \in \mathbb{R}$ with $x_0 < z < y, x_0 + \delta$. Applying [eq: 16.180] gives

$$f(z) \leqslant f(x_0) \tag{16.184}$$

Further using [theorem: 16.157] f is concave on $[x_0, y]$ so that

$$\frac{f(x_0) \cdot (y - z) + f(y) \cdot (z - x_0)}{y - x_0} \leqslant f(z) \tag{16.185}$$

As $0 < z - x_0$ and by assumption $f(x_0) < f(y)$ it follows that

$$f(x_0) \cdot (z - x_0) < f(y) \cdot (z - x_0) \tag{16.186}$$

Hence we have

$$\begin{aligned}
f(x_0) &= \frac{f(x_0) \cdot (y - x_0)}{(y - x_0)} \\
&= \frac{f(x_0) \cdot (y - z + z - x_0)}{(y - x_0)} \\
&= \frac{f(x_0) \cdot (y - z) + f(x_0) \cdot (z - x_0)}{(y - x_0)} \\
&<_{\text{[eq: 16.186]}} \frac{f(x_0) \cdot (y - z) + f(y) \cdot (z - x_0)}{(y - x_0)} \\
&\leqslant_{\text{[eq: 16.185]}} f(z) \\
&\leqslant_{\text{[eq: 16.184]}} f(x_0)
\end{aligned}$$

leading to the contradiction $f(x_0) < f(x_0)$.

As in all cases we have a contradiction the assumption must be false, so it follows that

$$\forall x \in [a, b] \text{ we have } f(x) \leqslant f(x_0)$$

□

16.3.2 Derivatives on a closed interval

The definition of a derivative of a function at a point in its domain makes only sense if the domain of the function is open [see note: 16.11]. This section introduces left/right derivatives to help us to work with functions where the domain is a closed interval in $\mathbb{R}$. This will be essential if we want to formulate the Fundamental Theorem of Analysis and the Main Value theorems.

Definition 16.160. *Let $\langle \mathbb{R}, \|\rangle$ be the real normed space with the canonical norm, $a, b \in \mathbb{R}$ with $a < b$, $\langle X, \|\|\rangle$ a normed space and $f: [a,b] \to X$ a function then we define the left and right derivative of f at a point as follows:*

1. *If $x \in [a,b[$ then f has a **right derivative** at x noted as $f'_{+,x} \in X$ if $\forall \varepsilon \in \mathbb{R}^+$ there exist a $\delta \in \mathbb{R}^+$ such that $\forall h \in \mathbb{R}$ with $0 < h < \delta$ and $x + h \in [a,b]$ we have*
$$\left\| \frac{f(x+h) - f(x)}{h} - f'_{+,x} \right\| < \varepsilon$$
2. *If $x \in]a,b]$ then f has a **left derivative** at x noted as $f'_{-,x} \in X$ if $\forall \varepsilon \in \mathbb{R}^+$ there exist a $\delta \in \mathbb{R}^+$ such that $\forall h \in \mathbb{R}$ with $0 < h < \delta$ and $x - h \in [a,b]$ we have*
$$\left\| \frac{f(x-h) - f(x)}{-h} - f'_{-,x} \right\| < \varepsilon$$

Proof. For this definition to make sense we must of course prove that the left and right derivative is unique.

1. Assume that d_1, d_2 are right derivatives at $x \in [a,b[$ with $d_1 \neq d_2$. Take $\varepsilon = \|d_2 - d_1\| \in \mathbb{R}^+$ then there exists $\delta_1, \delta_2 \in \mathbb{R}^+$ such that if $0 < h < \delta_1$ and $x + h \in [a,b]$ we have
$$\left\| \frac{f(x+h) - f(x)}{h} - d_1 \right\| < \frac{\varepsilon}{2}$$
and if $0 < h < \delta_2$ and $x + h \in [a,b]$ we have
$$\left\| \frac{f(x+h) - f(x)}{h} - d_2 \right\| < \frac{\varepsilon}{2}$$
As $0 < \min(\delta_1, \delta_2)$ there exist a $h \in \mathbb{R}$ with $0 < h < \min(\delta_1, \delta_2)$ and we have
$$\begin{aligned} \varepsilon &= \|d_2 - d_1\| \\ &= \left\| \frac{f(x+h) - f(x)}{h} - d_1 - \left(\frac{f(x+h) - f(x)}{h} - d_2 \right) \right\| \\ &\leqslant \left\| \frac{f(x+h) - f(x)}{h} - d_1 \right\| + \left\| \frac{f(x+h) - f(x)}{h} - d_2 \right\| \\ &< \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \\ &= \varepsilon \end{aligned}$$
leading to the contradiction $\varepsilon < \varepsilon$. Hence the assumptions must be false and we must have $d_1 = d_2$.
2. Assume that d_1, d_2 are left derivatives at $x \in [a,b[$ with $d_1 \neq d_2$. Take $\varepsilon = \|d_2 - d_1\| \in \mathbb{R}^+$ then there exists $\delta_1, \delta_2 \in \mathbb{R}^+$ such that if $0 < h < \delta_1$ and $x - h \in [a,b]$ we have
$$\left\| \frac{f(x-h) - f(x)}{-h} - d_1 \right\| < \frac{\varepsilon}{2}$$
and if $0 < h < \delta_2$ and $x - h \in [a,b]$ we have
$$\left\| \frac{f(x-h) - f(x)}{-h} - d_2 \right\| < \frac{\varepsilon}{2}$$
As $0 < \min(\delta_1, \delta_2)$ there exist a $h \in \mathbb{R}$ with $0 < h < \min(\delta_1, \delta_2)$ and we have
$$\begin{aligned} \varepsilon &= \|d_2 - d_1\| \\ &= \left\| \frac{f(x-h) - f(x)}{-h} - d_1 - \left(\frac{f(x-h) - f(x)}{-h} - d_2 \right) \right\| \\ &\leqslant \left\| \frac{f(x-h) - f(x)}{-h} - d_1 \right\| + \left\| \frac{f(x-h) - f(x)}{-h} - d_2 \right\| \\ &< \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \\ &= \varepsilon \end{aligned}$$
leading to the contradiction $\varepsilon < \varepsilon$. Hence the assumptions must be false and we must have $d_1 = d_2$. □

Right/left derivatives have the same properties as derivatives.

Theorem 16.161. *Let $\langle \mathbb{R}, \|\rangle$ be the real normed space with the canonical norm, $a, b \in \mathbb{R}$ with $a < b$ $\langle X, \|\|\rangle$ a normed space then we have:*

1. *If $f: [a,b] \to X$ and $g: [a,b] \to X$ has a right derivative at $x \in [a,b[$ then $f+g: [a,b] \to X$ has a right derivative at x and $(f+g)'_{+,x} = f'_{+,x} + g'_{+,x}$*
2. *If $f: [a,b] \to X$ and $g: [a,b] \to X$ has a left derivative at $x \in]a,b]$ then $f+g: [a,b] \to X$ has a left derivative at x and $(f+g)'_{-,x} = f'_{-,x} + g'_{-,x}$*
3. *If $\alpha \in \mathbb{R}$ and $f: [a,b] \to X$ has a right derivative at $x \in [a,b[$ then $\alpha \cdot f: [a,b] \to X$ has a right derivative at x and $(\alpha \cdot f)'_{+,x} = \alpha \cdot f'_{+,x}$.*
4. *If $\alpha \in \mathbb{R}$ and $f: [a,b] \to X$ has a left derivative at $x \in]a,b]$ then $\alpha \cdot f: [a,b] \to X$ has a left derivative at x and $(\alpha \cdot f)'_{-,x} = \alpha \cdot f'_{+-x}$.*

Proof.

1. Let $\varepsilon \in \mathbb{R}^+$. Then there exist $\delta_1, \delta_2 \in \mathbb{R}^+$ such that if $0 < h < \delta_1$ and $a + h \in [a,b]$ then
$$\left\| \frac{f(a+h) - f(a)}{h} - f'_{+,a} \right\| < \frac{\varepsilon}{2}$$
and if $0 < h < \delta_2$ and $a + h \in [a,b]$ then
$$\left\| \frac{g(a+h) - g(a)}{h} - g'_{+,a} \right\| < \frac{\varepsilon}{2}$$
Take $\delta = \min(\delta_1, \delta)$ then we have
$$\begin{aligned} \left\| \frac{(f+g)(a+h) - (f+g)(a)}{h} - (f'_{+,a} + g'_{+,a}) \right\| &= \\ \left\| \frac{f(a+h) + g(a+h) - f(a) - g(a)}{h} - f'_{+,a} - g'_{+,a} \right\| &= \\ \left\| \frac{f(a+h) - f(a)}{h} - f'_{+,a} + \frac{g(a+h) - g(a)}{h} - g'_{+,a} \right\| &\leqslant \\ \left\| \frac{f(a+h) - f(a)}{h} - f'_{+,a} \right\| + \left\| \frac{g(a+h) - g(a)}{h} - g'_{+,a} \right\| &< \\ \frac{\varepsilon}{2} + \frac{\varepsilon}{2} &= \\ \varepsilon \end{aligned}$$
proving that $f+g$ has a right derivative at a and $(f+g)'_{+,a} = f'_{+,a} + g'_{+,a}$.
2. Let $\varepsilon \in \mathbb{R}^+$. Then there exist $\delta_1, \delta_2 \in \mathbb{R}^+$ such that if $0 < h < \delta_1$ and $b - h \in [a,b]$ then
$$\left\| \frac{f(b-h) - f(b)}{-h} - f'_{-,a} \right\| < \frac{\varepsilon}{2}$$
and if $0 < h < \delta_2$ and $b - h \in [a,b]$ then
$$\left\| \frac{g(b-h) - g(b)}{-h} - g'_{-,b} \right\| < \frac{\varepsilon}{2}$$
Take $\delta = \min(\delta_1, \delta)$ then we have
$$\begin{aligned} \left\| \frac{(f+g)(b-h) - (f+g)(b)}{-h} - (f'_{-,b} + g'_{-,a}) \right\| &= \\ \left\| \frac{f(b-h) + g(b-h) - f(b) - g(b)}{-h} - f'_{-,b} - g'_{-,b} \right\| &= \\ \left\| \frac{f(b-h) - f(b)}{-h} - f'_{-,a} + \frac{g(b-h) - g(b)}{-h} - g'_{-,b} \right\| &\leqslant \\ \left\| \frac{f(b-h) - f(b)}{-h} - f'_{-,b} \right\| + \left\| \frac{g(b-h) - g(b)}{-h} - g'_{-,b} \right\| &< \\ \frac{\varepsilon}{2} + \frac{\varepsilon}{2} &= \\ \varepsilon \end{aligned}$$
proving that $f+g$ has a left derivative at a and $(f+g)'_{-,b} = f'_{-,b} + g'_{-,b}$.

3. Let $\varepsilon \in \mathbb{R}^+$. Then there exist a $\delta \in \mathbb{R}^+$ such that if $0 < h < \delta$ and $a + h \in [a, b]$ then
$$\left\| \frac{f(a+h) - f(a)}{h} - f'_{+,a} \right\| < \frac{\varepsilon}{|\alpha| + 1}$$
then we have
$$\begin{aligned} \left\| \frac{(\alpha \cdot f)(a+h) - (\alpha \cdot f)}{h} - \alpha \cdot f'_{+,a} \right\| &= \left\| \alpha \cdot \left(\frac{f(a+h) - f(a)}{h} - f'_{+,a} \right) \right\| \\ &= |\alpha| \cdot \left\| \frac{f(a+h) - f(a)}{h} - f'_{+,a} \right\| \\ &< |\alpha| \cdot \frac{\varepsilon}{|\alpha| + 1} \\ &< \varepsilon \end{aligned}$$
proving that $\alpha \cdot f$ has a right derivative at a and $(\alpha \cdot f)'_{+.a} = \alpha \cdot f'_{+,a}$.
4. Let $\varepsilon \in \mathbb{R}^+$. Then there exist a $\delta \in \mathbb{R}^+$ such that if $0 < h < \delta$ and $b - h \in [a, b]$ then
$$\left\| \frac{f(b-h) - f(b)}{-h} - f'_{-,a} \right\| < \frac{\varepsilon}{|\alpha| + 1}$$
then we have
$$\begin{aligned} \left\| \frac{(\alpha \cdot f)(b-h) - (\alpha \cdot f)}{-h} - \alpha \cdot f'_{-,b} \right\| &= \left\| \alpha \cdot \left(\frac{f(b-h) - f(b)}{-h} - f'_{-,b} \right) \right\| \\ &= |\alpha| \cdot \left\| \frac{f(b-h) - f(b)}{-h} - f'_{-,b} \right\| \\ &< |\alpha| \cdot \frac{\varepsilon}{|\alpha| + 1} \\ &< \varepsilon \end{aligned}$$
proving that $\alpha \cdot f$ has a left derivative at b and $(\alpha \cdot f)'_{-.b} = \alpha \cdot f'_{-,b}$. □

We have the following relation between left, right derivatives and derivatives.

Theorem 16.162. *Let $\langle \mathbb{R}, \|\rangle$ be the real normed space with the canonical norm, $a, b \in \mathbb{R}$ with $a < b$, $\langle X, \|\|\rangle$ a normed space and $f: [a, b] \to X$ a function then*

1. *If $x \in]a, b[$ and f has a right derivative $f'_{+,x}$ and left derivative $f'_{-,x}$ with $f'_{+,x} = f'_{-,x}$ then $f_{|]a,b[}$ has a derivative at x with $(f_{|]a,b[})' = f'_{+,x} = f'_{-,x}$*
2. *If $x \in]a, b[$ and $f_{|]a,b[}$ has a derivative at x then f has a left and right derivative at x with $(f_{|]a,b[})'_x = f'_{+,x} = f'_{-,x}$.*
3. *If $[a, b] \subseteq U$ and $f: U \to X$ is a function such that $\forall x \in U$ f has a derivative f'_x then*
   a. *$f_{|[a,b]}$ has a right derivative at a with $(f_{|[a,b]})'_{+,a} = f'_a$.*
   b. *$f_{|[a,b]}$ has a left derivative at b with $(f_{|[a,b]})'_{+,b} = f'_b$.*
   c. *We have $\forall x \in]a, b[$ that $f_{[a,b]}$ has a left and right derivative at x with*
$$(f_{|[a,b]})'_{+,x} = f'_x = (f_{|[a,b]})'_{-,x}$$

Proof.

1. Let $d = f'_{+,x} = f'_{-,x}$ and let $\varepsilon \in \mathbb{R}^+$ then there exist $\delta_1, \delta_2 \in \mathbb{R}^+$ such that if $0 < h < \delta_1$ and $x + h \in [a, b]$ we have
$$\left\| \frac{f(x+h) - f(x)}{h} - d \right\| < \varepsilon \tag{16.187}$$
and if $0 < h < \delta_2$ and $x - h \in [a, b]$ we have
$$\left\| \frac{f(x-h) - f(x)}{-h} - d \right\| < \varepsilon \tag{16.188}$$
So if $0 < |h| < \min(\delta_1, \delta_2)$ with $h \in]a, b[_x$ [or $x + h \in]a, b[$] we have either:

   $0 < h$. Then as $0 < |h| < \min(\delta_1, \delta_2) < \delta_1$ we have $0 < h < \delta_1$ and from $h \in]a, b[_x$ that $x + h \in]a, b[\subseteq [a, b]$, hence
$$\begin{aligned} \left\| \frac{f_{|]a,b[}(x+h) - f_{]a,b[}(x)}{h} - d \right\| &\underset{x, x+h \in]a,b[}{=} \left\| \frac{f(x+h) - f(x)}{h} - d \right\| \\ &<_{\text{[eq: 16.187]}} \varepsilon \end{aligned}$$

$h<0$. Then $-h=|h|$ so that from $h\in\,]a,b[_x$ we have $x-|h|\in\,]a,b[$, further we have $0<|h|<\delta_2$, hence

$$\begin{aligned}\left\|\frac{f_{|]a,b[}(x+h)-f_{]a,b[}(x)}{h}-d\right\| &\underset{x,x+h\in]a,b[}{=} \left\|\frac{f(x+h)-f(x)}{h}-d\right\| \\ &= \left\|\frac{f(x-|h|)-f(x)}{-|h|}-d\right\| \\ &<_{[\text{eq:}16.188]} \varepsilon\end{aligned}$$

so in all cases we have

$$\left\|\frac{f_{|]a,b[}(x+h)-f_{]a,b[}(x)}{h}-d\right\|<\varepsilon$$

proving that $f_{|]a,b[}$ has a derivative at x and $(f_{|]a,b[})'_x=d=f'_{+,x}=f'_{-,x}$.

2. Let $\varepsilon\in\mathbb{R}^+$ then, as $f_{|]a,b[}$ has a derivative at x, there exist a $\delta_1\in\mathbb{R}^+$ such that $\forall h\in\,]a,b[_x$ [or equivalently $x+h\in\,]a,b[$ with $0<|h|<\delta_1$ we have

$$\left\|\frac{f(x+h)-f(x)}{h}-(f_{|]a,b]})'_x\right\|=\left\|\frac{f_{|]a,b[}(x+h)-f_{|]a,b[}(x)}{h}-(f_{|]a,b[})'_x\right\|<\varepsilon \tag{16.189}$$

As $x\in\,]a,b[$ a open set there exist a $\delta_2\in\mathbb{R}^+$ such that $x\in\,]x-\delta_2,x+\delta_2[\subseteq\,]a,b[$. Take now $\delta=\min(\delta_1,\delta_2)$ then if $0<h<\delta\leqslant\delta_1,\delta_2$ we have $h<\delta_2$ so that $x-\delta_2<x-h<x<x+h<x+\delta_2$ or $x-h,x+h\in\,]x-\delta_2,x+\delta_2[\subseteq\,]a,b[$ so that $h,-h\in\,]a,b[_x$ and $0<|h|$, $|-h|<\delta_1$. Using then [eq: 16.189] it follows that

$$\left\|\frac{f(x+h)-f(x)}{h}-(f_{|]a,b[})'_x\right\|<\varepsilon \text{ and } \left\|\frac{f(x-h)-f(x)}{-h}-(f_{|]a,b[})'_x\right\|<\varepsilon$$

proving that f has a left and right derivative at x and

$$(f_{|]a,b[})'_x=f'_{+,x}=f'_{-,x}$$

3. Let $x\in[a,b]$ then as $[a,b]\subseteq U$ it follows that f has a derivative at x, hence if $\varepsilon\in\mathbb{R}^+$ there exist a $\delta_{\varepsilon,x}\in\mathbb{R}^+$ such that

$$\forall h\in U_x \text{ with } 0<|h|<\delta_{\varepsilon,x} \text{ we have } \left\|\frac{f(x+h)-f(x)}{h}-f'_x\right\|<\varepsilon \tag{16.190}$$

   a. Let $\varepsilon\in\mathbb{R}^+$ then $\forall h\in\mathbb{R}$ with $0<h<\delta_{\varepsilon,a}$ and $a+h\in[a,b]$ we have $0<|h|<\delta_{\varepsilon,a}$ and $a+h\in U\Rightarrow h\in U_a$ so that

$$\left\|\frac{f_{|[a,b]}(a+h)-f_{|[a,b]}(a)}{h}-f'_a\right\|=\left\|\frac{f(a+h)-f(a)}{h}-f'_a\right\|<_{[\text{eq: }16.190]}\varepsilon$$

   proving that $(f_{|[a,b]})'_{+,a}=f'_a$.

   b. Let $\varepsilon\in\mathbb{R}^+$ then $\forall h\in\mathbb{R}$ with $0<h<\delta_{\varepsilon,b}$ and $b-h\in[a,b]$ we have $0<|-h|<\delta_{\varepsilon,b}$ and $b-h\in U\Rightarrow -h\in U_b$ so that

$$\left\|\frac{f_{|[a,b]}(b-h)-f_{|[a,b]}(b)}{-h}-f'_b\right\|=\left\|\frac{f(b-h)-f(b)}{-h}-f'_b\right\|<_{[\text{eq: }16.190]}\varepsilon$$

   proving that $(f_{|[a,b]})'_{-,b}=f'_b$.

   c. Let $\varepsilon\in\mathbb{R}^+$ then $\forall h\in\mathbb{R}$ with $0<h<\delta_\varepsilon$ and $x+h\in[a,b]$ we have $0<|h|<\delta$ and $x+h\in U\Rightarrow h\in U_x$ so that

$$\left\|\frac{f_{|[a,b]}(x+h)-f_{|[a,b]}(x)}{h}-f'_x\right\|=\left\|\frac{f(x+h)-f(x)}{h}-f'_x\right\|<_{[\text{eq: }16.190]}\varepsilon$$

   proving that $(f_{|[a,b]})'_{+,x}=f'_x$. Further $\forall h\in\mathbb{R}$ with $0<h<\delta_\varepsilon$ and $x-h\in[a,b]$ we have $0<|-h|<\delta$ and $x-h\in U\Rightarrow -h\in U_x$ so that

$$\left\|\frac{f_{|[a,b]}(x-h)-f_{|]a,b[}(x)}{-h}-f'_x\right\|=\left\|\frac{f(x-h)-f(x)}{-h}-f'_x\right\|<_{[\text{eq: }16.190]}\varepsilon$$

   proving that $(f_{|[a,b]})'_{-x}=f'_x$.

□

We use the above theorem in the following definition that extend the concept of derivatives to a **closed interval** $[a,b]$.

Definition 16.163. *Let $\langle \mathbb{R}, \|\rangle$ be the normed space of the real numbers, $\langle X, \|\|\rangle$ a normed space, $a, b \in \mathbb{R}$ with $a < b$ and $f: [a, b] \to X$ a function, $x \in [a, b]$ then f has a derivative at x noted as f'_x if for x we have*

$x = a$. *f has a right derivative at x*

$x = b$. *f has a left derivative at x*

$x \in]a, b[$. *$f_{|]a,b[}$ has a derivative at x using [definition: 16.12].*

the derivative is then defined by

$$f'_x = \begin{cases} f'_{+,a} \text{ if } x = a \\ f'_{-,b} \text{ if } x = b \\ (f_{|]a,b[})'_x \text{ if } x \in]a, b[\end{cases}$$

We say that **f has a derivate on $[a, b]$** *if $\forall x \in [a, b]$ f has a derivative at x [in the above sense]. If* **f has a derivative on $[a, b]$** *then the function f' is defined to be*

$$f': [a, b] \to X \text{ where } f'(x) = f'_x$$

In other words **f has a derivative on $[a, b]$** *if*

1. *$\forall x \in]a, b[$ we have that $f_{|]a,b[}$ has a derivative at x.*
2. *f has a right derivative at a and a left derivative at b.*

If f has a derivative on $[a, b]$ then the function f' is defined to be

$$f': [a, b] \to \mathbb{R} \text{ by } f'(x) = \begin{cases} f'_{+,a} \text{ if } x = a \\ f'_{-,b} \text{ if } x = b \\ (f_{|]a,b[})'_x \text{ if } x \in]a, b[\end{cases}$$

***Note* 16.164.** *Be careful, in this definition the word derivative has two meanings, the derivative at $x \in [a, b]$ (defined here) and the derivative of $f_{|]a,b[}$ (defined in [definition: 16.12]). The same happens for f'_x which is defined in this definition and $f'_{|]a,b[}$ which is defined in [definition: 16.12]. The two definitions happens to coincide on $]a, b[$ but for a, b [definition: 16.12] does not work and we have to use the right/left derivative. In general if we look carefully at the context there is not a problem and we avoid introducing excessive notation.*

Example 16.165. Let $\langle \mathbb{R}, \|\rangle$ be the normed space of the real numbers, $\langle X, \|\|\rangle$ a normed space, $a, b \in \mathbb{R}$ with $a < b$, $y \in [a, b]$ then

$$C_y: [a, b] \to X \text{ defined by } C_y(r) = x$$

has a derivative on $[a, b]$ and $\forall x \in [a, b]$ $(C_y)'(x) = 0$ [or in other words $(C_y)' = C_0$]

Proof. Let $x \in [a, b]$ then we have:

$x = a$. Let $\varepsilon \in \mathbb{R}^+$. If $0 < h < 1$ with $a + h \in [a, b]$ we have

$$\left\| \frac{C_y(a+h) - C_y(a)}{h} - 0 \right\| = \left\| \frac{x - x}{h} - 0 \right\| = 0 < \varepsilon$$

which proves that C_y has a right derivative at a with $(C_y)'_{+,a} = 0$.

$x = b$. Let $\varepsilon \in \mathbb{R}^+$. If $0 < h < 1$ with $b - h \in [a, b]$ we have

$$\left\| \frac{C_y(b-h) - C_y(b)}{-h} - 0 \right\| = \left\| \frac{x - x}{-h} - 0 \right\| = 0 < \varepsilon$$

which proves that C_y has a left derivative at a with $(C_y)'_{-,b} = 0$.

$x \in]a, b[$. Let $\varepsilon \in \mathbb{R}^+$. If $h \in [a, b]_x$ with $0 < |h| < 1$ then we have

$$\left\| \frac{C_y(x+h) - C_y(x)}{h} - 0 \right\| = \left\| \frac{y - y}{h} - 0 \right\| = 0 < \varepsilon$$

which proves that $(C_y)_{|]a,b[}$ has a derivative at x with $((C_y)_{|]a,b[})'_x = 0$.

Hence by definition C_y has a derivative on $[a, b]$ with $\forall x \in [a, b]$ $(C_y)'(x) = 0$. □

We can now extend [theorem: 16.38] to a function whose domain is a closed interval.

Theorem 16.166. *Let $\langle \mathbb{R}, \|\rangle$ be the normed space of the real numbers, $\langle X, \|\|\rangle$ a normed space, $a, b \in \mathbb{R}$ with $a < b$, $x \in [a, b]$ then:*

1. *If $f: [a, b] \to X$ and $g: [a, b] \to X$ has a derivative at x then $f + g$ has a derivative at x and $(f + g)'_x = f'_x + g'_x$.*
2. *If $\alpha \in \mathbb{R}$ and $f: [a, b] \to X$ has a derivative at x then $\alpha \cdot f$ has a derivative at x and $(\alpha \cdot f)'_x = \alpha \cdot f'_x$.*

Proof.

1. For x we have three cases to consider:

   $\boldsymbol{x = a}$**.** Then f, g have a right derivative at a and $f'_x = f'_{+,a}$, $g'_x = g'_{+,a}$. Using [theorem: 16.161] it follows that $f + g$ has a right derivative at a and $(f + g)'_{+,a} = f'_{+,a} + g'_{+,a}$. Hence by definition $f + g$ has a derivative at x and $(f + g)'_x = f'_x + g'_x$.

   $\boldsymbol{x = b}$**.** Then f, g have a left derivative at b and $f'_x = f'_{-,b}$, $g'_x = g'_{-,b}$. Using [theorem: 16.161] it follows that $f + g$ has a left derivative at b and $(f + g)'_{-,b} = f'_{-,b} + g'_{-,b}$. Hence by definition $f + g$ has a derivative at x and $(f + g)'_x = f'_x + g'_x$.

   $\boldsymbol{x \in]a, b[}$**.** Then $f_{|]a,b[}$, $g_{|]a,b[}$ has a derivative at x, so by [theorem: 16.166] $(f + g)_{|]a,b[} = f_{|]a,b[} + g_{|]a,b[}$ has a derivative at x with

   $$((f + g)_{|]a,b[})'_x = (f_{|]a,b[} + g_{|]a,b[})'_x = (f_{|]a,b[})'_x + (g_{|]a,b[})'_x.$$

   Hence by definition $f + g$ has a derivative at x with $(f + g)'_x = f'_x + g'_x$.

   So in all cases we have that $f + g$ has a derivative at x and $(f + g)'_x = f'_x + g'_x$.

2. For x we have three cases to consider:

   $\boldsymbol{x = a}$**.** Then f has a right derivative at a and $f'_x = f'_{+,a}$. Using [theorem: 16.161] it follows that $\alpha \cdot f$ has a right derivative at a and $(\alpha \cdot f)'_{+,a} = \alpha \cdot f'_{+,a}$. Hence by definition $\alpha \cdot f$ has a derivative at x and $(\alpha \cdot f)'_x = \alpha \cdot f'_x$.

   $\boldsymbol{x = b}$**.** Then f has a left derivative at b and $f'_x = f'_{-,b}$. Using [theorem: 16.161] it follows that $\alpha \cdot f$ has a left derivative at b and $(\alpha \cdot f)'_{-,b} = \alpha \cdot f'_{-,b}$. Hence by definition $\alpha \cdot f$ has a derivative at x and $(\alpha \cdot f)'_x = \alpha \cdot f'_x$.

   $\boldsymbol{x \in]a, b[}$**.** Then $f_{|]a,b[}$ has a derivative at x, so so by [theorem: 16.166] $\alpha \cdot f_{|]a,b[}$ and $(\alpha \cdot f_{|]a,b[})'_x = \alpha \cdot (f_{|]a,b[})'_x$. Hence by definition $\alpha \cdot f$ has a derivative at x and $(\alpha \cdot f)'_x = \alpha \cdot f'_x$.

   So in all cases we have that $\alpha \cdot f$ has a derivative at x and $(\alpha \cdot f)'_x = \alpha \cdot f'_x$. □

Theorem 16.167. *Let $\langle \mathbb{R}, \|\rangle$ be the normed space of the real numbers, $\langle X, \|\|\rangle$ a normed space, $a, b \in \mathbb{R}$ and a function $f: [a, b] \to \mathbb{R}$ then the following are equivalent:*

1. *There exist a open set U with $[a, b] \subseteq U$ and a function $f^U: U \to X$ with $(f^U)_{|[a,b]} = f$ such that $\forall x \in U$ $(f^U)'_x$ exist and that the function*

   $$(f^U)': U \to Y \text{ defined by } (f^U)'(x) = (f^U)'_x$$

   is continuous.

2. *f has a derivative on $[a, b]$ and $f': [a, b] \to X$ defined by $f'(x) = f'_x$ is continuous.*

Further if (1) or (2) is valid then $\forall x \in [a, b]$ $(f^U)'_x = f'_x$ so that for

$$f'|[a, b] \to X \text{ defined by } f'(x) = f'_x$$

we have $f' = ((f^U)')_{|[a,b]}$.

Proof.

1 ⇒ 2. Using the previous theorem [theorem: 16.162 (3)] it follows that $f = (f^U)_{|[a,b]}$ has a right derivative at a, a left derivative at b and $\forall x \in]a, b[$ f has a left and right derivative at x, further we have

$$f'_{+,a} = (f^U)'_a \tag{16.191}$$
$$f'_{-,b} = (f^U)'_b \tag{16.192}$$
$$f'_{+.x} = f'_{-,x} = (f^U)'_x \text{ where } x \in]a, b[\tag{16.193}$$

Let $x \in]a, b[\subseteq U$ then, as $(f^U)'_x$ exist, we have by [theorem: 16.33] that $((f^U)_{|]a,b[})'_x$ exists and $((f^U)_{|]a,b[})'_x = (f^U)'_x$. Further as $f_{|]a,b[} \underset{f=(f^U)_{|[a.b]}}{=} ((f^U)_{|[a,.b]})_{|]a,b[} \underset{\text{[theorem: 2.86]}}{=} (f^U)_{|]a,b[}$ we have that $(f_{|]a,b[})'_x$ exist and

$$(f_{|]a,b[})'_x = ((f^U)_{|]a,b[})'_x = (f^U)'_x \underset{\text{[eq: 16.193]}}{=} f'_{+,x} = f'_{-,x} \tag{16.194}$$

Hence f has a derivative on $[a,b]$ and $\forall x\in[a,b]$ we have

$$f'(x)=\begin{cases} f'_{+,a} \text{ if } x=a \\ f'_{-,b} \text{ if } x=b \\ (f_{|]a,b[})'_x \text{ if } x\in]a,b[\end{cases} \overset{\text{[eqs: 16.191, 16.192,16.194]}}{=} \begin{cases} (f^U)'_a \text{ if } x=a \\ (f^U)'_b \text{ if } x=b \\ (f^U)'_x \text{ if } x\in]a,b[\end{cases} =(f^U)'_x=(f^{U\prime})(x)$$

proving that

$$f'=((f^U)')_{[a,b]} \tag{16.195}$$

As $(f^U)'$ is continuous it follows from [theorem: 14.136] that $((f^U)')_{[a,b]}\colon[a,b]\to\mathbb{R}$ is continuous, hence by [eq: 16.195] f' is continuous.

2 ⇒ 1. As f has a derivative on $[a,b]$ we have that $f'_+(a)$, $f'_-(a)$ exists and $\forall x\in[a,b]$ $f_{|]a,b[}$ has a derivative at x. Take $U=]a-1,b+1[$ so that $[a,b]\subseteq U$ and define

$$f^U\colon U\to X \text{ by } f^U(x)=\begin{cases} f(x) \text{ if } x\in[a,b] \\ f(a)+(x-a)\cdot f'_{+,a} \text{ if } x\in]a-1,a[\\ f(b)+(x-b)\cdot f'_{-,b} \text{ if } x\in]b,b+1[\end{cases} \tag{16.196}$$

then we have

$$(f^U)_{|[a,b]}=f \tag{16.197}$$

Let $x\in]a-1,b+1[$ then we have the following cases to consider:

$x\in]a-1,a[$. Let $\varepsilon\in\mathbb{R}^+$. Take $\delta=a-x\in\mathbb{R}^+$ then if $h\in]a-1,b+1[_x$ and $0<|h|<\delta$ we have $x+h\in]a-1,b+1[\Rightarrow a-1<x+h$ and $h<|h|<a-x$ so that $a-1<x+h<a$. Then we have

$$\begin{aligned} \left\|\frac{f^U(x+h)-f(x)}{h}-f'_{+,a}\right\| &= \\ \left\|\frac{(f(a)+(x+h-a)\cdot f'_{+,a}\cdot(x+h-a))-(f(a)+(x-a)\cdot f'_{+,a})}{h}-f'_{+,a}\right\| &= \\ \left\|\frac{\underbrace{f(a)}_{1}+\underbrace{x\cdot f'_{+,a}}_{2}+h\cdot f'_{+,a}-\underbrace{a\cdot f'_{+,a}}_{3}-\underbrace{f(a)}_{1}-\underbrace{x\cdot f'_{+,a}}_{2}+\underbrace{a\cdot f'_{+,a}}_{3}}{h}-f'_{+,a}\right\| &= \\ \left\|\frac{h\cdot f'_{+,a}}{h}-f'_{+,a}\right\| &= \\ 0 &< \\ \varepsilon & \end{aligned}$$

proving that

$$(f^U)'_x \text{ exist and } (f^U)'_x=f'_{+,a}$$

$x=a$. Let $\varepsilon\in\mathbb{R}^+$. As f has a right derivative at a it follows by the definition of $f'_{+,a}$ that there exist a $\delta_1\in\mathbb{R}^+$ such that if $0<h<\delta_1$ and $a+h\in[a,b]$ we have

$$\left\|\frac{f(a+h)-f(a)}{h}-f'_{+,a}\right\|<\varepsilon \tag{16.198}$$

Take $\delta=\min(\delta_1,b-a)\in\mathbb{R}^+$. Let $h\in]a-1,b+1[_a\Rightarrow a+h\in]a-1,b+1[$ such that $0<|h|<\delta$, then we have either:

$h<0$. Then $a+h<a$ so that $a+h\in]a-1,a[$ hence

$$\begin{aligned} \left\|\frac{f^U(a+h)-f^U(a)}{h}-f'_{+,a}\right\| &= \left\|\frac{f(a)+(a+h-a)\cdot f'_{+,a}-f(a)}{h}-f'_{+,a}\right\| \\ &= \left\|\frac{h\cdot f'_+(a)}{h}-f'_{+,a}\right\| \\ &= 0 \\ &< \varepsilon \end{aligned}$$

$0<h$. Then $0<h<\delta\leqslant b-a,\delta_1$ so that $a<a+h<b$ proving that $a+h\in\,]a,b[\,\subseteq[a,b]$ so that

$$\left\|\frac{f^U(a+h)-f^U(a)}{h}-f'_{+,a}\right\| = \left\|\frac{f(a+h)-f(a)}{h}-f'_{+,a}\right\| <_{0<h<\delta_1\wedge[\text{eq: }16.198]} \varepsilon$$

So in all cases $\left\|\frac{f^U(a+h)-f^U(a)}{h}-f'_{+,a}\right\|<\varepsilon$ proving that

$$(f^U)'_x \text{ exist and } (f^U)'_x=f'_{+,a}$$

$x\in\,]a,b[$. Let $\varepsilon\in\mathbb{R}^+$. As $f_{|]a,b[}$ has a derivative at x there exist a $\delta_1\in\mathbb{R}^+$ such that if $h\in\,]a,b[_x$ and $0<|h|<\delta_1$ then

$$\left\|\frac{f_{|]a,b[}(x+h)-f_{|]a,b[}(x)}{h}-(f_{|]a,b[})'_x\right\|<\varepsilon \tag{16.199}$$

Take $\delta=\min(\delta_1,x-a,b-x)\in\mathbb{R}^+$ then if $0<|h|<\delta$ we have $h<|h|<b-x\Rightarrow x+h<b$ and $-h\leqslant|-h|=|h|<x-a\Rightarrow a<x+h$ so that $x+h\in\,]a,b[\,\subseteq[a,b]$ hence we have

$$\begin{aligned}\left\|\frac{f^U(x+h)-f^U(x)}{h}-(f_{|]a,b[})'_x\right\| &\underset{x,x+h\in]a,b[\subseteq[a,b]}{=}\\ \left\|\frac{f(x+h)-f(x)}{h}-(f_{|]a,b[})'_x\right\| &\underset{x,x+h\in]a,b[}{=}\\ \left\|\frac{f_{|]a,b[}(x+h)-f_{|]a,b[}(x)}{h}-(f_{|]a,b[})'_x\right\| &<_{|h|<\delta_1\wedge[\text{eq: }16.199]}\\ &\varepsilon\end{aligned}$$

proving that

$$(f^U)'_x \text{ exist and } (f^U)'_x=(f_{|]a,b[})'_x$$

$x=b$. Let $\varepsilon\in\mathbb{R}^+$. As f has a left derivative at b it follows by the definition of $f'_{-,b}$ that there exist a $\delta_1\in\mathbb{R}^+$ such that if $0<h<\delta_1$ and $b-h\in[a,b]$ we have

$$\left\|\frac{f(b-h)-f(b)}{-h}-f'_{-,b}\right\|<\varepsilon \tag{16.200}$$

Take $\delta=\min(\delta_1,b-a)\in\mathbb{R}^+$. Let $h\in\,]a-1,b+1[_b\Rightarrow b+h\in\,]a-1,b+1[$ such that $0<|h|<\delta,\delta_1$, then we have either:

$h<0$. Then $-h=|h|<b-a\Rightarrow a<b+h<b\Rightarrow b+h\in[a,b]$ hence

$$\begin{aligned}\left\|\frac{f^U(b+h)-f^U(b)}{h}-f'_{-,b}\right\| &\underset{b,b+h\in[a.b]}{=}\\ \left\|\frac{f(b+h)-f(b)}{h}-f'_{-}(b)\right\| &\underset{-|h|=h}{=}\\ \left\|\frac{f(b-|h|)-f(b)}{-|h|}-f'_{-}(b)\right\| &<_{|h|<\delta_1\wedge[\text{eq: }16.200]}\\ &\varepsilon\end{aligned}$$

$0<h$. then $b<b+h<b+1$ so that $b+h\in\,]b,b+1[$ hence

$$\begin{aligned}\left\|\frac{f^U(b+h)-f^U(b)}{h}-f'_{-,b}\right\| &=\\ \left\|\frac{f(b)+(b+h-b)\cdot f'_{-,b}-f(b)}{h}-f'_{-,b}\right\| &=\\ \left\|\frac{h\cdot f'_{-,b}}{h}-f'_{-,b}\right\| &=\\ 0 &<\\ &\varepsilon\end{aligned}$$

So in all cases we have $\left\|\frac{f^U(b+h)-f^U(b)}{h}-f'_{-,b}\right\|<\varepsilon$ proving that

$$(f^U)'_x \text{ exist and } (f^U)'_x = f'_{-,b}$$

$\boldsymbol{x\in\,]b,b+1[}$**.** Let $\varepsilon\in\mathbb{R}^+$. Take $\delta=x-b\in\mathbb{R}^+$ then if $h\in\,]a-1,b+1[_x$ and $0<|h|<\delta$ we have $x+h\in\,]a-1,b+1[$ and $-h\leqslant|h|<x-b\Rightarrow b<x+h$ so that $x+h\in\,]b,b+1[$. So that

$$\begin{aligned}
\left\|\frac{f^U(x+h)-f^U(b)}{h}-f'_{-,b}\right\| &= \\
\left\|\frac{f(b)+(x+h-b)\cdot f'_{-,b}-(f(b)+(x-b)\cdot f'_{-,b}x)}{h}-f'_{-,b}\right\| &= \\
\left\|\frac{\underbrace{f(b)}_{1}+\underbrace{x\cdot f'_{-,b}}_{2}+h\cdot f'_{-,b}-\underbrace{b\cdot f'_{-,b}}_{3}-\underbrace{f(b)}_{1}-\underbrace{x\cdot f'_{-,b}}_{2}+\underbrace{b\cdot f'_{-,b}}_{3}}{h}-f'_{-,b}\right\| &= \\
\left\|\frac{h\cdot f'_{-,b}}{h}-f'_{-,b}\right\| &= \\
0 &< \\
\varepsilon &
\end{aligned}$$

which proves that

$$(f^U)'_x \text{ exists and } (f^U)'_x = f'_{-,b}$$

To summarize we have $\forall x\in\,]a-1,b+1[$ that

$$(f^U)'_x \text{ exist and } (f^U)'_x=\begin{cases} f'_{+,a} \text{ if } x\in\,]a-1,a] \\ f'_{-,b} \text{ if } x\in[b,b+1[\\ (f_{|]a,b[})'_x \text{ if } x\in\,]a,b[\end{cases} \tag{16.201}$$

So $\forall x\in[a,b]$ we have that

$$(f^U)'_x=\begin{cases} f'_{+,a} \text{ if } x=a \\ f'_{-,b} \text{ if } x=b \\ (f_{|]a,b[})'_x \text{ if } x\in\,]a,b[\end{cases} \underset{\text{def}}{=} f'_x$$

Next we have to prove that the function

$$(f^U)'\colon U\to X \text{ defined by } (f^U)'(x)=(f^U)'_x$$

is continuous. Let $x\in U=\,]a-1,b+1[$ then we have either:

$\boldsymbol{x\in\,]a-1,a[}$**.** Let $\varepsilon\in\mathbb{R}^+$. Take $\delta=\min(a-x,x-(a-1))\in\mathbb{R}^+$ then for $y\in\,]a-1,b+1[$ with $|x-y|<\delta$ we have $x-y\leqslant|x-y|<\delta<x-(a-1)\wedge y-x\leqslant|x-y|<a-x$ so that $a-1<y\wedge y<a$ or $y\in\,]a-1,a[$. Hence

$$\|(f^U)'(y)-(f^U)'(x)\|=\|(f^U)'_y-(f^U)'_x\| \underset{\text{[eq: 16.201]}}{=} \|f'_{+,a}-f'_{+,a}\|=0<\varepsilon$$

proving that $(f^U)'$ is continuous at x in this case.

$\boldsymbol{x=a}$**.** Let $\varepsilon\in\mathbb{R}^+$. As f' is continuous at a there exist a $\delta_1\in\mathbb{R}^+$ such that $\forall y\in[a,b]$ with $|y-a|<\delta_1$ we have $\|f'(y)-f'(a)\|<\varepsilon$. Take $\delta=\min(\delta_1,b-a)\in\mathbb{R}^+$ then for $y\in\,]a-1,b+1[$ with $|a-y|<\delta\leqslant\delta_1$ we have either:

$\boldsymbol{y\leqslant a}$**.** Then $y\in\,]a-1,a]$ so that

$$\|(f^U)'(y)-(f^U)'(x)\|=\|(f^U)'_y-(f^U)'_a\| \underset{\text{[eq: 16.201]}}{=} \|f'_{+,a}-f'_{+,a}\|=0<\varepsilon$$

$\boldsymbol{a<y}$**.** Then as $y-a\leqslant|y-a|<b-a\Rightarrow y<b$ we have $y\in\,]a,b[$ so that

$$\|(f^U)'(y)-(f^U)'(x)\|=\|(f^U)'_y-(f^U)'_a\| \underset{\text{[eq: 16.201]}}{=} \|f'(y)-f'(a)\|<\varepsilon$$

so in all cases we have $\|(f^U)'(y)-(f^U)'(x)\|<\varepsilon$, proving that $(f^U)'$ is continuous at x in this case.

$\boldsymbol{x \in]a,b[}$. Let $\varepsilon \in \mathbb{R}^+$. As f' is continuous at x there exist a $\delta_1 \in \mathbb{R}^+$ such that $\forall y \in [a,b]$ with $|y-x| < \delta_1$ we have $\|f'(y) - f'(x)\| < \varepsilon$. Take $\delta = \min(\delta_1, x-a, b-x)$ then for $y \in]a-1, b+1[$ with $|x-y| < \delta$ we have $x - y \leqslant |x-y| < x-a \wedge y - x \leqslant |x-y| < b-x$ so that $y \in]a,b[$ and $|y-x| < \delta_1$. Hence we have

$$\begin{aligned} \|(f^U)'(y) - (f^U)'(x)\| &= \|(f^U)'_y - (f^U)'_x\| \\ &\underset{\text{[eq: 16.201]}}{=} \|f'_y - f'_x\| \\ &= \|f'(y) - f'(x)\| \\ &< \varepsilon \end{aligned}$$

proving that $(f^U)'$ is continuous at x in this case.

$\boldsymbol{x = b}$. Let $\varepsilon \in \mathbb{R}^+$. As f' is continuous at b there exist a $\delta_1 \in \mathbb{R}^+$ such that $\forall y \in [a,b]$ with $|y-b| < \delta_1$ we have $\|f'(y) - f'(b)\| < \varepsilon$. Take $\delta = \min(\delta_1, b-a)$ then for $y \in]a-1, b+1[$ with $|y-b| < \delta$ we have the following cases to consider:

$\boldsymbol{b \leqslant y}$. Then we have $y \in [b, b-1[$ so that

$$\|(f^U)'(y) - (f^U)'(x)\| = \|(f^U)'_y - (f^U)'_b\| \underset{\text{[eq: 16.201]}}{=} \|f'_{-,b} - f'_{-,b}\| = 0 < \varepsilon$$

$\boldsymbol{y < b}$. Then, as $|y-b| < \delta$, we have $b - y \leqslant |y-b| < b-a$ so that $y \in]a,b[$ and $|y-b| < \delta_1$. Hence

$$\|(f^U)'(y) - (f^U)'(x)\| = \|(f^U)'_y - (f^U)'_b\| \underset{\text{[eq: 16.201]}}{=} \|f'(y) - f'(b)\| < \varepsilon$$

so in all cases we have $\|(f^U)'(y) - (f^U)'(x)\| < \varepsilon$ proving that $(f^U)'$ is continuous at x in this case.

$\boldsymbol{x \in]b, b+1[}$. Let $\varepsilon \in \mathbb{R}^+$. Take $\delta = \min(b+1-x, x-b) \in \mathbb{R}^+$ then for $y \in]a-1, b+1[$ with $|y-x| < \delta$ we have $y - x \leqslant |y-x| < b+1-x \wedge x - y \leqslant |y-x| < x-b$ so that $y \in]b, b+1[$. Hence

$$\|(f^U)'(y) - (f^U)'(x)\| = \|(f^U)'_y - (f^U)'_x\| \underset{\text{[eq: 16.201]}}{=} \|f'_{-,b} - f'_{-,b}\| = 0 < \varepsilon$$

proving that $(f^U)'$ is continuous at x in this case.

So we have proved that $\forall x \in [a-1, b+1]$ $(f^U)'$ is continuous at x,hence $(f^U)'$ is continuous. □

Corollary 16.168. *Let $\langle \mathbb{R}, \|\rangle$ be the normed space of the real numbers, $\langle X, \|\|\rangle$ a normed space, $a, b \in \mathbb{R}$ with $a < b$ and $f: [a,b] \to \mathbb{R}$ a function then the following are equivalent:*

1. *There exist a open set U in $\mathbb{R}$ with $[a,b] \subseteq U$ and a function $f^U: U \to X$ that is C^1 on U and $(f^U)_{|[a,b]} = f$.*
2. *f has a derivative on $[a,b]$ and $f': [a.b] \to X$ is continuous.*

Further if (1) or (2) is valid then $\forall x \in [a,b]$ $(f^U)'_x = f'$ so that $f' = ((f^U)')_{|[a,b]}$

Proof. This follows by applying [theorem: 16.112] on the previous theorem [theorem: 16.167] □

16.3.3 Fundamental theorem of Calculus

We examine now the relation between the Riemann integral and the derivative of a function.

Theorem 16.169. (Fundamental Theorem of Calculus (I)) *Let $\langle \mathbb{R}, \|\rangle$ be the normed space of the real numbers, $\langle X, \|\|\rangle$ be a **Banach space**, $a, b \in \mathbb{R}$ with $a < b$ and $f: [a,b] \to X$ a continuous function [so that by [theorem: 15.31] $\forall x \in [a,b]$ $\int_a^x f_{|[a,x]}$ exist] then for the function*

$$F: [a,b] \to X \text{ defined by } F(x) = \int_a^x f_{|[a,x]}$$

we have that F has a derivative on $[a,b]$ and $F' = f$

Proof. As $x \in [a,b]$ we have to consider the following cases:

$\boldsymbol{x = a}$. Take $\varepsilon \in \mathbb{R}^+$. As f is continuous at a there exist a $\delta \in \mathbb{R}^+$ such that if $y \in [a,b]$ with $|y-a| < \delta$ it follows that $\|f(y) - f(a)\| < \frac{\varepsilon}{2}$. If $0 < h < \delta$ and $h \in [a,b]_a \Rightarrow a + h \in [a,b]$ then we have $\forall y \in [a, a+h]$ that $|y-a| = y - a < a + h - a = h < \delta$ so that $\|f(y) - f(a)\| < \frac{\varepsilon}{2}$. Hence, as $f(y) - f(a) = f(y) - C_{f(a)}(y) = (f - C_{f(a)})(y)$, we have

$$\forall y \in [a, a+h] \text{ we have } \|(f - C_{f(a)})(y)\| = \|f(y) - f(a)\| < \frac{\varepsilon}{2} \tag{16.202}$$

Next

$$\begin{aligned}
\left\|\frac{F(a+h)-F(a)}{h}-f(a)\right\| &= \left\|\frac{\int_a^{a+h}f-\int_a^a f}{h}-f(a)\right\| \\
&\underset{\text{[definition: 15.27]}}{=} \left\|\frac{\int_a^{a+h}f}{h}-f(a)\right\| \\
&= \left\|\frac{\left(\int_a^{a+h}f\right)-h\cdot f(a)}{h}\right\| \\
&\underset{\text{[example: 15.22]}}{=} \left\|\frac{\left(\int_a^{a+h}f\right)-\int_a^{a+h}C_{f(a)}}{h}\right\| \\
&\underset{\text{[theorem: 15.28]}}{=} \left\|\frac{\int_a^{a+h}(f-C_{f(a)})}{h}\right\| \\
&\underset{0<h}{=} \frac{\left\|\int_a^{a+h}(f-C_{f(a)})\right\|}{h} \\
&\leqslant_{\text{[theorem: 15.29]}\wedge\text{[eq: 16.202]}} \frac{(a+h-a)\cdot\frac{\varepsilon}{2}}{h} \\
&= \frac{\varepsilon}{2} \\
&< \varepsilon
\end{aligned}$$

proving that F has a right derivative at a and

$$F'_{+,a}=f(a)$$

x = b. Take $\varepsilon\in\mathbb{R}^+$. As f is continuous at b there exist a $\delta\in\mathbb{R}^+$ such that if $y\in[a,b]$ with $|y-b|<\delta$ it follows that $\|f(y)-f(b)\|<\frac{\varepsilon}{2}$. Hence if $0<h<\delta$ we have for $-h\in[a,b]_b\Rightarrow b-h\in[a,b]$ that $\forall y\in[b-h,b]\ |y-b|=b-y\leqslant b+h-b=h<\delta$ so that $\|f(y)-f(b)\|<\frac{\varepsilon}{2}$. Hence, as $f(y)-f(b)=f(y)-C_{f(b)}(y)=(f-C_{f(b)})(y)$, we have

$$\forall y\in[b-h,b] \text{ we have } \|(f-C_{f(b)})(y)\|<\frac{\varepsilon}{2} \tag{16.203}$$

Next

$$\begin{aligned}
\left\|\frac{F(b-h)-F(b)}{-h}-f(b)\right\| &= \\
\left\|\frac{\left(\int_a^{b-h}f\right)-\int_a^b f}{-h}-f(b)\right\| &\underset{\text{[theorem: 15.31]}}{=} \\
\left\|\frac{\left(\int_a^{b-h}f\right)-\left(\left(\int_a^{b-h}f\right)+\int_{b-h}^b f\right)}{-h}-f(b)\right\| &= \\
\left\|\frac{-\int_{b-h}^b f}{-h}-f(b)\right\| &= \\
\left\|\frac{\left(\int_{b-h}^b f\right)-h\cdot f(b)}{h}\right\| &\underset{\text{[example: 15.22]}}{=} \\
\left\|\frac{\left(\int_{b-h}^b f\right)-\left(\int_{b-h}^b C_{f(b)}\right)}{h}\right\| &\underset{\text{[theorem: 15.28]}}{=} \\
\left\|\frac{\int_{b-h}^b (f-C_{f(b)})}{h}\right\| &\underset{0<h}{=}
\end{aligned}$$

$$\begin{aligned}
\frac{\left\|\int_{b-h}^{b}(f-C_{f(b)})\right\|}{h} &\leqslant_{\text{[theorem: 15.29]}\wedge\text{[eq: 16.203]}} \\
\frac{(b-(b-h))}{h}\cdot\frac{\varepsilon}{2} &= \\
\frac{\varepsilon}{2} &< \\
\varepsilon &
\end{aligned}$$

proving that F has a left derivative at b and

$$F'_{-,b}=f(b)$$

$\boldsymbol{x\in\,]a,b[}$. Let $\varepsilon\in\mathbb{R}^+$. As f is continuous at x there exist a $\delta\in\mathbb{R}^+$ such that $\forall h\in[a,b]$ with $|y-x|<\delta$ we have $\|f(y)-f(x)\|<\frac{\varepsilon}{2}$. If h satisfies $0<|h|<\delta$ and $h\in\,]a,b[_x\Rightarrow x+h\in\,]a,b[$ then we have the following cases to consider:

$\boldsymbol{0<h}$. If $y\in[x,x+h]$ then $|y-x|=y-x\leqslant x+h-x=h=|h|<\delta$ so that $\|f(y)-f(x)\|<\frac{\varepsilon}{2}$. Hence, as $f(y)-f(x)=f(y)-C_{f(x)}(y)=(f-C_{f(x)})(y)$. It follows that

$$\forall y\in[x,x+h]\text{ we have }\|(f-C_{f(x)})(y)\|<\frac{\varepsilon}{2} \tag{16.204}$$

Next

$$\begin{aligned}
\left\|\frac{F_{]]a,b[}(x+h)-F_{]]a,b[}(x)}{h}-f(x)\right\| &=_{x+h,x\in]a,b[} \\
\left\|\frac{F(x+h)-F(x)}{h}-f(x)\right\| &= \\
\left\|\frac{\left(\int_a^{x+h}f\right)-\int_a^{x}f}{h}-f(x)\right\| &=_{\text{[theorem: 15.31]}} \\
\left\|\frac{\left(\int_a^{x}f\right)+\left(\int_x^{x+h}f\right)-\int_a^{x}f}{h}-f(x)\right\| &= \\
\left\|\frac{\int_x^{x+h}f}{h}-f(x)\right\| &= \\
\left\|\frac{\left(\int_x^{x+h}f\right)-h\cdot f(x)}{h}\right\| &=_{\text{[example: 15.22]}} \\
\left\|\frac{\left(\int_x^{x+h}f\right)-\int_x^{x+h}C_{f(x)}}{h}\right\| &=_{\text{[theorem: 15.28]}} \\
\left\|\frac{\int_x^{x+h}(f-C_{f(x)})}{h}\right\| &=_{0<h} \\
\frac{\left\|\int_x^{x+h}(f-C_{f(x)})\right\|}{h} &\leqslant_{\text{[theorem: 15.29]}\wedge\text{[eq: 16.204]}} \\
\frac{(x+h-x)}{h}\cdot\frac{\varepsilon}{2} &= \\
\frac{\varepsilon}{2} &< \\
\varepsilon &
\end{aligned}$$

$\boldsymbol{h<0}$. In this case $h=-|h|$. If $y\in[x+h,x]=[x-|h|,x]$ then

$$|y-x|=x-y<x-(x-|h|)=|h|<\delta$$

and thus $\|f(y)-f(x)\|<\frac{\varepsilon}{2}$. Hence, as $f(y)-f(x)=f(y)-C_{f(x)}(y)=(f-C_{f(x)})(y)$. It follows that

$$\forall y\in[x+h,x]\text{ we have }\|(f-C_{f(x)})(y)\|<\frac{\varepsilon}{2} \tag{16.205}$$

Next

$$\begin{aligned}
\left\|\frac{F_{]a,b[}(x+h)-F_{]a,b[}(x)}{h}-f(x)\right\| &\underset{x+h,x\in]a,b[}{=} \\
\left\|\frac{F(x+h)-F(x)}{h}-f(x)\right\| &= \\
\left\|\frac{F(x-|h|)-F(x)}{-|h|}-f(x)\right\| &= \\
\left\|\frac{\left(\int_a^{x-|h|}f\right)-\int_a^x f}{-|h|}-f(x)\right\| &\underset{\text{[theorem: 15.31]}}{=} \\
\left\|\frac{\left(\int_a^{x-|h|}f\right)-\left(\int_a^{x-|h|}f\right)-\int_{x-|h|}^x f}{-|h|}\right\| &= \\
\left\|\frac{-\int_{x-|h|}^x f}{-|h|}-f(x)\right\| &= \\
\left\|\frac{\int_{x-|h|}^x f}{|h|}-f(x)\right\| &= \\
\left\|\frac{\left(\int_{x-|h|}^x f\right)-|h|\cdot f(x)}{|h|}\right\| &\underset{\text{[example: 15.22]}}{=} \\
\left\|\frac{\left(\int_{x-|h|}^x f\right)-\int_{x-|h|}^x C_{f(x)}}{|h|}\right\| &\underset{\text{[theorem: 15.28]}}{=} \\
\left\|\frac{\int_{x-|h|}^x (f-C_{f(x)})}{|h|}\right\| &\underset{0<|h|}{=} \\
\frac{\left\|\int_{x-|h|}^x (f-C_{f(x)})\right\|}{|h|} &\leqslant_{\text{[theorem: 15.29]}\wedge\text{[eq: 16.205]}} \\
\frac{x-(x-|h|)}{|h|}\cdot\frac{\varepsilon}{2} &= \\
\frac{\varepsilon}{2} &< \\
\varepsilon &
\end{aligned}$$

Hence in all cases we have $\left\|\frac{F_{]a,b[}(x+h)-F_{]a,b[}(x)}{h}-f(x)\right\|<\varepsilon$ proving that $F_{]a,b[}$ has a derivative on $]a,b[$ and $\forall x\in]a,b[$

$$(F_{]a,b[})'_x=f(x)$$

So by [definition: 16.163] we have that $\forall x\in[a,b]$ we have F'_x exist and $F'_x=f(x)$, hence if we define

$$F'\colon[a.b]\to X \text{ by } F'(x)=F'_x$$

we have

$$F \text{ has a derivative on } [a,b] \text{ and } F'=f$$

□

We use now the above theorem to prove the Fundamental Theorem of Calculus.

Theorem 16.170. (Fundamental Theorem of Calculus (II)) *Let $\langle\mathbb{R},\|\rangle$ be the normed space of real numbers, $\langle X,\|\|\rangle$ be a Banach space, $a,b\in\mathbb{R}$ with $a<b$ and $f\colon[a,b]\to X$ a function such that f has a derivative on $[a,b]$ and **f' is continuous** then*

$$f(b)-f(a)=\int_a^b f'$$

Proof. As $\langle X, \|\|\rangle$ is a Banach space, f has a derivative on $[a,b]$ and $f'\colon [a,b] \to X$ is continuous, it follows from [theorem: 15.31] that $\forall x \in [a,b]$ $\int_a^x f'$ is well defined. This allows us to define

$$g\colon [a,b] \to X \text{ by } g(x) = f(a) + \int_a^x f'$$

So if we define

$$F\colon [a,b] \to X \text{ by } F(x) = \int_a^x f'$$

then we have that

$$g = C_{f(a)} + F$$

By [example: 16.165] $C_{f(a)}$ has a derivative on $[a,b]$ with $(C_{f(a)}) = C_0$ and using [theorem: 16.169] F has a derivative on $[a,b]$ with $F' = f'$. Using then the linearity of derivation [see theorem: 16.166] it follows that g has a derivative on $[a,b]$ with

$$g' = (C_{f(a)})' + F' = C_0 + f' = f' \tag{16.206}$$

Note also that $g(a) = C_{f(a)} + f(a) = f(a) + \int_a^a f' \underset{\text{[definition: 15.27]}}{=} f(a) + 0 = f(a)$ or

$$f(a) = g(a) \tag{16.207}$$

Define now the function φ by

$$\varphi\colon [a,b] \to X \text{ where } \varphi(x) = \|f(x) - g(x)\|$$

Let $x \in]a,b[$ then as $]a,b[$ is open there exist a $\delta \in \mathbb{R}^+$ such that $B_{||}(x,\delta) \subseteq]a,b[$. If $0 < |h| < \delta$ then $|x+h-x| = |h| < \delta$ so that $x+h \in B_{||}(x,\delta) \subseteq]a,b[$. Then we have

$$\begin{aligned}
\left|\frac{\varphi(x+h)-\varphi(x)}{h}\right| &= \left|\frac{\|f(x+h)-g(x+h)\| - \|f(x)-g(x)\|}{h}\right| \\
&= \frac{|\|f(x+h)-g(x+h)\| - \|f(x)-g(x)\||}{|h|} \\
&\leqslant_{\text{[theorem: 14.87]}} \frac{\|f(x+h)-g(x+h)+(g(x)-f(x))\|}{|h|} \\
&= \left\|\frac{(f(x+h)) - f(x) - (g(x+h)-g(x))}{h}\right\| \\
&\underset{f'=g'\text{[see 16.206]}}{=} \left\|\frac{f(x+h)-f(x)}{h} - f'(x) - \left(\frac{g(x+h)-g(x)}{h} - g'(x)\right)\right\| \\
&\leqslant \left\|\frac{f(x+h)-f(x)}{h} - f'(x)\right\| + \left\|\frac{g(x+h)-g(x)}{h} - g'(x)\right\|
\end{aligned}$$

Summarized, if $0 < |h| < \delta$ then

$$\left|\frac{\varphi(x+h)-\varphi(x)}{h}\right| \leqslant \left\|\frac{f(x+h)-f(x)}{h} - f'(x)\right\| + \left\|\frac{g(x+h)-g(x)}{h} - g'(x)\right\| \tag{16.208}$$

Let $\varepsilon \in \mathbb{R}^+$. As f has a derivative on $[a,b]$ we have by definition that $f_{|]a,b[}$ has a derivative at x. Hence there exist a $\delta_1 \in \mathbb{R}^+$ such that if $0 < |h| < \delta_1$ and $h \in]a,b[_x \Rightarrow x, x+h \in]a,b[$ that

$$\left\|\frac{f(x+h)-f(x)}{h} - f'(x)\right\| = \left\|\frac{f_{|]a,b[}(x+h) - f_{|]a,b[}(x)}{h} - (f_{|]a,b[})'(x)\right\| < \frac{\varepsilon}{2}$$

Likewise as g has a derivative on $[a,b]$ we have by definition that $g_{|]a,b[}$ has a derivative at x. Hence there exist a $\delta_2 \in \mathbb{R}^+$ such that if $0 < |h| < \delta_2$ and $h \in]a,b[_x \Rightarrow x, x+h \in]a,b[$ that

$$\left\|\frac{g(x+h)-g(x)}{h} - g'(x)\right\| = \left\|\frac{g_{|]a,b[}(x+h) - g_{|]a,b[}(x)}{h} - (g_{|]a,b[})'(x)\right\| < \frac{\varepsilon}{2}$$

So if $0 < |h| < \min(\delta, \delta_1, \delta_2)$ and $h \in]a,b[_x$ we have using the above and [eq: 16.208] that

$$\left|\frac{\varphi_{|]a,b[}(x+h) - \varphi_{|]a,b[}(x)}{h} - 0\right| \underset{x,x+h\in]a,b[}{=} \left|\frac{\varphi(x+h)-\varphi(x)}{h} - 0\right| < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$$

Hence

$$\forall x \in]a,b[\ \varphi_{|]a,b[} \text{ has a derivative at } x \text{ and } (\varphi_{|]a,b[|})'_x = 0$$

Let $x, y \in [a, b]$ then we can use Lagrange's theorem [see theorem: 16.152] to find a $\zeta \in]a, b[$ with

$$\varphi(x) - \varphi(y) = (\varphi_{|]a,b[})'_\zeta \cdot (x - y) = 0 \cdot (x - y) = 0$$

This prove that $\forall x \in [a, b]\ \varphi(x) = \varphi(a) = \|f(a) - g(a)\| \underset{[\text{eq: } 16.207]}{=} 0$. Hence $\forall x \in [a, b]$ we have

$$\|f(x) - g(x)\| = \varphi(x) = 0$$

proving that $f(x) = g(x)$ so that $f(b) = g(b) = f(a) + \int_a^b f'$. Hence

$$f(b) - f(a) = \int_a^b f'$$

□

16.3.4 Mean Value Theorems

The mean value theorems shows how the function values varies based on the variation of the function arguments. In essence they specify for a function $f: X \to Y$ a relation between $f(x) - f(y)$ and $x - y$. A example that is already proved is the Lagrange's Mean Value Theorem [see theorem: 16.152] that states that $f(b) - f(a) = f'_\zeta \cdot (b - a)$ where $\zeta \in [a, b]$. For these Mean Value Theorems we first need a little lemma that says that translating and scaling in C^1.

Lemma 16.171. *Let $\langle X, \|\|\rangle$ be a normed vector space, $\langle \mathbb{R}, \|\rangle$ the normed spaces of real numbers, $x, y \in X$ then we have that the function*

$$\sigma: \mathbb{R} \to X \text{ defined by } \sigma(t) = x + t \cdot (y - x)$$

is C^1 on $\mathbb{R}$. Further $\forall t \in \mathbb{R}\ D_t\sigma \in L(\mathbb{R}, X)$ is defined by

$$D_t\sigma: \mathbb{R} \to X \text{ where } D_t\sigma(h) = h \cdot (y - x)$$

so that

$$\sigma'_t \underset{[\text{theorem: } 16.32]}{=} D_t\sigma(1) = y - x$$

Proof. Define

$$L: \mathbb{R} \to X \text{ by } L(h) = h \cdot (y - x)$$

then by [theorem: 14.186] $L \in L(X, \mathbb{R})$. Let $t \in \mathbb{R}$, $\varepsilon \in \mathbb{R}^+$ then if $h \in \mathbb{R}_x$ with $|h| < 1$ we have that

$$\begin{aligned}
\|\sigma(t + h) - \sigma(t) - L(h)\| &= \|x + (t + h) \cdot (y - x) - (x + t \cdot (y - x)) - h \cdot (y - x)\| \\
&= \|h \cdot (y - x) - h \cdot (y - x)\| \\
&= 0 \\
&\leqslant \varepsilon \cdot |h|
\end{aligned}$$

proving that σ is differentiable at t with $D_t\sigma = L$. Hence we have that σ is 1-times differentiable on $\mathbb{R}$ and the function

$$D^{[1]}\sigma: \mathbb{R} \to L(X, \mathbb{R}) \text{ defined by } D^{[1]}\sigma(t) = D_t^{[1]}\sigma$$

is equal to the constant function C_L. As by [theorem: 14.132] C_L is continuous it follows that $D^{[1]}\sigma$ is continuous. Hence σ is C^1 on $\mathbb{R}$. □

Theorem 16.172. (Mean Value Theorem (I) *Let $\langle X, \|\|\rangle$ be a normed vector space, U a open set U in X, $\langle \mathbb{R}, \|\rangle$ the normed spaces of real numbers and $f: U \to \mathbb{R}$ a function that is C^1 on U. Let $x, y \in U$ be such that $\forall t \in [0, 1]\ (1 - t) \cdot x + t \cdot y \in U$ then there exist a $\zeta \in [0, 1]$ such that*

$$f(y) - f(x) = D_z f(y - x) \text{ where } z = x + \zeta \cdot (x - y)$$

Proof. Define

$$\sigma: \mathbb{R} \to X \text{ by } \sigma(t) = x + t \cdot (y - x) = x \cdot (1 - t) + t \cdot y$$

Take $W = \sigma^{-1}(U)$. As σ is C^1 on $\mathbb{R}$ [see lemma: 16.171] it follows from [theorem: 16.119] that σ is C^0 on $\mathbb{R}$ or in other words that σ is continuous. From this it follows that W is open in $\mathbb{R}$. Let $t \in [0, 1]$ then $\sigma(t) = (1 - t) \cdot x + y \in U$ so that $t \in \sigma^{-1}(U)$, hence we have

$$[0, 1] \subseteq \sigma^{-1}(U) = W \tag{16.209}$$

Then for

$$\sigma_{|W}: W \to X$$

we have that $\sigma_{|W}(W) = \sigma(W) = \sigma(\sigma^{-1}(U)) \subseteq U$. Hence the following function is well defined:

$$f \circ \sigma_{|W}: W \to \mathbb{R}$$

Let $t \in W$ then by [lemma: 16.171] σ is differentiable at t where $D_t\sigma \in L(\mathbb{R}, X)$ is defined by

$$D_t\sigma(h) = h \cdot (y - x).$$

So using [theorem: 16.24] it follows that $\sigma_{|W}$ is differentiable a t with $D_t\sigma_{|W} = D_t\sigma$. Further, as f is C^1 on U, f is differentiable at $\sigma(t)$. Using the chain rule [see theorem: 16.39] it follows that $f \circ \sigma_{|W}$ is differentiable at t and

$$D_t(f \circ \sigma_{|W}) = D_{\sigma_{|W}(t)} f \circ D_t\sigma \underset{t \in W}{=} D_{\sigma(t)} f \circ D_t\sigma \tag{16.210}$$

Define g by

$$g: [0,1] \to \mathbb{R} \text{ where } g = (f \circ \sigma_{|W})_{|[0,1]}$$

As f is C^1 on U, hence C^0 on U [see theorem: 16.119], it follows that f is continuous, further $\sigma_{|W}$ is continuous [as σ is continuous it follows from [theorem: 14.136] that $\sigma_{|w}$ is continuous]. Hence $f \circ \sigma_{|W}$ is continuous. Using [theorem: 14.136] again we have that $(f \circ \sigma_{|W})_{|[0,1]}$ is continuous so we have that

$$g \text{ is continuous} \tag{16.211}$$

As $]0,1[\subseteq [0,1] \subseteq W$ [see eq: 16.209] and $f \circ \sigma_{|W}$ is differentiable at $t \in W$ it follows from [theorem: 16.24] that $(f \circ \sigma_{|W})_{]0,1[}$ is differentiable at t with

$$D_t(f \circ \sigma_{|W})_{]0,1[} = D_t(f \circ \sigma_{|W}) \underset{\text{[eq: 16.210]}}{=} D_{\sigma(t)} f \circ D_t\sigma.$$

As further $g_{|]0,1[} = ((f \circ \sigma_{|W})_{|[0,1]})_{|]0,1[} \underset{\text{[theorem: 2.86]}}{=} (f \circ \sigma_{|W})_{|]0,1[}$ it follows from the above that

$$\forall t \in]0,1[\;\; g_{|]0,1[} \text{ is differentiable at } t \text{ with } D_t(g_{|]0,1[}) = D_{\sigma(t)} f \circ D_t\sigma \tag{16.212}$$

Because of [eqs: 16.211 and 16.212] we can use Lagrange's theorem [theorem: 16.152] on g to find a $\zeta \in]0,1[$ so that

$$g(1) - g(0) = (g_{|]0,1[})'_\zeta \cdot (1 - 0) = (g_{|]0,1[})'_\zeta \tag{16.213}$$

Take $z = x + \zeta \cdot (y - x) = \sigma(\zeta)$ then we have

$$\begin{aligned}
f(y) - f(x) &= f(x + 1 \cdot (y - x)) - f(x + 0 \cdot (y - x)) \\
&= f(\sigma(1)) - f(\sigma(0)) \\
&\underset{1,0 \in [0,1] \subseteq W}{=} f(\sigma_{|W}(1)) - f(\sigma_{|W}(0)) \\
&= (f \circ \sigma_{|W})(1) - (f \circ \sigma_{|w})(0) \\
&\underset{1,0 \in [0,1]}{=} (f \circ \sigma_{|W})_{|[0,1]}(1) - (f \circ \sigma_{|w})_{|[0,1]}(0) \\
&= g(1) - g(0) \\
&\underset{\text{[eq: 16.213]}}{=} (g_{]0,1[})'_\zeta \\
&\underset{\text{[theorem: 16.32]}}{=} D_\zeta(g_{|]0,1[})(1) \\
&\underset{\text{[eq: 16.212]}}{=} (D_{\sigma(\zeta)} f \circ D_\zeta\sigma)(1) \\
&= D_{\sigma(\zeta)} f(D_\zeta\sigma(1)) \\
&\underset{\text{[lemma: 16.171]}}{=} D_{\sigma(\zeta)} f(y - x) \\
&\underset{z = \sigma(\zeta)}{=} D_z f(y - x)
\end{aligned}$$

□

We generalize now the Mean Value Theorem to arbitrary normed spaces, first we need the concept of convex sets.

Definition 16.173. *Let X be a vector space over $\mathbb{K}$ then $C \subseteq X$ is convex if $\forall x, y \in C$ we have $\forall t \in [0,1]$ that $x + t \cdot (y - x) = (1 - t) \cdot x + t \cdot y \in C$*

Theorem 16.174. *Let $\langle X, \|\|\rangle$ be a normed space, $x \in X$ and $\delta \in \mathbb{R}^+$ then $B_{\|\|}(x,\delta)$ and $\overline{B_{\|\|}(x,\delta)}$ are convex.*

Proof. Let $x \in X$, $\delta \in \mathbb{R}^+$, $y, z \in X$ and $t \in [0,1]$ then we have

$$\begin{aligned}
\|(1-t)\cdot y + t\cdot z - x\| &= \|(1-t)\cdot y + t\cdot z - x + t\cdot x - t\cdot x\| \\
&= \|(1-t)\cdot y - x\cdot(1-t) + t\cdot z - t\cdot x\| \\
&= \|(1-t)\cdot(y-x) + t\cdot(z-x)\| \\
&\leqslant \|(1-t)\cdot(y-x)\| + \|t\cdot(z-x)\| \\
&= |1-t|\cdot\|y-x\| + |t|\cdot\|z-x\| \\
&\underset{0\leqslant 1-t,t}{=} (1-t)\cdot\|y-x\| + t\cdot\|z-x\|
\end{aligned} \tag{16.214}$$

Hence if $y, z \in B_{\|\|}(x,\delta)$ then

$$\begin{aligned}
\|(1-t)\cdot y + t\cdot z - x\| &\leqslant_{[\text{eq: } 16.214]} (1-t)\cdot\|y-x\| + t\cdot\|z-x\| \\
&< (1-t)\cdot\delta + t\cdot\delta \\
&= \delta
\end{aligned}$$

proving that

$$(1-t)\cdot y + t\cdot z \in B_{\|\|}(x,\delta)$$

Further if $y, z \in \overline{B_{\|\|}(x,\delta)}$ then

$$\begin{aligned}
\|(1-t)\cdot y + t\cdot z - x\| &\leqslant_{[\text{eq: } 16.214]} (1-t)\cdot\|y-x\| + t\cdot\|z-x\| \\
&\leqslant (1-t)\cdot\delta + t\cdot\delta \\
&= \delta
\end{aligned}$$

so that

$$(1-t)\cdot y + t\cdot z \in \overline{B_{\|\|}(x,\delta)}$$

□

Theorem 16.175. (Mean Value Theorem (II) *Let $\langle X, \|\|_X\rangle$ a normed space, $\langle Y, \|\|_Y\rangle$ a Banach space, U a open set in X and f: $U \to Y$ a function that is C^1 on U. Assume that there is a* ***convex subset*** *$C \subseteq U$ and a $k \in \mathbb{R}$ such that $\forall x \in C$ $\|D_x f\|_{L(X,Y)} \leqslant k$ then*

$$\forall x, y \in C \text{ we have } \|f(y) - f(x)\|_Y \leqslant k\cdot\|y-x\|_X$$

Proof. Let $x, y \in C$. Define the function

$$\sigma: \mathbb{R} \to X \text{ by } \sigma(t) = x + t\cdot(y-x)$$

then if $t \in [0,1]$ we have $\sigma(t) = x + t\cdot(y-x) = x\cdot(1-t) + t\cdot y \in C$ [as C is convex] proving that

$$\sigma([0,1]) \subseteq C \tag{16.215}$$

So $\sigma([0,1]) \subseteq C \subseteq U$ or $[0,1] \subseteq \sigma^{-1}(U)$. As σ is C^1 on $\mathbb{R}$ [see lemma: 16.171] and thus continuous, it follows that $\sigma^{-1}(U)$ is open. Take $W = \sigma^{-1}(U)$ then we have

$$W \text{ is open, } [0,1] \subseteq W,\ \sigma(W) \subseteq U$$

Using [lemma: 16.171] σ is C^1 on U so that by [theorem: 16.106]

$$\sigma_{|W}: W \to X$$

is C^1 on $\mathbb{R}$ and if we define

$$D^{[1]}\sigma: \mathbb{R} \to L_1(\mathbb{R};Y) = L(\mathbb{R},Y) \text{ by } D^{[1]}\sigma(t) = D^{[1]}_t\sigma$$

$$D^{[1]}\sigma_{|W}: W \to L_1(\mathbb{R};Y) = L(\mathbb{R},Y) \text{ by } D^{[1]}\sigma_{|W}(x) = D^{[1]}_x\sigma_{|W}$$

then we have

$$D^{[1]}\sigma_{|W} = (D^{[1]}\sigma)_{|W} \tag{16.216}$$

As $\sigma_{|W}(W) = \sigma(W) \subseteq U$ it follows that the following function is well defined

$$g = f\circ\sigma_{|W}: W \to Y$$

and, as f is C^1 on U, $\sigma_{|W}$ is C^1 on $\mathbb{R}$, it follows from the chain rule [see theorem: 16.147]

$$g \text{ is } C^1 \text{ on } \mathbb{R} \tag{16.217}$$

Let $t \in W$ then as g is 1-times differentiable at t [hence Fréchet differentiable at t] it follows from [theorem: 16.32] that g has a derivative at t and

$$\begin{aligned}
g'_t &= D_t g(1) \\
&= D_t(f \circ \sigma_{|W})(1) \\
&\underset{\text{[theorem: 16.39]}}{=} (D_{\sigma_{|W}(t)} f \circ D_t \sigma_{|W})(1) \\
&= \left(D_{\sigma_{|W}(t)} f \circ D_t^{[1]} \sigma_{|W}\right)(1) \\
&\underset{\text{[eq: 16.216]} \wedge t \in W}{=} \left(D_{\sigma(t)} f \circ D_t^{[1]} \sigma\right)(1) \\
&= D_{\sigma(t)} f\left(D_t^{[1]} \sigma(1)\right) \\
&\underset{\text{[lemma: 16.171]}}{=} D_{\sigma(t)} f(y - x)
\end{aligned} \tag{16.218}$$

As g is C^1 on $\mathbb{R}$ it follows from [corollary: 16.168] that

$$h = g_{|[0,1]} : [0,1] \to Y$$

has a derivative on $[0,1]$, $h' : [0,1] \to Y$ is continuous and $\forall t \in [0,1] \quad g'_t = h'_t$. So if $t \in [0,1]$ then we have

$$\begin{aligned}
\|h'_t\|_{|Y} &= \|g'_t\|_Y \\
&\underset{\text{[eq: 16.218]}}{=} \|D_{\sigma(t)} f(y - x)\| \\
&\leqslant \|D_{\sigma(t)} f\|_{L(X,Y)} \cdot \|y - x\|_X
\end{aligned}$$

By the hypothesis we have $\forall x \in C$ that $\|D_x f\|_{L(X,Y)} \leqslant k$, hence, as $\sigma(t) \in \sigma([0,1]) \subseteq C$ [see eq: 16.215] it follow from the above that

$$\|h'(t)\|_Y = \|h'_t\|_Y \leqslant k \cdot \|y - x\|_X \tag{16.219}$$

Finally we have

$$\begin{aligned}
\|f(y) - f(x)\|_Y &= \|f(x + 1 \cdot (x - y)) - f(x + 0 \cdot (x - y))\|_Y \\
&= \|f(\sigma(1)) - f(\sigma(0))\|_Y \\
&\underset{0,1 \in [0,1] \subseteq W}{=} \|f(\sigma_{|W}(1)) - f(\sigma_{|W}(0))\|_Y \\
&= \left\|\left(f \circ \sigma_{|W}\right)(1) - (f \circ \sigma_{|W}(0))\right\|_Y \\
&= \|g(1) - g(0)\| \\
&\underset{0,1 \in [0,1]}{=} \|h(1) - h(0)\|
\end{aligned}$$

As h has a derivative on $[0,1]$ and $h' : [0,1] \to X$ is continuous, we can apply the fundamental theorem of calculus [theorem: 16.170] to get $h(1) - h(0) = \int_0^1 h'$. Combining this with the above gives

$$\begin{aligned}
\|f(y) - f(x)\|_Y &= \left\|\int_0^1 h'\right\| \\
&\leqslant_{\text{[eq: 16.219]} \wedge \text{[theorem: 15.29]}} (1 - 0) \cdot k \cdot \|y - x\| \\
&= k \cdot \|y - x\|
\end{aligned}$$

which completes the proof of the theorem. □

Definition 16.176. *Let X be a vector space, $a, b \in X$ then the* ***line segment connecting a to b*** *noted as $L_{a,b}$ is defined to be the set*

$$L_{a,b} = \{t \cdot a + (1 - t) \cdot b | t \in [0,1]\} = \{b - t \cdot (a - b) | t \in [0,1]\} \subseteq X$$

***Note* 16.177.** *By taking $t = 0, 1$ it follows that $a, b \in L_{a,b}$*

Example 16.178. $[0,1] = L_{0,1}$ in $\mathbb{R}$

Proof. If $x \in L_{0,1}$ then there exist a $t \in [0,1]$ such that $x = t \cdot 0 + (1-t) \cdot 1 = 1 - t$. As $0 \leqslant t$ it follows that $x = 1 - t \leqslant 1$, further as $t \leqslant 1 \Rightarrow -1 \leqslant -t \Rightarrow 0 = 1 - 1 \leqslant 1 - t = x$. proving that $x \in [0,1]$. Hence

$$L_{0,1} \subseteq [0,1] \tag{16.220}$$

On the other hand if $x \in [0,1]$ then $0 \leqslant x \leqslant 1 \Rightarrow 0 \leqslant 1 - x \leqslant 1$, take $t = (1-x)$ then $t \in [0,1]$ and

$$t \cdot 0 + (1-t) \cdot 1 = (1-t) = (1-(1-x)) = x$$

proving $x \in L_{0,1}$. Hence $[0,1] \subseteq L_{0,1}$ which combined with [eq: 16.220] gives

$$L_{0,1} = [0,1]$$

□

Lemma 16.179. *Let $\langle X, \|\| \rangle$ be a normed space and $a, b \in X$ then $L_{a,b}$ is convex, compact and bounded.*

Proof. Let $x, y \in L_{a,b}$, then there exists $t_x, t_y \in [0,1]$ such that $x = t_x \cdot a + (1-t_x) \cdot b$ and $y = t_y \cdot a + (1-t_y) \cdot b$. Let $t \in [0,1]$ then we have

$$\begin{aligned}
(1-t) \cdot x + t \cdot y &= (1-t) \cdot (t_x \cdot a + (1-t_x) \cdot b) + t \cdot (t_y \cdot a + (1-t_y) \cdot b) \\
&= (1-t) \cdot t_x \cdot a + (1-t) \cdot (1-t_x) \cdot b + t \cdot t_y \cdot a + t \cdot (1-t_y) \cdot b \\
&= ((1-t) \cdot t_x + t \cdot t_y) \cdot a + ((1-t) \cdot (1-t_x) + t \cdot (1-t_y)) \cdot b \\
&= (t_x + t \cdot (t_y - t_x)) \cdot a + (1 - t_x - t + t \cdot t_x + t - t \cdot t_y) \cdot b \\
&= (t_x + t \cdot (t_y - t_x)) \cdot a + (1 - (t_x + t \cdot (t_y - t_x))) \cdot b \\
&= s \cdot a + (1-s) \cdot b \text{ where } s = t_x + t \cdot (t_y - t_x)
\end{aligned}$$

Now as $0 \leqslant t, t_x, t_y \leqslant 1$ we have that

$$t_x \cdot t \leqslant t_x \Rightarrow 0 \leqslant t_x - t_x \cdot t \Rightarrow 0 \leqslant t_x - t \cdot t_x + t \cdot t_y = \underbrace{t_x + t \cdot (t_y - t_x)}_{s} \leqslant t_x + (t_y - t_x) = t_y \leqslant 1$$

proving that $s \in [0,1]$ and thus that $x + t \cdot (y - x) \in L_{a,b}$. Hence we have that

$$L_{a,b} \text{ is convex}$$

Define $\sigma : \mathbb{R} \to X$ by $\sigma(t) = t \cdot a + (1-t) \cdot b$. so that

$$L_{a,b} = \sigma([0,1])$$

Given $\varepsilon \in \mathbb{R}^+$, $s \in \mathbb{R}$ take $\delta = \frac{\varepsilon}{\|a-b\|_Y + 1} \in \mathbb{R}^+$ then if $|s-t| < \delta$ and $t \in \mathbb{R}$ we have

$$\begin{aligned}
\|\sigma(t) - \sigma(s)\| &= \|t \cdot a + (1-t) \cdot b - s \cdot a - (1-s) \cdot b\| \\
&= \|(t-s) \cdot a + (s-t) \cdot b\| \\
&= |t-s| \cdot \|a-b\| \\
&< \delta \cdot \|a-b\| \\
&< \varepsilon
\end{aligned}$$

proving that

$$\sigma \text{ is continuous}$$

As $[0,1]$ is compact [see theorem: 14.235] and σ is continuous it follows from [theorem: 14.232] that

$$L_{a,b} = \sigma([0,1]) \text{ is compact}$$

Applying then [theorem: 14.230] proves that

$$L_{a,b} \text{ is bounded}$$

□

Theorem 16.180. (Mean Value Theorem (III)) *Let $\langle X, \|\|_X \rangle$ be a normed space, $\langle Y, \|\|_Y \rangle$ a Banach space, U a open set in X, x, $y \in X$ such that $L_{x,y} \subseteq U$ and $f : U \to Y$ a function that is C^1 on U then*

$$\sup(\{\|D_\zeta f\|_{L(X,Y)} | \zeta \in L_{x,y}\})$$

exists and

$$\|f(y) - f(x)\|_Y \leqslant \sup(\{\|D_\zeta f\|_{L(X,Y)} | \zeta \in L_{x,y}\}) \cdot \|y - x\|_X$$

Proof. As f is C^1 on U we have by [theorem: 16.109] that f is 1-times differentiable on U and that $D^{[1]}f: U \to L(X,Y)$ defined by $D^{[1]}f(x) = D_x^{[1]}f$ is continuous. Hence we have that

$$Df: U \to L(X,Y) \text{ defined by } Df(x) = D_x f$$

is well defined and is continuous, further by the previous lemma [lemma: 16.179] $L_{x,y}$ is compact. So we can use [theorem: 14.232] to prove that $Df(L_{x,y})$ is compact, applying then [theorem: 14.230] it follows that $Df(L_{x,y})$ is bounded. So there exist a $M \in \mathbb{R}^+$ such that $\forall L_1, L_2 \in Df(L_{x,y})$ we have that $\|L_1 - L_2\|_{L(X,Y)} \leqslant M$. Let $\zeta \in L_{x,y} \subseteq U$ then we have

$$\begin{aligned} \|Df(\zeta)\|_{L(X,Y)} &= \|Df(\zeta) - Df(x) + Df(x)\|_{L(X,Y)} \\ &\leqslant \|Df(\zeta) - Df(x)\|_{L(X,Y)} + \|Df(x)\|_{L(X,Y)} \\ &\leqslant M + \|Df(x)\|_{L(X,Y)} \end{aligned}$$

proving that $\{\|D_\zeta f\|_{L(X,Y)} | \zeta \in L_{x,y}\} = \{\|Df(\zeta)\| | \zeta \in L_{x,y}\}$ is bounded above by $M + \|Df(x)\|_{L(X,Y)}$. As $\mathbb{R}$ is conditionally complete [see theorem: 10.18] and $\{\|D_\zeta f\|_{L(X,Y)} | \zeta \in L_{x,y}\} \neq \varnothing$ [because $x \in L_{x,y} \Rightarrow L_{x,y} \neq \varnothing$] it follows that

$$\sup(\{\|D_\zeta f\|_{L(X,Y)} | \zeta \in L_{x,y}\}) \text{ exist}$$

As $L_{x,y}$ is convex [see lemma: 16.179], $L_{x,y} \subseteq U$ and $\forall \zeta \in L_{x,y}$

$$\|D_\zeta f\|_{L(X,Y)} \leqslant \sup(\{\|D_\zeta f\|_{L(X,Y)} | \zeta \in L_{x,y}\})$$

it follows from [theorem: 16.175] that

$$\|f(y) - f(x)\|_{L(X,Y)} \leqslant \sup(\{\|D_\zeta f\|_{L(X,Y)} | \zeta \in L_{x,y}\}) \cdot \|y - x\|_X$$ □

Corollary 16.181. *Let $\langle X, \|\|_X \rangle$ be a normed space, $\langle Y, \|\|_Y \rangle$ a Banach space, U a open set in X, $x \in U$, $\delta \in \mathbb{R}^+$ such that $B_{\|\|_X}(x,\delta) \subseteq U$, $f: U \to Y$ a function that is C^1 on U then $\forall y, z \in B_{\|\|_X}(x,\delta)$ we have that*

$$\sup(\{\|D_{y+t\cdot(z-y)} f\|_{L(X,Y)} | t \in [0,1]\})$$

exist and

$$\|f(z) - f(y)\|_Y \leqslant \sup(\{\|D_{y+t\cdot(z-y)} f\|_{L(X,Y)} | t \in [0,1]\}) \cdot \|z - y\|_X$$

Proof. Let $y, z \in B_{\|\|_X}(x,\delta)$ then as open balls are convex [see theorem: 16.174] we have that $L_{z,y} = \{y + t\cdot(z-y) | t \in [0,1]\} \subseteq B_{\|\|_X}(x,\delta) \subseteq U$. So by the previous theorem [theorem: 16.180]

$$\sup(\{\|D_\zeta f\|_{L(X,Y)} | \zeta \in L_{z,y}\})$$

exists and

$$\|f(z) - f(y)\|_Y \leqslant \sup(\{\|D_\zeta f\|_{L(X,Y)} | \zeta \in L_{x,y}\}) \cdot \|z - y\|_X$$

Now

$$\begin{aligned} r \in \{\|D_\zeta f\|_{L(X,Y)} | \zeta \in L_{z,y}\} &\Leftrightarrow \exists \zeta \in L_{z,y} \text{ with } r = \|D_\zeta f\|_{L(X,Y)} \\ &\Leftrightarrow \exists t \in [0,1] \text{ with } \zeta = y + t\cdot(z-y) \wedge r = \|D_\zeta f\|_{L(X,Y)} \\ &\Leftrightarrow \exists t \in [0,1] \text{ with } r = \|D_{y+t\cdot(z-y)}\|_{L(X,Y)} \\ &\Leftrightarrow r \in \{\|D_{y+t\cdot(z-y)} f\|_{L(X,Y)} | t \in [0,1]\} \end{aligned}$$

So $\{\|D_\zeta f\|_{L(X,Y)} | \zeta \in L_{z,y}\} = \{\|D_{y+t\cdot(z-y)} f\|_{L(X,Y)} | t \in [0,1]\}$ proving that

$$\sup(\{\|D_{y+t\cdot(z-y)} f\|_{L(X,Y)} | t \in [0,1]\})$$

exist and

$$\|f(z) - f(y)\|_Y \leqslant \sup(\{\|D_{y+t\cdot(z-y)} f\|_{L(X,Y)} | t \in [0,1]\}) \cdot \|z - y\|$$ □

Theorem 16.182. (Mean Value Theorem (IV)) *Let $\langle X, \|\|_X \rangle$ be a normed space, $\langle Y, \|\|_Y \rangle$ a Banach space, U a open set in X, a, $b \in X$ such that $L_{a,b} \subseteq U$ and $f: U \to Y$ a function that is C^1 on U then $\forall x \in U$ we have*

$$\|f(a) - f(b) - D_x f(a-b)\|_Y \leqslant \sup(\{\|D_\zeta f - D_x f\|_{L(X,Y)} | \zeta \in L_{a,b}\}) \cdot \|a - b\|_X$$

Proof. Let $x \in U$ and define

$$g: U \to Y \text{ by } g(\zeta) = f(\zeta) - D_x f(\zeta) \tag{16.221}$$

Then, as f is C^1 on U [so Fréchet differentiable on x] and $D_x f \in L(X, Y)$ is C^∞ on X [see example: 16.129], it follows from [theorem: 16.126] that g is C^1 on U. Hence we have that g is differentiable at $\zeta \in U$ [see theorem: 16.108] with

$$D_\zeta g = D_\zeta f - D_\zeta(D_x f) \underset{\text{[example: 16.27]}}{=} D_\zeta f - D_x f \tag{16.222}$$

By the Mean Value Theorem (III) [theorem: 16.180] it follows that

$$\|g(a) - g(b)\|_Y \leqslant \sup\left(\{\|D_\zeta g\|_{|L(X,Y)} | \zeta \in L_{a,b}|\}\right) \cdot \|a - b\|$$

Hence

$$\begin{aligned}
\|f(a) - f(b) - D_x f(a-b)\|_Y &= \|f(a) - f(b) - (D_x f(a) - D_c f(b))\|_Y \\
&\underset{\text{[eq: 16.221]}}{=} \|g(a) - g(b)\|_{|Y|} \\
&\leqslant \sup\left(\{\|D_\zeta g\|_{|L(X,Y)} | \zeta \in L_{a,b}|\}\right) \cdot \|a - b\|_X \\
&\underset{\text{[eq: 16.222]}}{=} \sup\left(\{\|D_\varsigma f - D_x f\|_{|L(X,Y)} | \zeta \in L_{a,b}\}\right) \cdot \|a - b\|_X
\end{aligned}$$

□

16.4 Symmetry of Higher Order Differentials

We set out now to proof that $D_x^{[n]} f(h_1 : \ldots : h_n) = D_x^{[n]} f(h_{\sigma(1)} : \ldots : h_{\sigma(n)})$ where $\sigma \in P_n$ or, using the multilinear representation of the higher order differential, that $D_x^n f(h_1, \ldots, h_n) = D_x^n f(h_{\sigma(1)}, \ldots, h_{\sigma(n)})$. In other words $D_x^n f$ is a symmetric multilinear function. The proof is rather elaborated, so to simplify it we divide the proof in different lemma'a. First we prove symmetry for the case $n = 2$.

Lemma 16.183. *Let $\langle X, \|\|_X \rangle$ be a normed space, $\langle Y, \|\|_Y \rangle$ a Banach space, U a open set in X and $f: U \to Y$ a function that is C^2 on U then $\forall x \in X$ we have $\forall u, v \in X$ that*

$$\left(D_x^{[2]} f\right)(v)(w) = \left(D_x^{[2]} f\right)(w)(v)$$

or for the function defined by

$$D^{[2]} f: U \to L_2(X; Y) \text{ where } D^{[2]} f(x) = D_x^{[2]} f$$

we have

$$(D^{[2]} f(x))(v)(w) = (D^{[2]} f(x))(w)(v)$$

Proof. Let $x \in U$ then as U is open there exist a $r \in \mathbb{R}^+$ such that

$$x \in B_{\|\|_X}(x, r) \subseteq U$$

Let $v, w \in X$ such that $\|v\|_X < \frac{r}{4}$, $\|w\|_X < \frac{r}{4}$ and define

$$\varphi_{v,w}:]-2, 2[\to X \text{ by } \varphi_{v,w}(t) = x + t \cdot v \text{ and } \psi_{v,w}:]-2, 2[\to X \text{ by } \psi_{v,w}(t) = x + w + t \cdot v \tag{16.223}$$

If $t \in]-2, 2[$ then we have $\|\varphi_{v,w}(t) - x\|_X = \|t \cdot v\|_X = |t| \cdot \|v\|_x \leqslant 2 \cdot \frac{r}{4} < r$ and $\|\psi_{v,w}(t) - x\|_X = \|w + t \cdot v\|_X \leqslant \|w\|_X + |t| \cdot \|v\|_X \leqslant \frac{r}{4} + 2 \cdot \frac{r}{4} < r$ proving that

$$\varphi_{v,w}(]-2, 2[) \subseteq U \wedge \psi_{v,w}(]-2, 2[) \subseteq U \tag{16.224}$$

The above allows us to define

$$g_{v,w}:]-2, 2[\to Y \text{ by } g_{v,w} = f \circ \psi_{v,w} - f \circ \varphi_{v,w} \tag{16.225}$$

As by [example: 16.131] $\psi_{v,w}, \varphi_{v,w}$ are C^∞ on U and f is C^2 on U it follows from [theorems: 16.147, 16.126] that $g_{v,w}$ is C^2 on U. Hence by [theorem: 16.119] $g_{v,w}$ is C^1 on U. So, as $L_{0,1} \underset{\text{[example: 16.178]}}{=} [0, 1] \subseteq]-2, 2[$ and $0 \in]-2, 2[$, we can use the second mean value theorem (IV) [see theorem: 16.182] to get

$$\|g_{v,w}(0) - g_{v,w}(1) - D_0 g_{v,w}(0 - 1)\|_Y \leqslant \sup\left(\{\|D_\zeta g_{v,w} - D_0 g_{v,w}\|_{L(\mathbb{K},Y)} | \zeta \in L_{0,1}\}\right) \cdot |0 - 1|$$

As $L_{0,1}=[0,1]$ and $0-1=-1$ we have

$$\|g_{v,w}(0)-g_{v,w}(1)-D_0g_{v,w}(-1)\|_Y \leqslant \sup\left(\{\|D_\zeta g_{v,w}-D_0g_{v,w}\|_{L(\mathbb{K},Y)}|\zeta\in[0,1]\}\right) \tag{16.226}$$

As $D_0g_{v,w}(1) \underset{\text{[theorem: 16.32]}}{=} (g_{v,w})'_0$ we have that

$$\begin{aligned}\|g_{v,w}(0)-g_{v,w}(1)-D_0g_{v,w}(-1)\|_Y &= \|g_{v,w}(0)-g_{v,w}(1)+D_0g_{v,w}(1)\|_Y\\ &= \|g_{v,w}(1)-g_{v,w}(0)-D_0g_{v,w}(1)\|_Y\\ &= \|g_{v,w}(1)-g_{v,w}(0)-(g_{v,w})'_0\|_Y\end{aligned}$$

so that by [eq: 16.226]

$$\|g_{v,w}(1)-g_{v,w}(0)-(g_{v,w})'_0\|_Y \leqslant \sup\left(\{\|D_\zeta g_{v,w}-D_0g_{v,w}\|_{L(\mathbb{K},Y)}|\zeta\in[0,1]\}\right) \tag{16.227}$$

Now given $h\in\mathbb{R}$ we have

$$\begin{aligned}\|(D_\zeta g_{v,w}-D_0g_{v,w})(h)\|_Y &= \|D_\zeta g_{v,w}(h)-D_0g_{v,w}(h)\|_Y\\ &\underset{\text{[theorem: 16.32]}}{=} \|h\cdot(g_{v,w})'_\zeta-h\cdot(g_{v,w})'_0\|_Y\\ &= \|(g_{v,w})'_\zeta-(g_{v,w})'_0\|_Y\cdot|h|\end{aligned}$$

proving by the definition of the norm of a linear continuous mapping [see theorem: 14.184] that $\|D_\zeta g_{v,w}-D_0g_{v,w}\|_{L(\mathbb{K},Y)}\leqslant\|(g_{v,w})'_\zeta-(g_{v,w})'_0\|_Y$, hence by [eq: 16.227] it follows that

$$\|g_{v,w}(1)-g_{v,w}(0)-(g_{v,w})'_0\|_Y \leqslant \sup\left(\{\|(g_{v,w})'_\zeta-(g_{v,w})'_0\|_Y|\zeta\in[0,1]\}\right) \tag{16.228}$$

Let $\zeta\in[0,1]$ then we have using the chain rule that

$$\begin{aligned}(g_{v,w})'_\zeta &\underset{\text{[theorem: 16.32]}}{=} D_\zeta g_{v,w}(1)\\ &= D_\zeta(f\circ\psi_{v,w}-f\circ\varphi_{v,w})(1)\\ &\underset{\text{[theorem: 16.38]}}{=} D_\zeta(f\circ\psi_{v,w})(1)-D_\zeta(f\circ\varphi_{v,w})(1)\\ &\underset{\text{[theorem: 16.39]}}{=} (D_{\psi_{v,w}(\zeta)}f\circ D_\zeta\psi_{v,w})(1)-(D_{\varphi_{v,w}(\zeta)}f\circ D_\zeta\varphi_{v,w})(1)\\ &= D_{\psi_{v,w}(\zeta)}f(D_\zeta\psi_{v,w}(1))-D_{\varphi_{v,w}(\zeta)}f(D_\zeta\varphi_{v,w}(1))\\ &\underset{\text{[example: 16.131]}}{=} D_{\psi_{v,w}(\zeta)}f(v)-D_{\varphi_{v,w}(\zeta)}f(v)\\ &= D_{x+\zeta\cdot v+w}f(v)-D_{x+\zeta\cdot v}f(v)\end{aligned}$$

so that

$$\forall\zeta\in[0,1]\ (g_{v,w})'_\zeta=D_{x+\zeta\cdot v+w}f(v)-D_{x+\zeta\cdot v}f(v) \tag{16.229}$$

As f is C^2 on U we have that the function

$$Df:U\to L_1(X;Y)=L(X,Y)\ \text{ defined by } Df(x)=D_xf$$

is Fréchet differentiable on every $x\in U$ and $D_x(Df)=D_x^{[2]}f$. Then given $\varepsilon\in\mathbb{R}^+$ there exist a $\delta\in\mathbb{R}^+$ such that if $h\in U_x$ and $\|x\|<\delta$ then

$$\left\|Df(x+h)-Df(x)-D_x^{[2]}f(h)\right\|_{L(X,Y)}\leqslant\varepsilon\cdot\|h\|_X \tag{16.230}$$

Let $v,w\in X$ with $\|v\|_X<\min\left(\frac{\delta}{4},\frac{r}{4}\right)$, $\|w\|_X\leqslant\min\left(\frac{\delta}{4},\frac{r}{4}\right)$ then $\forall\zeta\in[0,1]$ we have

$$\|\zeta\cdot v+w\|_X\leqslant|\zeta|\cdot\|v\|_X+\|w\|_X\leqslant 1\cdot\frac{\delta}{4}+\frac{\delta}{4}=\frac{\delta}{2}<\delta \text{ and } \|\zeta\cdot v\|_X=|\zeta|\cdot\|v\|_X\leqslant\frac{\delta}{4}<\delta$$

As $\|v\|_X,\|w\|_X<\frac{r}{4}$ and $\zeta\leqslant 1$ we have that

$$\|x+\zeta\cdot v+w-x\|_X\leqslant|\zeta|\cdot\|v\|_X+\|w\|_X\leqslant\frac{r}{4}+\frac{r}{4}<r \text{ and } \|x+\zeta\cdot v-x\|_X\leqslant|\zeta|\cdot\|v\|_X<r$$

so that $x+\zeta\cdot v+w,x+\zeta\cdot v\in B_{\|\|_X}(x,r)\subseteq U$ or

$$\zeta\cdot v+w,\zeta\cdot v\in U_x$$

Using the above we have that

$$\left\|Df(x+\zeta\cdot v+w)-Df(x)-D_x^{[2]}f(\zeta\cdot v+w)\right\|_{L(X,Y)}\leqslant\varepsilon\cdot\|\zeta\cdot v+w\|_X \tag{16.231}$$

$$\left\|Df(x+\zeta\cdot v)-Df(x)-D_x^{[2]}f(\zeta\cdot v)\right\|_{L(X,Y)}\leqslant\varepsilon\cdot\|\zeta\cdot v\|_X \tag{16.232}$$

Also

$$D_x^{[2]}f(\zeta\cdot v+w)(v)-D_x^{[2]}f(\zeta\cdot v)(v)\underset{D_x^2f\in L(X,L(X,Y))}{=}D_x^{[2]}(w)(v) \tag{16.233}$$

Now for $\zeta\in[0,1]$

$$\begin{aligned}
\left\|(g_{v,w})'_\zeta-D_x^{[2]}f(w)(v)\right\|_Y &\underset{\text{[eq: 16.229]}}{=}\\
\left\|D_{x+\zeta\cdot v+w}f(v)-D_{x+\zeta\cdot v}f(v)-D_x^{[2]}f(w)(v)\right\|_Y &\underset{\text{def of } Df}{=}\\
\left\|Df(x+\zeta\cdot v+w)(v)-Df(x+\zeta\cdot v)(v)-D_x^{[2]}f(w)(v)\right\|_Y &\underset{\text{[eq: 16.233}}{=}\\
\left\|\underbrace{Df(x+\zeta\cdot v+w)(v)}_{1}-\underbrace{Df(x+\zeta\cdot v)(v)}_{2}-\left(\underbrace{D_x^{[2]}f(\zeta\cdot v+w)(v)}_{3}-\underbrace{D_x^{[2]}f(\zeta\cdot v)(v)}_{4}\right)\right\|_Y &=\\
\left\|\underbrace{Df(x+\zeta\cdot v+w)(v)}_{1}-Df(x)(v)-\underbrace{D_x^{[2]}f(\zeta\cdot v+w)(v)}_{3}-\left(\underbrace{Df(x+\zeta\cdot v)(v)}_{2}-Df(x)(v)-\underbrace{D_x^{[2]}f(\zeta\cdot v)(v)}_{4}\right)\right\|_Y &\leqslant\\
\left\|Df(x+\zeta\cdot v+w)(v)-Df(x)(v)-D_x^{[2]}f(\zeta\cdot v+w)(v)\right\|_Y+\left\|Df(x+\zeta\cdot v)(v)-Df(x)(v)-D_x^{[2]}f(\zeta\cdot v)(v)\right\|_Y &\leqslant\\
\left\|Df(x+\zeta\cdot v+w)-Df(x)-D_x^{[2]}f(\zeta\cdot v+w)\right\|_{L(X,Y)}\cdot\|v\|_X+\left\|Df(x+\zeta\cdot v)-Df(x)-D_x^{[2]}f(\zeta\cdot v)\right\|_{L(X,Y)}\cdot\|v\|_X &\leqslant_{\text{[eqs: 16.231, 16.232}}\\
\varepsilon\cdot(\|\zeta\cdot v+w\|_X+\|\zeta\cdot v\|_X)\cdot\|v\|_X &\leqslant\\
\varepsilon\cdot\|v\|_X\cdot(|\zeta|\cdot\|v\|_X+\|w\|_X+|\zeta|\cdot\|v\|_X) &\leqslant_{\zeta\in[0,1]}\\
\varepsilon\cdot\|v_x\|\cdot(\|v\|_x+\|w\|_X+\|v\|_X) &\leqslant\\
\varepsilon\cdot\|v_x\|\cdot(\|v\|_x+\|w\|_X+\|w\|_X+\|v\|_X) &=\\
2\cdot\varepsilon\cdot\|v\|_X\cdot(\|v\|_X+\|w\|_X) &
\end{aligned}$$

proving that

$$\forall\zeta\in[0,1]\text{ we have }\left\|(g_{v,w})'_\zeta-D_x^{[2]}f(w)(v)\right\|_Y\leqslant 2\cdot\varepsilon\cdot\|v\|_X\cdot(\|v\|_X+\|w\|_X) \tag{16.234}$$

Further for $t\in[0,1]$ we have:

$$\begin{aligned}
\|(g_{v,w})'_t-(g_{v,w})'_0\|_Y &=\\
\left\|(g_{v,w})'_t-D_x^{[2]}f(w)(v)-\left((g_{v,w})'_0-D_x^{[2]}f(w)(v)\right)\right\|_Y &\leqslant\\
\left\|(g_{v,w})'_t-D_x^{[2]}f(w)(v)\right\|_Y+\left\|(g_{v,w})'_0-D_x^{[2]}f(w)(v)\right\|_Y &\leqslant_{t,0\in[0,1]\wedge\text{[eq: 16.234]}}\\
2\cdot\varepsilon\cdot\|v\|_X\cdot(\|v\|_X+\|w\|_X)+2\cdot\varepsilon\cdot\|v\|_X\cdot(\|v\|_X+\|w\|_X) &=\\
4\cdot\varepsilon\cdot\|v\|_X\cdot(\|v\|_X+\|w\|_X) &
\end{aligned}$$

proving

$$\|(g_{v,w})'_t-(g_{v,w})'_0\|_Y\leqslant 4\cdot\varepsilon\cdot\|v\|_X\cdot(\|v\|_X+\|w\|_X) \tag{16.235}$$

As $g_{v,w}$ is C^1 on $]-2,2[$, it follows from [theorem: 16.111] that the function

$$g'_{v,w}:]-2,2[\to Y\text{ defined by }g'_{v,w}(\zeta)=(g_{v,w})'_\zeta$$

is continuous. Define

$$h:]-2,2[\to\mathbb{R}\text{ by }h(\zeta)=\|g'_{v,w}(\zeta)-g'_{v,w}(0)\|_Y=(\|\|\circ(g'_{v,w}-C_{g'_{v,w}(0)}))(\zeta)$$

then as $g'_{v,w}$ is continuous we have by [example: 14.132] and [theorems: 14.152, 14.139] that h is continuous. Then as $[0,1]$ is compact and $[0,1]\subseteq]-2,2[$ it follows from the extreme value theorem [theorem: 14.238] that there exist a $\xi_0\in[0,1]$ such that $\forall t\in[0,1]\ h(t)\leqslant h(\xi_0)$. Hence we have $h(\xi_0)\leqslant\sup(h[0,1])\leqslant h(\xi_0)$ or

$$\|g'_{v,w}(\xi_0)-g'_{v,w}(0)\|_Y=h(\xi_0)=\sup(h([0,1])) \tag{16.236}$$

As $h([0,1]) = \{h(\zeta)|\zeta \in [0,1]\} = \{\|g'_{v,w}(\zeta) - g'_{v,w}(0)\|_Y|\zeta \in [0,1]\}$ it follows that

$$h(\zeta_0) = \sup\left(\{\|g'_{v,w}(\zeta) - g'_{v,w}(0)\|_Y|\zeta \in [0,1]\}\right) = \sup\left(\{\|(g_{v,w})'_\zeta - (g_{v,w})'_0\|_Y|\zeta \in [0,1]\}\right) \tag{16.237}$$

Next

$$\begin{aligned}
\left\|g_{v,w}(1) - g_{v,w}(0) - D_x^{[2]}f(w)(v)\right\|_Y &= \\
\left\|g_{v,w}(1) - g_{v,w}(0) - (g_{v,w})'_0 + (g_{v,w})'_0 - (g_{v,w})'_{\xi_0} + (g_{v,w})'_{\xi_0} - D_x^{[2]}f(w)(v)\right\|_Y &\leqslant \\
\|g_{v,w}(1) - g_{v,w}(0) - (g_{v,w})'_0\|_Y + \|(g_{v,w})'_0 - (g_{v,w})'_{\xi_0}\|_Y + \left\|(g_{v,w})'_{\xi_0} - D_x^{[2]}f(w)(v)\right\|_Y &\leqslant_{\text{[eq: 16.228]}} \\
\sup\left(\{\|(g_{v,w})'_\zeta - (g_{v,w})'_0\|_Y|\zeta \in [0,1]\}\right) + \|(g_{v,w})'_0 - (g_{v,w})'_{\xi_0}\|_Y + \left\|(g_{v,w})'_{\xi_0} - D_x^{[2]}f(w)(v)\right\|_Y &=_{\text{[eq: 16.237,16.236]}} \\
\|g'_{v,w}(\xi_0) - g'_{v,w}(0)\|_Y + \|(g_{v,w})'_0 - (g_{v,w})'_{\xi_0}\|_Y + \left\|(g_{v,w})'_{\xi_0} - D_x^{[2]}f(w)(v)\right\|_Y &= \\
\|(g_{v,w})'_{\xi_9} - (g_{v,w})'_0\|_Y + \|(g_{v,w})'_0 - (g_{v,w})'_{\xi_0}\|_Y + \left\|(g_{v,w})'_{\xi_0} - D_x^{[2]}f(w)(v)\right\|_Y &= \\
2 \cdot \|(g_{v,w})'_{\xi_0} - (g_{v,w})'_0\|_Y + \left\|(g_{v,w})'_{\xi_0} - D_x^{[2]}f(w)(v)\right\|_Y &\leqslant_{\text{[eq: 16.235]}} \\
8 \cdot \varepsilon \cdot \|v\|_X \cdot (\|v\|_X + \|w\|_X) + \left\|(g_{v,w})'_{\xi_0} - D_x^{[2]}f(w)(v)\right\|_Y &\leqslant_{\text{[eq: 16.234]}} \\
8 \cdot \varepsilon \cdot \|v\|_X \cdot (\|v\|_X + \|w\|_X) + 2 \cdot \varepsilon \cdot \|v\|_X \cdot (\|v\|_X + \|w\|_X) &= \\
10 \cdot \varepsilon \cdot \|v\|_X \cdot (\|v\|_X + \|w\|_X) &
\end{aligned}$$

proving that $\forall v, w \in X$ with $\|v\|_X < \min\left(\frac{\delta}{4}, \frac{r}{4}\right)$, $\|w\|_X < \min\left(\frac{\delta}{4}, \frac{r}{4}\right)$ we have

$$\left\|g_{v,w}(1) - g_{v,w}(0) - D_x^{[2]}f(w)(v)\right\|_Y \leqslant 10 \cdot \varepsilon \cdot \|v\|_X \cdot (\|v\|_X + \|w\|_X) \tag{16.238}$$

As for $v' = w$ and $w' = v'$ we have also $\|v'\|_X < \min\left(\frac{\delta}{4}, \frac{r}{4}\right)$, $\|w'\|_X < \min\left(\frac{\delta}{4}, \frac{r}{4}\right)$ it follows that

$$\left\|g_{v',w'}(1) - g_{v',w'}(0) - D_x^{[2]}f(w')(v')\right\|_Y \leqslant 10 \cdot \varepsilon \cdot \|v'\|_X \cdot (\|v'\|_X + \|w'\|_X)$$

or

$$\left\|g_{w,v}(1) - g_{w,v}(0) - D_x^{[2]}f(v)(w)\right\|_Y \leqslant 10 \cdot \varepsilon \cdot \|w\|_X \cdot (\|v\|_X + \|w\|_X) \tag{16.239}$$

Now

$$\begin{aligned}
g_{v,w}(1) - g_{v,w}(0) &= (f \circ \psi_{v,w})(1) - (f \circ \varphi_{v,w})(1) - ((f \circ \psi_{v,w})(0) - (f \circ \varphi_{v,w})(0)) \\
&= f(\psi_{v,w}(1)) - f(\varphi_{v,w}(1)) - f(\psi_{v,w}(0)) + f(\varphi_{v,w}(0)) \\
&= f(x + v \cdot 1 + w) - f(x + v \cdot 1) - f(x + v \cdot 0 + w) + f(x + v \cdot 0) \\
&= f(x + v + w) - f(x + v) - f(x + w) + f(x) \\
&= f(x + w + v) - f(x + w) - f(x + v) + f(x) \\
&= f(x + w \cdot 1 + v) - f(x + w \cdot 1) - f(x + w \cdot 0 + v) + f(x + w \cdot 0) \\
&= f(\psi_{w,v}(1)) - f(\varphi_{w,v}(1)) - f(\psi_{w,v}(0)) + f(\varphi_{w,v}(0)) \\
&= (f \circ \psi_{w,v})(1) - (f \circ \varphi_{w,v})(1) - ((f \circ \psi_{w,v})(0) - (f \circ \varphi_{w,v})(0)) \\
&= g_{w.v}(1) - g_{w,v}(0)
\end{aligned}$$

substituting in [eq: 16.239] gives

$$\left\|g_{v,w}(1) - g_{v,w}(0) - D_x^{[2]}f(v)(w)\right\|_Y \leqslant 10 \cdot \varepsilon \cdot \|w\|_X \cdot (\|v\|_X + \|w\|_X) \tag{16.240}$$

Next

$$\begin{aligned}
\left\|D_x^{[2]}f(v)(w) - D_x^{[2]}f(w)(v)\right\|_Y &= \\
\left\|g_{v,w}(1) - g_{v,w}(0) - D_x^{[2]}f(w)(v) - \left(g_{v,w}(1) - g_{v,w}(0) - D_x^{[2]}f(v)(w)\right)\right\|_Y &\leqslant \\
\left\|g_{v,w}(1) - g_{v,w}(0) - D_x^{[2]}f(w)(v)\right\|_Y + \left\|g_{v,w}(1) - g_{v,w}(0) - D_x^{[2]}f(v)(w)\right\|_Y &\leqslant_{\text{[eq: 16.238,16.240]}} \\
10 \cdot \varepsilon \cdot \|v\|_X \cdot (\|v\|_X + \|w\|_X) + 10 \cdot \varepsilon \cdot \|w\|_X \cdot (\|v\|_X + \|w\|_X) &= \\
\varepsilon \cdot [10 \cdot \|v\|_X \cdot (\|v\|_X + \|w\|_X) + 10 \cdot \|w\|_X \cdot (\|v\|_X + \|w\|_X)] &
\end{aligned}$$

As $\varepsilon \in \mathbb{R}^+$ was chosen arbitrary and v, w do not depend on ε it follows from [theorem: 10.31] that $\left\|D_x^{[2]}f(v)(w) - D_x^{[2]}f(w)(v)\right\|_Y \leqslant 0$ so that $\left\|D_x^{[2]}f(v)(w) - D_x^{[2]}f(w)(v)\right\|_Y = 0$ proving that $D_x^{[2]}f(v)(w) = D_x^{[2]}f(w)(v)$. Hence

$$\forall v, w \in X \text{ with } \|v\|_X < \min\left(\frac{\delta}{4}, \frac{r}{4}\right), \|w\|_X < \min\left(\frac{\delta}{4}, \frac{r}{4}\right) \text{ we have } D_x^{[2]}f(v)(w) = D_x^{[2]}f(w)(v)$$

Let $u, v \in X$ then for $v' = \frac{\min\left(\frac{\delta}{4}, \frac{r}{4}\right)}{\|v\|_X + 1} \cdot v$, $w' = \frac{\min\left(\frac{\delta}{4}, \frac{r}{4}\right)}{\|w\|_X + 1} \cdot w$ we have $\|v'\|_X < \min\left(\frac{\delta}{4}, \frac{r}{4}\right)$, $\|w'\|_X < \min\left(\frac{\delta}{4}, \frac{r}{4}\right)$ so that

$$\begin{aligned}
\frac{\min\left(\frac{\delta}{4}, \frac{r}{4}\right)}{\|v\|_X + 1} \cdot \frac{\min\left(\frac{\delta}{4}, \frac{r}{4}\right)}{\|w\|_X + 1} \cdot D_x^{[2]}f(v)(w) &= D_x^{[2]}f\left(\frac{\min\left(\frac{\delta}{4}, \frac{r}{4}\right)}{\|v\|_X + 1} \cdot v\right)\left(\frac{\min\left(\frac{\delta}{4}, \frac{r}{4}\right)}{\|w\|_X + 1} \cdot w\right) \\
&= D_x^{[2]}f(v')(w') \\
&= D_x^{[2]}f(w')(v') \\
&= D_x^{[2]}f\left(\frac{\min\left(\frac{\delta}{4}, \frac{r}{4}\right)}{\|w\|_X + 1} \cdot w\right)\left(\frac{\min\left(\frac{\delta}{4}, \frac{r}{4}\right)}{\|v\|_X + 1} \cdot v\right) \\
&= \frac{\min\left(\frac{\delta}{4}, \frac{r}{4}\right)}{\|v\|_X + 1} \cdot \frac{\min\left(\frac{\delta}{4}, \frac{r}{4}\right)}{\|w\|_X + 1} \cdot D_x^{[2]}f(w)(v)
\end{aligned}$$

proving, as $\frac{\min\left(\frac{\delta}{4}, \frac{r}{4}\right)}{\|v\|_X + 1} \cdot \frac{\min\left(\frac{\delta}{4}, \frac{r}{4}\right)}{\|w\|_X + 1} \neq 0$, that

$$D_x^{[2]}f(v)(w) = D_x^{[2]}f(w)(v) \text{ for any } v, w \in X.$$

□

The following lemma show that to prove that $D_x^{[n]}f(v_1 : \ldots : v_n) = D_x^{[n]}f(v_{\sigma(1)} : \ldots : v_{\sigma(n)})$ we only have to prove this for transposition [see definition: 11.223].

Lemma 16.184. *Let $n \in \mathbb{N} \setminus \{1\}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces, $L \in L_n(X; Y)$ and $(x_1, \ldots, x_n) \in X^n$ then if $\forall i \in \{1, \ldots, n-1\}$ $L(x_1 : \ldots : x_n) = L(x_{(i \underset{n}{\leftrightarrow} i+1)(1)} : \ldots : x_{(i \underset{n}{\leftrightarrow} i+1)(n)})$ it follows that $\forall \sigma \in P_n$ $L(x_1 : \ldots : x_n) = L(x_{\sigma(1)} : \ldots : x_{\sigma(n)})$*

Proof. Using [theorem: 16.91] there exist a linear isometric isomorphism

$$\mathcal{I}_{n,X,Y} : L_n(X; Y) \to L^n(X; Y)$$

such that $\forall (x_1, \ldots, x_n) \subseteq X^n$ $(\mathcal{I}_{n,X,Y}(L))(x_1, \ldots, x_n) = L(x_1 : \ldots : x_n)$. Take $K = \mathcal{I}_{n,X,Y}(L)$ then $\forall i \in \{1, \ldots, n-1\}$ we have

$$\begin{aligned}
\left(\left(i \underset{n}{\longleftrightarrow} i+1\right)K\right)(x_1, \ldots, x_n) &= \left(K(x_{(i \underset{n}{\leftrightarrow} i+1)(1)}, \ldots, x_{(i \underset{n}{\leftrightarrow} i+1)(n)})\right) \\
&= L(x_{(i \underset{n}{\leftrightarrow} i+1)(1)} : \ldots : x_{(i \underset{n}{\leftrightarrow} i+1)(n)}) \\
&= L(x_1 : \ldots : x_n) \\
&= K(x_1, \ldots, x_n)
\end{aligned}$$

proving that $\left(i \underset{n}{\longleftrightarrow} i+1\right)K = K$. Hence if $\sigma \in P_n$ we have by [corollary: 11.237] that $\sigma K = K$. Hence

$$\begin{aligned}
L(x_{\sigma(1)} : \ldots : x_{\sigma(n)}) &= K(x_{\sigma(1)}, \ldots, x_{\sigma(n)}) \\
&= (\sigma K)(x_1, \ldots, x_n) \\
&= K(x_1, \ldots, x_n) \\
&= L(x_1 : \ldots : x_n)
\end{aligned}$$

□

Next we define the evaluation operator and prove that is linear and continuous hence C^∞ on its domain.

Definition 16.185. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces and $(x_1, \ldots, x_n) \in X^n$ then the evaluation operator $\mathrm{ev}_{x_1, \ldots, x_n}$ is defined by*

$$\mathrm{ev}_{x_1, \ldots, x_n} : L_n(X; Y) \to Y \text{ where } \mathrm{ev}_{x_1, \ldots, x_n}(L) = L(x_1 : \ldots : x_n)$$

Lemma 16.186. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces and $(x_1, \ldots, x_n) \in X^n$ then*

$$\mathrm{ev}_{x_1,\ldots,x_n} \in L(L_n(X;Y), Y)$$

Hence by [theorem: 16.129] $\mathrm{ev}_{x_1,\ldots,x_n}$ is C^∞ on $L_n(X;Y)$ and $\forall L \in L_n(X;Y)$

$$D_L^{[n]}\mathrm{ev}_{x_1,\ldots,x_n} = \begin{cases} \mathrm{ev}_{x_1,\ldots,x_n} & \text{if } n=1 \\ 0_n & \text{if } 1<n \end{cases}$$

Proof. Let $\beta \in \mathbb{K}$, $L_1, L_2 \in L_n(X;Y)$ then

$$\begin{aligned} \mathrm{ev}_{x_1,\ldots,x_n}(L_1 + \beta \cdot L_2) &= (L_1 + \beta \cdot L_2)(x_1 : \ldots : x_n) \\ &\underset{\text{[theorem: 16.85]}}{=} L_1(x_1 : \ldots : x_n) + \beta \cdot L_2(x_1 : \ldots : x_n) \\ &= \mathrm{ev}_{x_1,\ldots,x_n}(L_1) + \beta \cdot \mathrm{ev}_{x_1,\ldots,x_n}(L_2) \end{aligned}$$

proving that

$$\mathrm{ev}_{x_1,\ldots,x_n} \in \mathrm{Hom}(L_n(X;Y), Y)$$

Further if $L \in L_n(X;Y)$ then

$$\begin{aligned} \|\mathrm{ev}_{x_1,\ldots,x_n}(L)\|_Y &= \|L(x_1 : \ldots : x_n)\|_Y \\ &\leqslant_{\text{[lemma: 16.87]}} \|L\|_{L_n(X;Y)} \cdot \prod_{i=1}^n \|x_i\|_X \\ &= \left(\prod_{i=1}^n \|x_i\|_X\right) \cdot \|L\|_{L_n(X;Y)} \end{aligned}$$

proving by [theorem: 14.177] that $\mathrm{ev}_{x_1,\ldots,x_n}$ is continuous hence

$$\mathrm{ev}_{v_1,\ldots,v_n} \in L(L_n(X;Y), Y)$$

□

Lemma 16.187. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces, U a open set in X, $(x_1, \ldots, x_n) \in X^n$ and $f : U \to Y$ a function that is C^{n+1} on U [so that $\forall y \subset U$ $D_y^{[n]} f$ exists] then for the function*

$$g : U \to Y \text{ defined by } g(y) = D_y^{[n]} f(x_1 : \ldots : x_n)$$

we have that g is C^1 on U and $\forall y \in U$ we have $\forall h \in X$ that $D_y g(h) = D_y^{[n+1]} f(h : x_1 : \ldots : x_n)$

Proof. As f is C^{n+1} on U it follows from [theorem: 16.109] it follows that f is $(n+1)$-times differentiable on U and the function

$$D^{[n+1]} f : U \to L_{n+1}(X;Y) \text{ defined by } D^{[n+1]} f(x) = D_x^{[n+1]} f \text{ is continuous}$$

Further using [theorem: 16.99] it follows that f is n-times differentiable on U and the function

$$D^{[n]} f : U \to L_n(X;Y) \text{ defined by } D^{[n]} f(x) = D_x^{[n]} f$$

is Fréchet differentiable on U with $D^{[n+1]} f = D(D^{[n]} f)$. Hence $D^{[n]} f$ is 1-times differentiable and $D^{[1]}(D^{[n]} f) = D^{[n+1]} f$ which is continuous. So by [theorem: 16.109] it follows that

$$D^{[n]} f \text{ is } C^1 \text{ on } U$$

Let $y \in U$ then we have

$$\begin{aligned} g(y) &= D_y^{[n]} f(x_1 : \ldots : x_n) \\ &= \mathrm{ev}_{x_1,\ldots x_n}\left(D_y^{[n]} f\right) \\ &= \mathrm{ev}_{x_1,\ldots,x_n}(D^{[n]} f(y)) \\ &= (\mathrm{ev}_{x_1,\ldots,x_n} \circ D^{[n]} f)(y) \end{aligned}$$

proving that

$$g = (\mathrm{ev}_{x_1,\ldots,x_n} \circ D^{[n]} f)$$

By [lemma: 16.186] $\mathrm{ev}_{x_1,\ldots,x_n}$ is C^∞ on $L_n(X;Y)$ so that as $D^{[n]}f$ is C^1 on U it follows from the chain rule [theorem: 16.147] that

$$g = \mathrm{ev}_{x_1,\ldots,x_n} \circ D^{[n]}f \text{ is } C^1 \text{ on } U \tag{16.241}$$

and

$$\begin{aligned} D_y g &= D_y(\mathrm{ev}_{x_1,\ldots,x_n} \circ D^{[n]}f) \\ &\underset{\text{[theorem: 16.39]}}{=} D_{D^{[n]}f(y)}\mathrm{ev}_{x_1,\ldots,x_n} \circ D_y(D^{[n]}f) \\ &\underset{\text{[lemma: 16.186]}}{=} \mathrm{ev}_{x_1,\ldots,x_n} \circ D_y(D^{[n]}f) \\ &= \mathrm{ev}_{x_1,\ldots,x_n} \circ D_y^{[n+1]}f \end{aligned}$$

proving that

$$D_y g = \mathrm{ev}_{x_1,\ldots,x_n} \circ D_y^{[n+1]}f$$

Hence if $h \in X$ we have

$$\begin{aligned} D_y g(h) &= \left(\mathrm{ev}_{x_1,\ldots,x_n} \circ D_y^{[n+1]}f\right)(h) \\ &= \mathrm{ev}_{x_1,\ldots,x_n}\left(D_y^{[n+1]}f(h)\right) \\ &= D_y^{[n+1]}f(h)(x_1:\ldots:x_n) \\ &= D_y^{[n+1]}f(h:x_1:\ldots:x_n) \end{aligned}$$

The lemma is then proved by the above and [eq: 16.241]. □

Lemma 16.188. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces then*

$$\mathrm{ev}: L(X,Y)\cdot X \to Y \textit{ defined by } \mathrm{ev}(L,x) = L(x)$$

is C^∞ on $L(X,Y)\cdot X$. Further $\forall L \in L(X,Y)$ and $x \in X$ we have

$$D^{[1]}_{(L,x)}\mathrm{ev} = D_{(L,x)}\mathrm{ev} = \mathrm{ev}(L,*) + \mathrm{ev}(*,x)$$

[see theorem: 16.135].

Proof. Using [theorem: 16.135] it is enough to prove that ev is a bi-linear continuous function or in other words $\mathrm{ev} \in L(L(X,Y),X;Y)$. Let $L_1, L_2 \in L(X,Y)$, $x \in X$ and $\alpha \in \mathbb{K}$ then

$$\begin{aligned} \mathrm{ev}(L_1 + \alpha\cdot L_2, x) &= (L_1 + \alpha\cdot L_2)(x) \\ &= L_1(x) + \alpha\cdot L_2(x) \\ &= \mathrm{ev}(L_1,x) + \alpha\cdot\mathrm{ev}(L_2,x) \end{aligned}$$

and for $L \in L(X,Y)$, $x, y \in X$ and $\alpha \in \mathbb{K}$

$$\begin{aligned} \mathrm{ev}(L, x + \alpha\cdot y) &= L(x + \alpha\cdot y) \\ &= L(x) + \alpha\cdot L(y) \\ &= \mathrm{ev}(L,x) + \alpha\cdot\mathrm{ev}(L,y) \end{aligned}$$

proving that

$$\mathrm{ev} \in \mathrm{Hom}(L(X,Y),X;Y)$$

Let $(L,x) \in L(X,Y)\cdot X$ then

$$\begin{aligned} \|\mathrm{ev}(L,x)\|_Y &= \|L(x)\|_Y \\ &\leqslant \|L\|_{L(X,Y)}\cdot\|x\|_X \end{aligned}$$

proving by [theorem: 14.190] that

$$\mathrm{ev} \in L(L(X,Y),X;Y)$$ □

Lemma 16.189. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces, U a open set in X, $x \in U$, $n \in \mathbb{N}\setminus\{1\}$ and*

$$f: U \to Y \textit{ a } n\textit{-times differentiable at } x \textit{ function}$$

then for $h \in X$ there exist a open set V with $x \in V \subseteq U$ such that the function

$$Df(*)(h): V \to Y \text{ defined by } (Df(*)(h))(y) = D_y f(h)$$

is $(n-1)$-times differentiable at x. Further $\forall k, h \in X$ we have

$$(D_x(Df(*)(h)))(k) = \left(\left(D_x^{[2]} f\right)(k)\right)(h)$$

Proof. As f is n-times differentiable at x and $1 < n$ we have by [theorem: 16.122] that there exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ we have that f is 1-times differentiable at y and the function

$$Df: V \to L(X, Y) \text{ defined by } Df(y) = D_y f \tag{16.242}$$

is $(n-1)$-times differentiable. Given $v \in X$ define

$$\varphi_v: U \to L(X, Y) \cdot X \text{ by } \varphi_v(x) = (Df(x), v) = (D_x f, v) \tag{16.243}$$

Then we have for $y \in X$

$$\begin{aligned}
(\pi_1 \circ \varphi_v)(y) &= \pi_1(\varphi_v(y)) \\
&= \pi_1((Df(x), v)) \\
&= Df(x) \\
(\pi_2 \circ \varphi_v)(y) &= \pi_2(\varphi_v(y)) \\
&= \pi_2((Df(x), v)) \\
&= v
\end{aligned}$$

proving that

$$\pi_1 \circ \varphi_v = Df \text{ and } \pi_2 \circ \varphi_v = C_v \tag{16.244}$$

As Df is $(n-1)$-times differentiable at x and C_v is ∞-times differentiable at x [see example: 16.128] it follows by [theorem: 16.141] that

$$\varphi_v \text{ is } (n-1)\text{-times differentiable at } x \tag{16.245}$$

As $1 < n$ it follows that $1 \in \{1, \ldots, n-1\}$ so that by [theorem: 16.118] φ_v is 1-times differentiable at x, hence using [theorem: 16.66] it follows that

$$\pi_1 \circ D_x \varphi_v = D_x(\pi_1 \circ \varphi_v) \underset{\text{[eq: 16.244]}}{=} D_x(Df) = D_x^{[2]} f$$

and

$$\pi_2 \circ D_x \varphi_v = D_x(\pi_2 \circ \varphi_v) \underset{\text{[eq: 16.244]}}{=} D_x C_v \underset{\text{[theorem: 16.128]}}{=} C_0$$

So that

$$D_x \varphi_v = \left(D_x^{[2]} f, C_0\right)_* \tag{16.246}$$

Given $h \in X$ we can, as $\forall y \in V$ f is 1-times differentiable at y, define

$$Df(*)(h): U \to Y \text{ by } (Df(*)(h))(y) = D_y f(h)$$

Let $h \in X$ then we have for $x \in U$

$$\begin{aligned}
(Df(*)(h))(x) &= D_x f(h) \\
&= \mathrm{ev}(D_x f, h) \\
&= \mathrm{ev}(\varphi_h(x)) \\
&= (\mathrm{ev} \circ \varphi_h)(x)
\end{aligned}$$

proving that

$$Df(*)(h) = \mathrm{ev} \circ \varphi_h \tag{16.247}$$

As ev is of ∞-times differentiable by [lemma: 16.188] and φ_v is by [eq: 16.245] $(n-1)$-times differentiable at x it follows that

$$Df(*)(h) \text{ is } (n-1)\text{-times differentiable at } x$$

Given that $1<n$ it follows that $1\in\{1,\ldots,n-1\}$ so that by [theorem: 16.118] $Df(*)(h)$ is 1-times differentiable at x, then for $k\in X$ we have

$$\begin{aligned}
(D_x(Df(*)(h)))(k) &\underset{\text{[eq: 16.247]}}{=} (D_x(\mathrm{ev}\circ\varphi_h))(k)\\
&\underset{\text{[theorem: 16.39]}}{=} (D_{\varphi_h(x)}\mathrm{ev}\circ D_x\varphi_h)(k)\\
&\underset{\text{[eq: 16.243]}}{=} (D_{(Df(x),h)}\mathrm{ev}\circ D_x\varphi_h)(k)\\
&\underset{\text{[lemma: 16.188]}}{=} ((\mathrm{ev}(D^{[1]}f(x),*)+\mathrm{ev}(*,h))\circ D\varphi_h(x))(k)\\
&\underset{\text{[eq: 16.246]}}{=} \big((\mathrm{ev}(D^{[1]}f(x),*)+\mathrm{ev}(*,h))\circ\big(D_x^{[2]}f,C_{1,0}\big)_*\big)(k)\\
&= (\mathrm{ev}(D^{[1]}f(x),*)+\mathrm{ev}(*,h))\big(\big(D_x^{[2]}f,C_{1,0}\big)_*(k)\big)\\
&= (\mathrm{ev}(D^{[1]}f(x),*)+\mathrm{ev}(*,h))\big(D_x^{[2]}f(k),C_{1,0}(k)\big)\\
&= (\mathrm{ev}(D^{[1]}f(x),*)+\mathrm{ev}(*,h))\big(D_x^{[2]}f(k),0\big)\\
&= \mathrm{ev}(D^{[1]}f(x),0)+\mathrm{ev}\big(D_x^{[2]}f(k),h\big)\\
&= D^{[1]}f(x)(0)+\big(\big(D_x^{[2]}f\big)(k)\big)(h)\\
&= \big(D_x^{[2]}f(k)\big)(h)
\end{aligned}$$

proving that

$$(D_x(Df(*)(h)))(k)=\big(D_x^{[2]}f(k)\big)(h)$$ □

Lemma 16.190. *Let $n\in\mathbb{N}$ with $2<n$, $\langle X,\|\|_X\rangle$, $\langle Y,\|\|_Y\rangle$ normed spaces, U a open set in X, $(x_1,\ldots,x_{n-2})\in X^{n-2}$ and $f:U\to Y$ a function that is C^n on U then the function*

$$g:U\to Y \text{ defined by } g(x)=D_x^{[n-2]}f(x_1:\ldots:x_{n-2})$$

is C^2 on U and for $u,v\in X$ we have $D_x^{[2]}g(u)(v)=D_x^{[n]}f(v:u:x_1:\ldots:x_{n-2})$

Proof. As f is C^n on U and $n-1,n-2\in\{1,\ldots,n\}$ it follows from [theorem: 16.119] that f is C^{n-2} and C^{n-1} on U, hence f is $(n-2)$-times differentiable and $(n-1)$-times differentiable on U so that the following functions are well defined

$$D^{[n-1]}f:U\to L_{n-1}(X;Y) \text{ defined by } D^{[n-1]}f(y)=D_y^{[n-1]}f$$

$$D^{[n-2]}f:U\to L_{n-2}(X;Y) \text{ defined by } D^{[n-2]}f(y)=D_y^{[n-2]}f$$

and continuous. Let $y\in U$ then we have

$$\begin{aligned}
g(y) &= D_y^{[n-2]}f(x_1:\ldots:x_{n-2})\\
&= D^{[n-2]}f(y)(x_1:\ldots:x_{n-2})\\
&\underset{\text{[definition: 16.185]}}{=} \mathrm{ev}_{x_1,\ldots,x_{n-2}}(D^{[n-2]}f(y))\\
&= (\mathrm{ev}_{x_1,\ldots,x_{n-2}}\circ D^{[n-2]}f)(y)
\end{aligned}$$

proving that

$$g=\mathrm{ev}_{x_1,\ldots,x_{n-2}}\circ D^{[n-2]}f \tag{16.248}$$

As $n=(n-2)+2$ it follows from [theorem: 16.120] that $D^{[n-2]}f$ is C^2 on U and that

$$D^{[2]}(D^{[n-2]}f)=D^{[n]}f$$

where

$$D^{[n]}f:U\to L_n(X;Y) \text{ is defined by } D^{[n]}f(x)=D_x^{[n]}f$$

and

$$D^{[2]}(D^{[n-2]}f):U\to L_2(X;L_{n-2}(X;Y))=L_n(X;Y) \text{ defined by } D^{[2]}(D^{[n-2]}f)(x)=D_x^{[2]}(D^{[n-2]}f)$$

As $D^{[n-2]}f$ is of C^2 on U and $\mathrm{ev}_{x_1,\ldots,x_{n-2}}$ is C^∞ on $L_{n-2}(X;Y)$ [see lemma: 16.186] it follows from the chain rule [theorem: 16.147] together with [eq: 16.248] that

$$g \text{ is } C^2 \text{ on } U \text{ and by [theorem: 16.119] also } C^1 \text{ on } U$$

Take

$$Dg: U \to L(X, Y) \text{ defined by } Dg(y) = D_y g$$

then for $y \in U$ we have:

$$\begin{aligned} Dg(y) &= D_y g \\ &\underset{\text{[theorem: 16.39]}}{=} D_{D^{[n-2]}f(y)} \mathrm{ev}_{x_1,\ldots,x_{n-2}} \circ D_y(D^{[n-2]}f) \\ &\underset{\text{[lemma: 16.186]}}{=} \mathrm{ev}_{x_1,\ldots,x_{n-2}} \circ D_y(D^{[n-2]}f) \\ &= \mathrm{ev}_{x_1,\ldots,x_{n-2}} \circ D_y^{[n-1]} f \end{aligned} \tag{16.249}$$

Let $u \in X$ then we have

$$\begin{aligned} Dg(y)(u) &\underset{\text{[eq: 16.249]}}{=} \left(\mathrm{ev}_{x_1,\ldots,x_{n-2}} \circ D_y^{[n-1]} f\right)(u) \\ &= \mathrm{ev}_{x_1,\ldots,x_{n-2}}\left(D_y^{[n-1]} f(u)\right) \\ &= D_y^{[n-1]} f(u)(x_1 : \ldots : x_{n-2}) \\ &= D_y^{[n-1]} f(u : x_1 : \ldots : x_{n-2}) \\ &= \mathrm{ev}_{u,x_1,\ldots,x_{n-2}}\left(D_y^{[n-1]} f\right) \\ &= \mathrm{ev}_{u,x_1,\ldots,x_{n-2}}(D^{[n-1]} f(y)) \\ &= (\mathrm{ev}_{u,x_1,\ldots,x_{n-2}} \circ D^{[n-1]} f)(y) \end{aligned} \tag{16.250}$$

Define now

$$Dg(*)(u): U \to Y \text{ by } (Dg(*)(u))(y) = Dg(y)(u)$$

then we have $\forall y \in U \ (Dg(*)(u))(y) = Dg(y)(u) \underset{\text{[eq: 16.250]}}{=} (\mathrm{ev}_{u,x_1,\ldots,x_{n-2}} \circ D^{[n-1]})(y)$ so that

$$Dg(\star)(u) = \mathrm{ev}_{u,x_1,\ldots,x_{n-2}} \circ D^{[n-1]} f \tag{16.251}$$

As $D^{[n-1]}f$ is C^1 on U [see theorem: 16.120] and $\mathrm{ev}_{x_1,\ldots,x_{n-2}}$ is C^∞on $L_{n-2}(X; Y)$ [see lemma: 16.186], it follows from the chain rule [theorem: 16.147] and the above that

$$Dg(\star)(u) \text{ is } C^1 \text{ on } U \text{ hence differentiable on } U$$

and for $y \in U$ that

$$\begin{aligned} D_y(Dg(*)(u)) &= D_y(\mathrm{ev}_{u,x_1,\ldots,x_{n-2}} \circ D^{[n-1]} f) \\ &\underset{\text{[theorem: 16.39]}}{=} D_{D^{[n-1]}D^{[n-1]}f(y)} \mathrm{ev}_{u,x_1,\ldots,x_{n-2}} \circ D_y(D^{[n-1]} f) \\ &\underset{\text{[lemma: 16.186]}}{=} \mathrm{ev}_{u,x_1,\ldots,x_{n-2}} \circ D_y(D^{[n-1]} f) \\ &= \mathrm{ev}_{u,x_1,\ldots,x_{n-2}} \circ D_y^{[n]} f \end{aligned} \tag{16.252}$$

Let additional $v \in X$ then

$$\begin{aligned} D_y^{[2]} g(v)(u) &\underset{\text{[lemma: 16.189]}}{=} (D_y(Dg(*)(u)))(v) \\ &\underset{\text{[eq: 16.252]}}{=} \left(\mathrm{ev}_{u,x_1,\ldots,x_{n-2}} \circ D_y^{[n]} f\right)(v) \\ &= \mathrm{ev}_{u,x_1,\ldots,x_{n-2}}\left(D_y^{[n]} f(v)\right) \\ &= D_y^{[n]} f(v)(u : x_1 : \ldots x_{n-2}) \\ &= D_y^{[n]} f(v : u : x_1 : \ldots : x_{n-2}) \end{aligned}$$

proving the last part of the lemma. □

Lemma 16.191. *Let $n \in \mathbb{N} \setminus \{1\}$, $\langle X, \|\|_X \rangle$ a normed space, $\langle Y, \|\|_Y \rangle$ a Banach space, U a open set in X, $f: U \to Y$ a function that is C^n on U then $\forall x \in U$ and $\forall i \in \{1, \ldots, n-1\}$ we have for $(u_1, \ldots, u_n) \in X^n$ that*

$$D_x^n f(u_1 : \ldots : u_n) = D_x^n f(u_{(i \underset{n}{\leftrightarrow} i+1)(1)} : \ldots : u_{(i \underset{n}{\leftrightarrow} i+1)(1)})$$

Proof. We prove this by induction on n, so let

$S = \left\{n \in \{2, \ldots, \infty\} | \text{If } f: U \to Y \text{ is } C^n \text{ on } U \text{ then } \forall x \in U \wedge \forall i \in \{1, \ldots, n-1\} \text{ we have that for } (u_1, \ldots, u_n) \in X^n \; D_x^n f(u_1 : \ldots : u_n) = D_x^n f(u_{(i \underset{n}{\leftrightarrow} i+1)(1)} : \ldots : u_{(i \underset{n}{\leftrightarrow} i+1)(n)})\right\}$

then we have:

$2 \in S$. Let $f: U \to Y$ be a function that is C^2 on U, $x \in U$ then for $i \in \{1, \ldots, 2-1\} = \{1\} \Rightarrow i = 1$ and $(u_1, u_2) \in X^2$ we have

$$\begin{aligned} D_x^{[2]} f(u_1 : \ldots : u_2) &= D_x^{[2]} f(u_1)(u_2) \\ &\underset{\text{[theorem: 16.183]}}{=} D_x^{[2]} f(u_2)(u_1) \\ &= D_x^{[2]} f(u_2 : \ldots : u_1) \\ &= D_x^{[2]} f\left(u_{(1 \underset{2}{\leftrightarrow} 2)(1)} : \ldots : u_{(1 \underset{2}{\leftrightarrow} 2)(2)}\right) \end{aligned}$$

proving that $2 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $f: U \to Y$ be a function that is C^{n+1} on U, $x \in U$, $(u_1, \ldots, u_{n+1}) \in X^{n+1}$ then for $i \in \{1, \ldots, (n+1)-1\} = \{1, \ldots, n\}$ we have the following cases to consider:

$i = 1$. Then $\left(i \underset{n+1}{\leftrightarrow} i+1\right) = \left(1 \underset{n+1}{\leftrightarrow} 2\right) \in P_{n+1}$, so that $\left(i \underset{n+1}{\leftrightarrow} i+1\right)(1) = 2$, $\left(i \underset{n+1}{\leftrightarrow} i+1\right)(2) = 1$ and $\forall k \in \{3, \ldots, n+1\}$ $\left(i \underset{n+1}{\leftrightarrow} i+1\right)(k) = k$. Define

$$g: U \to Y \text{ by } g(y) = D_y^{[(n+1)-2]} f(u_3 : \ldots : u_{n+1})$$

then by the previous lemma [lemma: 16.190] that g is C^2 on U and

$$\begin{aligned} D_x^{[n+1]} f(u_1 : u_2 : \ldots : u_{n+1}) &\underset{\text{[lemma: 16.190]}}{=} \\ D_x^{[2]} g(u_1)(u_2) &\underset{\text{[theorem: 16.183]}}{=} \\ D_x^{[2]} g(u_2)(u_1) &\underset{\text{[lemma: 16.190]}}{=} \\ D_x^{[n+1]} f(u_2 : u_1 : \ldots : u_{n+1}) &= \\ D_x^{[n+1]} f\left(u_{(i \underset{n+1}{\leftrightarrow} i+1)(1)} : u_{(i \underset{n+1}{\leftrightarrow} i+1)(2)} : \ldots : u_{(i \underset{n+1}{\leftrightarrow} i+1)(n+1)}\right) \end{aligned}$$

proving that in this case $n+1 \in S$.

$i \in \{2, \ldots, n\}$. Then $\forall k \in \{1, \ldots, n-1\}$ we have

$$\begin{aligned} \left(i-1 \underset{n}{\leftrightarrow} i\right)(k) + 1 &= 1 + \begin{cases} i-1 \text{ if } k = i \\ i \text{ if } k = i-1 \\ k \text{ if } k \neq i-1, i \end{cases} \\ &= \begin{cases} i \text{ if } k = i \\ i+1 \text{ if } k = i-1 \\ k+1 \text{ if } k \neq i-1.i \end{cases} \end{aligned} \tag{16.253}$$

further

$$\begin{aligned} \left(i \underset{n+1}{\leftrightarrow} i+1\right)(k+1) &= \begin{cases} i \text{ if } k+1 = i+1 \\ i+1 \text{ if } k+1 = i \\ k+1 \text{ if } k+1 \neq i+1, i \end{cases} \\ &= \begin{cases} i \text{ if } k = i \\ i+1 \text{ if } k = i-1 \\ k+1 \text{ if } k \neq i-1, i \end{cases} \\ &\underset{\text{[eq: 16.253]}}{=} \left(i-1 \underset{n}{\leftrightarrow} i\right)(k) + 1 \end{aligned}$$

so that

$$\forall k \in \{1,\dots,n-1\} \text{ we have } \left(i-1 \underset{n}{\leftrightarrow} i\right)(k)+1 = \left(i \underset{n+1}{\leftrightarrow} i+1\right)(k+1) \tag{16.254}$$

Let $y \in U$ then, as f is C^{n+1} on U, we have also that f is C^n on U [see theorem: 16.119] , so we have, if we define $(y_1,\dots,y_n)$ by $y_i = u_{i+1}$, that

$$\begin{aligned}
D_y^{[n]} f(u_2 : \dots : u_{n+1}) &= \\
D_y^{[n]} f(y_1 : \dots : y_n) &\underset{n \in S, i-1 \in \{1,\dots,n-1\}}{=} \\
D_y^{[n]} f(y_{(i-1 \underset{n}{\leftrightarrow} i)(1)} : \dots : y_{(i-1 \underset{n}{\leftrightarrow} i)(n)}) &= \\
D_y^{[n]} f(u_{(i-1 \underset{n}{\leftrightarrow} i)(1)+1} : \dots : u_{(i-1 \underset{n}{\leftrightarrow} i)(n)+1}) &\underset{\text{[eq: 16.254]}}{=} \\
D_y^{[n]} f(u_{(i \underset{n+1}{\leftrightarrow} i+1)(2)} : \dots : u_{(i \underset{n+1}{\leftrightarrow} i+1)(n+1)}) &
\end{aligned} \tag{16.255}$$

Define then g, h [as in [lemma: 16.187]

$$g : U \to Y \text{ by } g(y) = D_y^{[n]} f(u_2 : \dots : u_{n+1}) \tag{16.256}$$

$$h : U \to Y \text{ by } h(y) = D_y^{[n]} f(u_{(i \underset{n+1}{\leftrightarrow} i+1)(2)} : \dots : u_{(i \underset{n+1}{\leftrightarrow} i+1)(n+1)})$$

then we have by [eq: 16.255] that

$$g = h \tag{16.257}$$

As $1 < 2 \leqslant i < i+1$ we have that $\left(i \underset{n+1}{\leftrightarrow} i+1\right)(1) = 1$ so that

$$\begin{aligned}
D_x^{[n+1]} f(u_1 : \dots : u_{n+1}) &= D_x^{[n+1]} f(u_{(i \underset{n+1}{\leftrightarrow} i+1)(1)} : u_2 : \dots : u_{n+1}) \\
&\underset{\text{[lemma: 16.187]}}{=} D_x g(u_{(i \underset{n+1}{\leftrightarrow} i+1)(1)}) \\
&\underset{\text{[eq: 16.257]}}{=} D_y h(u_{(i \underset{n+1}{\leftrightarrow} i+1)(1)}) \\
&\underset{\text{[lemma: 16.187]}}{=} D_x^{[n+1]} f(u_{(i \underset{n+1}{\leftrightarrow} i+1)(1)} : \dots : u_{(i \underset{n+1}{\leftrightarrow} i+1)(n+1)})
\end{aligned}$$

proving that in this case we have also $n+1 \in S$.

Mathematical induction proves then the theorem. □

Having done all the heavy lifting with the previous lemma's we can now prove that higher order differentials are symmetric in there arguments.

Theorem 16.192. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$ a normed space, $\langle Y, \|\|_Y \rangle$ a Banach space, U a open set and $f : U \to Y$ a function that is C^n on U then $\forall x \in U$, $\sigma \in P_n$ and $(x_1,\dots,x_n) \in X^n$ we have*

$$D_x^{[n]} f(x_1 : \dots : x_n) = D_x^{[n]} f(x_{\sigma(1)} : \dots : x_{\sigma(n)})$$

***Note* 16.193.** *As $D_x^n f(y_1,\dots,y_n) = D_x^{[n]} f(y_1 : \dots : y_n)$ we have also*

$$D_x^n f(x_1,\dots : x_n) = D_x^n f(x_{\sigma(1)},\dots,x_{\sigma(n)})$$

***Note* 16.194.** *If we define*

$$D^{[n]} f : U \to L_n(X;Y) \text{ by } D^{[n]} f(x) = D_x^{[n]} f$$

then we have

$$D^{[n]} f(x)(x_1 : \dots : x_n) = D^{[n]} f(x)(x_{\sigma(1)} : \dots : x_{\sigma(n)})$$

Proof. For $n \in \mathbb{N}$ we have two possibilities to consider:

***n* = 1.** The $P_n = \{\mathrm{Id}_{\{1\}}\}$ so that we have trivially

$$D_x^{[1]} f\left(\underbrace{x_1 : \dots : x_1}_{1}\right) = D_x^{[1]} f\left(\underbrace{x_{\sigma(1)} : \dots : x_{\sigma(1)}}_{1}\right)$$

$\boldsymbol{n \in \mathbb{N} \setminus \{1\}}$. Then $\forall i \in \{1, \ldots, n-1\}$ we have by [lemma: 16.191] that

$$D_x^{[n]} f(x_1 : \ldots : x_n) = D_x^{[n]} f(x_{(i \underset{n}{\leftrightarrow} i+1)(1)} : \ldots : x_{(i \underset{n}{\leftrightarrow} i+1)(n)})$$

Let $\sigma \in P_n$ then by the above and [lemma: 16.184] it follows that

$$D_x^{[n]} f(x_1 : \ldots : x_n) = D_x^{[n]} f(x_{(\sigma 1)} : \ldots : x_{\sigma(n)})$$ □

16.5 Higher Order Partial Differentiation

16.5.1 Linear mappings to linear mappings

In order to define higher order partial derivation we must extend the definition of $L_n(X;Y)$ [see definition: 16.75] to the case where $X^n = \prod_{i \in \{1, \ldots, n\}} X_i$.

Definition 16.195. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i \rangle\}_{i \in \{1, \ldots, n\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y \rangle$ a normed space then we define $L_n(X_1 \ldots X_n; Y)$ as follows*

$$L_n(X_1 \ldots X_n; Y) = \begin{cases} L(X_1, Y) \text{ if } n = 1 \\ L(X_1, L_{n-1}(X_2 \ldots X_n)) \text{ if } 1 < n \end{cases}$$

Example 16.196.

$$\begin{aligned} L_4(X_1 \ldots X_4; Y) &= L(X_1, L_3(X_2 \ldots X_4; Y)) \\ &= L(X_1, L(X_2, L_2(X_3 \ldots X_4; Y))) \\ &= L(X_1, L(X_2, L(X_3, L_1(X_4 \ldots X_4; Y)))) \\ &= L(X_1, L(X_2, L(X_3, L(X_4, Y)))) \end{aligned}$$

Further we have

$$\begin{aligned} L_2(X_1 \ldots X_2; L_2(X_3 \ldots X_4; Y)) &= L(X_1, L_1(X_2 \ldots X_2; L_2(X_3 \ldots X_4; Y))) \\ &= L(X_1, L(X_2, L_2(X_3 \ldots X_4; Y))) \\ &= L(X_1, L(X_2, L(X_3, L_1(X_4 \ldots X_4; Y)))) \\ &= L(X_1, L(X_2, L(X_3, L(X_4, Y)))) \\ &= L_4(X_1 \ldots X_4; Y) \end{aligned}$$

The above example suggest the following two lemmas.

Lemma 16.197. *Let $n \in \mathbb{N}$ and $\{\langle X_i, \|\|_i \rangle\}_{i \in n+1}$ be a finite family of normed spaces then we have*

$$L_{n+1}(X_1 \ldots X_{n+1}; Y) = L_n(X_1 \ldots X_n; L(X_{n+1}, Y))$$

Proof. We prove this by induction so let

$S = \{n \in \mathbb{N} | \text{If } \{X_i, \|\|_i\}_{i \in \{1, \ldots, n+1\}} \text{ is a family of normed spaces and } \langle Y, \|\|_Y \rangle \text{ a normed space then } L_{n+1}(X_1 \ldots X_{n+1}; Y) = L_n(X_1 \ldots X_n; (L(X_{n+1}, Y)))\}$

then we have:

$\boldsymbol{1 \in S}$. If $\{\langle X_i, \|\|_i \rangle\}_{i \in \{1, \ldots, 2\}}$ is a family of normed spaces and $\langle Y, \|\|_Y \rangle$ a normed space then

$$L_2(X_1 \ldots X_2; Y) = L(X_1, L_1(X_2 \ldots X_2; Y)) = L_1\Big(\underbrace{X_1 \ldots X_1}_{1}; L(X_2, Y)\Big)$$

proving that $1 \in S$.

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$. If $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,(n+1)+1\}}$ is a family of normed spaces and $\langle Y, \|\|_Y\rangle$ a normed space. Define $\{Y_i\}_{i\in\{1,\ldots,n+1\}}$ by $Y_i = X_{i+1}$ then we have

$$\begin{aligned} L_{(n+1)+1}(X_1\ldots X_{(n+1)+1};Y) &\underset{\text{def}}{=} L(X_1, L_{n+1}(X_2\ldots X_{(n+1)+1};Y)) \\ &= L(X_1, L_{n+1}(Y_1\ldots Y_{n+1};Y)) \\ &\underset{n\in S}{=} L(X_1, L_n(Y_1,\ldots,Y_n;L(Y_{n+1},Y))) \\ &= L(X_1, L_n(X_2\ldots X_{n+1});L(X_{(n+1)+1},Y)) \\ &\underset{\text{def}}{=} L_{n+1}(X_1\ldots X_{n+1};L(X_{(n+1)+1},Y)) \end{aligned}$$

proving that

$$n+1 \in S$$

□

Lemma 16.198. *Let $n, m \in \mathbb{N}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n+m\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y\rangle$ a normed space then*

$$L_{n+m}(X_1\ldots X_{n+m}) = L_n(X_1\ldots X_n; L_m(X_{n+1}\ldots X_{n+m};Y))$$

Proof. For $n \in \mathbb{N}$ we have two cases to consider:

$\boldsymbol{n=1}$. Then

$$\begin{aligned} L_{1+m}(X_1,\ldots,X_{1+m};Y) &= L(X_1, L_m(X_2\ldots X_{1+m};Y)) \\ &= L_1(X_1\ldots X_1; L_m(X_2\ldots X_{1+m};Y)) \end{aligned}$$

proving the lemma for this case.

$\boldsymbol{1<n}$. We prove this case by induction on m, so let

$S_n = \{m \in \mathbb{N} | \text{If } \{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n+m\}}$ is a family of normed spaces then $L_{n+m}(X_1\ldots X_{n+m};Y) = L_n(X_1\ldots X_n; L_m(X_{n+1}\ldots X_{n+m};Y))\}$

then we have:

$\boldsymbol{1 \in S_n}$. If $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n+1\}}$ is a family of normed spaces then

$$L_{n+1}(X_1\ldots X_{n+1};Y) = L(X_1; L_n(X_2\ldots X_{n+1};Y)) - L_1(X_1\ldots X_1; L_n(X_2\ldots X_{n+1};Y))$$

proving that $1 \in S_n$.

$\boldsymbol{m \in S_n \Rightarrow m+1 \in S_n}$. Let $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n+(m+1)\}}$ be a family of normed spaces. Define $\{Y_i\}_{i\in\{1,\ldots,n+m\}}$ by $Y_i = X_{i+1}$ then we have

$$\begin{aligned} L_{n+(m+1)}(X_1\ldots.X_{n+(m+1)};Y) &= \\ L(X_1, L_{n+m}(X_2\ldots X_{n+m+1};Y)) &= \\ L(X_1, L_{n+m}(Y_1\ldots Y_{n+m};Y)) &\underset{m\in S_n}{=} \\ L(X_1, L_n(Y_1\ldots Y_n; L_m(Y_{n+1}\ldots Y_{n+m};Y))) &\underset{1<n\wedge[\text{lemma: } 16.197]}{=} \\ L(X_1, L_{n-1}(Y_1\ldots Y_{n-1}; L(Y_n, L_m(Y_{n+1}\ldots Y_{n+m};Y)))) &\underset{\text{def}}{=} \\ L(X_1, L_{n-1}(Y_1\ldots Y_{n-1}; L_{m+1}(Y_n\ldots Y_{n+m};Y))) &= \\ L(X_1, L_{n-1}(X_2,\ldots,X_n; L_{m+1}(X_{n+1}\ldots X_{n+m+1};Y))) &\underset{\text{def}}{=} \\ L_n(X_1\ldots X_n; L_{m+1}(X_{n+1}\ldots X_{n+(m+1)};Y)) & \end{aligned}$$

proves that $n+1$

Mathematical induction proves the lemma for the case $1<n$. □

We extend now the definition of $L(x_1:\ldots:x_n)$ [see definition: 16.79] to the more general case.

Definition 16.199. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n+m\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y\rangle$ a normed space, $m \in \mathbb{N}$ with $m \leqslant n$ then if $L \in L_n(X_1 \ldots X_n; Y)$ and $(x_1, \ldots, x_m) \in \prod_{i\in\{1,\ldots,m\}} X_i$ then we define*

$$L(x_1 : \ldots : x_m) = \begin{cases} L(x_1) \text{ if } m = 1 \\ (L(x_1))(x_2 : \ldots x_m) \text{ if } 1 < m \end{cases}$$

Lemma 16.200. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y\rangle$ a normed space, $m \in \mathbb{N}$ with $m \leqslant n$ then if $L \in L_n(X_1 \ldots X_n; Y)$ and $(x_1, \ldots, x_m) \in \prod_{i\in\{1,\ldots,m\}} X_i$ then*

$$L(x_1 : \ldots : x_m) \in \begin{cases} Y \text{ if } m = n \\ L_{n-m}(X_{m+1} \ldots X_n; Y) \text{ if } m < n \end{cases}$$

Proof. We prove this by induction, so let

$$S = \left\{ n \in \mathbb{N} | \text{If } \{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}} \text{ is a family of normed space and } L \in L_n(X_1 \ldots X_n; Y) \text{ then for every } m \in \{1, \ldots, n\} \text{ we have for every } (x_1, \ldots, x_m) \in \prod_{i\in\{1,\ldots,m\}} X_i \text{ that } L(x_1 : \ldots : x_m) \in \begin{cases} Y \text{ if } m = n \\ L_{n-m}(X_{m+1} \ldots X_n; Y) \text{ if } m < n \end{cases} \right\}$$

then we have:

$1 \in S$. If $m \in \{1, \ldots, 1\} = \{1\}$ then for $L \in L_1(X_1 \ldots X_1; Y) = L(X_1, Y)$ we have for $(x_1) \in \prod_{i\in\{1\}} X_i$ that $L(x_1 : \ldots : x_1) = L(x_1) \in Y$ which as $m = 1 = n$ proves that $1 \in S$.

$n \in S \Rightarrow n + 1 \in S$. Let $L \in L_{n+1}(X_1 \ldots X_{n+1}; Y)$ and $m \in \{1, \ldots, n+1\}$ then we must consider the following cases:

$m = 1$. Let $(x_1) \subseteq X^1$ then, as $L_{n+1}(X_1 \ldots X_{n+1}; Y) = L(X_1, L_n(X_2 \ldots X_{n+1}; Y))$, we have

$$L\Big(\underbrace{x_1 : \ldots : x_1}_{1}\Big) = L(x_1) \in L_n(X_2 \ldots X_{n+1}; Y) \underset{m=1}{=} L_{(n+1)-m}(X_{m+1} \ldots X_{n+1})$$

$m = n + 1$. Let $(x_1, \ldots, x_{n+1}) \in \prod_{i\in\{1,\ldots,n+1\}} X_i$ then, as

$$L_{n+1}(X_1 \ldots X_{n+1}; Y) = L(X_1, L_n(X_2 \ldots X_{n+1}; Y))$$

we have

$$L(x_1) \in L_n(X_2 \ldots X_{n+1}; Y)$$

Define $\{\langle Y_i, \|\|_{Y,i}\rangle\}_{i\in\{1,\ldots,n\}}$ by $\langle Y_i, \|_{Y,i}\|\rangle = \langle X_{i+1}, \|\|_{i+1}\rangle$ and $(y_1, \ldots, y_n) \in \prod_{i\in\{1,\ldots,n\}} Y_i$ by $y_i = x_{i+1}$ then $L(x_1) \in L_n(Y_1 \ldots Y_n; Y)$. As $n \in S$ we have that $L(x_1)(y_1 : \ldots : y_n) \in Y$, so $L(x_1)(x_2 : \ldots : x_{n+1}) \in Y$. Hence

$$L(x_1 : \ldots : x_m) = L(x_1 : \ldots : x_{n+1}) = L(x_1)(x_2 : \ldots : x_{n+1}) \in Y$$

$m \in \{2, \ldots, n\}$. Let $(x_1, \ldots, x_m) \in \prod_{i\in\{1,\ldots,m\}} X_i$ then as

$$L_{n+1}(X_1 \ldots X_{n+1}; Y) = L(X_1, L_n(X_2 \ldots X_{n+1}; Y))$$

we have that

$$L(x_1) \in L_n(X_2 \ldots X_{n+1}; Y)$$

Define $\{\langle Y_i, \|\|_{Y,i}\rangle\}_{i\in\{1,\ldots,n\}}$ by $\langle Y_i, \|_{Y,i}\|\rangle = \langle X_{i+1}, \|\|_{i+1}\rangle$ and $(y_1, \ldots, y_{m-1}) \in \prod_{i\in\{1,\ldots,n\}} Y_i$ by $y_i = x_{i+1}$ then

$$L(x_1) \in L(Y_1 \ldots Y_n; Y)$$

so, as $1 \leqslant m - 1 < n$ and $n \in S$ it follows that

$$L(x_1)(y_1 : \ldots : y_{m-1}) \in L_{n-(m-1)}(Y_{(m-1)+1} \ldots Y_n; Y)$$

hence

$$L(x_1)(x_2 : \ldots : x_m) \in L_{(n+1)-m}(X_{m+1} \ldots X_{n+1}; Y)$$

so that

$$L(x_1 : \ldots x_m) = L(x_1)(x_2 : \ldots : x_m) \in L_{(n+1)-m}(X_{m+1} \ldots X_{n+1}; Y)$$

So we have proved that

$$L(x_1 : \ldots : x_m) \in \begin{cases} Y \text{ if } m = n+1 \\ L_{(n+1)-m}(X_{m+1} \ldots X_{n+1}; Y) \text{ if } m < n \end{cases}$$

from which it follows that

$$n+1 \in S$$

□

Lemma 16.201. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i \rangle\}_{i \in \{1, \ldots, n\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y \rangle$ a normed space, $\alpha \in \mathbb{K}$, $L_1, L_2 \in L_n(X_1 \ldots X_n; Y)$ then $\forall (x_1, \ldots, x_n) \in \prod_{i \in \{1, \ldots, n\}} X_i$ we have*

$$(L_1 + \alpha \cdot L_2)(x_1 : \ldots : x_n) = L_1(x_1 : \ldots : x_n) + \alpha \cdot L_2(x_1 : \ldots : x_n)$$

Proof. The proof is by induction, so let

$$S = \left\{ n \in \mathbb{N} | \forall \alpha \in \mathbb{K} \text{ and } \forall L_1, L_2 \in L_n(X; Y) \text{ we have } \forall (x_1, \ldots, x_n) \in \prod_{i \in \{1, \ldots, n\}} X_i \text{ that } (L_1 + \alpha \cdot L_2)(x_1 : \ldots : x_n) = L_1(x_1 : \ldots : x_n) + \alpha \cdot L_2(x_1 : \ldots : x_n) \right\}$$

then we have:

$1 \in S$. Take $\alpha \in \mathbb{K}$, $L_1, L_2 \in L_1(X_1 \ldots X_1; Y) = L(X, Y)$ then we have for $(x_1) \in \prod_{i \in \{1\}} X_i$ that

$$\begin{aligned} (L_1 + \alpha \cdot L_2)(x_1 : \ldots : x_1) &= (L_1 + \alpha \cdot L_2)(x_1) \\ &\underset{\text{pointwise definition}}{=} L_1(x) + \alpha \cdot L_2(x_1) \\ &= L_1(x_1 : \ldots : x_1) + \alpha \cdot L_2(x_1 : \ldots : x_1) \end{aligned}$$

proving that $1 \in S$

$n \in S \Rightarrow n+1 \in S$. Take $\alpha \in \mathbb{K}$, $L_1, L_2 \in L_{n+1}(X_1 \ldots X_{n+1}; Y) = L(X_1, L_n(X_2 \ldots X_{n+1}; Y))$ and $(x_1, \ldots, x_n) \in \prod_{i \in \{1, \ldots, n\}} X_i$ then

$$(L_1 + \alpha \cdot L_2)(x_1) \underset{\text{pointwise definition}}{=} L_1(x_1) + \alpha \cdot L_2(x_1)$$

hence

$$\begin{aligned} (L_1 + \alpha \cdot L_2)(x_1 : \ldots : x_n) &= ((L_1 + \alpha \cdot L_2)(x_1))(x_2 : \ldots : x_n) \\ &= (L_1(x_1) + \alpha \cdot L_2(x_1))(x_2 : \ldots : x_n) \end{aligned} \tag{16.258}$$

As $L_1(x_1), L_2(x_1) \in L_n(X_1 \ldots X_n; Y)$ and $n \in S$ it follows that

$$\begin{aligned} (L_1(x_1) + \alpha \cdot L_2(x_1))(x_2 : \ldots : x_n) &= (L_1(x_1))(x_2 : \ldots : x_n) + \alpha \cdot (L_2(x_1))(x_2 : \ldots : x_n) \\ &= L_1(x_1 : \ldots : x_n) + \alpha \cdot L_2(x_1 : \ldots : x_n) \end{aligned}$$

which combined with [eq: 16.258] proves that

$$(L_1 + \alpha \cdot L_2)(x_1 : \ldots : x_n) = L_1(x_1 : \ldots : x_n) + \alpha \cdot L_2(x_1 : \ldots : x_n)$$

Hence we have that

$$n+1 \in S$$

□

Lemma 16.202. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i \rangle\}_{i \in \{1, \ldots, n\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y \rangle$ a normed space, $L \in L_n(X_1 \ldots X_n; Y)$ and $i \in \{1, \ldots, n\}$ then we have for*

$$\left(x_1, \ldots \underbrace{r + \alpha \cdot t}_{i} \ldots, x_n \right) \in \prod_{i \in \{1, \ldots, n\}} X_i$$

that

$$L\left(x_1, \ldots \underbrace{r + \alpha \cdot t}_{i} \ldots, x_n \right) = L\left(x_1, \ldots \underbrace{r}_{i} \ldots, x_n \right) + \alpha \cdot L\left(x_1, \ldots \underbrace{t}_{i} \ldots, x_n \right)$$

Proof. We use mathematical induction on n for the proof, so let

$$S=\left\{n\in\mathbb{N}|\text{If } L\in L_n(X_1\ldots X_n;Y) \text{ then } \forall i\in\{1,\ldots,n\} \text{ we have for } \left(x_1,\ldots\underbrace{r+\alpha\cdot t}_{i}\ldots,x_n\right)\in\prod_{i\in\{1,\ldots,n\}}X_i \text{ that } L\left(x_1:\ldots\underbrace{r+\alpha\cdot t}_{i}\ldots:x_n\right)=L\left(x_1:\ldots\underbrace{r}_{i}\ldots:x_n\right)+\alpha\cdot L\left(x_1,\ldots\underbrace{t}_{i}\ldots,x_n\right)\right\}$$

then we have:

$1\in S$. Let $L\in L_1(X_1\ldots X_1;Y)=L(X_1,Y)$ then if $i\in\{1,\ldots,1\}=\{1\}$ we have $i=1$. So given

$$(r+\alpha\cdot t)=\left(x_1,\ldots\underbrace{r+\alpha\cdot t}_{i}\ldots,x_n\right)\in X^1$$

we have

$$\begin{aligned}
L\left(x_1:\ldots\underbrace{r+\alpha\cdot t}_{i}\ldots:x_n\right) &= \\
L(r+\alpha\cdot t) &\underset{L\in L(X_1,Y)}{=} \\
L(r)+\alpha\cdot L(t) &= \\
L\left(x_1,\ldots\underbrace{r}_{i}\ldots:x_n\right)+\alpha\cdot L\left(x_1:\ldots\underbrace{t}_{i}\ldots:x_n\right)&
\end{aligned}$$

proving that $1\in S$.

$n\in S\Rightarrow n+1\in S$. Let $L\in L_{n+1}(X_1\ldots X_{n+1};Y)=L(X_1,L_n(X_2\ldots X_{n+1};Y))$ and take $i\in\{1,\ldots,n+1\}$ then we have either:

$i=1$. Then for $\left(x_1,\ldots\underbrace{r+\alpha\cdot t}_{i}\ldots,x_{n+1}\right)=(r+\alpha\cdot t,x_2,\ldots,x_{n+1})$ we have

$$\begin{aligned}
L\left(x_1,\ldots\underbrace{r+\alpha\cdot t}_{i}\ldots:x_{n+1}\right) &= \\
L(r+\alpha\cdot t:x_2:\ldots:x_{n+1}) &= \\
(L(r+\alpha\cdot t))(x_2:\ldots:x_{n+1}) &= \\
(L(r)+\alpha\cdot L(t))(x_2:\ldots:x_{n+1}) &\underset{\text{[lemma: 16.201]}}{=} \\
(L(r))(x_2:\ldots:x_{n+1})+\alpha\cdot L(t)(x_2:\ldots:x_{n+1}) &= \\
L(r:x_2:\ldots:x_{n+1})+\alpha\cdot L(t:x_2:\ldots:x_{n+1}) &= \\
L\left(x_1:\ldots\underbrace{r}_{i}\ldots:x_{n+1}\right)+\alpha\cdot L\left(x_1:\ldots\underbrace{t}_{i}\ldots:x_{n+1}\right)&
\end{aligned}$$

proving

$$n+1\in S$$

$i\in\{2,\ldots,n+1\}$. Then for $\left(x_1,\ldots\underbrace{r+\alpha\cdot t}_{i}\ldots,x_{n+1}\right)\in\prod_{i\in\{1,\ldots,n\}}X_i$ we have $\left(x_2,\ldots\underbrace{r+\alpha\cdot t}_{i-1}\ldots,x_{n+1}\right)\in\prod_{i\in\{2,\ldots,n+1\}}X_i$ which as $L(x_1)\in L_n(X_2\ldots X_{n+1};Y)$ and $n\in S$ results in

$$\begin{aligned}
L\left(x_1,\ldots\underbrace{r+\alpha\cdot t}_{i}\ldots,x_{n+1}\right) &= \\
(L(x_1))\left(x_2:\ldots\underbrace{r+\alpha\cdot t}_{i-1}\ldots:x_n\right) &\underset{n\in S}{=} \\
(L(x_1))\left(x_2:\ldots\underbrace{r}_{i-1}\ldots:x_n\right)+\alpha\cdot(L(x_1))\left(x_2:\ldots\underbrace{t}_{i-1}\ldots:x_n\right) &= \\
L\left(x_1:\ldots\underbrace{r}_{i}\ldots:x_n\right)+\alpha\cdot L(x_1:\ldots\underbrace{t}_{i}\ldots:x_n) &=
\end{aligned}$$

so that in this case we have also

$$n+1\in S$$

So in all cases we have

$$n+1 \in S$$

□

Lemma 16.203. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y\rangle$ a normed space, $L \in L_n(X_1 \ldots X_n; Y)$ and $(x_1, \ldots, x_n) \in \prod_{i\in\{1,\ldots,n\}} X_i$ then we have*

$$\|L(x_1 : \ldots : x_n)\|_Y \leqslant \|L\|_{L_n(X_1\ldots X_n;Y)} \cdot \prod_{i=1}^{n} \|x_i\|_i$$

Proof. We prove this by induction, so define

$$S = \left\{ n \in \mathbb{N} | \text{If } L \in L_n(X_1 \ldots \text{Xn}; Y) \text{ then } \forall (x_1, \ldots, x_n) \in \prod_{i\in\{1,\ldots,n\}} X_i \text{ we have } \|L(x_1 : \ldots : x_n)\|_Y \leqslant \|L\|_{L_n(X;Y)} \cdot \prod_{i=1}^{n} \|x_i\|_i \right\}$$

then we have:

$1 \in S$. If $L \in L_1(X_1 \ldots X_1; Y) = L(X_1, Y)$ then $\forall (x_1) \in \prod_{i\in\{1\}} X_i$ we have

$$\begin{aligned}
\|L(x_1 : \ldots : x_1)\|_Y &= \|L(x_1)\|_Y \\
&\leqslant \|L\|_{L(X_1,Y)} \cdot \|x_1\|_1 \\
&= \|L\|_{L_1(X_1\ldots X_1;Y)} \cdot \|x_1\|_1 \\
&= \|L\|_{L_1(X\ldots X_1;Y)} \cdot \prod_{i=1}^{1} \|x_i\|_i
\end{aligned}$$

proving that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $L \in L_{n+1}(X_1 \ldots X_{n+1}; Y) = L(X_1, L_n(X_2 \ldots X_{n+1}; Y))$ and $(x_1, \ldots, x_{n+1}) \in \prod_{i\in\{1,\ldots,n+1\}} X_i$ then, as $L(x_1) \in L_n(X_1 \ldots X_1; Y)$, $(x_2, \ldots, x_{n+1}) \in \prod_{i\in\{2,\ldots,n+1\}} X_i$ and $n \in S$, we have

$$\begin{aligned}
\|L(x_1)(x_2 : \ldots : x_{n+1})\|_Y &\leqslant \|L(x_1)\|_{L_n(X_2\ldots X_{n+1};Y)} \cdot \prod_{i=1}^{n} \|x_{i+1}\|_{i+1} \\
&= \|L(x_i)\|_{L_n(X_2\ldots X_{n+1};Y)} \cdot \prod_{i=2}^{n+1} \|x_i\|_X
\end{aligned} \tag{16.259}$$

Next we have

$$\begin{aligned}
\|L(x_1 : \ldots : x_{n+1})\|_Y &= \|(L(x_1))(x_2 : \ldots : x_{n+1})\|_Y \\
&\leqslant_{\text{[eq: 16.259]}} \|L(x_i)\|_{L_n(X_2\ldots X_{n+1};Y)} \cdot \prod_{i=2}^{n+1} \|x_i\|_X \\
&\leqslant_{L\in L(X_1, L_n(X_2\ldots X_{n+1};Y))} \|L\|_{L_{n+1}(X_1\ldots X_{n+1};Y)} \cdot \|x_1\|_X \cdot \prod_{i=2}^{n+1} \|x_i\|_X \\
&\leqslant \|L\|_{L_{n+1}(X_1\ldots X_{n+1};Y)} \cdot \prod_{i=1}^{n+1} \|x_i\|_X
\end{aligned}$$

proving that

$$n+1 \in S$$

□

Lemma 16.204. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y\rangle$ a normed space, $L_1, L_2 \in L_n(X_1 \ldots X_n; Y)$ such that $\forall (x_1, \ldots, x_n) \in \prod_{i\in\{1,\ldots,n\}} X_i$ we have*

$$L_1(x_1 : \ldots : x_n) = L_2(x_1 : \ldots x_n)$$

then

$$L_1 = L_2$$

Proof. We use induction to prove this, so define

$$S = \{n \in \mathbb{N} | \text{If } L_1, L_2 \in L_n(X_1 \ldots X_n; Y) \text{ satisfies } \forall (x_1, \ldots, x_n)\ L_1(x_1 : \ldots : x_n) = L_2(x_1 : \ldots : x_n) \text{ then } L_1 = L_2\}$$

then we have:

$1 \in S$. Let $L_1, L_2 \in L_1(X_1; Y) = L(X_1, Y)$ be such that $\forall (x_1) \in X^1$ we have $L_1(x_1 : \ldots : x_1) = L_2(x_1 : \ldots : x_1)$. Then $\forall x \in X$ we have for $y = (x) \in X^1$ [so that $y_1 = x$] that

$$L_1(x) = L_1(y_1) = L_1\left(\underbrace{y_1 : \ldots : y_1}_{1}\right) = L_2\left(\underbrace{y_1 : \ldots : y_1}_{1}\right) = L_2(y_1) = L_2(x)$$

proving that $L_1 = L_2$. Hence $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $L_1, L_2 \in L_{n+1}(X_1 \ldots X_{n+1}; Y) = L(X_1, L_n(X_2 \ldots X_{n+1}; Y))$ such that

$$\forall x = (x_1, \ldots, x_{n+1}) \in \prod_{i \in \{1, \ldots, n+1\}} X_i \text{ we have } L_1(x_1 : \ldots : x_{n+1}) = L_2(x_1 : \ldots : x_{n+1})$$

Let $y \in X$ then $L_1(y), L_2(y) \in L_n(X; Y)$ and $\forall (x_1, \ldots, x_n) \in X^n$ we have

$$L_1(y)(x_1 : \ldots : x_n) = L_1(y : x_1 : \ldots : x_n) = L_2(y : x_1 : \ldots : x_n) = L_2(y)(x_1 : \ldots : x_n)$$

which, as $n \in S$, proves that $L_1(y) = L_2(y)$. As y is chosen arbitrary we conclude that $L_1 = L_2$. Hence we have proved that

$$n+1 \in S$$

□

Lemma 16.205. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i \rangle\}_{i \in \{1, \ldots, n\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y \rangle$ a normed space. If $\forall (x_1, \ldots, x_n) \in \prod_{i \in \{1, \ldots, n\}} X_i$ we have*

$$\|L(x_1 : \ldots : x)\|_Y \leqslant M \cdot \prod_{i=1}^{n} \|x_i\|_i$$

then it follows that

$$\|L\|_{L_n(X_1 \ldots X_n; Y)} \leqslant M$$

Proof. We prove this by induction, so let

$$S = \left\{ n \in \mathbb{N} | \text{If } L \in L_n(X_1 \ldots X_n; Y) \text{ we have } \forall (x_1, \ldots, x_n) \in \prod_{i \in \{1, \ldots, n\}} X_i \text{ that } \|L(x_1 : \ldots : x_n)\|_Y \leqslant M \cdot \prod_{i=1}^{n} \|x_i\|_i \text{ then } \|L\|_{L_n(X_1 \ldots X_n; Y)} \leqslant M \right\}$$

then we have:

$1 \in S$. Let $L \in L_1\left(\underbrace{X_1 \ldots X_1}_{1}; Y\right) = L(X_1, Y)$ such that $\forall (x_1) \in \prod_{i \in \{1\}} X_i$ we have $\|L(x_1 : \ldots : x_1)\|_Y \leqslant M \cdot \prod_{i=1}^{1} \|x_i\|_i$. Then given $y \in X_1$ we have for $x = (y) \in \prod_{i \in \{1\}} X_i$ that

$$\|L(y)\|_Y = \|L(x_1)\|_Y = \left\| L\left(\underbrace{x_1 : \ldots : x_1}_{1}\right) \right\|_Y \leqslant M \cdot \prod_{i=1}^{1} \|x_i\|_i = M \cdot \|y\|_X$$

so that by [definition: 14.181] $\|L\|_{L_1(X_1 \ldots X_1; Y)} = \|L\|_{L(X_1, Y)} \leqslant M$ proving that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $L \in L_{n+1}(X_1 \ldots X_{n+1}; Y) = L(X_1, L_n(X_2 \ldots X_n; Y))$ such that $\forall (x_1, \ldots, x_{n+1}) \in \prod_{i \in \{1, \ldots, n+1\}} X_i$ we have:

$$\|L(x_1 : \ldots : x_{n+1})\|_Y \leqslant M \cdot \prod_{i=1}^{n+1} \|x_i\|_i$$

Fix $x \in X$ then $\forall (x_2, \ldots, x_{n+1}) \in \prod_{i \in \{2, \ldots, n+1\}} X_i$ we have

$$\|(L(x))(x_2 : \ldots : x_{n+1})\|_Y = \|L(x : x_2 : \ldots : x_{n+1})\|_Y \leqslant M \cdot \|x\|_1 \cdot \prod_{i=2}^{n+1} \|x_i\|_i = (M \cdot \|x\|_1) \cdot \prod_{i=2}^{n+1} \|x_i\|_i$$

As $n \in S$ and $L(x_1) \in L_n(X_2 \ldots X_{n+1}; Y)$ it follows that $\|L(x)\|_{L_n(X_2 \ldots X_{n+1}; Y)} \leqslant M \cdot \|x\|_1$. Hence by [definition: 14.181] it follows that $\|L\|_{L_{n+1}(X_1 \ldots X_{n+1}; Y)} \leqslant M$ proving

$$n+1 \in S$$

□

Lemma 16.206. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i \rangle\}_{i \in \{1, \ldots, n\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y \rangle$ a normed space, $L \in L(X_1 \ldots X_n; Y)$ [see definition: 14.192] then there exist a $K \in L_n(X_1 \ldots X_n; L)$ such that $\forall (x_1, \ldots, x_n) \in \prod_{i \in \{1, \ldots, n\}} X_i$*

$$K(x_1 : \ldots : x_n) = L(x_1, \ldots, x_n)$$

Proof. We use induction to prove this, so let

$S=\left\{n\in\mathbb{N}|\text{If } L\in L(X_1\ldots X_n;Y) \text{ then there exist a } K\in L_n(X_1\ldots X_n;Y) \text{ such that } \forall(x_1,\ldots,x_n)\in\prod_{i\in\{1,\ldots,n\}}X_i \text{ we have } K(x_1:\ldots:x_n)=L(x_1,\ldots,x_n)\right\}$

then we have:

$1\in S$. If $L\in L\left(\underbrace{X_1\ldots X_1}_{1};Y\right)$ then as $L_1\left(\underbrace{X_1\ldots X_1}_{1};Y\right)=L(X_1,Y)=L\left(\underbrace{X_1\ldots X_1}_{1};Y\right)$ we have that $L\in L_1(X_1\ldots X_1,Y)$ so if we take $K=L$ then we have $K\in L_1(X_1\ldots X_1,Y)$ and for $(x_1)\in\prod_{i\in\{1\}}X_i$ we have $K\left(\underbrace{x_1:\ldots:x_1}_{1}\right)=K(x_1)=L(x_1)=L\left(\underbrace{x_1,\ldots,x_1}_{1}\right)$. So we have that $1\in S$.

$n\in S\Rightarrow n+1\in S$. Let $L\in L(X_1\ldots X_{n+1};Y)$. Take $x\in X_1$ and define

$$L_x\colon\prod_{i\in\{2,\ldots,n+1\}}X_i\to Y \text{ by } L_x(x_1,\ldots,x_n)=L(x,x_1,\ldots,x_n)$$

If $i\in\{1,\ldots,n\}$ and $\left(x_1,\ldots\underbrace{r+\alpha\cdot t}_{i}\ldots,x_n\right)\in\prod_{i\in\{2,\ldots,n+1\}}X_i$ then

$$\begin{aligned}
L_x\left(x_1,\ldots\underbrace{r+\alpha\cdot t}_{i}\ldots,x_n\right) &= \\
L\left(x,x_1,\ldots\underbrace{r+\alpha\cdot t}_{i+1}\ldots,x_n\right) &= \\
L\left(x,x_1,\ldots\underbrace{r}_{i+1}\ldots,x_n\right)+\alpha\cdot L\left(x,x_1,\ldots\underbrace{t}_{i+1}\ldots,x_n\right) &= \\
L_x\left(x_1,\ldots\underbrace{r}_{i}\ldots,x_n\right)+\alpha\cdot L_x\left(x_1,\ldots\underbrace{t}_{i}\ldots,x_n\right)&
\end{aligned}$$

proving that

$$L_x\in\mathrm{Hom}(X_2\ldots X_{n+1};Y) \tag{16.260}$$

Let $(x_1,\ldots,x_n)\in\prod_{i\in\{2,\ldots,n+1\}}X_i$ then for $(y_1,\ldots,y_{n+1})$ where $y_i=\begin{cases}x \text{ if } i=1\\ x_{i-1} \text{ if } i\in\{2,\ldots,n+1\}\end{cases}$ we have

$$\begin{aligned}
\|L_x(x_1,\ldots,x_n)\|_Y &= L(x,x_1,\ldots,x_n)\\
&= L(y_1,\ldots,y_{n+1})\\
&\leqslant_{L\in L(X_1\ldots X_{n+1};Y)} \|L\|_{L(X_1\ldots X_{n+1};Y)}\cdot\prod_{i=1}^{n+1}\|y_i\|_i\\
&= \|L\|_{L(X_1\ldots X_{n+1};Y)}\cdot\|y_1\|_1\cdot\prod_{i=2}^{n+1}\|y_i\|_i\\
&= \|L\|_{L(X_1\ldots X_{n+1};Y)}\cdot\|x\|_1\cdot\prod_{i=2}^{n+1}\|x_{i-1}\|_i\\
&= (\|x\|_X\cdot\|L\|_{L^{n+1}(X;Y)})\cdot\prod_{i=1}^{n}\|x_i\|_{i+1}
\end{aligned}$$

proving by [theorem: 14.190] and [eq: 16.260] that L_x is continuous. Hence

$$L_x\in L(X_2\ldots X_{n+1};Y) \tag{16.261}$$

As $n\in S$ there exist a $K_x\in L_n(X_2\ldots X_{n+1};Y)$ such that $\forall(x_1,\ldots,x_n)\in\prod_{i\in\{2,\ldots,n+1\}}X_i$ we have

$$K_x(x_1:\ldots:x_n)=L_x(x_1,\ldots,x_n)=L(x,x_1,\ldots,x_n) \tag{16.262}$$

This allows us to define

$$K: X_1 \to L_n(X_2 \ldots X_{n+1}; Y) \text{ where } K(x) = K_x$$

then by [eq: 16.262] we have that for $(x_1, \ldots, x_{n+1}) \in \prod_{i \in \{1, \ldots, n+1\}} X_i$

$$K(x_1)(x_2 : \ldots : x_{n+1}) = K_{x_1}(x_2 : \ldots : x_1) = L(x_1, \ldots, x_{n+1}) \tag{16.263}$$

If $x, y \in X_1$ and $\alpha \in \mathbb{K}$ then we have $\forall (x_1, \ldots, x_n) \in \prod_{i \in \{2, \ldots, n+1\}} X_i$ that

$$\begin{aligned} K(x + \alpha \cdot y)(x_1 : \ldots : x_n) &\underset{\text{[eq: 16.263]}}{=} L(x + \alpha \cdot y, x_1, \ldots, x_n) \\ &\underset{L \in L(X_1 \ldots X_{n+1}; Y)}{=} L(x, x_1, \ldots, x_n) + \alpha \cdot L(y, x_1, \ldots, x_n) \\ &\underset{\text{[eq: 16.263]}}{=} K(x)(x_1 : \ldots : x_n) + \alpha \cdot K(y)(x_1 : \ldots : x_n) \\ &\underset{\text{[lemma: 16.85]}}{=} (K(x) + \alpha \cdot K(y))(x_1 : \ldots : x_n) \end{aligned}$$

which by [lemma: 16.88] proves that

$$K(x + \alpha \cdot y) = K(x) + \alpha \cdot K(y)$$

Hence we have that

$$K \in \mathrm{Hom}(X, L_n(X_1 \ldots X_{n+1}; Y)) \tag{16.264}$$

Let $x_1 \in X_1$ then we have for $(x_2, \ldots, x_{n+1}) \in \prod_{i \in \{2, \ldots, n+1\}} X_i$ that

$$\begin{aligned} \|K(x_1)(x_2 : \ldots : x_{n+1})\|_Y &= \|K_{x_1}(x_2 : \ldots : x_{n+1})\|_Y \\ &\underset{\text{[eq: 16.263]}}{=} \|L(x_1, x_2, \ldots, x_{n+1})\|_Y \\ &\leqslant_{L \in L(X_1 \ldots X_{n+1}; Y)} \|L\|_{L(X_1 \ldots X_{n+1}; Y)} \cdot \prod_{i=1}^{n+1} \|x_i\|_i \\ &= \|L\|_{L(X_1 \ldots X_{n+1}; Y)} \cdot \|x_1\|_1 \cdot \prod_{i=2}^{n+1} \|x_i\|_i \\ &= (\|L\|_{L(X_1 \ldots X_{n+1}; Y)} \cdot \|x_1\|_1) \cdot \prod_{i=2}^{n+1} \|x_i\|_i \end{aligned}$$

which as $K(x_1) \in L_n(X_2 \ldots X_n; Y)$ proves using [lemma: 16.205] that

$$\|K(x_1)\|_{L_n(X_2 \ldots X_{n+1}; Y)} \leqslant \|L\|_{L(X_1 \ldots X_{n+1}; Y)} \cdot \|x_1\|_X$$

Hence using [eq: 16.264] together with [theorem: 14.177] proves that K is continuous or

$$K \in L(X_1, L_n(X_2 \ldots X_{n+1}; Y)) = L_{n+1}(X_1 \ldots X_{n+1}; Y)$$

further

$$K(x_1 : \ldots : x_{n+1}) = K(x_1)(x_2 : \ldots : x_{n+1}) \underset{\text{[eq: 16.263]}}{=} L(x_1, \ldots, x_{n+1})$$

The above proves that

$$n + 1 \in S$$

□

Theorem 16.207. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i \rangle\}_{i \in \{1, \ldots, n\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y \rangle$ a normed space then*

$$\mathcal{I}_{X_1 \ldots X_n, Y}: L_n(X_1 \ldots X_n) \to L(X_1 \ldots X_n; Y) \text{ where } \mathcal{I}_{X_1 \ldots X_n, Y}(L): \prod_{i \in \{1, \ldots, n\}} X_i \to Y \text{ is defined by}$$

$$(\mathcal{I}_{X_1 \ldots X_n, Y}(L))(x_1, \ldots, x_m) = L(x_1 : \ldots x_m)$$

is a linear isometric isomorphism. In other words

1. $\forall L \in L_n(X_1 \ldots X_n; Y)$ $\mathcal{I}_{X_1 \ldots X_n, Y}(L) \in L(X_1 \ldots X_n; Y)$ *so that*

$$\mathcal{I}_{X_1 \ldots X_n, Y}: L_n(X_1 \ldots X_n; Y) \to L(X_1 \ldots X_n; Y)$$

is indeed a function

2. $\mathcal{I}_{X_1\dots X_n,Y}: L_n(X_1\dots X_n;Y)\to L(X_1\dots X_n;Y)$ *is a bijection.*
3. *For* $L\in L(X_1\dots X_n;Y)$ *we have* $\forall(x_1,\dots,x_n)\in\prod_{i\in\{1,\dots,n\}}X_i$ *that*
$$(\mathcal{I}_{X_1\dots X_n,Y})^{-1}(L)(x_1:\dots:x_n)=L(x_1,\dots,x_n)$$
4. $\forall L_1,L_2\in L_n(X_1\dots X_n;Y)$ *and* $\alpha\in\mathbb{K}$ *we have*
$$\mathcal{I}_{X_1\dots X_n,Y}(L_1+\alpha\cdot L_2)=\mathcal{I}_{X_1\dots X_n,Y}(L_1)+\alpha\cdot\mathcal{I}_{X_1\dots X_n,Y}(L_2)$$
5. $\forall L\in L_n(X_1\dots X_n:Y)$ *we have* $\|L\|_{L_n(X_1\dots X_n;Y)}=\|\mathcal{I}_{X_1\dots X_n,Y}(L)\|_{L(X_1\dots X_n;Y)}$

***Note* 16.208.** *Using [theorem: 14.120] it follows that*
$$(\mathcal{I}_{X_1\dots X_n,Y})^{-1}: L(X_1\dots X_n;Y)\to L_n(X_1\dots X_n;Y)$$
is a linear isometric isomorphism. In other words:

1. $(\mathcal{I}_{X_1\dots X_n,Y})^{-1}$ *is a bijection.*
2. $\forall L_1,L_2\in L(X_1\dots X_n;Y)$ *and* $\alpha\in\mathbb{K}$ *we have*
$$(\mathcal{I}_{X_1\dots X_n,Y})^{-1}(L_1+\alpha\cdot L_2)=(\mathcal{I}_{X_1\dots X_n,Y})^{-1}(L_1)+\alpha\cdot(\mathcal{I}_{X_1\dots X_n,Y})^{-1}(L_2)$$
3. $\forall L\in L(X_1,\dots,X_n)$ *we have* $\|L\|_{L(X_1\dots X_n;Y)}=\|(\mathcal{I}_{X_1\dots X_n,Y})^{-1}(L)\|_{L_n(X_1\dots X_n;Y)}$

Proof.

1. Let $L\in L_n(X_1\dots X_n;Y)$ then for $i\in\{1,\dots,n\}$ and $\left(x_1,\dots\underbrace{r+\alpha\cdot r}_{i}\dots,x_n\right)\in\prod_{i\in\{1,\dots,n\}}X_i$ we have
$$\begin{aligned}\mathcal{I}_{X_1\dots X_n,Y}(L)\left(x_1,\dots\underbrace{r+\alpha\cdot t}_{i}\dots,x_n\right) &= \\ L\left(x_1:\dots\underbrace{r+\alpha\cdot t}_{i}\dots:x_n\right) &\overset{\text{[lemma: 16.202]}}{=} \\ L\left(x_1:\dots\underbrace{r}_{i}\dots:x_n\right)+\alpha\cdot L\left(x_1:\dots\underbrace{t}_{i}\dots:x_n\right) &= \\ \mathcal{I}_{X_1\dots X_n,Y}(L)\left(x_1,\dots\underbrace{r}_{i}\dots x_n\right)+\alpha\cdot\mathcal{I}_{X_1\dots X_n,Y}(L)\left(x_1,\dots\underbrace{s}_{i}\dots x_n\right)\end{aligned}$$
proving that
$$\mathcal{I}_{X_1\dots X_n,Y}(L)\in\mathrm{Hom}(X_1,\dots,X_n;Y)\tag{16.265}$$
Further if $(x_1,\dots,x_n)\in\prod_{i\in\{1,\dots,n\}}X_i$ then we have:
$$\begin{aligned}\|\mathcal{I}_{X_1\dots X_n,Y}(L)(x_1,\dots,x_n)\|_Y &= \|L(x_1:\dots:x_n)\|_Y \\ &\leqslant_{\text{[lemma: 16.203]}} \|L\|_{L_n(X_1\dots X_n;Y)}\cdot\prod_{i=1}^{n}\|x_i\|_i\end{aligned}$$
Using [theorems: 14.190 and 14.196] it follows that
$$\mathcal{I}_{X_1\dots X_n,Y}(L)\text{ is continuous and }\|\mathcal{I}_{X_1\dots X_n,Y}(L)\|_{L(X_1,\dots,X_n;Y)}\leqslant\|L\|_{L_n(X_1\dots X_n;Y)}\tag{16.266}$$
Combining the above with [eq: 16.265] we have
$$\mathcal{I}_{X_1\dots X_n,Y}(L)\in L(X_1,\dots,X_n;Y)$$
2. For bijectivity we have to prove:

   injectivity. If $L_1,L_2\in L_n(X_1\dots X_n;Y)$ is such that $\mathcal{I}_{X_1\dots X_n,Y}(L_1)=\mathcal{I}_{X_1\dots X_n,Y}(L_2)$ then we have $\forall(x_1,\dots,x_n)\in\prod_{i\in\{1,\dots,n\}}X_i$ that
$$L_1(x_1:\dots:x_n)=\mathcal{I}_{X_1\dots X_n,Y}(L_1)(x_1,\dots,x_n)=\mathcal{I}_{X_1\dots X_n,Y}(L_2)(x_1,\dots,x_n)=L_2(x_1:\dots:x_n)$$
   Hence by [lemma: 16.204] it follows that $L_1=L_2$.

surjectivity. Let $L \in L(X_1 \dots X_n; Y)$ then using [lemma: 16.206] there exist a $K \in L_n(X_1 \dots X_n; Y)$ such that $\forall (x_1, \dots, x_n) \in \prod_{i \in \{1, \dots, n\}} X_i$ we have

$$K(x_1 : \dots : x_n) = L(x_1, \dots, x_n)$$

Hence

$$\mathcal{I}_{X_1 \dots X_n, Y}(K)(x_1, \dots, x_n) = K(x_1 : \dots : x_n) = L(x_1, \dots, x_n)$$

which proves that

$$\mathcal{I}_{X_1 \dots X_n, Y}(K) = L$$

so that $\mathcal{I}_{X_1 \dots X_n, Y}$ is surjective.

3. Let $L \in L(X_1 \dots X_n; Y)$ and take $K = (\mathcal{I}_{X_1 \dots X_n, Y})^{-1}(L) \in L_n(X_1 \dots X_n; Y)$ then we have that $L = \mathcal{I}_{X_1 \dots X_n, Y}(K)$ so that

$$(\mathcal{I}_{X_1 \dots X_n, Y})^{-1}(L)(x_1 : \dots : x_n) = K(x_1 : \dots : x_n) = \mathcal{I}_{X_1 \dots X_n, Y}(L)(x_1 : \dots : x_n) = L(x_1, \dots, x_n).$$

4. Let $L_1, L_2 \in L_n(X_1 \dots X_n; Y)$ and $\alpha \in \mathbb{K}$ then $\forall (x_1, \dots, x_n) \in \prod_{i \in \{1, \dots, n\}} X_i$ we have:

$$\begin{aligned}
\mathcal{I}_{X_1 \dots X_n, Y}(L_1 + \alpha \cdot L_2)(x_1, \dots, x_n) &= \\
(L_1 + \alpha \cdot L_2)(x_1 : \dots : x_n) &\underset{\text{[lemma: 16.201]}}{=} \\
L_1(x_1 : \dots : x_n) + \alpha \cdot L_2(x_1 : \dots : x_n) &= \\
\mathcal{I}_{X_1 \dots X_n, Y}(L_1)(x_1, \dots, x_n) + \alpha \cdot \mathcal{I}_{X_1 \dots X_n, Y}(L_2)(x_1, \dots, x_n) &= \\
(\mathcal{I}_{X_1 \dots X_n, Y}(L_1) + \alpha \cdot \mathcal{I}_{X_1 \dots X_n, Y}(L_2))(x_1, \dots, x_n) &
\end{aligned}$$

proving that

$$\mathcal{I}_{X_1 \dots X_n, Y}(L_1 + \alpha \cdot L_2) = \mathcal{I}_{X_1 \dots X_n, Y}(L_1) + \alpha \cdot \mathcal{I}_{X_1 \dots X_n, Y}(L_2)$$

5. Let $L \in L_n(X_1 \dots X_n; Y)$ then by [eq: 16.266] we have

$$\|\mathcal{I}_{X_1 \dots X_n, Y}(L)\|_{L(X_1 \dots X_n; Y)} \leqslant \|L\|_{L_n(X_1 \dots X_n; Y)} \tag{16.267}$$

For the opposite inequality, let $(x_1, \dots, x_n) \in \prod_{i \in \{1, \dots, n\}} X_i$ then

$$\begin{aligned}
\|L(x_1 : \dots : x_n)\|_Y &= \|\mathcal{I}_{X_1 \dots X_n, Y}(L)(x_1, \dots, x_n)\|_Y \\
&\leqslant \|\mathcal{I}_{X_1 \dots X_n, Y}(L)\|_{L(X_1 \dots X_n; Y)} \cdot \prod_{i=1}^{n} \|x_i\|_i
\end{aligned}$$

so that by [lemma: 16.205]

$$\|L\|_{L_n(X_1 \dots X_n; Y)} \leqslant \|\mathcal{I}_{X_1 \dots X_n, Y}(L)\|_{L(X_1 \dots X_n; Y)}$$

which combined with [eq: 16.267] proves that

$$\|L\|_{L_n(X_1 \dots X_n; Y)} = \|\mathcal{I}_{X_1 \dots X_n, Y}(L)\|_{L(X_1 \dots X_n; Y)}$$

□

16.5.2 Higher Order Partial Differentiation

Definition 16.209. *Let $n \in \mathbb{N} \setminus \{1\}$, $\{\langle X_i, \|\|_i \rangle\}_{i \in \{1, \dots, n\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y \rangle$ a normed space, $\langle X, \|\|_{\max} \rangle$ the normed space based on the product $X = \prod_{i \in \{1, \dots, n\}} X_i$ with the maximum norm $\|\|_{\max}$ [see definition: 14.94], U a open set in X, $x \in U$, $m \in \mathbb{N}$, $\{i_j\}_{j \in \{1, \dots, m\}} \subseteq \{1, \dots, n\}$ and $f : U \to Y$ a function. Then f has a* ***partial differential $D^{[m]}_{x, i_m \dots i_1} f$ of order m at x*** *if for m we have:*

$m = 1$. *f is i_1-partial differentiable at x [see definition: 16.47] and*

$$D^{[1]}_{x, \underbrace{i_1 \dots i_1}_{1}} f = D_{x, i_1} f \in L(X_i, Y) = L_1(X_1 \dots X_1; Y)$$

$1 < m$. *There exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ we have that f has a partial derivative $D^{[m-1]}_{x, i_{m-1} \dots i_1} f$ at x and that*

$$D^{[m-1]}_{i_{m-1} \dots i_1} f : V \to L_{m-1}(X_{i_m} \dots X_{i_1}; Y) \text{ defined by } D^{[m-1]}_{i_{m-1} \dots i_1} f(x) = D^{[m-1]}_{x, i_{m-1} \dots i_m} f$$

is i_m-partial differentiable at x. $D^{[m]}_{x,i_m\ldots i_1}f$ is then be defined by

$$D^{[m]}_{x,i_m\ldots i_1}f = D_{x,i_m}(D^{m-1}_{x,i_{m-1}\ldots i_1}) \in L(X_{i_m}, L_{m-1}(X_{m-1}\ldots X_1;Y)) = L(X_{i_m}\ldots X_{i_1};Y)$$

***Note* 16.210.** *In case $1<m$ we have to ensure that $D^{[m]}_{x,i_m\ldots i_1}f$ is independent of the choice of V. Luckily this is ensured by the fact that partial differentiability is a local property [see theorem: 16.50].*

Definition 16.211. *Let $n\in\mathbb{N}\setminus\{1\}$, $\{\langle X_i,\|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ a finite family of normed spaces, $\langle Y,\|\|_Y\rangle$ a normed space, $\langle X,\|\|_{\max}\rangle$ the normed space based on the product $X=\prod_{i\in\{1,\ldots,n\}}X_i$ with the maximum norm $\|\|_{\max}$ [see definition: 14.94], U a open set in X, $x\in U$, $m\in\mathbb{N}$, $\{i_j\}_{j\in\{1,\ldots,m\}}\subseteq\{1,\ldots,n\}$ and $f:U\to Y$ a function then f has a* ***$(i_m\ldots i_1)$-partial differential $D^{[m]}_{i_m\ldots i_1}f$ of order m on U*** *if $\forall x\in U$ f has partial differential $D^{[m]}_{x,i_m\ldots i_1}f$ of order m at x.*

Just as Fréchet differentiability implies partial differentiability, higher order differentiability implies higher order partial differentiability. To prove this we first need some lemmas.

Lemma 16.212. *Let $n\in\mathbb{N}\setminus\{1\}$, $\{\langle X_i,\|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ a finite family of normed spaces, $\langle Y,\|\|_Y\rangle$ a normed space, $\langle X,\|\|_{\max}\rangle$ the normed space based on the product $X=\prod_{i\in\{1,\ldots,n\}}X_i$ with the maximum norm $\|\|_{\max}$ [see definition: 14.94], U a open set in X, $x\in U$ and f: $U\to Y$ a function that is 1-times differentiable at x then $\forall i\in\{1,\ldots,n\}$ f has a partial derivative $D^{[1]}_{x,\underbrace{i\ldots i}_{1}}f$ at x of order 1. Further*

$$D^{[1]}_{x,i\ldots i}f = D^{[1]}_x f\circ I^{[i,0]} \text{ [see definition: 16.43 for the definition of } I^{[i,0]}]$$

and

$$D^{[1]}_x f = \sum_{i=1}^{n} D^{[1]}_{x,i\ldots i}f\circ\pi_i$$

Proof. Let $x\in U$ then as f is 1-times differentiable at x it follows that f is Fréchet differentiable at x. Then by [theorem: 16.52] f has a i-partial differential $D_{x,i}f$ at x $\forall i\in\{1,\ldots,n\}$ and

$$D_{x,i}f = D_x f\circ I^{[i,0]},\ D_x f = \sum_{i=1}^{n} D_{x,i}f\circ\pi_i$$

Hence by definition we have that f has a partial derivative $D^{[1]}_{x,i}f$ of order 1 at x and $D^{[1]}_{x,i\ldots i}f = D_{x,i}f$ so that

$$D^{[1]}_{x,\underbrace{i\ldots i}_{1}}f = D^{[1]}_x f\circ I^{[i,0]},\ D^{[1]}_x f = \sum_{i=1}^{n} D^{[1]}{}_{x,\underbrace{i\ldots i}_{1}}f\circ\pi_i$$ □

For the general case we need first a little lemma.

Lemma 16.213. *Let $n\in\mathbb{N}\setminus\{1\}$, $m\in\mathbb{N}$, $\{\langle X_i,\|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ a finite family of normed spaces, $\langle Y,\|\|_Y\rangle$ a normed space, $\langle X,\|\|_{\max}\rangle$ the normed space based on the product $X=\prod_{i\in\{1,\ldots,n\}}X_i$ with the maximum norm $\|\|_{\max}$ [see definition: 14.94] and $\{i_j\}_{j\in\{1,\ldots,m\}}\subseteq\{1,\ldots,n\}$ then there exist a*

$$\Phi\in L(L_m(X;Y), L_m(X_{i_m}\ldots X_{i_1};Y))$$

such that for every $L\in L_m(X;Y)$

$$\forall(h_1,\ldots,h_m)\in\prod_{j\in\{1,\ldots,m\}}X_{i_{m-j+1}}$$

we have

$$\Phi(L)(h_1:\ldots:h_m) = L(I^{[i_m,0]}(h_1):\ldots:I^{[i_1,0]}(h_m))$$

Proof. Let $L\in L_m(X;Y)$ and define

$$\Psi_L:\prod_{j\in\{1,\ldots,m\}}X_{m-j+1}\to Y \text{ by } \Psi_L(h_1,\ldots,h_m) = L(I^{[i_m,0]}(h_1):\ldots:I^{[i_1,0]}(h_m))\in Y \tag{16.268}$$

Let $j \in \{1,\ldots,m\}$ and

$$\left(h_1,\ldots\underbrace{k+\alpha\cdot l}_{j}\ldots,h_m\right) \in \prod_{j\in\{1,\ldots,m\}} X_{i_{m-j+1}}$$

where $k,l \in X_{i_{m-j+1}}$ and $k \in \mathbb{K}$ then we have

$$\begin{aligned}
\Psi_L\left(h_1,\ldots\underbrace{k+\alpha\cdot l}_{j}\ldots,h_m\right) &= \\
L\left(I^{[i_m,0]}(h_1):\ldots\underbrace{I^{[i_{m-j+1},0]}(k+\alpha\cdot l)}_{j}\ldots:I^{[i_1,0]}(h_m)\right) &\underset{\text{[lemma: 16.45]}}{=} \\
L\left(I^{[i_m,0]}(h_1):\ldots\underbrace{I^{[i_{m-j+1},0]}(k)+\alpha\cdot I^{[i_{m-j+1},0]}(l)}_{j}\ldots:I^{[i_1,0]}(h_m)\right) &\underset{\text{[lemma: 16.202]}}{=} \\
L\left(I^{[i_m,0]}(h_1):\ldots\underbrace{I^{[i_{m-j+1},0]}(k)}_{j}\ldots:I^{[i_1,0]}(h_m)\right)+\alpha\cdot L\left(I^{[i_m,0]}(h_1):\ldots\underbrace{I^{[i_{m-j+1},0]}(l)}_{j}\ldots:I^{[i_1,0]}(h_m)\right) &= \\
\Psi_L\left(h_1,\ldots\underbrace{k}_{j}\ldots,h_m\right)+\alpha\cdot\Psi_L\left(h_1,\ldots\underbrace{l}_{j}\ldots,h_m\right)
\end{aligned}$$

proving that

$$\Psi_L \in \mathrm{Hom}(X_{i_m}\ldots X_{i_1};Y) \tag{16.269}$$

Further if $(h_1,\ldots,h_m) \in \prod_{j\in\{1,\ldots,m\}} X_{i_{m-j+1}}$ then we have

$$\begin{aligned}
\|\Psi_L(h_1,\ldots,h_m)\|_Y &= \|L(I^{[i_m,0]}(h_1):\ldots:I^{[i_1,0]}(h_m))\|_Y \\
&\leqslant_{\text{[lemma: 16.203]}} \|L\|_{L^m(X;Y)}\cdot\prod_{j=1}^{m}\|I^{[i_{m-j+1]}}(h_j)\|_{i_{m-j+1}} \\
&\underset{\text{[lemma: 16.45]}}{=} \|L\|_{L^m(X;Y)}\cdot\prod_{j=1}^{m}\|h_j\|_{i_{m-j+1}}
\end{aligned}$$

proving by [theorems: 14.190, 14.184] and [eq: 16.269] that

$$\Psi_L \in L(X_{i_m}\ldots X_{i_1};Y) \text{ and } \|\Psi_L\|_{L(X_{i_m}\ldots X_{i_1};Y)} \leqslant \|L\|_{L^m(X;Y)} \tag{16.270}$$

Define now the function

$$\Psi: L_m(X;Y) \to L(X_{i_m}\ldots X_{i_1};Y) \text{ by } \Psi(L)=\Psi_L \tag{16.271}$$

Let $\alpha \in \mathbb{K}$, $L_1,L_2 \in L_m(X;Y)$ and $(h_1,\ldots,h_m) \in \prod_{j\in\{1,\ldots,m\}} X_{i_{m-j+1}}$ then we have

$$\begin{aligned}
(\Psi(L_1+\alpha\cdot L_2))(h_1:\ldots h_m) &\underset{\text{[eq: 16.271]}}{=} \\
\Psi_{L_1+\alpha\cdot L_2}(h_1:\ldots:h_m) &\underset{\text{[eq: 16.268]}}{=} \\
(L_1+\alpha\cdot L_2)(I^{[i_m,0]}(h_1):\ldots:I^{[i_1,0]}(h_m)) &\underset{\text{[lemma: 16.85]}}{=} \\
L_1(I^{[i_m,0]}(h_1):\ldots:I^{[i_1,0]}(h_m))+\alpha\cdot L_2(I^{[i_m,0]}(h_1):\ldots:I^{[i_1,0]}(h_m)) &\underset{\text{[eq: 16.268]}}{=} \\
\Psi_{L_1}(h_1:\ldots:h_m)+\alpha\cdot\Psi_{L_2}(h_1:\ldots:h_m) &= \\
(\Psi_{L_1}+\alpha\cdot\Psi_{L_2})(h_1:\ldots:h_m) &\underset{\text{[eq: 16.271]}}{=} \\
(\Psi(L_1)+\alpha\cdot\Psi(L_2))(h_1:\ldots:h_m)
\end{aligned}$$

proving by [lemma: 16.204] that

$$\Psi(L_1+\alpha\cdot L_2)=\Psi(L_1)+\alpha\cdot\Psi(L_2) \tag{16.272}$$

Using [theorem: 16.207] we can define the function

$$\Phi: L_m(X;Y) \to L_m(X_{i_m}\ldots X_{i_1};Y) \text{ by } \Phi=(\mathcal{I}_{X_{i_m}\ldots X_{i_1},Y})^{-1}\circ\Psi \tag{16.273}$$

then we have

$$\begin{aligned}
\Phi(L_1+\alpha\cdot L_2) &\underset{\text{[eq: 16.273]}}{=} ((\mathcal{I}_{X_{i_m}\dots X_{i_1},Y})^{-1}\circ\Psi)(L_1+\alpha\cdot L_2)\\
&= (\mathcal{I}_{X_{i_m}\dots X_{i_1},Y})^{-1}(\Psi(L_1+\alpha\cdot L_2))\\
&\underset{\text{[eq: 16.272]}}{=} (\mathcal{I}_{X_{i_m}\dots X_{i_1},Y})^{-1}(\Psi(L_1)+\alpha\cdot\Psi(L_2))\\
&\underset{\text{[theorem: 16.207]}}{=} (\mathcal{I}_{X_{i_m}\dots X_{i_1},Y})^{-1}(\Psi(L_1))+\alpha\cdot(\mathcal{I}_{X_{i_m}\dots X_{i_1},Y})^{-1}(\Psi(L_2))\\
&= ((\mathcal{I}_{X_1\dots X_n,Y})^{-1}\circ\Psi)(L_1)+\alpha\cdot((\mathcal{I}_{X_1\dots X_n,Y})^{-1}\circ\Psi)(L_2)\\
&= \Phi(L_1)+\alpha\cdot\Phi(L_2)
\end{aligned}$$

proving that

$$\Phi\in\mathrm{Hom}(L_m(X;Y),L_m(X_{i_m}\dots X_{i_1};Y)) \tag{16.274}$$

If $L\in L_m(X;Y)$ then

$$\begin{aligned}
\|\Phi(L)\|_{L_m(X_{i_m}:\dots:X_{i_1};Y)} &\underset{\text{[eq: 16.273]}}{=} \|((\mathcal{I}_{X_{i_m}\dots X_{i_1},Y})^{-1}\circ\Psi)(L)\|_{L_m(X_{i_m}:\dots:X_{i_1};Y)}\\
&= \|(\mathcal{I}_{X_{i_m}\dots X_{i_1},Y})^{-1}(\Psi(L))\|_{L_m(X_{i_m}:\dots:X_{i_1};Y)}\\
&\underset{\text{[theorem: 16.207]}}{=} \|\Psi(L)\|_{L(X_{i_m}\dots X_{i_1};Y)}\\
&\underset{\text{[eq: 16.271]}}{=} \|\Psi_L\|_{L(X_{i_m}\dots X_{i_1};Y)}\\
&\leqslant_{\text{[eq: 16.270]}} \|L\|_{L^m(X;Y)}
\end{aligned}$$

proving by [theorem: 14.177] together with [eq: 16.274] that

$$\Phi\in L(L_m(X;Y),L_m(X_{i_m}\dots X_{i_1};Y)) \tag{16.275}$$

Finally if $L\in L_m(X;Y)$ and $(h_1,\dots,h_m)\in\prod_{j\in\{1,\dots,m\}}X_{m-j+1}$ then we have

$$\begin{aligned}
\Phi(L)(h_1:\dots:h_m) &\underset{\text{[eq: 16.273]}}{=} (((\mathcal{I}_{X_{i_m}\dots X_{i_1},Y})^{-1}\circ\Psi)(L))(h_1:\dots:h_m)\\
&= ((\mathcal{I}_{X_{i_m}\dots X_{i_1},Y})^{-1}\Psi(L))(h_1:\dots:h_m)\\
&\underset{\text{[theorem: 16.207]}}{=} \Psi(L)(h_1,\dots,h_m)\\
&\underset{\text{[eq: 16.271]}}{=} \Psi_L(h_1,\dots,h_m)\\
&\underset{\text{[eq:16.268]}}{=} L(I^{[i_m,0]}(h_1):\dots:I^{[i_1,0]}(m))
\end{aligned}$$

proving

$$\Phi(L)(h_1:\dots:h_m)=L(I^{[i_m,0]}(h_1)\dots I^{[i_1,0]}(m))$$

□

Theorem 16.214. *Let $n\in\mathbb{N}\setminus\{1\}$, $m\in\mathbb{N}$, $\{\langle X_i,\|\|_i\rangle\}_{i\in\{1,\dots,n\}}$ a finite family of normed spaces, $\langle Y,\|\|_Y\rangle$ a normed space, $\langle X,\|\|_{\max}\rangle$ the normed space based on the product $X=\prod_{i\in\{1,\dots,n\}}X_i$ with the maximum norm $\|\|_{\max}$ [see definition: 14.94], U a open set in X, $x\in U$ and $f:U\to Y$ a function that is m-times differentiable at x then $\forall\{i_j\}_{j\in\{1,\dots,m\}}\subseteq\{1,\dots,n\}$ f has a partial derivative $D^{[m]}_{x,i_m,\dots,i_1}f$ of order m at x. Further $\forall h=(h_1,\dots,h_n)\in\prod_{j\in\{1,\dots,m\}}X_{i_{m-j+1}}$ we have*

$$D^{[m]}_{x,i_m\dots i_1}f(h_1:\dots:h_m)=D^{[m]}_x f(I^{[i_m,0]}(h_1):\dots:I^{[i_1,0]}(h_m))$$

Proof. We prove this by induction, so let

$$S=\Bigg\{m\in\mathbb{N}\,\Big|\,\text{If } U \text{ is a open set in } X \text{ and } f:U\to Y \text{ is a function that is } m\text{-times differentiable at } x\in U \text{ then } \forall\{i_j\}_{j\in\{1,\dots,m\}}\subseteq\{1,\dots,n\}\ f \text{ has a partial differential } D^{[m]}_{x,i_m\dots i_1}f \text{ of order } m \text{ and } \forall(h_1,\dots,h_m)\in\prod_{j\in\{1,\dots,m\}}X_{i_{m-j+1}}\ D^{[m]}_{x,i_m\dots i_1}f(h_1:\dots:h_m)=D^{[m]}_x f(I^{[i_m,0]}(h_1):\dots:I^{[i_1,0]}(h_m))\Bigg\}$$

then we have:

$1\in S$. Using [lemma: 16.212] it follows that $D^{[1]}_{x,\underbrace{i_1\dots i_1}_{1}}f$ exist and

$$D^{[1]}_{x,\underbrace{i_1\dots i_1}_{1}}f=D^{[1]}_x f\circ I^{[i,0]} \tag{16.276}$$

If $h \in \prod_{j\in\{1\}} X_{i_j}$ then

$$\begin{aligned} D^{[1]}_{x,\underbrace{i_1\ldots i_1}_{1}} f\left(\underbrace{h_1:\ldots:h_1}_{1}\right) &= D^{[1]}_{x,\underbrace{i_1\ldots i_1}_{1}} f(h_1) \\ &\underset{\text{[eq: 16.276]}}{=} \left(D^{[1]}_x f \circ I^{[i,0]}\right)(h_1) \\ &= D^{[1]}_x f(I^{[i,0]}(h_1)) \\ &= D^{[1]}_x f\left(\underbrace{I^{[i,0]}(h_1)\ldots I^{[i,0]}(h_1)}_{1}\right) \end{aligned}$$

Hence

$$1 \in S$$

$\boldsymbol{m \in S \Rightarrow m+1 \in S}$**.** Assume that f is $(m+1)$-times differentiable at x and take $\{i_j\}_{j\in\{1,\ldots,m+1\}} \subseteq \{1,\ldots,n\}$. As f is $(m+1)$-times differentiable at x there exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ f is m-times differentiable at y and the function

$$D^{[m]}f: V \to L_m(X;Y) \text{ defined by } D^{[m]}f(y) = D^{[m]}_y f$$

is Fréchet differentiable at x with by definition

$$D^{[m+1]}_x f = D_x(D^{[m]}f) \tag{16.277}$$

As $m \in S$ it follows that for $y \in V$ $D^{[m]}_{y,i_m\ldots i_1} f$ exists and for $(h_1,\ldots,h_m) \in \prod_{j\in\{1,\ldots,n\}} X_{m-j+1}$ we have

$$D^{[m]}_{y,i_m\ldots i_1} f(h_1:\ldots:h_m) = D^{[m]}_y f(I^{[i_m,0]}(h_1):\ldots:I^{(i_1,0)}(h_1)) \tag{16.278}$$

As $\forall y \in V$ $D^{[m]}_{y,i_m\ldots i_1} f$ exist we can define

$$D^{[m]}_{y,i_m\ldots i_1} f: V \to L_m(X_{i_m}\ldots X_{i_1};Y) \text{ by } \left(D^{[m]}_{i_m\ldots i_1} f\right)(y) = D^{[m]}_{y,i_m\ldots i_1} f \tag{16.279}$$

Using [lemma: 16.213] there exist a $\Phi \in L(L_m(X;Y), L_m(X_{i_m}\ldots X_{i_2};Y))$ such that $\forall L \in L_m(X;Y)$ and $(h_1,\ldots,h_m) \in \prod_{j\in\{1,\ldots,n\}} X_{m-j+1}$ we have

$$\Phi(L)(h_1:\ldots:h_m) = L(I^{[i_m,0]}(h_1):\ldots:I^{[i_1,0]}(h_m)) \tag{16.280}$$

Let $y \in V$ and $(h_1,\ldots,h_m) \in \prod_{j\in\{1,\ldots,n\}} X_{m-j+1}$ then as $D^{[m]}f(y) = D^{[m]}_y f \in L_m(X;Y)$ we have that

$$\begin{aligned} (\Phi \circ D^{[m]}f)(y) &= \Phi(D^{[m]}f(y))(h_1:\ldots:h_m) \\ &= (D^{[m]}f(y))(I^{[i_m,0]}(h_1):\ldots:I^{[i_1,0]}(h_m)) \\ &= D^{[m]}_y f(I^{[i_m,0]}(h_1):\ldots:I^{[i_1,0]}(h_m)) \\ &\underset{\text{[eq: 16.278]}}{=} D^{[m]}_{y,i_m\ldots i_1} f(h_1:\ldots:h_m) \\ &\underset{\text{[eq: 16.279]}}{=} \left(D^{[m]}_{i_m\ldots i_1} f(y)\right)(h_1:\ldots:h_m) \end{aligned}$$

proving by [lemma: 16.204] that $(\Phi \circ D^{[m]}f)(y) = D^{[m]}_{i_m\ldots i_1} f(y)$ so that

$$\Phi \circ D^{[m]}f = D^{[m]}_{i_m\ldots i_1} f \tag{16.281}$$

As $D^{[m]}f$ is Fréchet differentiable at x and $\Phi \in L(L_m(X;Y), L_m(X_{i_m}\ldots X_{i_2};Y))$ hence ∞-times differentiable on $L_m(X;Y)$ [see 16.129] it follows from the chain rule [see theorem: 16.39] that $\Phi \circ D^{[m]}f$ is Fréchet differentiable at x, hence $D^{[m]}_{i_m\ldots i_1} f$ is Fréchet differentiable at x. Further

$$\begin{aligned} D_x\left(D^{[m]}_{i_m\ldots i_1} f\right) &\underset{\text{[eq: 16.281]}}{=} D_x(\Phi \circ D^{[m]}f) \\ &\underset{\text{[theorem: 16.39]}}{=} D_{D^{[m]}f(x)}\Phi \circ D_x(D^{[m]}f) \\ &\underset{\text{[theorem: 16.27]}}{=} \Phi \circ D_x(D^{[m]}f) \\ &= \Phi \circ D^{[m+1]}f \end{aligned}$$

proving that

$$D_x\left(D^{[m]}_{i_m\ldots i_1} f\right) = \Phi \circ D^{[m+1]}f \tag{16.282}$$

As by [theorem: 16.52] Fréchet differentiability implies partial differentiability it follows that $D^{[m]}_{i_m\ldots i_1}f$ has a i_{m+1}-partial differential at x and

$$\begin{aligned} D_{x,i_{m+1}}\big(D^{[m]}_{i_m\ldots i_1}f\big) &\underset{\text{[theorem: 16.52]}}{=} D_x\big(D^{[m]}_{i_m\ldots i_1}f\big)\circ I^{[i_{m+1},0]} \\ &\underset{\text{[eq: 16.282]}}{=} \big(\Phi\circ D^{[m+1]}_x f\big)\circ I^{[i_{m+1},0]} \end{aligned}$$

Hence by definition

$$f \text{ has a partial differential } D^{[m+1]}_{x,i_{m+1}\ldots i_1}f \text{ of order } m+1 \text{ at } x \tag{16.283}$$

and

$$D^{[m+1]}_{x,i_{m+1}\ldots i_1}f \underset{\text{def}}{=} D_{x,i_{m+1}}\big(D^{[m]}_{i_m\ldots i_1}f\big) = \big(\Phi\circ D^{[m+1]}_x f\big)\circ I^{i_{m+1},0} \tag{16.284}$$

Further, as $D^{[m+1]}_x f\in L_{m+1}(X;Y)=L(X,L_m(X;Y))$,

$$D^{[m+1]}_x f(I^{[i_{m+1},0]}(h_1))\in L_m(X;Y) \tag{16.285}$$

So for $(h_1,\ldots,h_{m+1})\in\prod_{j\in\{1,\ldots,m+1\}}X_{i_{(m+1)-j+1}}$ we have

$$\begin{aligned} D^{[m+1]}_{x,i_{m+1}\ldots,i_1}f(h_1:\ldots:h_{m+1}) &\underset{\text{[eq: 16.284]}}{=} \\ \big(\Phi\circ D^{[m+1]}_x f\circ I^{[i_{m+1},0]}\big)(h_1:\ldots:h_{m+1}) &= \\ \big(\big(\Phi\circ D^{[m+1]}_x f\circ I^{[i_{m+1},0]}\big)(h_1)\big)(h_2:\ldots:h_{m+1}) &= \\ \big(\Phi\big(D^{[m+1]}_x f(I^{[i_{m+1},0]}(h_1))\big)\big)(h_2:\ldots:h_{m+1}) &\underset{\text{[eqs: 16.280, 16.285]}}{=} \\ \big(D^{[m+1]}_x f(I^{[i_{m+1},0]}(h_1))\big)(I^{[i_m,0]}(h_2):\ldots:I^{[i_1,0]}(h_{m+1})) &= \\ D^{[m+1]}_x f(I^{[m+1,0]}(h_1):I^{[i_m,0]}(h_2):\ldots:I^{[i_1,0]}(h_{m+1})) &= \\ D^{[m+1]}_x f(I^{[m+1,0]}(h_1):\ldots:I^{[i_1,0]}(h_{m+1})) & \end{aligned}$$

proving that

$$D^{[m+1]}_{x,i_{m+1}\ldots,i_1}f(h_1:\ldots:h_{m+1}) = D^{[m+1]}_x f(I^{[m+1,0]}(h_1):\ldots:I^{[i_1,0]}(h_{m+1}))$$

which together with [eq: 16.283] proves

$$m+1\in S$$

□

Theorem 16.215. *Let $n\in\mathbb{N}\setminus\{1\}$, $m\in\mathbb{N}$, $\{\langle X_i,\|\|_i\rangle\}_{i\in\{1,\ldots,n\}}$ a finite family of normed spaces, $\langle Y,\|\|_Y\rangle$ a normed space, $\langle X,\|\|_{\max}\rangle$ the normed space based on the product $X=\prod_{i\in\{1,\ldots,n\}}X_i$ with the maximum norm $\|\|_{\max}$ [see definition: 14.94], U a open set in X and*

$$f:U\to Y \text{ a function that is } C^m \text{ on } U$$

then $\forall\{i_j\}_{j\in\{1,\ldots,m\}}\subseteq\{1,\ldots,n\}$ we have that $\forall x\in U$

$$f \text{ has a partial differential } D^{[m]}_{x,i_m\ldots i_1}f \text{ of order } m \text{ at } x$$

and the function

$$D^{[m]}_{i_m\ldots i_1}f:U\to L_m(X_{i_m}\ldots X_{i_1};Y) \text{ defined by } \big(D^{[m]}_{i_m\ldots i_1}f\big)(x)=D^{[m]}_{x,i_m\ldots i_1}f$$

is continuous.

Proof. Let $x\in U$, as f is C^m on U f is m-times differentiable at x. Hence, using the previous theorem [theorem: 16.214] f has a partial derivative $D^{[m]}_{x,i_m\ldots i_1}f$ of order m at x so we can define the function

$$D^{[m]}_{i_m\ldots i_1}f:U\to L_m(X_{i_m}\ldots X_{i_1};Y) \text{ by } D^{[m]}_{i_m\ldots i_1}f(x)=D^{[m]}_{x,i_m\ldots i_1}f$$

As f is m-times differentiable on U we can define the function

$$D^{[m]}f:U\to L_m(X;Y) \text{ by } D^{[m]}f(x)=D^{[m]}_x f$$

Further for every $(h_1,\ldots,h_m)\in\prod_{j\in\{1,\ldots,m\}}X_{m-j+1}$ we have

$$D^{[m]}_{x,i_m\ldots i_1}f(h_1:\ldots:h_m)=D^{[m]}_x f(I^{[i_m,0]}(h_1):\ldots:I^{[i_1,0]}(h_m))$$

so that for $x \in U$ we have

$$D^{[m]}_{i_m \dots i_1} f(x)(h_1 : \dots : h_m) = D^{[m]} f(x)(I^{[i_m,0]}(h_1) : \dots : I^{[i_1,0]}(h_m)) \tag{16.286}$$

Now using [lemma: 16.213] there exist a $\Phi \in L(L_m(X;Y), L_m(X_{i_m} \dots X_{i_1};Y))$ such that

$$\Phi(D^{[m]} f(x))(h_1 : \dots : h_m) = D^{[m]} f(x)(I^{[i_m,0]}(h_1) : \dots : I^{[i_1,0]}(h_m)) = D^{[m]}_{i_m \dots i_1} f(x)(h_1 : \dots : h_m)$$

proving by [lemma: 16.204] that $\Phi(D^{[m]} f(x)) = D^{[m]}_{i_m \dots i_1} f(x)$. Hence as $(\Phi \circ D^{[m]} f)(x) = \Phi(D^{[m]} f(x))$ it follows that

$$D^{[m]}_{i_m \dots i_1} f = \Phi \circ D^{[m]} f$$

As $\Phi \in L(L_m(X;Y), L_m(X_{i_m} \dots X_{i_1};Y))$ and f is C^m on U we have that Φ and $D^{[m]} f$ are continuous, so $\Phi \circ D^{[m]} f$ is continuous proving that $D^{[m]}_{i_m \dots i_1} f$ is continuous. □

Next we show that the order in which you do the partial differentiation does not matter.

Theorem 16.216. *Let $n \in \mathbb{N} \setminus \{1\}$, $m \in \mathbb{N}$, $\{\langle X_i, \|\|_i \rangle\}_{i \in \{1,\dots,n\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y \rangle$ a **Banach** space, $\langle X, \|\|_{\max} \rangle$ the normed space based on the product $X = \prod_{i \in \{1,\dots,n\}} X_i$ with the maximum norm $\|\|_{\max}$ [see definition: 14.94], U a open set in X, $x \in U$ and $f : U \to Y$ a function that is m-times differentiable at x, $\{i_j\}_{j \in \{1,\dots,m\}} \subseteq \{1,\dots,n\}$ and $(h_1,\dots,h_m) \in \prod_{j \in \{1,\dots,m\}} X_{m-j+1}$ then $\forall \sigma \in P_n$ we have*

$$D^{[m]}_{x, i_m, \dots i_1} f(h_1 : \dots h_m) = D^{[m]}_{i_{\sigma(m)} \dots i_{\sigma(1)}} f(h_{\sigma(1)}, \dots, h_{\sigma(m)})$$

***Note* 16.217.** *Existence of the partial differentials of order m at x is guaranteed by [theorem: 16.214]*

Proof. We have

$$\begin{aligned}
D^{[m]}_{x, i_{\sigma(m)}, \dots i_{\sigma(1)}} f(h_{\sigma(1)} : \dots h_{\sigma(m)}) &\underset{\text{[theorem: 16.214]}}{=} \\
D^{[m]}_x f(I^{i_{[\sigma(m)],0}}(h_{\sigma(1)}) : \dots : I^{[i_{\sigma(1)},0]}(h_{\sigma(m)})) &\underset{\text{[theorem: 16.192]}}{=} \\
D^{[m]}_x (I^{[i_m,0]}(h_1) : \dots : I^{[i_1,0]}(h_1)) &\underset{\text{[theorem: 16.214]}}{=} \\
D^{[m]}_{x, i_m \dots i_1} f(h_1 : \dots : h_m) &
\end{aligned}$$

□

It was show in [example: 16.55] that the existence of partial differentials at a point does not mean that the function is differentiable at the point. However if the partial derivatives exist on a open neighborhood of the point and are continuous then the function is differentiable at the point. To prove this we need first some lemma's and definitions.

Definition 16.218. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i \rangle\}_{i \in \{1,\dots,n\}}$ a finite family of normed spaces, $\langle X, \|\|_{\max} \rangle$ the normed space based on the product $X = \prod_{i \in \{1,\dots,n\}} X_i$ with the maximum norm $\|\|_{\max}$ [see definition: 14.94] then given $h = (h_1,\dots,h_n) \in X$ and $i \in \{0,\dots,n\}$ we define*

$$h^{\{i\}} = \begin{cases} \sum_{j=1}^n I^{[j,0]}(h_j) \text{ if } i \in \{1,\dots,n\} \\ 0 \text{ if } i = 0 \end{cases}$$

Lemma 16.219. *Let $n \in \mathbb{N}$, $\{\langle X_i, \|\|_i \rangle\}_{i \in \{1,\dots,n\}}$ a finite family of normed spaces, $\langle X, \|\|_{\max} \rangle$ the normed space based on the product $X = \prod_{i \in \{1,\dots,n\}} X_i$ with the maximum norm $\|\|_{\max}$ [see definition: 14.94] then given $h \in X$ we have*

1. $h^{\{0\}} = 0$
2. $h^{\{n\}} = h$
3. $\forall i \in \{1,\dots,n\}$ *we have* $\forall k \in \{1,\dots,n\}$ *that* $(h^{\{i\}})_k = \begin{cases} 0 \text{ if } i < k \\ h_k \text{ if } k \leqslant i \end{cases}$. *In other words we have*

$$h^{\{i\}} = \begin{cases} \left(h_1, \dots, h_i, \underbrace{0 \dots, 0}_{n-i}\right) \text{ if } i \in \{1,\dots,n\} \\ \left(\underbrace{0,, \dots,, 0}_{n}\right) \text{ if } i = 0 \end{cases}$$

4. *Let* $x, h \in \prod_{i \in \{1,\dots,n\}} X_i$ *then* $\forall i \in \{1,\dots,n\}$ *we have*
   a. $I^{[i,x+h^{\{i\}}]}(x_i + h_i) = x + h^{\{i\}}$
   b. $I^{[i,x+h^{\{i\}}]}(x_i) = x + h^{\{i-1\}}$
5. $\forall i \in \{0,\dots,n\}$ *we have* $\|h^{\{i\}}\|_{\max} \leqslant \|h\|_{\max}$

Proof.

1. This follows from the definition.
2. $h^{\{n\}} \underset{n \in \mathbb{N} \Rightarrow 0 \neq n}{=} \sum_{j=1}^{n} I^{[j,0]} h_j \underset{\text{[lemma: 16.45]}}{=} h$
3. Let $i \in \{1,\dots,n\}$ then for $k \in \{1,\dots,n\}$ we have either:

   $\boldsymbol{k \leqslant i}$**.** Then

$$\begin{aligned}
(h^{\langle i \rangle})_k &= \left(\sum_{j=1}^{i} I^{[j,0]}(h_j) \right)_k \\
&= \sum_{j=1}^{i} (I^{[j,0]}(h_j))_k \\
&\underset{\text{[lemma: 16.45]}}{=} \sum_{j=1}^{i} \delta_{j,k} \cdot h_j \\
&\underset{k \in \{1,\dots,i\}}{=} h_k
\end{aligned}$$

   $\boldsymbol{i < k}$**.** Then

$$\begin{aligned}
(h^{\langle i \rangle})_k &= \left(\sum_{j=1}^{i} I^{[j,0]}(h_j) \right)_k \\
&= \sum_{j=1}^{i} (I^{[j,0]}(h_j))_k \\
&\underset{\text{[lemma: 16.45]}}{=} \sum_{j=1}^{i} \delta_{j,k} \cdot h_j \\
&\underset{\forall j \in \{1,\dots,n\}\ k \neq j}{=} 0
\end{aligned}$$

   so that

$$(h^{\{i\}})_k = \begin{cases} 0 \text{ if } i < k \\ h_k \text{ if } k \leqslant i \end{cases}.$$

4. Let $x, h \in \prod_{i \in \{1,\dots,n\}} X_i$ and $i \in \{1,\dots,n\}$ then we have:
   a. Then we have for $k \in \{1,\dots,n\}$ either:

   $\boldsymbol{k = i}$**.** Then

$$\begin{aligned}
\left(I^{[i,x+h^{\{i\}}]}(x_i + h_i)\right)_k &\underset{k=i}{=} \left(I^{[i,x+h^{\{i\}}]}(x_i + h_i)\right)_i \\
&\underset{\text{[definition: 16.43]}}{=} x_i + h_i \\
&\underset{i=k}{=} x_k + h_k \\
&\underset{(3) \wedge k \leqslant i}{=} x_k + (h^{\{i\}})_k \\
&= (x + h^{\{i\}})_k
\end{aligned}$$

   $\boldsymbol{k \neq i}$**.** Then

$$\left(I^{[i,x+h^{\{i\}}]}(x_i + h_i)\right)_k \underset{\text{[definition: 16.43]}}{=} (x + h^{\{i\}})_k$$

proving that

$$I^{[i,x+h^{\{i\}}]}(x_i+h_i)=x+h^{\{i\}}$$

b. Then we have for $k\in\{1,\dots,n\}$ either:

$k=i$.

$$\begin{aligned}\left(I^{[i,x+h^{\{i\}}]}(x_i)\right)_k &\underset{k=i}{=} \left(I^{[i,x+h^{\{i\}}]}(x_i)\right)_i\\ &\underset{\text{[definition: 16.43]}}{=} x_i\\ &= x_i+0\\ &\underset{i=k}{=} x_k+0\\ &\underset{i-1<i=k}{=} x_k+(h^{\{i-1\}})_k\\ &= (x+h^{\{i-1\}})_k\end{aligned}$$

$k<i$.

$$\begin{aligned}\left(I^{[i,x+h^{\{i\}}]}(x_i)\right)_k &\underset{\text{[definition: 16.43]}}{=} (x+h^{\{i\}})_k\\ &= x_k+(h^{\{i\}})_k\\ &\underset{(3)\wedge k\leqslant i}{=} x_k+h_k\\ &\underset{(3)\wedge k\leqslant i-1}{=} x_k+(h^{\{i-1\}})_k\\ &= (x+h^{\{i-1\}})_k\end{aligned}$$

$i<k$.

$$\begin{aligned}\left(I^{[i,x+h^{\{i\}}]}(x_i)\right)_k &\underset{\text{[definition: 16.43]}}{=} (x+h^{\{i\}})_k\\ &= x_k+(h^{\{i\}})_k\\ &\underset{(3)\wedge i<k}{=} x_k+0\\ &\underset{(3)\wedge i-1<i<k}{=} x_k+(h^{\{i-1\}})_k\\ &= (x+h^{\{i-1\}})_k\end{aligned}$$

proving that

$$I^{[i,x+h^{\{i\}}]}(x_i)=x+h^{\{i-1\}}$$

5. Given $i\in\{0,\dots,n\}$ then we have either:

$i=0$. Then

$$\|h^{\langle i\rangle}\|_{\max}=\|h^{\langle 0\rangle}\|_{\max}=\|0\|_{\max}\leqslant\|h\|_{\max}$$

$i\in\{1,\dots,n\}$. Then for $k\in\{1,\dots,n\}$ we have

$k\in\{1,\dots,i\}$. Then

$$\begin{aligned}(h^{\langle i\rangle})_k &= \left(\sum_{j=1}^{i} I^{[j,0]}(h_j)\right)_k\\ &= \sum_{j=1}^{i}(I^{[j,0]}(h_j))_k\\ &\underset{\text{[lemma: 16.45]}}{=} \sum_{j=1}^{i}\delta_{j,k}\cdot h_j\\ &= h_k\end{aligned}$$

so that $\|(h^{\langle i\rangle})_k\|_k=\|h_k\|_k$

$\boldsymbol{k \in \{i+1,\dots,n\}}$. Then

$$\begin{aligned}(h^{\langle i\rangle})_k &= \left(\sum_{j=1}^{i} I^{[j,0]}(h_j)\right)_k \\ &= \sum_{j=1}^{i} (I^{[j,0]}(h_j))_k \\ &\underset{\text{[lemma: 16.45]}}{=} \sum_{j=1}^{i} \delta_{j,k}\cdot h_j \\ &\underset{\forall j\in\{1,\dots,n\}\ k\neq j}{=} 0\end{aligned}$$

so that $\|(h^{\langle i\rangle})_k\|_k = \|0\|_k \leqslant \|h_k\|_k$

proving that $\forall k\in\{1,\dots,n\}\ \|(h^{\langle i\rangle})_k\|_k \leqslant \|h_k\|_k$. Hence

$$\|h^{\langle i\rangle}\|_{\max} = \max(\{\|h^{\langle i\rangle}\|_k | k\in\{1,\dots,n\}\}) \leqslant \max(\{\|h_k\|_k | k\in\{1,\dots n\}\}) = \|h\|_{\max}$$

So we have that

$$\forall i\in\{0,\dots,n\}\ \|h^{\langle i\rangle}\|_{\max} \leqslant \|h\|_{\max} \text{ for every } h\in X$$

□

Lemma 16.220. *Let $n\in\mathbb{N}\setminus\{1\}$, $m\in\mathbb{N}$, $\{\langle X_i,\|\|_i\rangle\}_{i\in\{1,\dots,n\}}$ a finite family of normed spaces, $\langle Y,\|\|_Y\rangle$ a* ***Banach*** *space, $\langle X,\|\|_{\max}\rangle$ the normed space based on the product $X=\prod_{i\in\{1,\dots,n\}} X_i$ with the maximum norm $\|\|_{\max}$ [see definition: 14.94], U a open set in X, $x\in U$, $\delta\in\mathbb{R}^+$ with $B_{\|\|_{\max}}(x,\delta)\subseteq U$, $i\in\{1,\dots,n\}$ and a function*

$$f: U\to Y$$

such that $\forall y\in U$ f has a i-partial differential $D_{y,i}f$ at y and the function

$$D_i f: U\to L(X_i;Y) \text{ defined by } D_i f(y) = D_{y,i}f$$

is continuous. Then if $u,v\in B_{\|\|_i}(x_i,\delta)$ we have that

$$\sup(\{\|D_i f(I^{[i,x]}(u+t\cdot(v-u)))\|_{L(X_i,Y)} | t\in[0,1]\})$$

exists and

$$\|f(I^{[i,x]}(u)) - f(I^{[i,x]}(v))\|_Y \leqslant \|u-v\|_i \cdot \sup(\{\|D_i f(I^{[i,x]}(u+t\cdot(v-u)))\|_{L(X_i,Y)} | t\in[0,1]\})$$

Proof. As $(I^{[i,x]})^{-1}(U)\bigcap X_i = (I^{[i,x]})^{-1}(U)$ we can define by [theorem: 2.28] the function

$$f\circ I^{[i,x]}: (I^{[i,x]})^{-1}(U)\to Y$$

Let $t\in(I^{[i,x]})^{-1}(U)$ then $y=I^{[i,x]}(t)\in U$ so that by the hypothesis f has a i-partial differential $D_{y,i}f$ at y. By definition of the partial differentials [see definition: 16.47] it follows that $f\circ I^{[i,y]}$ is Fréchet differentiable at $y_i=(I^{[i,y]}(t))_i=t$ and $D_{I^{[i,y]}(t),i}f = D_{y,i}f = D_t(f\circ I^{[i,y]})$. Let $s\in X_i$ then

$$I^{[i,y]}(s) = \left(y_1,\dots\underbrace{s}_{i},\dots,y_n\right) \underset{y=I^{[i,x]}(t)}{=} \left(x_1,\dots\underbrace{s}_{i}\dots x_{n_i}\right) = I^{[i,x]}(s)$$

so that $I^{[i,y]}=I^{[i,x]}$. Hence $f\circ I^{[i,x]}$ is Fréchet differentiable at t and $D_{I^{[i,x]}(t),i}f = D_t(f\circ I^{[i,x]})$. Summarized

$$f\circ I^{[i,x]} \text{ is Fréchet differentiable on } (I^{[i,x]})^{-1}(U) \tag{16.287}$$

$$\forall t\in(I^{[i,x]})^{-1}(U)\ D_{I^{[i,x]}(t),i}f = D_t(f\circ I^{[i,x]}) \tag{16.288}$$

As $\forall y\in U$ $D_{y,i}f$ exist we can define the function

$$D_i f: U\to L(X_i,Y) \text{ by } D_i f(y) = D_{y,i}f$$

further by [eq: 16.287] we can also define the function

$$D(f\circ I^{[i,x]}): (I^{[i,x]})^{-1}(U)\to L(X_i,Y) \text{ by } D(f\circ I^{[i,x]})(t) = D_t(f\circ I^{[i,x]})$$

Then we have for $t \in (I^{[i,x]})^{-1}(U)$ that

$$D(f \circ I^{[i,x]})(t) = D_t(f \circ I^{[i,x]}) \underset{\text{[eq: 16.288]}}{=} D_{I^{[i,x]}(t),i} f = D_i f(I^{[i,x]}(t)) = (D_i f \circ I^{[i,x]})(t)$$

proving that

$$D(f \circ I^{[i,x]}) = D_i f \circ I^{[i,x]} \tag{16.289}$$

As by the hypothesis $D_i f$ is continuous and $I^{[i,x]}$ is continuous [by lemma: 16.45] it follows that $D(f \circ I^{[i,x]})$ is continuous. Hence

$$f \circ I^{[i,x]} \text{ is } C^1 \text{ on } X_i \tag{16.290}$$

Further we have

$$\begin{aligned}
t \in (I^{[i,x]})^{-1}(B_{\|\|_{\max}}(x,\delta)) &\Leftrightarrow I^{[i,x]}(t) \in B_{\|\|_{\max}}(x,\delta) \\
&\Leftrightarrow \|I^{[i,x]}(t) - x\|_{\max} < \delta \\
&\Leftrightarrow \left\|\left(x_1, \dots \underbrace{t}_{i} \dots, x_n\right) - \left(x_1, \dots \underbrace{x_i}_{i} \dots, x_n\right)\right\|_{\max} < \delta \\
&\Leftrightarrow \left\|\left(0, \dots \underbrace{t - x_i}_{i} \dots, x_n\right)\right\|_{\max} < \delta \\
&\Leftrightarrow \max\left(\left\{\|0\|_1, \dots \underbrace{\|t - x_i\|_i}_{i} \dots \|0\|_n | i \in \{1, \dots, n\}\right\}\right) < \delta \\
&\Leftrightarrow \|t - x_i\|_i < \delta \\
&\Leftrightarrow t \in B_{\|\|_i}(x_i, \delta)
\end{aligned}$$

so that

$$B_{\|\|_i}(x_i,\delta) = (I^{[i,x]})^{-1}(B_{\|\|_{\max}}(x,\delta)) \subseteq (I^{[i,x]})^{-1}(U) \tag{16.291}$$

[Eqs: 16.291 and 16.291] allows us to apply the Mean Value Theorem [corollary: 16.181]. Hence $\forall u, v \in B_{\|\|_i}(x_i,\delta)$ we have that

$$\sup\left(\{\|D_{u+t\cdot(v-u)}(f \circ I^{[i,x]})\|_{L(X_i,Y)} | t \in [0,1]\}\right)$$

exist and

$$\|(f \circ I^{[i,x]})(u) - (f \circ I^{[i,x]})(v)\|_Y \leqslant \|u - v\|_i \cdot \sup\left(\{\|D_{u+t\cdot(v-u)}(f \circ I^{[i,x]})\|_{L(X_i,Y)} | t \in [0,1]\}\right)$$

or using the definition of $D(f \circ I^{[i,x]})$ together with [eq: 16.289]

$$\sup\left(\{\|D_i(f(I^{[i,x]}(u + t\cdot(v-u)))\|_{L(X_i,Y)} | t \in [0,1]\}\right)$$

exist and

$$\|f(I^{[i,x]}(u)) - f(I^{[i,x]}(v))\|_Y \leqslant \|u - v\|_i \cdot \sup\left(\{\|D_i(f(I^{[i,x]}(u + t\cdot(v-u)))\|_{L(X_i,Y)} | t \in [0,1]\}\right)$$

□

Theorem 16.221. *Let $n \in \mathbb{N} \setminus \{1\}$, $\{\langle X_i, \|\|_i\rangle\}_{i \in \{1,\dots,n\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y\rangle$ a **Banach** space, $\langle X, \|\|_{\max}\rangle$ the normed space based on the product $X = \prod_{i \in \{1,\dots,n\}} X_i$ with the maximum norm $\|\|_{\max}$ [see definition: 14.94], U a open set in X, f: $U \to Y$ a function such that $\forall x \in U$ and $\forall i \in \{1,\dots,n\}$ f has a i-partial derivative $D_{x,i} f$ at x and the function*

$$D_i f : U \to L(X_i; Y) \text{ defined by } D_i f(y) = D_{y,i} f$$

is continuous. Then f is C^1 on U and

$$D_x f = \sum_{i=1}^{n} (D_{x,i} f \circ \pi_i)$$

So if we define the function

$$Df : U \to L(X; Y) \text{ where } (Df)(x) = D_x f$$

then

$$Df(x) = \sum_{i=1}^{n} (D_i f(x) \circ \pi_i)$$

Proof. By the hypothesis we have that

$$\forall i \in \{1,\dots,n\} \quad D_i f : U \to L(X_i, Y) \text{ defined by } D_i f(x) = D_{x,i} f \text{ is continuous} \tag{16.292}$$

Let $x \in U$ then as U is open there exist a $\delta \in \mathbb{R}^+$ such that

$$x \in B_{\|\|_{\max}}(x, \delta) \subseteq U$$

Define

$$K: X \to Y \text{ by } K(y) = \sum_{j=1}^{n} D_j f(x)(y_j) \tag{16.293}$$

We proceed now to prove that K is linear and continuous. Let $y, z \in X$ and $\alpha \in \mathbb{K}$ then we have

$$\begin{aligned} K(y + \alpha \cdot z) &= \sum_{j=1}^{n} D_j f(x)(y + \alpha \cdot z)_j \\ &= \sum_{j=1}^{n} D_i f(x)(y_j + \alpha \cdot z_j) \\ &= \sum_{j=1}^{n} (D_j f(x)(y_j) + \alpha \cdot D_i f(x)(z_j)) \\ &= \sum_{i=1}^{n} D_j f(x)(y_j) + \alpha \cdot \sum_{j=1}^{n} D_j f(x)(z_j) \\ &= K(y) + \alpha \cdot K(z) \end{aligned}$$

proving that

$$L \in \mathrm{Hom}(X, Y) \tag{16.294}$$

Further for every $y \in X$ we have

$$\begin{aligned} \|K(y)\|_Y &= \left\| \sum_{j=1}^{n} D_j f(x)(y_j) \right\|_Y \\ &\leqslant \sum_{j=1}^{n} \|D_j f(x)(y_j)\|_Y \\ &\leqslant \sum_{j=1}^{n} \|D_j f(x)\|_{L(X_i, Y)} \cdot \|y_j\|_j \\ &\leqslant \sum_{j=1}^{n} \|D_j f(x)\|_{L(X_i, Y)} \cdot \|y\|_{\max} \\ &\leqslant \left(\sum_{j=1}^{n} \|D_j f(x)\|_{L(X_j, Y)} \right) \cdot \|y\|_{\max} \end{aligned}$$

So using [theorem: 14.177] it follows that

$$K \in L(X, Y) \tag{16.295}$$

Let $i \in \{1, \ldots, n\}$. From the above it follows from [example: 16.129] and [theorem: 16.24] that K is ∞-times differentiable on $B_{\|\|_{\max}}(x, \delta_1)$ and $\forall y \in B_{\|\|_{\max}}(x, \delta)$ $D_y K = K$. Applying [theorem: 16.52] on K gives us that

$$\forall y \in B_{\|\|_{\max}}(x, \delta) \; D_{y,i} K \text{ exists and } D_{y,i} K = K \circ I^{[i,0]}$$

Now for $k \in X_i$ we have

$$\begin{aligned} (K \circ I^{[i,0]})(k) &= K(I^{[i,0]}(k)) \\ &= \sum_{j=1}^{n} D_j f(x)(I^{[i,0]}(k))_j \\ &\underset{\text{[lemma: 16.45]}}{=} \sum_{j=1}^{n} D_j f(x) \cdot \delta_{i,j}(k) \\ &= D_i f(x)(k) \end{aligned}$$

proving that $K \circ I^{[i,0]} = D_i f(x)$. Hence we have

$$\forall y \in B_{\|\|_{\max}}(x,\delta) \text{ we have that } D_{y,i}K \text{ exists and } D_{y,i}K = D_i f(x) \tag{16.296}$$

Further applying [theorem: 16.50] on [eq: 16.292] we have that

$$\forall y \in B_{\|\|_{\max}}(x,\delta)\ D_{y,i}(f_{|B_{\|\|_{\max}}(x,\delta)}) \text{ exist and } D_{y,i}(f_{|B_{\|\|_{\max}}(x,\delta)}) = D_{y,i}f = D_i f(y) \tag{16.297}$$

Also, using [example: 16.53], it follows that

$$\forall y \in B_{\|\|_{\max}}(x,\delta)\ D_{y,i}C_{f(x)} \text{ exist and } D_{y,i}C_{f(x)} = C_0 \tag{16.298}$$

$$\forall y \in B_{\|\|_{\max}}(x,\delta)\ D_{y,i}C_{\sum_{j=1}^n D_j f(x)\cdot x_i} \text{ exist and } D_{y,i}C_{\sum_{j=1}^n D_j f(x)\cdot x_i} = C_0 \tag{16.299}$$

Define

$$L\colon B_{\|\|_{\max}}(x,\delta) \to Y \text{ by } L(x) = \sum_{j=1}^n D_j f(x)(y_j - x_j) = \left(\sum_{j=1}^n D_j f(x)(y_j)\right) - \sum_{j=1}^n D_j f(x)(x_j)$$

then as, $K(y) = \sum_{j=1}^n D_j f(x)(y_j)$, we have

$$L = K - C_{\sum_{j=1}^n D_j f(x)(x_j)} \tag{16.300}$$

Using [theorem: 16.56] together with [eqs: 16.296,16.299] it follows that

$$\forall y \in B_{\|\|_{\max}}(x,\delta)\ D_{y,x}L \text{ exists and } D_{y,i}L = D_i f(x) \tag{16.301}$$

Define

$$g\colon B_{\|\|_{\max}}(x,\delta) \to Y \text{ by } g(y) = f(y) - f(x) - \sum_{j=1}^n D_j f(x)(y_j - x_j) \tag{16.302}$$

then

$$g = f_{|B_{\|\|_{\max}}(x,\delta)} - C_{f(x)} - L$$

Hence by [eqs: 16.297, 16.299, 16.301] and [theorem: 16.56] it follows that

$$\forall y \in B_{\|\|_{\max}}(x,\delta)\, D_{y,i}g \text{ exist and } D_{y,i}g = D_{y,i}f - D_i f(x) \tag{16.303}$$

or if we define

$$D_i g\colon B_{\|\|_{\max}}(x,\delta) \to L(X_i, Y) \text{ by } D_i g(y) = D_{y,i}g$$

that

$$\forall y \in B_{\|\|_{\max}}(x,\delta)\ D_i g(y) = D_i f(y) - D_i f(x) \tag{16.304}$$

So $D_i g = (D_i f)_{|B_{\|\|_{\max}}(x,\delta)} - C_{D_i f(x)}$ and, as $D_i f$, $-C_{D_i f(x)}$ are continuous it follows] that

$$D_i g \text{ is continuous} \tag{16.305}$$

Further we have

$$g(x) \underset{\text{[eq: 16.302]}}{=} f(x) - f(x) - \sum_{j=1}^n D_j f(x_j - x_j) = 0 \tag{16.306}$$

Take $\varepsilon \in \mathbb{R}^+$. As $D_i f$ is continuous at x there exist a $\delta_{i,2} \in \mathbb{R}^+$ such that $\forall y \in U$ with $\|y - x\|_{\max} < \delta_{i,2}$ we have $\|D_i f(y) - D_i f(x)\|_{L(X_i,Y)} < \frac{\varepsilon}{n}$. Define $\delta_2 = \min(\delta, \min(\{\delta_{j,2} | j \in \{1,\ldots,n\}\})) \in \mathbb{R}^+$ then we have [using 16.304] that

$$\forall i \in \{1,\ldots,n\}\ \forall y \in B_{\|\|_{\max}}(x,\delta_2) \text{ we have } \|D_i g(y)\|_{L(X_i,Y)} < \frac{\varepsilon}{n} \tag{16.307}$$

Let $h \in B_{\|\|_{\max}}(0,\delta_2)$ then $\forall i \in \{0,\ldots,n\}$ we have that

$$\|(x + h^{\{i\}}) - x\|_{\max} = \|h^{\{i\}}\|_{\max} \underset{\text{[lemma: 16.219]}}{\leqslant} \|h\|_{\max} < \delta_2$$

so that

$$\forall i \in \{0,\ldots,n\}\ x + h^{\{i\}} \in B_{\|\|_{\max}}(x,\delta_2) \text{ and by [eq: 16.307] } \|D_i g(x + h^{\{i\}})\|_{L(X_i,Y)} < \frac{\varepsilon}{n} \tag{16.308}$$

Next

$$\begin{aligned} g(x+h) &\underset{\text{[lemma: 16.219]}}{=} g(x+h^{\{n\}}) \\ &\underset{\text{[eq: 16.306]}}{=} g(x+h^{\{n\}})-g(x) \\ &\underset{\text{[lemma: 16.219]}}{=} g(x+h^{\{n\}})-g(x+h^{\{0\}}) \\ &\underset{\text{[theorem: 11.21]}}{=} \sum_{i=1}^{n}\left(g(x+h^{\{i\}})-g(x+h^{\{i-1\}})\right) \end{aligned}$$

so that

$$\|g(x+h)\|_Y \leqslant \sum_{i=1}^{n} \|g(x+h^{\{i\}})-g(x+h^{\{i-1\}})\| \tag{16.309}$$

Let $i\in\{1,\dots,n\}$ then, as $\|x_i+h_i-x_i\|_i=\|h_i\|_i\leqslant\|h\|_{\max}<\delta_2$, it follows that $x_i+h_i,x_i\in B_{\|\|_i}(x_i,\delta)$, hence, as D_ig is continuous [see eq: 16.305] and $x+h^{\{i\}}\in B_{\|\|_{\max}}(x,\delta_2)\subseteq U$, we can use [lemma: 16.220] to get

$$\begin{aligned} &\left\|g\big(I^{[i,x+h^{\{i\}}]}(x_i+h_i)\big)-g\big(I^{[i,x+h^{\{i\}}]}(x_i)\big)\right\|_Y \leqslant \\ &\|h_i\|_i\cdot\sup\left(\left\{\left\|D_ig\big(I^{[i,x+h^{\{i\}}]}(x_i+h_i-t\cdot h_i)\big)\right\|_{L(X_i,Y)}|t\in[0,1]\right\}\right) \end{aligned}$$

As $I^{[i,x+h^{\{i\}}]}(x+h_i)\underset{\text{[lemma: 16.219]}}{=}x+h^{\{i\}}$ and $I^{[i,x+h^{\{i\}}]}(x_i)\underset{\text{[lemma: 16.219]}}{=}x+h^{\{i-1\}}$ it follows that

$$\begin{aligned} &\|g(x+h^{\{i\}})-g(x+h^{\{i-1\}})\|_Y \leqslant \\ &\|h_i\|_i\cdot\sup\left(\left\{\left\|D_ig\big(I^{[i,x+h^{\{i\}}]}(x_i+h_i-t\cdot h_i)\big)\right\|_{L(X_i,Y)}|t\in[0,1]\right\}\right) \end{aligned} \tag{16.310}$$

To reduce the above inequality we look at $I^{[i,x+h^{\{i\}}]}(x_i+h_i-t\cdot h_i)$. For $k\in\{1,\dots,n\}$ we have either:

k = i. Then

$$\begin{aligned} \left\|\big(I^{[i,x+h^{\{i\}}]}(x_i+h_i-t\cdot h_i)-x\big)_k\right\|_k &= \left\|\big(I^{[i,x+h^{\{i\}}]}(x_i+h_i-t\cdot h_i)-x\big)_i\right\|_i \\ &= \left\|I^{[i,x+h^{\{i\}}]}(x_i+h_i-t\cdot h_i)_i-x_i\right\|_i \\ &= \|x_i+h_i-t\cdot h_i-x_i\|_i \\ &= \|h_i\cdot(1-t)\|_i \\ &\underset{0\leqslant 1-t}{=} (1-t)\cdot\|h\|_i \\ &< \|h_i\|_i \\ &\leqslant \|h\|_{\max} \\ &< \delta_2 \end{aligned}$$

k ≠ i. Then

$$\begin{aligned} \left\|\big(I^{[i,x+h^{\{i\}}]}(x_i+h_i-t\cdot h_i)-x\big)_k\right\|_k &= \left\|I^{[i,x+h^{\{i\}}]}(x_i+h_i-t\cdot h_i)_k-x\right\|_k \\ &= \|(x+h^{\{i\}})_k-x_k\|_k \\ &= \|x_k+(h^{\{i\}})_k-x_k\|_k \\ &= \|(h^{\{i\}})_k\|_k \\ &\leqslant \|h^{\{i\}}\|_{\max} \\ &\leqslant_{\text{[lemma: 16.219]}} \|h\|_{\max} \\ &< \delta_2 \end{aligned}$$

so that

$$\begin{aligned} \left\|I^{[i,x+h^{\{i\}}]}(x_i+h_i-t\cdot h_i)\right\|_{\max} &= \max\left(\left\{\left\|\big(I^{[i,x+h^{\{i\}}]}(x_i+h_i-t\cdot h_i)-x\big)_k\right\|_k|k\in\{1,\dots,n\}\right\}\right) \\ &< \delta_2 \end{aligned}$$

Hence $I^{[i,x+h^{\{i\}}]}(x_i+h_i-t\cdot h_i)\in B_{\|\|_{\max}}(x,\delta_2)$ so that by [eq: 16.307] we have

$$\left\|D_ig\big(I^{[i,x+h^{\{i\}}]}(x_i+h_i-t\cdot h_i)\big)\right\|_{L(X_i,Y)}<\frac{\varepsilon}{n}$$

which by [eq: 16.310] proves that

$$\|g((+h^{\{i\}})) - g(x+h^{\{i-1\}})\|_Y < \|h_i\|_i \cdot \frac{\varepsilon}{n} \leqslant \|h\|_{\max} \cdot \frac{\varepsilon}{n}$$

Substituting the above in [eq: 16.309] results then in

$$\|g(x+h)\|_Y \leqslant \sum_{i=1}^{n} \|g(x+h^{\{i\}}) - g(x+h^{\{i-1\}})\| < \sum_{i=1}^{n} \frac{\varepsilon}{n} \cdot \|h\|_{\max} = \varepsilon \cdot \|h\|_{\max} \tag{16.311}$$

Further

$$\begin{aligned} g(x+h) &\underset{\text{[eq: 16.302]}}{=} f(x+h) - f(x) - \sum_{i=1}^{n} D_i f(x)((x_i+h_i) - x_i) \\ &= f(x+h) - f(x) - \sum_{i=1}^{n} D_i f(x)(h_i) \end{aligned}$$

so that

$$\left\| f(x+h) - f(x) - \sum_{i=1}^{n} D_i f(h_i) \right\|_Y \leqslant \varepsilon \cdot \|h\|_{\max}$$

which proves that

$$f \text{ is Fréchet differentiable at } x \text{ and } D_x f(h) = \sum_{i=1}^{n} D_i f(x)(h_i)$$

As $x \in U$ was chosen arbitrary, f is Fréchet differentiable on U and we can define the function

$$Df : U \to L(X,Y) \text{ by } Df(x) = D_x f$$

where

$$Df(x) = \sum_{i=1}^{n} D_i f(x) \circ \pi_i$$

Finally we have to prove that Df is continuous. Let $x \in U$ and $\varepsilon \in \mathbb{R}^+$ as $D_i f$ is continuous there exist a $\delta \in \mathbb{R}^+$ such that $\|D_i f(x) - D_i(f)\|_{L(X,Y)} < \frac{\varepsilon}{n}$. Then we have

$$\begin{aligned} \|(Df(x) - Df(y))(h)\|_Y &= \|Df(x)(h) - Dg(y)(h)\|_Y \\ &= \left\| \sum_{i=1}^{n} D_i f(x)(h_i) - \sum_{i=1}^{n} D_i f(y)(h_i) \right\|_Y \\ &= \left\| \sum_{i=1}^{n} (D_i f(x)(h_i) - D_i f(y)(h_i)) \right\|_Y \\ &= \left\| \sum_{i=1}^{n} (D_i f(x) - D_i f(y))(h_i) \right\|_Y \\ &\leqslant \sum_{i=1}^{n} \|(D_i f(x) - D_i f(y))(h_i)\|_Y \\ &\leqslant \sum_{i=1}^{n} \|D_i f(x) - D_i f(y)\|_{L(X_i,Y)} \cdot \|h\|_i \\ &= \sum_{i=1}^{n} (\|D_i f(x) - D_i f(y)\|_{L(X_i,Y)} \cdot \|h\|_{\max}) \\ &= \left(\sum_{i=1}^{n} \|D_i f(x) - D_i f(y)\|_{L(X_i,Y)} \right) \cdot \|h\|_{\max} \\ &\leqslant \left(\sum_{i=1}^{n} \frac{\varepsilon}{n} \right) \cdot \|h\|_{\max} \\ &= \varepsilon \cdot \|h\|_{\max} \end{aligned}$$

so that by [theorem: 14.184] $\|Df(x) - Df(y)\|_{L(X,Y)} < \varepsilon$. Hence Df is continuous at x and as x was chosen arbitrary we have that Df is continuous. Using [theorem: 16.109] we can finally conclude that

$$f \text{ is } C^1 \text{ on } U$$

□

Combining the above theorem with [theorem: 16.215] gives the following equivalence.

Corollary 16.222. *Let $n \in \mathbb{N}\setminus\{1\}$, $\{\langle X_i, \|\|_i\rangle\}_{i\in\{1,\dots,n\}}$ a finite family of normed spaces, $\langle Y, \|\|_Y\rangle$ a **Banach** space, $\langle X, \|\|_{\max}\rangle$ the normed space based on the product $X = \prod_{i\in\{1,\dots,n\}} X_i$ with the maximum norm $\|\|_{\max}$ [see definition: 14.94], U a open set in X, $f: U \to Y$ a function then the following are equivalent:*

1. *f is C^1 on U*
2. *$\forall x \in U$ we have that $\forall i \in \{1,\dots,n\}$ f has a i-partial derivative $D_{x,i}f$ at x and the function*

$$D_i f: U \to L(X_i; Y) \text{ defined by } D_i f(y) = D_{y,i} f$$

is continuous.

Proof.

⇒. Using [theorem: 16.215] for the case $m = 1$ proves that $\forall i \in \{1,\dots,n\}$ f has a i-partial derivative $D_{x,i}f$ at $x \in U$ and the function

$$D_i f: U \to L(X_i; Y) \text{ defined by } D_i f(y) = D_{y,i} f$$

is continuous.

⇐. This is proved in the previous theorem [theorem: 16.221]. □

16.5.3 Higher order derivatives

Definition 16.223. *Let $n \in \mathbb{N}\setminus\{1\}$, $m \in \mathbb{N}$, $\langle \mathbb{K}^n, \|\|_n\rangle$ the normed space with the maximum norm $\|\|_n$, $\langle Y, \|\|_Y\rangle$ a normed space, U a open set in $\mathbb{K}^n$, $x \in U$, $\{i_j\}_{j\in\{1,\dots,m\}} \subseteq \{1,\dots,n\}$ and $f: U \to Y$ then f has a **partial derivative** $\partial^m_{x,i_m\dots i_1} f$ of **order m** at x if for $m \in \mathbb{N}$ we have either:*

$m = 1$. *$\partial_{x,i_1} f \in \mathbb{K}$ exist [see definition: 16.58].*

$1 < m$. *If there exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V$ $\partial_{y,i_{m-1}\dots i_1} f$ exist and the function*

$$\partial_{i_{m-1}\dots i_1} f: U \to Y \text{ defined by } \partial_{i_{m-1}\dots i_1} f(y) = \partial_{y,i_{m-1}\dots i_1} f$$

has a i_m-partial derivative at x and $\partial_{x,i_m\dots i_1} f = \partial_{x,i_m}(\partial_{i_{m-1}\dots i_1} f)$.

***Note* 16.224.** *[theorem: 16.60] ensures that the above definition is independent of the chosen V.*

Definition 16.225. *Let $n \in \mathbb{N}\setminus\{1\}$, $m \in \mathbb{N}$, $\langle \mathbb{K}^n, \|\|_n\rangle$ the normed space with the maximum norm $\|\|_n$, $\langle Y, \|\|_Y\rangle$ a normed space, U a open set in $\mathbb{K}^n$, $\{i_j\}_{j\in\{1,\dots,m\}} \subseteq \{1,\dots,n\}$ and $f: U \to Y$ then f has a **$(i_m\dots i_1)$-partial derivative** $\partial^m_{i_m\dots i_1} f$ of **order m on U** if $\forall x \in U$ f has a partial derivative $\partial^m_{x,i_m\dots i_1} f$ at x.*

Just as there is a relation between partial derivatives and partial differentials [see theorem: 16.59] the same applies to partial derivatives and differentials of higher order.

Theorem 16.226. *Let $n \in \mathbb{N}\setminus\{1\}$, $m \in \mathbb{N}$, $\langle \mathbb{K}^n, \|\|_n\rangle$ the normed space with the maximum norm $\|\|_n$, $\langle Y, \|\|_Y\rangle$ a normed space, U a open set in $\mathbb{K}^n$, $x \in U$, $\{i_j\}_{j\in\{1,\dots,m\}} \subseteq \{1,\dots,n\}$ and $f: U \to Y$ a function that has a partial differential $D^{[m]}_{x,i_m\dots i_1} f$ of order m at x then f has a partial derivative $\partial^m_{x,i_m\dots i_1} f$ of order m and $\partial^m_{x,i_m\dots i_1} f = D^{[m]}_{x,i_m\dots i_1} f\left(\underbrace{1:\dots:1}_{m}\right)$.*

Proof. We prove this by induction so let

$$\mathcal{S} = \left\{ m \in \mathbb{N} \middle| \text{If } \{i_j\}_{j\in\{1,\dots,m\}} \subseteq \{1,\dots,n\},\ U \subseteq \mathbb{R}^n \text{ a open set, } x \in U \text{ and } f: U \to Y \text{ a function such that } D^m_{x,i_m,\dots,i_n} f \text{ exist then } \partial^m_{x,i_m,\dots,i_1} f \text{ exist with } \partial^m_{x,i_m,\dots,i_1} f = D^m_{x,i_m,\dots,i_1} f\left(\underbrace{1:\dots:1}_{m}\right) \right\}$$

then we have:

$1 \in S$. Given $\{i_j\}_{j\in\{1\}} \subseteq \{1,\dots,n\}$, let U be a open set, $x \in U$ and $f: U \to Y$ a function such that $D^{[1]}_{x,i_1\dots i_1} f$ exist then by definition $D_{x,i_1} f$ exist and $D_{x,i_1} f = D^{[1]}_{x,i_1\dots i_1} f$. Hence using [theorem: 16.59] $\partial_{x,i_1} f$ exist and $\partial_{x,i_1} f = D_{x,i_1} f(1)$. So by definition $\partial^1_{x,i_1\dots i_1} f \underset{\text{def}}{=} \partial_{x,i_1} f = D^{[1]}_{x,i_1\dots i_1} f(1)$ proving that $1 \in S$.

$m \in S \Rightarrow m+1 \in S$. Let $\{i_j\}_{j\in\{1,\dots,m+1\}} \subseteq \{1,\dots,n\}$, U a open set, $x \in U$ and $f: U \to Y$ a function such that $D^{[m+1]}_{x,i_{m+1}\dots i_1} f$ exist. Then there exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V\, D^{[m]}_{x,i_m\dots i_1} f$ exist and the function

$$D^{[m]}_{i_m\dots i_1} f: V \to L_m(\mathbb{K};Y) \text{ defined by } D^{[m]}_{i_m\dots i_1} f(y) = D^{[m]}_{y,i_m\dots i_1} f$$

has a i_{m+1}-partial derivative at x and $D^{[m+1]}_{x,i_{m+1}\dots i_1} f = D_{x,i_m}\left(D^{[m]}_{i_m\dots i_1} f\right)$. As $m \in S$ we have that $\forall y \in V\, \partial^m_{y,i_m\dots i_1} f$ exist and $\partial^m_{y,i_m\dots i_1} f = D^{[m]}_{y,i_m\dots i_1} f\left(\underbrace{1:\dots:1}_{m}\right)$. Define

$$\partial^m_{i_m\dots i_1} f: V \to Y \text{ by } \partial^m_{i_m\dots i_1} f(y) = \partial^m_{y,i_m\dots i_1} f$$

Consider the evaluation operator defined by [see definition: 16.185]

$$\mathrm{ev}_{\underbrace{1\dots1}_{m}}: L_m(\mathbb{K};Y) \to Y \text{ where } \mathrm{ev}_{\underbrace{1\dots1}_{m}}(L) = L\left(\underbrace{1:\dots:1}_{m}\right)$$

then

$$\begin{aligned} D^{[m]}_{y,i_m\dots i_1} f\left(\underbrace{1:\dots:1}_{m}\right) &= v_{\underbrace{1\dots1}_{m}}\left(D^{[m]}_{y,i_m\dots i_1} f\right) \\ &= v_{\underbrace{1\dots1}_{m}}\left(D^{[m]}_{i_m\dots i_1} f(y)\right) \\ &= \left(\mathrm{ev}_{\underbrace{1\dots1}_{m}} \circ D^{[m]}_{i_m\dots i_1} f\right)(y) \\ &= \left(\mathrm{ev}_{\underbrace{1\dots1}_{n}} \circ D^{[m]}_{i_m\dots i_1} f\right)(y) \end{aligned}$$

So if $y \in V$ then

$$\partial^m_{i_m\dots i_1} f(y) = \partial^m_{y,i_m\dots i_1} f = D^{[m]}_{y,i_m\dots i_1} f\left(\underbrace{1:\dots:1}_{n}\right) = \left(\mathrm{ev}_{\underbrace{1\dots1}_{n}} \circ D^{[m]}_{i_m\dots i_1} f\right)(y)$$

proving that

$$\partial^m_{i_m\dots i_1} f = \mathrm{ev}_{\underbrace{1\dots1}_{n}} \circ D^{[m]}_{i_m\dots i_1} f \tag{16.312}$$

As $D^{[m]}_{i_m\dots i_1} f$ has a i_{m+1}-partial differential at x, and by [lemma: 16.186] $\mathrm{ev}_{\underbrace{1\dots1}_{n}}$ is differentiable on $L_m(\mathbb{K};Y)$ it follows from the chain rule for partial differentiation [theorem: 16.57] that $\mathrm{ev}_{\underbrace{1\dots1}_{n}} \circ D^{[m]}_{i_m\dots i_1} f$ has a i_{m+1}-partial derivative at x and

$$\begin{aligned} D_{x,i_{m+1}}\left(\mathrm{ev}_{\underbrace{1\dots1}_{n}} \circ D^{[m]}_{i_m\dots i_1} f\right) &= D_{D_{i_m\dots i_1}(x)}\mathrm{ev}_{\underbrace{1\dots1}_{n}} \circ D_{x,i_{i_{m+1}}}\left(D^{[m]}_{i_m\dots i_1} f\right) \\ &\underset{\text{[lemma: 16.186]}}{=} \mathrm{ev}_{\underbrace{1\dots1}_{m}} \circ D_{x,i_{i_{m+1}}}\left(D^{[m]}_{i_m\dots i_1} f\right) \\ &= \mathrm{ev}_{\underbrace{1\dots1}_{m}} \circ D^{[m+1]}_{x,i_{m+1}\dots i_1} f \\ &= D^{[m+1]}_{x,i_{m+1}\dots i_1} f\left(\underbrace{1:\dots:1}_{n}\right) \end{aligned}$$

combining this with [eq: 16.312] proves that $\partial^m_{i_m\dots i_1} f$ has a i_{m+1}-partial derivative at x and

$$D_{x,i_{m+1}}\left(\partial^m_{i_m\dots i_1} f\right) = D^{[m+1]}_{x,i_{m+1}\dots i_1} f\left(\underbrace{1:\dots:1}_{n}\right) \tag{16.313}$$

Using [theorem: 16.59] it follows that $\partial^m_{i_m\dots i_1} f$ has a i_{m+1} partial derivative at x and

$$\begin{aligned} \partial^m_{x,i_{m+1}\dots i_1} f &= \partial_{x,i_{m+1}}\left(\partial^m_{i_m\dots i_1} f\right) \\ &= D^{[m+1]}_{x,i_{m+1}}\left(\partial^m_{i_m\dots i_1} f\right)(1) \\ &\underset{\text{[eq: 16.313]}}{=} D^{[m+1]}_{x,i_{m+1}\dots i_1} f\left(\underbrace{1:\dots:1}_{m}\right)(1) \\ &\underset{\text{[lemma: 16.84]}}{=} D^{[m+1]}_{x,i_{m+1}\dots i_1} f\left(\underbrace{1:\dots:1}_{m+1}\right. \end{aligned}$$

proving that

$$m+1\in S$$

□

So we have proved that higher order partial differentiation implies higher order derivation, next we prove the opposite.

Definition 16.227. *Let $m\in\mathbb{N}$, $\langle\mathbb{K}^m,\|\|_m\rangle$ the normed space with the maximum norm $\|\|_m$, $\langle Y,\|\|\rangle$ a normed space and $a\in Y$ then we define*

$$h_{m,a}:\mathbb{K}^m\to Y \text{ by } h_{m,a}(x)=\left(\prod_{i=1}^m x_i\right)\cdot a$$

Using [example: 14.191] it follows that $h_{m,a}\in L^m(\mathbb{K},Y)$ so that we can use

$$\mathcal{I}_{m,\mathbb{K},Y}:L_m(\mathbb{K};Y)\to L^m(\mathbb{K};Y) \text{ defined in [theorem: 16.91]}$$

to finally define $\mathcal{P}[m,a]$ by

$$\mathcal{P}[m,a]=(\mathcal{I}_{m,\mathbb{K},Y})^{-1}(h_{m,a})\in L_m(\mathbb{K};Y)$$

***Note* 16.228.** *If $x=(x_1,\ldots,x_m)\in\mathbb{K}^n$ then we have*

$$\mathcal{P}[m,a](x_1:\ldots:x_1)=(\mathcal{I}_{m,\mathbb{K},Y})^{-1}(h_{m,a})(x_1:\ldots:x_m)\underset{\text{[theorem: 16.91]}}{=}h_{m,a}(x_1,\ldots,x_m)=\left(\prod_{i=1}^m x_i\right)\cdot a$$

so that

$$\mathcal{P}[m,a]\left(\underbrace{1:\ldots:1}_{m}\right)=a$$

Lemma 16.229. *Let $m\in\mathbb{N}$, $\langle\mathbb{K}^m,\|\|_m\rangle$ the normed space with the maximum norm $\|\|_m$, $\langle Y,\|\|\rangle$ a normed space then if we define*

$$\mathcal{P}[m]:Y\to L_m(\mathbb{K};Y) \text{ by } \mathcal{P}[m](y)=\mathcal{P}[m,y]$$

then

$$\mathcal{P}[m]\in L(Y,L_m(\mathbb{K};Y))$$

so that by [example: 16.129] $\mathcal{P}[m]$ is ∞-times differentiable on Y and $\forall y\in Y$

$$D_y\mathcal{P}[m]=D_y^{[1]}\mathcal{P}[m]=\mathcal{P}[m]$$

Proof. First we prove linearity, so let $\alpha\in\mathbb{K}$ and $x,y\in Y$ then we have for $h\in\mathbb{K}^m$ that

$$\begin{aligned}(\mathcal{P}[m](x+\alpha\cdot y))(h_1:\ldots:h_m) &= \mathcal{P}[m,x+\alpha\cdot y](h_1:\ldots:h_m)\\ &= \left(\prod_{i=1}^m h_i\right)\cdot(x+\alpha\cdot y)\\ &= \left(\prod_{i=1}^m h_i\right)\cdot x+\alpha\cdot\left(\left(\prod_{i=1}^m h_i\right)\cdot y\right)\\ &= (\mathcal{P}[m](x))(h_1:\ldots:h_m)+(\alpha\cdot\mathcal{P}[m](y))(h_1:\ldots:h_m)\\ &\underset{\text{[lemma: 16.85]}}{=} (P[m](x)+\alpha\cdot\mathcal{P}[m](y))(h_1:\ldots:h_m)\end{aligned}$$

proving by [lemma: 16.88] that $\mathcal{P}[m](x+\alpha\cdot y)=P[m](x)+\alpha\cdot\mathcal{P}[m](y)$. Hence

$$\mathcal{P}[m]\in\mathrm{Hom}(Y;L_m(\mathbb{K};Y))$$

Further we have

$$\begin{aligned}\|(\mathcal{P}[m](x))(h_1:\ldots:h_m)\|_Y &= \|\mathcal{P}[m,x](h_1\ldots h_m)\|_Y\\ &= \left\|\left(\prod_{i=1}^m h_i\right)\cdot x\right\|_Y\\ &= \left|\prod_{i=1}^m h_i\right|\cdot\|x\|_Y\\ &= \|x\|_Y\cdot\prod_{i=1}^m |h_i|\end{aligned}$$

so that by [lemma: 16.89] we have $\|\mathcal{P}[m](x)\|_{L_m(\mathbb{K};Y)} \leqslant \|x\|_Y$. Hence by [theorem: 14.177] $\mathcal{P}[m]$ is continuous proving that

$$\mathcal{P}[m] \in L(Y, L_m(\mathbb{K};Y))$$

□

Theorem 16.230. *Let $n \in \mathbb{N}\setminus\{1\}$, $m \in \mathbb{N}$, $\langle \mathbb{K}^n, \|\|_n\rangle$ the normed space with the maximum norm $\|\|_n$, $\langle Y, \|\|_Y\rangle$ a normed space, U a open set in $\mathbb{K}^n$, $x \in U$, $\{i_j\}_{j\in\{1,\dots,m\}} \subseteq \{1,\dots,n\}$ and $f: U \to Y$ has a partial derivative $\partial^m_{x,i_m\dots i_1}$ at x of order m then f has a partial differential $D^{[m]}_{x,i_m\dots i_1}f$ of order m at x and $D^{[m]}_{x,i_m\dots i_1}f = \mathcal{P}[m, \partial^m_{x,i_m\dots i_1}f]$.*

Proof. We prove this by induction, so define

$S = \big\{m \in \mathbb{N} | \text{If } \{i_j\}_{j\in\{1,\dots,m\}} \subseteq \{1,\dots,n\}, U \subseteq \mathbb{K}^n \text{ a open set, } x \in U \text{ and } f: U \to Y \text{ a function such that } \partial^m_{x,i_m\dots i_1}f \text{ exists then } D^{[m]}_{x,i_m\dots i_1}f$ exist and $D^{[m]}_{x,i_m\dots i_1}f = \mathcal{P}[m, \partial^1_{x,i_m\dots i_1}f]\big\}$

then we have:

$1 \in S$. Given $\{i_j\}_{j\in\{1\}} \subseteq \{1,\dots,n\}$, let $f: U \to Y$ be a function such that $\partial^1_{x,i_1\dots\partial_{i_1}}f$ exist, then by definition $\partial_{x,i_1}f$ exist and $\partial_{x,i_1}f = \partial^1_{x,i_1\dots i_1}f$. Hence using [theorem: 16.59] $D_{x,i_1}f$ exist and is defined by

$$D_{x,i_1}f: \mathbb{K} \to Y \text{ by } D_{x,i_1}f(h) = h \cdot \partial_{x,i_1}f = h \cdot \partial^1_{x,i_1\dots i_1}f$$

Further if $h_1 \in \mathbb{K}$ then

$$\begin{aligned}
\mathcal{P}[1, \partial^1_{x,i_1\dots i_1}f]\Big(\underbrace{h_1 : \dots : h_1}_{1}\Big) &\underset{\text{[note: 16.228]}}{=} \left(\prod_{i=1}^{1} h_i\right) \cdot \partial^1_{x,i_1\dots i_1}f \\
&= h_1 \cdot \partial^1_{x,i_1\dots i_1}f \\
&= D_{x,i_1}f \\
&= D^{[1]}_{x,i_1\dots i_1}f
\end{aligned}$$

hence $1 \in S$.

$m \in S \Rightarrow m+1 \in S$. Let $\{i_j\}_{j\in\{1,\dots,m+1\}} \subseteq \{1,\dots,n\}$ and $f: U \to Y$ a function such that $\partial^{m+1}_{x,i_{m+1}\dots i_1}f$ exist. Then by definition there exist a open set V with $x \in V \subseteq U$ such that $\forall y \in V\, \partial^m_{y,i_m\dots i_1}f$ exist and the function

$$\partial^m_{i_m\dots i_1}f: V \to Y \text{ defined by } \partial^m_{i_m\dots i_1}f(y) = \partial^m_{y,i_m\dots i_1}f$$

has a i_{m+1}-derivative at x and

$$\partial^{m+1}_{x,i_{m+1}\dots i_1}f = \partial_{x,i_{m+1}}(\partial^m_{x,i_m\dots i_1}f) \tag{16.314}$$

As $m \in S$ we have that $\forall y \in V\, D^{[m]}_{y,i_m\dots i_1}f$ exist and

$$\begin{aligned}
D^{[m]}_{y,i_m\dots i_1}f &= \mathcal{P}\big[m, \partial^{[m]}_{y,i_m\dots i_1}f\big] \\
&= \mathcal{P}\big[m, \partial^{[m]}_{i_m\dots i_1}f(y)\big] \\
&\underset{\text{[lemma: 16.229]}}{=} \mathcal{P}[m]\big(\partial^{[m]}_{i_m\dots i_1}f(y)\big) \\
&= \big(\mathcal{P}[m] \circ \partial^{[m]}_{i_m\dots i_1}f\big)(y)
\end{aligned}$$

So if we define

$$D^{[m]}_{i_m\dots i_1}f: V \to L_m(\mathbb{K};Y) \text{ by } D^{[m]}_{i_m\dots i_1}f(y) = D^{[m]}_{y,i_m\dots i_1}f$$

then $D^{[m]}_{i_m\dots i_1}f(y) = D^{[m]}_{y,i_m\dots i_1}f = \big(\mathcal{P}[m] \circ \partial^{[m]}_{i_m\dots i_1}f\big)(y)$, proving that

$$D^{[m]}_{i_m\dots i_1}f = \mathcal{P}[m] \circ \partial^{[m]}_{i_m\dots i_1}f \tag{16.315}$$

As $\partial^m_{i_m\dots i_1}f$ has a i_{m+1}-partial derivative at x we can use [theorem: 16.59] to prove that $\partial^m_{i_m\dots i_1}f$ has a i_{m+1}-partial differential at x and that the function $D_{x,i_{m+1}}(\partial^m_{i_m\dots i_1}f) \in L(\mathbb{K}, Y)$ is defined by

$$D_{x,i_{m+1}}(\partial^m_{y_m\dots y_1}f): \mathbb{K} \to Y \text{ where } D_{x,i_{m+1}}(\partial^m_{i_m\dots i_1}f)(h) = h \cdot \partial_{x,i_{m+1}}(\partial^m_{i_m\dots i_1}f) \tag{16.316}$$

As $\mathcal{P}[m]$ is Fréchet differentiable on Y [see lemma: 16.229] and $\partial^m_{i_m\ldots i_1}f$ has a i_{m+1}-partial differential at x we can apply the chain rule for partial differentials [see theorem: 16.57] resulting in the fact that $\mathcal{P}[m]\circ\partial^m_{i_m\ldots i_1}f$ has a i_{m+1}-partial differential at x and

$$\begin{aligned} D_{x,i_{m+1}}(\mathcal{P}[m]\circ\partial^m_{i_m\ldots i_1}f) &= D_{\partial^{[m]}_{i_m\ldots i_1}f(x)}\mathcal{P}[m]\circ D_{x,i_{m+1}}\partial^m_{i_m\ldots i_1}f \\ &\underset{\text{[lemma: 16.229]}}{=} \mathcal{P}[m]\circ D_{x,i_{m+1}}\partial^m_{i_m\ldots i_1}f \end{aligned}$$

Using [eq: 16.315] and the above we get that $D^{[m]}_{i_m\ldots i_1}f$ has a i_{m+1}-partial differential at x and

$$D_{x,i_{m+1}}\big(D^{[m]}_{i_m\ldots i_1}f\big)=\mathcal{P}[m]\circ D_{x,i_{m+1}}\partial^{[m]}_{i_m\ldots i_1}f$$

Hence by definition f has a partial differential $D^{[m+1]}_{x,i_{m+}\ldots i_1}f$ and

$$D^{[m+1]}_{x,i_{m+1}\ldots i_1}f=\mathcal{P}[m]\circ D_{x,i_{m+1}}\partial^{[m]}_{i_m\ldots i_1}f \tag{16.317}$$

Now given $h\in\mathbb{K}^{m+1}$ we have

$$\begin{aligned} D^{[m+1]}_{x,i_{m+1}\ldots i_1}f(h_1:\ldots:h_{m+1}) &\underset{\text{[eq: 16.317]}}{=} \\ \big(\mathcal{P}[m]\circ D_{x,i_{m+1}}\partial^{[m]}_{i_m\ldots i_1}f\big)(h_1:\ldots:h_{m+1}) &= \\ \big(\big(\mathcal{P}[m]\circ D_{x,i_{m+1}}\partial^{[m]}_{i_m\ldots i_1}f\big)(h_1)\big)(h_2:\ldots:h_{m+1}) &= \\ \big(\mathcal{P}[m]\big(D_{x,i_{m+1}}\big(\partial^{[m]}_{i_m\ldots i_1}f\big)(h_1)\big)\big)(h_2:\ldots:h_{m+1}) &\underset{\text{[eq: 16.316]}}{=} \\ (\mathcal{P}[m](h_1\cdot\partial_{x,i_{m+1}}(\partial^m_{i_m\ldots i_1}f)))(h_2:\ldots:h_{m+1}) &\underset{\mathcal{P}[m]\in L(Y;L_m(\mathbb{K};Y))}{=} \\ h_1\cdot(\mathcal{P}[m](\partial_{x,i_{m+1}}(\partial^m_{i_m\ldots i_1}f)))(h_2:\ldots h_{m+1}) &= \\ h_1\cdot\mathcal{P}[m,\partial_{x,i_{m+1}}(\partial^m_{i_m\ldots i_1}f)](h_2:\ldots h_{m+1}) &= \\ \left(h_1\cdot\prod_{i=1}^m h_{i+1}\right)\cdot\partial_{x,i_{m+1}}(\partial^m_{i_m\ldots i_1}f) &= \\ \left(\prod_{i=1}^{m+1} h_i\right)\cdot\partial_{x,i_{m+1}}(\partial^m_{i_m\ldots i_1}f) &\underset{\text{[eq: 16.314]}}{=} \\ \left(\prod_{i=1}^{m+1} h_i\right)\cdot\partial^{m+1}_{x,i_{m+1}\ldots i_1}f &= \\ \mathcal{P}[m+1,\partial_{x,i_{m+1}\ldots i_1}f](h_1:\ldots:h_{m+1}) & \end{aligned}$$

Hence by [lemma: 16.88] we have

$$D^{[m+1]}_{x,i_{m+1}\ldots i_1}f=\mathcal{P}[m+1,\partial^{m+1}_{x,i_{m+1}\ldots i_1}f]$$

proving

$$m+1\in S$$

□

We can now combine [theorem: 16.226] and [theorem: 16.230] to find the following equivalences.

Theorem 16.231. *Let $n\in\mathbb{N}\setminus\{1\}$, $m\in\mathbb{N}$, $\langle\mathbb{K}^n,\|\|_n\rangle$ the normed space with the maximum norm $\|\|_n$, $\langle Y,\|\|_Y\rangle$ a normed space, U a open set in $\mathbb{K}^n$, $x\in U$, $\{i_j\}_{j\in\{1,\ldots,m\}}\subseteq\{1,\ldots,n\}$ and $f:U\to Y$ a function then we have*

$$f \text{ has a partial differential } D^{[m]}_{x,i_m\ldots i_1}f \text{ at } x$$

$$\Updownarrow$$

$$f \text{ has a partial derivate } \partial^m_{x,i_m\ldots i_1}f$$

Further if f has a partial differential or derivative at x then

$$\partial^m_{x,i_m\ldots i_1}f=D^{[m]}_{x,i_m\ldots i_1}f\Big(\underbrace{1:\ldots:1}_{m}\Big)$$

and

$$D^{[m]}_{x,i_m\ldots i_1}f\in L_m(\mathbb{K};Y) \text{ is defined by } D^{[m]}_{x,i_m\ldots i_1}f=\mathcal{P}[m,\partial^m_{x,i_m\ldots i_1}]$$

so that for $h \in \mathbb{K}^m$ we have

$$D^{[m]}_{x,i_m\ldots i_1}f(h_1:\ldots h_m) = \left(\prod_{i=1}^{m} h_i\right)\cdot \partial^m_{x,i_m\ldots i_1}f$$

Proof. This follows directly from [theorems: 16.226 and 16.230]. □

Theorem 16.232. *Let $n \in \mathbb{N}\backslash\{1\}$, $\langle \mathbb{K}^n, \|\|_n\rangle$ the normed space with the maximum norm $\|\|_n$, $\langle Y, \|\|_Y\rangle$ a normed space, U a open set in $\mathbb{K}^n$, $\{i_j\}_{j\in\{1,\ldots,m\}} \subseteq \{1,\ldots,n\}$ and $f: U \to Y$ a function then we have the following equivalences:*

1. *f has a $(i_m\ldots i_1)$-partial differential on U and*
$$D^{[m]}_{i_m\ldots i_1}f: U \to L_m(\mathbb{K};Y) \text{ defined by } D^{[m]}_{i_m\ldots i_1}f(x) = D^{[m]}_{x,i_m\ldots i_1}f$$
is continuous.
2. *f has a $(i_m\ldots i_1)$-partial derivative on U and*
$$\partial_{i_m\ldots i_1}f: U \to L_m(\mathbb{K};Y) \text{ defined by } \partial_{i_m\ldots i_1}f(x) = \partial_{x,i_m\ldots i_1}f$$
is continuous.

Proof.

⇒. Using the previous theorem [theorem: 16.231] it follows that f has a $(i_m\ldots i_1)$-partial derivative on U so we must only prove continuity. Let $x \in U$ then we have by [theorem: 16.231] that

$$\begin{aligned}
\partial^m_{i_1\ldots i_m}f(x) = \partial^m_{x,i_m\ldots i_1}f &= D^{[m]}_{x,i_m\ldots i_1}f\left(\underbrace{1:\ldots:1}_{m}\right)\\
&\underset{\text{[definition: 16.185]}}{=} \mathrm{ev}_{\underbrace{1\ldots1}_{m}}\left(D^{[m]}_{x,i_m\ldots i_1}f\right)\\
&= \mathrm{ev}_{\underbrace{1\ldots1}_{m}}\left(D^{[m]}_{i_m\ldots i_1}f(x)\right)\\
&= \left(\mathrm{ev}_{\underbrace{1\ldots1}_{m}}\circ D^{[m]}_{i_m\ldots i_1}f\right)(x)
\end{aligned}$$

proving that $\partial^m_{i_1\ldots i_m}f = \mathrm{ev}_{\underbrace{1\ldots1}_{m}}\circ D^{[m]}_{i_m\ldots i_1}f$. As by [lemma: 16.186] $\mathrm{ev}_{\underbrace{1\ldots1}_{m}}$ is continuous and $D^{[m]}_{i_m\ldots i_1}f$ is continuous it follows that $\partial^m_{i_1\ldots i_m}f$ is continuous.

⇐. Using the previous theorem [theorem: 16.231] it follows that f has a $(i_m\ldots i_1)$-partial differential on U so we must only prove continuity. Let $x \in U$ then we have by [theorem: 16.231] that

$$\begin{aligned}
D^{[m]}_{i_m\ldots i_1}f(x) &= D^{[m]}_{x,i_m\ldots i_1}f\\
&= \mathcal{P}[m,\partial_{x,\partial_m\ldots\partial_1}f]\\
&= \mathcal{P}[m](\partial_{x,\partial_m\ldots\partial_1}f)\\
&= \mathcal{P}[m](\partial_{\partial_m\ldots\partial_1}f(x))\\
&= (\mathcal{P}[m]\circ\partial_{\partial_m\ldots\partial_1}f)(x)
\end{aligned}$$

proving that $D^{[m]}_{i_m\ldots i_1}f = \mathcal{P}[m]\circ\partial_{\partial_m\ldots\partial_1}f$. As by [lemma: 16.229] is $\mathcal{P}[m]$ is continuous and $\partial_{\partial_m\ldots\partial_1}f$ is continuous it follows that $D^{[m]}_{i_m\ldots i_1}f$ is continuous. □

Lemma 16.233. *Let $n \in \mathbb{N}$, $m \in \mathbb{N}$, $\langle \mathbb{K}^n, \|\|\rangle$ be the vector space of real [complex] numbers with the maximum norm, $\langle Y, \|\|_Y\rangle$ a normed space and $L \in L_m(\mathbb{K}^n;Y)$ then for $\{h_i\}_{i\in\{1,\ldots,m\}} \subseteq \mathbb{K}^n$ we have*

$$L(h_1:\ldots:h_m) = \sum_{i\in\{1,\ldots,n\}^m}\left(\prod_{j=1}^{m}(h_j)_{i_j}\right)\cdot L(e_{i_1}:\ldots:e_{i_m})$$

where $\{e_i\}_{i\in\{1,\ldots,n\}}$ is the canonical basis on $\mathbb{K}^n$ defined by $(e_i)_j = \delta_{i,j}$.

Proof. We proof this by induction on m so define

$$S = \left\{m \in \mathbb{N} \middle| \text{If } \{h_i\}_{i\in\{1,\ldots,m\}} \subseteq \mathbb{K}^n \text{ and } L \in L_m(\mathbb{K}^n;Y) \text{ then } L(h_1:\ldots:h_m) = \sum_{i\in\{1,\ldots,n\}^m}\left(\prod_{j=1}^{m}(h_j)_{i_j}\right)\cdot L(e_{i_1}:\ldots:e_{i_m})\right\}$$

then we have:

$1 \in S$. If $\{h_i\}_{i\in\{1\}} \subseteq \mathbb{K}^n$ and $L \in L_1(\mathbb{K}^n;Y) = L(\mathbb{K}^n,Y)$ then we have

$$\begin{aligned}
L\Big(\underbrace{h_1:\ldots:h_1}_{1}\Big) &= L(h_1) \\
&= L\left(\sum_{i=1}^n (h_1)_i \cdot e_i\right) \\
&= \sum_{i=1}^n (h_1)_i \cdot L(e_i) \\
&= \sum_{i\in\{1,\ldots,n\}^1} (h_1)_{i_1} \cdot L(e_{i_1}) \\
&= \sum_{i\in\{1,\ldots,n\}^1} (h_1)_{i_1} \cdot L(e_{i_1}) \\
&= \sum_{i\in\{1,\ldots,n\}^1} \left(\prod_{j=1}^1 (h_j)_{i_j}\right) \cdot L\Big(\underbrace{e_{i_1}:\ldots:e_{i_1}}_{1}\Big)
\end{aligned}$$

which proves that $1 \in S$.

$m \in S \Rightarrow m+1 \in S$. If $\{h_i\}_{i\in\{1,\ldots,m+1\}} \subseteq \mathbb{K}^n$ and $L \in L_{m+1}(\mathbb{K}^n;Y)$ then for $i \in \{1,\ldots,n\}$ $L(e_i) \in L_m(\mathbb{K}^n;Y)$ so, as $m \in S$, we have

$$L(e_i)(h_2:\ldots:h_{m+1}) = \sum_{i\in\{1,\ldots,n\}^m} \left(\prod_{j=2}^{m+1} (h_j)_{i_j}\right) \cdot L(e_i)(e_{i_1}:\ldots:e_{i_{m+1}}) \tag{16.318}$$

Next we have

$$\begin{aligned}
L(h_1:\ldots:h_{m+1}) &= \\
L(h_1)(h_2:\ldots:h_{m+1}) &= \\
L\left(\sum_{i=1}^n (h_1)_i \cdot e_i\right)(h_2:,\ldots,:h_{m+1}) &= \\
\sum_{i\in\{1,\ldots,n\}} (h_1)_i \cdot L(e_i)(h_2:\ldots:h_{m+1}) &= \text{[eq: 16.318]} \\
\sum_{i\in\{1,\ldots,n\}} \left((h_1)_i \cdot \sum_{i\in\{1,\ldots,n\}^m} \left(\prod_{j=2}^{m+1} (h_j)_{i_j}\right) \cdot L(e_i)(e_{i_1}:\ldots:e_{i_{m+1}})\right) &= \\
\sum_{i\in\{1,\ldots,n\}} \left(\sum_{i\in\{1,\ldots,n\}^m} (h_1)_i \cdot \left(\prod_{j=2}^{m+1} (h_j)_{i_j}\right) \cdot L(e_i)(e_{i_1}:\ldots:e_{i_{m+1}})\right) &= \text{[theorem: 11.46]} \\
\sum_{i\in\{1,\ldots,n\}^{m+1}} \left((h_1)_{i_1} \cdot \prod_{j=2}^{m+1} (h_j)_{i_j}\right) \cdot L(e_{i_1})(e_{i_2}:\ldots:e_{i_{m+1}}) &= \\
\sum_{i\in\{1,\ldots,n\}^{m+1}} \left(\prod_{j=1}^{m+1} (h_j)_{i_j}\right) \cdot L(e_{i_1}:\ldots:e_{i_{m+1}})
\end{aligned}$$

proving that $m+1 \in S$ □

Theorem 16.234. *Let $n \in \mathbb{N}\backslash\{1\}$, $m \in \mathbb{N}$, $\langle \mathbb{K}^n, \|\|\rangle$ be the vector space $\mathbb{K}^n$ with the maximum norm, $\langle Y, \|\|_Y\rangle$ a normed space, U a open set in $\mathbb{K}^n$, $x \in U$, $f: U \to Y$ a function that is m-times differentiable at x then $\forall \{i_j\}_{j\in\{1,\ldots,m\}} \subseteq \{1,\ldots,n\}$ $\partial^m_{x,i_m,\ldots,i_1} f$ exists and we have*

$$\partial^m_{x,i_m\ldots i_1} f = D^{[m]}_{x,i_m\ldots i_1} f\Big(\underbrace{1:\ldots:1}_{m}\Big) = D^{[m]}_x f(e_{i_m}:\ldots:e_{i_1})$$

and for $\{h_i\}_{i\in\{1,\ldots,m\}}\subseteq\mathbb{K}^n$ *that*

$$D_x^{(m)}f(h_1,\ldots,h_m)=D_x^{[m]}f(h_1:\ldots:h_m)=\sum_{i\in\{1,\ldots,n\}^m}\left(\prod_{j=1}^m(h_j)_{i_j}\right)\cdot\partial_{x,i_1\ldots i_m}f$$

where $\{e_i\}_{i\in\{1,\ldots,n\}}$ *is the canonical basis on* $\mathbb{K}^n$ *defined by* $(e_i)_j=\delta_{i,j}$.

Proof. Let $\{i_j\}_{j\in\{1,\ldots,m\}}\subseteq\{1,\ldots,n\}$. Using [theorem: 16.214] it follows that $D^{[m]}_{x,i_m\ldots i_1}f$ exist and for $h\in\mathbb{K}^m$

$$D^{[m]}_{x,i_m\ldots i_1}f(h_1:\ldots:h_m)=D_x^{[m]}f(I^{[i_m,0]}(h_1):\ldots:I^{[i_1,0]}(h_m)) \tag{16.319}$$

Next by [theorem: 16.231] $\partial^m_{x,i_m\ldots i_1}f$ exist and

$$\partial_{x.i_m\ldots i_1}f=D^{[m]}_{x,i_m\ldots i_1}f\left(\underbrace{1:\ldots:1}_{n}\right) \tag{16.320}$$

Let $k\in\{1,\ldots,n\}$ and $j\in\{1,\ldots,m\}$ then $(I^{[i_j,0]}(1))_k\underset{\text{[theorem: 16.45]}}{=}\delta_{i_j,k}\cdot 1=\delta_{i_j,k}=(e_{i_j})_k$ so that

$$I^{[i_j,0]}(1)=e_{i_j} \tag{16.321}$$

$$\begin{aligned}\partial_{x.i_m\ldots i_1}f &\underset{\text{[eqs: 16.319, 16.320]}}{=} D_x^{[m]}f\left(\underbrace{I^{[i_m,0]}(1):\ldots:I^{[i_1,0]}(1)}_{m}\right)\\ &\underset{\text{[eq: 16.321]}}{=} D_x^{[m]}f(e_{i_m}:\ldots:e_{i_1})\end{aligned} \tag{16.322}$$

Finally we have

$$\begin{aligned}D_x^{[m]}f(h_1:\ldots:h_m) &\underset{\text{[lemma: 16.233]}}{=} \sum_{i\in\{1,\ldots,n\}^m}\left(\prod_{j=1}^m(h_j)_{i_j}\right)\cdot L(e_{i_1}:\ldots:e_{i_m})\\ &\underset{\text{[eq: 16.322]}}{=} \sum_{i\in\{1,\ldots,n\}^m}\left(\prod_{j=1}^m(h_j)_{i_j}\right)\cdot\partial_{x.i_1\ldots i_m}f\end{aligned}$$

□

Theorem 16.235. *Let* $n\in\mathbb{N}\setminus\{1\}$, $m\in\mathbb{N}$, $\langle\mathbb{K}^n,\|\|\rangle$ *be the vector space* $\mathbb{K}^n$ *with the maximum norm,* $\langle Y,\|\|_Y\rangle$ *a Banach space, a open set* $U\subseteq\mathbb{K}^n$, $f:U\to Y$ *a function that is* C^m *on* U *then* $\forall x\in U$ *and* $\forall\{i_j\}_{j\in\{1,\ldots,m\}}\subseteq\{1,\ldots,n\}$ $\partial_{x,i_m\ldots i_1}f$ *exist and the function*

$$\partial_{i_m\ldots i_1}f:U\to Y \text{ defined by } \partial_{i_m\ldots i_1}f(x)=\partial_{x,i_m\ldots i_1}f$$

is continuous. Further for every permutation $\sigma\in P_m$ *we have*

$$\partial_{i_{\sigma(m)}\ldots i_{\sigma(1)}}f(x)=\partial_{i_m\ldots i_1}f(x)$$

Proof. Using [theorem: 16.215] it follows that $\forall\{i_j\}_{j\in\{1,\ldots,m\}}\subseteq\{1,\ldots,n\}$ and $\forall x\in U$ $D_{x,i_m,\ldots,i_1}f$ exist and the function

$$D_{i_m\ldots,i_1}f:U\to L_m(X_i;Y) \text{ defined by } D_{i_m\ldots i_1}f(x)=D_{x,i_m\ldots i_1}f$$

is continuous. Hence by [theorem: 16.232] it follows that $\forall x\in U$ $\partial_{x,i_m\ldots i_1}f$ exist and the function

$$\partial_{i_m\ldots i_1}f:U\to Y \text{ defined by } \partial_{i_m\ldots i_1}f(x)=\partial_{x,i_m\ldots i_1}f$$

is continuous. Further let $\sigma\in P_n$ then we have

$$\begin{aligned}\partial_{i_m\ldots i_1}f(x) &= \partial_{x,i_m\ldots i_1}f(x)\\ &\underset{\text{[theorem: 16.226]}}{=} D^{[m]}_{x,i_m\ldots i_1}f\left(\underbrace{1:\ldots:1}_{n}\right)\\ &\underset{\text{[theorem: 16.216]}}{=} D^{[m]}_{x,i_{\sigma(m)}\ldots i_{\sigma(1)}}f\left(\underbrace{1:\ldots:1}_{n}\right)\\ &= \partial_{x,i_{\sigma(m)}\ldots i_{\sigma(1)}}f(x)\end{aligned}$$

□

16.6 Inverse Function Theorem

The purpose of this section is to prove the inverse function theorem that gives a sufficient conditions for a function between Banach spaces to be invertible. First we introduce some concepts needed to prove this theorem.

Definition 16.236. *A topological vector space is a vector space $\langle X, +, \cdot \rangle$ over $\mathbb{K}$ together with a topology $\mathcal{T}$ on X such that*

1. $+: X \times X \to X$ *defined by* $(x, y) \to +(x, y) = x + y$ *is continuous*
2. $\cdot: \mathbb{K} \times X \to X$ *defined by* $(\alpha, x) \to \cdot(\alpha, x) = \alpha \cdot x$ *is continuous*

Here we use the product topology on $X \times X$ based on the topology $\mathcal{T}$ of X and the product topology on $\mathbb{K} \times X$ based on the absolute norm topology $\mathcal{T}_{||}$ of $\mathbb{K}$ and the topology $\mathcal{T}$ of X.

Example 16.237. If $\langle X, \|\|\rangle$ is a normed space over $\mathbb{K}$ then $\langle X, \mathcal{T}_{\|\|}\rangle$ is a topological vector space.

Proof. This follows from [theorems: 14.143 and 14.158] □

Definition 16.238. *Let X, Y be topological vector spaces then a* ***toplinear isomorphism*** *is a function $L: X \to Y$ satisfying*

1. *L is a linear isomorphism, meaning that*
   a. *L is a bijection*
   b. $L(x + y) = L(x) + L(y)$
   c. $L(\alpha \cdot x) = \alpha \cdot L(x)$
2. *L and L^{-1} are continuous*

In other words a toplinear isomorphism is linear homeomorphism [see definition: 14.165].

***Note* 16.239.** *Using [theorems: 11.176, 2.73] L^{-1} is also a continuous bijective linear isomorphism. Hence $L^{-1} \in L(Y, X)$ if L is a toplinear isomorphism.*

Theorem 16.240. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be normed spaces then $\forall L \in L(X, Y)$ we have that L is a toplinear isomorphism if and only if L is a bijection and L^{-1} is continuous.*

Proof. This follows trivial from the definition of $L(X, Y)$ and a toplinear isomorphism. □

We can use a consequence of the open mapping theorem [see corollary: 14.393] to formulate the following corollary.

Theorem 16.241. *Let $\langle X, \|\|_X\rangle$, $\langle Y, \|\|_Y\rangle$ be Banach spaces, $L: X \to Y$ is a continuous isomorphism [in other words $L \in L(X, Y)$ and L is a bijection] then L is a toplinear isomorphism.*

Proof. By [corollary: 14.393] L is a homeomorphism so that L^{-1} is continuous, hence by [theorem: 16.240] L is a toplinear isomorphism. □

Definition 16.242. *If $\langle X, \|\|\rangle$ is a normed space then $\mathcal{G}L(X)$ is defined by*

$$\mathcal{G}L(X) = \{L \in L(X, X) | L \text{ is a toplinear isomorphism}\} \subseteq L(X, X)$$

The set of toplinear isomorphisms on a Banach space forms a group under composition as stated in the next theorem.

Theorem 16.243. *If $\langle X, \|\|\rangle$ is a normed space then $\mathcal{G}L(X)$ is a group with the composition $\circ$ as the operator and the identity function Id_X [see definition: 2.48] as neutral element and for every $L \in \mathcal{G}L(X)$ L^{-1} as inverse of L.*

Proof. If $L_1, L_2 \in \mathcal{G}L(X)$ then by definition $L_1, L_2 \in L(X, Y)$ and L_1, L_2 are toplinear isomorphism. Hence by [theorem: 16.240 L_1, L_2 are bijections and L_1^{-1}, L_2^{-1} are continuous. As the composition of bijections is a bijection [see theorem: 2.76] $L_1 \circ L_2$ is bijective, further by [theorem: 14.188] we have $L_1 \circ L_2 \in L(X, Y)$. As $(L_1 \circ L_2)^{-1} \underset{\text{[theorem: 2.76]}}{=} L_2^{-1} \circ L_1^{-1}$ we have by [theorem: 14.139] that $(L_1 \circ L_2)^{-1}$ is continuous. Hence $L_1 \circ L_2 \in \mathcal{G}L(X)$ so that

$$\circ: \mathcal{G}L(X) \times \mathcal{G}L(X) \to \mathcal{G}L(X)$$

is well defined. Next we have:

- **neutral element.** As Id_X is a bijection [see theorem: 2.65], $\mathrm{Id}_X \in L(X, X)$ [see theorem: 14.175] and $(\mathrm{Id}_X)^{-1} = \mathrm{Id}_X \Rightarrow \mathrm{Id}_X$ is continuous it follows that $\mathrm{Id}_X \in \mathcal{G}L(X)$. Finally we have trivially $\forall L \in L(X, X)$ $\mathrm{Id}_X \circ L = L = L \circ \mathrm{Id}_X$.
- **inverse element.** If $L \in \mathcal{G}L(X)$ then L is a linear isomorphism and L^{-1} is continuous. As by [theorem: 11.176] L^{-1} is a linear isomorphism it follows that $L^{-1} \in L(X, X)$, further $(L^{-1})^{-1} = L$ so that $(L^{-1})^{-1}$ is continuous. proving that $L^{-1} \in \mathcal{G}L(X)$. Finally $L \circ L^{-1} = \mathrm{Id}_X = L^{-1} \circ L$.

associativity. This is trivial as composition of function is associative. □

We will need the following theorem about limits in $L(X,X)$ and composition

Theorem 16.244. *Let $\langle X, \|\|\rangle$ be a normed space, $L \in L(X,X)$ and $\{K_n\}_{n\in\mathbb{N}} \subseteq L(X,X)$ a countable family such that $\lim_{n\to\infty} K_n$ exist. Then we have*

$$\lim_{n\to\infty}(L\circ K_n) \text{ exist and } \lim_{n\to\infty}(L\circ K_n) = L\circ\left(\lim_{n\to\infty} K_n\right)$$

and

$$\lim_{n\to\infty}(K_n\circ L) \text{ exist and } \lim_{n\to\infty}(K_n\circ L) = \left(\lim_{n\to\infty} K_n\right)\circ L$$

***Note* 16.245.** *[theorem: 14.188] ensures that $L\circ K_n$, $K_n\circ L \in L(X,X)$ for every $n\in\mathbb{N}$.*

Proof. As $\lim_{n\to\infty} K_n$ exist there exist a $K = \lim_{n\to\infty} K_n$ such that $\forall\varepsilon\in\mathbb{R}^+$ there exist a $N\in\mathbb{N}$ such that $\forall n \geqslant N$ we have

$$\|K_n - K\|_{L(X,X)} < \frac{\varepsilon}{1+\|L\|_{L(X,X)}}$$

Further we have

$$L\circ K_n - L\circ K \underset{\text{[theorem: 14.200]}}{=} L\circ(K_n - K) \text{ and } K_n\circ L - K\circ L \underset{\text{[theorem: 14.200]}}{=} (K_n - K)\circ L \tag{16.323}$$

Next if $n\geqslant N$ then we have

$$\begin{aligned}
\|L\circ K_n - L\circ K\|_{L(X,Y)} &\underset{\text{[eq: 16.323]}}{=} \|L\circ(K_n-K)\|_{L(X,X)} \\
&\leqslant_{\text{[theorem: 14.188]}} \|L\|_{L(X,X)}\cdot\|K_n - K\|_{L(X,X_n)} \\
&< \|L\|_{L(X,X)}\cdot\frac{\varepsilon}{1+\|L\|_{L(X,X)}} \\
&< \varepsilon \\
\|K_n\circ L - K\circ L\|_{L(X,X)} &\underset{\text{[eq: 16.323]}}{=} \|(K_n-K)\circ L\|_{L(X,X)} \\
&\leqslant_{\text{[theorem: 14.188]}} \|K_n - K\|_{L(X,X_n)}\cdot\|L\|_{L(X,X)} \\
&< \frac{\varepsilon}{1+\|L\|_{L(X,X)}}\cdot\|L\|_{L(X,X)} \\
&< \varepsilon
\end{aligned}$$

This proves that

$$\lim_{n\to\infty}(L\circ K_n) = L\circ K = L\circ\left(\lim_{n\to\infty} K_n\right)$$

and

$$\lim_{n\to\infty}(K_n\circ L) = K\circ L = \left(\lim_{n\to\infty} K_n\right)$$

□

Definition 16.246. *Let $\langle X, \|\|\rangle$ be a normed space and $H\in L(X,X)$, $n\in\mathbb{N}$ then $H^n: X\to X$ is defined by*

$$H^n = \begin{cases} H \text{ if } n=1 \\ H\circ H^{n-1} \text{ if } 1<n \end{cases}$$

in other words

$$H^n = \underbrace{H\circ\cdots\circ H}_{n}$$

Theorem 16.247. *Let $\langle X, \|\|\rangle$ be a normed space, $n\in\mathbb{N}$ and $H\in L(X,X)$ then we have:*

1. $H^n\circ H = H^{n+1}$
2. $\forall\alpha\in\mathbb{K}$ *we have* $(\alpha\cdot H)^n = (\alpha)^n\cdot H^n$
3. $H^n\in L(X,X)$ *and* $\|H^n\|_{L(X,X)} \leqslant \|H\|^n_{L(X,Y)}$
4. $\sum_{i=1}^n H^i \in L(X,X)$ *and* $\|\sum_{i=1}^n H^i\|_{L(X,X)} \leqslant \sum_{i=1}^n \|H\|^i_{L(X,X)}$

Proof.

1. We prove this by induction so let

$$S = \{n\in\mathbb{N} | H^n\circ H = H^{n+1}\}$$

then we have:

$1 \in S$. As $H^1 \circ H = H \circ H = H \circ H^1 = H^{1+1}$ it follows that $1 \in S$

$n \in S \Rightarrow n+1 \in S$. We have

$$\begin{aligned} H^{n+1} \circ H &= (H^1 \circ H^n) \circ H \\ &\underset{\circ \text{ is associative}}{=} H^1 \circ (H^n \circ H) \\ &\underset{n \in S}{=} H^1 \circ H^{n+1} \\ &= H \circ H^{n+1} \\ &= H^{(n+1)+1} \end{aligned}$$

proving that $n+1 \in S$.

2. This is easily proved by induction, so let

$$S = \{n \in \mathbb{N} | (\alpha \cdot H)^n = \alpha^n \cdot H^n\}$$

then we have:

$1 \in S$. Let $x \in X$ then $(\alpha \cdot H)^1(x) = (\alpha \cdot H)(x) = \alpha \cdot H(x) = \alpha^1 \cdot H^1(x) = (\alpha \cdot H^1)(x)$ proving that $(\alpha \cdot H)^1 = \alpha^1 \cdot H^1$. Hence $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $x \in X$ then we have as $1 < n+1$

$$\begin{aligned} (\alpha \cdot H)^{n+1}(x) &= ((\alpha \cdot H) \circ (\alpha \cdot H)^n)(x) \\ &= (\alpha \cdot H)((\alpha \cdot H)^n(x)) \\ &\underset{n \in S}{=} (\alpha \cdot H)((\alpha^n \cdot H^n)(x)) \\ &= (\alpha \cdot H)(\alpha^n \cdot H^n(x)) \\ &= \alpha \cdot H(\alpha^n \cdot H^n(x)) \\ &= \alpha \cdot \alpha^n \cdot H(H^n(x)) \\ &= \alpha^{n+1} \cdot ((H \circ H^n))(x) \\ &= \alpha^{n+1} \cdot H^{n+1}(x) \\ &= (\alpha^{n+1} \cdot H^{n+1})(x) \end{aligned}$$

proving that $(\alpha \cdot H)^{n+1} = \alpha^{n+1} \cdot H^{n+1}$. Hence

$$n+1 \in S$$

3. We prove this by induction, so let

$$S = \{n \in \mathbb{N} | H^n \in L(X, X) \text{ and } \|H^n\|_{L(X,Y)} \leqslant \|H\|^n_{L(X,X)}\}$$

then we have:

$1 \in S$. As $H^1 = H \in L(X, X)$ and $\|H^1\|_{L(X,X)} = \|H\|_{L(X,X)} = \|H\|^1_{L(X,X)}$ it follows that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $\alpha \in \mathbb{K}$, $x, y \in X$ then we have

$$\begin{aligned} H^{n+1}(x + \beta \cdot y) &= (H \circ H^n)(x + \beta \cdot y) \\ &= H(H^n(x + \beta \cdot y)) \\ &\underset{n \in S}{=} H(H^n(x) + \beta \cdot H^n(y)) \\ &= H^{n+1}(x) + \beta \cdot H^{n+1}(y) \end{aligned}$$

proving that

$$H^{n+1} \in \mathrm{Hom}(X, X)$$

Further we have

$$\begin{aligned} \|H^{n+1}(x)\| &= \|(H \circ H^n)(x)\| \\ &= \|H(H^n(x))\| \\ &\leqslant \|H\|_{L(X,Y)} \cdot \|H^n(x)\| \\ &\leqslant_{n \in S \Rightarrow H^n \in L(X < X)} \|H\|_{L(X,Y)} \cdot \|H^n\|_{L(X,X)} \cdot \|x\| \\ &\leqslant_{n \in S} \|H\|_{L(X,Y)} \cdot \|H\|^n_{L(X,X)} \cdot \|x\| \\ &= \|H\|^{n+1}_{L(X,X)} \cdot \|x\| \end{aligned}$$

so that by [theorem: 14.177] $H^{n+1} \in L(X,X)$ and by [theorem: 14.184] that $\|H_{n+1}\|_{L(X,X)} \leqslant \|H\|^{n+1}_{L(X,X)}$. Hence we have

$$n+1 \in S$$

4. Let $\alpha \in \mathbb{K}$ and $x, y \in X$

$$\begin{aligned}
\left(\sum_{i=1}^{n} H^i\right)(x+\beta\cdot y) &\underset{\text{def}}{=} \sum_{i=1}^{n} H^i(x+\beta\cdot y) \\
&\underset{(1)}{=} \sum_{i=1}^{n} (H^i(x)+\beta\cdot H^i(y)) \\
&= \sum_{i=1}^{n} H^i(x)+\beta\cdot\sum_{i=1}^{n} H^i(y) \\
&= \left(\sum_{i=1}^{n} H^i\right)(x)+\beta\cdot\left(\sum_{i=1}^{n} H^i\right)(y)
\end{aligned}$$

proving that

$$\sum_{i=1}^{n} H^i \in \mathrm{Hom}(X,X)$$

Further

$$\begin{aligned}
\left\|\left(\sum_{i=1}^{n} H^i\right)(x)\right\| &= \left\|\sum_{i=1}^{n} H^i(x)\right\| \\
&\leqslant \sum_{i=1}^{n} \|H^i(x)\| \\
&\leqslant \sum_{i=1}^{n} (\|H^i\|\cdot\|x\|) \\
&\leqslant_{(3)} \sum_{i=1}^{n} (\|H\|^i_{L(X,X)}\cdot\|x\|) \\
&= \left(\sum_{i=1}^{n} \|H\|^i_{L(X,Y)}\right)\cdot\|x\|
\end{aligned}$$

so that by [theorem: 14.177] $\sum_{i=1}^{n} H^i \in L(X,X)$ and by [theorem: 14.184] that $\|\sum_{i=1}^{n} H^i\|_{L(X,X)} \leqslant \sum_{i=1}^{n} \|H\|^i_{L(X,Y)}$. □

Lemma 16.248. *Let $\langle X, \|\|\rangle$ be a normed space, $k \in \mathbb{N}$ and $H \in L(X,X)$ such that $\sum_{i=k}^{\infty} H^i$ converges [using the norm $\|\|_{L(X,X)}$] then $\forall x \in X$ we have that $\sum_{i=k}^{\infty} H^i(x)$ converges and $(\sum_{i=k}^{\infty} H^i)(x) = \sum_{i=k}^{\infty} H^i(x)$.*

Proof. Let $x \in X$ and $\varepsilon \in \mathbb{R}^+$ then there exist a $N \in \mathbb{N}$ such that for $n \geqslant N$ we have that

$$\left\|\sum_{i=k}^{n} H^i - \sum_{i=k}^{\infty} H^i\right\|_{L(X,X)} < \frac{\varepsilon}{1+\|x\|}$$

then we have

$$\begin{aligned}
\left\|\sum_{i=k}^{n} H^i(x) - \left(\sum_{i=k}^{\infty} H^i\right)(x)\right\| &= \left\|\left(\sum_{i=k}^{n} H^i - \sum_{i=k}^{\infty} H^i\right)(x)\right\| \\
&\leqslant \left\|\sum_{i=k}^{n} H^i - \sum_{i=k}^{\infty} H^i\right\|_{L(X,X)}\cdot\|x\| \\
&< \frac{\varepsilon}{1+\|x\|}\cdot\|x\| \\
&< \varepsilon
\end{aligned}$$

proving that $\lim_{n\to\infty} \sum_{i=k}^{n} H^i(x)$ converges and

$$\lim_{n\to\infty} \sum_{i=k}^{n} H^i(x) = \left(\sum_{i=k}^{\infty} H^i\right)(x)$$

so that

$$\sum_{i=k}^{\infty} H^i(x) = \left(\sum_{i=k}^{\infty} H^i\right)(x)$$

□

Lemma 16.249. *Let $\langle X, \|\|\rangle$ be a Banach space and $H \in B_{\|\|_{L(X,X)}}(0,1)$ then*

$$\sum_{i=1}^{\infty} H^i \text{ converges}$$

$$\mathrm{Id}_X - H \in \mathcal{G}L(X) \text{ and } (\mathrm{Id}_X - H)^{-1} = \mathrm{Id}_X + \sum_{i=1}^{\infty} H^i$$

Note 16.250. In this lemma and the rest of this subsection the neutral element of $L(X,X)$ is noted as 0. Context can be used to determine if 0 is the neutral element of $\mathbb{K}$, X or $L(X,X)$.

Proof. As $H \in B_{\|\|_{L(X,X)}}(0,1)$ it follows that $\|H\|_{L(X,Y)} < 1$ so that by [example: 14.353]

$$\sum_{i=1}^{\infty} \|H\|^i_{L(X,X)} \text{ exist and } \sum_{i=1}^{\infty} \|H\|^i_{L(X,X)} = \frac{\|H\|_{L(X,X)}}{1 - \|H\|_{L(X,X)}}$$

As X is a Banach space it follows from [theorem: 14.339] that $L(X,X)$ is a Banach space. Further for $i \in \mathbb{N}$ we have $\|H^i\|_{L(X,Y)} \leqslant_{\text{[theorem: 16.247]}} \|H\|^i_{L(X,X)}$. So we can use dominant convergence [see 14.377] to prove that

$$\sum_{i=1}^{\infty} H^i \text{ exist}, \quad \sum_{i=1}^{\infty} H^i \in L(X,X) \text{ and } \left\|\sum_{i=1}^{\infty} H^i\right\|_{L(X,X)} \leqslant \sum_{i=1}^{\infty} \|H\|^i_{L(X,X)} = \frac{\|H\|_{L(X,X)}}{1 - \|H\|_{L(X,X)}} \tag{16.324}$$

From the above and the fact that $\mathrm{Id}_X \in L(X,X)$ [see example: 14.185]

$$\mathrm{Id}_X + \sum_{i=1}^{\infty} H^i \in L(X,X) \tag{16.325}$$

Further as $\sum_{i=1}^{\infty} H^i$ converges it follows from [theorem: 14.354] that

$$\lim_{n\to\infty} H^i = 0 \tag{16.326}$$

Next

$$\begin{aligned}
\left\|\mathrm{Id}_X + \sum_{i=1}^{\infty} H^i\right\|_{L(X,X)} &\leqslant \|\mathrm{Id}_X\|_{L(X,Y)} + \left\|\sum_{i=1}^{\infty} H^i\right\|_{L(X,X)} \\
&\leqslant_{\text{[example: 14.185]}} 1 + \left\|\sum_{i=1}^{\infty} H^i\right\|_{L(X,X)} \\
&\leqslant_{\text{[eq: 16.324]}} 1 + \frac{\|H\|_{L(X,X)}}{1 - \|H\|_{L(X,X)}} \\
&= \frac{1 - \|H\|_{L(X,X)} + \|H\|_{L(X.X)}}{1 - \|H\|_{L(X,X)}} \\
&= \frac{1}{1 - \|H\|_{L(X,X)}}
\end{aligned} \tag{16.327}$$

Next we prove by induction on n that

$$(\mathrm{Id}_X - H) \circ \left(\mathrm{Id}_X + \sum_{i=1}^{n} H^i\right) = \mathrm{Id}_X - H^{n+1} \tag{16.328}$$

Proof. Let

$$S = \left\{n \in \mathbb{N} | (\mathrm{Id}_X - H) \circ \left(\mathrm{Id}_X + \sum_{i=1}^{n} H^i\right) = \mathrm{Id}_X - H^{n+1}\right\}$$

then we have:

$1 \in S$. Let $x \in X$ then we have

$$\begin{aligned}
\left((\mathrm{Id}_X - H) \circ \left(\mathrm{Id}_X + \sum_{i=1}^{1} H^i\right)\right)(x) &= (\mathrm{Id}_X - H)\left(\left(\mathrm{Id}_X + \sum_{i=1}^{1} H^i\right)(x)\right) \\
&= (\mathrm{Id}_X - H)\left(\mathrm{Id}_X(x) + \left(\sum_{i=1}^{1} H^i\right)(x)\right) \\
&= (\mathrm{Id}_X - H)(x + H(x)) \\
&= \mathrm{Id}_X(x + H(x)) - H(x + H(x)) \\
&= x + H(x) - H(x) - H(H(x)) \\
&= x - (H \circ H)(x) \\
&= x - H^2(x) \\
&= \mathrm{Id}_X(x) - H^2(x) \\
&= (\mathrm{Id}_X - H^2)(x)
\end{aligned}$$

proving that $(\mathrm{Id}_X - H) \circ (\mathrm{Id}_X + \sum_{i=1}^{1} H^i) = \mathrm{Id}_X - H^{(1+1)}$. So it follows that $1 \in S$.

$n \in S \Rightarrow n + 1 \in S$. Let $x \in X$ then

$$\begin{aligned}
\left((\mathrm{Id}_X - H) \circ \left(\mathrm{Id}_X + \sum_{i=1}^{n+1} H^i\right)\right)(x) &= \\
(\mathrm{Id}_X - H)\left(\left(\mathrm{Id}_X + \sum_{i=1}^{n+1} H^i\right)(x)\right) &= \\
(\mathrm{Id}_X - H)\left(\mathrm{Id}_X(x) + \left(\sum_{i=1}^{n+1} H^i\right)(x)\right) &= \\
(\mathrm{Id}_X - H)\left(\mathrm{Id}_X(x) + \sum_{i=1}^{n+1} H^i(x)\right) &= \\
(\mathrm{Id}_X - H)\left(\mathrm{Id}_X(x) + \sum_{i=1}^{n} H^i(x) + H^{n+1}(x)\right) &= \\
(\mathrm{Id}_X - H)\left(\mathrm{Id}_X(x) + \sum_{i=1}^{n} H^i(x)\right) + (\mathrm{Id}_X - H)(H^{n+1}(x)) &= \\
(\mathrm{Id}_X - H)\left(\left(\mathrm{Id}_X + \sum_{i=1}^{n} H^i\right)(x)\right) + (\mathrm{Id}_X - H)(H^{n+1}(x)) &= \\
\left((\mathrm{Id}_X - H) \circ \left(\mathrm{Id}_X + \sum_{i=1}^{n} H^i\right)\right)(x) + \mathrm{Id}_X(H^{n+1}(x)) - H(H^{n+1}(x)) &\underset{n \in S}{=} \\
(\mathrm{Id}_X - H^{n+1})(x) + H^{n+1}(x) - (H \circ H^{n+1})(x) &= \\
\mathrm{Id}_X(x) - H^{(n+1)+1}(x)(x) &= \\
(\mathrm{Id}_X - H^{(n+1)+1})(x)
\end{aligned}$$

proving that $(\mathrm{Id}_X - H) \circ (\mathrm{Id}_X + \sum_{i=1}^{n+1} H^i) = (\mathrm{Id}_X - H^{(n+1)+1})$. Hence

$$n + 1 \in S$$

Mathematical induction completes the proof of [eq: 16.328]. □

Next using induction we prove that

$$\left(\mathrm{Id}_X + \sum_{i=1}^{n} H^i\right) \circ (\mathrm{Id}_X - H) = \mathrm{Id}_X - H^{n+1} \tag{16.329}$$

Proof. Define

$$S=\left\{n\in\mathbb{N}|\left(\mathrm{Id}_X+\sum_{i=1}^{n}H^i\right)\circ(\mathrm{Id}_X-H)=\mathrm{Id}_X-H^{n+1}\right\}$$

then we have:

$1\in S$. Let $x\in X$ then

$$\begin{aligned}\left(\left(\mathrm{Id}_X+\sum_{i=1}^{1}H^i\right)\circ(\mathrm{Id}_X-H)\right)(x) &= ((\mathrm{Id}_X+H)\circ(\mathrm{Id}_X-H))(x)\\ &= (\mathrm{Id}_X+H)((\mathrm{Id}_X-H)(x))\\ &= (\mathrm{Id}_X+H)(\mathrm{Id}_X(x)-H(x))\\ &= \mathrm{Id}_X(\mathrm{Id}_X(x)-H(x))+H(\mathrm{Id}_X(x)-H(x))\\ &= \mathrm{Id}_X(x)-H(x)+H(\mathrm{Id}_X(x))-H(H(x))\\ &= \mathrm{Id}_X(x)-H(x)+H(x)-(H\circ H)(x)\\ &= \mathrm{Id}_X(x)-H^2(x)\\ &= (\mathrm{Id}_X-H^2)(x)\end{aligned}$$

proving that $(\mathrm{Id}_X+\sum_{i=1}^{1}H^i)\circ(\mathrm{Id}_X-H)=\mathrm{Id}_X-H^{1+1}$. Hence $1\in S$.

$n\in S\Rightarrow n+1$. Let $x\in X$ then

$$\begin{aligned}\left(\left(\mathrm{Id}_X+\sum_{i=1}^{n+1}H^i\right)\circ(\mathrm{Id}_X-H)\right)(x) &=\\ \left(\mathrm{Id}_X+\sum_{i=1}^{n+1}H^i\right)((\mathrm{Id}_X-H)(x)) &=\\ \left(\mathrm{Id}_X+\sum_{i=1}^{n}H^i+H^{n+1}\right)((\mathrm{Id}_X-H)(x)) &=\\ \left(\mathrm{Id}_X+\sum_{i=1}^{n}H^i\right)((\mathrm{Id}_X-H)(x))+H^{n+1}((\mathrm{Id}_X-H)(x)) &=\\ \left(\left(\mathrm{Id}_X+\sum_{i=1}^{n}H^i\right)\circ(\mathrm{Id}_X-H)\right)(x)+H^{n+1}(x-H(x)) &\underset{n\in S}{=}\\ (\mathrm{Id}_X-H^{n+1})(x)+H^{n+1}(x)-H^{n+1}(H(x)) &=\\ \mathrm{Id}_X(x)-(H^{n+1}\circ H)(x) &\underset{\text{[theorem: 16.247]}}{=}\\ \mathrm{Id}_X(x)-H^{(n+1)+1}(x) &=\\ (\mathrm{Id}_X-H^{(n+1)+1})(x)\end{aligned}$$

proving that $(\mathrm{Id}_X+\sum_{i=1}^{n+1}H^i)\circ(\mathrm{Id}_X-H)=\mathrm{Id}_X-H^{(n+1)+1}$. Hence

$$n+1\in S$$

Mathematical induction proves then [eq: 16.329]. □

To summarize [eqs: 16.328,16.329] we have

$$(\mathrm{Id}_X-H)\circ\left(\mathrm{Id}_X+\sum_{i=1}^{n}H^i\right)=\mathrm{Id}_X-H^{n+1}=\left(\mathrm{Id}_X+\sum_{i=1}^{n+1}H^i\right)\circ(\mathrm{Id}_X-H)=\mathrm{Id}_X-H^{n+1} \tag{16.330}$$

Let $\varepsilon\in\mathbb{R}^+$ then as $\lim_{n\to\infty}H^i=0$ [see eq: 16.326] there exist a $N\in\mathbb{N}$ such that for $n>N$

$$\|H^n\|_{L(X.X)}<\varepsilon$$

then

$$\begin{aligned}\left\|(\mathrm{Id}_X - H)\circ\left(\mathrm{Id}_X + \sum_{i=1}^{n} H^i\right) - \mathrm{Id}_X\right\|_{L(X,X)} &\underset{\text{[eq: 16.330]}}{=} \|\mathrm{Id}_X - H^{n+1} - \mathrm{Id}_X\|_{L(X,Y)} \\ &= \|H^{n+1}\|_{L(X,Y)} \\ &<_{n+1>n\geqslant N} \varepsilon\end{aligned}$$

and

$$\begin{aligned}\left\|\left(\mathrm{Id}_X + \sum_{i=1}^{n} H^i\right)\circ(\mathrm{Id}_X - H) - \mathrm{Id}_X\right\|_{L(X,X)} &\underset{\text{[eq: 16.330]}}{=} \|\mathrm{Id}_X - H^{n+1} - \mathrm{Id}_X\|_{L(X,Y)} \\ &= \|H^{n+1}\|_{L(X,Y)} \\ &<_{n+1>n\geqslant N} \varepsilon\end{aligned}$$

So that

$$\lim_{n\to\infty}\left(\left(\mathrm{Id}_X + \sum_{i=1}^{n} H^i\right)\circ(\mathrm{Id}_X - H)\right) = \mathrm{Id}_X = \lim_{n\to\infty}\left((\mathrm{Id}_X - H)\circ\left(\mathrm{Id}_X + \sum_{i=1}^{n} H^i\right)\right) \tag{16.331}$$

Next we have, as $\sum_{i=1}^{\infty} H^i$ exist [see eq: 16.324], by [theorem: 14.300] that $\lim_{n\to\infty}(\mathrm{Id}_X + \sum_{i=1}^{n} H^i)$ exist. Hence we have

$$\begin{aligned}\lim_{n\to\infty}\left(\left(\mathrm{Id}_X + \sum_{i=1}^{n} H^i\right)\circ(\mathrm{Id}_X - H)\right) &\underset{\text{[theorem: 16.244]}}{=} \left(\lim_{n\to\infty}\left(\mathrm{Id}_X + \sum_{i=1}^{n} H^i\right)\right)\circ(\mathrm{Id}_X - H) \\ &\underset{\text{[theorem: 14.300]}}{=} \left(\mathrm{Id}_X + \lim_{n\to\infty}\sum_{i=1}^{n} H^i\right)\circ(\mathrm{Id}_X - H) \\ &= \left(\mathrm{Id}_X + \sum_{i=1}^{\infty} H^i\right)\circ(\mathrm{Id}_X - H)\end{aligned}$$

and

$$\begin{aligned}\lim_{n\to\infty}\left((\mathrm{Id}_X - H)\circ\left(\mathrm{Id}_X + \sum_{i=1}^{n} H^i\right)\right) &\underset{\text{[theorem: 16.244]}}{=} (\mathrm{Id}_X - H)\circ\left(\lim_{n\to\infty}\left(\mathrm{Id}_X + \sum_{i=1}^{n} H^i\right)\right) \\ &\underset{\text{[theorem: 14.300]}}{=} (\mathrm{Id}_X - H)\circ\left(\mathrm{Id}_X + \lim_{n\to\infty}\left(\sum_{i=1}^{n} H^i\right)\right) \\ &= (\mathrm{Id}_X - H)\circ\left(\mathrm{Id}_X + \sum_{i=1}^{\infty} H^i\right)\end{aligned}$$

which combined with [eq: 16.331] proves that

$$(\mathrm{Id}_X - H)\circ\left(\mathrm{Id}_X + \sum_{i=1}^{\infty} H^i\right) = \mathrm{Id}_X = \left(\mathrm{Id}_X + \sum_{i=1}^{\infty} H^i\right)\circ(\mathrm{Id}_X - H)$$

hence

$$\mathrm{Id}_X - H \text{ is a bijection and } (\mathrm{Id}_X - H)^{-1} = \mathrm{Id}_X + \sum_{i=1}^{\infty} H^i \in L(X,X)$$

As Id_X, $H \in B_{\|\|_{L(X,X)}}(0,1) \subseteq L(X,X)$ and X is a Banach space it follows from [theorem: 16.241] that $\mathrm{Id}_X - H$ is a toplinear isomorphism, so that

$$\mathrm{Id}_X - H \in \mathcal{G}L(X)$$

□

Corollary 16.251. *Let $\langle X, \|\|\rangle$ be a Banach space, $H \in B_{\|\|_{L(X,X)}}(0,1)$ then $\sum_{i=1}^{\infty}(-1)^i \cdot H^i$ converges, $\mathrm{Id}_X + H \in \mathcal{G}L(X)$ and $(\mathrm{Id}_X + H)^{-1} = \mathrm{Id}_X + \sum_{i=1}^{\infty}(-1)^i \cdot H^i$.*

Proof. If $H \in B_{\|\|_{L(X,X)}}(0,1)$ then $\|-H\|_{L(X,X)} = \|(-1)\cdot H\|_{L(X,Y)} = \|H\|_{L(X,X)} < 1$ so that $-H \in B_{\|\|_{L(X,X)}}(0,1)$. Hence by the previous theorem [theorem: 16.249] we have that

$$\mathrm{Id}_X + H = \mathrm{Id}_X - (-H) \in \mathcal{G}L(X)$$

and

$$\sum_{i=1}^{\infty}(-1)^i\cdot H^i \underset{\text{[theorem: 16.247]}}{=} \sum_{i=1}^{\infty}(-H)^i \text{ exist}$$

and

$$(\mathrm{Id}_X+H)^{-1}=(\mathrm{Id}_X-(-H))^{-1}=\mathrm{Id}_X+\sum_{i=1}^{\infty}(-H)^i \underset{\text{[theorem: 16.247]}}{=} \mathrm{Id}_X+\sum_{i=1}^{\infty}(-1)^n\cdot H^i$$ □

TODO

Theorem 16.252. *Let $\langle X,\|\|\rangle$ be a Banach space then we have:*

1. *$\mathcal{G}L(X)$ is a open set in $L(X,X)$*
2. *The function*

$$\tau:\mathcal{G}L(X)\to L(X,X) \text{ defined by } \tau(L)=L^{-1}$$

is Fréchet differentiable on $\mathcal{G}L(X)$ and $\forall L\in\mathcal{G}L(X)$ we have that

$$D_L\tau\in L(L(X,X),L(X,X)) \text{ is defined by } D_L\tau(H)=-L^{-1}\circ H\circ L$$

3. *The function τ is C^∞ on U.*

Proof.

1. Let $L\in\mathcal{G}L(X)\subseteq L(X,X)$ then for any $H\in L(X,X)$ we have

$$\begin{aligned} H &= L+(H-L)\\ &= L\circ\mathrm{Id}_X+\mathrm{Id}_X\circ(H-L)\\ &= L\circ\mathrm{Id}_X+(L\circ L^{-1})\circ(H-L)\\ &= L\circ\mathrm{Id}_X+L\circ(L^{-1}\circ(H-L))\\ &\underset{\text{[theorem: 14.200]}}{=} L\circ(\mathrm{Id}_X+L^{-1}\circ(H-L)) \end{aligned} \tag{16.332}$$

Take $\delta_L=\frac{1}{\|L^{-1}\|_{L(X,Y)}+1}\in\mathbb{R}^+$ then if $\|H-L\|_{L(X,Y)}<\delta_L$ we have that

$$\begin{aligned} \|L^{-1}\circ(H-L)\|_{L(X,X)} &\leqslant_{\text{[theorem: 14.188]}} \|L^{-1}\|_{L(X,X)}\cdot\|H-L\|_{L(X,X)}\\ &< \|L^{-1}\|_{L(X,X)}\cdot\delta_L\\ &= \frac{\|L^{-1}\|_{L(X,X)}}{\|L^{-1}\|_{L(X,X)}+1}\\ &< 1 \end{aligned}$$

Hence $\|L^{-1}\circ(H-L)\|_{L(X,X)}\in B_{\|\|_{L(X,X)}}(0,1)$ so that by [corollary: 16.251]

$$\mathrm{Id}_X+L^{-1}\circ(H-L)\in\mathcal{G}L(X)$$

and as $L\in\mathcal{G}L(X)$ we have by [theorem: 16.243] that $L\circ(\mathrm{Id}_X+L^{-1}\circ(H-L))\in\mathcal{G}L(X)$, so by [eq: 16.332] $H\in\mathrm{GL}(X)$. In other words if $H\in B_{\|\|_{L(X,X)}}(L,\delta_L)$ then $H\in\mathcal{G}L(X)$ so that

$$\forall L\in\mathcal{G}L(X) \text{ we have } L\in B_{\|\|_{L(X,X)}}(L,\delta_L)\subseteq\mathcal{G}L(X) \tag{16.333}$$

which proves that

$$\mathcal{G}L(X) \text{ is a open set}$$

2. If $H\in B_{\|\|_{L(X,X)}}(\mathrm{Id}_X,1)$ then $\|H-\mathrm{Id}_X\|_{L(X,X)}<1$ hence $H-\mathrm{Id}_X\in B_{\|\|_{L(X,X)}}(0,1)$ so that by [corollary: 16.251]

$$H=\mathrm{Id}_X+(H-\mathrm{Id}_X)\in\mathcal{G}L(X)$$

so that

$$B_{\|\|_{L(X,X)}}(\mathrm{Id}_X,1)\subseteq\mathcal{G}L(X) \tag{16.334}$$

To prove differentiability we will rely on [corollary: 16.30], hence the need for a ε-mapping [see definition: 16.28]. Let $H\in B_{\|\|_{L(X,X)}}(0,1)$ then by [corollary: 16.251] $\sum_{i=1}^{\infty}(-1)^i\cdot H^i$ converges, so applying [theorem: 14.357] we have that

$$\sum_{i=2}^{\infty}(-1)^i\cdot H^i\in L(X,X) \text{ converges and } \sum_{i=1}^{\infty}(-1)^iH^i=-H+\sum_{i=2}^{\infty}(-1)^i\cdot H^i \tag{16.335}$$

As 0, $\sum_{i=2}^{\infty}(-1)^i \cdot H^i \in L(X,X)$ it follows that the following function is well defined

$$\varepsilon: B_{\|\|_{L(X,X)}}(0,1) \to L(X,Y) \text{ by } \varepsilon(H) = \begin{cases} 0 \text{ if } H=0 \\ \frac{1}{\|H\|_{L(X,X)}} \cdot \sum_{i=2}^{\infty}(-1)^i \cdot H^i \text{ if } H \neq 0 \end{cases} \tag{16.336}$$

Let $x \in X$ then we have

$$\begin{aligned} \|(\varepsilon(H))(x)\| &= \begin{cases} \|0(x)\| \text{ if } H=0 \\ \left\| \frac{1}{\|\|_{L(X,X)}} \cdot (\sum_{i=2}^{\infty}(-1) \cdot H^i)(x) \right\| \text{ if } H \neq 0 \end{cases} \\ &= \begin{cases} 0 \text{ if } H=0 \\ \frac{1}{\|H\|_{L(X,X)}} \cdot \|(\sum_{i=2}^{\infty}(-1) \cdot H^i)(x)\| \text{ if } H \neq 0 \end{cases} \\ &\leqslant \begin{cases} 0 \cdot \|x\| \text{ if } H=0 \\ \frac{1}{\|H\|_{L(X,X)}} \cdot \|\sum_{i=2}^{\infty}(-1) \cdot H^i\|_{L(X,X)} \cdot \|x\| \text{ if } H \neq 0 \end{cases} \\ &= \|x\| \cdot \begin{cases} 0 \cdot \|x\| \text{ if } H=0 \\ \frac{1}{\|H\|_{L(X,X)}} \cdot \|\sum_{i=2}^{\infty}(-1) \cdot H^i\|_{L(X,X)} \text{ if } H \neq 0 \end{cases} \end{aligned}$$

proving by [theorem: 14.184] that

$$\|\varepsilon(H)\|_{L(X,Y)} \leqslant \begin{cases} 0 \cdot \|x\| \text{ if } H=0 \\ \frac{1}{\|H\|_{L(X,X)}} \cdot \|\sum_{i=2}^{\infty}(-1) \cdot H^i\|_{L(X,X)} \text{ if } H \neq 0 \end{cases} \tag{16.337}$$

For $H \in B_{\|\|_{L(X,X)}}(0,1)$ we have $\|H\|_{L(X,X)} < 1$ so that by [example: 14.353] $\sum_{i=1}^{\infty}\|H\|^i_{L(X,X)} = \frac{\|H\|_{L(X,X)}}{1-\|H\|_{L(X,X)}}$. Hence we have by [theorem: 14.357] that

$$\begin{aligned} \sum_{i=2}^{\infty}\|H\|^i_{L(X,X)} &\underset{\text{[eq: 16.335]}}{=} \left(\sum_{i=1}^{\infty}\|H\|^i_{L(X,X)}\right) - \|H\|_{L(X,X)} \\ &= \frac{\|H\|_{L(X,X)}}{1-\|H\|_{L(X,X)}} - \|H\|_{L(X,X)} \\ &= \frac{\|H\|_{L(X,X)} - \|H\|_{L(X,X)} \cdot (1-\|H\|_{L(X,X)})}{1-\|H\|_{L(X,X)}} \\ &= \frac{\|H\|^2_{L(X,X)}}{1-\|H\|_{L(X,X)}} \end{aligned} \tag{16.338}$$

As by [theorem: 16.247] we have $\|(-1)^i H^i\|_{L(X,X)} = \|H^i\|_{L(X,X)} \leqslant \|H\|^i_{L(X,X)}$ we can apply the dominant convergence theorem [theorem: 14.377] proving that $\|\sum_{i=2}^{\infty}(-1)^i \cdot H^i\|_{L(X,X)}$ converges and $\|\sum_{i=2}^{\infty}(-1)^i \cdot H^i\|_{L(X,X)} \leqslant \frac{\|H\|^2_{L(X,X)}}{1-\|H\|_{L(X,X)}}$. Substituting this result in [eq: 16.337] gives

$$\begin{aligned} \|\varepsilon(H)\|_{L(X,X)} &\leqslant \begin{cases} 0 \cdot \|x\| \text{ if } H=0 \\ \frac{1}{\|H\|_{L(X,X)}} \cdot \frac{\|H\|^2_{L(X,X)}}{1-\|H\|_{L(X,X)}} \text{ if } H \neq 0 \end{cases} \\ &= \begin{cases} 0 \text{ if } H=0 \\ \frac{\|H\|_{L(X,X)}}{1-\|H\|_{L(X,X)}} \text{ if } H \neq 0 \end{cases} \end{aligned}$$

so that

$$\forall H \in B_{\|\|_{L(X,X)}}(0,1) \text{ we have } \|\varepsilon(H)\|_{L(X,X)} \leqslant \frac{\|H\|_{L(X,X)}}{1-\|H\|_{L(X,X)}} \tag{16.339}$$

Let $\zeta \in \mathbb{R}^+$ then if $\|H\|_{L(X,X)} < \min\left(\frac{1}{2}, \frac{\zeta}{2}\right) < 1$ it follows that

$$\begin{aligned}
\|\varepsilon(H) - \varepsilon(0)\|_{L(X,X)} &= \|\varepsilon(H)\|_{L(X,Y)} \\
&\leqslant_{\text{[eq: 16.339]}} \frac{\|H\|_{L(X,X)}}{1 - \|H\|_{L(X,X)}} \\
&< \frac{\|H\|_{L(X,X)}}{1 - \frac{1}{2}} \\
&< \frac{\zeta}{2} \cdot \frac{2}{1} \\
&= \zeta
\end{aligned}$$

which proves that

$$\varepsilon \text{ is continuous at } 0 \tag{16.340}$$

or using [definition: 16.28]

$$\varepsilon \text{ is a } \varepsilon\text{-mapping} \tag{16.341}$$

If $H \in B_{\|\|_{L(X,X)}}(0,1)$ then

$$\begin{aligned}
\tau(\mathrm{Id}_X + H) - \tau(\mathrm{Id}_X) &= (\mathrm{Id}_X + H)^{-1} - (\mathrm{Id}_X)^{-1} \\
&= (\mathrm{Id}_X + H)^{-1} - \mathrm{Id}_X \\
&=_{\text{[corollary: 16.251]}} \mathrm{Id}_X + \sum_{i=1}^{\infty} (-1)^i \cdot H^i - \mathrm{Id}_X \\
&= \sum_{i=1}^{\infty} (-1)^i \cdot H^i \\
&=_{\text{[theorem: 14.357]}} -H + \sum_{i=2}^{\infty} (-1)^i \cdot H^i
\end{aligned}$$

As $\tau(\mathrm{Id}_X + 0) - \tau(\mathrm{Id}_X) - 0 = 0$ we have using the above that

$$\begin{aligned}
\tau(\mathrm{Id}_X + H) - \tau(\mathrm{Id}_X) - (-H) &= \\
\begin{cases} 0 \text{ if } H = 0 \\ \sum_{i=2}^{\infty} (-1)^i \cdot H^i \text{ if } H \neq 0 \end{cases} &= \\
\begin{cases} \|H\|_{L(X,X)} \cdot 0 \text{ if } H = 0 \\ \|H\|_{L(X,X)} \cdot \left(\frac{1}{\|H\|_{L(X,X)}} \cdot \sum_{i=2}^{\infty} (-1)^i \cdot H^i\right) \text{ if } H \neq 0 \end{cases} &=_{\text{[eq: 16.336}} \\
\|H\|_{L(X,X)} \cdot \varepsilon(H)
\end{aligned} \tag{16.342}$$

Consider $L \in \mathcal{G}L(X)$ then we have the following cases to consider:

$L = \mathrm{Id}_X$.

As $-\mathrm{Id}_X \circ H \circ \mathrm{Id}_X = -H$ we have from the above that

$$\tau(\mathrm{Id}_X + H) - \tau(\mathrm{Id}_X) - (-\mathrm{Id}_X \circ H \circ \mathrm{Id}_X) = \|H\|_{L(X,X)} \cdot \varepsilon(H) \tag{16.343}$$

Note that $-\mathrm{Id}_{L(L(X,X),L(X,X))} \in L(L(X,X), L(X,X))$ and

$$-\mathrm{Id}_{L(L(X,X),L(X,X))}(H) = -H = -\mathrm{Id}_X \circ H \circ \mathrm{Id}_X$$

So that $\forall H \in B_{\|\|_X}(0,1)$ we have

$$\tau(\mathrm{Id}_X + H) - \tau(\mathrm{Id}_X) - (-\mathrm{Id}_{L(L(X,X),L(X,X))})(H) = \|H\|_{L(X,X)} \cdot \varepsilon(H) \tag{16.344}$$

Using the above, the fact that ε is a ε-mapping [see eq: 16.341] and $B_{\|\|_{L(X,X)}}(\mathrm{Id}_X, 1) \subseteq \mathcal{G}L(X)$ [see eq: 16.334] we can apply [corollary: 16.30] resulting in

$$D_{\mathrm{Id}_X}\tau \text{ exist and } D_{\mathrm{Id}_X}\tau = -\mathrm{Id}_{L(L(X,X),L(X,X))}$$

where $D_{\mathrm{Id}_X}\tau \in L(L(X,X), L(X,X))$ is defined by

$$D_{\mathrm{Id}_X}\tau(H) = -\mathrm{Id}_{L(L(X,X),L(X,X))}(H) = -H = -\mathrm{Id}_X \circ H \circ \mathrm{Id}_X$$

$\boldsymbol{L \neq \mathrm{Id}_X}$**.** Take $\delta = \min\left(\frac{1}{1+\|L^{-1}\|_{L(X,X)}}, 1\right)$ then if $H \in B_{\|\|_{LX,X}}(0,\delta)$ we have

$$\begin{aligned}
\|H \circ L^{-1}\|_{L(X,X)} &\leqslant_{\text{[theorem: 14.188]}} \|H\|_{L(X,X)} \cdot \|L^{-1}\|_{L(X,X)} \\
&< \delta \cdot \|L^{-1}\|_{L(X,X)} \\
&\leqslant \frac{1}{1+\|L^{-1}\|_{L(X,X)}} \cdot \|L^{-1}\|_{L(X,X)} \\
&< 1
\end{aligned}$$

Hence using [corollary: 16.251] we conclude that

$$\mathrm{Id}_X + H \circ L^{-1} \in \mathcal{G}L(X) \tag{16.345}$$

As $L \in \mathcal{G}L(X)$ we have that $(\mathrm{Id}_X + H \circ L^{-1}) \circ L \in \mathcal{G}L(X)$, further we have that $(\mathrm{Id}_X + H \circ L^{-1}) \circ L \underset{\text{[theorem: 14.200]}}{=} \mathrm{Id}_X \circ L + (H \circ L^{-1}) \circ L = \mathrm{Id}_X \circ L + H = L + H$, hence it follows that

$$L + H = (\mathrm{Id}_X + H \circ L^{-1}) \circ L \in \mathcal{G}L(X) \tag{16.346}$$

If $H \in B_{\|\|_{L(X,X)}}(L,\delta)$ then $\|H - L\|_{L(X,X)} < \delta$ so that $L - H \in B_{\|\|_{L(X,X)}}(0,\delta)$ and by [eq: 16.346] that $L = (L-H) + H \in \mathcal{G}L(X)$, proving that

$$B_{\|\|_{L(X,X)}}(L,\delta) \subseteq \mathcal{G}L(X) \tag{16.347}$$

If $H \in B_{\|\|_{L(X,X)}}(0,\delta)$ then by [theorem: 14.188] we have

$$\begin{aligned}
\|H \circ L^{-1}\|_{L(X,X)} &\leqslant \|H\|_{L(X,X)} \cdot \|L^{-1}\|_{L(X,X)} \\
&< \delta \cdot \|L^{-1}\|_{L(X,X)} \\
&\leqslant \frac{1}{1+\|L^{-1}\|_{L(X,X)}} \cdot \|L^{-1}\|_{L(X,X)} \\
&< 1
\end{aligned}$$

so that

$$H \circ L^{-1} \in B_{\|\|_{L(X,X)}}(0,1)$$

proving, as $\mathrm{dom}(\varepsilon) \underset{\text{[eq: 16.336]}}{=} B_{\|\|_{L(X,X)}}(0,1)$, that

$$\forall H \in B_{\|\|_{L(X,X)}}(0,\delta) \text{ we have that } \varepsilon(H \circ L^{-1}) \text{ is defined}$$

and by inserting $H \circ L^{-1}$ for H in [eq: 16.342]

$$\tau(\mathrm{Id}_X + H \circ L^{-1}) - \tau(\mathrm{Id}_X) = -H \circ L^{-1} + \|H \circ L^{-1}\|_{L(X,X)} \cdot \varepsilon(H \circ L^{-1}) \tag{16.348}$$

Hence

$$\begin{aligned}
\tau(L+H) - \tau(L) &= \\
(L+H)^{-1} - L^{-1} &\underset{\text{[eq: 16.346]}}{=} \\
((\mathrm{Id}_X + H \circ L^{-1}) \circ L)^{-1} - L^{-1} &= \\
L^{-1} \circ (\mathrm{Id}_X + H \circ L^{-1})^{-1} - L^{-1} &= \\
L^{-1} \circ (\mathrm{Id}_X + H \circ L^{-1})^{-1} - L^{-1} \circ \mathrm{Id}_X &\underset{\text{[theorem: 14.200]}}{=} \\
L^{-1} \circ ((\mathrm{Id}_X + H \circ L^{-1})^{-1} - \mathrm{Id}_X) &= \\
L^{-1} \circ (\tau(\mathrm{Id}_X + H \circ L^{-1}) - \mathrm{Id}_X) &= \\
L^{-1} \circ (\tau(\mathrm{Id}_X + H \circ L^{-1}) - \mathrm{Id}_X^{-1}) &= \\
L^{-1} \circ (\tau(\mathrm{Id}_X + H \circ L^{-1}) - \tau(\mathrm{Id}_X)) &\underset{\text{[eq: 16.348]}}{=} \\
L^{-1} \circ (-H \circ L^{-1} + \|H \circ L^{-1}\|_{L(X,X)} \cdot \varepsilon(H \circ L^{-1})) &\underset{\text{[theorem: 14.200]}}{=} \\
-L \circ H \circ L^{-1} + \|H \circ L^{-1}\|_{L(X,X)} \cdot L^{-1} \circ \varepsilon(H \circ L^{-1}) &
\end{aligned}$$

proving that

$$\tau(L+H)-\tau(H)=-L\circ H\circ L^{-1}+\|H\circ L^{-1}\|_{L(X,X)}\cdot L^{-1}\circ\varepsilon(H\circ L^{-1}) \tag{16.349}$$

As $0\in L(X,X)$ and if $H\neq 0$ by]theorem: 14.188] that

$$\frac{\|H\circ L^{-1}\|_{L(X,X)}}{\|H\|_{L(X,X)}}\cdot L^{-1}\circ\varepsilon(H\circ L^{-1})\in L(X,X)$$

we can define the following function

$$\varepsilon'\colon B_{\|\|_{L(X,X)}}(0,\delta)\to L(X,X)\text{ by }\varepsilon'(H)=\begin{cases}0\text{ if }H=0\\ \frac{\|H\circ L^{-1}\|_{L(X,X)}}{\|H\|_{L(X,X)}}\cdot L^{-1}\circ\varepsilon(H\circ L^{-1})\text{ if }H\neq 0\end{cases}$$

then $\forall H\in B_{\|\|_{L(X,X)}}(0,\delta)$

$$\|H\|_{L(X,X)}\cdot\varepsilon'(H)=\|H\circ L^{-1}\|_{L(X,X)}\cdot L^{-1}\circ\varepsilon(H\circ L^{-1}) \tag{16.350}$$

Further for $H\in B_{\|\|_{L(X,X)}}(0,\delta)$ and $x\in X$ we have

$$\begin{aligned}
\|\varepsilon'(H)(x)\| &= \\
\left\|\begin{cases}0(x)\text{ if }H=0\\ \frac{\|H\circ L^{-1}\|_{L(X,X)}}{\|H\|_{L(X,X)}}\cdot(L^{-1}\circ\varepsilon(H\circ L^{-1}))(x)\text{ if }H\neq 0\end{cases}\right\| &= \\
\left\|\begin{cases}0\text{ if }H=0\\ \frac{\|H\circ L^{-1}\|_{L(X,X)}}{\|H\|_{L(X,X)}}\cdot(L^{-1}\circ\varepsilon(H\circ L^{-1}))(x)\text{ if }H\neq 0\end{cases}\right\| &= \\
\begin{cases}\|x\|\cdot 0\text{ if }H=0\\ \frac{\|H\circ L^{-1}\|_{L(X,X)}}{\|H\|_{L(X,X)}}\cdot\|(L^{-1}\circ\varepsilon(H\circ L^{-1}))(x)\|\text{ if }H\neq 0\end{cases} &\leqslant \\
\begin{cases}\|x\|\cdot 0\text{ if }H=0\\ \frac{\|H\circ L^{-1}\|_{L(X,X)}}{\|H\|_{L(X,X)}}\cdot\|(L^{-1}\circ\varepsilon(H\circ L^{-1}))\|_{L(X,X)}\cdot\|x\|\text{ if }H\neq 0\end{cases} &= \\
\|x\|\cdot\begin{cases}0\text{ if }H=0\\ \frac{\|H\circ L^{-1}\|_{L(X,X)}}{\|H\|_{L(X,X)}}\cdot\|(L^{-1}\circ\varepsilon(H\circ L^{-1}))\|_{L(X,X)}\text{ if }H\neq 0\end{cases} &\leqslant_{[14.188]} \\
\|x\|\cdot\begin{cases}0\text{ if }H=0\\ \frac{\|H\circ L^{-1}\|_{L(X,X)}\cdot}{\|H\|_{L(X,X)}}\|\cdot L^{-1}\|_{L(X,X)}\cdot\|\varepsilon(H\circ L^{-1})\|_{L(X,X)}\text{ if }H\neq 0\end{cases} &\leqslant_{[14.188]} \\
\|x\|\cdot\begin{cases}0\text{ if }H=0\\ \frac{\|H\|_{L(X,X)}\cdot}{\|H\|_{L(X,X)}}\cdot\|L^{-1}\|^2_{L(X,X)}\cdot\|\varepsilon(H\circ L^{-1})\|_{L(X,X)}\text{ if }H\neq 0\end{cases} &= \\
\|x\|\cdot\begin{cases}0\text{ if }H=0\\ \|L^{-1}\|^2_{L(X,X)}\cdot\|\varepsilon(H\circ L^{-1})\|_{L(X,X)}\text{ if }H\neq 0\end{cases} &\leqslant \\
\|x\|\cdot\|L^{-1}\|^2_{L(X,X)}\cdot\|\varepsilon(H\circ L^{-1})\|_{L(X,X)} &
\end{aligned}$$

proving by [theorem: 14.184] that

$$\|\varepsilon'(H)\|_{L(X,X)}\leqslant\|L^{-1}\|^2_{L(X,X)}\cdot\|\varepsilon(H\circ L^{-1})\|_{L(X,X)} \tag{16.351}$$

Let $\zeta \in \mathbb{R}^+$ then as ε is continue at 0 [see 16.340] there exist a $\delta_1 \in \mathbb{R}^+$ such that if $\|H\|_{L(X,X)} < \delta_1$ then

$$\|\varepsilon(H)\|_{L(X,X)} < \frac{\zeta}{\|L^{-1}\|^2_{L(X,X)}+1}$$

Take $\delta_2 = \frac{\delta_1}{\|L^{-1}\|_{L(X,X)}+1}$ then if $\|H\|_{L(X,X)} < \delta_2$ we have

$$\begin{aligned}
\|H \circ L^{-1}\|_{L(X,X)} &\leqslant_{[14.188]} \|H\|_{L(X,X)} \cdot \|L^{-1}\|_{L(X,X)} \\
&< \frac{\delta_1}{\|L^{-1}\|_{L(X,X)}+1} \cdot \|L^{-1}\|_{L(X,X)} \\
&< \delta_1
\end{aligned}$$

so that

$$\|\varepsilon(H \circ L^{-1})\|_{L(X,X)} < \frac{\zeta}{\|L^{-1}\|^2_{L(X,X)}+1}$$

Substituting the above in [eq: 16.351] we have for $\|H\|_{L(X,Y)} < \min(\delta, \delta_2)$ that

$$\|\varepsilon'(H) - \varepsilon'(0)\| = \|\varepsilon'(H)\|_{L(X,X)} \leqslant \|L^{-1}\|^2_{L(X,X)} \cdot \frac{\zeta}{\|L^{-1}\|^2_{L(X,X)}+1} < \zeta$$

which proves that ε' is continuous at 0. Hence

$$\varepsilon' \text{ is a } \varepsilon\text{-mapping at } 0 \tag{16.352}$$

Define now

$$\psi: L(X,X) \to L(X,X) \text{ by } \psi(H) = -L^{-1} \circ H \circ L$$

Then for $H_1, H_2 \in L(X,X)$ and $\alpha \in \mathbb{K}$ we have

$$\begin{aligned}
\psi(H_1 + \alpha \cdot H_2) &= -L^{-1} \circ (H_1 + \alpha \cdot H_2) \circ L \\
&\underset{\text{associativity}}{=} -L^{-1} \circ ((H_1 + \alpha \cdot H_2) \circ L) \\
&\underset{[\text{theorem: } 14.200]}{=} -L^{-1} \circ (H_1 \circ L + \alpha \cdot H_2 \circ L) \\
&\underset{[\text{theorem: } 14.200]}{=} -L^{-1} \circ H_1 \circ L + \alpha \cdot (-L^{-1} \circ H_2 \circ L) \\
&= \psi(H_1) + \alpha \cdot \psi(H_2)
\end{aligned}$$

proving that

$$\psi \in \mathrm{Hom}(L(X,X), L(X,X))$$

Further for $H \in L(X,X)$ we have

$$\begin{aligned}
\|\psi(H)\|_{L(X,X)} &= \|-L \circ H \circ L\|_{L(X,X)} \\
&\leqslant_{[\text{theorem: } 14.188]} \|-L \circ H\|_{L(X,X)} \cdot \|L\|_{L(X,X)} \\
&\leqslant \|L\|_{L(X,X)} \cdot \|H\|_{L(X,X)} \cdot \|L\|_{L(X,X)} \\
&= \|L\|^2_{L(X,X)} \cdot \|H\|_{L(X,X)}
\end{aligned}$$

proving by [theorem: 14.184] that

$$\psi \in L(L(X,X), L(X,X)) \text{ and } \|\psi\|_{L(L(X,X),L(X,X))} \leqslant \|L\|^2_{L(X,X)} \tag{16.353}$$

Next

$$\begin{aligned}
\tau(L+H) - \tau(L) - \psi(H) &= \tau(L+H) - \tau(L) - (-L \circ H \circ L) \\
&\underset{[\text{eq: } 16.349]}{=} \|H \circ L^{-1}\|_{L(X,X)} \cdot L^{-1} \circ \varepsilon(H \circ L^{-1}) \\
&\underset{[\text{eq: } 16.350]}{=} \|H\|_{L(X,X)} \cdot \varepsilon'(H)
\end{aligned}$$

Finally using [eqs: 16.347, 16.352 and the above allows us to] apply [corollary: 16.30] proving that τ is Fréchet differentiable at L and

$$D_L\tau = \psi$$

so that $D_L\tau \in L(L(X,X),L(X,X))$ is defined by $D_L\tau(H) = \psi(H) = -L\circ H\circ L$.

So in all cases we have that $\forall L \in \mathcal{G}L(X)$ τ is Fréchet differentiable at L and $D_L\tau \in L(L(X,X),L(X,X))$ is defined by $D_L\tau(H) = -L\circ H\circ L$.

3. Using (2) we have that $\forall L \in \mathcal{G}L(X)$ τ has a Fréchet differential $D_L\tau$ at L where $D_L\tau \in L(L(X,X),L(X,X))$ is defined by $D_L\tau(H) = -L\circ H\circ L$. Hence we can define

$$D^{[1]}\tau : \mathcal{G}L(X) \to L(L(X,X),L(X,X)) \text{ by } D^{[1]}\tau(L) = D_L\tau$$

where

$$D_L\tau \text{ is defined by } D_L(\tau)(H) = -L\circ H\circ L \tag{16.354}$$

We proceed now to show that $D^{[1]}\tau$ is the composition of ∞-times differentiable mappings and τ. Define

$$\chi : \mathcal{G}L(X) \to \mathcal{G}L(X)\cdot\mathcal{G}L(X) \text{ by } \chi(L) = (L,L)$$

then $\forall L \in \mathcal{G}L(X)$ we have

$$(\pi_1\circ\chi)(L) = \pi_1(\chi(L)) = \pi_1((L,L)) = L = \mathrm{Id}_{\mathcal{G}L(X)}(L)$$

and

$$(\pi_2\circ\chi)(L) = \pi_2(\chi(L)) = \pi_2((L,L)) = L = \mathrm{Id}_{\mathcal{G}L(X)}(L)$$

so that $\pi_1\circ\chi = \mathrm{Id}_{\mathcal{G}L(X)}$, $\pi_2\circ\chi = \mathrm{Id}_{\mathcal{G}L(X)}$. As $\mathrm{Id}_{\mathcal{G}L(X)}$ is of C^∞ on $\mathrm{GL}(X)$ [see theorem: 16.128], it follows from [theorem: 16.66] that

$$\mathcal{X} \text{ is } C^\infty \text{ on } \mathcal{G}L(X) \tag{16.355}$$

Given $L,K \in L(X,X)$ define

$$\varphi_{L,K} : L(X,X) \to L(X,X) \text{ by } \varphi_{L,K}(H) = -L\circ H\circ K \tag{16.356}$$

Let $H_1,H_2 \in L(X,X)$, $\alpha \in \mathbb{K}$ then we have

$$\begin{aligned}
\varphi_{L,K}(H_1+\alpha\cdot H_2) &= -L\circ(H_1+\alpha\cdot H_2)\circ K \\
&\underset{\text{[theorem: 14.200]}}{=} -L\circ(H_1\circ K+\alpha\cdot H_2\circ K) \\
&\underset{\text{[theorem: 14.200]}}{=} -L\circ H_1\circ K+\alpha\cdot(-L\circ H_2\circ K) \\
&= \varphi_{L,K}(H_1)+\alpha\cdot\varphi_{L,K}(H_2)
\end{aligned}$$

proving that

$$\varphi_{L,K} \in \mathrm{Hom}(L(X,X),L(X,X))$$

Further if $H \in L(X,X)$ then

$$\begin{aligned}
\|\varphi_{L,K}(H)\|_{L(X,X)} &= \|-L\circ H\circ K\|_{L(X,X)} \\
&= \|-L\circ(H\circ K)\|_{L(X,X)} \\
&\leqslant_{\text{[theorem: 14.188]}} \|L\|_{L(X<X)}\cdot\|H\circ K\|_{L(X,X)} \\
&\leqslant_{\text{[theorem: 14.188]}} \|L\|_{L(X<X)}\cdot\|H\|_{L(X,X)}\cdot\|K\|_{L(X,X)} \\
&= (\|L\|_{L(X,X)}\cdot\|K\|_{L(X,X)})\cdot\|H\|_{L(X,X)}
\end{aligned}$$

hence, using [theorems: 14.177 and 14.184] it follows that

$$\varphi_{L,K} \in L(L(X,X),L(X,X)) \wedge \|\varphi_{L,K}\|_{L(L(X,X),L(X,X))} \leqslant \|L\|_{L(X,X)}\cdot\|K\|_{L(X,X)} \tag{16.357}$$

So we can define

$$\varphi : L(X,X)\cdot L(X,X) \to L(L(X,X),L(X,X)) \text{ by } \varphi(L,K) = \varphi_{L,K} \tag{16.358}$$

Then we have for $L, L_1, L_2 \in L(X, X)$ and $\alpha \in \mathbb{K}$ that

$$\begin{aligned}
\varphi(L, L_1 + \alpha \cdot L_2)(H) &\underset{\text{[eq: 16.358}}{=} \varphi_{L, L_1 + \alpha \cdot L_2}(H) \\
&\underset{\text{[eq: 16.356]}}{=} -L \circ H \circ (L_1 + \alpha \cdot L_2) \\
&\underset{\text{[theorem: 14.200]}}{=} -L \circ (H \circ L_1 + \alpha \cdot H \circ L_2) \\
&\underset{\text{[theorem: 14.200]}}{=} -L \circ H \circ L_1 + \alpha \cdot (-L \circ H \circ L_2) \\
&= \varphi(L, L_1)(H) + \alpha \cdot \varphi(L, L_2)(H) \\
&= (\varphi(L, L_1) + \alpha \cdot \varphi(L, L_2))(H) \\
\varphi(L_1 + \alpha \cdot L_2, L)(H) &= \varphi_{L_1 + \alpha \cdot L_2, L}(H) \\
&\underset{\text{[eq: 16.356]}}{=} -(L_1 + \alpha \cdot L_2) \circ H \circ L \\
&= (-(L_1 + \alpha \cdot L_2) \circ H) \circ L \\
&\underset{\text{[theorem: 14.200]}}{=} (-L_1 \circ H + \alpha \cdot (-L_2 \circ H)) \circ L \\
&\underset{\text{[theorem: 14.200]}}{=} -L_1 \circ H \circ L + \alpha \cdot (-L_2 \circ H \circ L) \\
&= \varphi(L_1, L)(H) + \alpha \cdot \varphi(L_2, L)(H) \\
&= (\varphi(L_1, L) + \alpha \cdot \varphi(L_2, L))(H)
\end{aligned}$$

which proves that

$$\varphi(L, L_1 + \alpha \cdot L_2) = \varphi(L_1, L) + \alpha \cdot \varphi(L_2, L) \text{ and } \varphi(L_1 + \alpha \cdot L_2, L) = \varphi(L_1, L) + \alpha \cdot \varphi(L_2, L)$$

Hence

$$\varphi \in \mathrm{Hom}(L(X, X), L(X, X); L(L(X, X), L(X, X)))$$

Further if $(L, K) \in L(X, X) \cdot L(X, X)$ then we have

$$\begin{aligned}
\|\varphi(L, K)\|_{|L(L(X,X),L(X,X))} &\underset{\text{[eq: 16.358]}}{=} \|\varphi_{L,K}\|_{L(L(X,X),L(X,X))} \\
&\leqslant_{\text{[eq: 16.357]}} \|L\|_{L(X,X)} \cdot \|K\|_{L(X,X)}
\end{aligned}$$

which by [theorem: 14.190] proves that

$$\varphi \in L(L(X, X), L(X, X); L(L(X, X), L(X, X)))$$

Hence by [theorem: 16.135] we have that

$$\varphi \text{ is } C^\infty \text{ on } L(X, X) \cdot L(X, X) \tag{16.359}$$

Take $L \in \mathcal{G}L(X)$ then for $H \in L(X, X)$ we have

$$\begin{aligned}
((\varphi \circ \chi \circ \tau)(L))(H) &= (\varphi(\chi(\tau(L))))(H) \\
&= (\varphi(\chi(L^{-1})))(H) \\
&= (\varphi(L^{-1}, L^{-1}))(H) \\
&\underset{\text{[eq: 16.358}}{=} \varphi_{L^{-1}, L^{-1}}(H) \\
&\underset{\text{[eq: 16.356]}}{=} -L \circ H \circ L \\
&\underset{\text{[eq: 16.354]}}{=} D_L \tau(H)
\end{aligned}$$

proving that $\forall L \in \mathcal{G}L(X)$ $(\varphi \circ \chi \circ \tau)(L) = D_L \tau = D^{[1]}\tau(L)$. Hence we have

$$D^{[1]}\tau = \varphi \circ \chi \circ \tau \tag{16.360}$$

We use now induction for the final part of the proof for (3). So define

$$S = \{n \in \mathbb{N}_0 | \tau \text{ is } C^n \text{ on } \mathcal{G}L(X)\}$$

then we have:

$0 \in S$. As $\forall L \in \mathcal{G}L(X)$ τ is Fréchet differentiable at L, it follows by [theorem: 16.31] that τ is continuous. Hence τ is C^0 on $\mathcal{G}L(X)$ proving that $0 \in S$.

$n \in S \Rightarrow n+1 \in S$. By [eqs: 16.355, 16.359] φ, χ are C^∞ on their domains and, as $n \in S$, τ is C^n on $\mathcal{G}L(X)$. So we can use the chain rule [see theorem: 16.147] to prove that $\varphi \circ \chi \circ \tau$ is C^n on $\mathcal{G}L(X)$. Hence by [eq: 16.360] $D^{[1]}\tau$ is C^n on $\mathcal{G}L(X)$, which by [theorem: 16.124] means that τ is C^{n+1} on $\mathcal{G}L(X)$. So that

$$n+1 \in S$$

By mathematical induction $S = \mathbb{N}$ so that τ is C^∞ on $\mathcal{G}L(X)$. □

We introduce now the concept of differentiable functions who have a differentiable inverse.

Definition 16.253. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces, U a open set in X, V a open set in Y and $f: U \to V$ a function then we say that*

1. *f is a **diffeomorphism** iff*
   a. *$f: U \to V$ is a bijection*
   b. *$f: U \to Y$ is differentiable on U*
   c. *$f^{-1}: V \to X$ is differentiable on V*
2. *f is a **diffeomorphism of class C^n** where $n \in \mathbb{N}_0 \bigcup \{\infty\}$ iff*
   a. *$f: U \to V$ is a bijection*
   b. *$f: U \to Y$ is C^n on U*
   c. *$f^{-1}: V \to X$ is C^n on V*

Example 16.254. Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces then a homeomorphism $f: X \to Y$ is of is a diffeomorphism of class C^0

Proof. This follows trivially from the definitions of a homeomorphism [definition: 14.165] and diffeomorphism of class C^0 [definition: 16.253]. □

Example 16.255. Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be Banach spaces and $L: X \to Y$ a continuous linear isomorphism [in other words $L \in L(X, Y)$ and L is a bijection] then L is a diffeomorphism of class C^∞.

Proof. First using [theorem: 14.393] is a homeomorphism so that L, L^{-1} are continuous. Taking in account [theorem: 11.176] we have also that L^{-1} is linear. So $L \in L(X, Y)$ and $L^{-1} \in L(Y, X)$. Finally by [example: 16.129] it follows that L, L^{-1} are C^∞ on their domains proving that L is a diffeomorphism of class C^∞. □

Theorem 16.256. *Let $n \in \mathbb{N}_0$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces, U a open set in X, V a open set in Y and $f: U \to V$ a diffeomorphism of class C^n then for every open set $W \subseteq U$ we have that*

$$f_{|W}: W \to f(W)$$

is a diffeomorphism of class C^n.

Proof. Using [theorem: 2.90] it follows that $f_{|W}: W \to f(W)$ is a bijection. As f is a diffeomorphism of class C^n $f: U \to Y$ is C^n on U and $f^{-1}: V \to X$ is C^n on V. Using [theorem: 16.106] it follows that $f_{|W}: W \to Y$ is C^n on W. Further as $f^{-1}: V \to Y$ is C^n on V it is C^0 on V hence continuous. So $f(W) \underset{\text{[theorem: 2.69]}}{=} (f^{-1})^{-1}(W)$ is open in the subspace topology of V hence open in the topology of X [see theorem: 14.11]. Applying then [theorem: 16.106] it follows that $(f^{-1})_{|f(W)}: f(W) \to X$ is C^n on $f(W)$. Finally by [theorem: 2.92] $(f^{-1})_{|f(W)} = (f_{|W})^{-1}$ so that $(f_{|W})^{-1}$ is C^n on $f(W)$. Hence $f_{|W}: W \to f(W)$ is a diffeomorphism of class C^n. □

Theorem 16.257. *Let $n \in \mathbb{N}_0$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces, U a open set in X, V a open set in Y and $f: U \to V$ then we have*

f is a diffeomorphism [of class C^n]

$$\Updownarrow$$

$f: U \to Y$ is a differentiable on U [or C^n on U] and there exist a function $g: V \to U$ that is a diffeomorphism [or C^n on V] and $f \circ g = \mathrm{Id}_U \wedge g \circ f = \mathrm{Id}_V$

Proof.

$\Rightarrow$. If f is a diffeomorphism [or C^n on U] then $f: U \to Y$ is differentiable on U [or C^n on U] and $f^{-1}: V \to X$ is differentiable [or C^n on V]. Take $g = f^{-1}$ then g is differentiable on V [or C^n on V], $f \circ g = f \circ f^{-1} = \mathrm{Id}_V$ and $g \circ f = f^{-1} \circ f = \mathrm{Id}_U$.

⇐. As $f \circ g = \mathrm{Id}_V \wedge g \circ f = \mathrm{Id}_U$ it follows from [theorems: 2.72, 2.74] that $g = f^{-1}$ proving that f is a diffeomorphism [or of class C^n]. □

We examine now what happens when diffeomorphism's are composed.

Theorem 16.258. *Let $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces, U a open set in X, V a open set in Y and $f: U \to V$ a diffeomorphism then $\forall x \in U$ we have that*

$$D_{f(x)}(f^{-1}) \circ D_x f = \mathrm{Id}_X \text{ and } D_x f \circ D_{f(x)}(f^{-1}) = \mathrm{Id}_Y$$

so that

$$D_{f(x)}(f^{-1}) = (D_x f)^{-1}$$

Further $D_{f(x)}(f^{-1})$ and $D_x f$ are toplinear isomorphisms [see definition: 16.241]

Proof. Using [theorem: 16.22] Id_U, Id_V are Fréchet differentiable on U, V and $\forall x \in U$ that $D_x \mathrm{Id}_Y = \mathrm{Id}_X$ and $D_{f(x)} \mathrm{Id}_V = \mathrm{Id}_Y$. Further using the chain rule [see theorem: 16.39] we have

$$\mathrm{Id}_X = D_x \mathrm{Id}_U = D_x(f^{-1} \circ f) = D_{f(x)}(f^{-1}) \circ D_x f$$

and

$$\mathrm{Id}_Y = D_{f(x)} \mathrm{Id}_V = D_{f(x)}(f \circ f^{-1}) = D_{f^{-1}(f(x))} f \circ D_{f(x)}(f^{-1}) = D_x f \circ D_{f(x)}(f^{-1})$$

Further as $D_{f(x)}(f^{-1}) \circ D_x f = \mathrm{Id}_X$ and $D_x f \circ D_{f(x)}(f^{-1}) = \mathrm{Id}_Y$ it follows from [theorem: 2.72, 2.74] that $D_{f(x)}(f^{-1})$, $D_x f$ are bijections and $(D_x f)^{-1} = D_{f(x)}(f^{-1}) \in L(Y, X)$, $(D_{f(x)}(f^{-1}))^{-1} = D_x f \in L(X, Y)$ proving that $(D_x f)^{-1}, (D_{f(x)} g)^{-1}$ are continuous. Applying then [theorem: 16.240] proves that $D_{f(x)} g$ and $D_x f$ are toplinear isomorphisms. □

Composition of diffeomorphism's is again a diffeomorphism as is show in the next theorem.

Theorem 16.259. *Let $n \in \mathbb{N}_0$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$, $\langle Z, \|\|_Z \rangle$ be normed spaces, U a open set in X, V a open set in Y, W a open set in X, $f: U \to V$ a diffeomorphism [of class C^n] and $g: V \to W$ a diffeomorphism of class C^n then $g \circ f: V \to W$ is a diffeomorphism [of class C^n].*

Proof. Using [theorem: 2.76] it follows that $g \circ f$ is a bijection and $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$. If f, g are diffeomorphism's then f is differentiable on U, f^{-1}, g are differentiable on V and g^{-1} is differentiable on W. Using the chain rule [theorem: 16.39] $g \circ f$ is differentiable on U and $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$ is differentiable on W, hence $g \circ f$ is a diffeomorphism. Likewise if f, g are diffeomorphism's of class C^n then f, g, f^{-1}, g^{-1} are C^n on their domains, hence, using the chain rule [theorem: 16.147], $g \circ f$ and $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$ are C^n on their domains. From this it follows that $g \circ f$ are differentiable of class C^n. □

We weaken now the concept of a diffeomorphism to that of a local diffeomorphism.

Definition 16.260. *Let $n \in \mathbb{N}_0$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be normed spaces, U a open set in X, $x \in U$ and $f: U \to Y$ a function then **f is a local diffeomorphism [of class C^n] at x** if there exist a open set U_x in X with $x \in U_x \subseteq U$ and a open set $V_{f(x)}$ in Y with $f(x) \in V_{f(x)}$ such that*

$$f_{|U_x}: U_x \to V_{f(x)}$$

is a diffeomorphism [of class C^n].

We are now ready to state and prove the inverse function theorem.

Theorem 16.261. (Inverse Function Theorem) *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be Banach spaces, U a open set in X, $x_0 \in U$ and $f: U \to Y$ a function such that f is C^n on U and $D_{x_0} f \in L_n(X, Y)$ is a bijection then f is a **local diffeomorphism of class C^n** at x_0. In other words there exist a open set U_{x_0} in X with $x_0 \in U_{x_0} \subseteq U$ and a open set $V_{f(x_0)}$ in Y with $f(x_0) \in V_{f(x_0)}$ such that*

$$f_{|U_{x_0}}: U_{x_0} \to V_{f(x_0)} \text{ is a diffeomorphism of class } C^n$$

Proof. The proof is very long and will span several pages, so we split it up in different propositions and conjectures. First note that by the definition of the Fréchet differential [see definition: 16.18] that $D_{x_0} f \in L(X, Y)$. As, by the hypothesis $D_{x_o} f$ is a bijection and X, Y are Banach spaces, it follows from [theorem: 16.241] that

$$D_{x_0} f \text{ is a toplinear isomorphism} \tag{16.361}$$

Next we prove a limited version of the Inverse Function Theorem and extend it later to the more general case.

Proposition 16.262. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$ be a Banach space and U a open set in X with $0 \in U$ and $f: U \to X$ a function such that f is C^n on U, $D_0 f = \mathrm{Id}_X$ and $f(0) = 0$ then f is a local diffeomorphism of class C^n at 0.*

Proof. Define

$$T = \mathrm{Id}_U - f: U \to X \tag{16.362}$$

Then

$$T(0) = \mathrm{Id}_U(0) - f(0) = 0$$

By [example: 16.130] Id_U is C^∞ on U, so using [theorems: 16.126, 16.119] it follows that

$$T \text{ is } C^n \text{ on } U \tag{16.363}$$

and using [theorem: 16.119] it follows that T is C^1 on U hence we have form [theorem: 16.109] that

$$DT: U \to L(X, X) \text{ defined by } DT(x) = D_x T \text{ is continuous} \tag{16.364}$$

and $\forall x \in U$ we have

$$DT(x) = D_x T = D_x \mathrm{Id}_U - D_x f = \mathrm{Id}_X - D_x f \tag{16.365}$$

so that

$$D\,T(0) = \mathrm{Id}_X - D_0 f \underset{D_0 f = \mathrm{Id}_X}{=} \mathrm{Id}_x - \mathrm{Id}_X = 0 \in L(X, X) \tag{16.366}$$

As $D\,T$ is continuous at 0 [by eq: 16.364] there exist a $\rho_1 \in \mathbb{R}^+$ such that $\forall x \in U$ with $\|x\| < \rho_1$ we have $\|DT(x)\|_{L(X,X)} = \|DT(x) - 0\|_{L(X,X)} \underset{\text{[eq: 16.366]}}{=} \|DT(x) - DT(0)\|_{L(X,X)} < \frac{1}{2}$. Further as $0 \in U$ there exist a $\rho_2 \in \mathbb{R}^+$ such that $0 \in B_{\|\|_X}(0, \delta_2) \subseteq U$. Take $\rho_3 = \min(\rho_1, \rho_2) \in \mathbb{R}^+$ then if $x \in B_{\|\|_X}(0, \rho_3)$ we have $\|x\| < \delta_2 \Rightarrow x \in U$ and $\|x\| \leqslant \delta_1 \Rightarrow \|Df(x)\|_X < \frac{1}{2}$. Take $\rho = \frac{\rho_3}{2}$ then we have

$$\overline{B_{\|\|_X}(0, \rho)} \subseteq B_{\|\|_X}(0, \rho_3) \subseteq U \text{ and } \forall x \in \overline{B_{\|\|_X}(0, \rho)} \text{ we have } \|DT(x)\|_{L(X,X)} < \frac{1}{2} < 1 \tag{16.367}$$

If $x \in B_{\|\|_X}(0, \rho)$ then by the above $DT(x) \in B_{\|\|_{L(X,X)}}(0, 1)$ so that by [lemma: 16.249] $\mathrm{Id}_X - DT(x) \in \mathcal{GL}(X)$ and using [eq: 16.365] that $D_x f \in \mathcal{GL}(X)$. Summarized we have

$$\forall x \in B_{\|\|_X}(0, \rho) \quad D_x f \in \mathcal{GL}(X) \text{ [hence by [theorem: 16.243] } (D_x f)^{-1} \in \mathcal{GL}(X) \subseteq L(X, X)] \tag{16.368}$$

As $\overline{B_{\|\|_X}(0, \rho)}$ is convex [see theorem: 16.174] we can use [eq: 16.367] to apply the mean value theorem [theorem: 16.175] giving

$$\forall x \in \overline{B_{\|\|_X}(0, \rho)} \text{ we have } \|T(x)\| = \|T(x) - T(0)\| \leqslant \frac{1}{2} \cdot \|x - 0\| = \frac{1}{2} \cdot \|x\| \tag{16.369}$$

To finish the proposition we prove the following conjectures.

Conjecture 16.263. *If $0 < \rho' \leqslant \rho$ then $\forall y \in \overline{B_{\|\|_X}\left(0, \frac{\rho'}{2}\right)}$ there exist a **uniquely determined** $x \in \overline{B_{\|\|_X}(0, \rho')}$ such that $y = f(x)$.*

Proof. Let $y \in \overline{B_{\|\|_X}\left(0, \frac{\rho'}{2}\right)}$ and define

$$T_y: U \to X \text{ by } T_y(x) = y + T(x) \underset{\text{[eq: 16.362]}}{=} y + \mathrm{Id}_U(x) - f(x) = y + x - f(x)$$

in other words

$$T_y = C_y + T$$

Hence as C_y is C^∞ X [see example: 16.128] and T is C^n on U [see eq: 16.363] it follows from [theorem: 16.126] that

$$T_y \text{ is } C^n \text{ on } U$$

Let $x \in \overline{B_{\|\|_X}(0, \rho')} \subseteq \overline{B_{\|\|_X}(0, \rho)} \subseteq_{\text{[eq: 16.367]}} U$ then we have

$$\|T_y(x)\|_X = \|y + T(x)\|_X \leqslant \|y\|_X + \|T(x)\|_X \leqslant_{\text{[eq: 16.369]}} \|y\|_X + \frac{1}{2} \cdot \|x\|_X \leqslant \frac{\rho'}{2} + \frac{1}{2} \cdot \|x\| \leqslant \frac{\rho'}{2} + \frac{\rho'}{2} = \rho'$$

proving that

$$\forall x \in \overline{B_{\|\|_X}(0, \rho')} \text{ we have } \|T_y(x)\| \leqslant \rho' \text{ so that } T_y(x) \in \overline{B_{\|\|_X}(0, \rho')} \tag{16.370}$$

As $D_xT_y = D_x(C_y + T) = D_xC_y + D_xT = 0 + D_xT = D_xT$ we have using [eq: 16.367] that

$$\forall x \in \overline{B_{\|\|_X}(0,\rho')} \subseteq \overline{B_{\|\|_X}(0,\rho)} \ \|D_xT_y\|_{L(X,X)} = \|D_xT\|_{L(X,X)} < \frac{1}{2} \tag{16.371}$$

As X is a Banach space and $\overline{B_{\|\|_X}(0,\rho')}$ is convex we can apply the mean value theorem [theorem: 16.175] on the above to get

$$\forall x_1, x_2 \in \overline{B_{\|\|_X}(0,\rho')} \text{ we have } \|T_y(x_1) - T_y(x_2)\| \leqslant \frac{1}{2} \cdot \|x_1 - x_2\| \tag{16.372}$$

Using [eq: 16.370] it follows that the following function is well defined

$$S_y = (T_y)_{|\overline{B_{\|\|_X}(0,\rho')}} : \overline{B_{\|\|_X}(0,\rho')} \to \overline{B_{\|\|_X}(0,\rho')}$$

and that this function is a contraction [see definition: 14.385]. As $\overline{B_{\|\|_X}(0,\rho')}$ is closed and X is a Banach space it follows from [theorem: 14.334] that $\overline{B_{\|\|_X}(0,\rho')}$ is a complete metric space [note that a normed space is a metric space]. So we can apply the Banach Fixed Point theorem [see theorem: 14.387] giving

$$\text{There exist a } \textbf{unique } x \in \overline{B_{\|\|_X}(0,\rho')} \text{ such that } T_y(x) = x \tag{16.373}$$

From the definition of T_y we have that $f(x) = y + x - T_y(x) \underset{\text{[eq: 16.373]}}{=} y + x - x = y$ proving that

$$y = f(x)$$

As for uniqueness assume that there exist a $x' \in \overline{B_{\|\|_X}(0,\rho')}$ such that $y = f(x')$ then we have that $T_y(x') = y + x' - f(x') = y + x' - y = x'$ so that by [eq: 16.373] $x = x'$. □

Conjecture 16.264. *For the open set*

$$U_\rho = B_{\|\|_X}\left(0, \frac{\rho}{2}\right) \bigcap f^{-1}\left(B_{\|\|_X}\left(0, \frac{\rho}{4}\right)\right)$$

[as f is C^n on U it is continuous hence $f^{-1}\left(B_{\|\|_X}\left(0, \frac{\rho}{4}\right)\right)$ is open] we have that

$$0 \in U_\rho$$

and

$$f_{|U_\rho} : U_\rho \to B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$$

is a bijection.

Proof. First as $f(0) = 0 \in B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$ it follows that

$$0 \in B_{\|\|_X}\left(0, \frac{\rho}{2}\right) \bigcap f^{-1}\left(B_{\|\|_X}\left(0, \frac{\rho}{4}\right)\right) = U_\rho$$

Second for the function

$$f_{|U_\rho} : U_\rho \to B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$$

we have:

surjectivity. Let $y \in B_{\|\|_X}\left(0, \frac{\rho}{4}\right) \subseteq \overline{B_{\|\|_X}\left(0, \frac{\rho}{4}\right)}$ then by the previous conjecture [conjecture: 16.263] there exist a $x \in \overline{B_{\|\|_X}\left(0, \frac{\rho}{2}\right)}$ such that

$$f(x) = y \tag{16.374}$$

We prove now by contradiction that

$$\|x\|_X \neq \frac{\rho}{2} \tag{16.375}$$

So assume that $\|x\|_X = \frac{\rho}{2}$. As $y \in B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$ we have that $\|f(x)\|_X = \|y\|_X < \frac{\rho}{4}$ so that $\varepsilon = \frac{\rho}{4} - \|y\| \in \mathbb{R}^+$. Given that f is continuous [because f is C^n on U], hence C^0 on U by [theorem: 16.119] there exist a $\delta' \in \mathbb{R}^+$ such that if $z \in U$ with $\|x - z\| < \delta'$ then we have $\|f(x) - f(z)\| < \varepsilon$. Define $\delta = \min\left(\delta', \frac{\rho}{2}\right) \in \mathbb{R}^+$ and take $x_1 = \left(1 + \frac{\delta}{2 \cdot \rho}\right) \cdot x$ then we have, as $1 < 1 + \frac{\delta}{2 \cdot \rho}$, and $\|x\| = \frac{\rho}{2} \neq 0$ that

$$\|x\| < \left(1 + \frac{\delta}{2 \cdot \rho}\right) \cdot \|x\| = \|x_1\|$$

Further

$$\|x_1\| = \left(1 + \frac{\delta}{2 \cdot \rho}\right) \cdot \|x\| = \left(1 + \frac{\delta}{2 \cdot \rho}\right) \cdot \frac{\rho}{2} = \frac{\rho}{2} + \frac{\delta}{2 \cdot \rho} \cdot \frac{\rho}{2} = \frac{\rho}{2} + \frac{\rho}{4} < \frac{\rho}{2} + \frac{\rho}{2} = \rho$$

so that

$$\frac{\rho}{2} = \|x\| < \|x_1\| < \rho \text{ and by [eq: 16.367] } x_1 \in U \tag{16.376}$$

Further we have

$$\|x - x_1\| = \left\| x - \left(1 + \frac{\delta}{\rho}\right) \cdot x \right\| = \left\| \frac{\delta}{2 \cdot \rho} \cdot x \right\| = \frac{\delta}{2 \cdot \rho} \cdot \|x\| \underset{\|x\| = \frac{\rho}{2}}{=} \frac{\delta}{2 \cdot \rho} \cdot \frac{\rho}{2} = \frac{\delta}{4} < \delta \leqslant \delta'$$

so that

$$\|f(x) - f(x_1)\| < \varepsilon = \frac{\rho}{4} - \|y\|$$

Hence

$$\begin{aligned} \|f(x_1)\| &= \|f(x_1) - f(x + f(x))\| \\ &\leqslant \|f(x_1) - f(x)\| + \|f(x)\| \\ &< \frac{\rho}{4} - \|y\| + \|f(x)\| \\ &\underset{\text{[eq: 16.374]}}{=} \frac{\rho}{4} - \|y\| + \|y\| \\ &= \frac{\rho}{4} \end{aligned}$$

proving that $f(x_1) \in B_{\|\|_X}(0, \frac{\rho}{4}) \subseteq \overline{B_{\|\|_X}(0, \frac{\rho}{4})}$. Using the previous conjecture [conjecture: 16.263] there exist a $x_2 \in \overline{B_{\|\|_X}(0, \frac{\rho}{2})}$ such that $f(x_1) = f(x_2)$. As

$$f(x_1) = f(x_2) \subseteq B_{\|\|_X}\left(0, \frac{\rho}{4}\right) \subseteq \overline{B_{\|\|_X}\left(0, \frac{\rho}{2}\right)} \text{ and } \|x_1\| < \rho \wedge \|x_2\| \leqslant \frac{\rho}{2} < \rho$$

it follows from the uniqueness in [conjecture: 16.263] that $x_1 = x_2$. So we have

$$\frac{\rho}{2} <_{\text{[eq: 16.376]}} \|x_1\| = \|x_2\| \leqslant \frac{\rho}{2}$$

leading to the contradiction $\frac{\rho}{2} < \frac{\rho}{2}$. Hence our assumption is wrong and we must have that

$$\|x\| \neq \frac{\rho}{2}$$

So as $x \in \overline{B_{\|\|_X}(0, \frac{\rho}{2})}$ we have $x \in B_{\|\|_X}(0, \frac{\rho}{2})$, further as $f(x) = y \in B_{\|\|_X}(0, \frac{\rho}{4})$ it follows that $x \in f^{-1}(B_{\|\|_X}(0, \frac{\rho}{4}))$, proving that $x \in B_{\|\|_X}(0, \frac{\rho}{2}) \bigcap f^{-1}(B_{\|\|_X}(0, \frac{\rho}{4})) = U_\rho$. Hence we have found a $x \in U_\rho$ such that $f(x) = y$.

injectivity. Assume that there exist $x_1, x_2 \in U_\rho \subseteq B_{\|\|_X}(0, \frac{\rho}{4})$ such that $f(x_1) = f(x_2) \in B_{\|\|_X}(0, \frac{\rho}{4})$ then by the uniqueness of the previous conjecture [conjecture: 16.263] $x_1 = x_2$.

Hence $f_{|U_\rho}: U_\rho \to B_{\|\|_X}(0, \frac{\rho}{4})$ is a bijection. □

Proceeding with the proof of [proposition: 16.262] we have as $f_{|U_\rho}: U_\rho \to B_{\|\|_X}(0, \frac{\rho}{4})$ is a bijection that $f_{|U_\rho}$ has a inverse hence we have

$$g = (f_{|U_\rho})^{-1}: B_{\|\|_X}\left(0, \frac{\rho}{4}\right) \to U_\rho \text{ where } U_\rho = B_{\|\|_X}\left(0, \frac{\rho}{2}\right) \bigcap f^{-1}\left(B_{\|\|_X}\left(0, \frac{\rho}{4}\right)\right) \tag{16.377}$$

We prove now that g is continuous.

Conjecture 16.265. *g is continuous.*

Proof. Let $x \in U_\rho$ then $x = x - f(x) + f(x) \underset{\text{[eq: 16.362]}}{=} T(x) + f(x)$, so if $x_1, x_2 \in U_\rho$ then

$$\begin{aligned} \|x_1 - x_2\|_X &= \|T(x_1) + f(x_1) - T(x_2) - f(x_2)\|_X \\ &\leqslant \|T(x_1) - T(x_2)\|_X + \|f(x_1) - f(x_2)\|_X \end{aligned}$$

As [eq: 16.377] $U_\rho \subseteq B_{\|\|_X}(0, \frac{\rho}{2}) \subseteq \overline{B_{\|\|_X}(0, \frac{\rho}{2})}$ which is convex [see theorem: 16.174] and $\forall x \in B_{\|\|_X}(0, \frac{\rho}{2}) \subseteq B_{\|\|_X}(0, \rho)$ we have $\|D_x T\|_{L(X,X)} < \frac{1}{2}$ [see eq: 16.367] we can apply the main value theorem [theorem: 16.175] giving $\|T(x_1) - T(x_2)\|_X \leqslant \frac{1}{2} \cdot \|x_1 - x_2\|_X$ so that

$$\|x_1 - x_2\|_X \leqslant \frac{1}{2} \cdot \|x_1 - x_2\|_X + \|f(x_1) - f(x_2)\|_X$$

hence

$$\|x_1 - x_2\|_X \leqslant 2 \cdot \|f(x_1) - f(x_2)\|_X$$

To summarize we have proved that

$$\forall x_1, x_2 \in U_\rho \quad \|x_1 - x_2\|_X \leqslant 2 \cdot \|f(x_1) - f(x_3)\|_X \tag{16.378}$$

Let $y_1,\ y_2 \in B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$ then by [eq: 16.377] $g(y_1), g(y_2) \in U_\rho$ so that by [eq: 16.378] we have

$$\|g(y_1) - g(y_2)\|_X \leqslant 2 \cdot \|f(g(y_1)) - f(g(y_2))\|_X = 2 \cdot \|y_1 - y_2\|_X \tag{16.379}$$

Let $\varepsilon \in \mathbb{R}^+$ and $y \in B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$ then for all $y' \in B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$ with $\|y - y'\| < \frac{\varepsilon}{2}$ we have

$$\|g(y) - g(y')\| \leqslant 2 \cdot \|y - y'\| = 2 \cdot \frac{\varepsilon}{2} = \varepsilon$$

proving that g is continuous at y. As $y \in B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$ was chosen arbitrary we must conclude that g is continuous. □

Next we prove that g is differentiable on $B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$.

Conjecture 16.266. *g is differentiable on $B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$ and $\forall y \in B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$ we have $D_y g = (D_{g(y)} f)^{-1}$.*

Proof. Let $y \in B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$ then by [eq: 16.377] $g(y) \in U_\rho \subseteq B_{\|\|_X}\left(0, \frac{\rho}{2}\right) \subseteq B_{\|\|_X}(0, \rho) \subseteq_{\text{[eq: 16.367]}} U$. Further using [eq: 16.368] we have that $D_{g(y)} f$ is a toplinear isomorphism so that

$$(D_{g(y)} f)^{-1} \text{ exists and } (D_{g(y)} f)^{-1} \in L(X, X) \tag{16.380}$$

Take $h \in \left(B_{\|\|_X}\left(0, \frac{\rho}{4}\right)\right)_y$ so that $y + h \in B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$ then for k defined by

$$k = g(y + h) - g(y) \tag{16.381}$$

we have $k + g(y) = g(y + h) \in g\left(B_{\|\|_X}\left(0, \frac{\rho}{4}\right)\right) \underset{\text{[eq: 16.377]}}{=} U_\rho \subseteq B_{\|\|_X}\left(0, \frac{\rho}{2}\right) \subseteq B_{\|\|_X}(0, \rho) \subseteq_{\text{[eq: 16.367]}} U$. So that

$$k = g(y + h) \in U_{g(y)}$$

As f is Fréchet differentiable at $g(y)$ [for $g(y) \in U$] there exist by [theorem: 16.29] a ε-mapping $\zeta: U_{g(y)} \to X$ such that

$$f(g(y) + k) - f(g(y)) - D_{g(y)} f(k) = \|k\|_X \cdot \zeta(k) \tag{16.382}$$

As $f(g(y) + k) \underset{\text{[eq: 16.381]}}{=} f(g(y) + g(y + h) - g(y)) = f(g(y + h)) = y + h$ and $f(g(y)) = y$ it follows that $y + h - y - D_{g(y)} f(k) = \|k\|_X \cdot \zeta(k)$. Hence we have

$$h = D_{g(y)} f(k) + \|k\|_X \cdot \zeta(k) \tag{16.383}$$

Applying $(D_{g(y)} f)^{-1}$ to both sides of [eq: 16.383] and using linearity we have

$$\begin{aligned}
(D_{g(y)} f)^{-1}(h) &= (D_{g(y)} f)^{-1}(D_{g(y)} f(k) + \|k\|_X \cdot \zeta(k)) \\
&= (D_{g(y)} f)^{-1}(D_{g(y)} f(k)) + \|k\|_X \cdot (D_{g(y)} f)^{-1}(\zeta(k)) \\
&= k + \|k\|_X \cdot (D_{g(y)} f)^{-1}(\zeta(k)) \\
&\underset{\text{[eq: 16.381]}}{=} g(y + h) - g(y) + \|g(y + h) - g(y)\|_X \cdot (D_{g(y)} f)^{-1}(\zeta(g(y + h) - g(y)))
\end{aligned}$$

so that

$$g(y + h) - g(y) - (D_{g(y)} f)^{-1}(h) = -\|g(y + h) - g(y)\|_X \cdot (D_{g(y)} f)^{-1}(\zeta(g(y + h) - g(y))) \tag{16.384}$$

The above suggest that we use [theorem: 16.29] again, so define

$$\varepsilon: \left(B_{\|\|_X}\left(0, \frac{\rho}{4}\right)\right)_y \to X \text{ by } \begin{cases} 0 \text{ if } h = 0 \\ -\frac{\|g(y+h) - g(y)\|_X}{\|h\|} \cdot (D_{g(y)} f)^{-1}(\zeta(g(y + h) - g(y))) \text{ if } h \neq 0 \end{cases}$$

Using the fact that $g(y + 0) - g(0) - (D_{g(y)} f)^{-1}(0) = 0$ we have from the above definition and [eq: 16.384] that

$$g(y + h) - g(y) - (D_{g(y)} f)^{-1}(h) = \|h\|_X \cdot \varepsilon(h) \tag{16.385}$$

As $y, y + h \in B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$ it follows from [eq: 16.379] that

$$\|g(y + h) - g(y)\|_X \leqslant 2 \cdot \|y + h - y\|_X = 2 \cdot \|h\|_X \tag{16.386}$$

Let $\chi \in \mathbb{R}^+$ then by continuity of the ε-mapping ζ [see definition: 16.28] there exist a $\delta'_\chi \in \mathbb{R}^+$ such that for $h \in U_{g(y)}$ with $\|h\|_X = \|h-0\|_X < \delta'_\chi$ we have $\|\zeta(h)\|_X < \chi$. By continuity of g [see conjecture: 16.265] there exist a $\delta_\chi \in \mathbb{R}^+$ such that if $h \in \left(B_{\|\|_X}\left(0, \frac{\rho}{4}\right)\right)_y$ with $\|h\|_X < \delta_\chi$ we have $\|g(y+h) - g(y)\|_X < \delta'_\chi$. Further as $(g(y+h) - g(y)) + g(y) = g(y+h) \in U_\rho \subseteq B_{\|\|_X}\left(0, \frac{\rho}{2}\right) \subseteq B_{\|\|_X}(0, \rho) \subseteq_{\text{[eq: 16.367]}} U$ it follows that $g(y+h) - g(y) \in U_{g(y)}$. Hence we have $\|\zeta(g(y+h) - g(y))\|_X < \chi$. To summarize:

$$\forall \chi \in \mathbb{R}^+ \ \exists \delta_\chi \in \mathbb{R}^+ \text{ such that } \forall h \in \left(B_{\|\|_X}\left(0, \frac{\rho}{4}\right)\right)_y \text{ with } \|h\|_X < \delta_\chi \quad \|\zeta(g(+h) - g(y))\|_X < \chi \tag{16.387}$$

Take $\mu \in \mathbb{R}^+$ then given $\chi = \frac{\mu}{2 \cdot (\|(D_{g(y)}f)^{-1}\|_{L(X,Y)} + 1)} \in \mathbb{R}^+$ we have for $h \in B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$ with $\|h\|_X < \delta_\chi$

$$\begin{aligned}
\|\varepsilon(h) - \varepsilon(0)\|_X &= \|\varepsilon(h)\|_X \\
&= \begin{cases} \|0\|_X \text{ if } h = 0 \\ \left\| -\frac{\|g(y+h) - g(y)\|_X}{\|h\|_X} \cdot (D_{g(y)}f)^{-1}(\zeta\,(g(y+h) - g(y))) \right\|_X \text{ if } h \neq 0 \end{cases} \\
&= \begin{cases} 0 \text{ if } h = 0 \\ \frac{\|g(y+h) - g(y)\|_X}{\|h\|_X} \cdot \|(D_{g(y)}f)^{-1}(\zeta\,(g(y+h) - g(y)))\|_X \text{ if } h \neq 0 \end{cases} \\
&\leqslant \begin{cases} 0 \text{ if } h = 0 \\ \frac{\|g(y+h) - g(y)\|_X}{\|h\|_X} \cdot \|(D_{g(y)}f)^{-1}\|_{L(X,X)} \|\zeta\,(g(y+h) - g(y))\|_X \text{ if } h \neq 0 \end{cases} \\
&\leqslant_{\text{[eq: 16.386]}} \begin{cases} 0 \text{ if } h = 0 \\ \frac{2 \cdot \|h\|_X}{\|h\|_X} \cdot \|(D_{g(y)}f)^{-1}\|_{L(X,X)} \cdot \|\zeta\,(g(y+h) - g(y))\|_X \text{ if } h \neq 0 \end{cases} \\
&<_{\text{[eq: 16.387]}} \begin{cases} 0 \text{ if } h = 0 \\ \frac{2 \cdot \|h\|_X}{\|h\|_X} \cdot \|(D_{g(y)}f)^{-1}\|_{L(X,X)} \cdot \chi \text{ if } h \neq 0 \end{cases} \\
&= \begin{cases} 0 \text{ if } h = 0 \\ 2 \cdot \|(D_{g(y)}f)^{-1}\|_{L(X,X)} \cdot \chi \text{ if } h \neq 0 \end{cases} \\
&= \begin{cases} 0 \text{ if } h = 0 \\ 2 \cdot \|(D_{g(y)}f)^{-1}\|_{L(X,X)} \cdot \frac{\mu}{2 \cdot (\|(D_{g(y)}f)^{-1}\|_{L(X,Y)} + 1)} \text{ if } h \neq 0 \end{cases} \\
&< \begin{cases} 0 \text{ if } h = 0 \\ \mu \text{ if } h = 0 \end{cases} \\
&< \mu
\end{aligned}$$

proving that ε is continuous at 0. Hence ε is a ε-mapping, as further by [eq: 16.368] $(D_{g(y)}f)^{-1} \in L(X, X)$ it follows from [eq: 16.385] and [theorem: 16.29] that g is Fréchet differentiable at y with differential $D_y g = (D_{g(y)}f)^{-1}$. This concludes the proof of [conjecture: 16.266] □

To complete the proof of [proposition: 16.262] we need to proof that g is C^n on $B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$. Consider the inversion mapping:

$$\tau: \mathrm{GL}(X) \to L(X, X) \text{ defined by } \tau(L) = L^{-1} \text{ [see theorem: 16.252]}$$

As $f: U \to X$ is C^n on U hence C^1 on U we can define the function:

$$Df: U \to L(X, X) \text{ by } Df(x) = D_x f$$

Further by the previous conjecture [conjecture: 16.266] we can define the function

$$Dg: B_{\|\|_X}\left(0, \frac{\rho}{4}\right) \to L(X, X) \text{ by } Dg(y) = D_y g$$

As $g\left(B_{\|\|_X}\left(0, \frac{\rho}{4}\right)\right) \underset{\text{[eq: 16.377]}}{=} U_\rho \subseteq B_{\|\|_X}\left(0, \frac{\rho}{2}\right) \subseteq B_{\|\|_X}(0, \rho) \subseteq_{\text{[eq: 16.367]}} U$ the function

$$\tau \circ Df \circ g: B_{\|\|_X}\left(0, \frac{\rho}{4}\right) \to L(X, X)$$

is well defined. If $y \in B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$ then we have

$$(\tau \circ Df \circ g)(y) = \tau(Df(g(y))) = (Df(g(y)))^{-1} = (D_{g(y)}f)^{-1} \underset{\text{[conjecture: 16.266]}}{=} D_y g = Dg(y)$$

proving that

$$\tau \circ Df \circ g = Dg \tag{16.388}$$

Next we use mathematical induction to prove that g is C^n on $B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$. So define

$$S = \left\{ m \in \mathbb{N} | \text{If } m \leqslant n \text{ then } g \text{ is } C^m \text{ on } B_{\|\|_X}\left(0, \frac{\rho}{4}\right) \right\}$$

then we have:

$1 \in S$. By [theorem: 16.252] τ is C^∞ on $\mathcal{GL}(X)$ hence continuous, further by [conjecture: 16.265] g is continuous and, as f is C^n on U hence C^1 on U, Df is continuous. So $\tau \circ Df \circ g$ is continuous proving by [eq: 16.388] that Dg is continuous, hence g is C^1 on $B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$. So $1 \in S$.

$m \in S \Rightarrow m+1 \in S$. If $m+1 \leqslant n$ then as f is C^n on U it follows from [theorem: 16.119] that f is C^{m+1} on U so that by [theorem: 16.124] Df is C^m on U. Further as τ is C^∞ on $\mathcal{GL}(X)$ and g is C^m on $B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$ [because $m \in S$] it follows from the chain rule [theorem: 16.147] that $\tau \circ Df \circ g$ is C^m on $B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$. Hence using [eq: 16.388] we conclude that $D^{[1]}g = Dg$ is C^m on $B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$, which by [theorem: 16.125] proves that g C^{m+1} on $B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$. Hence it follows that $m+1 \in S$.

Using induction it follows that $S = \mathbb{N}$ so that, as $n \in \mathbb{N}$ and $n \leqslant n$, g is s C^n on its domain. As g is the inverse of $f_{|U_\rho}: U_\rho \to B_{\|\|_X}\left(0, \frac{\rho}{4}\right)$, $0 \in U_\rho$ [see conjecture: 16.264], it follows that f is a local diffeomorphism of class C^n at 0. This concludes the proof of [proposition: 16.262]. □

Next we must extend [proposition: 16.262] to a more general case.

Proposition 16.267. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be Banach spaces, U a open set in X, $0 \in U$ and $f: U \to Y$ a function such that f is C^n on U, $f(0) = 0$ and $D_0 f \in L(X, Y)$ is a bijection then f is a local diffeomorphism of class C^n at 0.*

Proof. As $D_0 f \in L(X, Y)$ is a bijection it follows from [theorem: 16.241] that

$$D_0 f \text{ is a toplinear isomorphism} \tag{16.389}$$

so that

$$(D_0 f)^{-1}: Y \to X$$

is well defined and is linear and continuous, hence by [theorem: 16.129] $(D_0 f)^{-1}$ is C^∞ on Y. As f is C^n on U it follows from the chain rule [theorem: 16.147] that

$$h = (D_0 f)^{-1} \circ f: U \to X$$

is C^n on U. Then

$$\begin{aligned} h(0) &= ((D_0 f)^{-1} \circ f)(0) \\ &= (D_0 f)^{-1}(f(0)) \\ &\underset{f(0)=0}{=} (D_0 f)^{-1}(0) \\ &\underset{\text{linearity}}{=} 0 \end{aligned} \tag{16.390}$$

Also

$$\begin{aligned} D_0 h &\underset{\text{[theorem: 16.39]}}{=} D_0((D_0 f)^{-1} \circ f) \\ &= D_{f(0)}(D_0 f)^{-1} \circ D_0 f \\ &\underset{\text{[theorem: 16.129]}}{=} (D_{f(0)} f)^{-1} \circ D_0 f \\ &\underset{f(0)=0}{=} (D_0 f)^{-1} \circ D_0 f \\ &= \mathrm{Id}_X \end{aligned} \tag{16.391}$$

So the conditions for [proposition: 16.262] are satisfied for h and it follows that h is a local diffeomorphism of class C^n at 0. Hence there exist open sets U_0, V_0' in X with $0 \in U_0$ and $0 = h(0) \in V_0'$ such that

$$h_{|U_0}: U_0 \to V_0' \text{ is a diffeomorphism of class } C^n \tag{16.392}$$

As D_0f is a toplinear isomorphism [see eq: 16.389] we have that

$$V_0 = (D_0f)(V_0') \underset{[\text{theorem:: } 2.69]}{=} ((D_0f)^{-1})^{-1}(V_0') \text{ is open in } Y \tag{16.393}$$

Further as $D_0f \in L(X,Y)$ and is bijective it follows from [example: 16.255] that D_0f is a diffeomorphism of class C^∞. Applying then [theorem: 16.256] proves that

$$(D_0f)_{|V_0'}: V_0' \to D_0f(V_0') = V_0 \text{ is a diffeomorphism of class } C^n \tag{16.394}$$

Next as $0 \in V_0'$ and D_0f is linear we have that $0 = (D_0f)_{|V_0'}(0) = D_0f(0) \in D_0f(V_0') = V_0$ so that

$$0 \in V_0$$

Take

$$g: (D_0f)_{|V_0'} \circ h_{|U_0}: U_0 \to V_0$$

then as $h_{|U_0}$, $(D_0f)_{|V_0'}$ are diffeomorphism of class C^n it follows from [theorem: 16.259] that

$$g \text{ is a diffeomorphism of class } C^n \tag{16.395}$$

Let now $x \in U_0$ then we have

$$\begin{aligned} g(x) &= ((D_0f)_{|V_0'} \circ h_{|U_0})(x) \\ &= (D_0f)_{|V_0'}(h_{|U_0}(x)) \\ &= (D_0f)(h_{|U_0}(x)) \\ &= (D_0f)(h(x)) \\ &= (D_0f)(((D_0f)^{-1} \circ f)(x)) \\ &= (D_0f)(D_0f)^{-1}(f(x))) \\ &= f(x) \\ &\underset{x \in U_0}{=} f_{|U_0}(x) \end{aligned}$$

so that

$$g = f_{|U_0}$$

So that $f_{|U_0}: U_0 \to V_0$ is a diffeomorphism of class C^n which proves that f is a local diffeomorphism of class C^n at 0. □

Finally we extend the latest proposition to prove the inverse function theorem, to increase readability we repeat here the inverse function theorem as a conjecture, so as this conjecture is proved we have completed the proof of the inverse function theorem.

Conjecture 16.268. *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ be Banach spaces, U a open set in X, $x_0 \in U$, $f: U \to Y$ a function such that f is C^n on U and $D_{x_0}f \in L_n(X,Y)$ is a bijection then f is a local diffeomorphism of class C^n at x_0. In other words there exist a open set U_{x_0} in X with $x_0 \in U_{x_0} \subseteq U$ and a open set $V_{f(x_0)}$ in Y with $f(x_0) \in V_{f(x_0)}$ such that*

$$f_{|U_{x_0}}: U_{x_0} \to V_{f(x_0)} \text{ is a diffeomorphism of class } C^n$$

Proof. Define $\mathcal{T}_1: X \to X$ by $\mathcal{T}_1(x) = x + x_0$ then by [example: 16.133] $\mathcal{T}_1$ is C^∞ on U with $D_0\mathcal{T}_1 = \mathrm{Id}_X$. Further

$$\mathcal{T}_1(0) = x_0 \Rightarrow x + 0 \in W \text{ where } W = (\mathcal{T}_1)^{-1}(U) \tag{16.396}$$

As $\mathcal{T}_1$ is C^∞ on X hence continuous, W is a open set, so applying [theorem: 16.106] we have

$$(\mathcal{T}_1)_{|W}: W \to X \text{ is } C^\infty \text{ on } W \text{ with } D_0(\mathcal{T}_1)_{|W} = D_0\mathcal{T}_1 = \mathrm{Id}_X \tag{16.397}$$

Further

$$(\mathcal{T}_1)_{|W}(W) \underset{[\text{theorem: } 2.86]}{=} \mathcal{T}_1(W) = \mathcal{T}_1((\mathcal{T}_1)^{-1}(U)) \subseteq_{[\text{theorem: } 2.25]} U \tag{16.398}$$

Further define $\mathcal{T}_2: Y \to Y$ by $\mathcal{T}_2(x) = x - f(x_0)$ then by [example: 16.133] $\mathcal{T}_2$ is C^∞ on Y with $D_0\mathcal{T}_2 = \mathrm{Id}_Y$. So we can construct the function

$$h = \mathcal{T}_2 \circ f \circ (\mathcal{T}_1)_{|W}: W \to Y \tag{16.399}$$

Using the chain rule [theorem: 16.147] it follows that h C^n on W and

$$\begin{aligned}
D_0h &= D_0(\mathcal{T}_2\circ f\circ(\mathcal{T}_1)_{|W})\\
&= D_0((\mathcal{T}_2\circ f)\circ(\mathcal{T}_1)_{|W})\\
&= D_{(\mathcal{T}_1)_{|W}(0)}(\mathcal{T}_2\circ f)\circ D_0(\mathcal{T}_1)_{|W}\\
&= D_{(\mathcal{T}_1)_{|W}(0)}(\mathcal{T}_2\circ f)\circ \mathrm{Id}_X\\
&= D_{(\mathcal{T}_1)_{|W}(0)}(\mathcal{T}_2\circ f)\\
&= D_{x_0}(\mathcal{T}_2\circ f)\\
&= D_{f(x_0)}\mathcal{T}_2\circ D_{x_0}f\\
&= \mathrm{Id}_Y\circ D_{x_0}f\\
&= D_{x_0}f
\end{aligned}$$

As $D_{x_0}f$ is a bijection it follows from the above that

$$D_0h \text{ is a bijection}$$

Further we have

$$\begin{aligned}
h(0) &= (\mathcal{T}_2\circ f\circ(\mathcal{T}_1)_{|W})(0)\\
&= \mathcal{T}_2(f((\mathcal{T}_1)_{|W}(0)))\\
&= \mathcal{T}_2(f(x_0))\\
&= \mathcal{T}_2(f(x_0))\\
&= f(x_0)-f(x_0)\\
&= 0
\end{aligned}$$

So the conditions for the previous proposition [proposition: 16.267] are satisfied for h and we have that h is a local diffeomorphism of class C^n at 0. Hence there exist by [definition: 16.260] open sets U_0, V_0

$$0\in U_0\subseteq W,\ 0=h(0)\in V_0 \text{ and } h_{|U_0}\colon U_0\to V_0 \text{ is a diffeomorphism of class } C^n \tag{16.400}$$

Define now

$$\mathcal{T}_3\colon X\to X \text{ by } \mathcal{T}_3(x)=x-x_0$$

then we have that for $x\in X$

$$(\mathcal{T}_3\circ\mathcal{T}_1)(x)=\mathcal{T}_3(\mathcal{T}_1(x))=\mathcal{T}_3(x+x_0)=x+x_0-x_0=x=\mathrm{Id}_X(x)$$

$$(\mathcal{T}_1\circ\mathcal{T}_3)(x)=\mathcal{T}_1(\mathcal{T}_3(x))=\mathcal{T}_1(x-x_0)=x-x_0+x_0=x=\mathrm{Id}_X(x)$$

proving that $\mathcal{T}_3\circ\mathcal{T}_1=\mathrm{Id}_X=\mathcal{T}_3\circ\mathcal{T}_1$ so that

$$\mathcal{T}_3,\mathcal{T}_1 \text{ are bijections and } (\mathcal{T}_3)^{-1}=\mathcal{T}_1\wedge(\mathcal{T}_1)^{-1}=\mathcal{T}_3 \tag{16.401}$$

Let $U_{x_0}=(\mathcal{T}_3)^{-1}(U_0)$ then as $\mathcal{T}_3$ is a bijection we have that $\mathcal{T}_3(U_{x_0})\underset{\text{[theorem: 2.56]}}{=}U_0$ hence

$$(\mathcal{T}_3)_{|U_{x_0}}\colon U_{x_0}\to U_0 \text{ is a bijection} \tag{16.402}$$

Further we have that

$$((\mathcal{T}_3)_{|U_{x_0}})^{-1}\underset{\text{[theorem: 2.92]}}{=}((\mathcal{T}_3)^{-1})_{|\mathcal{T}_3(U_{x_0})}=((\mathcal{T}_3)^{-1})_{|U_0}\underset{\text{[eq: 16.401]}}{=}(\mathcal{T}_1)_{|U_0}\colon U_0\to U_{x_0} \tag{16.403}$$

We have also

$$U_{x_0}=(\mathcal{T}_3)^{-1}(U_0)\subseteq_{\text{[eq: 16.400]}}(\mathcal{T}_3)^{-1}(W)=((\mathcal{T}_1)^{-1})^{-1}(W)\underset{\text{[theorem: 2.69]}}{=}\mathcal{T}_1(W)\underset{\text{[eq: 16.398]}}{=}U$$

or

$$U_{x_0}\subseteq U \tag{16.404}$$

By [eq: 16.400] $0\in U_0$ so that $\mathcal{T}_3(x_0)=x_0-x_0=0\in U_0$ proving that

$$x_0\in(\mathcal{T}_3)^{-1}(U_0)=U_{x_0} \tag{16.405}$$

Using [example: 16.133] it follows that $\mathcal{T}_3,\mathcal{T}_1$ are C^∞ on X. So applying [theorem: 16.106] we have that

$$(\mathcal{T}_3)_{|U_{x_0}}\colon U_{x_0}\to X,\ ((\mathcal{T}_3)_{|U_{x_0}})^{-1}\colon U_0\to X \text{ are } C^\infty \text{ on their respectively domains} \tag{16.406}$$

As $\mathcal{T}_3$ is C^∞ on X $\mathcal{T}_3$ is continuous so that

$$U_{x_0} = (\mathcal{T}_3)^{-1}(U_0) \text{ is a open set} \tag{16.407}$$

Hence by definition of a diffeomorphism [see definition: 16.253] it follows from [eqs: 16.402,16.406, 16.407] that

$$(\mathcal{T}_3)_{|U_{x_0}}: U_{x_0} \to U_0 \text{ is a diffeomorphism of class } C^n \tag{16.408}$$

Next define

$$\mathcal{T}_4: Y \to Y \text{ by } \mathcal{T}_4(y) = y + f(x_0) \text{ and } \mathcal{T}_5: Y \to Y \text{ by } \mathcal{T}_5(y) = y - f(x_0)$$

then we have that for $y \in Y$

$$(\mathcal{T}_4 \circ \mathcal{T}_5)(y) = \mathcal{T}_4(\mathcal{T}_5(y)) = \mathcal{T}_4(y - f(x_0)) = y - f(x_0) + f(x_0) = y = \mathrm{Id}_Y(y)$$

$$(\mathcal{T}_5 \circ \mathcal{T}_4)(y) = \mathcal{T}_5(\mathcal{T}_4(y)) = \mathcal{T}_5(y + f(x_0)) = y + f(x_0) - f(x_0) = y = \mathrm{Id}_Y(y)$$

proving that $\mathcal{T}_4 \circ \mathcal{T}_5 = \mathrm{Id}_Y = \mathcal{T}_5 \circ \mathcal{T}_4$ so that

$$\mathcal{T}_4, \mathcal{T}_5 \text{ are bijections and } (\mathcal{T}_4)^{-1} = \mathcal{T}_5 \wedge (\mathcal{T}_5)^{-1} = \mathcal{T}_4$$

Let $V_{f(x_0)} = \mathcal{T}_4(V_0)$ then we have

$$(\mathcal{T}_4)_{|V_0}: V_0 \to V_{f(x_0)} \text{ is a bijection} \tag{16.409}$$

further we have

$$V_{f(x_0)} = \mathcal{T}_4(V_0) = ((\mathcal{T}_5)^{-1})(V_0) \underset{\text{[theorem: 2.69]}}{=} (\mathcal{T}_5)^{-1}(V_0) \tag{16.410}$$

and

$$((\mathcal{T}_4)_{|V_0})^{-1} \underset{\text{[theorem: 2.92]}}{=} ((\mathcal{T}_4)^{-1})_{|\mathcal{T}_4(V_0)} = ((\mathcal{T}_4)^{-1})_{|V_{f(x_0)}}: V_{f(x_0)} \to V_0 \tag{16.411}$$

Using [example: 16.133] it follows that $\mathcal{T}_4, \mathcal{T}_5$ are C^∞ on Y. So applying [theorem: 16.106] we have that

$$(\mathcal{T}_4)_{|V_0}: V_0 \to Y,\ ((\mathcal{T}_4)_{|V_0})^{-1}: V_{f(x_0)} \to Y \text{ are } C^\infty \text{ on their respectively domains} \tag{16.412}$$

As $\mathcal{T}_5$ isC^∞ on Y hence continuous it follows that

$$V_{f(x_0)} \underset{\text{[eq: 16.410]}}{=} (\mathcal{T}_5)^{-1}(V_0) \text{ is a open set} \tag{16.413}$$

Hence by definition of a diffeomorphism [see definition: 16.253] it follows from [eq: 16.409, 16.412, 16.413] that

$$(\mathcal{T}_4)_{|V_0}: V_0 \to V_{f(x_0)} \text{ is a diffeomorphism of class } C^n \tag{16.414}$$

Define now

$$g = (\mathcal{T}_4)_{|V_0} \circ h_{|U_0} \circ (\mathcal{T}_3)_{|U_{x_0}}: U_{x_0} \to V_{f(x_0)}$$

then using [eqs 16.408, 16.400, 16.414] and [theorem: 16.259] it follows that

$$g: U_{x_0} \to V_{f(x_0)} \text{ is a diffeomorphism of class } C^n \tag{16.415}$$

Further we have for $x \in U_{x_0}$ that

$$\begin{aligned}
g(x) &= ((\mathcal{T}_4)_{|V_0} \circ h_{|U_0} \circ (\mathcal{T}_3)_{|U_{x_0}})(x) \\
&= (\mathcal{T}_4)_{|V_0}(h_{|U_0}((\mathcal{T}_3)_{|U_{x_0}}(x))) \\
&= \mathcal{T}_4(h(\mathcal{T}_3(x))) \\
&= \mathcal{T}_4(h(x - x_0)) \\
&\underset{\text{[eq: 16.399]}}{=} \mathcal{T}_4((\mathcal{T}_2 \circ f \circ (\mathcal{T}_1)_{|W})(x - x_0)) \\
&= \mathcal{T}_4((\mathcal{T}_2 \circ f \circ \mathcal{T}_1)(x - x_0)) \\
&= \mathcal{T}_4(\mathcal{T}_2(f(\mathcal{T}_1(x - x_0)))) \\
&= \mathcal{T}_4(\mathcal{T}_2(f(x - x_0 + x_0))) \\
&= \mathcal{T}_4(\mathcal{T}_2(f(x))) \\
&= \mathcal{T}_4(f(x) + f(x_0)) \\
&= f(x) + f(x_0) - f(x_0) \\
&= f(x) \\
&= f_{|U_{x_0}}(x)
\end{aligned} \tag{16.416}$$

which proves that $g = f_{|U_{x_0}}$. Hence by [eq: 16.415] $f_{|U_{x_0}}: U_{x_0} \to V_{x_0}$ is a diffeomorphism of class C^n. As $x_0 \in U_{x_0}$ [see eq: 16.405], $f(x_0) \underset{x_0 \in U_{x_0}}{=} g(x_0) \in V_{f(x_0)}$, $U_{x_0} \subseteq U$[see eq: 16.404] it follows from the definition of a local diffeomorphism [see definition: 16.260] that f is a local diffeomorphism of class C^n at x_0. □

Finally as the above conjecture [conjecture: 16.268] is the same as the Inverse Function Theorem [theorem: 16.261] we have proved the Inverse Function Theorem. □

Corollary 16.269. *Let $n, m \in \mathbb{N}$, $\langle \mathbb{K}^n, \|\|_n \rangle$ be the normed space equipped with the maximum norm $\|x\|_n = \max(\{|x_i| i \in \{1, \ldots, n\}\})$, U a open set in $\mathbb{K}^n$, $x_0 \in U$ and $f: U \to \mathbb{K}^n$ a function such that f is C^m on U such that $\det\left(\left[\frac{\partial(f_1, \ldots, f_m)}{\partial(1, \ldots, n)}\right]_{x_0}\right) \neq 0$ then f is a local diffeomorphism of class C^n at x_0. In other words there exist a open set U_{x_0} in $\mathbb{K}^n$ with $x_0 \in U_{x_0} \subseteq U$ and a open set $V_{f(x_0)}$ in $\mathbb{K}^n$ with $f(x_0) \in V_{f(x_0)}$ such that*

$$f_{|U_{x_0}}: U_{x_0} \to V_{f(x_0)} \text{ is a diffeomorphism of class } C^n$$

Proof. Using the canonical basis $E = \{e_1, \ldots, e_n\}$ defined by $(e_i)_j = \delta_{i,j}$ we have by [theorem: 16.68] that

$$\mathcal{M}(D_{x_0} f; E, E) = \left[\frac{\partial(f_1, \ldots, f_n)}{\partial(1, \ldots, n)}\right]_{x_0}$$

As $\det\left(\left[\frac{\partial(f_1, \ldots, f_n)}{\partial(1, \ldots, n)}\right]_{x_0}\right) \neq 0$ it follows that $\det(\mathcal{M}(D_{x_0} f; E, E)) \neq 0$. So by [theorem: 11.352] $D_{x_0} f$ is a bijection. The rest of the proof follows by applying the inverse function theorem [theorem: 16.261]. □

The following consequence of the inverse function is actually the inverse function theorem as know in calculus.

Corollary 16.270. *Let $\langle \mathbb{K}, \|\rangle$ be the normed space of the real (complex) numbers, $U \subseteq \mathbb{K}$ a open set, $x_0 \in U$ and a function $f: U \to \mathbb{K}$ such that $\forall x \in U$ f has a derivative f'_x at x and the function*

$$f': U \to \mathbb{K} \text{ defined by } f'(x) = f'_x$$

is continuous. If $f'_{x_0} = f'(x_0) \neq 0$ then there exists open sets $U_{x_0}, V_{f(x_0)} \subseteq \mathbb{K}$ with $x_0 \in U_{x_0} \subseteq U$ and $f(x_0) \in V_{f(x_0)}$ such that:

1. *$f_{|U_{x_0}}: U_{x_0} \to V_{f(x_0)}$ is a bijection*
2. *$\forall y \in V_{f(x_0)}$ we have that $(f_{|U_{x_0}})^{-1}$ has a derivative $((f_{|U_{x_0}})^{-1})'_y$ at y such that*

$$((f_{|U_{x_0}})^{-1})': V_{f(x_0)} \to \mathbb{K} \text{ defined by } ((f_{|U_{x_0}})^{-1})'(y) = ((f_{|U_{x_0}})^{-1})'_y$$

   is continuous.
3. *$\forall x \in U_{x_0}$ we have that*

$$f'_x \neq 0 \text{ and } ((f_{|U_{x_0}})^{-1})'_{f(x)} = \frac{1}{f'_x}$$

Proof. Using [theorem: 16.111] it follows that

$$f \text{ is } C^1 \text{ on } U$$

As $f'_{x_0} \neq 0$ we can define the function $g: \mathbb{K} \to \mathbb{K}$ by $g(t) = \frac{t}{f'_{x_0}}$ then we have $\forall t \in \mathbb{K}$

$$\begin{aligned}
(D_{x_0} f \circ g)(t) &= D_{x_0} f(g(t)) \\
&= D_{x_0} f\left(\frac{t}{f'_{x_0}}\right) \\
&\underset{\text{[theorem: 16.32]}}{=} \frac{t}{f'_{x_0}} \cdot f'_{x_0} \\
&= t \\
&= \mathrm{Id}_{\mathbb{K}}(t) \\
(g \circ D_{x_0} f)(t) &= g(D_{x_0} f(t)) \\
&\underset{\text{[theorem: 16.32]}}{=} g(t \cdot f'_{x_0}) \\
&= \frac{t \cdot f'_{x_0}}{f'_{x_0}} \\
&= t \\
&= \mathrm{Id}_{\mathbb{K}}(t)
\end{aligned}$$

proving that $D_{x_0}f \circ g = \mathrm{Id}_{\mathbb{K}} = g \circ D_{x_0}f$. Hence

$$D_{x_0}f \text{ is a bijection and } (D_{x_0}f)^{-1} = g \tag{16.417}$$

So by the inverse function theorem [theorem: 16.261] there exists open sets U_{x_0}, $V_{f(x_0)}$ with $x_0 \in U_{x_0} \subseteq U$, $f(x_0) \in V_{f(x_0)}$ such that

$$f_{|U_{x_0}}: U_{x_0} \to V_{f(x_0)} \text{ is a diffeomorphism of class } C^1$$

Hence we have that

$$(f_{|U_{x_0}})^{-1}: V_{f(x_0)} \to \mathbb{K} \text{ is } C^1 \text{ on } V_{f(x_0)}$$

so that by [theorem: 16.111] $\forall y \in V_{f(x_0)}$ we have that $(f_{|U_{x_0}})^{-1}$ has a derivative $((f_{|U_{x_0}})^{-1})'_y$ at y and the function

$$((f_{|U_{x_0}})^{-1})': V_{f(x_0)} \to \mathbb{K} \text{ with } ((f_{|U_{x_0}})^{-1})'(x) = ((f_{|U_{x_0}})^{-1})'_x$$

is continuous. If $x \in U_{x_0}$ then $f(x) = f_{|U_{x_0}}(x) \in V_{f(x_0)}$ and, as $f_{|U_{x_0}} \circ (f_{|U_{x_0}})^{-1} = \mathrm{Id}_{V_{f(x_0)}}$, we have by the chain rule that

$$\begin{aligned}
\mathrm{Id}_{V_{f(x_0)}} &\underset{\text{[theorem: 16.22]}}{=} D_{f(x)}(\mathrm{Id}_{V_{f(x_0)}}) \\
&= D_{f(x)}(f_{|U_{x_0}} \circ (f_{|U_{x_0}})^{-1}) \\
&\underset{\text{[theorem: 16.39]}}{=} D_{(f_{|U_{x_0}})^{-1}(f(x))}f_{|U_{x_0}} \circ D_{f(x)}((f_{|U_{x_0}})^{-1}) \\
&= D_x f_{|U_{x_0}} \circ D_{f(x)}((f_{|U_{x_0}})^{-1})
\end{aligned}$$

Hence

$$\begin{aligned}
1 &= \mathrm{Id}_{V_{f(x_0)}}(1) \\
&= (D_x f_{|U_{x_0}} \circ D_{f(x)}((f_{|U_{x_0}})^{-1}))(1) \\
&= D_x f_{|U_{x_0}}(D_{f(x)}((f_{|U_{x_0}})^{-1})(1)) \\
&\underset{\text{[theorem: 16.32]}}{=} D_x f_{|U_{x_0}}(1 \cdot ((f_{|U_{x_0}})^{-1})'_{f(x)}) \\
&= ((f_{|U_{x_0}})^{-1})'_{f(x)} \cdot D_x f_{|U_{x_0}}(1) \\
&= ((f_{|U_{x_0}})^{-1})'_{f(x)} \cdot (f_{|U_{x_0}})'_x \\
&\underset{\text{[theorem: 16.33]}}{=} ((f_{|U_{x_0}})^{-1})'_{f(x)} \cdot f'_x
\end{aligned}$$

so that $f'_x \neq 0$ [otherwise we have $1 = 0$] and

$$((f_{|U_{x_0}})^{-1})'_{f(x)} = \frac{1}{f'_x}$$

□

Next we use the inverse function theorem to prove the implicit function theorem. First we need a little lemma.

Lemma 16.271. *Let X, Y, Z be vector spaces over the field $\mathbb{K}$. $L \in \mathrm{Hom}(X, Z)$ and $H \in \mathrm{Hom}(Y, Z)$ a linear isomorphism then*

$$T: X \cdot Y \to X \cdot Z \text{ defined by } T(x, y) = (x, L(x) + H(y))$$

is a linear isomorphism with inverse $S = T^{-1}$ defined by

$$S: X \cdot Z \to X \cdot Y \text{ by } S(x, z) = (x, -H^{-1}(L(x)) + H^{-1}(z))$$

Proof. Let $(x_1, y_1), (x_2, y_2) \in X \cdot Y$ and $\alpha \in \mathbb{K}$ then

$$\begin{aligned}
T((x_1, y_1) + \alpha \cdot (x_2, y_2)) &= T(x_1 + \alpha \cdot x_2, y_1 + \alpha \cdot y_2) \\
&= (x_1 + \alpha \cdot x_2, L(x_1 + \alpha \cdot x_2) + H(y_1 + \alpha \cdot y_2)) \\
&= (x_1 + \alpha \cdot x_2, L(x_1) + \alpha \cdot L(x_2) + H(y_1) + \alpha \cdot H(y_2)) \\
&= (x_1, L(x_1) + H(y_1)) + (\alpha \cdot x_2, \alpha \cdot L(x_2) + \alpha \cdot H(y_2)) \\
&= (x_1, L(x_1) + H(y_1)) + \alpha \cdot (x_2, L(x_2) + H(y_2)) \\
&= T(x_1, y_1) + \alpha \cdot T(x_2, y_2)
\end{aligned}$$

proving that

$$T \text{ is a linear mapping}$$

Let $x \in X$, $y \in Y$ and $z \in Z$ then

$$\begin{aligned}
(T \circ S)(x,z) &= T(S(x,z)) \\
&= T(x, -H^{-1}(L(x)) + H^{-1}(z)) \\
&= (x, L(x) + H(-H^{-1}(L(x)) + H^{-1}(z))) \\
&= (x, L(x) - H(H^{-1}(L(x))) + H(H^{-1}(z))) \\
&= (x, L(x) - L(x) + z) \\
&= (x, z) \\
&= \mathrm{Id}_{X \cdot Z} \\
(S \circ T)(x,y) &= S(T(x,z)) \\
&= S(x, L(x) + H(z)) \\
&= (x, -H^{-1}(L(x)) + H^{-1}(L(x) + H(z))) \\
&\underset{\text{[theorem: 11.176]}}{=} (x, -H^{-1}(L(x)) + H^{-1}(L(x)) + H^{-1}(H(z))) \\
&= (x, z) \\
&= \mathrm{Id}_{X \cdot Y}
\end{aligned}$$

proving that

$$S, T \text{ are bijections and } S = T^{-1}$$ □

Theorem 16.272. (Implicit Function Theorem (1)) *Let $n \in \mathbb{N}$, $\langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ and $\langle Z, \|\|_Z \rangle$ be Banach spaces, U a open set in X, V a open set in Y and $f: U \cdot V \to Z$ be a function that is C^n on $U \cdot V$. Using [theorem: 16.215] and [definition: 16.209] we have that*

$$D_1 f: U \cdot V \to L(X, Z) \text{ defined by } D_1 f(x,y) = D_{(x,y),1} f$$

$$D_2 f: U \cdot V \to L(Y, Z) \text{ defined by } D_2 f(x,y) = D_{(x,y),2} f$$

are well defined and continuous. If $\exists (x_0, y_0) \in U \cdot V$ such that $D_2 f(x_0, y_0)$ is a bijection then we have:

1. *There exist a open set $W_0 \subseteq U \cdot Z$ and a open set $V_0 \subseteq V$ with $(x_0, f(x_0, y_0)) \in W_0$ such that there exist a map $g: W_0 \to V_0$ such that g is C^n on W_0 such that $g(x_0, f(x_0, y_0)) = y_0$ and*

$$\forall (x,z) \in W_0 \text{ we have } f(x, g(x,z)) = z$$

2. *$\forall (x,z) \in W_0$ we have $D_2 f(x, g(x,z))$ is a bijection so that $(D_2 f(x, g(x,z)))^{-1}$ exist.*
3. *As g is C^n on W_0 we have by [theorem: 16.215] and [definition: 16.209] that*

$$D_1 g: W_0 \to L(X, Y) \text{ defined by } D_1 g(x) = D_{1,x} g \text{ is well defined and continuous}$$

$$D_2 g: W_0 \to L(Z, Y) \text{ defined by } D_2 g(x) = D_{2,x} g \text{ is well defined and continuous}$$

Then we have for the above functions that $\forall (x,z) \in W_0$:

a. $D_1 g(x,z) = -(D_2 f(x, g(x,z)))^{-1} \circ D_1 f(x, g(x,z))$
b. $D_2 g(x,z) = (D_2 f(x, g(x,z)))^{-1}$

Proof. First, as we have to deal with different products hence different projections, we introduce the following notations for the different projections:

$$\begin{aligned}
\pi_1^{X \cdot Y}: X \cdot Y \to X \text{ defined by } \pi_1^{X \cdot Y}(x,y) = x \\
\pi_2^{X \cdot Y}: X \cdot Y \to Y \text{ defined by } \pi_2^{X \cdot Y}(x,y) = y \\
\pi_1^{X \cdot Z}: X \cdot Z \to X \text{ defined by } \pi_1^{X \cdot Z}(x,y) = x \\
\pi_2^{X \cdot Z}: X \cdot Z \to Z \text{ defined by } \pi_2^{X \cdot Z}(x,y) = y
\end{aligned}$$

Note that by [theorems: 16.134, 16.106] we have:

$$\pi_1^{X \cdot Y}, \pi_2^{X \cdot Y}, \pi_1^{X \cdot Z}, \pi_2^{X \cdot Z} \text{ and their restrictions to open sets are } C^\infty \text{ on their domains} \tag{16.418}$$

Define now the function

$$\varphi: U \cdot V \to X \cdot Z \text{ by } \varphi(x,y) \to (x, f(x,y)) \tag{16.419}$$

then $\forall(x,y)\in U\cdot V$ we have

$$\begin{aligned}(\pi_1^{X\cdot Y}\circ\varphi)(x,y) &= \pi_1^{X\cdot Y}(\varphi(x,y))\\ &= \pi_1^{X\cdot Y}(x,fx,y)\\ &= x\\ &= \pi_1^{X\cdot Y}(x,y)\end{aligned}$$

proving, taking in account [eq: 16.418], that

$$\pi_1^{X\cdot Y}\circ\varphi=(\pi_1^{X\cdot Y})_{|U\cdot V}\text{ and }\pi_1^{X\cdot Y}\circ\varphi\text{ is }C^\infty\text{ on }U\cdot V \tag{16.420}$$

Further we have

$$\begin{aligned}(\pi_2^{X\cdot Y}\circ\varphi)(x,y) &= \pi_2^{X\cdot Y}(\varphi(x,y))\\ &= \pi_2^{X\cdot Y}(x,f(x,y))\\ &= f(x,y)\end{aligned}$$

proving that

$$\pi_2^{X\cdot Y}\circ\varphi=f\text{ so that }\pi_2^{X\cdot Y}\circ\varphi\text{ is }C^n\text{ on }U\cdot V \tag{16.421}$$

Using [theorem: 16.143] together with [eq: 16.420] and [eq: 16.421] proves that

$$\varphi\text{ is }C^n\text{ on }U\cdot V \tag{16.422}$$

So for $(x,y)\in U\cdot V$ we have that φ is Fréchet differentiable at (x,y) and we have

$$\begin{aligned}D_{(x,y)}\varphi &\underset{\text{[theorem: 16.66]}}{=} (D_{(x,y)}(\pi_1^{X\cdot Y}\circ\varphi),D_{(x,y)}(\pi_2^{X\cdot Y}\circ\varphi))_*\\ &\underset{\text{[eq: 16.420, 16.421]}}{=} (D_{(x,y)}(\pi_1^{X\cdot Y})_{|U\cdot V},D_{(x,y)}f)_\star\\ &\underset{\text{[theorem: 16.24]}}{=} (D_{(x,y)}\pi_1^{X\cdot Y},D_{(x,y)}f)_\star\\ &\underset{\text{[theorem: 16.134]}}{=} (\pi_1^{X\cdot Y},D_{(x,y)}f)_\star\\ &\underset{\text{[theorem: 16.52]}}{=} (\pi_1^{X\cdot Y},(D_{(x,y),1}f)\circ\pi_1^{X\cdot Y}+(D_{(x,y),2}f)\circ\pi_2^{X\cdot Y})_\star\\ &= (\pi_1^{X\cdot Y},D_1f(x,y)\circ\pi_1^{X\cdot Y}+D_2f(x,y)\circ\pi_2^{X\cdot Y})_\star\end{aligned} \tag{16.423}$$

So if $h=(r,s)\in X\cdot Y$ we have that

$$\begin{aligned}D_{(x,y)}\varphi(r,s) &\underset{\text{[eq: 16.423]}}{=} (\pi_1^{X\cdot Y},D_1f(x,y)\circ\pi_1^{X\cdot Y}+D_2f(x,y)\circ\pi_2^{X\cdot Y})_\star(r,s)\\ &= (\pi_1^{X\cdot Y}(r,s),(D_1f(x,y)\circ\pi_1^{X\cdot Y}+D_2f(x,y)\circ\pi_2^{X\cdot Y})(r,s))\\ &= (r,(D_1f(x,y)\circ\pi_1^{X\cdot Y})(r,s)+(D_2f(x,y)\circ\pi_2^{X\cdot Y})(r,s))\\ &= (r,D_1f(x,y)(\pi_1^{X\cdot Y}(r,s))+D_2f(x,y)(\pi_2^{X\cdot Y}(r,s)))\\ &= (r,D_1f(x,y)(r)+D_2f(x,y)(s))\end{aligned}$$

Hence we have:

$$\forall(x,y)\in U\cdot V,\forall(r,s\in X\cdot Y\text{ we have }D_{(x,y)}\varphi(r,s)=(r,D_1f(x,y)(r)+D_2f(x,y)(s))) \tag{16.424}$$

Take $L=D_1f(x_0,y_0)\in L(X,Z)\subseteq\mathrm{Hom}(X,Y)$ and $H=D_2f(x_0,y_0)\in L(Y,Z)\subseteq\mathrm{Hom}(Y,Z)$ then by [theorem: 16.424] we have

$$D_{(x_0,y_0)}\varphi(r,s)=(r,L(r)+H(s))$$

Further as $H=D_2f(x_0,y_0)$ is supposed to be a bijection it follows from [lemma: 16.271] that

$$D_{(x_0,y_0)}\varphi\text{ is a bijection} \tag{16.425}$$

with $\forall(r,s)\in X\cdot Y$

$$(D_{(x_0,y_0)}\varphi)^{-1}(r,s) = (r,-H^{-1}(L(r))+H^{-1}(s))$$

so that

$$(D_{(x_0,y_0)}\varphi)^{-1}\colon X\cdot Z\to X\cdot Y$$

is defined by

$$(D_{(x_0,y_0)}\varphi)^{-1}(r,s)=(r,-(D_2f(x_0,y_0))^{-1}\circ D_1f(x_0,y_0)(r)+(D_2f(x_0,y_0))^{-1}(s)) \tag{16.426}$$

Using the inverse function theorem [theorem: 16.261] it follows that there exist a open set W_1 in $X \cdot Y$ with $(x_0, y_0) \in W_1 \subseteq U \cdot V$ and a open set W_2 in $X \cdot Z$ with $\varphi(x_0, y_0) \in W_2$ such that

$$\varphi_{|W_1}: W_1 \to W_2 \text{ is a diffeomorphism of class } C^n \tag{16.427}$$

Using the definition of the product topology on $X \cdot Y$ [see: definition: 14.41] and [theorems: 14.47, 14.94] there exists a open set U_0 in X and a open set in V_0 in Y such that $(x_0, y_0) \in U_0 \cdot V_0 \subseteq W_1$. Using [theorem: 16.256] we have, if we take $W_0 = \varphi(U_0 \cdot V_0)$, that

$$\varphi_{|U_0 \cdot V_0} \underset{\text{[theorem: 2.86]}}{=} (\varphi_{|W_1})_{|U_0 \cdot V}: U_0 \cdot V_0 \to W_0 \text{ is a diffeomorphism of class } C^n \tag{16.428}$$

So

$$\forall (x, y) \in W_0 \text{ we have } \pi_1^{X \cdot Y}(\varphi_{|U_0 \cdot V_0})^{-1}(x, y) \in \pi_1^{X \cdot Y}(U_0 \cdot V_0) = U_0 \tag{16.429}$$

$$\pi_2^{X \cdot Y}(\varphi_{|U_0 \cdot V_0})^{-1}(x, y) \in \pi_2^{X \cdot Y}(U_0, V_0) = V_0 \tag{16.430}$$

Further if $(x, y) \in U_0 \cdot V_0$ then $(x, y) \in W_1 \subseteq U \cdot V$ so that $x \in U$, as further $\varphi(x, y) = (x, f(x, y)) \in X \cdot Z$ it follows that $\varphi(x, y) \in U \cdot Z$ so that

$$W_0 = \varphi(U_0 \cdot V_0) \subseteq U \cdot Z \tag{16.431}$$

Further we have that

$$(x_0, f(x_0, y_0)) = \varphi(x_0, y_0) \in W_0 \tag{16.432}$$

If $y \in V_0$ then as $x_0 \in U$ we have $(x_0, y) \in U_0 \cdot V_0 \subseteq W_1 \subseteq U \cdot V$ so that $y \in V$ hence we have

$$V_0 \subseteq V \tag{16.433}$$

Using [eq: 16.428]

$$(\varphi_{|U_0 \cdot V})^{-1}: W_0 \to U_0 \cdot V_0 \text{ exists and is } C^n \text{ on } W_0 \tag{16.434}$$

If $(x, z) \in W_0$ then

$$\begin{aligned}
(x, z) &= \varphi_{|U_0 \cdot V_0}((\varphi_{|U_0 \cdot V_0})^{-1}(x, z)) \\
&= \varphi((\varphi_{|U_0 \cdot V_0})^{-1}(x, z)) \\
&= \varphi(\pi_1^{X \cdot Y}((\varphi_{|U_0 \cdot V_0})^{-1}(x, z)), \pi_2^{X \cdot Y}((\varphi_{|U_0 \cdot V_0})^{-1}(x, z))) \\
&= (\pi_1^{X \cdot Y}((\varphi_{|U_0 \cdot V_0})^{-1}(x, z)), f(\pi_1^{X \cdot Y}((\varphi_{|U_0 \cdot V_0})^{-1}(x, z)), \pi_2^{X \cdot Y}((\varphi_{|U_0 \cdot V_0})^{-1}(x, z))))
\end{aligned}$$

so that

$$x = \pi_1^{X \cdot Y}((\varphi_{|U_0 \cdot V_0})^{-1}(x, z)) \in U_0 \text{ [see eq: 16.429]} \tag{16.435}$$

$$z = f(\pi_1^{X \cdot Y}((\varphi_{|U_0 \cdot V_0})^{-1}(x, z)), \pi_2^{X \cdot Y}((\varphi_{|U_0 \cdot V_0})^{-1}(x, z))) \tag{16.436}$$

Define

$$g: W_0 \to V_0 = \pi_2^{X \cdot Y}(U_0 \cdot V_0) \text{ by } g = \pi_2^{X \cdot Y} \circ (\varphi_{|U_0 \cdot V_0})^{-1} \tag{16.437}$$

Then we have given $(x, z) \in W_0$ that

$$\begin{aligned}
z &\underset{\text{[eq: 16.436]}}{=} f(\pi_1^{X \cdot Y}((\varphi_{|U_0 \cdot V_0})^{-1}(x, z)), \pi_2^{X \cdot Y}((\varphi_{|U_0 \cdot V_0})^{-1}(x, z))) \\
&= f(\pi_1^{X \cdot Y}((\varphi_{|U_0 \cdot V_0})^{-1}(x, z)), g(x, z)) \\
&\underset{\text{[eq: 16.435]}}{=} f(x, g(x, z))
\end{aligned}$$

proving

$$\forall (x, z) \in W_0 \text{ that } f(x, g(x, z)) = z \tag{16.438}$$

As $(x_0, y_0) \in U_0 \cdot V_0$ $\varphi_{|U_0 \cdot V_0}(x_0, y_0) = \varphi(x_0, y_0) = (x_0, f(x_0, y_0))$ it follows that

$$(x_0, y_0) = (\varphi_{|U_0 \cdot V_0})^{-1}(x_0, f(x_0, y_0))$$

so that $y_0 = \pi_2^{X \cdot Y}((\varphi_{|U_0 \cdot V_0})^{-1}(x_0, f(x_0, y_0))) \underset{\text{[eq: 16.437]}}{=} g(x_0, f(x_0))$ proving that

$$g(x_0, f(x_0, y_0)) = y_0 \tag{16.439}$$

As $\pi_2^{X \cdot Y}$ is C^∞ on $X \cdot Y$ [see eq: 16.418] and by [eq: 16.434] $(\varphi_{|U_0 \cdot V_0})^{-1}$ is C^n on W_0 it follows from the chain rule [theorem: 16.147] that

$$g \text{ is } C^n \text{ on } W_0 \tag{16.440}$$

As $\varphi_{|U_0\cdot V_0}: U_0\cdot V_0\to W_0$ is a diffeomorphism of class C^n [see eq: 16.428] it follows from [theorem: 16.258] that

$$\forall(x,y)\in U_0\cdot V_0 \text{ we have that } D_{(x,y)}\varphi \underset{\text{[theorem: 16.24]}}{=} D_{(x,y)}\varphi_{|U_0\cdot V_0} \text{ is bijective} \tag{16.441}$$

So part (1) of the theorem is proved by [eqs: 16.437, 16.438, 16.439 and 16.440].

Now for the next part. Take $r,s\in Y$ such that $D_2f(x,y)(r)=D_2f(x,y)(s)$ then we have

$$\begin{aligned} D_{(x,y)}\varphi(0,r) &\underset{\text{[eq: 16.424]}}{=} (0,D_1f(x,y)(0)+D_2f(x,y)(r)) \\ &= (0,D_1f(x,y)(0)+D_2f(x,y)(s)) \\ &\underset{\text{[eq: 16.424]}}{=} D\varphi(x,y)(0,s) \end{aligned}$$

so that by [eq: 16.441] $(0,r)=(0,s)$ $r=s$ proving that

$$D_2f(x,y) \text{ is injective} \tag{16.442}$$

If $z\in Z$ then as $D_{(x,y)}\varphi$ is a bijection [see eq: 16.441] there exist a $(r,s)\in X\cdot Y$ such that $D\varphi(r,s)=(0,z)$, hence [by [eq: 16.424] we have $(r,D_1f(x,y)(r)+D_2f(x,y)(s))=(0,z)$ so that $r=0\wedge D_1f(x,y)(r)+D_2f(x,y)(s)=z$. So we have $z=D_1f(x,y)(0)+D_2f(x,y)(s)=D_2f(x,y)(s)$ which proves that $D_2f(x,y)$ is surjective. Combining this with [eq: 16.442] proves that

$$\forall(x,y)\in U_0\cdot V_0 \text{ we have that } D_2f(x,y) \text{ is bijective}$$

Take now $(x,z)\in W_0$ then by [eq: 16.435] $x\in U_0$ and by [eq: 16.437] $g(x,z)\in V_0$ so that by the above we have

$$\forall(x,z)\in W_0 \text{ we have } D_2f(x,g(x,z)) \text{ is bijective so that } (D_2f(x,g(x,z)))^{-1} \text{ exist} \tag{16.443}$$

Which proves part (2) of the theorem.

For the next part. Define

$$\psi: W_0\to X\cdot Y \text{ by } \psi(x,z)=(x,g(x,z))$$

Then we have that for $(x,z)\in W_0$ that

$$\begin{aligned} (\pi_1^{X\cdot Y}\circ\psi)(x,z) &= \pi_1^{X\cdot Y}(\psi(x,z))=\pi_1^{X\cdot Y}(x,g(x,z))=x=\pi_1^{X\cdot Y}(x,z) \\ (\pi_2^{X\cdot Y}\circ\psi)(x,z) &= \pi_2^{X\cdot Y}(\psi(x,z))=\pi_2^{X\cdot Y}(x,g(x,z))=g(x,z) \end{aligned}$$

proving that

$$\pi_1^{X\cdot Y}\circ\psi=\pi_1^{X\cdot Y} \text{ and } \pi_2^{X\cdot Y}\circ\psi=g$$

By [example: 16.134] $\pi_1^{X\cdot Y}$ is C^∞ on $X\cdot Y$ and by [eq: 16.440] g is C^n on W_0, so using the above and [theorem: 16.143] it follows that

$$\psi \text{ is } C^n \text{ on } W_0 \text{ hence Fréchet differentiable on } W_0 \tag{16.444}$$

Define

$$f\circ\psi: W_0\to Z$$

then we have for $(x,z)\in W_0$ that

$$\begin{aligned} (f\circ\psi)(x,z) &= f(\psi(x,z)) \\ &= f(x,g(x,z)) \\ &\underset{\text{[eq: 16.438]}}{=} z \\ &= \pi_2^{X\cdot Z}(x,z) \end{aligned}$$

proving that

$$f\circ\psi=\pi_2^{X\cdot Z} \tag{16.445}$$

Further for $t\in X$ we have

$$((f\circ\psi)\circ I^{[1,(x,z)]})(t)=(f\circ\psi)(I^{[1,(x,z)]}(t)) \underset{\text{[definition: 16.43]}}{=} (f\circ\psi)(t,z) \underset{\text{[eq: 16.445]}}{=} z=C_z(t)$$

proving that

$$(f\circ\psi)\circ I^{[1,(x,z)]}=C_z$$

so that by [example: 16.26] $(f\circ\psi)\circ I^{[1,(x,z)]}$ is Fréchet differentiable at t which by [definition: 16.47] proves that $f\circ\psi$ has a 1-partial differential at t with

$$D_{(x,z),1}(f\circ\psi)\underset{\text{[definition: 16.47]}}{=}D_x((f\circ\psi)\circ I^{[1,(x,z)]})=D_xC_z\underset{\text{[example: 16.26]}}{=}0\in L(X,Z) \tag{16.446}$$

Also

$$\begin{aligned}((\pi_1^{X\cdot Z}\circ\psi)\circ I^{[1,(x,z)]})(t) &= \pi_1^{X\cdot Z}(\psi(I^{[1,(x,z)]}(t)))\\ &= \pi_1^{X\cdot Z}(\psi(t,z))\\ &= \pi_1^{X\cdot Z}(t,g(t,z))\\ &= t\\ &= \mathrm{Id}_X(t)\\ ((\pi_2^{X\cdot Z}\circ\psi)\circ I^{[1,(x,z)]})(t) &= \pi_2^{X\cdot Z}(\psi(I^{[1,(x,z)]}(t)))\\ &= \pi_2^{X\cdot Z}(\psi(t,z))\\ &= \pi_2^{X\cdot Z}(t,g(t,z))\\ &= g(t,z)\\ &= g(I^{[1,(x,z)]}(t))\\ &= (g\circ I^{[1,(x,z)]})(t)\end{aligned}$$

so that

$$(\pi_1^{X\cdot Z}\circ\psi)\circ I^{[1,(x,z)]}=\mathrm{Id}_X \text{ and } (\pi_2^{X\cdot Z}\circ\psi)\circ I^{[1,(x,z)]}=g\circ I^{[1,(x,z)]} \tag{16.447}$$

As g is C^n on W_0 [see eq: 16.440] g is Fréchet differentiable on W_0 hence by [theorem: 16.215] and [definition: 16.209] that

$$D_1g\colon W_0\to L(X,Y) \text{ defined by } D_1g(x)=D_{1,x}g \text{ is well defined and continuous}$$

$$D_2g\colon W_0\to L(Z,Y) \text{ defined by } D_2g(x)=D_{2,x}g \text{ is well defined and continuous}$$

Given $h\in X$ we have

$$\begin{aligned}D_{(x,z),1}(f\circ\psi)(h) &\underset{\substack{\text{[eq: 16.444]}\\ \text{[theorem: 16.57]}}}{=}\\ (D_{\psi(x,z)}f\circ D_{(x,z),1}\psi)(h) &=\\ (D_{\psi(x,z)}f\circ(D_{(x,z)}(\psi\circ I^{[1,(x,z)]})))(h) &\underset{\text{[theorem: 16.66]}}{=}\\ (D_{\psi(x,z)}f\circ(D_{(x,z)}(\pi_1^{X\cdot Z}\circ(\psi\circ I^{[1,(x,z)]})),D_{(x,z)}(\pi_2^{X\cdot Z}\circ(\psi\circ I^{[1,(x,z)]})))_\star)(h) &\underset{\text{[eq: 16.447]}}{=}\\ (D_{\psi(x,z)}f\circ(D_{(x,z)}\mathrm{Id}_X,D_{(x,z)}(g\circ I^{[1,(x,z)]}))_*)(h) &\underset{\text{[example: 16.22]}}{=}\\ (D_{\psi(x,z)}f\circ(\mathrm{Id}_X,D_{(x,z)}(g\circ I^{[1,(x,z)]}))_*)(h) &=\\ (D_{\psi(x,z)}f\circ(\mathrm{Id}_X,D_{(x,z),1}g)_*)(h) &=\\ D_{\psi(x,z)}f((\mathrm{Id}_X,D_{(x,z),1}g)_*(h)) &=\\ D_{\psi(x,z)}f(h,D_{(x,z),1}g(h)) &\underset{\text{[theorem: 16.52]}}{=}\\ D_{\psi(x,z),1}f(h)+D_{\psi(x,z),2}f(D_{(x,z),1}g(h)) &=\\ D_{\psi(x,z),1}f(h)+(D_{\psi(x,z),2}f\circ D_{(x,z),1}g)(h) &=\\ (D_{\psi(x,z),1}f+D_{\psi(x,z).2}f\circ D_{(x,z),1}g)(h) &=\\ (D_1f(\psi(x,z))+D_2f(\psi(x,z))\circ D_1g(x,z))(h) &=\\ (D_1f(x,g(x,z))+D_2f(x,g(x,z))\circ D_1g(x,z))(h)\end{aligned}$$

proving that

$$D_1f(x,g(x,z))+D_2f(x,g(x,z))\circ D_1g(x,z)=D_{(x,z),1}(f\circ\psi)\underset{\text{[eq: 16.446]}}{=}0$$

so that

$$D_2f(x,g(x,z))\circ D_1g(x,z)=-D_1f(x,g(x,z))$$

as $(D_2f(x,g(x,z))^{-1}$ exist [see eq: 16.443] and is linear by [theorem: 11.176] we have

$$\forall(x,z)\in W_0\ D_1g(x,z)=-(D_2f(x,g(x,z)))^{-1}\circ D_1f(x,g(x,z)) \tag{16.448}$$

which proves part (3.a) of the theorem.

For the remaining part (3.b) of the theorem note that for $(x,z)\in W_0$ we have for $t\in Z$ that

$$(\pi_2^{X\cdot Z}\circ I^{[2,(x,z)]})(t)=\pi_2^{X\cdot Z}(I^{[2,(x,z)]}(t))=\pi_2^{X\cdot Z}(x,t)=t=\mathrm{Id}_Z(t)$$

so that

$$\pi_2^{X\cdot Z_2}\circ I^{[2,(z,x)]}=\mathrm{Id}_Z \tag{16.449}$$

hence we have

$$\begin{aligned} D_{(x,z),2}(f\circ\psi) &\underset{\text{[eq: 16.445]}}{=} D_{(x,z),2}(\pi_2^{X\cdot Z}) \\ &= D_{(x,z)}(\pi_2^{X\cdot Z}\circ I^{[2,(x,z)]}) \\ &\underset{\text{[eq: 16.449]}}{=} D_{(x,z)}\mathrm{Id}_Z \\ &\underset{\text{[eq: 16.22]}}{=} \mathrm{Id}_Z \end{aligned} \tag{16.450}$$

Further we have

$$\begin{aligned} (\pi_1^{X\cdot Z}\circ\psi\circ I^{[2,(x,z)]})(t) &= \pi_1^{X\cdot Z}(\psi(I^{[2,(x,z)]}(t))) \\ &= \pi_1^{X\cdot Z}(\psi(x,t)) \\ &= \pi_1^{X\cdot Z}(x,g(x,t)) \\ &= x \\ &= C_x(t) \\ (\pi_2^{X\cdot Z}\circ\psi\circ I^{[2,(x,z)]})(t) &= \pi_2^{X\cdot Z}(\psi(I^{[2,(x,z)]}(t))) \\ &= \pi_2^{X\cdot Z}(\psi(x,t)) \\ &= \pi_2^{X\cdot Z}(x,g(x,t)) \\ &= g(x,t) \\ &= g(I^{[2,(x,z)]}(t)) \\ &= (g\circ I^{[2,(x,z)]})(t) \end{aligned}$$

proving that

$$\pi_1^{X\cdot Z}\circ\psi\circ I^{[2,(x,z)]}=C_x\wedge\pi_2^{X\cdot Z}\circ\psi\circ I^{[2,(x,z)]}=g\circ I^{[2,(x,z)]} \tag{16.451}$$

We use the above to calculate $D_{(x,z),2}(f\circ\psi)$ in another way, let $h\in Z$ then

$$\begin{aligned} D_{(x,z),2}(f\circ\psi)(h) &\underset{\substack{\text{[eq: 16.444]}\\ \text{[theorem: 16.57]}}}{=} \\ (D_{\psi(x,z)}f\circ D_{(x,z),2}\psi)(h) &= \\ (D_{\psi(x,z)}f\circ D_{(x,z)}(\psi\circ I^{[2,(x,z)]}))(h) &\underset{\text{[theorem: 16.66]}}{=} \\ (D_{\psi(x,z)}f\circ(D_{(x,z)}(\pi_1^{X\cdot Z}\circ(\psi\circ I^{[2,(x,z)]})),D_{(x,z)}(\pi_2^{X\cdot Z}\circ(\psi\circ I^{[2,(x,z)]})))_*)(h) &\underset{\text{[eq: 16.451]}}{=} \\ (D_{\psi(x,z)}f\circ(D_{(x,z)}C_x,D_{(x,z)}(g\circ I^{[2,(x,z)]}))_*)(h) &\underset{\text{[example: 16.26]}}{=} \\ (D_{\psi(x,z)}f\circ(0,D_{(x,z)}(g\circ I^{[2,(x,z)]}))_*)(h) &= \\ (D_{\psi(x,z)}f\circ(0,D_{(x,z),2}g)_*)(h) &= \\ D_{\psi(x,z)}f((0,D_{(x,z),2}g)_*(h)) &= \\ D_{\psi(x,z)}f(0(h),D_{(x,z),2}g(h)) &= \\ D_{\psi(x,z)}f(0,D_{(x,z),2}g(h)) &\underset{\text{[theorem: 16.52]}}{=} \\ D_{\psi(x,z),1}f(0)+D_{\psi(x,z),2}f(D_{(x,z),2}g(h)) &= \\ D_{\psi(x,z),2}f(D_{(x,z),2}g(h)) &= \\ D_2f(\psi(x,z)(D_2g(x,z)(h))) &= \\ D_2f(x,g(x,z))(D_2g(x,z)(h)) &= \\ (D_2f(x,g(x,z))\circ D_2g(x,z))(h) \end{aligned}$$

proving that

$$D_2 f(x, g(x,z)) \circ D_2 g(x,z) = D_{(x,z),2}(f \circ \psi) \underset{\text{[eq: 16.450]}}{=} \mathrm{Id}_Z$$

Hence we have, as $(D_2 f(x, g(x,z))^{-1}$ exist [see eq: 16.443], that

$$\forall (x,z) \in W_0 \text{ we have } D_2 g(x,z) = (D_2 f(x, g(x,z))^{-1} \tag{16.452}$$

which proves part (3.b) of the theorem. □

A simpler version of the implicit function theorem is the following.

Theorem 16.273. *Let $n \in \mathbb{N}, \langle X, \|\|_X \rangle$, $\langle Y, \|\|_Y \rangle$ and $\langle Z, \|\|_Z \rangle$ be Banach spaces, U a open set in X, V a open set in Y and $f: U \cdot V \to Z$ a function that is C^n on $U \cdot V$. Using [theorem: 16.215] and [definition: 16.209] we have that*

$$D_1 f: U \cdot V \to L(X, Z) \text{ defined by } D_1 f(x,y) = D_{(x,y),1} f$$

$$D_2 f: U \cdot V \to L(Y, Z) \text{ defined by } D_2 f(x,y) = D_{(x,y),2} f$$

are well defined and continuous. If $\exists (x_0, y_0) \in U \cdot V$ such that $D_2 f(x_0, y_0)$ is bijective then there exist a open set W with $x_0 \in W \subseteq U$ and a function $g: W \to Y$ that is C^n on W such that

$$g(x_0) = y_0 \text{ and } \forall x \in W \text{ we have } f(x, g(x)) = f(x_0, y_0)$$

$$\forall x \in W \ (D_2 f(x, g(x)))^{-1} \text{ exist and } Dg(x) = -(D_2 f(x, g(x)))^{-1} \circ D_1 f(x, g(x))$$

where $Dg: W \to L(X, Y)$ is defined by $Dg(x) = D_x g$.

Proof. Using the implicit function theorem [theorem: 16.272] there exist a open set $W_0 \subseteq U \cdot Z$ and a open set $V_0 \subseteq V$ with $(x_0, y_0) \in W_0$ such that there exist a map $h: W_0 \to V_0$ that is C^n on W_0 and satisfies

$$(x_0, f(x_0, y_0)) \in W_0 \tag{16.453}$$

$$h(x_0, f(x_0, y_0)) = y_0 \tag{16.454}$$

and $\forall (x,z) \in W_0$

$$f(x, h(x,z)) = z \tag{16.455}$$

$$D_1 h(x,z) = -(D_2 f(x, h(x,z)))^{-1} \circ D_1 f(x, h(x,z)) \tag{16.456}$$

$$D_2 h(x,z) = (D_2 f(x, h(x,z)))^{-1} \tag{16.457}$$

where

$$D_1 h: W_0 \to L(X, Y) \text{ is defined by } D_1 h(x,z) = D_{(x,z),1} h$$

$$D_2 h: W_0 \to L(Z, Y) \text{ is defined by } D_2 h(x,z) = D_{(x,z),2} h$$

Using the definition of the product topology on $X \cdot Y$ [see: definition: 14.41] and [theorems: 14.47, 14.94] there exists a open set W in X and a open set O in Z such that

$$(x_0, f(x_0, y_0)) \in W \cdot O \subseteq W_0 \subseteq U \cdot Z$$

From the above it follows that $f(x_0, w_0) \in O$ so if $x \in W$ then by the above $(x, f(x_0, y_0)) \in W \cdot O \subseteq W_0$ which is the domain of h so the following function is well defined

$$g: W \to V \text{ where } g(x) = h(x, f(x_0, y_0)) \tag{16.458}$$

then we have

$$g(x_0) = h(x_0, f(x_0, y_0)) \underset{\text{[eq: 16.454]}}{=} y_0 \tag{16.459}$$

Further for $x \in W$ we have $(x, f(x_0, y_0)) \in W \cdot O \subseteq W_0$ so that

$$f(x, g(x)) = f(x, h(x, f(x_0, y_0))) \underset{\text{[eq: 16.455]}}{=} f(x_0, y_0)$$

hence

$$\forall x \in W \text{ we have } f(x, g(x)) = f(x_0, y_0) \tag{16.460}$$

Further we have for $t \in W$ that

$$\begin{aligned}(h \circ I^{[1,(x,f(x_0,y_0))]})(t) &= h(I^{[1,(x,f(x_0,y_0))]}(t)) \\ &= h(t, f(x_0, y_0)) \\ &\underset{\text{[eq: 16.458]}}{=} g(t)\end{aligned}$$

proving that

$$g = h \circ I^{[1,(x,f(x_0,y_0))]}$$

Using the chain rule [see theorem: 16.147] and the fact that h is C^n on W_0 and $I^{[1,(x,f(x_0,y_0))]}$ is C^∞ on W_0 [see example: 16.132] it follows that

$$g \text{ is } C^n \text{ on } W \tag{16.461}$$

so that

$$Dg: W \to L(X, Y) \text{ defined by } Dg(x) = D_x g$$

is well defined. Further we have for $x \in W$ that

$$\begin{aligned}Dg(x) &= D_x g \\ &= D_x(h \circ I^{[1,(x,f(x_0,y_0))]}) \\ &\underset{\text{[definition: 16.47]}}{=} D_{(x,f(x_0,y_0)),1} h \\ &= D_1 h(x, f(x_0, y_0)) \\ &\underset{\text{[eq: 16.456]}}{=} -(D_2 f(x, h(x, f(x_0, y_0))))^{-1} \circ D_1 f(x, h(x, f(x_0, y_0))) \\ &\underset{\text{[eq: 16.458]}}{=} -(D_2 f(x, g(x)))^{-1} \circ D_1 f(x, g(x))\end{aligned} \tag{16.462}$$

The theorem is then proved by [eqs: 16.461, 16.459, 16.460 and 16.462]. □

Chapter 17
Fundamental theorem of algebra

The purpose of this chapter is to prove the fundamental theorem of algebra. This states that every higher order equation of the form

$$a_n \cdot x^n + a_{n-1} \cdot x^{n-1} + \cdots + a_0 = 0$$

has a solution in $\mathbb{C}$. In other words there exist a $z_0 \in \mathbb{C}$ such that

$$a_n \cdot {z_0}^n + a_{n-1} \cdot {z_0}^{n-1} + \cdots + a_0 = 0$$

In many books this is done by integration in the complex plane. However in this book we will use algebraic and analytic operations to prove the theorem. First to define the concept of a higher order equation we introduce the concept of polynomials.

17.1 Prerequisites

17.1.1 Polynomials

Definition 17.1. *If $n \in \mathbb{N}_0$ then a function $p: \mathbb{C} \to \mathbb{C}$ is a **polynomial of order n** if there exist a family $\{a_i\}_{i \in \{0,\ldots,n\}} \subseteq \mathbb{C}$, called the **coefficients of p**, with $a_n \neq 0$ so that p is defined by*

$$p: \mathbb{C} \to \mathbb{C} \text{ where } p(z) = \sum_{i=0}^{n} a_i \cdot z^i$$

The collection of complex polynomials of order n is noted as $\mathcal{P}[n]$ so that

$$\mathcal{P}[n] = \{p \in \mathbb{C}^{\mathbb{C}} | p \text{ is a polynomial of order } n\}$$

The collection of all polynomials is noted as $\mathcal{P}$ so that

$$\mathcal{P} = \bigcup_{n \in \mathbb{N}_0} \mathcal{P}[n]$$

Note that in principle different coefficients of different order define the same polynomial function. We will prove however that this is not the case and that every polynomial can be represented by a unique set of coefficients.

Lemma 17.2. *Let $\{a_i\}_{i \in \{0,\ldots,n\}} \subseteq \mathbb{C}$ such that $\forall x \in \mathbb{R} \subseteq \mathbb{C}$ we have $\sum_{i=0}^{n} a_i \cdot x^i = 0$ then $\forall i \in \{0,\ldots,n\}$ we have $a_i = 0$*

Proof. Assume that $\exists k \in \{0,\ldots,n\}$ such that $a_i \neq 0$. Define $\mathcal{N} = \{i \in \{0,\ldots,n\} | a_i \neq 0\}$ then $k \in \mathcal{N} \neq 0$ hence $m = \max(\mathcal{N})$ exist. So $\forall i \in \{m+1,\ldots,n\}$ we have $a_i = 0$. So that

$$\forall x \in \mathbb{R} \text{ we we have } 0 = p(x) = \sum_{i=0}^{n} a_i \cdot x^i = \sum_{i \in \{0,\ldots,m\}} a_i \cdot x^i + \sum_{i \in \{m+1,\ldots,n\}} a_i \cdot x^i = \sum_{i=0}^{m} a_i \cdot x^i \tag{17.1}$$

$m = 0$. Then we have $0 = p(1) = \sum_{i=0}^{0} a_0 \cdot 1^0 = a_0 \neq 0$ a contradiction.

$0 < m$. Then as $a_m \neq 0$ we can take $x = \frac{\sum_{i=0}^{m-1} |a_i|}{|a_m|} + 1$ then $1 \leqslant x$ and we have by [theorem: 10.63] that $\forall j \in \{0,\ldots,m-1\}$ we have $x^j \leqslant x^{m-1}$. Hence

$$\begin{aligned}
\left|\sum_{i=0}^{m-1} a_i \cdot x^i\right| &\leqslant \sum_{i=0}^{m-1} |a_i \cdot x^i| \\
&\underset{\text{[theorem: 10.84]}}{=} \sum_{i=0}^{m-1} |a_i| \cdot |x|^i \\
&\leqslant \sum_{i=0}^{m-1} |a_i| \cdot |x|^{m-1} \\
&= |x|^{m-1} \cdot \sum_{i=0}^{m-1} |a_i|
\end{aligned}$$

$$\begin{aligned} &\underset{x=\frac{\sum_{i=0}^{m-1}|a_i|}{|a_m|}+1}{=} && |x|^{m-1}\cdot|a_m|\cdot(x-1) \\ &<_{x-1<x} && |x|^{m-1}\cdot|a_m|\cdot x \\ &\underset{0<1\leqslant x}{=} && |x|^{m}\cdot|a_m| \\ &\underset{\text{[theorem: 10.84]}}{=} && |-a_m\cdot x^m| \end{aligned}$$

Hence $\sum_{i=0}^{m-1} a_i\cdot x^i \neq -a_m x^m$ so that $\sum_{i=0}^{m} a_i\cdot x^i = \sum_{i=0}^{m-1} a_i\cdot x^i + a_m\cdot x^m \neq 0$ contradicting $0 \underset{\text{[eq: 17.1]}}{=} p(x) = \sum_{i=0}^{m} a_i\cdot x^i$.

As in all possible cases we have a contradiction the assumption is wrong and thus $\forall i\in\{0,\dots,n\}$ we have $a_i=0$. □

Note 17.3. The function $C_0\colon\mathbb{C}\to\mathbb{C}$ defined by $C_0(z)=0$ is not a polynomial.

Proof. Assume that C_0 is a polynomial then there exist a $\{a_i\}_{i\in\{0,\dots,n\}}\subseteq\mathbb{C}$ with $a_n\neq 0$ such that $\forall z\in\mathbb{C}\ \sum_{i=0}^{n} a_i\cdot z^i = C_0 = 0$. Then by [lemma: 17.2] we must have $a_n=0$ contradicting $a_n\neq 0$. □

Corollary 17.4. *Let $n\in\mathbb{N}_0$ and $\{a_i\}_{i\in\{1,\dots,n\}}\subseteq\mathbb{C}$, $\{b_i\}_{i\in\{1,\dots,n\}}\subseteq\mathbb{C}$ be finite families such that $\forall z\in\mathbb{C}$ we have*

$$\sum_{i=0}^{n} a_i\cdot z^i = \sum_{i=0}^{n} b_i\cdot z^i$$

then we have $\forall i\in\{0,\dots,n\}\ a_i=b_i$.

Proof. As $\forall z\in\mathbb{C}$ we have that $\sum_{i=0}^{n} a_i\cdot z^i = \sum_{i=0}^{n} b_i\cdot z^i$ it follows that

$$0=\sum_{i=0}^{n} a_i\cdot z^i - \sum_{i=0}^{n} b_i\cdot z^i = \sum_{i=0}^{n}(\alpha_i\cdot z^i - b_i\cdot z^i) = \sum_{i=0}^{n}(a_i-b_i)\cdot z^i$$

hence by [lemma: 17.2] it follows that $\forall\in\{0,\dots,n\}\ a_i=b_i$. □

Lemma 17.5. *Let $n,m\in\mathbb{N}_0$, $\{a_i\}_{i\in\{0,\dots,n\}}\subseteq\mathbb{C}$ a family such that $a_n\neq 0$ and $\{b_i\}_{i\in\{0,\dots,m\}}\subseteq\mathbb{C}$ a family such that $b_m\neq 0$. Then if $\forall z\in\mathbb{C}\ \sum_{i=1}^{n} a_i\cdot z^i = \sum_{i=1}^{m} b_i\cdot z^i$ it follows that $n=m$ and $\forall i\in\{0,\dots,n\}$ we have $a_i=b_i$ [in other words $\{a_i\}_{i\in\{0,\dots,n\}}=\{b_i\}_{i\in\{0,\dots,m\}}$.*

Proof. For $n,m\in\mathbb{N}_0$ we have the following different cases:

n = m. Then by [corollary: 17.4] we have $\forall i\in\{0,\dots,n\}\ a_i=b_i$ and trivially $n=m$.

n < m. Define then $\{a'_i\}_{i\in\{0,\dots,m\}}\subseteq\mathbb{C}$ by $a'_i=\begin{cases} 0 \text{ if } n<i \\ a_i \text{ if } i\in\{0,\dots,n\}\end{cases}$ then we have $\forall z\in\mathbb{C}$

$$\begin{aligned} \sum_{i=0}^{m} a'_i\cdot z^i &= \sum_{i=0}^{n} a'_i\cdot z^i + \sum_{i=n+1}^{m} a'_i\cdot z^i \\ &= \sum_{i=0}^{n} a_i\cdot z^i + \sum_{i=n+1}^{m} 0\cdot z^i \\ &= \sum_{i=0}^{n} a_i\cdot z^i \\ &= \sum_{i=1}^{m} b_i\cdot z^i \end{aligned}$$

so that by [corollary: 17.4] we have that $0=a'_m=b_m$. As $b_m\neq 0$ we reach a contradiction. Hence this case will never occur.

m < n. Define then $\{b'_i\}_{i\in\{0,\dots,n\}}\subseteq\mathbb{C}$ by $b'_i=\begin{cases} 0 \text{ if } m<i \\ b_i \text{ if } i\in\{0,\dots,m\}\end{cases}$ then we have $\forall z\in\mathbb{C}$

$$\begin{aligned} \sum_{i=0}^{n} b'_i\cdot z^i &= \sum_{i=0}^{m} b'_i\cdot z^i + \sum_{i=m+1}^{n} b'_i\cdot z^i \\ &= \sum_{i=0}^{m} b_i\cdot z^i + \sum_{i=m+1}^{n} 0\cdot z^i \\ &= \sum_{i=0}^{m} b_i\cdot z^i \\ &= \sum_{i=1}^{n} a_i\cdot z^i \end{aligned}$$

so that by [corollary: 17.4] we have that $0=b'_n=a_n$. As $a_n\neq 0$ we reach a contradiction. Hence this case will never occur. So the only valid cases is $n=m$ proving the lemma. □

The above ensures that the following functions are valid.

Definition 17.6. *Let* $\mathcal{C}=\{\{a_i\}_{i\in\{0,\ldots,n\}}\subseteq\mathbb{C}|a_n\neq 0\}$ *then we define*

$$\mathrm{ord}_{\mathrm{coef}}:\mathcal{C}\to\mathbb{N}_0 \text{ by } \mathrm{ord}_{\mathrm{coef}}\left(\sum_{i=0}^{n} a_i\cdot z^i\right)=n$$

$$\mathrm{coef}:\mathcal{P}\to\mathcal{C} \text{ where } \mathrm{coef}(p)=\{a_i\}_{i\in\{1,\ldots,n\}}\in\mathcal{C} \text{ is the unique family [see lemma: 17.5] such that } \forall z\in\mathbb{C} \text{ we have } p(z)=\sum_{i=0}^{n} a_i\cdot z^i$$

and

$$\mathrm{ord}:\mathcal{P}\to\mathbb{N}_0 \text{ where } \mathrm{ord}(p)=\mathrm{ord}(\mathrm{coef}(p))$$

Actually it turns out that the relation between a polynomial and its coefficients is a bijection

Theorem 17.7. *The function*

$$\mathrm{coef}:\mathcal{P}\to\mathcal{C} \text{ where } \mathrm{coef}(p)=\{a_i\}_{i\in\{1,\ldots,n\}}\in\mathcal{C} \text{ such that } \forall z\in\mathbb{C} \text{ we have } p(z)=\sum_{i=0}^{n} a_i\cdot z^i$$

is a bijection. In a sense we can identify a polynomial with its coefficients.

Proof.

injectivity. If $\mathrm{coef}(p)=\mathrm{coef}(q)$ then there exist a $\{a_i\}_{i\in\{0,\ldots,n\}}\subseteq\mathcal{C}$ such that $\forall z\in\mathbb{C}$

$$p(z)=\sum_{i=0}^{n} a_i\cdot z^i=q(z)$$

so that $p=q$.

surjectivity. If $\{a_i\}_{i\in\{1,\ldots,n\}}\in\mathcal{C}$ then $\{a_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{C}$ and $a_n\neq 0$. So if we define $p:\mathbb{C}\to\mathbb{C}$ by $p(z)=\sum_{i=0}^{n} a_i\cdot z^i$ then $\mathrm{coef}(p)=\{a_i\}_{i\in\{1,\ldots,n\}}$. □

Note 17.8. To simplify notation we use the following convention. Instead of saying that the polynomial p is defined by the coefficients $\{a_i\}_{i\in\{0,\ldots,n\}}\subseteq\mathbb{C}$ with $a_n\neq 0$ such that $\forall z\in\mathbb{C}$ $p(z)=\sum_{i=0}^{n} a_i\cdot z^i$ we simply say that $p(z)=\sum_{i=0}^{n} a_i\cdot z^i$.

Definition 17.9. *A polynomial* $p\in\mathcal{P}$ *is* ***non constant*** *if* $0<\mathrm{ord}(p)$, *a polynomial* p *is* ***constant*** *if* $\mathrm{ord}(p)=0$.

The following is a very trivial lemma that shows how to construct new polynomials from another polynomial.

Lemma 17.10. *Let* $p\in\mathcal{P}$ *a polynomial and* $c\in\mathbb{C}\setminus\{0\}$ *then* $c\cdot p:\mathbb{C}\to\mathbb{C}$ *defined by* $(c\cdot p)(x)=c\cdot p(z)$ *is a polynomial with* $\mathrm{ord}(c\cdot p)=\mathrm{ord}(p)$.

Proof. As p is a polynomial there exist a family $\{a_i\}_{i\in\{0,\ldots,n\}}\subseteq\mathbb{C}$ with $a_n\neq 0$ where $n=\mathrm{ord}(p)$. Define $\{b_i\}_{i\in\{0,\ldots,n\}}\subseteq\mathbb{C}$ by $b_i=c\cdot a_i$ then as $c\neq 0\wedge a_n\neq 0$ we have that $b_n\neq 0$ so that

$$q:\mathbb{C}\to\mathbb{C} \text{ defined by } q(z)=\sum_{i=0}^{n} b_i\cdot z^i$$

is a polynomial with $\mathrm{ord}(q)=n$. As $\forall z\in\mathbb{C}$ we have

$$q(z)=\sum_{i=0}^{n} b_i\cdot z^i=\sum_{i=0}^{n} c\cdot a_i\cdot z^i=c\cdot\sum_{i=0}^{n} a_i\cdot z^i=c\cdot p(z)=(c\cdot p)(z)$$

it follows that $q=c\cdot p$ so that $c\cdot p$ is a polynomial with $\mathrm{ord}(c\cdot p)=n=\mathrm{ord}(p)$. □

We will show now that the product of polynomials is again a polynomial. First we need a little lemma.

Lemma 17.11. *Let $m,n\in\mathbb{N}_0$ then*

$$\{0,\ldots,n\}\times\{0,\ldots,m\}=\bigcup_{i\in\{0,\ldots,n+m\}}\{(r,s)\in\{0,\ldots,n\}\times\{0,\ldots,m\}|r+s=i\}$$

and $\forall i,j\in\{0,\ldots,n+m\}$ with $i\neq j$ we have that

$$\{(r,s)\in\{0,\ldots,n\}\times\{0,\ldots,m\}|r+s=i\}\bigcap\{(r,s)\in\{0,\ldots,n\}\times\{0,\ldots,m\}|r+s=j\}=\varnothing$$

Proof. Given $i\in\{0,\ldots,n+m\}$ define

$$I_i=\{(r,s)\in\{0,\ldots,n\}\times\{0,\ldots,m\}|r+s=i\}\subseteq\{0,\ldots,n\}\times\{0,\ldots,m\}$$

then we have trivially that

$$\bigcup_{i\in\{0,\ldots,n+m\}}I_i\subseteq\{0,\ldots,n\}\times\{0,\ldots,m\}\tag{17.2}$$

If $(r,s)\in\{0,\ldots,n\}\times\{0,\ldots,m\}$ then $0\leqslant r\leqslant n\wedge 0\leqslant s\leqslant m$ so that $0\leqslant r+s\leqslant n+m$ hence

$$(r,s)\in I_{r+s}\subseteq\bigcup_{i\in\{0,\ldots,n+m\}}I_i$$

Combining with [eq: 17.2] proves that

$$\{0,\ldots,n\}\times\{0,\ldots,m\}=\bigcup_{i\in\{0,\ldots,n+m\}}I_i$$

Let $i,j\in\{0,\ldots,n+m\}$ with $i\neq j$ then if $(r,s)\in I_i\bigcap I_j$ we have that $i=r+s=j$ contradicting $i\neq j$ so that

$$I_i\bigcap I_j=\varnothing$$

□

Theorem 17.12. *Let $p,q\in\mathcal{P}$ be two polynomials then*

$$p\cdot q:\mathbb{C}\to\mathbb{C}\text{ defined by }(p\cdot q)(z)=p(z)\cdot q(z)$$

is also a polynomial. If $p(z)=\sum_{i=0}^{n}a_i\cdot z^i$ and $q(z)=\sum_{i=0}^{m}b_i\cdot z^i$ then $p\cdot q$ is defined by

$$(p\cdot q)(z)=\sum_{i=0}^{n+m}\left(\sum_{(k,l)\in\{(r,s)\in\{0,\ldots,n\}\times\{0,\ldots,m\}|r+s=i\}}a_k\cdot b_l\right)\cdot z^i$$

from which it follows that

$$\operatorname{ord}(p\cdot q)=\operatorname{ord}(p)+\operatorname{ord}(q)$$

Proof. Let $z\in\mathbb{C}$ then

$$\begin{aligned}
(p\cdot q)(z) &= p(z)\cdot q(z)\\
&= \left(\sum_{k=0}^{n}a_k\cdot z^l\right)\cdot\left(\sum_{l=0}^{m}b_l\cdot z^i\right)\\
&= \left(\sum_{k\in\{0,\ldots,n\}}a_k\cdot z^k\right)\cdot\left(\sum_{l\in\{0,\ldots,m\}}b_l\cdot z^l\right)\\
&\underset{\text{[theorem: 11.48]}}{=} \sum_{(k,l)\in\{0,\ldots,n\}\times\{0,\ldots,m\}}a_k\cdot b_l\cdot z^k\cdot z^l\\
&= \sum_{(k,l)\in\{0,\ldots,n\}\times\{0,\ldots,m\}}a_k\cdot b_l\cdot z^{k+l}\\
&\underset{\text{[lemma: 17.11, theorem: 11.43]}}{=} \sum_{i=0}^{n+m}\left(\sum_{(k,l)\in\{(r,s)\in\{0,\ldots,n\}\times\{0,\ldots,m\}|r+s=i\}}a_k\cdot b_l\cdot z^{k+l}\right)\\
&= \sum_{i=0}^{n+m}\left(\sum_{(k,l)\in\{(r,s)\in\{0,\ldots,n\}\times\{0,\ldots,m\}|r+s=i\}}a_k\cdot b_l\cdot z^{i}\right)\\
&= \sum_{i=0}^{n+m}\left(\sum_{(k,l)\in\{(r,s)\in\{0,\ldots,n\}\times\{0,\ldots,m\}|r+s=i\}}a_k\cdot b_l\right)\cdot z^{i}
\end{aligned}$$

To finish the proof we must prove that $\sum_{(k,l)\in\{(r,s)\in\{0,\ldots,n\}\times\{0,\ldots,m\}|r+s=n+m\}} a_k\cdot b_l\neq 0$. Now if $(r,s)\in\{(r,s)\in\{0,\ldots,n\}\times\{0,\ldots,m\}|r+s=n+m\}$ then $r+s=n+m$. If $r\neq n$ then $r<n$ and as $s\leqslant m$ we have then $r+s<n+m$ contradicting $r+s=n+m$ so we must have that $r=n$ which as $r+s=n+m$ means that $s=m$. Hence $(k,l)\in\{(r,s)\in\{0,\ldots,n\}\times\{0,\ldots,m\}|r+s=n+m\}=\{(n,m)\}$ so that $\sum_{(k,l)\in\{(r,s)\in\{0,\ldots,n\}\times\{0,\ldots,m\}|r+s=n+m\}} a_k\cdot b_l=a_n\cdot b_m$, as $a_n\neq 0\neq b_m$ it follows that

$$\sum_{(k,l)\in\{(r,s)\in\{0,\ldots,n\}\times\{0,\ldots,m\}|r+s=n+m\}} a_k\cdot b_l\neq 0$$

□

We can now use mathematical induction to prove that a finite product of polynomials is again a polynomial.

Theorem 17.13. *Let $n\in\mathbb{N}$ and $\{p_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{P}$ a finite family of polynomials then if we define*

$$\prod_{i=1}^{n} p_i\colon\mathbb{C}\to\mathbb{C} \text{ by } \left(\prod_{i=1}^{n} p_i\right)(z)=\prod_{i=1}^{n} p_i(z)$$

then $\prod_{i=1}^{n} p_i$ is a polynomial with

$$\operatorname{ord}\left(\prod_{i=1}^{n} p_i\right)=\sum_{i=1}^{n}\operatorname{ord}(p_i)$$

Proof. We use mathematical induction to prove this, so define

$$S=\left\{n\in\mathbb{N}|\text{If }\{p_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{P}\text{ then }\prod_{i=1}^{n} p_i\in\mathcal{P}\text{ and }\operatorname{ord}\left(\prod_{i=1}^{n} p_i\right)=\sum_{i=1}^{n}\operatorname{ord}(p_i)\right\}$$

then we have:

- $\boldsymbol{1\in S}$**.** Then $\forall z\in\mathbb{C}$ we have $(\prod_{i=1}^{1} p_i)(z)=p_1(z)$ proving that $\prod_{i=1}^{1} p_i=p_1$ [which is a polynomial] and $\operatorname{ord}(\prod_{i=1}^{1} p_i)=\operatorname{ord}(p_1)=\sum_{i=1}^{1}\operatorname{ord}(p_i)$ hence $1\in\mathcal{S}$
- $\boldsymbol{n\in S\Rightarrow n+1\in\mathcal{S}}$**.** Then $\forall z\in\mathbb{C}$ we have that

$$\left(\prod_{i=1}^{n+1} p_i\right)(x)=\prod_{i=1}^{n+1} p_i(z)=p_{n+1}(z)\cdot\left(\prod_{i=1}^{n} p_i\right)(z)$$

proving that $\prod_{i=1}^{n+1} p_i=p_{n+1}\cdot\prod_{i=1}^{n} p_i$ which as $n\in\mathcal{S}$ is a product of polynomials and thus by [lemma: 17.12] is a polynomial, further

$$\begin{aligned}\operatorname{ord}\left(\prod_{i=1}^{n+1} p_i\right) &= \operatorname{ord}\left(p_{n+1}\cdot\prod_{i=1}^{n} p_i\right)\\ &\underset{\text{[lemma: 17.13]}}{=} \operatorname{ord}(p_{n+1})+\operatorname{ord}\left(\prod_{i=1}^{n} p_i\right)\\ &\underset{n\in\mathcal{S}}{=} \operatorname{ord}(p_{n+1})+\sum_{i=1}^{n}\operatorname{ord}(p_i)\\ &= \sum_{i=1}^{n+1}\operatorname{ord}(p_i)\end{aligned}$$

□

17.1.2 Divergent limits

In the proof of the fundamental theorem of algebra we need the concept not of convergent limits but the concept of divergent limits.

Definition 17.14. *Let $f\colon\mathbb{R}\to\mathbb{R}$ be a function then*

1. $\lim_{x\to\infty} f(x)=\infty$ *if* $\forall M\in\mathbb{R}$ *there exist a* $N\in\mathbb{R}$ *such that* $\forall x\geqslant N$ *we have* $f(x)\geqslant M$
2. $\lim_{x\to\infty} f(x)=-\infty$ *if* $\forall M\in\mathbb{R}$ *there exists a* $N\in\mathbb{R}$ *such that* $\forall x\geqslant N$ *we have* $f(x)\leqslant M$

Theorem 17.15. *Let $f\colon\mathbb{R}\to\mathbb{R}$ be a function then for*

$$-f\colon\mathbb{R}\to\mathbb{R} \text{ defined by } (-f)(x)=-f(x)$$

we have:

1. *If* $\lim_{x\to\infty} f(x)=\infty$ *then* $\lim_{x\to\infty}(-f)(x)=-\infty$
2. *If* $\lim_{x\to\infty} f(x)=-\infty$ *then* $\lim_{x\to\infty}(-f)(x)=\infty$

Proof.

1. Take $\mathrm{M}\in\mathbb{R}$ then there exists a N such that $\forall x\geqslant N$ we have $-M\leqslant f(x)\Rightarrow(-f)(x)\leqslant M$ proving that $\lim_{x\to\infty}(-f)(x)=-\infty$
2. Take $\mathrm{M}\in\mathbb{R}$ then there exists a N such that $\forall x\geqslant N$ we have $f(x)\leqslant -M\Rightarrow M\leqslant(-f)(x)$ proving that $\lim_{x\to\infty}(-f)(x)=\infty$ □

Lemma 17.16. *Let* $n\in\mathbb{N}$, $\{a_i\}_{i\in\{0,\ldots,n\}}\subseteq\mathbb{R}$ *then*

1. *If* $a_n>0$ *we have* $\lim_{x\to\infty}(\sum_{i=0}^n a_i\cdot x^i)=\infty$
2. *If* $a_n<0$ *we have* $\lim_{x\to\infty}(\sum_{i=0}^n a_i\cdot x^i)=-\infty$

Proof.

1. we prove this by induction so let

$$\mathcal{S}=\left\{n\in\mathbb{N}|\forall\{a_i\}_{i\in\{0,\ldots,n\}}\subseteq\mathbb{R}\text{ with }a_n>0\text{ we have }\lim_{x\to\infty}\left(\sum_{i=0}^n a_i\cdot x^i\right)=\infty\right\}$$

then we have

$1\in\mathcal{S}$. Let $M\in\mathbb{R}$ and take $N=\frac{M-a_0}{a_1}$ then if $x\geqslant N$ we have

$$M-a_0=a_1\cdot N\leqslant a_1\cdot x=a_1\cdot x^1$$

hence $M\leqslant a_1\cdot x^1+a_0=\sum_{i=0}^1 a_i\cdot x^i$ proving that $\lim_{x\to\infty}\sum_{i=0}^1 a_i\cdot x^i=\infty$. Hence $1\in S$.

$n\in\mathcal{S}\Rightarrow n+1\in\mathcal{S}$. Let $\{a_i\}_{i\in\{0,\ldots,n+1\}}\subseteq\mathbb{R}$ with $a_{n+1}>0$ then

$$\sum_{i=0}^{n+1} a_i\cdot x^i=\left(\sum_{i=1}^{n+1} a_i\cdot x^i\right)+a_0=x\cdot\left(\sum_{i=1}^{n+1} a_i\cdot x^{i-1}\right)+a_0=x\cdot\left(\sum_{i=0}^{n} a_{i+1}\cdot x^i\right)+a_0,$$

hence if we define $\{b_i\}_{i\in\{0,\ldots,n\}}$ by $b_i=a_{i+1}$, then we have

$$\sum_{i=1}^{n+1} a_i\cdot x^i=x\cdot\left(\sum_{i=0}^{n} b^i\cdot x^i\right)+a_0\wedge b_n=a_{n+1}>0 \tag{17.3}$$

Take $M\in\mathbb{R}$ then as $n\in\mathcal{S}$ there exists a $N'\in\mathbb{R}$ such that if $N'\leqslant x$ we have that

$$0<\max(1,M-a_0)\leqslant\sum_{i=0}^{n} b^i\cdot x^i$$

Take then $N=\max(N',1)$ then we have if $N\leqslant x$ that $1\leqslant x$ so that

$$\max(1,M-a_0)\leqslant x\cdot\max(1,M-a_0)$$

and

$$x\cdot\max(1,M-a_0)\leqslant x\cdot\sum_{i=0}^{n} b^i\cdot x^i$$

so that

$$M-a_0\leqslant\max(1,M-a_0)\leqslant x\cdot\sum_{i=0}^{n} b^i\cdot x^i$$

or

$$M\leqslant a_0+x\cdot\sum_{i=0}^{n} b^i\cdot x^i\underset{\text{[eq: 17.3]}}{=}\sum_{i=1}^{n+1} a_i\cdot x^i$$

hence $\lim_{x\to\infty}\sum_{i=1}^{n+1} a_i\cdot x^i$ proving that $n+1\in S$.

2. If $a_n<0$ then $0<(-a_n)$ and we have by (1) that $\lim_{x\to\infty}-\sum_{i=0}^n a_i\cdot x^i=\lim_{z\to\infty}\sum_{i=0}^n(-a_i)\cdot x^i=\infty$ and thus by [theorem: 17.15] that $\lim_{x\to\infty}(\sum_{i=0}^n a_i\cdot x^i)=\lim_{x\to\infty}(-\sum_{i=0}^n a_i\cdot x^i)=-\infty$. □

17.1.3 Properties of $\mathbb{C}$ needed for the fundamental theorem

First we define a norm on $\mathbb{C}$ that does not need the square root.

Theorem 17.17. *The function* $\|\|: \mathbb{C} \to \mathbb{R}$ *defined by* $\|z\| = |\mathrm{Re}(z)| + |\mathrm{Img}(z)|$ *is a norm on the vector space* $\mathbb{C}$ *over* $\mathbb{R}$.

Proof. We have:

1. If $z \in \mathbb{C}$ then $\|z\| = |\mathrm{Re}(z)| + |\mathrm{Img}(z)| \geqslant 0$
2. If $\alpha \in \mathbb{R}$ then for z we have

$$\begin{aligned}
\|\alpha \cdot z\| &= |\mathrm{Re}(\alpha \cdot z)| + |\mathrm{Img}(\alpha \cdot z)| \\
&\underset{\text{[theorem: 10.79]}}{=} |\alpha \cdot \mathrm{Re}(z)| + |\alpha \cdot \mathrm{Img}(z)| \\
&= |\alpha| \cdot |\mathrm{Re}(z)| + |\alpha| \cdot |\mathrm{Img}(z)| \\
&= |\alpha| \cdot (|\mathrm{Re}(z)| + |\mathrm{Img}(z)|) \\
&= |\alpha| \cdot \|z\|
\end{aligned}$$

3. If $z_1, z_2 \in \mathbb{C}$ then we have

$$\begin{aligned}
\|z_1 + z_2\| &= |\mathrm{Re}(z_1 + z_2)| + |\mathrm{Img}(z_1 + z_2)| \\
&\underset{\text{[theorem: 10.79]}}{=} |\mathrm{Re}(z_1) + \mathrm{Re}(z_2)| + |\mathrm{Img}(z_1) + \mathrm{Img}(z_2)| \\
&\leqslant |\mathrm{Re}(z_1)| + |\mathrm{Re}(z_2)| + |\mathrm{Img}(z_1)| + |\mathrm{Img}(z_2)| \\
&= (|\mathrm{Re}(z_1)| + |\mathrm{Img}(z_1)|) + (|\mathrm{Re}(z_2)| + |\mathrm{Img}(z_2)|) \\
&= \|z_1\| + \|z_2\|
\end{aligned}$$

4. If $z \in \mathbb{C}$ satisfies $\|z\| = 0$ then $|\mathrm{Re}(z)| + |\mathrm{Img}(z)| = 0$ so that $|\mathrm{Re}(z)| = 0 = |\mathrm{Img}(z)|$ hence $\mathrm{Re}(z) = \mathrm{Img}(z) = 0$ so that $z = 0$. □

The above norm has the following properties.

Lemma 17.18. *The norm* $\|\|$ *has the following properties:*

1. *If* $z \in \mathbb{R}$ *then* $\|z\| = |z|$
2. $\forall z \in \mathbb{C}$ *we have that* $\|\bar{z}\| = \|z\|$
3. $\forall z, w \in \mathbb{C}$ *we have that* $\frac{\|z\| \cdot \|w\|}{2} \leqslant \|z \cdot w\| \leqslant \|z\| \cdot \|w\|$
4. $\forall z, w \in \mathbb{C}$ *we have* $\|\mathrm{Re}(z \cdot w)\| \leqslant \|z\| \cdot \|w\|$
5. $\forall n \in \mathbb{N}$, $z \in \mathbb{C}$ *then* $\|z^n\| \leqslant \|z\|^n$
6. $\forall n \in \mathbb{N}$, $z \in \mathbb{C}$ *then* $\|\mathrm{Re}(z^n)\| \leqslant \|z\|^n$
7. $\forall n \in \mathbb{N}, z \in \mathbb{C}$ *then* $\frac{\|z\|^n}{2^n} \leqslant \|z^n\|$

Proof.

1. If $z \in \mathbb{R}$ then by [theorem: 10.79] $\mathrm{Img}(z) = 0$ so that $\|z\| = |\mathrm{Re}(z)| + |\mathrm{Img}(z)| = |\mathrm{Re}(z)|$
2. Let $z = \mathrm{Re}(z) + \mathrm{Img}(z) \in \mathbb{C}$ then

$$\|z\| = |\mathrm{Re}(z)| + |\mathrm{Img}(z)| = |\mathrm{Re}(z)| + |-\mathrm{Img}(z)| = \|\mathrm{Re}(x) - i \cdot \mathrm{Img}(z)\| = \|\bar{z}\|$$

3. If $a, b, c, d \in \mathbb{R}$ then we have $0 \leqslant (|a| - |b|)^2 = |a|^2 + |b|^2 - 2 \cdot |a| \cdot |b|$ so that

$$2 \cdot |a| \cdot |b| \leqslant |a|^2 + |b|^2 \tag{17.4}$$

So $(|a| + |b|)^2 = |a|^2 + |b|^2 + 2 \cdot |a| \cdot |b| \leqslant_{\text{[eq: 17.4]}} |a|^2 + |b|^2 + |a|^2 + |b|^2 = 2 \cdot (|a|^2 + |b|^2)$ proving that

$$(|a| + |b|)^2 \leqslant 2 \cdot (|a|^2 + |b|^2) \tag{17.5}$$

Similar we have $0 \leqslant (|c| - |d|)^2 = |c|^2 + |d|^2 - 2 \cdot |c| \cdot |d|$ so that

$$2 \cdot |c| \cdot |d| < |c|^2 + |d|^2 \tag{17.6}$$

So $(|c|+|d|)^2=|c|^2+|d|^2+2\cdot|c|\cdot|d|\leqslant_{\text{[eq: 17.6]}}|c|^2+|d|^2+|c|^2+|d|^2=2\cdot(|c|^2+|d|^2)$ proving that

$$(|c|+|d|)^2\leqslant 2\cdot(|c|^2+|d|^2) \tag{17.7}$$

Hence we have by [eqs: 17.5, 17.7]

$$\begin{aligned}(|a|+|b|)^2\cdot(|c|+|d|)^2 &\leqslant_{\text{[eq: 17.5]}} 2\cdot(|a|^2+|b|^2)\cdot(|c|+|d|)^2\\ &\leqslant_{\text{[eq: 17.7]}} 2\cdot(|a|^2+|b|^2)\cdot 2\cdot(|c|^2+|d|^2)\\ &= 4\cdot(|a|^2+|b|^2)\cdot(|c|^2+|d|^2)\end{aligned}$$

proving that

$$(|a|+|b|)^2\cdot(|c|+|d|)^2\leqslant 4\cdot(|a|^2+|b|^2)\cdot(|c|^2+|d|^2) \tag{17.8}$$

Now

$$\begin{aligned}(a\cdot c-b\cdot d)^2+(a\cdot d+b\cdot c)^2 &= a^2\cdot c^2+b^2\cdot d^2-2\cdot a\cdot c\cdot b\cdot d+a^2\cdot d^2+b^2\cdot c^2+\cdot a\cdot d\cdot b\cdot c\\ &= a^2\cdot c^2+b^2\cdot d^2+a^2\cdot d^2+b^2\cdot c^2\\ &= a^2\cdot(c^2+d^2)+b^2\cdot(d^2+c^2)\\ &= (a^2+b^2)\cdot(c^2+d^2)\\ &\underset{a,b,c,d\in\mathbb{R}}{=} (|a|^2+|b|^2)\cdot(|c|^d+|d|^2)\end{aligned}$$

substituting the above in [eq: 17.8] we have that

$$\begin{aligned}(|a|+|b|)^2\cdot(|c|+|d|)^2 &\leqslant 4\cdot((a\cdot c-b\cdot d)^2+(a\cdot d+b\cdot c)^2)\\ &= 4\cdot(|a\cdot c-b\cdot d|^2+|a\cdot d+b\cdot c|^2)\\ &= 4\cdot|a\cdot c-b\cdot d|^2+4\cdot|a\cdot d+b\cdot c|^2\\ &\leqslant 4\cdot|a\cdot c-b\cdot d|^2+4\cdot|a\cdot d+b\cdot c|^2+8\cdot|a\cdot c-b\cdot d|\cdot|a\cdot d+b\cdot c|\\ &= 4\cdot(|a\cdot c-b\cdot d|+|a\cdot d+b\cdot c|)^2\end{aligned}$$

Using the fact that the square root is increasing on $\mathbb{R}^+$ [see theorem: 10.70] it follows that

$$(|a|+|b|)\cdot(|c|+|d|)\leqslant 2\cdot(|a\cdot c-b\cdot d|+|a\cdot d+b\cdot c|) \tag{17.9}$$

Let $z=a+i\cdot b\in\mathbb{C}$ and $w=c+i\cdot d\in\mathbb{C}$ then $z\cdot w=(a\cdot c-b\cdot d)+i\cdot(a\cdot d+b\cdot c)$ so that

$$\begin{aligned}\|z\cdot w\| &= |a\cdot c-b\cdot d|+|a\cdot d+b\cdot c|\\ &\geqslant_{\text{[eq: 17.9]}} \frac{1}{2}\cdot(|a|+|b|)\cdot(|c|+|d|)\\ &= \frac{1}{2}\cdot\|z\|\cdot\|w\|\end{aligned}$$

proving that

$$\frac{1}{2}\cdot\|z\|\cdot\|w\|\leqslant\|z\cdot w\| \tag{17.10}$$

Further we have

$$\begin{aligned}\|z\cdot w\| &= |a\cdot c-b\cdot d|+|a\cdot d+b\cdot c|\\ &\leqslant |a|\cdot|c|+|b|\cdot|d|+|a|\cdot|d|+|b|\cdot|c|\\ &= |a|\cdot(|c|+|d|)+|b|\cdot(|d|+|c|)\\ &= (|a|+|b|)\cdot(|c|+|d|)\\ &= \|z\|\cdot\|w\|\end{aligned}$$

proving that

$$\|z\cdot w\|\leqslant\|z\|\cdot\|w\|$$

(3) is proved by the above and [eq: 17.10].

4. If $z=a+i\cdot b$ and $w=c+i\cdot d$ so that $z\cdot w=(a\cdot c-b\cdot d)+i\cdot(a\cdot d+b\cdot c)$ then we have

$$\begin{aligned}\|\mathrm{Re}(z\cdot w)\| &= |\mathrm{Re}(z\cdot w)|\\ &= |a\cdot c-b\cdot d|\\ &\leqslant |a\cdot c-b\cdot d|+|a\cdot d+b\cdot c|\\ &= \|z\cdot w\|\end{aligned}$$

5. We prove this by induction, so define
$$S = \{n \in \mathbb{N} | \|z^n\| \leqslant \|z\|^n\}$$
then we have:

   $1 \in S$. As $\|z^1\| = \|z\| = \|z\|^1$ it follows that $1 \in S$.

   $n \in S \Rightarrow n+1 \in S$. As $\|z^{n+1}\| = \|z \cdot z^n\| \leqslant_{(3)} \|z\| \cdot \|z^n\| \leqslant_{n \in \mathbb{N}} \|z\| \cdot \|z\|^n = \|z\|^{n+1}$ proving that $n+1 \in S$.
6. For $z = x + i \cdot y$ we for $n \in \mathbb{N}$ two cases:

   $n = 1$. Then $\|\mathrm{Re}(z^1)\| = \|\mathrm{Re}(z)\| = |x| < |x| + |y| = \|z\| = \|z\|^1$ so that $\|\mathrm{Re}(z^1)\| \leqslant \|z\|^1$

   $1 < n$. Then $1 \leqslant n-1$ and we have
$$\|\mathrm{Re}(z^n)\| = \|\mathrm{Re}(z \cdot z^{n-1})\| \leqslant_{(4)} \|z\| \cdot \|z^{n-1}\| \leqslant_{(5)} \|z\| \cdot \|z\|^{n-1} = \|z\|^n$$
   so that
$$\|\mathrm{Re}(z^n)\| \leqslant \|z\|^n$$
7. This is proved by induction, so define
$$S = \left\{ n \in \mathbb{N} | \frac{\|z\|^n}{2^n} \leqslant \|z^n\| \right\}$$
then we have:

   $1 \in S$. As $\frac{1}{2} < 1$ we have $\frac{\|z^1\|}{2} \leqslant \|z^1\| = \|z\| = \|z\|^1$ so that $1 \in S$.

   $n \in S \Rightarrow n+1 \in S$. Then we have
$$\frac{\|z\| \cdot \|z^n\|}{2} \leqslant_{(3)} \|z \cdot z^n\| = \|z^{n+1}\| \tag{17.11}$$
   As $n \in S$ we have $\frac{\|z\|^n}{2^n} \leqslant \|z^n\|$. So that
$$\frac{\|z\|^{n+1}}{2^{n+1}} = \frac{\|z\| \cdot \|z\|^n}{2 \cdot 2^n} \leqslant_{n \in S} \frac{\|z\|}{2} \cdot \|z\|^n \leqslant_{[\text{eq: } 17.11]} \|z^{n+1}\|$$
   giving $n+1 \in S$. □

In the proof of the fundamental theorem of algebra we use the extreme value theorem [theorem: 14.238], so we need to look at continuous functions using the above norm. This is the subject of the following theorem.

Theorem 17.19. *The following functions are continuous in the normed space $\langle \mathbb{C}, \|\|\rangle$*

1. *Given $\alpha \in \mathbb{C}$ then function $(\alpha \cdot): \mathbb{C} \to \mathbb{C}$ defined by $(\alpha \cdot)(x) = \alpha \cdot x$ is continuous.*
2. Given $n \in \mathbb{N}_0$ *we have that $(\cdot)^n: \mathbb{C} \to \mathbb{C}$ defined by $(\cdot)^n(z) = z^n$ is continuous.*
3. *Given $n \in \mathbb{N}$, $\{\alpha_i\}_{i \in \{0, \ldots, n\}}$ then the function $p: \mathbb{C} \to \mathbb{C}$ defined by $p(z) = \sum_{i=0}^n \alpha_i \cdot z^i$ is continuous.*
4. *The function $\langle z \rangle: \mathbb{C} \to \mathbb{R}$ defined by $\langle z \rangle = \langle \rangle(z) = z \cdot \bar{z} = |z|^2$ is continuous*
5. *Given $n \in \mathbb{N}_0$, $\{a_i\}_{i \in \{0, \ldots, n\}}$ the function*
$$p \cdot \bar{p}: \mathbb{C} \to \mathbb{R} \text{ defined by } (p \cdot \bar{p})(z) = \left(\sum_{i=0}^n \alpha_i \cdot z^i \right) \cdot \overline{\left(\sum_{i=0}^n \alpha_i \cdot z^i \right)}$$
   is continuous.
6. *The function $(\bar{\cdot}): \mathbb{C} \to \mathbb{C}$ defined by $(\bar{\cdot})(z) = \bar{z}$ is continuous.*
7. *Given $z \in \mathbb{C}$ then the function $(\cdot z): \mathbb{R} \to \mathbb{C}$ defined by $(.z)(\alpha) = \alpha \cdot z$ is continuous.*
8. *If $p: \mathbb{C} \to \mathbb{C}$ is a polynomial and $z \in \mathbb{C}$ then $p_{\cdot z}: \mathbb{R} \to \mathbb{C}$ defined by $p_{\cdot z}(\alpha) = p(\alpha \cdot z)$ is continuous.*
9. *The function $\mathrm{Re}: \mathbb{C} \to \mathbb{R}$ is continuous*
10. *If $f: \mathbb{C} \to \mathbb{C}$ and $g: \mathbb{C} \to \mathbb{C}$ are continuous functions in $\langle \mathbb{C}, \|\|\rangle$ then*
$$f \cdot g: \mathbb{C} \to \mathbb{C} \text{ define by } (f \cdot g) \text{ is continuous in } \langle \mathbb{C}, \|\|\rangle$$

Proof.

1. As $\forall z \in \mathbb{C}$ we have $(\alpha \cdot)(z) = \alpha \cdot z = \alpha \cdot \mathrm{Id}_{\mathbb{C}}(z)$ we have $(\alpha \cdot) = \alpha \cdot \mathrm{Id}_{\mathbb{C}}$. By [example: 14.133] $\mathrm{Id}_{\mathbb{C}}$ is continuous so that by [theorem: 14.145] $(\alpha \cdot)$ is continuous.
2. As $\forall z \in \mathbb{C}$ we have that $(\cdot)^n(z) = z^n = (\mathrm{Id}_{\mathbb{C}}(z))^n$ we have, as $\mathrm{Id}_{\mathbb{C}}$ is continuous, by [theorem: 14.148] that $(\cdot)^n$ is continuous.

3. Let $i \in \{1, \ldots, n\}$ then by (1) and (2) $(\alpha_i \cdot)$ and $(\cdot)^i$ are continuous. So, as the composition of continuous functions is continuous [see theorem: 14.139], it follows that $(\alpha_i \cdot) \circ (\cdot)^i$ is continuous. Using now [theorem: 14.146] it follows that
$$\sum_{i=0}^{n} ((\alpha_i \cdot) \circ (\cdot)^i)$$
is continuous. Let $z \in \mathbb{C}$ then
$$\left(\sum_{i=0}^{n} ((\alpha_i \cdot) \circ (\cdot)^i)\right)(z) = \sum_{i=0}^{n} ((\alpha_i \cdot) \circ (\cdot)^i)(z) = \sum_{i=0}^{n} (\alpha_i \cdot)((\cdot)^i(z)) = \sum_{i=0}^{n} \alpha_i \cdot z^i = p(z)$$
it follows that $p = \sum_{i=0}^{n} ((\alpha_i \cdot) \circ (\cdot)^i)$. Hence p is continuous.
4. Let $y \in \mathbb{C}$ and $\varepsilon \in \mathbb{R}^+$. Take $\delta = \min\left(1, \frac{\varepsilon}{2 \cdot \|y\| + 1}\right) \in \mathbb{R}^+$ then if $z \in \mathbb{C}$ with $\|z - y\| < \delta$ then if we define $h = z - y$ we have $\|h\| < \delta$ and
$$\begin{aligned}
|\langle z \rangle - \langle y \rangle| &\underset{\text{[lemma: 17.18]}}{=} \|\langle z \rangle - \langle y \rangle\| \\
& \quad \|\langle y + h \rangle - \langle y \rangle\| \\
&= \|(y + h) \cdot \overline{(y + h)} - y \cdot \overline{y}\| \\
&\underset{\text{[theorem: 10.84]}}{=} \|(y + h) \cdot (\overline{y} + \overline{h}) - y \cdot \overline{y}\| \\
&= \|y \cdot \overline{y} + y \cdot \overline{h} + h \cdot \overline{y} + h \cdot \overline{h} - y \cdot \overline{y}\| \\
&= \|y \cdot \overline{h} + h \cdot \overline{y} + h \cdot \overline{h}\| \\
&\leqslant \|y \cdot \overline{h}\| + \|h \cdot \overline{y}\| + \|h \cdot \overline{h}\| \\
&\underset{\text{[lemma: 17.18(3)]}}{\leqslant =} \|y\| \cdot \|\overline{h}\| + \|h\| \cdot \|\overline{y}\| + \|h\| \cdot \|\overline{h}\| \\
&\underset{\text{[lemma: 17.18(2)]}}{=} \|y\| \cdot \|h\| + \|h\| \cdot \|y\| + \|h\| \cdot \|h\| \\
&= \|h\| \cdot (2 \cdot \|y\| + \|h\|) \\
&\leqslant_{\|h\| < \delta \leqslant 1} \|h\| \cdot (2 \cdot \|y\| + 1) \\
&< \frac{\varepsilon}{2 \cdot \|y\| + 1} \cdot (2 \cdot \|y\| + 1) \\
&= \varepsilon
\end{aligned}$$
proving continuity of $\langle \cdot \rangle$.
5. Let $z \in \mathbb{C}$ then
$$\begin{aligned}
(\langle \cdot \rangle \circ p)(z) &= \langle \cdot \rangle(p(z)) \\
&= \langle \cdot \rangle\left(\sum_{i=0}^{n} \alpha_i \cdot z^i\right) \\
&= \left(\sum_{i=0}^{n} \alpha_i \cdot z^i\right) \cdot \overline{\left(\sum_{i=0}^{n} \alpha_i \cdot z^i\right)} \\
&= (p \cdot \overline{p})(z)
\end{aligned}$$
so that
$$(\langle \cdot \rangle \circ p) = p \cdot \overline{p}$$
By (3),(4) p and $\langle \cdot \rangle$ are continuous, hence using [theorem: 14.139] $p \cdot \overline{p}$ is continuous.
6. Let $\varepsilon \in \mathbb{R}$, $z \in \mathbb{C}$ then if $z' \in \mathbb{C}$ with $\|z - z'\| < \varepsilon$ we have
$$\|\overline{z} - \overline{z'}\| \underset{\text{[theorem: 10.82]}}{=} \|\overline{z - z'}\| \underset{\text{[lemma: 17.18]}}{=} \|z - z'\| < \varepsilon$$
7. Let $z \in \mathbb{C}$, $\alpha \in \mathbb{R}$, given $\varepsilon > 0$ define $\delta = \frac{\varepsilon}{\|z\| + 1} \in \mathbb{R}^+$ then we have $\forall \alpha' \in \mathbb{R}$ with $|\alpha - \alpha'| < \delta$ that
$$\|(\cdot z)(\alpha) - (\cdot z)(\alpha')\| = \|\alpha \cdot z - \alpha' \cdot z\| = \|(\alpha - \alpha') \cdot z\| = |\alpha - \alpha'| \cdot \|z\| < \frac{\varepsilon}{\|z\| + 1} \cdot \|z\| < \varepsilon$$
proving that $(\cdot z)$ is continuous.
8. Given $\alpha \in \mathbb{R}$ we have $(p_{\cdot z})(\alpha) = p(\alpha \cdot z) = p((\cdot z)(\alpha)) = (p \circ (\cdot z))(\alpha)$ so that $p_{\cdot z} = p \circ (\cdot z)$. As $p_{\cdot z} = p \circ (\cdot z)$ is the composition of two continuous functions [see (3) and (7)] we have that $p_{\cdot z}$ is continuous.

9. Let $z \in \mathbb{C}$ then given $\varepsilon \in \mathbb{R}^+$ we have for $\delta = \varepsilon$ that $\forall z' \in \mathbb{C}$ with $\|z - z'\| < \delta$ so that
$$|\mathrm{Re}(z) - \mathrm{Re}(z')| = |\mathrm{Re}(z - z')| \leqslant |\mathrm{Re}(z - z')| + |\mathrm{Img}(z - z')| = \|z - z'\| < \delta = \varepsilon$$
proving continuity.
10. Let $z \in \mathbb{C}$ and $\varepsilon \in \mathbb{R}^+$ then as f, g are continuous there exist a $\delta_1, \delta_2 \in \mathbb{R}^+$ such that
$$\forall z' \in \mathbb{C} \text{ with } \|z - z'\| < \delta_1 \text{ we have } \|f(z) - f(z')\| < \min\left(1, \frac{\varepsilon}{2 \cdot (1 + \|g(z)\|)}\right) \tag{17.12}$$
$$\forall z' \in \mathbb{C} \text{ with } \|z - z'\| < \delta_2 \text{ we have } \|g(z) - g(z')\| < \frac{\varepsilon}{2 \cdot (1 + \|f(z)\|)} \tag{17.13}$$
Define $\delta = \min(\delta_1, \delta_2) \in \mathbb{R}^+$ then if $z' \in \mathbb{C}$ with $\|z'\| < \delta$ we have
$$\|f(z')\| \leqslant \|f(z) - (f(z) - f(z'))\| \leqslant \|f(z) - f(z')\| + \|f(z)\| < 1 + \|f(z\| \tag{17.14}$$
Now
$$\begin{aligned}
\|(f \cdot g)(z) - (f \cdot g)(z')\| &= \\
\|f(z) \cdot g(z) - f(z') \cdot g(z')\| &= \\
\|f(z) \cdot g(z) - f(z') \cdot g(z) + f(z') \cdot g(z) - f(z') \cdot g(z')\| &\leqslant \\
\|f(z) \cdot g(z) - f(z') \cdot g(z)\| + \|f(z') \cdot g(z) - f(z') \cdot g(z')\| &= \\
\|(f(z) - f(z')) \cdot g(z)\| + \|f(z') \cdot (g(z) - g(z'))\| &\leqslant_{\text{[lemma: 17.18(4)]}} \\
\|f(z) - f(z')\| \cdot \|g(z)\| + \|f(z')\| \cdot \|g(z) - g(z')\| &<_{\text{[eq: 17.14]}} \\
\|f(z) - f(z')\| \cdot \|g(z)\| + (1 + \|f(z)\|) \cdot \|g(z) - g(z')\| &<_{\text{[eqs: 17.12, 17.13}} \\
\frac{\varepsilon}{2 \cdot (1 + \|g(z)\|)} \cdot \|g(z)\| + (1 + \|f(z)\|) \cdot \frac{\varepsilon}{2 \cdot (1 + \|f(z)\|)} &< \\
\frac{\varepsilon}{2} + \frac{\varepsilon}{2} &= \\
\varepsilon &
\end{aligned}$$
proving that $f \cdot g$ is continuous at z. As $z \in \mathbb{C}$ was chosen arbitrary $f \cdot g$ is continuous. □

The following very specific lemma will be used in the proof of the fundamental theorem of algebra.

Lemma 17.20. *Let $n \in \mathbb{N}_0$ then*

1. $(1 + i)^{4 \cdot n + 2} = 2 \cdot (-4)^n \cdot i$
2. $(1 - i)^{4 \cdot n + 2} = -2 \cdot (-4)^n \cdot i$

Proof. This is easily proved by induction.

1. Take $S = \{n \in \mathbb{N}_0 | (1 + i)^{4 \cdot n + 2} = 2 \cdot (-4)^n \cdot i\}$ then we have:

   $\boldsymbol{0 \in S}$. $(1 + i)^{4 \cdot 0 + 2} = (1 + i)^2 = 1^2 + 2 \cdot i + i^2 = 1 + 2 \cdot i - 1 = 2 \cdot i = 2 \cdot (-4)^0 \cdot i$ so that $0 \in S$.

   $\boldsymbol{n \in S \Rightarrow n + 1 \in S}$. We have
$$\begin{aligned}
(1 + i)^{4 \cdot (n+1) + 2} &= (1 + i)^{(4 \cdot n + 2) + 4} \\
&= (1 + i)^{(4 \cdot n + 2)} \cdot (1 + i)^4 \\
&\underset{n \in S}{=} 2 \cdot (-4)^n \cdot i \cdot (1 + i)^4 \\
&= 2 \cdot (-4)^n \cdot i \cdot (1 + i)^2 \cdot (1 + i)^2 \\
&= 2 \cdot (-4)^n \cdot i \cdot (1 + 2 \cdot i + i^2) \cdot (1 + 2 \cdot i + i^2) \\
&= 2 \cdot (-4)^n \cdot i \cdot (2 \cdot i) \cdot (2 \cdot i) \\
&= 2 \cdot (-4)^n \cdot i \cdot (4 \cdot i^2) \\
&= 2 \cdot (-4)^n \cdot i \cdot (-4) \\
&= 2 \cdot (-4)^{n+1} \cdot i
\end{aligned}$$
   proving that $n + 1 \in S$.
2. Take $S = \{n \in \mathbb{N}_0 | (1 - i)^{4 \cdot n + 2} = -2 \cdot (-4)^n \cdot i\}$ then we have:

   $\boldsymbol{0 \in S}$. $(1 - i)^{4 \cdot 0 + 2} = (1 - i)^2 = 1^2 - 2 \cdot i + i^2 = 1 - 2 \cdot i - 1 = -2 \cdot i = -2 \cdot (-4)^0 \cdot i$ so that $0 \in S$.

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$**.** We have

$$\begin{aligned}
(1-i)^{4\cdot(n+1)+2} &= (1-i)^{(4\cdot n+2)+4} \\
&= (1-i)^{(4\cdot n+2)}\cdot(1-i)^4 \\
&\underset{n\in S}{=} -2\cdot(-4)^n\cdot i\cdot(1-i)^4 \\
&= -2\cdot(-4)^n\cdot i\cdot(1-i)^2\cdot(1-i)^2 \\
&= -2\cdot(-4)^n\cdot i\cdot(1-2\cdot i+i^2)\cdot(1-2\cdot i+i^2) \\
&= -2\cdot(-4)^n\cdot i\cdot(-2\cdot i)\cdot(-2\cdot i) \\
&= -2\cdot(-4)^n\cdot i\cdot(4\cdot i^2) \\
&= -2\cdot(-4)^n\cdot(-4)\cdot i \\
&= -2\cdot(-4)^{n+1}\cdot i
\end{aligned}$$

proving that $n+1\in S$. □

We also use the binomial expansion of $(a+b)^n$ so we need the following definitions and theorems.

Definition 17.21. *Given $n\in\mathbb{N}_0$ then we define $n!\in\mathbb{N}$ by*

$$n! = \begin{cases} 1 \text{ if } n=0 \\ n\cdot(n-1) \text{ if } 0<n \end{cases} > 0$$

Definition 17.22. *Given $n\in\mathbb{N}_0$ and $k\in\{0,\ldots,n\}$ then*

$$\binom{n}{k} = \frac{n!}{k!\cdot(n-k)!}$$

Theorem 17.23. *Let $n\in\mathbb{N}_0$ then we have*

1. $\binom{n}{0}=1$
2. $\binom{n}{n}=1$
3. *If $n\in\mathbb{N}$ and $0<k\leqslant n$ then $\binom{n}{k}+\binom{n}{k-1}=\binom{n+1}{k}$*

Proof.

1. $\binom{n}{0}=\frac{n!}{0!\cdot(n-0)!}=\frac{n!}{1\cdot n!}=1$
2. $\binom{n}{n}=\frac{n!}{n!\cdot(n-n)!}=\frac{n!}{n!\cdot 0!}=\frac{n!}{n!\cdot 1}=1$
3. We have

$$\begin{aligned}
\binom{n}{k}+\binom{n}{k-1} &= \frac{n!}{k!\cdot(n-k)!}+\frac{n!}{(k-1)!\cdot(n-(k-1))!} \\
&= \frac{n!\cdot((n+1)-k)}{k!\cdot(n-k)!\cdot((n+1)-k)}+\frac{n!\cdot k}{k\cdot(k-1)!\cdot(n+1-k)} \\
&= \frac{n!\cdot(n+1-k)}{k!\cdot((n+1)-k)!}+\frac{n!\cdot k}{k!\cdot((n+1)-k)!} \\
&= \frac{n!\cdot(n+1-k)+n!\cdot k}{k!\cdot((n+1)-k)!} \\
&= \frac{n!\cdot(n+1)}{k!\cdot((n+1)-k)!} \\
&= \frac{(n+1)!}{k!\cdot((n+1)-k)!} \\
&= \binom{n+1}{k}
\end{aligned}$$

□

We prove now the binomial formula.

Theorem 17.24. (Binomial Formula) *Let F be a field, $n\in\mathbb{N}$, $a,b\in F$ then*

$$(a+b)^n = \sum_{k=0}^{n}\binom{n}{k}\cdot a^k\cdot b^{n-k}$$

Proof. We prove this by induction, so defined

$$S=\left\{n\in\mathbb{N}_0|(a+b)^n=\sum_{k=0}^{n}\binom{n}{k}\cdot a^k\cdot b^{n-k}\right\}$$

then we have:

$\boldsymbol{0\in S}$. As $\sum_{k=0}^{0}\binom{0}{k}\cdot a^k\cdot b^{0-k}=\binom{0}{0}\cdot a^0\cdot b^{0-0}\underset{[theorem:\ 17.23]}{=}1\cdot 1\cdot 1=1=(a+b)^0$

$\boldsymbol{n\in S\Rightarrow n+1\in S}$. We have

$$\begin{aligned}
(a+b)^{n+1} &= \\
(a+b)^n\cdot(a+b) &\underset{n\in S}{=} \\
\left(\sum_{k=0}^{n}\binom{n}{k}\cdot a^k\cdot b^{n-k}\right)\cdot(a+b) &= \\
\sum_{k=0}^{n}\binom{n}{k}\cdot a\cdot a^k\cdot b^{n-k}+\sum_{k=0}^{n}\binom{n}{k}\cdot a^k\cdot b\cdot b^{n-k} &= \\
\sum_{k=0}^{n}\binom{n}{k}\cdot a^{k+1}\cdot b^{n-k}+\sum_{k=0}^{n}\binom{n}{k}\cdot a^k\cdot b^{n-k+1} &= \\
\sum_{k=1}^{n+1}\binom{n}{k-1}\cdot a^k\cdot b^{n-(k-1)}+\sum_{k=0}^{n}\binom{n}{k}\cdot a^k\cdot b^{n-k+1} &= \\
\sum_{k=1}^{n+1}\binom{n}{k-1}\cdot a^k\cdot b^{(n+1)-k}+\sum_{k=0}^{n}\binom{n}{k}\cdot a^k\cdot b^{n-k+1} &= \\
\binom{n}{n+1-1}\cdot a^{n+1}\cdot b^{(n+1)-(n+1)}+\sum_{k=1}^{n}\binom{n}{k-1}\cdot a^k\cdot b^{(n+1)-k}+\sum_{k=0}^{n}\binom{n}{k}\cdot a^k\cdot b^{n-k+1} &= \\
a^{n+1}+\sum_{k=1}^{n}\binom{n}{k-1}\cdot a^k\cdot b^{(n+1)-k}+\sum_{k=0}^{n}\binom{n}{k}\cdot a^k\cdot b^{n-k+1} &= \\
a^{n+1}+\sum_{k=1}^{n}\binom{n}{k-1}\cdot a^k\cdot b^{(n+1)-k}+\sum_{k=1}^{n}\binom{n}{k}\cdot a^k\cdot b^{n-k+1}+\binom{n}{0}\cdot a^0\cdot b^{n-0+1} &= \\
a^{n+1}+\sum_{k=1}^{n}\binom{n}{k-1}\cdot a^k\cdot b^{(n+1)-k}+\sum_{k=1}^{n}\binom{n}{k}\cdot a^k\cdot b^{n-k+1}+b^{n+1} &= \\
a^{n+1}+b^{n+1}+\sum_{k=1}^{n}\left(\binom{n}{k-1}+\binom{n}{k}\right)\cdot a^k\cdot b^{(n+1)-k} &= \\
a^{n+1}+b^{n+1}+\sum_{k=1}^{n}\binom{n+1}{k}\cdot a^k\cdot b^{(n+1)-k} &= \\
\binom{n+1}{n+1}\cdot a^{(n+1)}\cdot b^{(n+1)-(n+1)}+\binom{n+1}{0}\cdot a^n\cdot b^{(n+1)-0}+\sum_{k=1}^{n}\binom{n+1}{k}\cdot a^k\cdot b^{(n+1)-k} &= \\
\sum_{k=0}^{n+1}\binom{n+1}{k}\cdot a^k\cdot b^{(n+1)-k} &
\end{aligned}$$

proving that $n+1\in S$. □

Lemma 17.25. *$p\in\mathcal{P}$ be a polynomial [see definition: 17.9] and $z_0\in\mathbb{C}$ then*

$$p_{(+z_0)}:\mathbb{C}\to\mathbb{C}\ \textit{defined by}\ p_{(+z_0)}(z)=p(z_0+z)$$

is a polynomial with $\operatorname{ord}(p_{(+z_0)})=\operatorname{ord}(p)$.

Proof. We prove this by induction so let

$$S=\{n\in\mathbb{N}_0|\text{If } p\in\mathcal{P}\text{ with }\operatorname{ord}(p)=n\text{ then }p_{(+z_0)}\in\mathcal{P}\text{ with }\operatorname{ord}(p)=\operatorname{ord}(p_{(+z_0)})\}$$

then we have:

$0 \in S$. If $p \in \mathcal{P}$ with $\operatorname{ord}(p) = 0$ then $p = \sum_{i=0}^{0} a_i \cdot z^i = a_0 \cdot z^0 = a_0$. If $z \in \mathbb{C}$ then $p_{(+z_0)}(z) = p(z + z_0) = a_0 = p(z)$ so that $p_{(+z_0)} = p$. Hence $0 \in S$.

$n \in S \Rightarrow n + 1 \in S$. Let $p \in \mathcal{P}$ with $\operatorname{ord}(p) = n + 1$ then there exist a $\{a_i\}_{i \in \{0, \ldots, n+1\}} \subseteq \mathbb{C}$ such that $a_{n+1} \neq 0$ such that $\forall z \in \mathbb{C}$ $p(z) = \sum_{i=0}^{n+1} a_i \cdot z^i$. Define

$$\{b_i\}_{i \in \{0, \ldots, n\}} \text{ by } b_i = a_{i+1}$$

then $b_n = a_{n+1} \neq 0$ so that $q = \sum_{i=0}^{n} b_i \cdot z^i$ is a polynomial with $\operatorname{ord}(q) = n$. Further we have for $z \in \mathbb{C}$ that:

$$\begin{aligned}
p(z) &= \sum_{i=0}^{n+1} a_i \cdot z^i \\
&= a_0 + \sum_{i=1}^{n+1} a_i \cdot z^i \\
&= a_0 + \sum_{i=1}^{n+1} a_i \cdot z \cdot z^{i-1} \\
&= a_0 + z \cdot \sum_{i=1}^{n+1} a_i \cdot z^{i-1} \\
&= a_0 + z \cdot \sum_{i=0}^{n} a_{i+1} \cdot z^i \\
&= a_0 + z \cdot \sum_{i=0}^{n} b_i \cdot z^i \\
&= a_0 + z \cdot q(z)
\end{aligned} \tag{17.15}$$

As $n \in S$ we have that $q_{(+z_0)}$ is a polynomial of order n, hence there exist a $\{c_i\}_{i \in \{0, \ldots, n\}} \subseteq \mathbb{C}$ with $c_n \neq 0$ such that

$$\forall z \in \mathbb{C} \text{ we have } q(z_0 + z) = q_{(+z_0)}(z) = \sum_{i=0}^{n} c_i \cdot z^i \tag{17.16}$$

Further we have

$$\begin{aligned}
p_{(+z_0)}(z) &= p(z_0 + z) \\
&\underset{\text{[eq: 17.15]}}{=} a_0 + (z_0 + z) \cdot q(z_0 + z) \\
&\underset{\text{[eq: 17.16]}}{=} a_0 + (z_0 + z) \cdot \sum_{i=0}^{n} c_i \cdot z^i \\
&= a_0 + z_0 \cdot \sum_{i=0}^{n} c_i \cdot z^i + z \cdot \sum_{i=0}^{n} c_i \cdot z^i \\
&= a_0 + \sum_{i=0}^{n} c_i \cdot z_0 \cdot z^i + \sum_{i=0}^{n} c_i \cdot z^{i+1} \\
&= a_0 + \sum_{i=0}^{n} c_i \cdot z_0 \cdot z^i + \sum_{i=1}^{n+1} c_{i-1} \cdot z^i \\
&= a_0 + c_0 \cdot z_0 + \sum_{i=1}^{n} c_i \cdot z_0 \cdot z^i + \sum_{i=1}^{n+1} c_{i-1} \cdot z^i \\
&= a_0 + c_0 \cdot z_0 + \sum_{i=1}^{n} c_i \cdot z_0 \cdot z^i + \sum_{i=1}^{n} c_{i-1} \cdot z^i + c_n \cdot z^{n+1} \\
&= (a_0 + c_0 \cdot z_0) + \sum_{i=1}^{n} (c_i \cdot z_0 + c_{i-1}) \cdot z^i + c_n \cdot z^{n+1} \\
&= \sum_{i=1}^{n+1} d_i \cdot z^i
\end{aligned}$$

where

$$\{d_i\}_{i\in\{0,\ldots,n+1\}} \text{ is defined by } d_i = \begin{cases} a_0 + c_0 \cdot z_0 \text{ if } i = 0 \\ c_i \cdot z_0 + c_{i-1} \text{ if } i \in \{1,\ldots,n\} \\ c_n \text{ if } i = n+1 \end{cases}$$

As $d_{n+1} = c_n \neq 0$ it follows that $p_{(+z_0)}(z)$ is a polynomial with $\text{ord}(p_{(z_0)}) = n+1 = \text{ord}(p)$ which proves that $n+1 \in S$. □

Lemma 17.26. *Let $p: \mathbb{C} \to \mathbb{C}$ be a polynomial of order $n \in \mathbb{N}$ then there exists a $1 \leqslant m \leqslant n$ and a polynomial q of order $n-m$ such that $p(z) = p(0) + z^m \cdot q(z)$ and $q(0) \neq 0$.*

Proof. As p is a polynomial of order n there exist a $\{a_i\}_{i\in\{0,\ldots,n\}} \subseteq \mathbb{C}$ with $a_n \neq 0$ so that $\forall z \in \mathbb{C}$

$$p(z) = \sum_{i=0}^{n} a_i \cdot z^i$$

Then we have that $p(0) = \sum_{i=0}^{n} a_i \cdot 0^i = a_0 + \sum_{i=1}^{n} a_i \cdot 0^i = a_0 + \sum_{i=1}^{n} a_i \cdot 0 = a_0$ proving that

$$a_0 = p(0) \tag{17.17}$$

Define $K = \{i \in \{1,\ldots,n\} | a_i \neq 0\}$ then as $1 \leqslant n$ and $a_n \neq 0$ $K \neq \varnothing$ so that $m = \min(K)$ exist and $\forall i \in \{0,\ldots,m-1\}$ we have $a_i = 0$ and $a_m \neq 0$. Define now

$$\{c_i\}_{\in\{0,\ldots,n-m\}} \text{ by } c_i = a_{i+m} \text{ then } c_{n-m} = a_n \neq 0$$

Define the polynomial q or order $n-m$ by

$$q: \mathbb{C} \to \mathbb{C} \text{ where } q(z) = \sum_{i=0}^{n-m} c_i \cdot z^i \tag{17.18}$$

then we have for $z \in \mathbb{C}$

$$\begin{aligned}
p(z) &= \sum_{i=0}^{n} a_i \cdot z^i \\
&= \sum_{i\in\{0,\ldots,n\}} a_i \cdot z^i \\
&= a_0 + \sum_{i\in\{1,\ldots,n\}} a_i \cdot z^i \\
&= a_0 + \sum_{i\in\{1,\ldots,m-1\}} a_i \cdot z^i + \sum_{i\in\{m,\ldots,n\}} a_i \cdot z^i \\
&= a_0 + \sum_{i\in\{1,\ldots,m-1\}} 0 \cdot z^i + \sum_{i\in\{m,\ldots,n\}} a_i \cdot z^i \\
&= a_0 + \sum_{i=m}^{n} a_i \cdot z^i \\
&= a_0 + \sum_{i=m}^{n} a_i \cdot z^m \cdot z^{i-m} \\
&= a_0 + z^m \cdot \sum_{i=m}^{n} a_i \cdot z^{i-m} \\
&= a_0 + z^m \cdot \sum_{i=0}^{n-m} a_{i+m} \cdot z^i \\
&= a_0 + z^m \cdot \sum_{i=0}^{n-m} c_i \cdot z^i \\
&\underset{\text{[eqs: 17.17, 17.18]}}{=} p(0) + z^m \cdot q(z)
\end{aligned} \tag{17.19}$$

Finally we have $q(0) = \sum_{i=0}^{n-m} c_i \cdot 0^i = c_0 + \sum_{i=1}^{n-m} c_i \cdot 0^i = c_0 = a_m \neq 0$ □

The following lemma shows how we can split up the sets $\{0,\ldots,2\cdot n\}$ and $\{0,\ldots,2\cdot n-1\}$ in disjoint sets of even and odd numbers.

Lemma 17.27. *Let $n\in\mathbb{N}$ then we have the following **disjoint** unions*

1. $\{0,\ldots,2\cdot n\}=\{2\cdot k|k\in\{0,\ldots,n\}\}\bigsqcup\{2\cdot k+1|k\in\{0,\ldots,n-1\}\}$
2. $\{0,\ldots,2\cdot n-1\}=\{2\cdot k|k\in\{0,\ldots,n-1\}\}\bigsqcup\{2\cdot k+1|k\in\{0,\ldots,n-1\}\}$

Proof.

1. We use induction in the proof, so let

$$S=\left\{n\in\mathbb{N}|\{0,\ldots,2\cdot n\}=\{2\cdot k|k\in\{0,\ldots,n\}\}\bigcup\{2\cdot k+1|k\in\{0,\ldots,n-1\}\}\right\}$$

then we have:

$1\in S$. As $\{0,\ldots,2\cdot 1\}=\{0,1,2\}=\{0,2\}\bigsqcup\{1\}=\{2\cdot k|k\in\{0,1\}\}\bigsqcup\{2\cdot k+1|k\in\{0\}\}$ we have that $1\in S$

$n\in S\Rightarrow n+1\in S$. We have

$$\begin{aligned}\{0,\ldots,2\cdot(n+1)\} &= \\ \{0,\ldots,2\cdot n\}\bigcup\{2\cdot n+1,2\cdot n+2\} & \\ \{0,\ldots,2\cdot n\}\bigcup\{2\cdot n+1,2\cdot(n+1)\} &\underset{n\in S}{=} \\ \{2\cdot k|k\in\{0,\ldots,n\}\}\bigcup\{2\cdot k+1|k\in\{0,\ldots,n-1\}\}\bigcup\{2\cdot n+1,2\cdot(n+1)\} &= \\ \{2\cdot k|k\in\{0,\ldots,n+1\}\}\bigcup\{2\cdot k+1|k\in\{0,\ldots,n\}\} &= \\ \{2\cdot k|k\in\{0,\ldots,n+1\}\}\bigcup\{2\cdot k+1|k\in\{0,\ldots,(n+1)-1\}\} & \end{aligned}$$

proving that $n+1\in S$.

Mathematical induction proves then that $\forall n\in\mathbb{N}$ we have

$$\{0,\ldots,2\cdot n\}=\{2\cdot k|k\in\{0,\ldots,n\}\}\bigcup\{2\cdot k+1|k\in\{0,\ldots,n-1\}\}$$

Further if $m\in\{2\cdot k|k\in\{0,\ldots,n\}\}\bigcap\{2\cdot k+1|k\in\{0,\ldots,n-1\}\}$ then there exist a $k\in\{0,\ldots,n\}$ and a $l\in\{0,\ldots.n-1\}$ such that $2\cdot k=m=2\cdot l+1$ so that by [theorem: 7.52] m is even and odd [= not even by [definition: 7.50]] leading to a contradiction. Hence we must have that

$$\{2\cdot k|k\in\{0,\ldots,n\}\}\bigcap\{2\cdot k+1|k\in\{0,\ldots,n-1\}\}=\varnothing$$

so that

$$\{0,\ldots,2\cdot n\}=\{2\cdot k|k\in\{0,\ldots,n\}\}\bigsqcup\{2\cdot k+1|k\in\{0,\ldots,n-1\}\}$$

2. We use induction in the proof, so let

$$S=\left\{n\in\mathbb{N}|\{0,\ldots,2\cdot n-1\}=\{2\cdot k|k\in\{0,\ldots,n-1\}\}\bigcup\{2\cdot k+1|k\in\{0,\ldots,n-1\}\}\right\}$$

then we have:

$1\in S$. As $\{0,\ldots,2\cdot 1-1\}=\{0,1\}=\{0\}\bigcup\{1\}=\{2\cdot k|k\in\{0\}\}\bigcup\{2\cdot k+1|k\in\{0\}\}$ we have that $1\in S$.

$n\in S\Rightarrow n+1\in S$. We have

$$\begin{aligned}\{0,\ldots,2\cdot(n+1)-1\} &= \\ \{0,\ldots,2\cdot n+1\} &= \\ \{0,\ldots,2\cdot n-1\}\bigcup\{2\cdot n,2\cdot n+1\} &\underset{n\in S}{=} \\ \{2\cdot k|k\in\{0,\ldots,n-1\}\}\bigcup\{2\cdot k+1|k\in\{0,\ldots,n-1\}\}\bigcup\{2\cdot n,2\cdot n+1\} &= \\ \{2\cdot k|k\in\{0,\ldots,n\}\}\bigcup\{2\cdot k+1|k\in\{0,\ldots,n\}\} &= \\ \{2\cdot k|k\in\{0,\ldots,(n+1)-1\}\}\bigcup\{2\cdot k+1|k\in\{0,\ldots,(n+1)-1\}\} & \end{aligned}$$

so that $n+1\in S$.

Mathematical induction proves then that $\forall n\in\mathbb{N}$ we have

$$\{0,\ldots,2\cdot n-1\}=\{2\cdot k|k\in\{0,\ldots,n-1\}\}\bigcup\{2\cdot k+1|k\in\{0,\ldots,n-1\}\}$$

Further if $m \in \{2 \cdot k | k \in \{0, \ldots, n-1\}\} \bigcap \{2 \cdot k + 1 | k \in \{0, \ldots, n-1\}\}$ then there exist a $k \in \{0, \ldots, n-1\}$ and a $l \in \{0, \ldots . n-1\}$ such that $2 \cdot k = m = 2 \cdot l + 1$ so that by [theorem: 7.52] m is even and odd [= not even by [definition: 7.50]] leading to a contradiction. Hence we must have that

$$\{2 \cdot k | k \in \{0, \ldots, n-1\}\} \bigcap \{2 \cdot k + 1 | k \in \{0, \ldots, n-1\}\} = \varnothing$$

so that

$$\{0, \ldots, 2 \cdot n - 1\} = \{2 \cdot k | k \in \{0, \ldots, n-1\}\} \bigsqcup \{2 \cdot k + 1 | k \in \{0, \ldots, n-1\}\}$$ □

Lemma 17.28. *Let $n \in \mathbb{N}$ then if we define*

$$A = \{(k, l) \in \{0, \ldots, n\}^2 | k < l\} \text{ and for } m \in \{1, \ldots, 2 \cdot n - 1\}\ B_m = \{(k, l) \in A | k + l = m\} \subseteq A$$

we have that

$$A = \bigsqcup_{m \in \{1, \ldots, 2 \cdot n - 1\}} B_m$$

Proof. As $\forall m \in \{1, \ldots, 2 \cdot n - 1\}\ B_m \subseteq A$ it follows that

$$\bigcup_{m \in \{1, \ldots, 2 \cdot n - 1\}} B_m \subseteq A \tag{17.20}$$

Further if $(k, l) \in A$ then $0 \leqslant k < l \leqslant n$ so that $k + l < l + l \leqslant 2 \cdot n$ hence $k + l \leqslant 2 \cdot n - 1$. Further as $0 < l$ we have $0 < k + l$ or $1 \leqslant k + l$. Hence if we take $m = k + l$ we have $m \in \{1, \ldots, 2 \cdot n - 1\}$ proving that $(k, l) \in B_m \subseteq \bigcup_{m \in \{1, \ldots, 2 \cdot n - 1\}} B_m$ or that $A \subseteq \bigcup_{m \in \{1, \ldots, 2 \cdot n - 1\}} B_m$. Combining this with [eq: 17.20] gives us

$$A = \bigcup_{m \in \{1, \ldots, 2 \cdot n - 1\}} B_m$$

Let $m, m' \in \{1, \ldots, 2 \cdot n - 1\}$ with $m \neq m'$ and assume that $(k, l) \in B_m \bigcap B_{m'}$ then $m = k + l = m'$ contradicting $m = m'$, so we must have that $B_m \bigcap B_{m'} = \varnothing$. Hence

$$A = \bigsqcup_{m \in \{1, \ldots, 2 \cdot n - 1\}} B_m$$ □

Lemma 17.29. *Let $n \in \mathbb{N}$ then for $k = 2 \cdot n$ and $\zeta = \left(1 + \frac{i}{k}\right)^2$ we have that $\mathrm{Re}(\zeta^k) < 0 < \mathrm{Img}(\zeta^k)$.*

Proof. We have

$$\begin{aligned}
\zeta^k &= \\
\left(\left(1 + \frac{i}{k}\right)^2\right)^k &\underset{\text{[theorem: 10.53]}}{=} \\
\left(1 + \frac{i}{k}\right)^{2 \cdot k} &\underset{k = 2 \cdot n}{=} \\
\left(1 + \frac{i}{2 \cdot n}\right)^{4 \cdot n} &\underset{\text{[theorem: 17.24]}}{=} \\
\sum_{l=0}^{4 \cdot n} \binom{4 \cdot n}{l} \cdot \left(\frac{i}{2 \cdot n}\right)^l \cdot 1^{4 \cdot n - l} &= \\
\sum_{l=0}^{4 \cdot n} \binom{4 \cdot n}{l} \cdot \left(\frac{i}{2 \cdot n}\right)^l &= \\
\sum_{l \in \{0, \ldots, 2 \cdot (2 \cdot n)\}} \binom{4 \cdot n}{l} \cdot \left(\frac{i}{2 \cdot n}\right)^l &\underset{\text{[lemma: 17.27]}}{=} \\
\sum_{l \in \{2 \cdot j | j \in \{0, \ldots, 2 \cdot n\}\} \bigsqcup \{2 \cdot j + 1 | j \in \{0, \ldots, 2 \cdot n - 1\}\}} \binom{4 \cdot n}{l} \cdot \left(\frac{i}{2 \cdot n}\right)^l &= \\
\sum_{l \in \{2 \cdot j | j \in \{0, \ldots, 2 \cdot n\}\}} \binom{4 \cdot n}{l} \cdot \left(\frac{i}{2 \cdot n}\right)^l + \sum_{l \in \{2 \cdot j + 1 | j \in \{0, \ldots, 2 \cdot n - 1\}\}} \binom{4 \cdot n}{l} \cdot \left(\frac{i}{2 \cdot n}\right)^l &
\end{aligned}$$

so that we have

$$\zeta^k = A + B \tag{17.21}$$

where

$$A = \sum_{l \in \{2 \cdot j \mid j \in \{0, \ldots, 2 \cdot n\}\}} \binom{4 \cdot n}{l} \cdot \left(\frac{i}{2 \cdot n}\right)^l \tag{17.22}$$

$$B = \sum_{l \in \{2 \cdot j + 1 \mid j \in \{0, \ldots, 2 \cdot n - 1\}\}} \binom{4 \cdot n}{l} \cdot \left(\frac{i}{2 \cdot n}\right)^l \tag{17.23}$$

For A we have

$$\begin{aligned}
A &\underset{\text{[eq: 17.22]}}{=} \\
\sum_{l \in \{2 \cdot j \mid j \in \{0, \ldots, 2 \cdot n\}\}} \binom{4 \cdot n}{l} \cdot \left(\frac{i}{2 \cdot n}\right)^l &\underset{\text{[theorem: 11.36]}}{=} \\
\sum_{l \in \{0, \ldots, 2 \cdot n\}} \binom{4 \cdot n}{2 \cdot l} \cdot \left(\frac{i}{2 \cdot n}\right)^{2 \cdot l} &\underset{\text{[lemma: 17.27]}}{=} \\
\sum_{l \in \{2 \cdot j \mid j \in \{0, \ldots, n\}\} \bigsqcup \{2 \cdot j + 1 \mid j \in \{0, \ldots, n-1\}\}} \binom{4 \cdot n}{2 \cdot l} \cdot \left(\frac{i}{2 \cdot n}\right)^{2 \cdot l} &= \\
\sum_{l \in \{2 \cdot j \mid j \in \{0, \ldots, n\}\}} \binom{4 \cdot n}{2 \cdot l} \cdot \left(\frac{i}{2 \cdot n}\right)^{2 \cdot l} + \sum_{l \in \{2 \cdot j + 1 \mid j \in \{0, \ldots, n-1\}\}} \binom{4 \cdot n}{2 \cdot l} \cdot \left(\frac{i}{2 \cdot n}\right)^{2 \cdot l}
\end{aligned}$$

So that

$$A = C + D \tag{17.24}$$

where

$$C = \sum_{l \in \{2 \cdot j \mid j \in \{0, \ldots, n\}\}} \binom{4 \cdot n}{2 \cdot l} \cdot \left(\frac{i}{2 \cdot n}\right)^{2 \cdot l} \tag{17.25}$$

$$D = \sum_{l \in \{2 \cdot j + 1 \mid j \in \{0, \ldots, n-1\}\}} \binom{4 \cdot n}{2 \cdot l} \cdot \left(\frac{i}{2 \cdot n}\right)^{2 \cdot l} \tag{17.26}$$

For C we have

$$\begin{aligned}
C &\underset{\text{[eq: 17.25]}}{=} \\
\sum_{l \in \{2 \cdot j \mid j \in \{0, \ldots, n\}\}} \binom{4 \cdot n}{2 \cdot l} \cdot \left(\frac{i}{2 \cdot n}\right)^{2 \cdot l} &\underset{\text{[theorem: 11.36]}}{=} \\
\sum_{l \in \{0, \ldots, n\}} \binom{4 \cdot n}{2 \cdot (2 \cdot l)} \cdot \left(\frac{i}{2 \cdot n}\right)^{2 \cdot (2 \cdot l)} &= \\
\sum_{l \in \{0, \ldots, n\}} \binom{4 \cdot n}{4 \cdot l} \cdot \left(\frac{i}{2 \cdot n}\right)^{4 \cdot l} &= \\
\sum_{l \in \{0, \ldots, n\}} \binom{4 \cdot n}{4 \cdot l} \cdot \frac{i^{4 \cdot l}}{(2 \cdot n)^{4 \cdot l}} &\underset{\text{[theorem: 10.80]}}{=} \\
\sum_{l \in \{0, \ldots, n\}} \binom{4 \cdot n}{4 \cdot l} \cdot \frac{1}{(2 \cdot n)^{4 \cdot l}} &= \\
\binom{4 \cdot n}{4 \cdot 0} \cdot \frac{1}{(2 \cdot n)^{4 \cdot 0}} + \binom{4 \cdot n}{4 \cdot 1} \cdot \frac{1}{(2 \cdot n)^{4 \cdot 1}} + \sum_{l \in \{2, \ldots, n\}} \binom{4 \cdot n}{4 \cdot l} \cdot \frac{1}{(2 \cdot n)^{4 \cdot l}} &= \\
1 + \binom{4 \cdot n}{4} \cdot \frac{1}{(2 \cdot n)^4} + \sum_{l \in \{2, \ldots, n\}} \binom{4 \cdot n}{4 \cdot l} \cdot \frac{1}{(2 \cdot n)^{4 \cdot l}} &= \\
1 + \binom{4 \cdot n}{4} \cdot \frac{1}{(2 \cdot n)^4} + \sum_{l \in \{1, \ldots, n-1\}} \binom{4 \cdot n}{4 \cdot (l+1)} \cdot \frac{1}{(2 \cdot n)^{4 \cdot (l+1)}} &\underset{2 \cdot n = k}{=} \\
1 + \binom{2 \cdot k}{4} \cdot \frac{1}{k^4} + \sum_{l \in \{1, \ldots, n-1\}} \binom{4 \cdot n}{4 \cdot (l+1)} \cdot \frac{1}{(2 \cdot n)^{4 \cdot (l+1)}}
\end{aligned}$$

so that

$$C = 1 + \binom{2\cdot k}{4}\cdot\frac{1}{k^4} + \sum_{l\in\{1,\dots,n-1\}}\binom{4\cdot n}{4\cdot(l+1)}\cdot\frac{1}{(2\cdot n)^{4\cdot(l+1)}} \tag{17.27}$$

For D we have

$$\begin{aligned}
D &\underset{\text{[eq: 17.26]}}{=} \\
\sum_{l\in\{2\cdot j+1 \mid j\in\{0,\dots,n-1\}\}}\binom{4\cdot n}{2\cdot l}\cdot\left(\frac{i}{2\cdot n}\right)^{2\cdot l} &\underset{\text{[theorem: 11.36]}}{=} \\
\sum_{l\in\{0,\dots,n-1\}}\binom{4\cdot n}{2\cdot(2\cdot l+1)}\cdot\left(\frac{i}{2\cdot n}\right)^{2\cdot(2\cdot l+1)} &= \\
\sum_{l\in\{0,\dots,n-1\}}\binom{4\cdot n}{4\cdot l+2}\cdot\left(\frac{i}{2\cdot n}\right)^{4\cdot l+2} &= \\
\sum_{l\in\{0,\dots,n-1\}}\binom{4\cdot n}{4\cdot l+2}\cdot\frac{i^{4\cdot l+2}}{(2\cdot n)^{4\cdot l+2}} &\underset{\text{[theorem: 10.80]}}{=} \\
-\sum_{l\in\{0,\dots,n-1\}}\binom{4\cdot n}{4\cdot l+2}\cdot\frac{1}{(2\cdot n)^{4\cdot l+2}} &= \\
-\binom{4\cdot n}{4\cdot 0+2}\cdot\frac{1}{(2\cdot n)^{4\cdot 0+2}} - \sum_{l\in\{1,\dots,n-1\}}\binom{4\cdot n}{4\cdot l+2}\cdot\frac{1}{(2\cdot n)^{4\cdot l+2}} &= \\
-\binom{4\cdot n}{2}\cdot\frac{1}{(2\cdot n)^{2}} - \sum_{l\in\{1,\dots,n-1\}}\binom{4\cdot n}{4\cdot l+2}\cdot\frac{1}{(2\cdot n)^{4\cdot l+2}} &\underset{k=2\cdot n}{=} \\
-\binom{2\cdot k}{2}\cdot\frac{1}{k^{2}} - \sum_{l\in\{1,\dots,n-1\}}\binom{4\cdot n}{4\cdot l+2}\cdot\frac{1}{(2\cdot n)^{4\cdot l+2}} &
\end{aligned}$$

So that

$$D = -\binom{2\cdot k}{2}\cdot\frac{1}{k^2} - \sum_{l\in\{1,\dots,n-1\}}\binom{4\cdot n}{4\cdot l+2}\cdot\frac{1}{(2\cdot n)^{4\cdot l+2}} \tag{17.28}$$

So we have from [eqs: 17.27, 17.28] that

$$A = C + D = 1 + \binom{2\cdot k}{4}\cdot\frac{1}{k^4} - \binom{2\cdot k}{2}\cdot\frac{1}{k^2} + E \tag{17.29}$$

where

$$E = \sum_{l\in\{1,\dots,n-1\}}\binom{4\cdot n}{4\cdot(l+1)}\cdot\frac{1}{(2\cdot n)^{4\cdot(l+1)}} - \sum_{l\in\{1,\dots,n-1\}}\binom{4\cdot n}{4\cdot l+2}\cdot\frac{1}{(2\cdot n)^{4\cdot l+2}} \tag{17.30}$$

First we look the term $1+\binom{2\cdot k}{4}\cdot\frac{1}{k^4}-\binom{2\cdot k}{2}\cdot\frac{1}{k^2}$ and calculate $\binom{2\cdot k}{4}$ in terms of $\binom{2\cdot k}{2}$. First notice that $2\leqslant 2\cdot n = k$ so that $2<3<4\leqslant 2\cdot k$ and thus $0<2\cdot k-3\wedge 0<2\cdot k-2$ which we use in the following calculation:

$$\begin{aligned}
\binom{2\cdot k}{4} &= \frac{(2\cdot k)!}{4!\cdot(2\cdot k-4)!} \\
&= \frac{(2\cdot k)!}{4\cdot 3\cdot 2!\cdot(2\cdot k-4)!} \\
&\underset{0<2\cdot k-3,2\cdot k-2}{=} \frac{(2\cdot k)!\cdot(2\cdot k-2)\cdot(2\cdot k-3)}{4\cdot 3\cdot 2!\cdot(2\cdot k-4)!\cdot(2\cdot k-2)\cdot(2\cdot k-3)} \\
&= \frac{(2\cdot k)!\cdot(2\cdot k-2)\cdot(2\cdot k-3)}{4\cdot 3\cdot 2!\cdot(2\cdot k-2)\cdot(2\cdot k-3)\cdot(2\cdot k-4)!} \\
&= \frac{(2\cdot k)!\cdot(2\cdot k-2)\cdot(2\cdot k-3)}{4\cdot 3\cdot 2!\cdot(2\cdot k-2)!} \\
&= \frac{(2\cdot k)!\cdot(2\cdot k-2)\cdot(2\cdot k-3)}{2!\cdot(2\cdot k-2)!\cdot 4\cdot 3} \\
&= \binom{2\cdot k}{2}\cdot\frac{(2\cdot k-2)\cdot(2\cdot k-3)}{4\cdot 3}
\end{aligned}$$

$$
\begin{aligned}
&= \binom{2\cdot k}{2}\cdot\frac{4\cdot k^2-6\cdot k-4\cdot k+6}{12}\\
&= \binom{2\cdot k}{2}\cdot\frac{4\cdot k^2-10\cdot k+6}{12}\\
&= \binom{2\cdot k}{2}\cdot\frac{2\cdot k^2-5\cdot k+3}{6}
\end{aligned}
$$

so that

$$
\begin{aligned}
1+\binom{2\cdot k}{4}\cdot\frac{1}{k^4}-\binom{2\cdot k}{2}\cdot\frac{1}{k^2} &= 1+\binom{2\cdot k}{2}\cdot\frac{2\cdot k^2-5\cdot k+3}{6}\cdot\frac{1}{k^4}-\binom{2\cdot k}{2}\cdot\frac{1}{k^2}\\
&= 1+\binom{2\cdot k}{2}\cdot\left(\frac{2\cdot k^2-5\cdot k+3}{6}\cdot\frac{1}{k^4}-\frac{1}{k^2}\right)\\
&= 1+\binom{2\cdot k}{2}\cdot\frac{1}{k^2}\cdot\left(\frac{2\cdot k^2-5\cdot k+3}{6\cdot k^2}-1\right)\\
&= 1+\binom{2\cdot k}{2}\cdot\frac{1}{k^2}\cdot\left(\frac{2\cdot k^2-5\cdot k+3-6\cdot k^2}{6\cdot k^2}\right)\\
&= 1+\binom{2\cdot k}{2}\cdot\frac{1}{k^2}\cdot\left(\frac{-4\cdot k^2-5\cdot k+3}{6\cdot k^2}\right)\\
&= 1+\binom{2\cdot k}{2}\cdot\frac{1}{k^2}\cdot\left(-\frac{2}{3}+\frac{-5\cdot k+3}{6\cdot k^2}\right)\\
&= 1+\frac{(2\cdot k)!}{2!\cdot(2\cdot k-2)!}\cdot\frac{1}{k^2}\cdot\left(-\frac{2}{3}+\frac{-5\cdot k+3}{6\cdot k^2}\right)\\
&= 1+\frac{2\cdot k\cdot(2\cdot k-1)\cdot(2\cdot k-2)!}{2\cdot(2\cdot k-2)!}\cdot\frac{1}{k^2}\cdot\left(-\frac{2}{3}+\frac{-5\cdot k+3}{6\cdot k^2}\right)\\
&= 1+k\cdot(2\cdot k-1)\cdot\frac{1}{k^2}\cdot\left(-\frac{2}{3}+\frac{-5\cdot k+3}{6\cdot k^2}\right)\\
&= 1+\left(2-\frac{1}{k}\right)\cdot\left(-\frac{2}{3}+\frac{-5\cdot k+3}{6\cdot k^2}\right)\\
&= 1-\frac{4}{3}+\frac{-5\cdot k+3}{3\cdot k^2}+\frac{2}{3\cdot k}-\frac{5\cdot k+3}{6\cdot k^3}\\
&= -\frac{1}{3}+\frac{-10\cdot k^2+3\cdot k+4\cdot k^2-5\cdot k+3}{6\cdot k^3}\\
&= -\frac{1}{3}+\frac{-6\cdot k^2-2\cdot k+3}{6\cdot k^3}\\
&= -\frac{1}{3}+\frac{-6\cdot k^2}{6\cdot k^3}+\frac{-2\cdot k+3}{6\cdot k^3}\\
&= -\frac{1}{3}-\frac{1}{k}+\frac{-2\cdot k+3}{6\cdot k^3}
\end{aligned}
$$

So that

$$
1+\binom{2\cdot k}{4}\cdot\frac{1}{k^4}-\binom{2\cdot k}{2}\cdot\frac{1}{k^2}=-\frac{1}{3}-\frac{1}{k}+\frac{-2\cdot k+3}{6\cdot k^3} \tag{17.31}
$$

As $2\leqslant 2\cdot n=k$ we have $4\leqslant 2\cdot k\Rightarrow 3<2\cdot k$ or $3-2\cdot k<0$, hence using the above we have that

$$
1+\binom{2\cdot k}{4}\cdot\frac{1}{k^4}-\binom{2\cdot k}{2}\cdot\frac{1}{k^2}<0 \tag{17.32}
$$

Next we calculate the value of the terms in E

$$
\begin{aligned}
E &\underset{\text{[eq 17.30]}}{=}\\
\sum_{l\in\{1,\ldots,n-1\}}\binom{4\cdot n}{4\cdot(l+1)}\cdot\frac{1}{(2\cdot n)^{4\cdot(l+1)}}-\sum_{l\in\{1,\ldots,n-1\}}\binom{4\cdot n}{4\cdot l+2}\cdot\frac{1}{(2\cdot n)^{4\cdot l+2}} &=\\
\sum_{l\in\{1,\ldots,n-1\}}\left(\binom{4\cdot n}{4\cdot(l+1)}\cdot\frac{1}{(2\cdot n)^{4\cdot(l+1)}}-\binom{4\cdot n}{4\cdot l+2}\cdot\frac{1}{(2\cdot n)^{4\cdot l+2}}\right) &=
\end{aligned}
$$

So we have that

$$E=\sum_{l\in\{1,\dots,n-1\}}E_l \text{ where } E_l=\binom{4\cdot n}{4\cdot(l+1)}\cdot\frac{1}{(2\cdot n)^{4\cdot(l+1)}}-\binom{4\cdot n}{4\cdot l+2}\cdot\frac{1}{(2\cdot n)^{4\cdot l+2}} \tag{17.33}$$

Now for $l\in\{1,\dots,n-1\}$ we have

$$\begin{aligned}
E_l &= \\
\binom{4\cdot n}{4\cdot(l+1)}\cdot\frac{1}{(2\cdot n)^{4\cdot(l+1)}}-\binom{4\cdot n}{4\cdot l+2}\cdot\frac{1}{(2\cdot n)^{4\cdot l+2}} &= \\
\binom{4\cdot n}{4\cdot l+4}\cdot\frac{1}{(2\cdot n)^{4\cdot l+4}}-\binom{4\cdot n}{4\cdot l+2}\cdot\frac{1}{(2\cdot n)^{4\cdot l+2}} &= \\
\binom{4\cdot n}{4\cdot l+4}\cdot\frac{1}{(2\cdot n)^{4\cdot l+2}\cdot(2\cdot n)^2}-\binom{4\cdot n}{4\cdot l+2}\cdot\frac{1}{(2\cdot n)^{4\cdot l+2}} &= \\
\frac{1}{(2\cdot n)^{4\cdot l+2}}\cdot\left(\binom{4\cdot n}{4\cdot l+4}\cdot\frac{1}{(2\cdot n)^2}-\binom{4\cdot n}{4\cdot l+2}\right) &= \\
\frac{1}{(2\cdot n)^{4\cdot l+2}}\cdot\left(\frac{(4\cdot n)!}{(4\cdot l+4)!\cdot(4\cdot n-(4\cdot l+4))!}\cdot\frac{1}{(2\cdot n)^2}-\frac{(4\cdot n)!}{(4\cdot l+2)!\cdot(4\cdot n-(4\cdot l+2))!}\right) &= \\
\frac{1}{(2\cdot n)^{4\cdot l+2}}\cdot\left(\frac{(4\cdot n)!}{(4\cdot l+4)!\cdot(4\cdot n-4\cdot l-4)!}\cdot\frac{1}{(2\cdot n)^2}-\frac{(4\cdot n)!}{(4\cdot l+2)!\cdot(4\cdot n-4\cdot l-2)!}\right) &= \\
\frac{1}{(2\cdot n)^{4\cdot l+2}}\cdot\left(\frac{(4\cdot n)!}{(4\cdot l+4)\cdot(4\cdot l+3)\cdot(4\cdot l+2)!\cdot(4\cdot n-4\cdot l-4)!}\cdot\frac{1}{(2\cdot n)^2}-\frac{(4\cdot n)!}{(4\cdot l+2)!\cdot(4\cdot n-4\cdot l-2)!}\right) &= \\
\frac{1}{(2\cdot n)^{4\cdot l+2}\cdot(4\cdot l+2)!}\cdot\left(\frac{(4\cdot n)!}{(4\cdot l+4)\cdot(4\cdot l+3)\cdot(4\cdot n-4\cdot l-4)!}\cdot\frac{1}{(2\cdot n)^2}-\frac{(4\cdot n)!}{(4\cdot n-4\cdot l-2)!}\right) &= \\
\frac{1}{(2\cdot n)^{4\cdot l+2}\cdot(4\cdot l+2)!}\cdot\left(\frac{(4\cdot n)!}{(4\cdot l+4)\cdot(4\cdot l+3)\cdot(4\cdot n-4\cdot l-4)!}\cdot\frac{1}{(2\cdot n)^2}-\frac{(4\cdot n)!}{(4\cdot n-4\cdot l-2)\cdot(4\cdot n-4\cdot l-3)\cdot(4\cdot n-4\cdot l-4)!}\right) &= \\
\frac{1}{(2\cdot n)^{4\cdot l+2}\cdot(4\cdot l+2)!\cdot(4\cdot n-4\cdot l-4)!}\cdot\left(\frac{(4\cdot n)!}{(4\cdot l+4)\cdot(4\cdot l+3)}\cdot\frac{1}{(2\cdot n)^2}-\frac{(4\cdot n)!}{(4\cdot n-4\cdot l-2)\cdot(4\cdot n-4\cdot l-3)}\right) &= \\
\frac{(4\cdot n)!}{(2\cdot n)^{4\cdot l+2}\cdot(4\cdot l+2)!\cdot(4\cdot n-4\cdot l-4)!}\cdot\left(\frac{1}{(4\cdot l+4)\cdot(4\cdot l+3)}\cdot\frac{1}{(2\cdot n)^2}-\frac{1}{(4\cdot n-4\cdot l-2)\cdot(4\cdot n-4\cdot l-3)}\right) &= \\
\frac{(4\cdot n)!}{(2\cdot n)^{4\cdot l+2}\cdot(4\cdot l+2)!\cdot(4\cdot n-4\cdot l-4)!}\cdot\frac{(4\cdot n-4\cdot l-2)\cdot(4\cdot n-4\cdot l-3)-(4\cdot l+4)\cdot(4\cdot l+3)\cdot(2\cdot n)^2}{(4\cdot l+4)\cdot(4\cdot l+3)\cdot(4\cdot n-4\cdot l-2)\cdot(4\cdot n-4\cdot l-3)\cdot(2\cdot n)^2}
\end{aligned}$$

Define

$$F=\frac{(4\cdot n)!}{(2\cdot n)^{4\cdot l+2}\cdot(4\cdot l+2)!\cdot(4\cdot n-4\cdot l-4)!}\cdot\frac{1}{(4\cdot l+4)\cdot(4\cdot l+3)\cdot(4\cdot n-4\cdot l-2)\cdot(4\cdot n-4\cdot l-3)\cdot(2\cdot n)^2}$$

then, as $l\leqslant n-1\Rightarrow 4\cdot l\leqslant 4\cdot n-4\Rightarrow 0\leqslant 4\cdot n-4\cdot l-4<4\cdot n-4\cdot l-3<4\cdot n-4\cdot l-2$, we have that

$$0<F \text{ and } E_l=F\cdot(4\cdot n-4\cdot l-2)\cdot(4\cdot n-4\cdot l-3)-(4\cdot l+4)\cdot(4\cdot l+3)\cdot(2\cdot n)^2 \tag{17.34}$$

Now as $l\in\{0,\dots,n-1\}$ we have that $0<l<n$, further we have $1\leqslant n\Rightarrow 1\leqslant n^2\Rightarrow -16\cdot n^2\leqslant -16$

$$l^2<n^2,\ l<n \text{ and } -16\cdot n^2\leqslant -16$$

which will be use in the following calculation

$$\begin{aligned}
(4\cdot n-4\cdot l-2)\cdot(4\cdot n-4\cdot l-3)-(4\cdot l+4)\cdot(4\cdot l+3)\cdot(2\cdot n)^2 &= \\
16\cdot n^2-\underbrace{16\cdot n\cdot l}_{1}-\underbrace{12\cdot n}_{2}-\underbrace{16\cdot n\cdot l}_{1}+16\cdot l^2+\underbrace{12\cdot l}_{3}-\underbrace{8\cdot n}_{2}+\underbrace{8\cdot l}_{3}+6-(4\cdot l+4)\cdot(4\cdot l+3)\cdot(2\cdot n)^2 &= \\

\underbrace{-32\cdot n^2}_{1}-32\cdot n\cdot l-20\cdot n+16\cdot l^2+20\cdot l+6-64\cdot n^2\cdot l^2-112\cdot n^2\cdot l &= \\
-32\cdot n^2-32\cdot n\cdot l-20\cdot n+16\cdot l^2+20\cdot l+6-64\cdot n^2\cdot l^2-112\cdot n^2\cdot l &<_{l^2<n^2} \\
-32\cdot n^2-32\cdot n\cdot l-20\cdot n+16\cdot n^2+20\cdot l+6-64\cdot n^2\cdot l^2-112\cdot n^2\cdot l &<_{l<n} \\
-32\cdot n^2-32\cdot n\cdot l-20\cdot n+16\cdot n^2+20\cdot n+6-64\cdot n^2\cdot l^2-112\cdot n^2\cdot l &= \\
\underbrace{-32\cdot n^2}_{1}-32\cdot n\cdot l-\underbrace{20\cdot n}_{2}+\underbrace{16\cdot n^2}_{1}+\underbrace{20\cdot n}_{2}+6-64\cdot n^2\cdot l^2-112\cdot n^2\cdot l &= \\
\underbrace{-16\cdot n^2}_{1}-32\cdot n\cdot l+6-64\cdot n^2\cdot l^2-112\cdot n^2\cdot l &<_{-16n^2\leftarrow 16} \\
-16-32\cdot n\cdot l+6-64\cdot n^2\cdot l^2-112\cdot n^2\cdot l &= \\
-10-32\cdot n\cdot l-64\cdot n^2\cdot l^2-112\cdot n^2\cdot l &< \\
0 &
\end{aligned}$$

Which proves that $(4\cdot n-4\cdot l-2)\cdot(4\cdot n-4\cdot l-3)-(4\cdot l+4)\cdot(4\cdot l+3)\cdot(2\cdot n)^2<0$ and after combining this with [eq: 17.34] that $\forall l\in\{1,\ldots,n-1\}\ E_l<0$ so that by [eq: 17.33]

$$E<0 \tag{17.35}$$

Combining then [eqs: 17.35, 17.32 and 17.29 proves that

$$A\in\mathbb{R}\text{ and }A<0 \tag{17.36}$$

We calculate now B

$$\begin{aligned}
B &\underset{\text{[eq: 17.23]}}{=} \\
\sum_{l\in\{2\cdot j+1|j\in\{0,\ldots,2\cdot n-1\}\}}\binom{4\cdot n}{l}\cdot\left(\frac{i}{2\cdot n}\right)^l &\underset{\text{[theorem: 11.36]}}{=} \\
\sum_{l\in\{0,\ldots,2\cdot n-1\}}\binom{4\cdot n}{2\cdot l+1}\cdot\left(\frac{i}{2\cdot n}\right)^{2\cdot l+1} &\underset{\text{[lemma: 17.27]}}{=} \\
\sum_{l\in\{2\cdot j|j\in\{0,\ldots,n-1\}\}\bigsqcup\{2\cdot j+1|j\in\{0,\ldots,n-1\}\}}\binom{4\cdot n}{2\cdot l+1}\cdot\left(\frac{i}{2\cdot n}\right)^{2\cdot l+1} &= \\
\sum_{l\in\{2\cdot j|j\in\{0,\ldots,n-1\}\}}\binom{4\cdot n}{2\cdot l+1}\cdot\left(\frac{i}{2\cdot n}\right)^{2\cdot l+1}+\sum_{l\in\{2\cdot j+1|j\in\{0,\ldots,n-1\}\}}\binom{4\cdot n}{2\cdot l+1}\cdot\left(\frac{i}{2\cdot n}\right)^{2\cdot l+1} &\underset{\text{[theorem: 11.36]}}{=} \\
\sum_{l\in\{0,\ldots,n-1\}}\binom{4\cdot n}{2\cdot(2\cdot l)+1}\cdot\left(\frac{i}{2\cdot n}\right)^{2\cdot(2\cdot l)+1}+\sum_{l\in\{0,\ldots,n-1\}}\binom{4\cdot n}{2\cdot(2\cdot l+1)+1}\cdot\left(\frac{i}{2\cdot n}\right)^{2\cdot(2\cdot l+1)+1} &= \\
\sum_{l\in\{0,\ldots,n-1\}}\binom{4\cdot n}{4\cdot l+1}\cdot\left(\frac{i}{2\cdot n}\right)^{4\cdot l+1}+\sum_{l\in\{0,\ldots,n-1\}}\binom{4\cdot n}{4\cdot l+3}\cdot\left(\frac{i}{2\cdot n}\right)^{4\cdot l+3} &= \\
\sum_{l\in\{0,\ldots,n-1\}}\binom{4\cdot n}{4\cdot l+1}\cdot\frac{i^{4\cdot l+1}}{(2\cdot n)^{4\cdot l+1}}+\sum_{l\in\{0,\ldots,n-1\}}\binom{4\cdot n}{4\cdot l+3}\cdot\frac{i^{4\cdot l+3}}{(2\cdot n)^{4\cdot l+3}} &\underset{\text{[theorem: 10.80]}}{=} \\
\sum_{l\in\{0,\ldots,n-1\}}\binom{4\cdot n}{4\cdot l+1}\cdot\frac{i}{(2\cdot n)^{4\cdot l+1}}+\sum_{l\in\{0,\ldots,n-1\}}\binom{4\cdot n}{4\cdot l+3}\cdot\frac{-i}{(2\cdot n)^{4\cdot l+3}} &= \\
i\cdot\left(\sum_{l\in\{0,\ldots,n-1\}}\binom{4\cdot n}{4\cdot l+1}\cdot\frac{1}{(2\cdot n)^{4\cdot l+1}}-\sum_{l\in\{0,\ldots,n-1\}}\binom{4\cdot n}{4\cdot l+3}\cdot\frac{1}{(2\cdot n)^{4\cdot l+3}}\right) &= \\
i\cdot\sum_{l\in\{0,\ldots,n-1\}}\left(\binom{4\cdot n}{4\cdot l+1}\cdot\frac{1}{(2\cdot n)^{4\cdot l+1}}-\binom{4\cdot n}{4\cdot l+3}\cdot\frac{1}{(2\cdot n)^{4\cdot l+3}}\right) &
\end{aligned}$$

So that

$$B = i \cdot \sum_{l \in \{0,\ldots,n-1\}} B_l \text{ where } B_l = \binom{4\cdot n}{4\cdot l+1} \cdot \frac{1}{(2\cdot n)^{4\cdot l+1}} - \binom{4\cdot n}{4\cdot l+3} \cdot \frac{1}{(2\cdot n)^{4\cdot l+3}} \tag{17.37}$$

Now for $l \in \{0,\ldots,n-1\}$ we have

$$\begin{aligned}
B_l &\underset{\text{[eq: 17.37]}}{=} \\
\binom{4\cdot n}{4\cdot l+1} \cdot \frac{1}{(2\cdot n)^{4\cdot l+1}} - \binom{4\cdot n}{4\cdot l+3} \cdot \frac{1}{(2\cdot n)^{4\cdot l+3}} &= \\
\binom{4\cdot n}{4\cdot l+1} \cdot \frac{1}{(2\cdot n)^{4\cdot l+1}} - \binom{4\cdot n}{4\cdot l+3} \cdot \frac{1}{(2\cdot n)^{4\cdot l+1}\cdot(2\cdot n)^2} &= \\
\frac{1}{(2\cdot n)^{4\cdot l+1}} \cdot \left(\binom{4\cdot n}{4\cdot l+1} - \binom{4\cdot n}{4\cdot l+3} \cdot \frac{1}{(2\cdot n)^2}\right) &= \\
\frac{1}{(2\cdot n)^{4\cdot l+1}\cdot(2\cdot n)^2} \cdot \left(\binom{4\cdot n}{4\cdot l+1} \cdot (2\cdot n)^2 - \binom{4\cdot n}{4\cdot l+3}\right) &= \\
\frac{1}{(2\cdot n)^{4\cdot l+1}\cdot(2\cdot n)^2} \cdot \left(\frac{(4\cdot n)!\cdot(2\cdot n)^2}{(4\cdot l+1)!\cdot(4\cdot n-(4\cdot l+1))!} - \frac{(4\cdot n)!}{(4\cdot l+3)!\cdot(4\cdot n-(4\cdot l+3))!}\right) &= \\
\frac{(4\cdot n)!}{(2\cdot n)^{4\cdot l+1}\cdot(2\cdot n)^2} \cdot \left(\frac{(2\cdot n)^2}{(4\cdot l+1)!\cdot(4\cdot n-4\cdot l-1)!} - \frac{1}{(4\cdot l+3)!\cdot(4\cdot n-4\cdot l-3)!}\right) &= \\
\frac{(4\cdot n)!}{(2\cdot n)^{4\cdot l+1}\cdot(2\cdot n)^2} \cdot \left(\frac{(2\cdot n)^2}{(4\cdot l+1)!\cdot(4\cdot n-4\cdot l-1)!} - \frac{1}{(4\cdot l+3)\cdot(4\cdot l+2)\cdot(4\cdot l+1)!\cdot(4\cdot n-4\cdot l-3)!}\right) &= \\
\frac{(4\cdot n)!}{(2\cdot n)^{4\cdot l+1}\cdot(2\cdot n)^2\cdot(4\cdot l+1)!} \cdot \left(\frac{(2\cdot n)^2}{(4\cdot n-4\cdot l-1)!} - \frac{1}{(4\cdot l+3)\cdot(4\cdot l+2)\cdot(4\cdot n-4\cdot l-3)!}\right) &= \\
\frac{(4\cdot n)!}{(2\cdot n)^{4\cdot l+1}\cdot(2\cdot n)^2\cdot(4\cdot l+1)!} \cdot \left(\frac{(2\cdot n)^2}{(4\cdot n-4\cdot l-1)\cdot(4\cdot n-4\cdot l-2)\cdot(4\cdot n-4\cdot l)-3!} - \frac{1}{(4\cdot l+3)\cdot(4\cdot l+2)\cdot(4\cdot n-4\cdot l-3)!}\right) &= \\
\frac{(4\cdot n)!}{(2\cdot n)^{4\cdot l+1}\cdot(2\cdot n)^2\cdot(4\cdot l+1)!\cdot(4\cdot n-4\cdot l)-3!} \cdot \left(\frac{(2\cdot n)^2}{(4\cdot n-4\cdot l-1)\cdot(4\cdot n-4\cdot l-2)} - \frac{1}{(4\cdot l+3)\cdot(4\cdot l+2)}\right) &=
\end{aligned}$$

Define $G_l = \frac{(4\cdot n)!}{(2\cdot n)^{4\cdot l+1}\cdot(2\cdot n)^2\cdot(4\cdot l+1)!\cdot(4\cdot n-4\cdot l)-3!}$ then

$$0 < G \text{ and } B_l = G \cdot \left(\frac{(2\cdot n)^2}{(4\cdot n-4\cdot l-1)\cdot(4\cdot n-4\cdot l-2)} - \frac{1}{(4\cdot l+3)\cdot(4\cdot l+2)}\right) \tag{17.38}$$

Now for $l \in \{1,\ldots,n-1\}$ we have

$$l \leqslant n-1 \Rightarrow 0 \leqslant n-l-1 \Rightarrow 0 \leqslant 4\cdot n-4\cdot l-4 < 4\cdot n-4\cdot l-2 < 4\cdot n-4\cdot l-1 \tag{17.39}$$

Further

$$\begin{aligned}
&\frac{(2\cdot n)^2}{(4\cdot n-4\cdot l-1)\cdot(4\cdot n-4\cdot l-2)} - \frac{1}{(4\cdot l+3)\cdot(4\cdot l+2)} = \\
&\frac{(2\cdot n)^2\cdot(4\cdot l+3)\cdot(4\cdot l+2)-(4\cdot n-4\cdot l-1)\cdot(4\cdot n-4\cdot l-2)}{(4\cdot n-4\cdot l-1)\cdot(4\cdot n-4\cdot l-2)\cdot(4\cdot l+3)\cdot(4\cdot l+2)}
\end{aligned}$$

Define $H_l = (4\cdot n-4\cdot l-1)\cdot(4\cdot n-4\cdot l-2)\cdot(4\cdot l+3)\cdot(4\cdot l+2)$ then using [eq: 17.39]

$$0 < H_l \text{ and } \frac{(2\cdot n)^2}{(4\cdot n-4\cdot l-1)\cdot(4\cdot n-4\cdot l-2)} - \frac{1}{(4\cdot l+3)\cdot(4\cdot l+2)} = \frac{(2\cdot n)^2\cdot(4\cdot l+3)\cdot(4\cdot l+2)-(4\cdot n-4\cdot l-1)\cdot(4\cdot n-4\cdot l-2)}{H_l} \tag{17.40}$$

As $l \in \{1,\ldots,n-1\}$ we have $l < n \Rightarrow -l > -n$ and from $1 \leqslant n \Rightarrow 1 \leqslant n^2 \Rightarrow -n^2 \leqslant -1$ so that

$$-l > -n,\ -2 \geqslant -2\cdot n^2 \tag{17.41}$$

which we will use in the following:

$$\begin{aligned}
(2\cdot n)^2\cdot(4\cdot l+3)\cdot(4\cdot l+2)-(4\cdot n-4\cdot l-1)\cdot(4\cdot n-4\cdot l-2) &= \\
(2\cdot n)^2\cdot(4\cdot l+3)\cdot(4\cdot l+2)-16\cdot n^2+16\cdot n\cdot l+8\cdot n+16\cdot l\cdot n-16\cdot l^2-8\cdot l+4\cdot n-4\cdot l-2 &= \\
(2\cdot n)^2\cdot(4\cdot l+3)\cdot(4\cdot l+2)-16\cdot n^2+\underbrace{16\cdot n\cdot l}_{1}+\underbrace{8\cdot n}_{2}+\underbrace{16\cdot l\cdot n}_{1}-16\cdot l^2-\underbrace{8\cdot l}_{3}+\underbrace{4\cdot n}_{2}-\underbrace{4\cdot l}_{3}-2 &= \\
(2\cdot n)^2\cdot(4\cdot l+3)\cdot(4\cdot l+2)-16\cdot n^2+\underbrace{32\cdot n\cdot l}_{1}+\underbrace{12\cdot n}_{2}-16\cdot l^2-\underbrace{12\cdot l}_{2}-2 &= \\
(2\cdot n)^2\cdot(4\cdot l+3)\cdot(4\cdot l+2)-16\cdot n^2+32\cdot n\cdot l+12\cdot n-16\cdot l^2-12\cdot l-2 &= \\
(2\cdot n)^2\cdot(16\cdot l^2+8\cdot l+12\cdot l+6)-16\cdot n^2+32\cdot n\cdot l+12\cdot n-16\cdot l^2-12\cdot l-2 &= \\
4\cdot n^2\cdot(16\cdot l^2+20\cdot l+6)-16\cdot n^2+32\cdot n\cdot l+12\cdot n-16\cdot l^2-12\cdot l-2 &= \\
64\cdot n^2\cdot l^2+80\cdot n^2\cdot l+24\cdot n^2-16\cdot n^2+32\cdot n\cdot l+12\cdot n-16\cdot l^2-12\cdot l-2 &= \\
64\cdot n^2\cdot l^2+80\cdot n^2\cdot l+\underbrace{24\cdot n^2}_{1}-\underbrace{16\cdot n^2}_{1}+32\cdot n\cdot l+12\cdot n-16\cdot l^2-12\cdot l-2 &= \\
64\cdot n^2\cdot l^2+80\cdot n^2\cdot l+\underbrace{8\cdot n^2}_{1}+32\cdot n\cdot l+12\cdot n-16\cdot l^2-12\cdot l-2 &= \\
64\cdot n^2\cdot l^2+80\cdot n^2\cdot l+8\cdot n^2+32\cdot n\cdot l+12\cdot n-16\cdot l^2-12\cdot l-2 &>_{\text{eq: 17.41}} \\
64\cdot n^2\cdot l^2+80\cdot n^2\cdot l+8\cdot n^2+32\cdot n\cdot l+\underbrace{12\cdot n}_{1}-16\cdot l^2-\underbrace{12\cdot n}_{1}-2 &= \\
64\cdot n^2\cdot l^2+80\cdot n^2\cdot l+8\cdot n^2+32\cdot n\cdot l-16\cdot l^2-2 &\geqslant_{\text{eq: 17.41}} \\
64\cdot n^2\cdot l^2+80\cdot n^2\cdot l+8\cdot n^2+32\cdot n\cdot l-16\cdot l^2-2\cdot n^2 &= \\
64\cdot n^2\cdot l^2+80\cdot n^2\cdot l+\underbrace{8\cdot n^2}_{1}+32\cdot n\cdot l-16\cdot l^2-\underbrace{2\cdot n^2}_{1} &= \\
64\cdot n^2\cdot l^2+80\cdot n^2\cdot l+\underbrace{6\cdot n^2}_{1}+32\cdot n\cdot l-16\cdot l^2 &= \\
64\cdot n^2\cdot l^2+80\cdot n^2\cdot l+6\cdot n^2+32\cdot n\cdot l-16\cdot l^2 &>_{n>l} \\
64\cdot n^2\cdot l^2+80\cdot n^2\cdot l+6\cdot n_1^2+32\cdot l^2-16\cdot l^2 &= \\
64\cdot n^2\cdot l^2+80\cdot n^2\cdot l+6\cdot n_1^2+16\cdot l^2 &> \\
0 &
\end{aligned}$$

Using the above in [eq; 17.40] proves that $0<\frac{(2\cdot n)^2}{(4\cdot n-4\cdot l-1)\cdot(4\cdot n-4\cdot l-2)}-\frac{1}{(4\cdot l+3)\cdot(4\cdot l+2)}$ which by [eq: 17.38] proves that $0<B_l$ so that by [eq: 17.37]

$$B=i\cdot\sum_{l\in\{1,\ldots,n-1\}}B_l \text{ where } 0<\sum_{l\in\{1,\ldots,n-1\}}B_l\in\mathbb{R} \tag{17.42}$$

Combining the above with [eqs: 17.21,17.36 and 17.42] proves that

$$\zeta^k=A+i\cdot\sum_{l\in\{1,\ldots,n-1\}}B$$

where $A,\sum_{l\in\{1,\ldots,n-1\}}B\in\mathbb{R}$, $A<0<\sum_{l\in\{1,\ldots,n-1\}}B$ so that

$$\mathrm{Re}(\zeta^k)<0<\mathrm{Img}(\zeta^k)$$

□

17.1.4 Proof of the fundamental theorem of algebra

After all this work we are now ready to proof the fundamental theorem of algebra.

Theorem 17.30. *Let $n\in\mathbb{N}$, $\{a_i\}_{i\in\{0,\ldots,n\}}\subseteq\mathbb{C}$ with $a_n\neq 0$ and $p:\mathbb{C}\to\mathbb{C}$ the polynomial defined by $p(z)=\sum_{i=0}a_0\cdot z^i$ then there exist a $z_0\in\mathbb{C}$ such that $p(z_0)=0$. In other words every non constant polynomial has a root.*

Proof. First define

$$p\cdot\overline{p}:\mathbb{C}\to\mathbb{C} \text{ by } (p\cdot\overline{p})(z)=p(z)\cdot\overline{p(z)}$$

then for $z \in \mathbb{C}$ we have

$$\begin{aligned}
(p \cdot \overline{p})(z) &= \\
p(z) \cdot \overline{p(z)} &= \\
\left(\sum_{i=0}^{n} a_i \cdot z^i\right) \cdot \overline{\left(\sum_{i=0}^{n} a_i \cdot z^i\right)} &= \\
\left(\sum_{i \in \{0,\dots,n\}} a_i \cdot z^i\right) \cdot \overline{\left(\sum_{i \in \{0,\dots,n\}} a_i \cdot z^i\right)} &= \text{[theorem: 10.82]} \\
\left(\sum_{i \in \{0,\dots,n\}} a_i \cdot z^i\right) \cdot \left(\sum_{i \in \{0,\dots,n\}} \overline{a_i \cdot z^i}\right) &= \text{[theorem: 11.48]} \\
\sum_{(i,j) \in \{0,\dots,\}^2} a_i \cdot z^i \cdot \overline{a_j \cdot z^j} &= \\
\sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | k=l\}} a_i \cdot z^i \cdot \overline{a_j \cdot z^j} + \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | k<l\}} a_i \cdot z^i \cdot \overline{a_j \cdot z^j} + \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | l<k\}} a_i \cdot z^i \cdot \overline{a_j \cdot z^j} &= \\
\sum_{i \in \{0,\dots,n\}} a_i \cdot z^i \cdot \overline{a_i \cdot z^i} + \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | k<l\}} a_i \cdot z^i \cdot \overline{a_j \cdot z^j} + \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | l<k\}} a_i \cdot z^i \cdot \overline{a_j \cdot z^j} &= \\
\sum_{i \in \{0,\dots,n\}} a_i \cdot z^i \cdot \overline{a_i \cdot z^i} + \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | k<l\}} a_i \cdot z^i \cdot \overline{a_j \cdot z^j} + \sum_{(j,i) \in \{(k,l) \in \{0,\dots,n\}^2 | k<l\}} a_i \cdot \overline{a_j} \cdot z^i \cdot (\overline{z})^j &= \\
\sum_{i \in \{0,\dots,n\}} a_i \cdot z^i \cdot \overline{a_i \cdot z^i} + \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | k<l\}} a_i \cdot z^i \cdot \overline{a_j \cdot z^j} + \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | k<l\}} a_j \cdot z^j \cdot \overline{a_i \cdot z^i} &= \\
\sum_{i \in \{0,\dots,n\}} a_i \cdot \overline{a_i} \cdot z^i \cdot (\overline{z})^i + \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | k<l\}} \left(a_i \cdot z^i \cdot \overline{a_j \cdot z^j} + a_j \cdot z^j \cdot \overline{a_i \cdot z^i}\right) &= \text{[theorem: 10.82]} \\
\sum_{i \in \{0,\dots,n\}} a_i \cdot \overline{a_i} \cdot z^i \cdot (\overline{z})^i + \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | k<l\}} \left(a_i \cdot z^i \cdot \overline{a_j \cdot z^j} + \overline{a_i \cdot z^i \cdot \overline{a_j \cdot z^j}}\right) &= \text{[theorem: 10.82]} \\
\sum_{i \in \{0,\dots,n\}} a_i \cdot \overline{a_i} \cdot z^i \cdot (\overline{z})^i + 2 \cdot \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | k<l\}} \operatorname{Re}(a_i \cdot z^i \cdot \overline{a_j \cdot z^j}) &= \\
\sum_{i \in \{0,\dots,n\}} |a_i|^2 \cdot |z|^{2 \cdot i} + 2 \cdot \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | k<l\}} \operatorname{Re}(a_i \cdot z^i \cdot \overline{a_j \cdot z^j})
\end{aligned}$$

so we have that

$$(p \cdot \overline{p})(z) = \sum_{i \in \{0,\dots,n\}} |a_i|^2 \cdot |z|^{2 \cdot i} + 2 \cdot \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | k<l\}} \operatorname{Re}(a_i \cdot z^i \cdot \overline{a_j \cdot z^j}) \tag{17.43}$$

Further we have

$$\begin{aligned}
(p \cdot \overline{p})(z) &= \\
p(z) \cdot \overline{p(z)} &= \\
|p(z) \cdot \overline{p(z)}| &= \text{[lemma: 17.18]} \\
\|p(z) \cdot \overline{p(z)}\| &= \text{[eq: 17.43]} \\
\left\| \sum_{i \in \{0,\dots,n\}} |a_i|^2 \cdot |z|^{2 \cdot i} + 2 \cdot \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | k<l\}} \operatorname{Re}(a_i \cdot z^i \cdot \overline{a_j \cdot z^j}) \right\| &\geqslant \text{[theorem: 14.87]} \\
\left\| \sum_{i \in \{0,\dots,n\}} |a_i|^2 \cdot |z|^{2 \cdot i} \right\| - \left\| 2 \cdot \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | k<l\}} \operatorname{Re}(a_i \cdot z^i \cdot \overline{a_j \cdot z^j}) \right\| &= \text{[lemma: 17.18]} \\
\left| \sum_{i \in \{0,\dots,n\}} |a_i|^2 \cdot |z|^{2 \cdot i} \right| - \left\| 2 \cdot \sum_{(i,j) \in \{(k,l) \in \{0,\dots,n\}^2 | k<l\}} \operatorname{Re}(a_i \cdot z^i \cdot \overline{a_j \cdot z^j}) \right\| &= \\

|a_n|^2\cdot\frac{\|z^n\|^2}{2}-2\cdot\sum_{(i,j)\in\{(k,l)\in\{0,\dots,n\}^2|k<l\}}\|a_i\cdot\overline{a_j}\|\cdot\|z\|^{i+j} &\geqslant_{\text{[lemma: 17.18(7)]}}\\
|a_n|^2\cdot\frac{1}{2}\cdot\left(\frac{\|z\|^n}{2^n}\right)^2-2\cdot\sum_{(i,j)\in\{(k,l)\in\{0,\dots,n\}^2|k<l\}}\|a_i\cdot\overline{a_j}\|\cdot\|z\|^{i+j} &=\\
|a_n|^2\cdot\frac{\|z\|^{2\cdot n}}{2^{2\cdot n+1}}-2\cdot\sum_{(i,j)\in\{(k,l)\in\{0,\dots,n\}^2|k<l\}}\|a_i\cdot\overline{a_j}\|\cdot\|z\|^{i+j}&
\end{aligned}$$

so that

$$(p\cdot\overline{p})(z)\geqslant|a_n|^2\cdot\frac{\|z\|^{2\cdot n}}{2^{2\cdot n+1}}-2\cdot\sum_{(i,j)\in\{(k,l)\in\{0,\dots,n\}^2|k<l\}}\|a_i\cdot\overline{a_j}\|\cdot\|z\|^{i+j}\tag{17.44}$$

Using [lemma: 17.28] we have $A=\{(k,l)\in\{0,\dots,n\}^2|k<l\}=\bigsqcup_{m\in\{1,\dots,2\cdot n-1\}}B_m$ where $B_m=\{(k,l)\in A|k+l=m\}$. So that

$$\begin{aligned}
\sum_{(i,j)\in\{(k,l)\in\{0,\dots,n\}^2|k<l\}}\|a_i\cdot\overline{a_j}\|\cdot\|z\|^{i+j} &=\\
\sum_{(i,j)\in\bigsqcup_{m\in\{1,\dots,2\cdot n-1\}}B_i}\|a_i\cdot\overline{a_j}\|\cdot\|z\|^{i+j} &=_{\text{[theorem: 11.44]}}\\
\sum_{m\in\{1,\dots,2\cdot n-1\}}\left(\sum_{(i,j)\in B_m}\|a_i\cdot\overline{a_j}\|\cdot\|z\|^{i+j}\right) &=\\
\sum_{m\in\{1,\dots,2\cdot n-1\}}\left(\sum_{(i,j)\in\{(k,l)|k+l=m\}}\|a_i\cdot\overline{a_j}\|\cdot\|z\|^{i+j}\right) &=
\end{aligned}$$

$$\begin{aligned}\sum_{m\in\{1,\ldots,2\cdot n-1\}}\left(\sum_{(i,j)\in\{(k,l)\subset A|k+l=m\}}\|a_i\cdot\overline{a_j}\|\cdot\|z\|^m\right) &= \\ \sum_{m\in\{1,\ldots,2\cdot n-1\}}\left(\sum_{(i,j)\in\{(k,l)\in A|k+l=m\}}\|a_i\cdot\overline{a_j}\|\right)\cdot\|z\|^m &= \\ \sum_{m\in\{1,\ldots,2\cdot n-1\}} b_m\cdot\|z\|^m &\end{aligned}$$

where $\forall m\in\{1,\ldots,2\cdot n-1\}$ $b_m=\sum_{(i,j)\in\{(k,l)\in A|k+l=m\}}\|a_i\cdot\overline{a_j}\|$. Substituting this in [eq: 17.44] gives

$$\begin{aligned}(p\cdot\overline{p})(z) &\geqslant |a_n|^2\cdot\frac{\|z\|^{2\cdot n}}{2^{2\cdot n+1}}-2\cdot\sum_{m\in\{1,\ldots,2\cdot n-1\}} b_m\cdot\|z\|^m \\ &= |a_n|^2\cdot\frac{\|z\|^{2\cdot n}}{2^{2\cdot n+1}}+\sum_{m\in\{1,\ldots,2\cdot n-1\}}(-2\cdot b_m)\cdot\|z\|^m \\ &= 0\cdot\|z\|^0+|a_n|^2\cdot\frac{\|z\|^{2\cdot n}}{2^{2\cdot n+1}}+\sum_{m\in\{1,\ldots,2\cdot n-1\}}(-2\cdot b_m)\cdot\|z\|^m \\ &= \sum_{i=0}^{2\cdot n} c_i\cdot\|z\|^i \qquad (17.45)\end{aligned}$$

where

$$\{c_i\}_{i\in\{0,\ldots,2\cdot n\}}\text{where } c_i=\begin{cases}0 \text{ if } i=0\\ -2\cdot b_i \text{ if } i\in\{1,\ldots,2\cdot n-1\}\\ \frac{1}{2^{2\cdot n+1}}\cdot|a_n|^2 \text{ if } i=2\cdot n\end{cases}$$

then as $a_n\neq 0$ we have that $0<c_{2\cdot n}$. Hence using [lemma: 17.16] it follows that

$$\lim_{x\to\infty}\sum_{i=0}^{2\cdot n} c_i\cdot x^i=\infty$$

so there exist a $R'\in\mathbb{R}$ such that if $x\geqslant R'$ then $\sum_{i=0}^{2\cdot n}c_i\cdot x^i\geqslant(p\cdot\overline{p})(0)+1>(p\cdot\overline{p})(0)$. Take $R=\min(R',1)$ then we have using [eq: 17.45] that

$$0<R \text{ and } \forall z\in\mathbb{C} \text{ with } \|z\|\geqslant R \text{ we have } (p\cdot\overline{p})(z)\geqslant\sum_{i=0}^{2\cdot n} c_i\cdot\|z\|^i>(p\cdot\overline{p})(0) \qquad (17.46)$$

Now as $\overline{B_{\|\|}(0,R)}$ is closed and bounded in $\langle\mathbb{C},\|\|\rangle$ [see theorems: 14.65, 14.78] it follows from [theorem: 14.281] that

$$\overline{B_{\|\|}(0,R)} \text{ is compact in } \langle\mathbb{C},\|\|\rangle \qquad (17.47)$$

Now by [theorem: 17.19(5)] the function $p\cdot\overline{p}$ is continuous in $\langle\mathbb{C},\|\|\rangle$ so that, using the above, we can apply the extreme value theorem [theorem: 14.238]. Hence there exist a $z_0\in\overline{B_{\|\|}(0,R)}$ so that

$$\forall z\in\overline{B_{\|\|}(0,R)} \text{ we have } (p\cdot\overline{p})(z)\geqslant(p\cdot\overline{p})(z_0) \qquad (17.48)$$

As $0\in\overline{B_{\|\|}(0,R)}$ it follows from the above that

$$(p\cdot\overline{p})(0)\geqslant(p\cdot\overline{p})(z_0) \qquad (17.49)$$

If $z\in\mathbb{C}$ then we have either:

$\|\boldsymbol{z}\|\leqslant\boldsymbol{R}$. then by [eq: 17.48] $(p\cdot\overline{p})(z)\geqslant(p\cdot\overline{p})(z_0)$

$\boldsymbol{R}<\|\boldsymbol{z}\|$. then by [eq: 17.46] $(p\cdot\overline{p})(z)\geqslant(p\cdot\overline{p})(0)\geqslant_{\text{[eq: 17.49]}}(p\cdot\overline{p})(z_0)$

so we have

$$\forall z\in\mathbb{C} \text{ that } (p\cdot\overline{p})(z)\geqslant(p\cdot\overline{p})(z_0) \qquad (17.50)$$

Define now

$$r:\mathbb{C}\to\mathbb{C} \text{ by } r(z)=p(z+z_0) \text{ and } r\cdot\overline{r}:\mathbb{C}\to\mathbb{C} \text{ by } (r\cdot\overline{r})(z)=r(z)\cdot\overline{r(z)} \qquad (17.51)$$

Then we have

$$r(0) = p(0 + z_0) = p(z_0) \tag{17.52}$$

Further

$$\begin{aligned}
(r \cdot \overline{r})(z) &= r(z) \cdot \overline{r(z)} \\
&= p(z + z_0) \cdot \overline{p(z + z_0)} \\
&= (p \cdot \overline{p})(z + z_0) \\
&\geqslant_{\text{[eq: 17.50]}} (p \cdot \overline{p})(z_0) \\
&= p(z_0) \cdot \overline{p(z_0)} \\
&\underset{\text{eq: 17.52}}{=} r(0) \cdot \overline{r(0)} \\
&= (r \cdot \overline{r})(0)
\end{aligned}$$

in other words

$$\forall z \in \mathbb{C} \text{ we have } (r \cdot \overline{r})(z) - (r \cdot \overline{r})(0) \geqslant 0 \tag{17.53}$$

By [lemma: 17.25] and the definition of r it follows that r is a polynomial with $\operatorname{ord}(r) = \operatorname{ord}(p)$. Further using [lemma: 17.26] there exist a $k \in \{1, \ldots, n\}$ and a polynomial of order $n - k$ such that

$$q(0) \neq 0 \text{ and } \forall z \in \mathbb{C} \text{ we have } r(z) = r(0) + z^k \cdot q(z) \tag{17.54}$$

Then we have

$$\begin{aligned}
0 &\underset{\text{[eq: 17.53]}}{\leqslant} (r \cdot \overline{r})(z) - (r \cdot \overline{r})(0) \\
&= r(z) \cdot \overline{r(z)} - r(0) \cdot \overline{r(0)} \\
&= (r(0) + z^k \cdot q(z)) \cdot (\overline{r(0) + z^k \cdot q(z)}) - (r(0) + 0^k \cdot q(0)) \cdot (\overline{r(0) + 0^k \cdot q(0)}) \\
&= (r(0) + z^k \cdot q(z)) \cdot (\overline{r(0) + z^k \cdot q(z)}) - r(0) \cdot \overline{r(0)} \\
&\underset{\text{[theorem: 10.82]}}{=} (r(0) + z^k \cdot q(z)) \cdot (\overline{r(0)} + \overline{z^k \cdot q(z)}) - r(0) \cdot \overline{r(0)} \\
&= r(0) \cdot \overline{r(0)} + r(0) \cdot \overline{z^k \cdot q(z)} + z^k \cdot q(z) \cdot \overline{r(0)} + z^k \cdot q(z) \cdot \overline{z^k \cdot q(z)} - r(0) \cdot \overline{r(0)} \\
&= r(0) \cdot \overline{z^k \cdot q(z)} + z^k \cdot q(z) \cdot \overline{r(0)} + z^k \cdot q(z) \cdot \overline{z^k \cdot q(z)} \\
&= \overline{\overline{r(0)} \cdot z^k \cdot q(z)} + z^k \cdot q(z) \cdot \overline{r(0)} + z^k \cdot q(z) \cdot \overline{z^k \cdot q(z)} \\
&= \overline{z^k \cdot q(z) \cdot \overline{r(0)}} + z^k \cdot q(z) \cdot \overline{r(0)} + z^k \cdot q(z) \cdot \overline{z^k \cdot q(z)} \\
&\underset{\text{[theorem: 10.82]}}{=} 2 \cdot \operatorname{Re}(z^k \cdot q(z) \cdot \overline{r(0)}) + z^k \cdot q(z) \cdot \overline{z^k \cdot q(z)} \\
&\underset{\text{[theorem: 10.84]}}{=} 2 \cdot \operatorname{Re}(z^k \cdot q(z) \cdot \overline{r(0)}) + |z^k \cdot q(z)|^2
\end{aligned}$$

hence

$$|z^k \cdot q(z)|^2 + 2 \cdot \operatorname{Re}(z^k \cdot q(z) \cdot \overline{r(0)}) \geqslant 0 \tag{17.55}$$

Given $x \in \mathbb{C}$ and $\delta \in \mathbb{R}^+$ then taken $z = \delta \cdot x$ and substituting this in the above gives

$$\begin{aligned}
0 &\leqslant |(\delta \cdot x)^k \cdot q(\delta \cdot x)|^2 + 2 \cdot \operatorname{Re}((\delta \cdot x)^k \cdot q(\delta \cdot x) \cdot \overline{r(0)}) \\
&\underset{\text{[theorems: 10.82,10.79]}}{=} \delta^{2 \cdot k} \cdot |x^k \cdot q(\delta \cdot x)|^2 + 2 \cdot \delta^k \cdot \operatorname{Re}(x^k \cdot q(\delta \cdot x) \cdot \overline{r(0)})
\end{aligned}$$

and by dividing both sides of the above by $\delta^k > 0$ we have

$$0 \leqslant \delta^k \cdot |x^k \cdot q(\delta \cdot x)|^2 + 2 \cdot \operatorname{Re}(x^k \cdot q(\delta \cdot x) \cdot \overline{r(0)}) \tag{17.56}$$

Given $x \in \mathbb{C}$ define

$$f_x \colon \mathbb{R} \to \mathbb{R} \text{ by } f_x(\delta) = \delta^k \cdot |x^k \cdot q(\delta \cdot x)|^2 + 2 \cdot \operatorname{Re}(x^k \cdot q(\delta \cdot x) \cdot \overline{r(0)}) \tag{17.57}$$

We prove now that f_x is continuous by showing that it is the sum of functions composed of continuous functions defined in [theorem: 17.19]. So define

$$f_{x,1} \colon \mathbb{C} \to \mathbb{R} \text{ by } \langle \cdot \rangle \circ (x^k \cdot) \circ q \circ (x \cdot)$$

which is continuous as the composition the continuous mappings $\langle\cdot\rangle$, $(x^k\,\cdot\,)$, q and $(x\,\cdot\,)$ [see theorem: 17.19(1,3,4)]. Using the definition of $f_{x,1}$ we have:

$$f_{x,1}(\delta)=\langle\cdot\rangle((x^k\,\cdot\,)(q((x\,\cdot\,)(\delta))))=\langle\cdot\rangle((x^k\,\cdot\,)(q(x\cdot\delta)))=\langle\cdot\rangle(x^k\cdot q(x\cdot\delta))=|x^k\cdot q(\delta\cdot x)|^2 \tag{17.58}$$

Define

$$f_{x,2}\colon\mathbb{C}\to\mathbb{C}\text{ by }f_{x,2}=((\cdot)^k)\cdot f_{x,1}\text{ so that }f_{x,2}(\delta)=(\cdot)^k(\delta)\cdot f_{x,1}(\delta)\underset{\text{[eq: 17.58]}}{=}\delta^2\cdot|x^k\cdot q(\delta\cdot x)|^2 \tag{17.59}$$

which is continuous because it is the product of the continuous mappings $(\cdot)^k$ and $f_{x,1}$ [see theorem: 17.19(2,10). Define

$$f_{x,3}\colon\mathbb{C}\to\mathbb{R}\text{ by }f_{x,3}=\mathrm{Re}\circ(x^k\,\cdot\,)\circ(\overline{r(0)}\,\cdot\,)\circ q\circ(x\,\cdot\,)$$

which is continuous as the composition of continuous functions [see theorem: 17.19(1,3,4,9)]. Further using the definition of $f_{x,3}$ we have

$$\begin{aligned}
f_{x,3}(\delta) &= \mathrm{Re}((x^k\,\cdot\,)(\overline{r(0)}\,\cdot\,)(q((x\,\cdot\,)(\delta))))\\
&= \mathrm{Re}((x^k\,\cdot\,)(\overline{r(0)}\,\cdot\,)(q(x\cdot\delta)))\\
&= \mathrm{Re}((x^k\,\cdot\,)(\overline{r(0)}\,\cdot\,)(q(\delta\cdot x)))\\
&= \mathrm{Re}((x^k\,\cdot\,)(\overline{r(0)}\cdot q(\delta\cdot x)))\\
&= \mathrm{Re}((x^k\,\cdot\,)(q(\delta\cdot x)\cdot\overline{r(0)}))\\
&= \mathrm{Re}(x^k\cdot q(\delta\cdot x)\cdot\overline{r(0)})
\end{aligned} \tag{17.60}$$

Hence we have for $\delta\in\mathbb{R}$

$$\begin{aligned}
((f_{x,2})_{|\mathbb{R}}+2\cdot(f_{x,3})_{|\mathbb{R}})(\delta) &= (f_{x,2})_{|\mathbb{R}}(\delta)+2\cdot(f_{x,3})_{|\mathbb{R}}(\delta)\\
&= f_{x,2}(\delta)+2\cdot f_{x,3}(\delta)\\
&\underset{\text{[eqs: 17.59,17.60]}}{=} \delta^k\cdot|x^k\cdot q(\delta\cdot x)|^2+2\cdot\mathrm{Re}(x^k\cdot q(\delta\cdot x)\cdot\overline{r(0)})\\
&\underset{\text{[eq: 17.57]}}{=} f_x(\delta)
\end{aligned}$$

proving that

$$f_x=(f_{x,2})_{|\mathbb{R}}+(f_{x,3})_{|\mathbb{R}}$$

where by [theorem: 14.136] $(f_{x,2})_{|\mathbb{R}}$ and $(f_{x,3})_{|\mathbb{R}}$ are continuous. So f_x is the sum of two continuous function hence by [theorem: 14.146] it is continuous. To summarize

$$\forall x\in\mathbb{C}\ f_x\colon\mathbb{R}\to\mathbb{R}\text{ defined by }f(\delta)=\delta^k\cdot|x^k\cdot q(\delta\cdot x)|^2+2\cdot\mathrm{Re}(x^k\cdot q(\delta\cdot x)\cdot\overline{r(0)})\text{ is continuous} \tag{17.61}$$

Combining this result with [eq: 17.56] results in

$$\forall x\in\mathbb{C}\text{ we have }\forall\delta\in\mathbb{R}^+\text{ that }0\leqslant f_x(\delta) \tag{17.62}$$

What about $\delta=0$? Assume that $f_x(0)<0$ then $\varepsilon=-f_x(0)\in\mathbb{R}^+$ so by the continuity of f_x at 0 there exist a $\zeta\in\mathbb{R}^+$ such that $\forall\delta\in\mathbb{R}$ with $|\delta|=|\delta-0|<\zeta$ $\|f_x(0)-f_x(\delta)\|<-f(0)$. So if we take $\delta=\frac{\zeta}{2}$ then we have

$$\left|f_x(0)-f_x\left(\frac{\zeta}{2}\right)\right|\underset{\text{[theorem: 17.18(1)]}}{=}\left\|f_x(0)-f_x\left(\frac{\zeta}{2}\right)\right\|<-f_x(0)$$

As $f_x(0)\underset{\text{assumption}}{<}0\underset{\text{[eq: 17.62]}}{\leqslant}f_x\left(\frac{\zeta}{2}\right)$ we have that $f_x\left(\frac{\zeta}{2}\right)-f_x(0)=\left|f_x(0)-f_x\left(\frac{\zeta}{2}\right)\right|<-f_x(0)$ so that $f_x\left(\frac{\zeta}{2}\right)<0$ contradiction $0\leqslant f_x\left(\frac{\zeta}{2}\right)$. Hence the assumption is wrong and we have for $x\in\mathbb{C}$ that

$$\begin{aligned}
0 &\leqslant f_x(0)\\
&= 0^2\cdot|x^k\cdot q(0\cdot x)|^2+2\cdot\mathrm{Re}(x^k\cdot q(0\cdot x)\cdot\overline{r(0)})\\
&= 2\cdot\mathrm{Re}(x^k\cdot q(0)\cdot\overline{r(0)}
\end{aligned}$$

or as $q(0)\cdot\overline{r(0)}\in\mathbb{C}$

$$0\leqslant\mathrm{Re}(x^k\cdot(a+i\cdot b))\text{ where }q(0)\cdot\overline{r(0)}=a+i\cdot b\ \forall x\in\mathbb{C} \tag{17.63}$$

Now for $k \in \{1, \ldots, n\}$ we have the following exclusive cases:

k is odd. Then $k = 2 \cdot m + 1$ [see theorem: 7.51]. Substituting $x = 1$ and $x = -1$ in [eq: 17.63] gives

$$0 \leqslant \mathrm{Re}(1^k \cdot (a + i \cdot b)) \underset{\text{[theorem: 10.55]}}{=} \mathrm{Re}(a + i \cdot b) = a$$

$$0 \leqslant \mathrm{Re}((-1)^k \cdot (a + i \cdot b)) = \mathrm{Re}((-1)^{2 \cdot m + 1} \cdot (a + i \cdot b)) \underset{\text{[theorem: 10.55]}}{=} \mathrm{Re}(-a - i \cdot b) = -a$$

hence $0 \leqslant a \wedge a \leqslant 0$ so that

$$a = 0$$

Now for m we have either:

$m =$ even. Then $m = 2 \cdot l$ so that $k = 4 \cdot l + 1$. Substitute $x = i$ and $x = -i$ in [eq: 17.63] and take in account that $a = 0$ gives

$$0 \leqslant \mathrm{Re}(i^k \cdot i \cdot b) = \mathrm{Re}(i^{4 \cdot l + 1} \cdot i \cdot b) \underset{\text{[theorem: 10.80]}}{=} \mathrm{Re}(i \cdot i \cdot b) = \mathrm{Re}(-b) = -b$$

and

$$0 \leqslant \mathrm{Re}((-i)^k \cdot i \cdot b) = \mathrm{Re}((-1)^{2 \cdot m + 1} \cdot i^{4 \cdot l + 1} \cdot i \cdot b) \underset{\text{[theorem: 10.55,10.80]}}{=} \mathrm{Re}(-i \cdot i \cdot b) = b$$

Hence $0 \leqslant b \wedge b \leqslant 0$ so that

$$b = 0$$

$m =$ odd. Then $m = 2 \cdot l + 1$ so that $k = 2 \cdot (2 \cdot l + 1) + 1 = 4 \cdot l + 3$ hence if we substitute $x = i$ and $x = -i$ in [eq: 17.63] and take in account that $a = 0$ we get

$$0 \leqslant \mathrm{Re}(i^k \cdot i \cdot b) = \mathrm{Re}(i^{4 \cdot l + 3} \cdot i \cdot b) \underset{\text{[theorem: 10.80]}}{=} \mathrm{Re}((-i) \cdot i \cdot b) = \mathrm{Re}(b) = b$$

and

$$0 \leqslant \mathrm{Re}((-i)^k \cdot i \cdot b) = \mathrm{Re}((-1)^{2 \cdot m + 1} \cdot i^{4 \cdot l + 3} \cdot i \cdot b) \underset{\text{[theorem: 10.55,10.80]}}{=} \mathrm{Re}((-1) \cdot (-i) \cdot i \cdot b) = \mathrm{Re}(-b) = -b$$

Hence $0 \leqslant b \wedge b \leqslant 0$ so that

$$b = 0$$

So we have in all cases that $a = b = 0$ so that $q(0) \cdot \overline{r(0)} = 0 + i \cdot 0 = 0$, as $q(0) \neq 0$ [see eq: 17.54] we conclude that

$$\overline{r(0)} = 0$$

k is even. Then $k = 2 \cdot m$ [see theorem: 7.51] and for m we have either:

m is odd. Then $m = 2 \cdot l + 1$ so that $k = 4 \cdot l + 2$. Substituting $x = i$ in [eq: 17.63] gives

$$\begin{aligned} 0 &\leqslant \mathrm{Re}(i^k \cdot (a + i \cdot b)) \\ &= \mathrm{Re}(i^{4 \cdot l + 2} \cdot (a + i \cdot b)) \\ &\underset{\text{[theorem: 10.80]}}{=} \mathrm{Re}(-(a + i \cdot b)) \\ &= \mathrm{Re}(-a - i \cdot b) \\ &= -a \end{aligned}$$

Substituting $x = 1$ in [eq: 17.63] gives

$$0 \leqslant \mathrm{Re}(1^k \cdot (a + i \cdot b)) = \mathrm{Re}(a + i \cdot b) = a$$

Hence $0 \leqslant a \wedge a \leqslant 0$ proving that

$$a = 0$$

Substituting $x = (1 + i)$ in [eq: 17.63] gives, using $a = 0$, that

$$\begin{aligned} 0 &\leqslant \mathrm{Re}((1 + i)^k \cdot (a + i \cdot b)) \\ &= \mathrm{Re}((1 + i)^{4 \cdot l + 2} \cdot i \cdot b) \\ &\underset{\text{[lemma: 17.20]}}{=} \mathrm{Re}(2 \cdot (-4)^l \cdot i \cdot i \cdot b) \\ &= \mathrm{Re}(-2 \cdot (-4)^l \cdot b) \\ &= -2 \cdot (-4)^l \cdot b \end{aligned}$$

and substituting $x=(1-i)$ in [eq: 17.63] gives

$$\begin{aligned}0 &\leqslant \operatorname{Re}((1-i)^k\cdot(a+i\cdot b))\\ &= \operatorname{Re}((1-i)^{4\cdot l+2}\cdot i\cdot b)\\ &\underset{\text{[lemma: 17.20]}}{=} \operatorname{Re}(-2\cdot(-4)^l\cdot i\cdot i\cdot b)\\ &= \operatorname{Re}(2\cdot(-4)^l\cdot b)\\ &= 2\cdot(-4)^l\cdot b\end{aligned}$$

If now $(-4)^l\leqslant 0$ then we have $b\leqslant 0\wedge 0\leqslant b\Rightarrow b=0$ and if $0\leqslant(-4)^l$ then $0\leqslant b\wedge b\leqslant 0\Rightarrow b=0$. So we have $a=b=0$ proving that $q(0)\cdot\overline{r(0)}=0+i\cdot 0=0$. As $q(0)\neq 0$ [see eq: 17.54] we conclude that

$$\overline{r(0)}=0$$

***m* is even.** Then $m=2\cdot l$ so that $k=2\cdot m=4\cdot l$. Substituting $x=1$ in [eq: 17.63] gives

$$0\leqslant\operatorname{Re}(1^k\cdot(a+i\cdot b))=\operatorname{Re}(a+i\cdot b)=a$$

proving that

$$0\leqslant a \tag{17.64}$$

Take now $x=\left(1+\frac{i}{k}\right)^2$ then as $k=2\cdot m$ we have by [lemma: 17.29] that

$$\operatorname{Re}(x^k)<0<\operatorname{Img}(x^k)$$

As $x^k\in\mathbb{C}$ we can write x^k as $x^k=c+i\cdot d$ where $c=\operatorname{Re}(x^k)\in\mathbb{R}$ and $d=\operatorname{Img}(x^k)\in\mathbb{R}$ so that

$$c<0<d \tag{17.65}$$

Substituting $x^k=c+i\cdot d$ in [eq: 17.63] gives

$$\begin{aligned}0 &\leqslant \operatorname{Re}(x^k\cdot(a+i\cdot b))\\ &= \operatorname{Re}((c+i\cdot d)\cdot(a+i\cdot b))\\ &= \operatorname{Re}(c\cdot a-b\cdot d+i\cdot(d\cdot a+c\cdot b))\\ &= c\cdot a-b\cdot d\end{aligned}$$

so that

$$0\leqslant c\cdot a-b\cdot d \tag{17.66}$$

Take $y=\overline{x}$ then $y^k=(\overline{x})^k\underset{\text{[theorem: 10.82]}}{=}\overline{x^k}$ so that $y^k=c-i\cdot d$, substituting this in [eq: 17.63] gives

$$\begin{aligned}0 &\leqslant \operatorname{Re}(y^k\cdot(a+i\cdot b))\\ &= \operatorname{Re}((c-i\cdot d)\cdot(a+i\cdot b))\\ &= \operatorname{Re}(c\cdot a+b\cdot d+i\cdot(c\cdot b-d\cdot a))\\ &= c\cdot a+b\cdot d\end{aligned}$$

so that

$$0\leqslant c\cdot a+b\cdot d \tag{17.67}$$

Adding [eq: 17.66] to [eq: 17.67] gives $0\leqslant c\cdot a-b\cdot d+c\cdot a+b\cdot d=2\cdot c\cdot a$ so that $0\leqslant c\cdot a$. As by [eq: 17.65] $c<0$ it follows that $a\leqslant 0$ which combined with [eq: 17.64] proves that

$$a=0$$

Substituting this in [eqs: 17.66 and 17.67] yields $0\leqslant -b\cdot d\Rightarrow b\cdot d\leqslant 0$ and $0\leqslant b\cdot d$ so that $b\cdot d=0$, as by [eq: 17.65] $0<d$ it follows that

$$b=0$$

Hence $q(0)\cdot\overline{r(0)}=a+i\cdot b=0$ and as $q(0)\neq 0$ [see eq: 17.54] it follows that

$$\overline{r(0)}=0$$

So in all cases we have $\overline{r(0)}=0$ so that $|r(0)|^2=r(0)\cdot\overline{r(0)}=0$ from which it follows that $r(0)=0$. As by definition [see: 17.52] $r(0)=p(z_0)$ it follows that

$$p(z_0)=0$$

and we have proved that there exist a root of the polynomial p. □

Note 17.31. In the above proof we have used the extreme value theorem to find the existence of a root of p without actual providing a explicit expression to calculate the root of a polynomial. It is a well known fact that for a polynomial of a higher order then 4 there is no closed form general solution using radicals.

Theorem 17.32. *Let $n\in\mathbb{N}$ and $\{a_i\}_{i\in\{0,\ldots,n\}}\subseteq\mathbb{R}$ with $a_n\neq 0$ then if we define*

$$p:\mathbb{C}\to\mathbb{C} \text{ by } p(z)=\sum_{i=0}^{n} a_i\cdot z^i$$

[in other words p is a polynomial of order n with real coefficients] then for $z\in\mathbb{C}$ with $p(z)=0$ we have that $p(\overline{z})=0$.

Proof. If $p(z)=0$ then we have

$$\begin{aligned}
0 &= \overline{0}\\
&= \overline{p(z)}\\
&= \overline{\sum_{i=0}^{n} a_i\cdot z^i}\\
&\underset{\text{[theorem: 10.82]}}{=} \sum_{i=0}^{n} \overline{a_i}\cdot(\overline{z})^i\\
&\underset{\text{[theorem: 10.82]}\wedge a_i\in\mathbb{R}}{=} \sum_{i=0}^{n} a_i\cdot(\overline{z})^i\\
&= p(\overline{z})
\end{aligned}$$

□

Theorem 17.33. *Let $n\in\mathbb{N}$ and $\{a_i\}_{i\in\{0,\ldots,n\}}\subseteq\mathbb{C}$ with $a_n\neq 0$ then if we define*

$$p:\mathbb{C}\to\mathbb{C} \text{ by } p(z)=\sum_{i=0}^{n} a_i\cdot z^i$$

[in other words p is a polynomial of order n] and $z_0\in\mathbb{C}$ such that $p(z_0)=0$ then there exist a $m\in\{1,\ldots,n\}$ and a polynomial q with $\operatorname{ord}(q)=n-m$ such that $\forall z\in\mathbb{C}$ we have $p(z)=(z-z_0)^m\cdot q(z)$ and $q(z_0)\neq 0$.

Proof. Define

$$r:\mathbb{C}\to\mathbb{C} \text{ by } r(z)=p(z+z_0) \tag{17.68}$$

then by [lemma: 17.25]

$$r \text{ is a polynomial with } \operatorname{ord}(r)=\operatorname{ord}(p)\in\mathbb{N} \tag{17.69}$$

Using [lemma: 17.26] there exist a $m\in\{1,\ldots,n\}$ and a polynomial s such

$$s(0)\neq 0 \ \operatorname{ord}(s)=n-m \text{ and } \forall z\in\mathbb{C} \text{ we have } r(z)=r(0)+z^m\cdot s(z) \tag{17.70}$$

Then we have for $z \in \mathbb{C}$

$$\begin{aligned} p(z) &= p((z-z_0)+z_0) \\ &= r(z-z_0) \\ &\underset{\text{[eq: 17.70]}}{=} r(0)+(z-z_0)^m \cdot s(z-z_0) \\ &\underset{\text{[eq: 17.68}}{=} p(0+z_0)+(z-z_0)^m \cdot s(z-z_0) \\ &= p(z_0)+(z-z_0)^m \cdot s(z-z_0) \\ &= (z-z_0)^m \cdot s(z-z_0) \end{aligned} \tag{17.71}$$

Define

$$q: \mathbb{C} \to \mathbb{C} \text{ by } q(z) = s(z-z_0) = s(z+(-z_0)) \tag{17.72}$$

then by [lemma: 17.25] we have that

$$q \text{ is a polynomial and } \operatorname{ord}(q) = \operatorname{ord}(s) = n-m$$

Substituting this in [eq: 17.71] gives

$$p(z) = (z-z_0)^m \cdot q(z)$$

Further

$$q(z_0) = s(z_0-z_0) = s(0) \neq 0$$

□

Theorem 17.34. *Let p be polynomial with $\operatorname{ord}(p) \in \mathbb{N}$ then there exists a $c \in \mathbb{C} \setminus \{0\}$ and a $\{z_i\}_{i \in \{1,\ldots,\operatorname{ord}(p)\}} \subseteq \mathbb{C}$ such that*

$$\forall z \in \mathbb{C} \text{ we have } p(z) = c \cdot \prod_{i=1}^{\operatorname{ord}(p)} (z-z_i)$$

Further more

$$\{z \in \mathbb{C} | p(z) = 0\} = \{z_i | i \in \{1,\ldots,\operatorname{ord}(p)\}\}$$

In other words the distinct number of zero points of a polynomial is less then the order of the polynomial.

Proof. We prove this by induction on the order of the polynomial. So let

$$S = \left\{ n \in \mathbb{N} | \text{If } p \text{ is a polynomial with } 1 \leqslant \operatorname{ord}(p) \leqslant n \text{ then there exists a } c \in \mathbb{C} \setminus \{0\} \text{ and } \{z_i\}_{i \in \operatorname{ord}(p)} \text{ such that } \forall z \in \mathbb{C}\ p(z) = c \cdot \prod_{i=1}^{\operatorname{ord}(p)} (z-z_i) \right\}$$

then we have:

- **$1 \in \mathbb{N}$.** Then $\operatorname{ord}(p) = 1$ so $p: \mathbb{C} \to \mathbb{C}$ is defined by $p(z) = a_0 + a_1 \cdot z$ where $a_1 \neq 0$. Take $z_1 = -\frac{a_0}{a_1}$ and $c = a_1$ then $c \neq 0$ and $c \cdot \prod_{i=1}^{1} (z-z_i) = c \cdot (z-z_i) = a_1 \cdot \left(z + \frac{a_0}{a_1}\right) = a_1 \cdot z + a_0 = p(z)$. So we have that $1 \in S$
- **$n \in \mathbb{N} \to n+1 \in \mathbb{N}$.** Let p be a polynomial with $1 \leqslant \operatorname{ord}(p) \leqslant n+1$ then we have for $\operatorname{ord}(p)$ either:
  - **$1 \leqslant \operatorname{ord}(p) \leqslant n$.** As $n \in S$ there exist a $c \in \mathbb{C} \setminus \{0\}$ and $\{z_i\}_{i \in \{1,\ldots,\operatorname{ord}(p)\}}$ with $p(z) = c \cdot \prod_{i=1}^{\operatorname{ord}(p)} (z-z_i)$ so that in this case $n+1 \in S$.
  - **$1 \leqslant \operatorname{ord}(p) = n+1$.** Let p be a polynomial with $\operatorname{ord}(p) = n+1 \in \mathbb{N}$. Using the fundamental theorem of algebra there exist a $y_0 \in \mathbb{C}$ such that $p(y_0) = 0$. Using the previous theorem [theorem: 17.33] there exist a $m \in \{1,\ldots,n+1\}$ and a polynomial q of order $(n+1)-m$ such that

    $$p(z) = (z-y_0)^m \cdot q(z) \text{ and } q(y_0) \neq 0 \tag{17.73}$$

    for m we have now either:

    - **$m = n+1$.** Then $\operatorname{ord}(q) = n+1-m = 0$ so that there exist a $c \in \mathbb{C} \setminus \{0\}$ with

      $$q: \mathbb{C} \to \mathbb{C} \text{ defined by } q(z) = c$$

      Hence if we define $\{z_i\}_{i \in \{1,\ldots,n+1\}} \subseteq \mathbb{C}$ by $z_i = y_0$ then

      $$\forall z \in \mathbb{C} \text{ we have } p(z) = c \cdot (z-y_0)^{n+1} = c \cdot \prod_{i=1}^{n+1} (z-y_0) = c \cdot \prod_{i=1}^{\operatorname{ord}(p)} (z-z_i)$$

proving that $n+1\in S$ in this case.

$\boldsymbol{m<n+1}$. Then $\operatorname{ord}(q)=(n+1)-m>0$ so that

$$1\leqslant \operatorname{ord}(q) \underset{1\leqslant m\Rightarrow \operatorname{ord}(q)=(n+1)-m\leqslant n}{\leqslant} n,$$

As $n\in S$ there exist a $c\in\mathbb{C}\setminus\{0\}$ and a $\{y_i\}_{i\in\{1,\ldots,\operatorname{ord}(q)\}}\subseteq\mathbb{C}$ such that $\forall z\in\mathbb{C}$ we have

$$q(z)=c\cdot\prod_{i=1}^{\operatorname{ord}(q)}(z-y_i)=c\cdot\prod_{i=1}^{(n+1)-m}(x-y_i) \tag{17.74}$$

Define now $\{z_i\}_{i\in\{1,\ldots,n+1\}}\subseteq\mathbb{C}$ by $z_i=\begin{cases} y_0 \text{ if } i\in\{1,\ldots,m\} \\ z_{i-m} \text{ if } i\in\{m+1,\ldots,n+1\}\end{cases}$ then we have

$$\begin{aligned}
p(z) &\underset{\text{[eq: 17.73]}}{=} (z-y_0)^m\cdot q(z)\\
&= \left(\prod_{i=1}^{m}(z-y_0)\right)\cdot q(z)\\
&= \left(\prod_{i=1}^{m}(z-z_i)\right)\cdot q(z)\\
&\underset{\text{[eq: 17.74]}}{=} c\cdot\left(\prod_{i=1}^{m}(z-z_i)\right)\cdot\left(\prod_{i=1}^{(n+1)-m}(x-y_i)\right)\\
&= c\cdot\left(\prod_{i=1}^{m}(z-z_i)\right)\cdot\left(\prod_{i=m+1}^{n+1}(x-y_{i-m})\right)\\
&= c\cdot\left(\prod_{i=1}^{m}(z-z_i)\right)\cdot\left(\prod_{i=m+1}^{n+1}(x-z_i)\right)\\
&= c\cdot\prod_{i=1}^{n+1}(z-z_i)\\
&= c\cdot\prod_{i=1}^{\operatorname{ord}(p)}(z-z_i)
\end{aligned}$$

proving that in this case $n+1\in S$.

Mathematical induction proves that $S=\mathbb{N}$. Hence if p is a polynomial with $\operatorname{ord}(p)\in\mathbb{N}$ then as $1\leqslant\operatorname{ord}(p)\in\mathbb{N}=S$ it follows that

$$\exists c\in\mathbb{C}\setminus\{0\} \text{ and } \{z_i\}_{i\in\{1,\ldots,\operatorname{ord}(p)\}}\subseteq\mathbb{C} \text{ such that } p(z)=c\cdot\prod_{i=1}^{\operatorname{ord}(p)}(z-z_i)$$

Further if $z\in\{z_i|i\in\{1,\ldots,\operatorname{ord}(p)\}\}$ then there exist a $k\in\{1,\ldots,\operatorname{ord}(p)\}$ such that $z=z_k$, Hence

$$\begin{aligned}
p(z) &= p(z_k)\\
&= c\cdot\prod_{i=1}^{\operatorname{ord}(p)}(z_k-z_i)\\
&= c\cdot\prod_{i\in\{1,\ldots,\operatorname{ord}(p)\}}(z_k-z_i)\\
&= c\cdot\prod_{i\in\{k\}}(z_k-z_i)\cdot\prod_{i\in\{1,\ldots,\operatorname{ord}(p)\}\setminus\{k\}}(z_k-z_i)\\
&= c\cdot(z_k-z_k)\cdot\prod_{i\in\{1,\ldots,\operatorname{ord}(p)\}\setminus\{i_0\}}(z_k-z_i)\\
&= c\cdot 0\cdot\prod_{i\in\{1,\ldots,\operatorname{ord}(p)\}\setminus\{i_0\}}(z_k-z_i)\\
&= 0
\end{aligned}$$

so that $z \in \{z \in \mathbb{C} | p(z) = 0\}$. Hence

$$\{z_i | i \in \{1, \ldots, \text{ord}(p)\}\} \subseteq \{z \in \mathbb{C} | p(z) = 0\} \tag{17.75}$$

Further if $z \in \{z \in S | p(z) = 0\}$ then $0 = c \cdot \prod_{i=1}^{\text{ord}(p)} (z - z_i)$, hence as $c \neq 0$, we have that

$$0 = \prod_{i=1}^{\text{ord}(p)} (z - z_i)$$

Assume that $\forall i \in \{1, \ldots, \text{ord}(p)\}$ $z_i \neq z$ then $\forall i \in \{1, \ldots, \text{ord}(p)\}$ $z - z_i \neq 0$, hence using [theorem: 11.53] $\prod_{i=1}^{\text{ord}(p)} (z - z_i) \neq 0$ contradicting $0 = \prod_{i=1}^{\text{ord}(p)} (z - z_i)$. So there must exist a $k \in \{1, \ldots, \text{ord}(p)\}$ such that $z = z_k$. So $\{z \in S | p(z) = 0\} \subseteq \{z_i | i \in \{1, \ldots, \text{ord}(p)\}\}$ which combined with [eq: 17.75] proves that

$$\{z_i | i \in \{1, \ldots, \text{ord}(p)\}\} = \{z \in \mathbb{C} | p(z) = 0\}$$

□

Lemma 17.35. *Let p be a polynomial then*

$$p \text{ has real coefficients} \Leftrightarrow \forall x \in \mathbb{R}\ p(x) \in \mathbb{R}$$

Proof.

⇒. If p has real coefficients then there exist a $\{a_i\}_{i \in n} \subseteq \mathbb{R}$ with $a_n \neq 0$ such that $\forall z \in \mathbb{C}\ p(z) = \sum_{i=0}^{n} a_i \cdot z^i$. Let $x \in \mathbb{R}$ then we have

$$\begin{aligned}
\text{img}(p(x)) &= \text{Img}\left(\sum_{i=0}^{n} a_i \cdot x^i\right) \\
&\underset{\text{[example: 11.171]}}{=} \sum_{i=0}^{n} \text{Img}(a_i \cdot x^i) \\
&\underset{\text{[theorem: 10.79]} \wedge x^i \in \mathbb{R}}{=} \sum_{i=0}^{n} \text{Img}(a_i) \cdot x^i \\
&\underset{a_{i \in \mathbb{R}}}{=} \sum_{i=0}^{n} 0 \cdot x^i \\
&= 0
\end{aligned}$$

so that $p(x) \in \mathbb{R}$.

⇐. As p is a polynomial there exist a $\{a_i\}_{i \in n} \subseteq \mathbb{C}$ with $a_n \neq 0$ such that $\forall z \in \mathbb{C}\ p(z) = \sum_{i=0}^{n} a_i \cdot z^i$. Let $x \in \mathbb{R}$ then as $p(x) \in \mathbb{R}$ we have

$$\begin{aligned}
0 &= \text{Img}(p(x)) \\
&= \text{Img}\left(\sum_{i=0}^{n} a_i \cdot x^i\right) \\
&\underset{\text{[example: 11.171]}}{=} \sum_{i=0}^{n} \text{Img}(a_i \cdot x^i) \\
&\underset{\text{[theorem: 10.79]} \wedge x^i \in \mathbb{R}}{=} \sum_{i=0}^{n} \text{Img}(a_i) \cdot x^i
\end{aligned}$$

so that $\forall x \in \mathbb{R}$ we have $\sum_{i=0}^{n} \text{Img}(a_i) \cdot x^i = 0$. As $\text{Img}(a_i) \in \mathbb{R}$ it follows from [theorem: 17.2] that $\forall i \in \{0, \ldots, n\}$ we have $\text{Img}(a_i) = 0$ so that $a_i \in \mathbb{R}$.

□

Theorem 17.36. *Let p be a polynomial with $\text{ord}(p) \in \mathbb{N}$ and **real coefficients** then there exists a $c \in \mathbb{R} \setminus \{0\}$, $m, M \in \mathbb{N}_0$, $\{\lambda_i\}_{i \in \{1, \ldots m\}} \subseteq \mathbb{R}$, $\{b_i\}_{i \in \{1, \ldots, M\}} \subseteq \mathbb{R}$ and $\{c_i\}_{i \in \{1, \ldots, M\}} \subseteq \mathbb{R}$ such that $\forall i \in \{1, \ldots, m\}$ we have*

$$(b_i)^2 < 4 \cdot c_i$$

and $\forall z \in \mathbb{C}$ *we have*

$$p(z) = c \cdot \left(\prod_{i \in \{1, \ldots, m\}} (z - \lambda_i) \right) \cdot \left(\prod_{i \in \{1, \ldots, M\}} (z^2 + b_i \cdot z + c_i) \right)$$

***Note* 17.37.** *If* $m = 0$ *then* $\{1, \ldots, m\} = \varnothing$ *so that* $\{\lambda_i\}_{i \in \varnothing}$ *is the empty family [see example: 2.105] and* $\prod_{i \in \varnothing} (z - \lambda_i) = 1$ *[see definition: 11.32]. Likewise if* $M = 0$ *then* $\{b_i\}_{i \in \{1, \ldots, M\}}$ *and* $\{c_i\}_{i \in \{1, \ldots, M\}}$ *are empty families and* $\prod_{i \in \{1, \ldots, M\}} (z^2 + b_i \cdot z + c_i) = 1$

Proof. We prove this by induction so define

$S = \Bigg\{ n \in \mathbb{N} | \text{If } p \text{ is a polynomial with real coefficients and } 1 \leqslant \operatorname{ord}(p) \leqslant n \text{ then there exists a } c \in \mathbb{R} \setminus \{0\},\ m, M \in \mathbb{N}_0,\ \{\lambda_i\}_{i \in \{1, \ldots, m\}} \subseteq \mathbb{R},$ $\{b_i\}_{i \in \{1, \ldots, M\}} \subseteq \mathbb{R}$ and $\{c_i\}_{i \in \{1, \ldots, M\}} \subseteq \mathbb{R}$ such that $\forall i \in \{1, \ldots, M\}$ we have $(b_i)^2 < 4 \cdot c_i$ and $\forall z \in \mathbb{C}$ that $p(z) = c \cdot \left(\prod_{i \in \{1, \ldots, M\}} (z - \lambda_i) \right) \cdot \left(\prod_{i \in \{1, \ldots, M\}} z^2 + b_i \cdot z + c_i \right) \Bigg\}$

then we have:

$1 \in S$. If $1 \leqslant \operatorname{ord}(p) \leqslant 1$ then $\operatorname{ord}(p) = 1$ and there exist $a_0, a_1 \in \mathbb{R}$ such that $a_1 \neq 0$ and $p(z) = a_0 + a_1 \cdot z$. Take $c = a_1 \in \mathbb{R} \setminus \{0\}$, $m = 1$, $M = 0$, $\{\lambda_i\}_{i \{1, \ldots, m\}}$ defined by $\lambda_1 = -\frac{a_0}{a_1} \in \mathbb{R}$, $\{b_i\}_{i \in \varnothing} = \{c_i\}_{i \in \varnothing} = \varnothing$ then we have

$$c \cdot \left(\prod_{i \in \{1, \ldots, m\}} (z - \lambda_i) \right) \cdot \left(\prod_{i \in \{1, \ldots, 0\} = \varnothing} z^2 + b_i \cdot z + c_i \right) = a_1 \cdot \left(z + \frac{a_0}{a_1} \right) = a_0 + a_1 \cdot z = p(z)$$

Hence we must have that $1 \in S$.

$n \in S \Rightarrow n + 1 \in S$. Let p be a polynomial with real coefficients and $1 \leqslant \operatorname{ord}(p) \leqslant n + 1$. For $\operatorname{ord}(p)$ we have either:

$\operatorname{ord}(p) < n + 1$. Then $\operatorname{ord}(p) \leqslant n$ so as $n \in S$ we have that there exists a $c \in \mathbb{R} \setminus \{0\}$, $m, M \in \mathbb{N}_0$, $\{\lambda_i\}_{i \in \{1, \ldots, m\}} \subseteq \mathbb{R}$, $\{b_i\}_{i \in \{1, \ldots, M\}} \subseteq \mathbb{R}$ and $\{c_i\}_{i \in \{1, \ldots, M\}} \subseteq \mathbb{R}$ such that $\forall z \in \mathbb{C}$ we have $p(z) = c \cdot \left(\prod_{i \in \{1, \ldots, M\}} (z - \lambda_i) \right) \cdot \left(\prod_{i \in \{1, \ldots, M\}} z^2 + b_i \cdot z + c_i \right)$. This proves that $n + 1 \in S$ in this case.

$\operatorname{ord}(p) = n + 1$. As $1 \leqslant \operatorname{ord}(p)$ $\operatorname{ord}(p) \in \mathbb{N}$ so that by the previous theorem [theorem: 17.34] there exist $\{z_i\}_{i \in \{1, \ldots, \operatorname{ord}(p)\}} \subseteq \mathbb{C}$ and a $c' \in \mathbb{C} \setminus \{0\}$ such that

$$\forall z \in \mathbb{C} \text{we have } p(z) = c' \cdot \prod_{i=1}^{\operatorname{ord}(p)} (z - z_i) = c' \cdot \prod_{i \in \{1, \ldots, \operatorname{ord}(p)\}} (z - z_i) \tag{17.76}$$

and

$$\{z_i | i \in \{1, \ldots, \operatorname{ord}(p)\}\} = \{z | p(z) = 0\} \tag{17.77}$$

If $\{z_i\}_{i \in \{1, \ldots, \ldots, \operatorname{ord}(p)\}} \subseteq \mathbb{R}$ then by taking $m = \operatorname{ord}(p)$, $M = 0$ and $\{b_i\}_{i \in \varnothing} = \{c_i\}_{i \in \varnothing} = \varnothing$ we have that

$$p(z) = c' \cdot \left(\prod_{i=1}^{\operatorname{ord}(p)} (z - z_i) \right) \cdot \left(\prod_{i \in \{1, \ldots, 0\} = \varnothing} (z^2 + b_i \cdot z + c_i) \right) = c' \cdot \prod_{i=1}^{\operatorname{ord}(p)} (z - z_i) \tag{17.78}$$

Take $x_0 = \max(\{z_i | i \in \{1, \ldots, \operatorname{ord}(p)\}\}) + 1 \in \mathbb{R}$ then $\forall i \in \{1, \ldots, \operatorname{ord}(p)\}$ $x_0 \neq z_i$ or $(x - x_i) \in \mathbb{R} \setminus \{0\}$ proving that $\prod_{i=1}^{\operatorname{ord}(p)} (z - z_i) \in \mathbb{R} \setminus \{0\}$ hence $c' = \frac{p(x_0)}{\prod_{i=1}^{\operatorname{ord}(p)} (x_0 - z_i)}$. As by [theorem: 17.35] $p(x_0) \in \mathbb{R}$ it follows that

$$c' \in \mathbb{R} \setminus \{0\}$$

Hence we have proved that $n + 1 \in S$ in the case where $\{z_i\}_{i \in \{1, \ldots, \ldots, \operatorname{ord}(p)\}} \subseteq \mathbb{R}$.

So we must only prove the case where there exist a $k \in \{1,\ldots,\text{ord}(p)\} = \{1,\ldots,n+1\}$ such that $z_k \notin \mathbb{R}$. Now as p has real coefficients it follows from [lemma: 17.32] that $p(\overline{z_k}) = 0$, hence by [eq: 17.77] there exist a $l \in \{1,\ldots,n+1\}$ such that $z_l = \overline{z_k}$. If $k = l$ then we would have that $z_k = \overline{z_k}$ so that by [theorem: 10.82] $z_k \in \mathbb{R}$ contradicting $z_k \notin \mathbb{R}$. Hence we must have that $k \neq l$ and $z_l = \overline{z_k}$. Next we have

$$\begin{aligned}
p(z) &\underset{\text{[eq: 17.78]}}{=} c' \cdot \prod_{i \in \{1,\ldots,\text{ord}(p)\}} (z - z_i) \\
&= c' \cdot \left(\prod_{i \in \{1,\ldots,\text{ord}(p)\} \setminus \{k,l\}} (z - z_i) \right) \cdot \left(\prod_{i \in \{k,l\}} (z - z_i) \right) \\
&= c' \cdot \left(\prod_{i \in \{1,\ldots,\text{ord}(p)\} \setminus \{k,l\}} (z - z_i) \right) \cdot (z - z_k) \cdot (z - z_l) \\
&= c' \cdot \left(\prod_{i \in \{1,\ldots,\text{ord}(p)\} \setminus \{k,l\}} (z - z_i) \right) \cdot (z - z_k) \cdot (z - \overline{z_k}) \\
&= c' \cdot \left(\prod_{i \in \{1,\ldots,\text{ord}(p)\} \setminus \{k,l\}} (z - z_i) \right) \cdot (z^2 - z \cdot \overline{z_k} - z_k \cdot z + z_k \cdot \overline{z_k}) \\
&= c' \cdot \left(\prod_{i \in \{1,\ldots,\text{ord}(p)\} \setminus \{k,l\}} (z - z_i) \right) \cdot (z^2 - (z_k + \overline{z_k}) \cdot z + z_k \cdot \overline{z_k}) \\
&= c' \cdot \left(\prod_{i \in \{1,\ldots,\text{ord}(p)\} \setminus \{k,l\}} (z - z_i) \right) \cdot (z^2 + d \cdot z + e)
\end{aligned}$$

where $d = -(z_k + \overline{z_k}) = -2 \cdot \text{Re}(z_k) \in \mathbb{R}$ and $e = z_k \cdot \overline{z_k} = |z_k|^2 \in \mathbb{R}$. Hence we have

$$p(z) = c' \cdot \left(\prod_{i \in \{1,\ldots,\text{ord}(p)\} \setminus \{k,l\}} (z - z_i) \right) \cdot (z^2 + d \cdot z + e) \text{ where } d = -2 \cdot \text{Re}(z_k) \in \mathbb{R} \wedge e = |z_k|^2 \in \mathbb{R} \tag{17.79}$$

Now as $z_k \in \mathbb{C} \setminus \mathbb{R}$ we have that $0 \neq \text{img}(z_k)$ so that

$$d^2 = 4 \cdot (\text{Re}(z_k))^2 < 4 \cdot (\text{Re}(z_k))^2 + 4 \cdot (\text{Img}(z_k))^2 = 4 \cdot |z_k|^2 = 4 \cdot e$$

hence

$$d^2 < 4 \cdot e \tag{17.80}$$

As $k \neq l$ and $k, l \in \{1,\ldots,\text{ord}(p)\}$ we have by [theorem: 10.91] that $\text{card}(\{1,\ldots,\text{ord}(p)\} \setminus \{k,l\}) = \text{ord}(p) - 2$. Hence there exist a bijection

$$\beta \colon \{1,\ldots,\text{ord}(p) - 2\} \to \{1,\ldots,\text{ord}(p)\} \setminus \{k,l\}$$

so that by applying [theorem: 11.36] on [eq; 17.79] gives

$$p(z) = c' \cdot \left(\prod_{i \in \{1,\ldots,\text{ord}(p)-2\}} (z - z_{\beta(i)}) \right) \cdot (z^2 + d \cdot z + e) \tag{17.81}$$

For $i \in \{1,\ldots,\text{ord}(p) - 2\}$ we have that

$$p_i \colon \mathbb{C} \to \mathbb{C} \text{ defined by } p_{\beta(i)}(z) = z - z_{\beta(i)} = -z_{\beta(i)} + z \text{ is a polynomial with } \text{ord}(p_{\beta(i)}) = 1$$

Define now

$$q \colon \mathbb{C} \to \mathbb{C} \text{ by } q(z) = c' \cdot \prod_{i \in \{1,\ldots,\text{ord}(p)-2\}} p_i(z) = c' \cdot \prod_{i=1}^{\text{ord}(p)-2} p_i(x) = c' \cdot \prod_{i=1}^{\text{ord}(p)-2} (z - z_{\beta(i)})$$

so that by [eq: 17.81] we have

$$p(z) = q(z) \cdot (z^2 + d \cdot z + e) \tag{17.82}$$

Using [theorem: 17.13] and [lemma: 17.10] it follows that

$$q \text{ is a polynomial with } \text{ord}(q) = \text{ord}(p) - 2 = n - 1 \tag{17.83}$$

Let $x \in \mathbb{R}$ then by [eq: 17.80] $0 < e - \frac{d^2}{4} \underset{0 \leqslant \left(x+\frac{d}{2}\right)^2}{\leqslant} \left(x + \frac{d}{2}\right)^2 + e - \frac{d^2}{4}$ and as

$$\left(x + \frac{d}{2}\right)^2 + e - \frac{d^2}{4} = x^2 + x \cdot d + \frac{d^2}{4} + e - \frac{d^2}{4} = x^2 + d \cdot x + e$$

we have that $0 < x^2 + d \cdot x + e \in \mathbb{R}$ which, as $p(x) \in \mathbb{R}$, proves that $q(x) = \frac{p(x)}{z^2 + d \cdot x + e} \in \mathbb{R}$. Using [theorem: 17.35] it follows that q has real coefficients, hence as $\operatorname{ord}(q) = n - 1 < n$ and $n \in S$ there exist $c \in \mathbb{R} \setminus \{0\}$, $m, M' \in \mathbb{N}_0$, $\{\lambda_i\}_{i \in \{1, \ldots, m\}} \subseteq \mathbb{R}$, $\{b'_i\}_{i \in \{1, \ldots, M'\}} \subseteq \mathbb{R}$ and $\{c'_i\}_{i \in \{1, \ldots, M'\}} \subseteq \mathbb{R}$ such that $\forall i \in \{1, \ldots, M'\}$ $(b'_i)^2 < 4 \cdot c'_i$ and

$$\forall z \in \mathbb{C} \; q(z) = c \cdot \left(\prod_{i \in \{1, \ldots, m\}} (z - \lambda_i) \right) \cdot \left(\prod_{i \in \{1, \ldots, M'\}} (z^2 + b'_i \cdot z + c'_i) \right) \tag{17.84}$$

Hence if we take $M = M' + 1$, $\{c_i\}_{i \in M} \subseteq \mathbb{R}$ by $b_i = \begin{cases} d \text{ if } i = M = M' + 1 \\ b'_i \text{ if } i \in \{1, \ldots, M'\} \end{cases}$ and $\{c_i\}_{i \in \{1, \ldots, M\}} \subseteq \mathbb{R}$ by $c_i = \begin{cases} e \text{ if } i = M = M' + 1 \\ c'_i \text{ if } i \in \{1, \ldots, M'\} \end{cases}$ then we have $\forall i \in \{1, \ldots, M\}$ that $b_i^2 < 4 \cdot c_i$. Further

$$\begin{aligned}
c \cdot \left(\prod_{i \in \{1, \ldots, m\}} (z - \lambda_i) \right) \cdot \left(\prod_{i \in \{1, \ldots, M\}} (z^2 + b_i \cdot z + c_i) \right) &= \\
c \cdot \left(\prod_{i \in \{1, \ldots, m\}} (z - \lambda_i) \right) \cdot \left(\prod_{i \in \{1, \ldots, M'\}} (z^2 + b_i \cdot z + c_i) \right) \cdot (z^2 + b_M \cdot z + c_M) &= \\
c \cdot \left(\prod_{i \in \{1, \ldots, m\}} (z - \lambda_i) \right) \cdot \left(\prod_{i \in \{1, \ldots, M'\}} (z^2 + b'_i \cdot z + c'_i) \right) \cdot (z^2 + d \cdot z + e) &\underset{\text{[eq: 17.84]}}{=} \\
q(z) \cdot (z^2 + d \cdot z + e) &\underset{\text{[eq: 17.82}}{=} \\
p(z) &
\end{aligned}$$

Hence we have that

$$p(z) = c \cdot \left(\prod_{i \in \{1, \ldots, m\}} (z - \lambda_i) \right) \cdot \left(\prod_{i \in \{1, \ldots, M\}} (z^2 + b_i \cdot z + c_i) \right)$$

so that we have $n + 1 \in S$ in this case. □

Chapter 18
Inner Product Spaces

18.1 Definition and properties

Inner products extends the notion of length and orthogonality of vectors in Euclidean space.

Definition 18.1. *A **real inner product space** is a pair $\langle X, \langle\rangle\rangle$ where X is a vector space over the field $\mathbb{R}$ together with a mapping [the **inner product**]*

$$\langle\rangle : X \times X \to \mathbb{R} \text{ where } \langle\rangle(x, y) \text{ is noted as } \langle x, y\rangle$$

satisfying:

1. $\forall x, y \in X$ *we have* $\langle x, y\rangle = \langle y, x\rangle$
2. $\forall x, y, z \in X$ *and* $\forall \alpha \in \mathbb{R}$ *we have* $\langle x + \alpha \cdot y, z\rangle = \langle x, z\rangle + \alpha \cdot \langle y, z\rangle$
3. $\forall x \in X$ *we have* $0 \leqslant \langle x, x\rangle$
4. $\forall x \in X$ *we have* $\langle x, x\rangle = 0 \Rightarrow x = 0$

Theorem 18.2. *Let $\langle X, \langle\rangle\rangle$ be a real inner product space and $Y \subseteq X$ a subspace of X then $\left\langle Y, \langle\rangle_{|_{Y \times Y}}\right\rangle$ is a real inner product space.*

Proof.

1. $\forall x, y \in Y$ we have $\langle x, y\rangle_{|Y \times Y} = \langle x, y\rangle = \langle y, x\rangle = \langle y, x\rangle_{|Y \times Y}$.
2. $\forall x, y, z \in Y$ and $\forall \alpha \in \mathbb{R}$ we have
$$\langle x + \alpha \cdot y, z\rangle_{|Y \times Y} = \langle x + \alpha \cdot y, z\rangle = \langle x, z\rangle + \alpha \cdot \langle y, z\rangle = \langle x, z\rangle_{|Y \times Y} + \alpha \cdot \langle y, z\rangle_{Y \times Y}.$$
3. $\forall x \in Y$ we have $\langle x, x\rangle_{Y \times Y} = \langle x, x\rangle \geqslant 0$
4. $\forall x \in Y$ we have $\langle x, x\rangle_{|Y \times Y} \Rightarrow \langle x, x\rangle = 0 \Rightarrow x = 0$ □

The inner product has the following properties.

Theorem 18.3. *Let $\langle X, \langle\rangle\rangle$ be a real inner product space then we have*

1. $\forall x, y, z \in X$ *we have:*
   a. $\langle x + y, z\rangle = \langle x, z\rangle + \langle y, z\rangle$
   b. $\langle z, x + y\rangle = \langle z, x\rangle + \langle z, y\rangle$
2. $\forall x \in X$ *we have* $\langle x, 0\rangle = \langle 0, x\rangle = 0$
3. *Let* $y, z \in X$ *then if* $\forall x \in X$ *we have* $\langle x, y\rangle = \langle x, z\rangle$ *then* $y = z$
4. $\forall x, y \in X$ *and* $\alpha \in \mathbb{R}$ *then*
   a. $\langle \alpha \cdot x, y\rangle = \alpha \cdot \langle x, y\rangle$
   b. $\langle x, \alpha \cdot y\rangle = \alpha \cdot \langle x, y\rangle$

Proof.

1. Given x, y, z we have:
   a. $\langle x + y, z\rangle = \langle x + 1 \cdot y, z\rangle = \langle x, z\rangle + 1 \cdot \langle y, z\rangle = \langle x, z\rangle + \langle y, z\rangle$

b. $\langle z, x+y\rangle = \langle x+y, z\rangle \underset{(1.a)}{=} \langle x, z\rangle + \langle y, z\rangle = \langle z, x\rangle + \langle z, y\rangle$

2. $\forall x \in X$ we have $\langle x, 0\rangle = \langle 0, x\rangle = \langle 0 \cdot 0, x\rangle = 0 \cdot \langle 0, x\rangle = 0$
3. We have

$$\begin{aligned}\langle z-y, y\rangle &= \langle z-y, z\rangle \\ &= \langle z-y, (z-y)+y\rangle \\ &= \langle z-y, z-y\rangle + \langle z-y, y\rangle\end{aligned}$$

so that $\langle z-y, z-y\rangle = 0$. Hence $z-y=0$ or $z=y$.

4. Given $x, y \in X$ and $\alpha \in \mathbb{R}$ we have:

a. $\langle \alpha \cdot x, y\rangle = \langle 0 + \alpha \cdot x, y\rangle = \langle 0, x\rangle + \alpha \cdot \langle x, y\rangle \underset{(2)}{=} \alpha \cdot \langle x, y\rangle$

b. $\langle x, \alpha \cdot y\rangle = \langle \alpha \cdot y, x\rangle = \alpha \cdot \langle y, x\rangle = \alpha \cdot \langle x, y\rangle$

□

Example 18.4. Let $n \in \mathbb{N}$ and define

$$\langle\rangle : \mathbb{R}^n \times \mathbb{R}^n \to \mathbb{R} \text{ by } \langle x, y\rangle = \sum_{i=1}^{n} x_i \cdot y_i$$

then

$$\langle \mathbb{R}, \langle\rangle\rangle \text{ is a real inner product space}$$

Proof.

1. If $x, y \in \mathbb{R}^n$ then $\langle x, y\rangle = \sum_{i=1}^n x_i \cdot y_i = \sum_{i=1}^n y_i \cdot x_i = \langle x, y\rangle$
2. If $x, y, z \in \mathbb{R}^n$ and $\alpha \in \mathbb{R}$ then we have

$$\begin{aligned}\langle x + \alpha \cdot y, z\rangle &= \sum_{i=1}^{n} (x_i + \alpha \cdot y_i) \cdot z_i \\ &= \sum_{i=1}^{n} (x_i \cdot z_i + \alpha \cdot y_i \cdot z_i) \\ &= \sum_{i=1}^{n} x_i \cdot z_i + \alpha \cdot \sum_{i=1}^{n} y_i \cdot z_i \\ &= \langle x, z\rangle + \alpha \cdot \langle y, z\rangle\end{aligned}$$

3. If $x \in X$ then we have trivially $0 \leqslant \sum_{i=1}^n x_i^2 = \langle x, x\rangle$.
4. Let $x \in X$ with $\langle x, x\rangle = 0$. Assume that $x \neq 0$ then there exist a $k \in \{1, \ldots, n\}$ such that $x_k \neq 0$. Hence $0 < x_k^2 \leqslant \sum_{i=1}^n x_i^2 = \langle x, x\rangle = 0$ which leads to the contradiction $0 < 0$ so that we must have $x = 0$. □

Definition 18.5. *A **complex inner product space** is a pair $\langle X, \langle\rangle\rangle$ where X is a vector space over the field $\mathbb{C}$ together with a mapping [the **inner product**]*

$$\langle\rangle : X \times X \to \mathbb{C} \text{ where } \langle\rangle(x, y) \text{ is noted as } \langle x, y\rangle$$

satisfying:

1. $\forall x, y \in X$ *we have* $\langle x, y\rangle = \overline{\langle y, x\rangle}$
2. $\forall x, y, z \in X$ *and* $\forall \alpha \in \mathbb{R}$ *we have* $\langle x + \alpha \cdot y, z\rangle = \langle x, z\rangle + \alpha \cdot \langle y, z\rangle$
3. $\forall x \in X$ *we have* $0 \leqslant \langle x, x\rangle$
4. $\forall x \in X$ *we have* $\langle x, x\rangle = 0 \Rightarrow x = 0$

***Note* 18.6.** *As $\langle x, x\rangle = \overline{\langle x, x\rangle}$ it follows from [theorem: 10.82] that $\langle x, x\rangle \in \mathbb{R}$ so that (3) makes sense.*

***Note* 18.7.** *In physics definition (2) is changed to*

$$\forall x, y, z \in X \text{ and } \forall \alpha \in \mathbb{C} \text{ we have } \langle x, y + \alpha \cdot z\rangle = \langle x, y\rangle + \alpha \cdot \langle y, z\rangle$$

we use the mathematical convention here.

Theorem 18.8. *Let $\langle X, \langle\rangle\rangle$ be a real inner product space and $Y \subseteq X$ a subspace of X then $\left\langle Y, \langle\rangle_{|Y\times Y}\right\rangle$ is a real inner product space.*

Proof.

1. $\forall x, y \in Y$ we have $\langle x, y\rangle_{|Y\times Y} = \langle x, y\rangle = \langle y, x\rangle = \langle y, x\rangle_{|Y\times Y}$.
2. $\forall x, y, z \in Y$ and $\forall \alpha \in \mathbb{R}$ we have
$$\langle x + \alpha \cdot y, z\rangle_{|Y\times Y} = \langle x + \alpha \cdot y, z\rangle = \langle x, z\rangle + \alpha \cdot \langle y, z\rangle = \langle x, z\rangle_{|Y\times Y} + \alpha \cdot \langle y, z\rangle_{Y\times Y}.$$
3. $\forall x \in Y$ we have $\langle x, x\rangle_{Y\times Y} = \langle x, x\rangle \geqslant 0$
4. $\forall x \in Y$ we have $\langle x, x\rangle_{|Y\times Y} \Rightarrow \langle x, x\rangle = 0 \Rightarrow x = 0$ □

Example 18.9. Let $n \in \mathbb{N}$ and define
$$\langle\rangle : \mathbb{C}^n \times \mathbb{C}^n \to \mathbb{C} \text{ by } \langle x, y\rangle = \sum_{i=1}^{n} x_i \cdot \overline{y_i}$$
then
$$\langle \mathbb{C}, \langle\rangle\rangle \text{ is a inner product space}$$

Proof.

1. If $x, y \in \mathbb{C}^n$ then
$$\begin{aligned}
\langle x, y\rangle &= \sum_{i=1}^{n} x_i \cdot \overline{y_i} \\
&\underset{\text{[theorem: 10.82]}}{=} \sum_{i=1}^{n} \overline{\overline{x}} \cdot \overline{y_i} \\
&\underset{\text{[theorem: 10.82]}}{=} \sum_{i=1}^{n} \overline{\overline{x_i} \cdot y_i} \\
&\underset{\text{[theorem: 10.82]}}{=} \overline{\sum_{i=1}^{n} y_i \cdot \overline{x_i}} \\
&= \overline{\langle y, x\rangle}
\end{aligned}$$
2. If $x, y, z \in \mathbb{R}^n$ and $\alpha \in \mathbb{R}$ then we have
$$\begin{aligned}
\langle x + \alpha \cdot y, z\rangle &= \sum_{i=1}^{n} (x_i + \alpha \cdot y_i) \cdot z_i \\
&= \sum_{i=1}^{n} (x_i \cdot z_i + \alpha \cdot y_i \cdot z_i) \\
&= \sum_{i=1}^{n} x_i \cdot z_i + \alpha \cdot \sum_{i=1}^{n} y_i \cdot z_i \\
&= \langle x, z\rangle + \alpha \cdot \langle y, z\rangle
\end{aligned}$$
3. If $x \in X$ then we have trivially $0 \leqslant \sum_{i=1}^{n} |x_i|^2 \underset{\text{[theorem: 10.84]}}{=} \sum_{i=1}^{n} x_i \cdot \overline{x_i} = \langle x, x\rangle$.
4. Let $x \in X$ with $\langle x, x\rangle = 0$. Assume that $x \neq 0$ then there exist a $k \in \{1, \ldots, n\}$ such that $x_k \neq 0$. Hence $0 < |x_k|^2 \leqslant \sum_{i=1}^{n} |x_i|^2 = \langle x, x\rangle = 0$ which leads to the contradiction $0 < 0$ so that we must have $x = 0$. □

Theorem 18.10. *Let $\langle X, \langle\rangle\rangle$ be a complex inner product space then we have*

1. *$\forall x \in X$ we have $\langle x, x\rangle \in \mathbb{R}$*
2. *$\forall x, y, z \in X$ we have:*
   a. *$\langle x + y, z\rangle = \langle x, z\rangle + \langle y, z\rangle$*
   b. *$\langle z, x + y\rangle = \langle z, x\rangle + \langle z, y\rangle$*

3. *Let $y, z \in X$ then if $\forall x \in X$ we have $\langle x, y\rangle = \langle x, z\rangle$ then $y = z$*
4. *$\forall x \in X$ we have $\langle x, 0\rangle = \langle 0, x\rangle = 0$*
5. *$\forall x, y \in X$ and $\alpha \in \mathbb{R}$ then*
   a. *$\langle \alpha \cdot x, y\rangle = \alpha \cdot \langle x, y\rangle$*
   b. *$\langle x, \alpha \cdot y\rangle = \overline{\alpha} \cdot \langle x, y\rangle$*

Proof.

1. Let $x \in X$ then $\langle x, x\rangle = \overline{\langle x, x\rangle}$ so that by [theorem: 10.82] $\langle x, x\rangle \in \mathbb{R}$.
2. Let $x, y, z \in X$ then we have:
   a. $\langle x + y, z\rangle = \langle x + 1 \cdot y, z\rangle = \langle x, z\rangle + 1 \cdot \langle y, z\rangle = \langle x, z\rangle + \langle y, z\rangle$
   b. $\langle z, x + y\rangle = \overline{\langle x + y, z\rangle} = \overline{\langle x, z\rangle + \langle y, z\rangle} \underset{\text{[theorem: 10.82]}}{=} \overline{\langle x, z\rangle} + \overline{\langle y, z\rangle} = \langle z, x\rangle + \langle z, y\rangle$
3. We have
$$\begin{aligned} \langle z - y, y\rangle &= \langle z - y, z\rangle \\ &= \langle z - y, (z - y) + y\rangle \\ &= \langle z - y, z - y\rangle + \langle z - y, y\rangle \end{aligned}$$
   so that $\langle z - y, z - y\rangle = 0$. Hence $z - y = 0$ or $z = y$.
4. $\forall x \in X$ we have $\langle 0, x\rangle = \langle 0 \cdot 0, x\rangle = 0 \cdot \langle 0, x\rangle = 0$ and $\langle x, 0\rangle = \overline{\langle 0, x\rangle} = \overline{0} = 0$
5. Let $x, y \in X$ and $\alpha \in \mathbb{C}$ then we have:
   a. $\langle \alpha \cdot x, y\rangle = \langle 0 + \alpha \cdot x, y\rangle = \langle 0, y\rangle + \alpha \cdot \langle x, y\rangle \underset{(2)}{=} \alpha \cdot \langle x, y\rangle$
   b. $\langle x, \alpha \cdot y\rangle = \overline{\langle \alpha \cdot y, x\rangle} = \overline{\alpha \cdot \langle y, x\rangle} \underset{\text{[theorem: 10.82]}}{=} \overline{\alpha} \cdot \overline{\langle y, x\rangle} = \overline{\alpha} \cdot \langle x, y\rangle$ □

We can use mathematical induction to extend [theorems: 18.3, 18.10] to finite sums.

Theorem 18.11. *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] inner product space, $n \in \mathbb{N}$, $y \in X$ and $\{x_i\}_{i \in \{1, \ldots, n\}} \subseteq X$ then*
$$\left\langle \sum_{i=1}^{n} x_i, y \right\rangle = \sum_{i=1}^{n} \langle x_i, y\rangle \text{ and } \left\langle y, \sum_{i=1}^{n} x_i \right\rangle = \sum_{i=1}^{n} \langle y, x_i\rangle$$

Proof. The first part is proved by induction, so define
$$S = \left\{ n \in \mathbb{N} | \text{If } y \in X,\ \{x_i\}_{i \in \{1, \ldots, n\}} \text{ then } \left\langle \sum_{i=1}^{n} x_i, y \right\rangle = \sum_{i=1}^{n} \langle x_i, y\rangle \right\}$$
then we have:

$1 \in S$. If $y \in X$, $\{x_i\}_{i \in \{1\}} \subseteq X$ then $\langle \sum_{i=1}^{1} x_i, y\rangle = \langle x_1, y\rangle = \sum_{i=1}^{1} \langle x_i, y\rangle$, hence $1 \in S$.

$n \in S \Rightarrow n + 1 \in S$. Let $y \in X$, $\{x_i\}_{i \in \{1, \ldots, n+1\}} \subseteq X$ then we have
$$\begin{aligned} \left\langle \sum_{i=1}^{n+1} x_i, y \right\rangle &= \left\langle x_{n+1} + \sum_{i=1}^{n} x_i, y \right\rangle \\ &= \langle x_{n+1}, y\rangle + \left\langle \sum_{i=1}^{n} x_i, y \right\rangle \\ &\underset{n \in S}{=} \langle x_{n+1}, y\rangle + \sum_{i=1}^{n} \langle x_i, y\rangle \\ &= \sum_{i=1}^{n+1} \langle x_i, y\rangle \end{aligned}$$
which proves that $n + 1 \in S$.

Hence by mathematical induction we have

$$\left\langle \sum_{i=1}^{n} x_i, y \right\rangle = \sum_{i=1}^{n} \langle x_i, y \rangle \tag{18.1}$$

For the second part we must make a distinction between real inner product spaces and complex inner product spaces.

real inner product space.

$$\left\langle y, \sum_{i=1}^{n} x_i \right\rangle = \left\langle \sum_{i=1}^{n} x_i, y \right\rangle \underset{\text{[eq: 18.1]}}{=} \sum_{i=1}^{n} \langle x_i, y \rangle = \sum_{i=1}^{n} \langle y, x_i \rangle$$

complex inner product space.

$$\left\langle y, \sum_{i=1}^{n} x_i \right\rangle = \overline{\left\langle \sum_{i=1}^{n} x_i, y \right\rangle} \underset{\text{[eq: 18.1]}}{=} \overline{\sum_{i=1}^{n} \langle x_i, y \rangle} \underset{\text{[theorem: 10.82]}}{=} \sum_{i=1}^{n} \overline{\langle x_i, y \rangle} = \sum_{i=1}^{n} \langle y, x_i \rangle$$

□

Theorem 18.12. *Let $\langle X, \langle\rangle \rangle$ be a **complex** inner product space, $L \in \mathrm{Hom}(X)$ then we have*

$$L = 0$$
$$\Updownarrow$$
$$\forall x \in X \text{ we have } \langle L(x), x \rangle = 0$$

Proof.

⇒. If $L = 0$ then we have $\forall x \in X$ that $\langle L(x), x \rangle = \langle 0(x), x \rangle = \langle 0, x \rangle \underset{\text{[theorem: 18.10]}}{=} 0$.

⇐. Let $x, y \in X$ then we have:

$$\begin{aligned}
\langle L(x+y), x+y \rangle - \langle L(x-y), x-y \rangle &= \\
\langle L(x) + L(y), x+y \rangle - \langle L(x) - L(y), x-y \rangle &= \\
\langle L(x), x \rangle + \langle L(x), y \rangle + \langle L(y), x+y \rangle - \langle L(x), x \rangle + \langle L(x), y \rangle - \langle L(y), x-y \rangle &= \\
2 \cdot \langle L(x), y \rangle + \langle L(y), x+y \rangle - \langle L(y), x-y \rangle &= \\
2 \cdot \langle L(x), y \rangle + \langle L(y), x \rangle + \langle L(y), y \rangle - \langle L(y), x \rangle + \langle L(y), y \rangle &= \\
2 \cdot \langle L(x), y \rangle + 2 \cdot \langle L(y), x \rangle &
\end{aligned}$$

proving that

$$\langle L(x+y), x+y \rangle - \langle L(x-y), x-y \rangle = 2 \cdot \langle L(x), y \rangle + 2 \cdot \langle L(y), x \rangle$$

Further we have that

$$\begin{aligned}
\langle L(x+i \cdot y), x+i \cdot y \rangle - \langle L(x-i \cdot y), x-i \cdot y \rangle &= \\
\langle L(x) + i \cdot L(y), x+i \cdot y \rangle - \langle L(x) - i \cdot L(y), x-i \cdot y \rangle &= \\
\langle L(x), x \rangle - i \cdot \langle L(x), y \rangle + \langle i \cdot L(y), x+i \cdot y \rangle - \langle L(x), x \rangle - \langle L(x), -i \cdot y \rangle + i \cdot \langle L(y), x-i \cdot y \rangle &= \\
-i \cdot \langle L(x), y \rangle + \langle i \cdot L(y), x+i \cdot y \rangle - \langle L(x), -i \cdot y \rangle + i \cdot \langle L(y), x-i \cdot y \rangle &= \\
-i \cdot \langle L(x), y \rangle + \langle i \cdot L(y), x+i \cdot y \rangle - i \cdot \langle L(x), y \rangle + i \cdot \langle L(y), x-i \cdot y \rangle &= \\
-2 \cdot i \cdot \langle L(x), y \rangle + \langle i \cdot L(y), x+i \cdot y \rangle + i \cdot \langle L(y), x-i \cdot y \rangle &= \\
-2 \cdot i \cdot \langle L(x), y \rangle + i \cdot \langle L(y), x \rangle + \langle L(y), y \rangle + i \cdot \langle L(y), x \rangle - \langle L(y), y \rangle &= \\
-2 \cdot i \cdot \langle L(x), y \rangle + 2 \cdot i \cdot \langle L(y), x \rangle &
\end{aligned}$$

Hence we have that

$$\begin{aligned}
\langle L(x+y), x+y \rangle - \langle L(x-y), x-y \rangle + i \cdot (\langle L(x+i \cdot y), x+i \cdot y \rangle - \langle L(x-i \cdot y), x-i \cdot y \rangle) &= \\
2 \cdot \langle L(x), y \rangle + 2 \cdot \langle L(y), x \rangle + i \cdot (-2 \cdot i \cdot \langle L(x), y \rangle + 2 \cdot i \cdot \langle L(y), x \rangle) &= \\
2 \cdot \langle L(x), y \rangle + 2 \cdot \langle L(y), x \rangle + 2 \cdot \langle L(x), y \rangle - 2 \cdot \langle L(y), x \rangle &= \\
4 \cdot \langle L(x), y \rangle &
\end{aligned}$$

As by the hypothesis $\langle L(x+y), x+y \rangle = 0$, $\langle L(x-y), x-y \rangle = 0$, $\langle L(x+i \cdot y), x+i \cdot y \rangle = 0$ and $\langle L(x-i \cdot y), x-i \cdot y \rangle = 0$ it follows that $\langle L(x), y \rangle = 0$. Take $y = L(x)$ then we have $\langle L(x), L(x) \rangle = 0$, hence we have $L(x) = 0$ for every $x \in X$ so that $L = 0$. □

Note 18.13. The proof of the above theorem works only for the complex case, later we will prove that on a real finite dimensional inner product space the theorem is true for self-adjoint operators. [see theorem: 18.90].

For finite dimensional vector spaces over $\mathbb{R}$ [or $\mathbb{C}$] we can always construct a inner product making it in a real [or complex] inner product space.

Theorem 18.14. *Let X be a finite dimensional vector space over the field $\mathbb{R}$ with a basis $\{e_1,\ldots,e_n\}$ then if we define $\langle\rangle: X\times X\to\mathbb{R}$ by*

$$\langle x,y\rangle=\sum_{i=1}^{n} x_i\cdot y_i$$

where $x=\sum_{i=1}^{n} x_i\cdot e_i$ and $y=\sum_{i=1}^{n} y_i\cdot e_i$ are the unique expansions of x,y in the basis $\{e_1,\ldots,e_n\}$.

Proof.

1. If $x,y\in X$ with $x=\sum_{i=1}^{n} x_i\cdot e_i$ and $y=\sum_{i=1}^{n} y_i\cdot e_i$ then
$$\langle x,y\rangle=\sum_{i=1}^{n} x_i\cdot y_i=\sum_{i=1}^{n} y_i\cdot x_i=\langle y,x\rangle$$
2. If $a\in\mathbb{R}$, $x,y,z\in X$ with $x=\sum_{i=1}^{n} x_i\cdot e_i$, $y=\sum_{i=1}^{n} y_i\cdot e_i$ and $z=\sum_{i=1}^{n} z_i\cdot e_i$ then
$$x+\alpha\cdot y=\sum_{i=1}^{n} x_i\cdot e_i+\alpha\cdot\sum_{i=1}^{n} y_i\cdot e_i=\sum_{i=1}^{n}(x_i+\alpha\cdot y_i)\cdot e_i$$
so that
$$\begin{aligned}\langle x+\alpha\cdot y,z\rangle &= \sum_{i=1}^{n}(x_i+\alpha\cdot y_i)\cdot z_i\\ &= \sum_{i=1}^{n}(x_i\cdot z_i+\alpha\cdot y_i\cdot z_i)\\ &= \sum_{i=1}^{n} x_i\cdot z_i+\alpha\cdot\sum_{i=1}^{n} y_i\cdot z_i\\ &= \langle x,z\rangle+\alpha\cdot\langle y,z\rangle\end{aligned}$$
3. If $x\in X$ with $x=\sum_{i=1}^{n} x_i\cdot e_i$ then
$$0\leqslant\sum_{i=1}^{n} x_i^2=\sum_{i=1}^{n} x_i\cdot x_i=\langle x,x\rangle$$
4. Let $x\in X$ with $x=\sum_{i=1}^{n} x_i\cdot e_i$ and $\langle x,x\rangle=0$. Assume that $x\neq 0$ then there exist a $k\in\{1,\ldots,n\}$ such that $x_k\neq 0$. Hence $0<x_k^2\leqslant\sum_{i=1}^{n} x_i^2=\langle x,x\rangle=0$ leading to the contradiction $0<0$, so we must have $x=0$. □

Theorem 18.15. *Let X be a finite dimensional vector space over the field $\mathbb{C}$ with a basis $\{e_1,\ldots,e_n\}$ then if we define $\langle\rangle: X\times X\to\mathbb{C}$ by*

$$\langle x,y\rangle=\sum_{i=1}^{n} x_i\cdot\overline{y_i}$$

where $x=\sum_{i=1}^{n} x_i\cdot e_i$ and $y=\sum_{i=1}^{n} y_i\cdot e_i$ are the unique expansions of x,y in the basis $\{e_1,\ldots,e_n\}$.

Proof.

1. If $x,y\in X$ with $x=\sum_{i=1}^{n} x_i\cdot e_i$ and $y=\sum_{i=1}^{n} y_i\cdot e_i$ then
$$\begin{aligned}\langle x,y\rangle &= \sum_{i=1}^{n} x_i\cdot\overline{y_i}\\ &\underset{\text{[theorem: 10.82]}}{=} \sum_{i=1}^{n}\overline{\overline{x}}\cdot\overline{y_i}\\ &\underset{\text{[theorem: 10.82]}}{=} \sum_{i=1}^{n}\overline{\overline{x_i}\cdot y_i}\\ &\underset{\text{[theorem: 10.82]}}{=} \overline{\sum_{i=1}^{n} y_i\cdot\overline{x_i}}\\ &= \overline{\langle y,x\rangle}\end{aligned}$$

2. If $a \in \mathbb{R}$, $x, y, z \in X$ with $x = \sum_{i=1}^{n} x_i \cdot e_i$, $y = \sum_{i=1}^{n} y_i \cdot e_i$ and $z = \sum_{i=1}^{n} z_i \cdot e_i$ then
$$x + \alpha \cdot y = \sum_{i=1}^{n} x_i \cdot e_i + \alpha \cdot \sum_{i=1}^{n} y_i \cdot e_i = \sum_{i=1}^{n} (x_i + \alpha \cdot y_i) \cdot e_i$$
so that
$$\begin{aligned} \langle x + \alpha \cdot y, z \rangle &= \sum_{i=1}^{n} (x_i + \alpha \cdot y_i) \cdot z_i \\ &= \sum_{i=1}^{n} (x_i \cdot z_i + \alpha \cdot y_i \cdot z_i) \\ &= \sum_{i=1}^{n} x_i \cdot z_i + \alpha \cdot \sum_{i=1}^{n} y_i \cdot z_i \\ &= \langle x, z \rangle + \alpha \cdot \langle y, z \rangle \end{aligned}$$
3. If $x \in X$ with $x = \sum_{i=1}^{n} x_i \cdot e_i$ then
$$0 \leqslant \sum_{i=1}^{n} |x_i|^2 = \sum_{i=1}^{n} x_i \cdot \overline{x}_i = \langle x, x \rangle$$
4. Let $x \in X$ with $x = \sum_{i=1}^{n} x_i \cdot e_i$ and $\langle x, x \rangle = 0$. Assume that $x \neq 0$ then there exist a $k \in \{1, \ldots, n\}$ such that $x_k \neq 0$. Hence $0 < |x_k|^2 \leqslant \sum_{i=1}^{n} |x_i|^2 = \sum_{i=1}^{n} x_i \cdot \overline{x_i} = \langle x, x \rangle = 0$ leading to the contradiction $0 < 0$, so we must have $x = 0$. □

18.2 Inner product norm

Given a inner product we can use the inner product to define a norm, the inner product norm.

Definition 18.16. *Let $\langle X, \langle\rangle \rangle$ be a real [or complex] inner product space then the* ***inner product norm*** *is defined by*
$$\|\|: X \to \mathbb{R} \text{ where } \|x\| = \sqrt{\langle x, x \rangle}$$

***Note* 18.17.** *As $\langle x, x \rangle \in \mathbb{R}$ and $0 \leqslant \langle x, x \rangle$ we can indeed take the square root of $\langle x, x \rangle$ and $0 \leqslant \|x\|$.*

As the name suggest the inner product norm is actually a norm., before we can prove this we must first proof a important inequality due Schwartz's.

Theorem 18.18. *Let $\langle X, \langle\rangle \rangle$ be a inner product space then and $\|\|$ the inner product norm then $\forall x, y \in X$ we have*
$$|\langle x, y \rangle| \leqslant \|x\| \cdot \|y\|$$
Further we have the following equivalence:
$$x, y \text{ are linear dependent } \Leftrightarrow |\langle x, y \rangle| = \|x\| \cdot \|y\|$$

Proof. We have the following cases to consider for x, $y \in X$:

$\boldsymbol{x = 0}$**.** then x and y are linear dependent. Further we have
$$\begin{aligned} |\langle 0, y \rangle| &\underset{\text{[theorems: 18.3, 18.10]}}{=} 0 \\ &= 0 \cdot \|y\| \\ &\underset{\text{[theorems: 18.3, 18.10]}}{=} |\langle 0, 0 \rangle| \cdot \|y\| \\ &= \|x\| \cdot \|y\| \end{aligned}$$

$\boldsymbol{y = 0}$**.** then x and y are linear dependent. Further we have
$$\begin{aligned} |\langle x, 0 \rangle| &\underset{\text{[theorems: 18.3, 18.10]}}{=} 0 \\ &= \|x\| \cdot 0 \\ &\underset{\text{[theorems: 18.3, 18.10]}}{=} \|x\| \cdot |\langle 0, 0 \rangle| \\ &= \|x\| \cdot \|y\| \end{aligned}$$

$x \neq 0 \wedge y \neq 0$. Then $\langle y, y\rangle \neq 0$ [otherwise by [theorems: 18.3, 18.10] we would have $y = 0$] so that we can define

$$\alpha = -\frac{\langle x, y\rangle}{\langle y, y\rangle} = -\frac{\langle x, y\rangle}{\|y\|^2}$$

We have now consider two cases:

real inner product. Then we have

$$\begin{aligned}
0 &\leqslant \langle x + \alpha \cdot y, x + \alpha \cdot y\rangle \\
&= \langle x, x + \alpha \cdot y\rangle + \alpha \cdot \langle y, x + \alpha \cdot y\rangle \\
&\underset{\text{[theorem: 18.3]}}{=} \langle x, x\rangle + \alpha \cdot \langle x, y\rangle + \alpha \cdot \langle y, x\rangle + \alpha^2 \cdot \langle y, y\rangle \\
&= \|x\|^2 + 2 \cdot \alpha \cdot \langle x, y\rangle + \alpha^2 \cdot \|y\|^2 \\
&= \|x\|^2 - 2 \cdot \frac{\langle x, y\rangle}{\|y\|^2} \cdot \langle x, y\rangle + \frac{\langle x, y\rangle^2}{\|y\|^4} \cdot \|y\|^2 \\
&= \|x\|^2 - 2 \cdot \frac{\langle x, y\rangle^2}{\|y\|^2} + \frac{\langle x, y\rangle^2}{\|y\|^2} \\
&= \|x\|^2 - \frac{\langle x, y\rangle^2}{\|y\|^2}
\end{aligned}$$

hence $\langle x, y\rangle^2 \leqslant \|x\|^2 \cdot \|y\|^2$. As the square root is increasing [see theorem: 10.70] we have that

$$|\langle x, y\rangle| \underset{\text{[theorem: 10.72]}}{=} \sqrt{\langle x, y\rangle^2} \leqslant \sqrt{\|x\|^2 \cdot \|y\|^2} \underset{\text{[theorem: 10.72]}}{=} |\|x\| \cdot \|y\|| = \|x\| \cdot \|y\|$$

or

$$|\langle x, y\rangle| \leqslant \|x\| \cdot \|y\|$$

Further if x, y are linear dependent then there exist a $\beta \in \mathbb{R}$ with either:

$x = \beta \cdot y$. Then

$$|\langle x, y\rangle|^2 = \langle \beta \cdot y, y\rangle \cdot \langle x, y\rangle = \beta \cdot \langle y, y\rangle \cdot \langle x, y\rangle = \langle y, y\rangle \cdot \langle x, x\rangle = \|x\|^2 \cdot \|y\|^2$$

so that by [theorem: 10.72]

$$|\langle x, y\rangle| = \|x\| \cdot \|y\|$$

$y = \beta \cdot x$. Then

$$|\langle x, y\rangle|^2 = \langle x, \beta \cdot x\rangle \cdot \langle x, y\rangle = \beta \cdot \langle x, x\rangle \cdot \langle x, y\rangle = \langle x, x\rangle \cdot \langle y, y\rangle = \|x\|^2 \cdot \|y\|^2$$

so that by [theorem: 10.72]

$$|\langle x, y\rangle| = \|x\| \cdot \|y\|$$

So we have proved that

$$\text{If } x, y \text{ are linear dependent then } |\langle x, y\rangle| = \|x\| \cdot \|y\|$$

For the opposite implication. Assume that $|\langle x, y\rangle| = \|x\| \cdot \|y\|$ then we have

$$\begin{aligned}
\langle \langle y, y\rangle \cdot x - \langle x, y\rangle \cdot y, \langle y, y\rangle \cdot x - \langle x, y\rangle \cdot y\rangle &= \\
\langle y, y\rangle^2 \cdot \langle x, x\rangle - \langle y, y\rangle \cdot \langle x, y\rangle \cdot \langle x, y\rangle - \langle x, y\rangle \cdot \langle y, y\rangle \cdot \langle y, x\rangle + \langle x, y\rangle \cdot \langle x, y\rangle \cdot \langle y, y\rangle &= \\
\langle y, y\rangle^2 \cdot \langle x, x\rangle - 2 \cdot \langle y, y\rangle \cdot \langle x, y\rangle^2 + \langle x, y\rangle^2 \cdot \langle y, y\rangle &= \\
\|y\|^4 \cdot \|x\|^2 - 2 \cdot \|y\|^2 \cdot \langle x, y\rangle^2 + \langle x, y\rangle^2 \cdot \|y\|^2 &= \\
\|y\|^4 \cdot \|x\|^2 - 2 \cdot \|y\|^2 \cdot \|x\|^2 \cdot \|y\|^2 + \|x\|^2 \cdot \|y^2\| \cdot \|y\|^2 & \\
\|y\|^4 \cdot \|x\|^2 - 2 \cdot \|y\|^4 \cdot \|x^2\| + \|y\|^4 \cdot \|x\|^2 &= 0
\end{aligned}$$

so that $\langle y, y\rangle \cdot x - \langle x, y\rangle \cdot y = 0$. Hence $\|y\|^2 \cdot x = \langle x, y\rangle \cdot y$ or as $\|y\|^2 \neq 0$ that $x = \frac{\langle x, y\rangle}{\|y\|^2} \cdot y$. This proves that

$$\text{If } |\langle x, y\rangle| = \|x\| \cdot \|y\| \text{ then } x, y \text{ are linear dependent}$$

complex inner product. Then we have

$$\begin{aligned}
0 &\leqslant \langle x+\alpha\cdot y, x+\alpha\cdot y\rangle \\
&= \langle x, x+\alpha\cdot y\rangle + \alpha\cdot\langle y, x+\alpha\cdot y\rangle \\
&\underset{\text{[theorem: 18.10]}}{=} \langle x,x\rangle + \overline{\alpha}\cdot\langle x,y\rangle + \alpha\cdot\langle y,x\rangle + \alpha\cdot\overline{\alpha}\cdot\langle y,y\rangle \\
&= \|x\|^2 + \overline{\alpha}\cdot\langle x,y\rangle + \alpha\cdot\overline{\langle x,y\rangle} + \alpha\cdot\overline{\alpha}\cdot\|y\|^2 \\
&= \|x\|^2 - \frac{\overline{\langle x,y\rangle}}{\|y\|^2}\cdot\langle x,y\rangle - \frac{\langle x,y\rangle}{\|y\|^2}\cdot\overline{\langle x,y\rangle} + \frac{|\langle x,y\rangle|^2}{\|y\|^4}\cdot\|y\|^2 \\
&= \|x\|^2 - 2\cdot\frac{|\langle x,y\rangle|^2}{\|y\|^2} + \frac{|\langle x,y\rangle|^2}{\|y\|^2} \\
&= \|x\|^2 - \frac{|\langle x,y\rangle|^2}{\|y\|^2}
\end{aligned}$$

hence $\langle x,y\rangle^2 \leqslant \|x\|^2\cdot\|y\|^2$. As the square root is increasing [see theorem: 10.70] we have that

$$|\langle x,y\rangle| \underset{\text{[theorem: 10.72]}}{=} \sqrt{\langle x,y\rangle^2} \leqslant \sqrt{\|x\|^2\cdot\|y\|^2} \underset{\text{[theorem: 10.72]}}{=} |\|x\|\cdot\|y\|| = \|x\|\cdot\|y\|$$

or

$$|\langle x,y\rangle| \leqslant \|x\|\cdot\|y\|$$

Further if x, y are linear dependent then there exist a $\beta\in\mathbb{C}$ such that either

$\boldsymbol{x=\beta\cdot y}$**.** Then

$$\begin{aligned}
|\langle x,y\rangle|^2 &= \langle x,y\rangle\cdot\overline{\langle x,y\rangle} \\
&= \langle \beta\cdot y, y\rangle\cdot\overline{\langle x,y\rangle} \\
&= \langle y,y\rangle\cdot\beta\cdot\langle y,x\rangle \\
&= \langle y,y\rangle\cdot\langle x,x\rangle \\
&= \|x\|^2\cdot\|y\|^2
\end{aligned}$$

so that by [theorem: 10.72]

$$|\langle x,y\rangle| = \|x\|\cdot\|y\|$$

$\boldsymbol{y=\beta\cdot x}$**.** Then

$$\begin{aligned}
|\langle x,y\rangle|^2 &= \langle x,y\rangle\cdot\overline{\langle x,y\rangle} \\
&\quad \langle x,y\rangle\cdot\langle y,x\rangle \\
&\quad \langle x,y\rangle\cdot\beta\cdot\langle x,x\rangle \\
&\quad \langle y,y\rangle\cdot\langle x,x\rangle \\
&\quad \|x\|^2\cdot\|y\|^2
\end{aligned}$$

$$|\langle x,y\rangle|^2 = \|x\|\cdot\|y\|$$

so that by [theorem: 10.72]

$$|\langle x,y\rangle| = \|x\|\cdot\|y\|$$

So we have proved that

$$\text{If } x, y \text{ are linear dependent then } |\langle x,y\rangle| = \|x\|\cdot\|y\|$$

For the opposite implication. Assume that $|\langle x,y\rangle| = \|x\|\cdot\|y\|$ then we have

$$\begin{aligned}
\langle\langle y,y\rangle\cdot x - \langle x,y\rangle\cdot y, \langle y,y\rangle\cdot x - \langle x,y\rangle\cdot y\rangle &= \\
\langle y,y\rangle^2\cdot\langle x,x\rangle - \langle y,y\rangle\cdot\overline{\langle x,y\rangle}\cdot\langle x,y\rangle - \langle x,y\rangle\cdot\langle y,y\rangle\cdot\langle y,x\rangle + \langle x,y\rangle\cdot\overline{\langle x,y\rangle}\cdot\langle y,y\rangle &= \\
\|y\|^4\cdot\|x\|^2 - \|y\|^2\cdot|\langle x,y\rangle|^2 - \|y\|^2\cdot|\langle x,y\rangle|^2 + |\langle x,y\rangle|^2\cdot\|y\|^2 &= \\
\|y\|^4\cdot\|x\|^2 - \|y\|^2\cdot\|x\|^2\cdot\|y\|^2 - \|y\|^2\cdot\|y\|^2\cdot\|x\|^2 + \|x\|^2\cdot\|y\|^2\cdot\|y\|^2 &= \\
\|y\|^4\cdot\|x\|^2 - \|y\|^4\cdot\|x\|^2 - \|y\|^4\cdot\|x\|^2 + \|x\|^2\cdot\|y\|^4 &= \\
0
\end{aligned}$$

so that $\langle y, y\rangle \cdot x - \langle x, y\rangle \cdot y = 0$. Hence $\|y\|^2 \cdot x = \langle x, y\rangle \cdot y$ or as $\|y\|^2 \neq 0$ that $x = \frac{\langle x, y\rangle}{\|y\|^2} \cdot y$. This proves that

$$\text{If } |\langle x, y\rangle| = \|x\| \cdot \|y\| \text{ then } x, y \text{ are linear dependent}$$ □

Theorem 18.19. *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] inner product space then the inner product norm $\|\|$ defined above is a norm on X making $\langle X, \|\|\rangle$ a normed space.*

Proof. We have for $\langle X, \langle\rangle\rangle$ two cases to consider:

real inner product. Then we have:

1. If $x \in X$ then $0 \leqslant \sqrt{\langle x, x\rangle} = \|x\|$ [see 10.66]
2. If $\alpha \in X$ then

$$\begin{aligned}
\|\alpha \cdot x\| &= \sqrt{\langle \alpha \cdot x, \alpha \cdot x\rangle} \\
&= \sqrt{\langle \alpha \cdot x, \alpha \cdot x\rangle} \\
&= \sqrt{\alpha \cdot \alpha \cdot \langle x, x\rangle} \\
&= \sqrt{\alpha^2 \cdot \langle x, x\rangle} \\
&\underset{\text{[theorem: 10.73]}}{=} \sqrt{\alpha^2} \cdot \sqrt{\langle x, x\rangle} \\
&\underset{\text{[theorem: 10.72]}}{=} |\alpha| \cdot \sqrt{\langle x, x\rangle} \\
&= |\alpha| \cdot \|x\|
\end{aligned}$$

3. If $x, y \in X$ then we have

$$\begin{aligned}
\|x + y\|^2 &= \langle x + y, x + y\rangle \\
&= \langle x, x + y\rangle + \langle y, x + y\rangle \\
&= \langle x, x\rangle + \langle x, y\rangle + \langle y, x\rangle + \langle y, y\rangle \\
&= \|x\|^2 + \langle x, y\rangle + \langle x, y\rangle + \|y\|^2 \\
&= \|x\|^2 + \langle x, y\rangle + \langle x, y\rangle + \|y\|^2 \\
&= \|x\|^2 + 2 \cdot \langle x, y\rangle + \|y\|^2 \\
&\leqslant \|x\|^2 + 2 \cdot |\langle x, y\rangle| + \|y\|^2 \\
&\leqslant_{|\text{theorem: 18.18}]} \|x\|^2 + 2 \cdot \|x\| \cdot \|y\| + \|y\|^2 \\
&= (\|x\| + \|y\|)^2
\end{aligned}$$

   which as the square root is strictly increasing [see theorem: 10.70] proves that

$$\|x + y\| \leqslant \|x\| + \|y\|$$

4. If $\|x\| = 0$ then $\langle x, x\rangle = \|x\|^2 = 0$ so that $x = 0$.

complex inner product. Then we have:

1. If $x \in X$ then $0 \leqslant \sqrt{\langle x, x\rangle} = \|x\|$ [see 10.66]
2. If $\alpha \in X$ then

$$\begin{aligned}
\|\alpha \cdot x\| &= \sqrt{\langle \alpha \cdot x, \alpha \cdot x\rangle} \\
&= \sqrt{\langle \alpha \cdot x, \alpha \cdot x\rangle} \\
&= \sqrt{\alpha \cdot \overline{\alpha} \cdot \langle x, x\rangle} \\
&= \sqrt{|\alpha|^2 \cdot \langle x, x\rangle} \\
&\underset{\text{[theorem: 10.73]}}{=} \sqrt{|\alpha|^2} \cdot \sqrt{\langle x, x\rangle} \\
&\underset{\text{[theorem: 10.72]}}{=} |\alpha| \cdot \sqrt{\langle x, x\rangle} \\
&= |\alpha| \cdot \|x\|
\end{aligned}$$

3. If $x, y \in X$ then we have

$$\begin{aligned}
\|x+y\|^2 &= \langle x+y, x+y\rangle \\
&= \langle x, x+y\rangle + \langle y, x+y\rangle \\
&= \langle x, x\rangle + \langle x, y\rangle + \langle y, x\rangle + \langle y, y\rangle \\
&= \|x\|^2 + \langle x, y\rangle + \overline{\langle x, y\rangle} + \|y\|^2 \\
&\underset{\text{[theorem: 10.82]}}{=} \|x\|^2 + 2\cdot \mathrm{Re}(\langle x, y\rangle) + \|y\|^2 \\
&\leqslant_{\text{[theorem: 10.84}} \|x\|^2 + 2\cdot |\langle x, y\rangle| + \|y\|^2 \\
&\leqslant_{\text{[theorem: 18.18]}} \|x\|^2 + 2\cdot \|x\|\cdot\|y\| + \|y\|^2 \\
&= (\|x\| + \|y\|)^2
\end{aligned}$$

which as the square root is strictly increasing [see theorem: 10.70] proves that

$$\|x+y\| \leqslant \|x\| + \|y\|$$

4. If $\|x\| = 0$ then $\langle x, x\rangle = \|x\|^2 = 0$ so that $x = 0$. □

Example 18.20. Let $n \in \mathbb{N}$ then $\langle \mathbb{R}^n, \|\|_e\rangle$ where $\|x\|_e = \sqrt{\sum_{i=1}^n x_i^2}$ is a normed space. $\|\|_e$ is called the Euclidean norm on $\mathbb{R}^n$.

Proof. Using [example: 18.4] $\langle \mathbb{R}, \langle\rangle\rangle$ where $\langle x, y\rangle = \sum_{i=1}^n x_i \cdot y_i$ is a real inner product space. Hence by [theorem: 18.19] $\|\|_e$ defined by $\|x\|_e = \sqrt{\langle x, x\rangle} = \sqrt{\sum_{i=1}^n x_i \cdot x_i} = \sqrt{\sum_{i=1}^n x_i^2}$ is a norm on $\mathbb{R}$. □

Example 18.21. Let $n \in \mathbb{N}$ then $\langle \mathbb{C}^n, \|\|_e\rangle$ where $\|x\|_e = \sqrt{\sum_{i=1}^n |x_i|^2}$ is a normed space. $\|\|_e$ is called the Euclidean norm on $\mathbb{C}^n$.

Proof. Using [example: 18.9] $\langle \mathbb{C}, \langle\rangle\rangle$ where $\langle x, y\rangle = \sum_{i=1}^n x_i \cdot \overline{y_i}$ is a real inner product space. Hence by [theorem: 18.19] $\|\|_e$ defined by $\|x\|_e = \sqrt{\langle x, x\rangle} = \sqrt{\sum_{i=1}^n x_i \cdot \overline{x_i}} = \sqrt{\sum_{i=1}^n |x_i|^2}$ is a norm on $\mathbb{C}$. □

We can extend the above two examples to all finite dimensional spaces.

Example 18.22. Let $n \in \mathbb{N}$, X a finite dimensional space over $\mathbb{R}$ with $E = \{e_1, \ldots, e_n\}$ a basis of X then $\|\|_e$,defined by $\|x\|_e = \sqrt{\sum_{i=1}^n x_i^2}$ where $x = \sum_{i=1}^n x_i \cdot e_i$, is a norm on X.

Proof. Using [theorem: 18.14] we have that $\langle\rangle$, defined by $\langle x, y\rangle = \sum_{i=1}^n x_i \cdot y_i$ where $x = \sum_{i=1}^n x_i \cdot e_i$, $y = \sum_{i=1}^n y_i \cdot e_i$, is a inner product on X. Hence by [theorem: 18.19] $\|\|_e$ defined by $\|x\|_e = \sqrt{\langle x, x\rangle} = \sum_{i=1}^n x_i \cdot x_i = \sum_{i=1}^n x_i^2$ is a norm on X. □

Example 18.23. Let $\langle \mathbb{R}^2, \|\|_e\rangle$ be the real vector space of pairs of real numbers equipped with the Euclidean norm defined by $\|x\|_e = \sqrt{\sum_{i=1}^2 x_i^2} = \sqrt{x_1^2 + x_2^2}$ and $\langle \mathbb{C}, \|\rangle$ be the space of complex numbers with the absolute value norm then there exist a linear isometric isomorphism between $\langle \mathbb{R}^2, \|\|_e\rangle$ and $\langle \mathbb{C}, \|\rangle$. Hence by [theorem:]14.170] $\langle \mathbb{R}^2, \|\|_e\rangle$ and $\langle \mathbb{C}, \|\rangle$ are homeomorphic.

Proof. Define $\varphi: \mathbb{R}^2 \to \mathbb{C}$ by $\varphi(x, y) = x + i \cdot y$ then we have:

injectivity. If $\varphi(x, y) = \varphi(x', y')$ then $x + i \cdot y = x' + i \cdot y'$ so that by [theorem: 10.76] $x = x'$ and $y = y'$, hence $(x, y) = (x', y')$.

surjectivity. If $z \in \mathbb{C}$ then $\varphi(\mathrm{Re}(x), \mathrm{Img}(z)) = \mathrm{Re}(z) + i \cdot \mathrm{Img}(z) = z$.

proving that

$$\varphi: \mathbb{R}^2 \to \mathbb{C} \text{ is a bijection}$$

Further if $(x, y), (x', y') \in \mathbb{R}^2$ and $\alpha \in \mathbb{R}$ then

$$\varphi((x, y) + \alpha \cdot (x', y')) = \varphi(x + \alpha \cdot x', y + \alpha \cdot y') = x + \alpha \cdot x' + i \cdot y + i \cdot \alpha \cdot y' = \varphi(x, y) + \alpha \cdot \varphi(x', y')$$

proving that

$$\varphi \text{ is a linear isomorphism}$$

Further for $(x, y) \in \mathbb{R}^2$

$$|\varphi(x, y)| = |x + i \cdot y| = \sqrt{x^2 + y^2} = \|x\|_e$$

proving that

$$\varphi \text{ is a isometric linear isomorphism}$$ □

Theorem 18.24. *Let $n \in \mathbb{N}$, X a finite dimensional space over $\mathbb{C}$ with $E = \{e_1, \ldots, e_n\}$ a basis of X then $\|\|_e$,defined by $\|\|_e = \sqrt{\sum_{i=1}^n |x_i|^2}$ where $x = \sum_{i=1}^n x_i \cdot e_i$, is a norm on X.*

Proof. Using [theorem: 18.15] we have that $\langle\rangle$, defined by $\langle x, y\rangle = \sum_{i=1}^n x_i \cdot \overline{y_i}$ where $x = \sum_{i=1}^n x_i \cdot e_i$, $y = \sum_{i=1}^n y_i \cdot e_i$, is a inner product on X. Hence by [theorem: 18.19] $\|\|_e$ defined by $\|x\|_e = \sqrt{\langle x, x\rangle} = \sqrt{\sum_{i=1}^n x_i \cdot \overline{x_i}} = \sqrt{\sum_{i=1}^n |x_i|^2}$ is a norm on X. □

18.3 Orthogonality

As show in the previous section a inner product on a vector space allows us to define the concept of a length or norm of a vector. Next we introduce the concept of orthogonal vectors as a generalization of orthogonality in Euclidean spaces.

Definition 18.25. (Orthogonality) *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] inner product space and $x, y \in X$ then x, y are **orthogonal** noted as $x \perp y$ if $\langle x, y\rangle = 0$.*

Definition 18.26. (Orthonormal Family) *Let $\langle X, \langle\rangle\rangle$ be a inner product space with the Euclidean norm $\|\|$ then $\{e_i\}_{i \in I} \subseteq X$ is orthonormal if $\forall i, j \in I$ we have $\langle e_i, e_j\rangle = \delta_{i,j}$ where $\delta_{i,j} = \begin{cases} 1 & \text{if } i = j \\ 0 & \text{if } i \neq j \end{cases}$*

Example 18.27. Let $n \in \mathbb{N}$ then we have that

1. Given $\langle \mathbb{R}^n, \langle\rangle\rangle$ (see example: 18.4) then the canonical basis basis $\{e_i\}_{i \in \{1, \ldots, n\}}$ defined by $(e_i)_j = \delta_{i,j}$ (see theorem: 11.165) is orthonormal.
2. Given $\langle \mathbb{C}^n, \langle\rangle\rangle$ (see example: 18.9) then the canonical basis basis $\{e_i\}_{i \in \{1, \ldots, n\}}$ defined by $(e_i)_j = \delta_{i,j}$ (see theorem: 11.165) is orthonormal.

Proof.

1. Given $i, j \in \{1, \ldots, n\}$ we have that
$$\langle e_i, e_j\rangle \underset{\text{[example: 18.4]}}{=} \sum_{k=1}^n (e_i)_k \cdot (e_j)_k = \sum_{k=1}^n \delta_{i,k} \cdot \delta_{j,k} = \sum_{k=1}^n \delta_{i,k} \cdot \delta_{i,j} = \delta_{i,j}$$
2. Given $i, j \in \{1, \ldots, n\}$ we have that
$$\langle e_i, e_j\rangle \underset{\text{[example: 18.9]}}{=} \sum_{k=1}^n (e_i)_k \cdot \overline{(e_j)_k} = \sum_{k=1}^n \delta_{i,k} \cdot \delta_{j,k} = \sum_{k=1}^n \delta_{i,k} \cdot \delta_{i,j} = \delta_{i,j}$$ □

Every orthonormal family is linear independent however the opposite is not true.

Theorem 18.28. *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] inner product space and $\{e_i\}_{i \in I} \subseteq X$ a orthonormal family then $\{e_i\}_{i \in I}$ is linear independent.*

Proof. Let W be a finite subset of I and $\{\alpha_i\}_{i \in W} \subseteq \mathbb{K}$ such that $\sum_{w \in W} \alpha_w \cdot e_w = 0$. By the definition of the generalized sum [see 11.32] there exist a bijection $\beta: \{1, \ldots, n\} \to W$ such that

$$\sum_{k=1}^n \alpha_{\beta(i)} \cdot e_{\beta(i)} = \sum_{w \in W} \alpha_w \cdot e_w = 0$$

Let $w \in W$ then there exist a $k \in \{1, \ldots, n\}$ such that $w = \beta(k)$. Hence

$$\begin{aligned}
0 &= \langle 0, e_{\beta(k)} \rangle \\
&= \left\langle \sum_{i=1}^{n} \alpha_{\beta(i)} \cdot e_{\beta(i)}, e_{\beta(k)} \right\rangle \\
&\underset{\text{[theorem: 18.11]}}{=} \sum_{i=1}^{n} \alpha_{\beta(i)} \cdot \langle e_{\beta(i)}, e_{\beta(k)} \rangle \\
&= \sum_{i=1}^{n} \alpha_{\beta(i)} \cdot \delta_{\beta(i),\beta(k)} \\
&\underset{\substack{\varphi \text{ is a bijection} \\ i=k \Leftrightarrow \beta(i) \neq \beta(k)}}{=} \sum_{i=1}^{n} \alpha_{\beta(i)} \cdot \delta_{i,k} \\
&= \alpha_{\beta(i)} \\
&= \alpha_w
\end{aligned}$$

Hence $\forall w \in W$ we have $\alpha_w = 0$ which by [theorem: 11.117] proves that $\{e_i\}_{i \in I}$ is linear independent. □

Using orthonormal bases in finite dimensional vector spaces has the benefit of giving a simple representation for the matrix of a linear mapping or of the expansion of a element in its basis.

Theorem 18.29. *Let $\langle X, \langle\rangle_X \rangle$ be a finite dimensional real [or complex] inner product spaces with a orthonormal basis $E = \{e_1, \ldots, e_n\}$ then $\forall x \in X$ we have $x = \sum_{i=1}^{n} \langle x, e_i \rangle \cdot e_i$*

Proof. If $x \in X$ then there exist a $\{x_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{K}$ such that $x = \sum_{i=1}^{n} x_i \cdot e_i$. Let $k \in \{1, \ldots, n\}$ then

$$\langle x, e_k \rangle = \left\langle \sum_{i=1}^{n} x_i \cdot e_i, e_k \right\rangle = \sum_{i=1}^{n} x_i \cdot \langle e_i, e_k \rangle = \sum_{i=1}^{n} x_i \cdot \delta_{i,k} = x_k$$

so that

$$x = \sum_{i=1}^{n} \langle x, e_i \rangle \cdot e_i$$

□

Theorem 18.30. *Let $\langle X, \langle\rangle_X \rangle$ and $\langle Y, \langle\rangle_Y \rangle$ be two finite dimensional real [or complex] inner product spaces with $E = \{e_1, \ldots, e_n\}$ a orthonormal basis for X and $F = \{f_1, \ldots, f_m\}$ a orthonormal basis for Y. Then if $L: X \to Y$ is a linear mapping with matrix $\mathcal{M}(L; E, F)$ [see definition: 11.333] we have*

$$\forall i \in \{1, \ldots, n\}, \forall j \in \{1, \ldots, m\} \text{ we have } \mathcal{M}(L; E, F)_{j,i} = \langle L(e_i), f_j \rangle$$

Proof. We have for $i \in [1, \ldots, n]$, $\forall j \in \{1, \ldots, m\}$ we have

$$\begin{aligned}
\langle L(e_i), f_j \rangle &\underset{\text{[definition: 11.333]}}{=} \left\langle \sum_{k=1}^{m} \mathcal{M}(L; E, F)_{k,i} \cdot f_k, f_j \right\rangle \\
&\underset{\text{[theorem: 18.11]}}{=} \sum_{k=1}^{m} \mathcal{M}(L; E, F)_{k,i} \cdot \langle f_k, f_j \rangle \\
&= \sum_{k=1}^{m} \mathcal{M}(L; E, F)_{k,i} \cdot \delta_{k,j} \\
&= \mathcal{M}(L; E, F)_{j,i} \\
&\quad \square
\end{aligned}$$

It turns out that for every finite dimensional real [or complex] inner product space we can construct a orthonormal basis.

Theorem 18.31. (Gram-Schmidt) *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] inner product space, $\|\|$ the inner product norm and $\{e_1,...,e_n\} \subseteq X$ a linear independent set where $n \in \mathbb{N}$ then $\{f_1, \ldots, f_n\} \subseteq X$ recursively defined by*

$$f_i = \begin{cases} \frac{e_1}{\|e_1\|} \text{ if } i = 1 \\ \frac{e_i - \sum_{j=1}^{i-1} \langle e_i, f_j\rangle \cdot f_j}{\|e_i - \sum_{j=1}^{i-1} \langle e_i, f_j\rangle \cdot f_j\|} \text{ if } i \in \{2, \ldots, n\} \end{cases}$$

is well defined [meaning no division by 0] and is a orthonormal set. Further we have that

$$\operatorname{span}(\{e_1, \ldots, e_n\}) = \operatorname{span}(\{f_1, \ldots, f_n\})$$

Proof. We will use induction to prove this, so define

$$S = \{m \in \mathbb{N} | \text{If } m \in \{1, \ldots, n\} \text{ then } \{f_1, \ldots, f_m\} \text{ is well defined, orthonormal and } \operatorname{span}(\{e_1, \ldots, e_m\}) = \operatorname{span}(\{f_1, \ldots, f_m\})\}$$

then we have:

$1 \in S$. As $\{e_1, \ldots, e_n\}$ is linear independent $e_1 \neq 0 \Rightarrow \|e_1\| \neq 0$ so that $f_1 = \frac{e_1}{\|e_i\|}$ is well defined. If $i, j \in \{1\}$ then $i = j = 1$ and $\langle f_i, f_j\rangle = \langle f_1, f_1\rangle = \|f_1\|^2 = \left\|\frac{e_1}{\|e_1\|}\right\|^2 = \left(\frac{\|e_1\|}{\|e_1\|}\right)^2 = 1 = \delta_{1,1} = \delta_{i.j}$ so that $\{f_1\}$ is orthonormal. Further we have $x \in \operatorname{span}(\{e_1\})$ if there exist a $\alpha \in \mathbb{K}$ such that $x = \alpha \cdot e_1 = \alpha \cdot \|e_1\| \cdot \frac{e_1}{\|e_1\|} = (\alpha \cdot \|e_1\|) \cdot f_1$ so that $\operatorname{span}(\{e_1\}) \subseteq \operatorname{span}(\{f_1\})$, if $x \in \operatorname{span}(\{f_1\})$ then there exist a $\alpha \in \mathbb{K}$ such that $x = \alpha \cdot f_1 = \frac{\alpha}{\|e_1\|} \cdot \|e_1\| \cdot f_1 = \frac{\alpha}{\|e_1\|} \cdot e_1$ proving that $x \in \operatorname{spam}(\{e_1\})$. So $\operatorname{span}(\{e_1\}) = \operatorname{span}(\{f_1\})$ and we have $1 \in S$.

$m \in S \Rightarrow m + 1 \in S$. As $m \in S$ we have that $\{f_1, \ldots, f_m\}$ is orthonormal and $\operatorname{span}(\{e_1, \ldots, e_m\}) = \operatorname{span}(\{f_1, \ldots, f_m\})$. Assume that $m + 1 \in \{1,...,n\}$ then as $m \in S \subseteq \mathbb{N}$ we have $m + 1 \in \{2,...,n\}$. If $e_{m+1} - \sum_{i=1}^{(m+1)-1} \langle e_{m+1}, f_i\rangle \cdot f_i = 0$ then $e_{m+1} = \sum_{i=1}^{m} \langle e_{m+1}, f_i\rangle \cdot f_i$ so that $e_{m+1} \in \operatorname{span}(\{f_1, \ldots, f_m\}) = \operatorname{span}(\{e_1, \ldots, e_m\})$ which is impossible because $\{e_1, \ldots, e_m\}$ is linear independent. Hence we have that $e_{m+1} - \sum_{i=1}^{m} \langle e_{m+1}, f_i\rangle \cdot f_i \neq 0$ so that

$$f_{m+1} = \frac{e_{m+1} - \sum_{i=1}^{m} \langle e_{m+1}, f_i\rangle \cdot f_i}{\|e_{m+1} - \sum_{i=1}^{m} \langle e_{m+1}, f_i\rangle \cdot f_i\|} \text{ is well defined} \tag{18.2}$$

Further

$$\begin{aligned} \langle f_{m+1}, f_{m+1}\rangle &= \|f_{m+1}\|^2 \\ &= \left\|\frac{e_{m+1} - \sum_{i=1}^{m} \langle e_{m+1}, f_i\rangle \cdot f_i}{\|e_{m+1} - \sum_{i=1}^{m} \langle e_{m+1}, f_i\rangle \cdot f_i\|}\right\|^2 \\ &= \left(\frac{e_{m+1} - \left\|\sum_{i=1}^{(m+1)-1} \langle e_{m+1}, f_i\rangle \cdot f_i\right\|}{\|e_{m+1} - \sum_{i=1}^{m} \langle e_{m+1}, f_i\rangle \cdot f_i\|}\right)^2 \\ &= 1 \end{aligned} \tag{18.3}$$

and $\forall k \in \{1, \ldots, m\}$ we have

$$\begin{aligned} \langle f_{m+1}, f_k\rangle &= \\ &= \frac{1}{\|e_{m+1} - \sum_{i=1}^{m} \langle e_m, f_i\rangle \cdot f_i\|} \cdot \left\langle e_{m+1} - \sum_{i=1}^{m} \langle e_{m+1}, f_i\rangle \cdot f_i, f_k \right\rangle \\ &= \frac{1}{\|e_{m+1} - \sum_{i=1}^{m} \langle e_m, f_i\rangle \cdot f_i\|} \cdot \left(\langle e_{m+1}, f_k\rangle - \left\langle \sum_{i=1}^{m} \langle e_{m+1}, f_i\rangle \cdot f_i, f_k \right\rangle \right) \\ &= \frac{1}{\|e_{m+1} - \sum_{i=1}^{m} \langle e_m, f_i\rangle \cdot f_i\|} \cdot \left(\langle e_{m+1}, f_k\rangle - \sum_{i=1}^{m} \langle e_{m+1}, f_i\rangle \cdot \langle f_i, f_k\rangle \right) \\ &= \frac{1}{\|e_{m+1} - \sum_{i=1}^{m} \langle e_m, f_i\rangle \cdot f_i\|} \cdot \left(\langle e_{m+1}, f_k\rangle - \sum_{i=1}^{m} \langle e_{m+1}, f_i\rangle \cdot \delta_{i,k} \right) \\ &= \frac{1}{\|e_{m+1} - \sum_{i=1}^{m} \langle e_m, f_i\rangle \cdot f_i\|} \cdot (\langle e_{m+1}, f_k\rangle - \langle e_{m+1}, f_k\rangle) \\ &= 0 \end{aligned} \tag{18.4}$$

So if $k, l \in \{1, \ldots, m+1\}$ then we have either:

$k \wedge l \in \{1, \ldots, m\}$. Then as $\{f_1, \ldots, f_m\}$ is orthonormal we have that $\langle f_k, f_l \rangle = \delta_{k,l}$.

$k = m+1 \wedge l \in \{1, \ldots, m\}$. Then $\langle f_k, f_l \rangle = \langle f_{m+1}, f_l \rangle \underset{\text{[eq: 18.4]}}{=} 0 = \delta_{k,l}$

$k \in \{1, \ldots, m\} \wedge l = m+1$. Then $\langle f_k, f_l \rangle = \langle f_l, f_k \rangle = \langle f_{m+1}, f_k \rangle \underset{\text{[eq: 18.4]}}{=} 0 = \delta_{k,l}$

$k = m+1 = l$. Then $\langle f_k, f_l \rangle = \langle f_{m+1}, f_{m+1} \rangle \underset{\text{[eq: 18.3]}}{=} 1 = \delta_{k.l}$

proving that

$$\{f_1, \ldots, f_{m+1}\} \text{ is orthonormal} \tag{18.5}$$

Further we have as $f_{m+1} = \frac{e_{m+1} - \sum_{i=1}^{m} \langle e_{m+1}, f_i \rangle \cdot f_i}{\| e_{m+1} - \sum_{i=1}^{m} \langle e_{m+1}, f_i \rangle \cdot f_i \|}$ that

$$e_{m+1} = \left\| e_{m+1} - \sum_{i=1}^{m} \langle e_{m+1}, f_i \rangle \cdot f_i \right\| \cdot f_{m+1} + \sum_{i=1}^{m} \langle e_{m+1}, f_i \rangle \cdot f_i$$

so that $e_{m+1} \in \operatorname{span}(\{f_1, \ldots, f_{m+1}\})$. As

$$\{e_1, \ldots, e_m\} \subseteq \operatorname{span}(\{e_1, \ldots, e_m\}) = \operatorname{span}(\{f_1, \ldots, f_m\}) \subseteq \operatorname{span}(\{f_1, \ldots, f_{m+1}\})$$

we have

$$\{e_1, \ldots, e_{m+1}\} \subseteq \operatorname{span}(\{e_1, \ldots, e_{m+1}\}) \subseteq \operatorname{span}(\{f_1, \ldots, f_{m+1}\}) \tag{18.6}$$

To prove the opposite inequality not that by [theorem: 18.28] and the fact that $\{f_1, \ldots, f_{m+1}\}$ is orthonormal it follows that $\{f_1, \ldots, f_{m+1}\}$ is linear independent. Further, as by [theorem: 11.108], $\operatorname{span}(\{f_1, \ldots, f_{m+1}\})$ is a vector space, it follows that $\{f_1, \ldots, f_{m+1}\}$ is a basis for the $m+1$-dimensional vector space $\operatorname{span}(\{f_1, \ldots, f_{m+1}\})$. As $\{e_1, \ldots, e_{m+1}\}$ is linear independent and by [eq: 18.6] a subset of $\operatorname{span}(\{f_1, \ldots, f_{m+1}\})$ it follow from [theorem: 11.153] that $\{e_1, \ldots, e_{m+1}\}$ is a basis for $\operatorname{span}(\{f_1, \ldots, f_{m+1}\})$. Hence

$$\operatorname{span}(\{e_1, \ldots, e_{m+1}\}) = \operatorname{span}(\{f_1, \ldots, f_{m+1}\}) \tag{18.7}$$

Summarized, from [eqs: 18.2, 18.5 and 18.7] it follows that $m+1 \in S$. □

Corollary 18.32. *Let $n \in \mathbb{N}$, $\langle X, \langle\rangle \rangle$ a finite dimensional real [or complex] inner product space with $\dim(X) = n$ then there exist a orthonormal basis $\{e_1, \ldots, e_n\}$ on X.*

Proof. As X is finite dimensional with $\dim(X) = n$ there exist a basis $\{e'_1, \ldots, e'_n\}$ on X. Hence $\{e'_1, \ldots, e'_n\}$ is linear independent and $\operatorname{span}(\{e'_1, \ldots, e'_n\}) = X$. Using the Gram-Schmidt procedure [see theorem: 18.31] we can construct a orthonormal set $\{e_1, \ldots, e_n\}$ [hence by [theorem: 18.28] a linear independent set] such that $\operatorname{span}(\{e_1, \ldots, e_n\}) = \operatorname{span}(\{e'_1, \ldots, e'_n\}) = X$. So we found a orthonormal basis on X. □

Theorem 18.33. *Let $n \in \mathbb{N}$, $\langle X, \langle\rangle \rangle$ a finite dimensional real [or complex] inner product space with $\dim(X) = n$ and $\{e_1, \ldots, e_n\}$ a orthonormal subset of X then $\{e_1, \ldots, e_n\}$ is a basis on X.*

Proof. By [theorem: 18.28] $\{e_1, \ldots, e_n\}$ is linear independent so that by [theorem: 11.153] $\{e_1, \ldots, e_n\}$ is a basis for X. □

18.3.1 Dual spaces and inner product

Recap the concept of the dual of a vector space [see definition: 11.183] which in the case of a real [or complex] inner vector spaces is defined by.

Definition 18.34. *Let $\langle X, \langle\rangle \rangle$ be a real [or complex] inner product vector space then the dual space, noted as X^* is defined by:*

real inner product space.

$$X^* = \operatorname{Hom}(X, \mathbb{R})$$

complex inner product space.

$$X^* = \mathrm{Hom}(X, \mathbb{C})$$

If we choose $\mathbb{K}$ to mean either $\mathbb{R}$ or $\mathbb{C}$ if $\langle X, \langle\rangle\rangle$ if $\langle X, \langle\rangle\rangle$ is a real or complex inner product space then we can use the simpler notation

$$X^* = \mathrm{Hom}(X, \mathbb{K})$$

We show now that elements of X^* can be written using a inner product.

Theorem 18.35. *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] inner product vector space and $u \in X$ then $\langle *, u$ defined by*

$$\langle *, u\rangle : X \to \mathbb{K} \text{ where } \langle *, u\rangle(y) = \langle y, u\rangle$$

is a element of X^*.

Proof. Let $x, y \in X$ and $\alpha \in \mathbb{K}$ then

$$\langle \star, u\rangle(x + \alpha \cdot y) = \langle x + \alpha \cdot y, u\rangle = \langle x, u\rangle + \alpha \cdot \langle y, u\rangle = \langle *, u\rangle(x) + \alpha \cdot \langle \star, u\rangle(y)$$

proving that $\langle *, u\rangle \in \mathrm{Hom}(X, \mathbb{K}) = X^*$ □

We have also the opposite of the above theorem.

Theorem 18.36. (Riesz Representation Theorem) *Let $n \in \mathbb{N}$, $\langle X, \langle\rangle\rangle$ a finite dimensional real [or complex] inner product vector space with $\dim(X) = n$ and $L \in X^*$ then there exist a **unique** $u \in X$ such that $L = \langle *, u\rangle$. In other words we have $\forall x \in X$ that $L(x) = \langle x, u\rangle$.*

Proof. Using [theorem: 18.32] there exist a orthonormal basis $\{e_1, \ldots, e_n\}$ on X. We consider now the following cases:

real inner product space. Take $u = \sum_{i=1}^n \varphi(e_i) \cdot e_i$. Let $x \in X$ then there exist a $\{x_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R}$ such that $x = \sum_{i=1}^n x_i \cdot e_i$

$$\begin{aligned}
\langle x, u\rangle &= \left\langle \sum_{i=1}^n x_i \cdot e_i, u \right\rangle \\
&= \sum_{i=1}^n x_i \cdot \langle e_i, u\rangle \\
&= \sum_{i=1}^n x_i \cdot \left\langle e_i, \sum_{j=1}^n \varphi(e_j) \cdot e_j \right\rangle \\
&= \sum_{i=1}^n x_i \cdot \left\langle \sum_{j=1}^n \varphi(e_j) \cdot e_j, e_i \right\rangle \\
&= \sum_{i=1}^n x_i \cdot \left(\sum_{j=1}^n \varphi(e_j) \cdot \langle e_j, e_i\rangle \right) \\
&= \sum_{i=1}^n x_i \cdot \left(\sum_{j=1}^n \varphi(e_j) \cdot \delta_{i,j} \right) \\
&= \sum_{i=1}^n x_i \cdot \varphi(e_i) \\
&= \varphi\left(\sum_{i=1}^n x_i \cdot e_i \right) \\
&= \varphi(x)
\end{aligned}$$

Let $v \in X$ be such that $\forall x \in X$ $\varphi(x) = \langle x, v\rangle$ then $\forall i \in \{1, \ldots, n\}$ we have $\varphi(e_i)$

complex inner product space. Take $u=\sum_{i=1}^{n}\overline{\varphi(e_i)}\cdot e_i$. Let $x\in X$ then there exist a $\{x_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{C}$ such that $x=\sum_{i=1}^{n}x_i\cdot e_i$

$$\begin{aligned}
\langle x,u\rangle &= \left\langle\sum_{i=1}^{n}x_i\cdot e_i,u\right\rangle\\
&= \sum_{i=1}^{n}x_i\cdot\langle e_i,u\rangle\\
&= \sum_{i=1}^{n}x_i\cdot\left\langle e_i,\sum_{j=1}^{n}\overline{\varphi(e_j)}\cdot e_j\right\rangle\\
&= \sum_{i=1}^{n}x_i\cdot\overline{\left\langle\sum_{j=1}^{n}\overline{\varphi(e_j)}\cdot e_j.e_i\right\rangle}\\
&= \sum_{i=1}^{n}x_i\cdot\overline{\sum_{j=1}^{n}\overline{\varphi(e_j)}\cdot\langle e_j.e_i\rangle}\\
&= \sum_{i=1}^{n}x_i\cdot\overline{\sum_{j=1}^{n}\overline{\varphi(e_j)}\cdot\delta_{i,j}}\\
&= \sum_{i=1}^{n}x_i\cdot\overline{\overline{\varphi(e_i)}}\\
&= \sum_{i=1}^{n}x_i\cdot\varphi(e_i)\\
&= \varphi(x)
\end{aligned}$$

So in all cases we have found a $u\in X$ such that

$$\forall x\in X \text{ we have } \varphi(x)=\langle x,u\rangle$$

The above proves existence, as for uniqueness. Assume that there exist a $v\in X$ such that $\forall x\in X$ we have $\varphi(x)=\langle x,v\rangle$. Then, as $u-v\in X$, there exist a $\{y_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{K}$ such that $u-v=\sum_{i=1}^{n}y_i\cdot e_i$. Hence we have

$$\begin{aligned}
\langle u-v,u-v\rangle &= \left\langle\sum_{i=1}^{n}y_i\cdot e_i,u-v\right\rangle\\
&= \sum_{i=1}^{n}y_i\cdot\langle e_i,u-v\rangle\\
&= \sum_{i=1}^{n}y_i\cdot(\langle e_i,u\rangle-\langle e_i,v\rangle)\\
&= \sum_{i=1}^{n}y_i\cdot(\varphi(e_i)-\varphi(e_i))\\
&= \sum_{i=1}^{n}y_i\cdot 0\\
&= 0
\end{aligned}$$

proving that $u-v=0$ or $u=v$. □

Riesz Representation Theorem allows us to define the concept of the adjoint of a operator.

Theorem 18.37. *Let $\langle X,\langle\rangle_X\rangle$, $\langle Y,\langle\rangle_Y\rangle$ be finite dimensional real [or complex] inner product spaces with $\dim(X)$, $\dim(Y)\in\mathbb{N}$ and $L\in\mathrm{Hom}(X,Y)$ then there exist a **unique** mapping*

$$L^*\in\mathrm{Hom}(Y,Z)$$

such that for $y \in Y$ $L^*(y)$ we have

$$\forall x \in X \text{ that } \langle L(x), y\rangle_Y = \langle x, L^*(y)\rangle_X$$

Also we have

$$L^* \in \mathrm{Hom}(Y, X)$$

The mapping L^* is called the ***adjoint of*** *L*

Proof. Given $y \in Y$ define

$$\varphi_y : X \to \mathbb{K} \text{ by } \varphi_y(x) = \langle L(x), y\rangle_Y$$

If $x_1, x_2 \in X$ and $\alpha \in \mathbb{K}$ then

$$\begin{aligned}
\varphi_y(x_1 + \alpha \cdot x_2) &= \langle L(x_1 + \alpha \cdot x_2), y\rangle_Y \\
&= \langle L(x_1) + \alpha \cdot L(x_2), y\rangle_Y \\
&= \langle L(x_1), y\rangle + \alpha \cdot \langle L(x_2), y\rangle_Y \\
&= \varphi_y(x_1) + \alpha \cdot \varphi_y(x_2)
\end{aligned}$$

so that

$$\varphi_y \in \mathrm{Hom}(X, \mathbb{K}) = X^*$$

Hence, using the Riesz Representation Theorem [see theorem: 18.36] there exist a **unique** $u_y \in X$ such that $\varphi_y = \langle *, u_y\rangle$, hence $\forall x \in X$ we have that

$$\langle L(x), y\rangle_Y = \varphi_y(x) = \langle *, u_y\rangle_X(x) = \langle x, u_y\rangle_X$$

So if we define

$$L^* : Y \to X \text{ by } L^*(y) = u_y$$

then $\forall y \in Y$ we have $\forall x \in X$ that $\langle L(x), y\rangle_Y = \langle x, u_y\rangle_X = \langle x, L^*(y)\rangle_X$. If $y_1, y_2 \in Y$ and $\alpha \in \mathbb{K}$. Then we have to consider either:

real inner product spaces. Then we have $\forall x \in X$

$$\varphi_{y_1 + \alpha \cdot y_2}(x) = \langle x, u_{y_1 + \alpha \cdot y_2}\rangle_X$$

but also

$$\begin{aligned}
\varphi_{y_1 + \alpha \cdot y_2}(x) &= \langle L(x), y_1 + \alpha \cdot y_2\rangle_Y \\
&= \langle L(x), y_1\rangle_Y + \alpha \cdot \langle L(x), y_2\rangle_Y \\
&= \varphi_{y_1}(x) + \alpha \cdot \varphi_{y_2}(x) \\
&= \langle x, u_{y_1}\rangle_X + \alpha \cdot \langle x, u_{y_2}\rangle_X \\
&= \langle x, u_{y_1} + \alpha \cdot u_{y_2}\rangle_X
\end{aligned}$$

so that by **uniqueness** we must have that $u_{y_1 + \alpha \cdot y_2} = u_{y_1} + \alpha \cdot y_2$, hence we have that

$$L^*(y_1 + \alpha \cdot y_2) = u_{y_1 + \alpha \cdot y_2} = u_{y_1} + \alpha \cdot y_2 = L(y_1) + \alpha \cdot L(y_2)$$

complex inner product spaces. Then we have $\forall x \in X$

$$\varphi_{y_1 + \alpha \cdot y_2}(x) = \langle x, u_{y_1 + \alpha \cdot y_2}\rangle$$

but also

$$\begin{aligned}
\varphi_{y_1 + \alpha \cdot y_2}(x) &= \langle L(x), y_1 + \alpha \cdot y_2\rangle_Y \\
&= \langle L(x), y_1\rangle_Y + \overline{\alpha} \cdot \langle L(x), y_2\rangle_Y \\
&= \varphi_{y_1}(x) + \overline{\alpha} \cdot \varphi_{y_2}(x) \\
&= \langle x, u_{y_1}\rangle_X + \overline{\alpha} \cdot \langle x, u_{y_2}\rangle_X \\
&= \langle x, u_{y_1} + \alpha \cdot u_{y_2}\rangle_X
\end{aligned}$$

so that by **uniqueness** we must have that $u_{y_1+\alpha\cdot y_2}=u_{y_1}+\alpha\cdot y_2$, hence we have that

$$L^*(y_1+\alpha\cdot y_2)=u_{y_1+\alpha\cdot y_2}=u_{y_1}+\alpha\cdot y_2=L(y_1)+\alpha\cdot L(y_2)$$

Hence we have that

$$L^\star\in\mathrm{Hom}(Y,X)$$

Finally assume that there is another $K^*\in\mathrm{Hom}(Y,X)$ such that $\forall y\in Y$ we have $\forall x\in X$ that $\langle L(x),y\rangle_Y=\langle x,L^*(y)\rangle_X$. Then given $y\in Y$ we have $\forall x\in X$ that

$$\begin{aligned}\varphi_y(x) &= \langle L(x),y\rangle_Y\\ &= \langle x,K^*(y))_X\end{aligned}$$

so that by uniqueness of u_y we must have that $K^*(y)=u_y=L^*(y)$ proving that $L^*=K^*$. □

Using the above it follows that for $L\in\mathrm{Hom}(X,Y)$ $L^*\in\mathrm{Hom}(Y,X)$ so that logically $(L^*)^*\in\mathrm{Hom}(X,Y)$. Actually we have even more, it turns out that $(L^*)^*=L$.

Theorem 18.38. *Let $\langle X,\langle\rangle_X\rangle$, $\langle Y,\langle\rangle_Y\rangle$ be finite dimensional real [or complex] inner product spaces with $\dim(X)$, $\dim(Y)\in\mathbb{N}$ and $L\in\mathrm{Hom}(X,Y)$ then $(L^*)^*=L$*

Proof. We must consider the following cases:

real inner product spaces. As $L^*\in\mathrm{Hom}(Y,X)$ we have by [theorem: 18.37] that $(L^*)^*\in\mathrm{Hom}(X,Y)$ is the unique mapping such that $\forall y\in X$ we have $\forall x\in Y$ that

$$\langle L^*(x),y\rangle_X=\langle x,(L^*)^*(y)\rangle_Y,$$

further we have also for $L\in\mathrm{Hom}(X,Y)$ by [theorem: 18.37] that

$$\begin{aligned}\langle L^*(x),y\rangle_X &= \langle y,L^*(x)\rangle_X\\ &\underset{\text{[theorem: 18.37]}}{=} \langle L(y),x\rangle_Y\\ &= \langle x,L(y)\rangle_Y\end{aligned}$$

so that by uniqueness we must have that

$$(L^*)^*=L$$

complex inner product spaces. As $L^*\in\mathrm{Hom}(Y,X)$ we have by [theorem: 18.37] that $(L^*)^*\in\mathrm{Hom}(X,Y)$ is the unique mapping such that $\forall y\in X$ we have $\forall x\in Y$ that

$$\langle L^*(x),y\rangle_X=\langle x,(L^*)^*(y)\rangle_Y,$$

further we have also for $L\in\mathrm{Hom}(X,Y)$ by [theorem: 18.37] that

$$\begin{aligned}\langle L^*(x),y\rangle_X &= \overline{\langle y,L^*(x)\rangle_X}\\ &\underset{\text{[theorem: 18.37]}}{=} \overline{\langle L(y),x\rangle_Y}\\ &= \langle x,L(y)\rangle_Y\end{aligned}$$

so that by uniqueness we must have that

$$(L^*)^*=L$$

□

The operator of taking the adjoint of a linear mapping is also linear as the following theorem shows.

Theorem 18.39. *Let $\langle X,\langle\rangle_X\rangle$, $\langle Y,\langle\rangle_Y\rangle$ be finite dimensional real [or complex] inner product spaces with $\dim(X)$, $\dim(Y)\in\mathbb{N}$, L_1, $L_2\in\mathrm{Hom}(X,Y)$ and $\boldsymbol{\alpha}\in\mathbb{R}$ **[or $\mathbb{C}$]** then*

$$(L_1+\alpha\cdot L_2)^*=L_1^*+\overline{\alpha}\cdot L_2^*$$

Proof. Using [theorem: 18.37] we have $\forall y\in Y$ that for $\forall x\in X$ that

$$\langle(L_1+\alpha\cdot L_2)(x),y\rangle_Y = \langle x,(L_1+\alpha\cdot L_2)^*\rangle$$

further we have also that

$$\begin{aligned}\langle (L_1+\alpha\cdot L_2)(x),y\rangle_Y &= \langle L_1(x)+\alpha\cdot L_2(x),y\rangle_Y\\ &= \langle L_1(x),y\rangle_Y+\alpha\cdot\langle L_2(x),y\rangle_Y\\ &= \langle x,L_1^*(y)\rangle_X+\alpha\cdot\langle x,L_2^*(y)\rangle_X\\ & \quad \langle x,L_1^*(y)\rangle_X+\langle x,\overline{\alpha}\cdot L_2^*(y)\rangle_X\\ &= \langle x,L_1^*(y)+\overline{\alpha}\cdot L_1^*(y)\rangle_X\\ &= \langle x.(L_1^*+\overline{\alpha}\cdot L_2^*)(y)\rangle_X\end{aligned} \tag{18.8}$$

proving by uniqueness in [theorem: 18.37] that $(L_1+\alpha\cdot L_2)^*=L_1^*+\alpha\cdot L_2^*$

Note 18.40. Step [eq: 18.8] is valid because in the real case $\alpha\in\mathbb{R}\Rightarrow\alpha=\overline{\alpha}$ and $\alpha\cdot\langle x,L_2^*(y)\rangle_X=\langle x,\overline{\alpha}\cdot L_2^*(y)\rangle_X$ and in the complex case $\alpha\cdot\langle x,L_2^*(y)\rangle_X=\langle x,\overline{\alpha}\cdot L_2^*(y)\rangle_X$. □

Theorem 18.41. *Let $\langle X,\langle\rangle_X\rangle$, $\langle Y,\langle\rangle_Y\rangle$ and $\langle Z,\langle\rangle_Z\rangle$ be finite dimensional real [or complex] inner product spaces with $\dim(X)$, $\dim(Y)\in\mathbb{N}$, $\dim(Z)\in\mathbb{N}$, $L_1\in\mathrm{Hom}(X,Y)$, $L_2\in\mathrm{Hom}(Y,Z)$ then*

$$(L_2\circ L_1)^*=L_1^*\circ L_2^*$$

Proof. Using [theorem: 18.37] we have $\forall z\in Z$ that $\forall x\in X$ that

$$\langle (L_2\circ L_1)(x),y\rangle_Z = \langle x,(L_2\circ L_1)^*(y)\rangle$$

further we have

$$\begin{aligned}\langle (L_2\circ L_1)(x),y\rangle_Z &= \langle L_2(L_1(x)),y\rangle_Z\\ &\underset{\text{[theorem: 18.38]}}{=} \langle L_1(x),L_2^*(y)\rangle_Y\\ &\underset{\text{[theorem: 18.38]}}{=} \langle x,L_1^*(L_2^*(y))\rangle_X\\ &= \langle x,(L_1^*\circ L_2^*)(y)\rangle_X\end{aligned}$$

hence we have that

$$(L_2\circ L_1)^*=L_1^*\circ L_2^*$$ □

To examine the relation between the adjoint of a linear operator and its matrix we first had to extend the concept of the transpose M^T of a matrix M [see definition: 11.327].

Definition 18.42. *Let $n,m\in\mathbb{N}$ then for $M\in\mathcal{M}_{n,m}(\mathbb{K})$ we have that M^H is defined by*

$$\forall(i,j)\in\{1,\ldots,m\}\times\{1,\ldots,n\}\ (M^H)_{i,j}=\overline{M_{j,i}}$$

***Note* 18.43.** *If $\mathbb{K}=\mathbb{R}$ then $\forall(i,j)\in\{1,\ldots,m\}\times\{1,\ldots,n\}$ $(M^H)_{i,j}=\overline{M_{j,i}}=M_{j,i}=(M^T)_{i,j}$ so that*

$$M^T=M^H$$

Definition 18.44. (Symmetric Matrix) *Let $n,m\in\mathbb{N}$ and $M\in\mathcal{M}_{n,m}(\mathbb{K})$ then M is symmetric if*

$$M=M^T$$

Definition 18.45. (Hermitian Matrix) *Let $n,m\in\mathbb{N}$ and $M\in\mathcal{M}_{n,m}(\mathbb{K})$ then M is Hermitian if*

$$M=M^H$$

Note 18.46. If $\mathbb{K}=\mathbb{R}$ then $M^H=M^T$ so if M is Hermitian if and only if M is symmetric

Definition 18.47. (Unitary Matrix) *Let $n,m\in\mathbb{N}$ and $M\in\mathcal{M}_{n,m}(\mathbb{K})$ then M is unitary if*

$$M^H\cdot M=E=M\cdot M^H$$

***Note* 18.48.** *From the above definition it follows that if M is unitary then $M^{-1}=M^H$.*

***Note* 18.49.** *If $\mathbb{K}=\mathbb{R}$ then $M^H=M^T$, hence if M is unitary then $M^{-1}=M^T$.*

Theorem 18.50. *Let $\langle X,\langle\rangle_X\rangle$, $\langle Y,\langle\rangle_Y\rangle$ be finite dimensional real [or complex] inner product spaces with $\dim(X)=n$, $\dim(Y)=m$, $n,m\in\mathbb{R}$, $E=\{e_1,\ldots,e_n\}$ a orthonormal basis for X, $F=\{f_1,\ldots,f_m\}$ a orthonormal basis for Y and $L\in\mathrm{Hom}(X,Y)$ then for $L^*\in\mathrm{Hom}(Y,X)$ we have that*

$$\mathcal{M}(L^*;F,E)=\mathcal{M}(L,E;F)^H$$

See [definition: 11.333] for $\mathcal{M}(L^*;F,E)$ and $\mathcal{M}(L,E;F)$.

Proof. We must make a distinction between the real and complex case.

real inner product space. Using [theorem: 18.30] we have $\forall(i,j)\in\{1,\ldots,n\}\times\{1,\ldots,m\}$ that

$$\begin{aligned}(\mathcal{M}(L;E,F)^H)_{i,j} &= \overline{\mathcal{M}(L;E,F)_{j,i}}\\ &\underset{\text{[theorem: 18.30]}}{=} \overline{\langle L(e_i),f_j\rangle_Y}\\ &\underset{\text{[theorem: 18.37]}}{=} \overline{\langle e_i,L^*(f_j)\rangle_X}\\ &\underset{\langle,\rangle_X\in\mathbb{R}}{=} \langle e_i,L^*(f_j)\rangle_X\\ &= \langle L^\star(f_j),e_i\rangle_X\\ &\underset{\text{[theorem: 18.30]}}{=} \mathcal{M}(L^*;F,E)_{i,j}\end{aligned}$$

proving that $\mathcal{M}(L^*;F,E)=\mathcal{M}(L,E;F)^H$.

complex inner product space. Using [theorem: 18.30] we have $\forall(i,j)\in\{1,\ldots,n\}\times\{1,\ldots,m\}$ that

$$\begin{aligned}(\mathcal{M}(L;E,F)^H)_{i,j} &= \overline{\mathcal{M}(L;E,F)_{j,i}}\\ &\underset{\text{[theorem: 18.30]}}{=} \overline{\langle L(e_i),f_j\rangle_Y}\\ &\underset{\text{[theorem: 18.37]}}{=} \overline{\langle e_i,L^*(f_j)\rangle_X}\\ &= \langle L^\star(f_j),e_i\rangle_X\\ &\underset{\text{[theorem: 18.30]}}{=} \mathcal{M}(L^*;F,E)_{i,j}\end{aligned}$$

proving that $\mathcal{M}(L^*;F,E)=\mathcal{M}(L,E;F)^H$. □

Corollary 18.51. *Let $\langle X,\langle\rangle_X\rangle$ be a finite dimensional real inner product spaces with $\dim(X)\in\mathbb{N}$ and $L\in\mathrm{Hom}(X)=\mathrm{Hom}(X,X)$ then*

$$\det(L)=\det(L^*)$$

Proof. Let $\{e_1,\ldots,e_n\}$ be a basis in X then

$$\begin{aligned}\det(L) &\underset{\text{[theorem: 11.351]}}{=} \det(\mathcal{M}(L;E,F))\\ &\underset{\text{[theorem: 11.350]}}{=} \det(\mathcal{M}(L;E,F)^T)\\ &= \det(\mathcal{M}(L;E,F)^H)\\ &\underset{\text{[theorem: 18.51]}}{=} \det(L^*)\end{aligned}$$

□

18.4 Spectral Theorem

18.4.1 Polynomials and linear operators

We use now the fundamental theorem of algebra to prove the spectral theorem of linear algebra, that states under which conditions a linear operator can be diagonlized. First we introduce linear operators and the relation of linear operators and polynomials.

Definition 18.52. *Let X be a vector space and $L: X \to X$ a mappings then L is a* ***linear operator on X*** *if $L \in \mathrm{Hom}(X, X) = \mathrm{Hom}(X)$.*

Theorem 18.53. *Let X be a finite dimensional and $L \in \mathrm{Hom}(X)$ [L is a linear operator] then we have the following equivalences:*

1. *L is a isomorphism.*
2. *L is injective.*
3. *L is surjective.*

Proof.

1 ⇒ 2. This is trivial as a bijection is injective and surjective.

1 ⇒ 3. This is trivial as a bijection is injective and surjective.

2 ⇒ 1. This follows from [theorem: 11.198].

3 ⇒ 1. As L is surjective it follows from [theorem: 11.195] that $\mathrm{rank}(L) = \dim(X)$. As by [theorem: 11.201] $\dim(X) = \dim(\ker(L)) + \mathrm{rank}(L)$ it follows that $\dim(\ker(L)) = 0$, hence using [theorem: 11.192] we have that L is injective. So L is a bijection and as L is linear it is by [theorem: 11.199] a linear isomorphism. □

Definition 18.54. *Let $n \in \mathbb{N}$, X a vector space and $\{L_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathrm{Hom}(X)$ a finite family of linear operators then $\bigodot_{i=1}^{n} L_i: X \to X$ is recursively defined by*

$$\left(\bigodot_{i=1}^{n} L_i\right) = \begin{cases} L_1 \text{ if } n = 1 \\ L_n \circ \bigodot_{i=1}^{n-1} \text{ if } 1 < n \end{cases}$$

A special case of the above is the following

Definition 18.55. *Let $n \in \mathbb{N}_0$, X a vector space and $L \in \mathrm{Hom}(X)$ then L^n is recursively defined by*

$$L^n = \begin{cases} \mathrm{Id}_X \text{ if } n = 0 \\ L \circ L^{n-1} \text{ if } 0 < n \end{cases}$$

In essence we have defined the power of linear operators.

We show now that the power of operators behaves as normal power functions.

Theorem 18.56. *Let $n, m \in \mathbb{N}_0$, X a vector space and $L \in \mathrm{Hom}(X)$ then*

$$L^{n+m} = L^n \circ L^m$$

Proof. This is trivially proved by induction, so define

$$S_n = \{m \in \mathbb{N}_0 | L^{n+m} = L^n \circ L^m\}$$

then we have:

$0 \in S_n$. As $L^{n+0} = L^n = L^n \circ \mathrm{Id}_X = L^n \circ L^0$ proving that $0 \in S$.

$n \in S_n \Rightarrow n + 1 \in S_n$. As

$$L^{n+(m+1)} = L^{(n+m)+1} = L^{(n+m)} \circ L \underset{m \in S_n}{=} (L^n \circ L^m) \circ L = L^n \circ (L^m \circ L) = L^n \circ L^{m+1}$$

proving that $n + 1 \in S_n$. □

Theorem 18.57. *Let $n \in \mathbb{N}_0$, X a vector space and $L \in \mathrm{Hom}(X)$ then $L^n \in \mathrm{Hom}(X)$*

Proof. This is trivially proved by induction, so define

$$S = \{n \in \mathbb{N}_0 | L^n \in \mathrm{Hom}(X)\}$$

then we have:

$0 \in S$. As $L^0 = \mathrm{Id}_X \in \mathrm{Hom}(X)$ it follows that $0 \in S$.

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$. As $n \in S$ we have that $L^n \in \mathrm{Hom}(X)$, further as $L \in \mathrm{Hom}(X)$ it follows form [theorem: 11.177] that $L^{n+1} = L^n \circ L^1 = L^n \circ (L^1 \circ L^0) = L^n \circ (L \circ \mathrm{Id}_x) = L^n \circ L \in \mathrm{Hom}(X)$ proving that $n+1 \in S$. □

Theorem 18.58. *Let X be a vector space, $n \in \mathbb{N}$ and $\{L_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathrm{Hom}(X)$ such that $\forall i \in \ker(L_i) = \{0\}$ then*

$$\ker\left(\bigodot_{i=1}^{n} L_i\right) = \{0\}$$

In other words, using [theorem: 11.192], if $\forall i \in \{1,\ldots,n\}$ L_i is injective then $\bigodot_{i=1}^{n} L_i$ is injective.

Proof. We use induction to prove this, so define

$$S = \left\{ n \in \mathbb{N} | \text{If } \{L_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathrm{Hom}(X) \text{ satisfies that } \forall i \in \{1,\ldots,n\} \ \ker(L_i) = \{0\} \text{ then } \ker\left(\bigodot_{i=1}^{n} L_i\right) = \{0\} \right\}$$

we have:

$\boldsymbol{1 \in S}$. Let $\{L_i\}_{i \in \{1\}} \subseteq \mathrm{Hom}(X)$ with $\ker(L_1) = \{0\}$ then we have $\ker(\bigodot_{i=1}^{1} L_i) = \ker(L_1) = \{0\}$ which proves that $1 \in S$.

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$. Let $\{L_i\}_{i \in \{1,\ldots,n+1\}} \subseteq \mathrm{Hom}(X)$ with $\forall i \in \{1,\ldots,n+1\}$ $\ker(L_i) = \{0\}$. If $x \in \ker(\bigodot_{i=1}^{n+1} L_i)$ then we have

$$\begin{aligned} 0 &= \left(\bigodot_{i=1}^{n+1} L_i\right)(x) \\ &= \left(L_{n+1} \circ \bigodot_{i=1}^{n} L_i\right)(x) \\ &= L_{n+1}\left(\left(\bigodot_{i=1}^{n} L_i\right)(x)\right) \end{aligned}$$

hence as $\ker(L_{n+1}) = \{0\}$ we must have that $(\bigodot_{i=1}^{n} L_i)(x) = 0$, hence as $n \in S$, it follows that $x = 0$. So $\ker(\bigodot_{i=1}^{n+1} L_i) = \{0\}$ proving that $n+1 \in S$. □

We are now ready to introduce polynomial linear operators.

Definition 18.59. *Let $n \in \mathbb{N}_0$, X a vector space over $\mathbb{C}$, $L \in \mathrm{Hom}(X)$ and $p \in \mathcal{P}_n$ a polynomial of order n [see definition: 17.1] then $p[L]: X \to X$ is defined by*

$$p[L](x) = \sum_{i=0}^{n} a_i \cdot L^i(x)$$

where $\{a_i\}_{i \in \{0,\ldots,n\}} \subseteq \mathbb{C}$ is the unique family with $\alpha_n \neq 0$ such that $p(z) = \sum_{i=0}^{n} a_i \cdot z^i$ [see definition: 17.1] and [theorem: 17.4]. Linear operators of the form $p[L]$ where p is a polynomial of order n are called ***polynomial operators of order n****.*

***Note* 18.60.** *Using [theorems: 11.182 and 18.57] it follows that $p[L] \in \mathrm{Hom}(X)$.*

We prove now that the product of polynomials is equal to the composition of the associated polynomial operator. This allows us to uplift properties of polynomials to polynomial operator.

Theorem 18.61. *Let X be a vector space over $\mathbb{C}$, $p, q \in \mathcal{P}_n$ polynomial operators of order n and $L \in \mathrm{Hom}(X)$ then we have*

$$(p \cdot q)[L] = p[L] \circ q[L]$$

***Note* 18.62.** *By [theorem: 17.12] it is guaranteed that $p \cdot q$ is a polynomial so that $(p \cdot q)$ makes sense.*

Proof. Let p be defined by $\{a_i\}_{i \in \{0,\ldots,n\}} \subseteq \mathbb{C}$ and q be defined by $\{b_i\}_{i \in \{0,\ldots,m\}} \subseteq \mathbb{C}$. Then by [theorem: 17.12] we have that

$$p \cdot q \text{ has coefficients } \{c_i\}_{i \in \{0,\ldots,n+m\}} \text{ where } c_i = \sum_{(k,l) \in \{(r,s) \in \{0,\ldots,n\} \times \{0,\ldots,m\} | r+s=i\}} a_k \cdot b_l \tag{18.9}$$

Next we calculate $p[L] \circ q[L]$, let $x \in X$ then we have

$$\begin{aligned}
(p[L] \circ q[L])(x) &= \\
p[L](q[L](x)) &= \\
\sum_{i=1}^{n} a_i \cdot L^i(q[L](x)) &= \\
\sum_{i=1}^{n} a_i \cdot L^i\left(\sum_{j=1}^{m} b_j \cdot L^j(x)\right) &= \text{[theorem: 18.57]} \\
\sum_{i=1}^{n} a_i \cdot \sum_{j=1}^{m} b_j \cdot L^i(L^j(x)) &= \\
\sum_{i=1}^{n}\left(\sum_{j=1}^{m} a_i \cdot b_j \cdot L^i(L^j(x))\right) &= \\
\sum_{i=1}^{n}\left(\sum_{j=1}^{m} a_i \cdot b_j \cdot (L^i \circ L^j)(x)\right) &= \text{[theorem: 18.56]} \\
\sum_{i=1}^{n}\left(\sum_{j=1}^{m} a_i \cdot b_j \cdot L^{i+j}(x)\right) &= \text{[theorem: 11.48]} \\
\sum_{(i,j)\in\{0,\dots,n\}\times\{0,\dots,m\}} a_i \cdot b_j \cdot L^{i+j}(x) &= \text{[lemma: 17.11, theorem: 11.43]} \\
\sum_{i=0}^{n+m}\left(\sum_{(k,l)\in\{(r,s)\in\{0,\dots,n\}\times\{0,\dots,m\}|r+s=i\}} a_k \cdot b_l \cdot L^{k+l}(x)\right) &= \\
\sum_{i=0}^{n+m}\left(\sum_{(k,l)\in\{(r,s)\in\{0,\dots,n\}\times\{0,\dots,m\}|r+s=i\}} a_k \cdot b_l \cdot L^{i}(x)\right) &= \\
\sum_{i=0}^{n+m}\left(\sum_{(k,l)\in\{(r,s)\in\{0,\dots,n\}\times\{0,\dots,m\}|r+s=i\}} a_k \cdot b_l\right) \cdot L^{i}(x) &= \text{[eq: 18.9]} \\
\sum_{i=0}^{n+m} c_i \cdot L^i(x) &= \text{[eq: 18.9]} \\
(p \cdot q)[L](x)
\end{aligned}$$

which proves that

$$p[L] \circ q[L] = (p \cdot q)[L]$$

□

The above can be extended, by induction.

Theorem 18.63. *Let $n \in \mathbb{N}$, X a vector space over $\mathbb{C}$, $\{p_i\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{P}$ a finite family of polynomials and $L \in \mathrm{Hom}(X)$ then*

$$\left(\prod_{i=1}^{n} p_i\right)[L] = \bigodot_{i=1}^{n} p_i[L]$$

Proof. Define

$$S = \left\{n \in \mathbb{N} | \text{If } \{p_i\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{P} \text{ then } \left(\prod_{i=1}^{n} p_i\right)[L] = \bigodot_{i=1}^{n} p_i[L]\right\}$$

then we have:

$1 \in S$. If $\{p_i\}_{i\in\{1\}} \subseteq \mathcal{P}$ then $(\prod_{i=1}^{1} p_i)[L] = p_1[L] = \bigodot_{i=1}^{1} p_i[L]$ proving that $1 \in S$.

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$. If $\{p_i\}_{i\in\{1,\dots,n+1\}} \subseteq \mathcal{P}$ then

$$\begin{aligned}
\left(\prod_{i=1}^{n+1} p_i\right)[L] &= \left(p_{n+1}\cdot\prod_{i=1}^{n} p_i\right)[L] \\
&\underset{\text{[theorem: 18.61]}}{=} p_{n+1}[L]\circ\left(\prod_{i=1}^{n} p_i\right)[L] \\
&\underset{n\in S}{=} p_{n+1}[L]\circ\bigodot_{i=1}^{n} p_i[L] \\
&\underset{\text{def}}{=} \bigodot_{i=1}^{n+1} p_i[L]
\end{aligned}$$

proving that $n+1\in S$. □

Definition 18.64. *Let X be a vector space over $\mathbb{C}$ and $L\in\mathrm{Hom}(X)$ then we define $\mathcal{P}[L]$ by*

$$\mathcal{P}[L]=\{p[L]|p\in\mathcal{P}\}$$

In essence $\mathcal{P}[L]$ is the set of all the polynomial operators based on the linear operator L.

Theorem 18.65. *Let X be a vector space over $\mathbb{C}$ and $L\in\mathrm{Hom}(X)$ then $\langle\mathcal{P}[L],\circ\rangle$ is a Abelian semi group with neutral element Id_X.*

Proof. First if $x,y\in\mathcal{P}[L]$ then there exist $p,q\in\mathcal{P}$ such that $x=p[L]$ and $y=q[L]$, so we have by [theorem: 18.61] we have that $x\circ y=p[L]\circ q[L]=(p\cdot q)[L]\in\mathcal{P}[L]$. Hence

$$\circ:\mathcal{P}[L]\times\mathcal{P}[L]\to\mathcal{P}[L] \text{ defined by } \circ[x,y]=x\circ y$$

is well defined. Further we have:

associativity. This is trivial as composition of functions is associative.

neutral element. Take $\{a_i\}_{i\in\{0\}}\subseteq\mathbb{C}$ define by $a_0=1$ then p defined by $p(z)=\sum_{i=0}^{0}a_i\cdot z^i=a_0\cdot z^0=a_0$ is a element of $\mathcal{P}$. Then $p[L]$ is defined by

$$p[L](x)=\sum_{i=0}^{0}a_i\cdot L^i(z)=L^0(z)=\mathrm{Id}_X(z)$$

proving that $\mathrm{Id}_X\in\mathcal{P}[L]$. Further if $x\in\mathcal{P}[L]$ then we have that $x\circ\mathrm{Id}_X=x=\mathrm{Id}_X\circ x$. Hence Id_X is the neutral element in $\langle\mathcal{P}[L],\circ\rangle$.

commutativity. If $x,y\in\mathcal{P}[L]$ then there exist $p,q\in\mathcal{P}$ such that $x=\mathcal{P}[L]$ and $y=\mathcal{P}[L]$. SO we have

$$x\circ y=p[L]\circ q[L]\underset{\text{[theorem: 18.61]}}{=}(p\cdot q)[L]=(q\cdot p)[L]\underset{\text{[theorem: 18.61]}}{=}q[L]\circ p[L]$$ □

The above can be used to prove that composition is stable under permutations.

Theorem 18.66. *Let $n\in\mathbb{N}$, X a vector space over $\mathbb{C}$, $L\in\mathrm{Hom}(X)$ then if $\{x_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{P}[L]$ and $\sigma\in P_n$ then we have that*

$$\bigodot_{i=1}^{n} x_i=\bigodot_{i=1}^{n} x_{\sigma(i)}$$

Proof. By the previous theorem [theorem: 18.65] $\circ$ can be considered the sum of the Abelian group $\langle\mathcal{P}[L],\circ\rangle$ and $\bigodot_{i=1}^{n}x_i$ as a finite sum. The theorem follows then from [theorem: 11.31]. □

The following theorem shows how we can factorize polynomial operators.

Theorem 18.67. *Let X be a vector space over $\mathbb{C}$, $L\in\mathrm{Hom}(X)$ and $p\in\mathcal{P}$ a polynomial of order $n\in\mathbb{N}$ [in other words a non constant polynomial] then there exist a $c\in\mathbb{C}\setminus\{0\}$ and a family $\{\lambda_i\}_{i\in\{1,\dots,n\}}\subseteq\mathbb{C}$ such that that*

$$p[L]=c\cdot\bigodot_{i=1}^{n}(L-\lambda_i\cdot\mathrm{Id}_X)$$

Proof. Using [theorem: 17.34] there exist a $c\in\mathbb{C}\setminus\{0\}$ and $\{\lambda_i\}_{i\in\{1,\dots,n\}}\subseteq\mathbb{C}$ such that

$$p(z)=c\cdot\prod_{i=1}^{n}(z-\lambda_i)=C_c(z)\cdot\prod_{i=1}^{n}(z-\lambda_i) \tag{18.10}$$

Given $i \in \{1, \ldots, n\}$ we have for $p_i: \mathbb{C} \to \mathbb{C}$ defined by $p_i(z) = x - \lambda_i$ that $p_i(z) = z - \lambda_i = \sum_{j=0}^{1} c_{i,j} \cdot z^j$ where $c_{i,0} = -\lambda_i$ and $c_{i,1} = 1 \neq 1$ so that p_i is a polynomial of order 1. Further, as for $\{a_i\}_{i \in \{0\}} \subseteq a_i$ with $a_0 = c$ we have $\sum_{i=0}^{0} a_i \cdot z^i = a_0 \cdot z^0 = C_z(z)$ it follows that C_c is a polynomial of order 0. So if we define

$$\{q_i\}_{i \in \{1, \ldots, n+1\}} \subseteq \mathcal{P} \text{ by } q_i = \begin{cases} C_c \text{ if } i = n+1 \\ p_i \text{ if } i \in \{1, \ldots, n\} \end{cases}$$

then we have for $z \in \mathbb{C}$ that

$$\begin{aligned} \left(\prod_{i=1}^{n+1} q_i\right)(z) &= \prod_{i=1}^{n+1} q_i(z) \\ &= q_{n+1}(z) \cdot \prod_{i=1}^{n} q_i(z) \\ &= C_c(z) \cdot \prod_{i=1}^{n} p_i(z) \\ &= c \cdot \prod_{i=1}^{n} (z - \lambda_i) \\ &= p(z) \end{aligned}$$

proving that

$$p = \prod_{i=1}^{n+1} q_i \tag{18.11}$$

Now if $i \in \{1, \ldots, n\}$ then we have for $x \in X$ that

$$\begin{aligned} q_i[L](x) &= \begin{cases} \sum_{i=0}^{0} a_i \cdot L^i(x) \text{ if } i = n+1 \\ \sum_{j=0}^{0} c_{i,j} \cdot L^j(x) \text{ if } i \in \{1, \ldots, n\} \end{cases} \\ &= \begin{cases} c \cdot L^0(x) \text{ if } i = n+1 \text{ if } i = n+1 \\ -\lambda_i \cdot L^0(x) + 1 \cdot L^1(x) \text{ if } i \in \{1, \ldots, n\} \end{cases} \\ &= \begin{cases} c \cdot \mathrm{Id}_X(x) \text{ if } i = n+1 \\ L(x) - \lambda_i \cdot \mathrm{Id}_X(x) \text{ if } i \in \{1, \ldots, n\} \end{cases} \\ &= \begin{cases} (c \cdot \mathrm{Id}_X)(x) \text{ if } i = n+1 \\ (L - \lambda_i \cdot \mathrm{Id}_X)(x) \text{ if } i \in \{1, \ldots, n\} \end{cases} \end{aligned}$$

so that

$$q_i[L] = \begin{cases} c \cdot \mathrm{Id}_X \text{ if } i = n+1 \\ (L - \lambda_i \cdot \mathrm{Id}_X) \text{ if } i \in \{1, \ldots, n\} \end{cases} \tag{18.12}$$

Hence we have that

$$\begin{aligned} p[L] &\underset{\text{[theorem: 18.11]}}{=} \left(\prod_{i=1}^{n+1} q_i\right)[L] \\ &\underset{\text{[theorem: 18.63]}}{=} \bigodot_{i=1}^{n+1} q_i[L] \\ &= q_{n+1}[L] \circ \bigodot_{i=1}^{n} q_i[L] \\ &\underset{\text{[eq: 18.12]}}{=} (c \cdot \mathrm{Id}_X) \circ \bigodot_{i=1}^{n} (L - \lambda_i \cdot \mathrm{Id}_X) \\ &= c \cdot \bigodot_{i=1}^{n} (L - \lambda_i \cdot \mathrm{Id}_X) \end{aligned}$$

$\square$

18.4.2 Eigenvectors and eigenvalues.

Definition 18.68. *Let X be a vector space over a field $\mathcal{F}$ and $L \in \mathrm{Hom}(X)$ then $x \in X$ is a* ***eigenvector*** *with* ***eigenvalue*** *$\lambda \in \mathcal{F}$ if*

$$x \neq 0 \text{ and } L(x) = \lambda \cdot x$$

***Note* 18.69.** *The condition $x \neq 0$ is essential because $L(0) = 0 = \lambda \cdot 0$ for all $\lambda \in \mathcal{F}$, hence if we want to have a special meaning for λ we must exclude the case $x = 0$.*

It turns out that in a non trivial finite dimensional vector spaces over $\mathbb{C}$ every $L \in \mathrm{Hom}(X)$ has eigenvectors with eigenvalues.

Theorem 18.70. *Let X be finite dimensional vector space over $\mathbb{C}$ with $\dim(X) \in \mathbb{N}$ [in other words X is not trivial] then ever $L \in \mathrm{Hom}(X)$ has at least one eigenvector.*

Proof. Let $n = \dim(X)$ then as $n \neq 0$ there exist a $x \in X$ with $x \neq 0$. Consider now the set $W = \{L^0(x), \dots, L^n(x)\} \subseteq X$ of $n+1$ vectors in X. As $\dim(X) = n$ W must be linear dependent [see theorem: 11.159]]. Hence there exist a family $\{a_i\}_{i \in \{0,\dots,n\}} \subseteq \mathbb{C}$ such that $\exists k \in \{0, \dots, n\}$ with $a_k \neq 0$ such that

$$\sum_{i=0}^{n} a_i \cdot L^i(x) = 0$$

As $k \in \{i \in \{0, \dots, n\} | a_i \neq 0\}$, $m = \max(\{i \in \{0, \dots, n\} | a_i \neq 0\})$ exist.

$$0 = \sum_{i=0}^{n} a_i \cdot L^i(x) = \sum_{i \in \{0,\dots,m\}} a_i \cdot L^i(x) + \sum_{i \in \{m+1,\dots,n\}} a_i \cdot L^i(x) = \sum_{i=0}^{m} a_i \cdot L^i(x)$$

hence we have

$$\sum_{i=0}^{m} a_i \cdot L^i(x) = 0 \text{ and } a_m \neq 0 \tag{18.13}$$

If $m = 0$ then $0 = \sum_{i=0}^{0} a_i \cdot L^i(x) = a_o \cdot L^0(x) = a_0 \cdot \mathrm{Id}(x) = a_0 \cdot x$ which, as $a_0 \neq 0$ leads to the contradiction $0 = x \neq 0$. Take the polynomial $p \in \mathcal{P}$ defined by $p(z) = \sum_{i=0}^{m} a_i \cdot z^i$ then as $m \in \mathbb{N}$ we have by [theorem: 18.67] that there exists a $c \in \mathbb{C} \setminus \{0\}$ and a family $\{\lambda_i\}_{i \in \{1,\dots,n\}} \subseteq \mathbb{C}$ such that

$$\sum_{i=0}^{n} a_i \cdot L^i = p[L] = c \cdot \bigodot_{i=1}^{n} (L - \lambda_i \cdot \mathrm{Id}_X)$$

So we have by [eq: 18.13]

$$0 = \sum_{i=0}^{n} a_i \cdot L^i(x) = \left(\sum_{i=0}^{n} a_i \cdot L^i \right)(x) = c \cdot \left(\bigodot_{i=1}^{n} (L - \lambda_i \cdot \mathrm{Id}_X) \right)(x)$$

which as $c \neq 0$ proves that $(\bigodot_{i=1}^{n} (L - \lambda_i \cdot \mathrm{Id}_X))(x) = 0$ which as $x \neq 0$ proves that

$$\ker\left(\bigodot_{i=1}^{n} (L - \lambda_i \cdot \mathrm{Id}_X) \right) \neq \{0\}$$

Assume that $\forall i \in \{1, \dots, n\}$ $\ker(L - \lambda_i \cdot \mathrm{Id}_X) = \{0\}$ then by [theorem: 18.58] $\ker(\bigodot_{i=1}^{n} (L - \lambda_i \cdot \mathrm{Id}_X)) = \{0\}$ contradicting the above. Hence there exist a $l \in \{1, \dots, n\}$ such that $\ker(L - \lambda_l \cdot \mathrm{Id}_X) \neq \{0\}$, so there exist a $w \in X$ with $w \neq 0$ such that $(L - \lambda_l \cdot \mathrm{Id}_X)(w) = L(w) - \lambda_l \cdot x = 0$ or $L(w) = \lambda_l \cdot w$. So we found a eigenvector w with eigenvalue λ_l. □

TODO some theorems about eigenvalues

Definition 18.71. (eigenspace) *Let X be a vector space over a field $\mathcal{F}$ and $L \in \mathrm{Hom}(X)$ with a eigenvalue λ then the* ***eigenspace*** *of λ note by $E(L, \lambda)$ is defined by*

$$E(L, \lambda) = \{x \in X | L(x) = \lambda \cdot x\}$$

***Note* 18.72.** *As $L(0) = 0 = \lambda \cdot 0$ we have that $0 \in E(L, \lambda)$ although 0 is not a eigenvector.*

Theorem 18.73. *Let X be a vector space over a field $\mathcal{F}$ and $L \in \mathrm{Hom}(X)$ then if λ is a eigenvalue of L then $E(L, \lambda)$ is a non trivial sub-space of X.*

Proof. As λ is a eigenvalue of L there exist a $x \in X$ such that $L(x) = \lambda \cdot x$, hence

$$\emptyset \neq E(L, \lambda) = \{x \in X | L(x) = \lambda \cdot x\} \neq \{0\}$$

If $x, y \in E(L, \lambda)$ and $\alpha \in \mathcal{F}$ then $L(x + \alpha \cdot y) = L(x) + \alpha \cdot L(y) = \lambda \cdot x + \alpha \cdot \lambda \cdot y = \lambda \cdot (x + \alpha \cdot y)$ proving that $x + \alpha \cdot y \in E(L, \lambda)$ □

Theorem 18.74. *Let X be a vector space over a field $\mathcal{F}$ and $L \in \mathrm{Hom}(X)$, $n \in \mathbb{N}$ and $\{e_i\}_{i\in\{1,\ldots,n\}}$ a finite family of eigenvectors with $\forall i \in \{1,\ldots,n\}$ a eigenvalue λ_i such that $\forall i,j \in \{1,\ldots,n\}$ with $i \neq j$ we have $\lambda_i \neq \lambda_j$ then $\{e_i\}_{i\in\{1,\ldots,n\}}$ is linear independent. In other words if $\{e_i\}_{i\in\{1,\ldots,n\}}$ is a finite family of eigenvectors with distinct eigenvalues then $\{e_i\}_{i\in\{1,\ldots,n\}}$ is linear independent.*

Proof. Assume that $\{e_i\}_{i\in\{1,\ldots,n\}}$ is linear dependent then by [theorem: 11.127] there exists a $k \in \{1,\ldots,n\}$ and $\{\alpha_i\}_{i\in\{1,\ldots,k-1\}} \subseteq F$ such that $e_k \in \sum_{i\in\{1,\ldots,k-1\}} \alpha_i \cdot x_i$. So the finite set

$$A = \left\{ k \in \{1,\ldots,n\} | \exists \{\alpha_i\}_{i \ni \{1,\ldots,k-1\}} \subseteq F \text{ such that } e_k = \sum_{i\in\{1,\ldots,k-1\}} \alpha_i \cdot x_i \right\}$$

is not empty. Hence $k = \min(A)$ exist and there exist a $\{\alpha_i\}_{i\in\{1,\ldots,k-1\}} \subseteq F$ such that

$$x_k = \sum_{i\in\{1,\ldots,k-1\}} \alpha_i \cdot x_i$$

If $\{e_i\}_{i\in\{1,\ldots,k-1\}}$ is again dependent then by [theorem: 11.127] again there exist a $l \in \{1,\ldots,k-1\} \subseteq \{1,\ldots,n\}$ and $\{\beta_i\}_{i\in\{1,\ldots,l-1\}} \subseteq F$ such that $e_l = \sum_{i\in\{1,\ldots,l-1\}} \beta_i \cdot e_i$, hence $l \in A$, contradicting the fact that $k = \min(A)$ [as $l \leqslant k-1 < k$]. So $\{e_i | i \in \{1,\ldots,k-1\}\}$ must be linear independent. Hence we have that

$$e_k = \sum_{i\in\{1,\ldots,k-1\}} \alpha_i \cdot x_i \text{ and } \{e_i | i \in \{1,\ldots,k-1\}\} \text{ is linear independent}$$

Applying then L we get

$$\begin{aligned} \lambda_k \cdot e_k &= L(e_k) \\ &= L\left(\sum_{i\in\{1,\ldots,k-1\}} \alpha_i \cdot e_i \right) \\ &= \sum_{i\in\{1,\ldots,k-1\}} \alpha_i \cdot L(e_i) \\ &= \sum_{i\in\{1,\ldots,k-1\}} \alpha_i \cdot \lambda_i \cdot e_i \end{aligned}$$

As also $\lambda_k \cdot e_k = \lambda_k \cdot \sum_{i\in\{1,\ldots,k-1\}} \alpha_i \cdot e_i = \sum_{i\in\{1,\ldots,k-1\}} \alpha_i \cdot \lambda_k \cdot e_i$ we have

$$\begin{aligned} 0 &= \sum_{i\in\{1,\ldots,k-1\}} \alpha_i \cdot \lambda_i \cdot e_i - \sum_{i\in\{1,\ldots,k-1\}} \alpha_i \cdot \lambda_k \cdot e_i \\ &= \sum_{i\in\{1,\ldots,k-1\}} \alpha_i \cdot (\lambda_i - \lambda_k) \cdot e_i \end{aligned}$$

Given that $\{e_1,\ldots,e_{k-1}\}$ is linear independent we have that $\forall i \in \{1,\ldots,k-1\}$ $\alpha_i \cdot (\lambda_i - \lambda_k) = 0$ which as $\lambda_k \neq \lambda_i$ [because $k \neq i$] proves that $\forall i \in \{1,\ldots,k-1\}$ $\alpha_i = 0$. Hence $e_k = \sum_{i\in\{1,\ldots,k-1\}} \alpha_i \cdot e_i = 0$ contradicting then fact that $e_k \neq 0$ because e_k is a eigenvector. So the assumption wrong and

$$\{e_1,\ldots,e_n\} \text{ is linear independent.}$$

□

Theorem 18.75. *Let X be a finite dimensional vector space over a field $\mathcal{F}$ and $L \in \mathrm{Hom}(X)$ then* $\mathrm{card}(\{\lambda \in \mathcal{F} | \lambda$ *is a eigenvalue for* $L\}) \leqslant \dim(X)$. *In other words every linear operator has at most* $\dim(X)$ *distinct eigenvalues.*

Proof. Let $\Lambda = \{\lambda \in \mathcal{F} | \lambda \text{ is a eigenvalue of } L\} = \{\lambda \in \mathcal{F} | \exists x \in X \text{ such that } L(x) = \lambda \cdot x\}$, If $m = \mathrm{card}(\Lambda)$ then we can write Λ as

$$\Lambda = \{\lambda_1,\ldots,\lambda_m\} \text{ [meaning that } \lambda\colon \{1,\ldots,n\} \to \Lambda \text{ is a bijection]}$$

For each $i \in \{1,\ldots,m\}$ we can find by definition a eigenvector $x \in X$ such that $L(x) = \lambda_i \cdot x$ allowing us to define a family $\{x_i\}_{i\in\{1,\ldots,n\}} \subseteq X$ such that $\forall i \in \{1,\ldots,n\}$ $L(e_i) = \lambda_i \cdot e_i$ [see theorem: 3.107]. Let $i,j \in \{1,\ldots,m\}$ with $i \neq j$ then, as λ is a bijection, $\lambda_i \neq \lambda_j$, so by the previous theorem [theorem: 18.74] $\{e_i\}_{i\in\{1,\ldots,m\}}$ is linear independent. Hence by [theorem:11.133] $\{e_i | i \in \{1,\ldots,m\}\}$ is linear independent set with $\mathrm{card}(\{e_i | i \in \{1,\ldots,m\}\}) = m$. Using then [theorem: 11.159] it follows that we must have that $m \leqslant \dim(X)$ or

$$\mathrm{card}(\{\lambda \in \mathcal{F} | \lambda \text{ is a eigenvalue of } L\}) \leqslant \dim(X)$$

□

Theorem 18.76. *Let X be a finite dimensional vector space over a field $\mathcal{F}$ and $L \in \mathrm{Hom}(X)$ with eigenvalues $\{e_1,\ldots,e_n\}$, $n \in \mathbb{N}$ then for $E(L,\lambda_1,\ldots,\lambda_n)$ defined by*

$$E(L;\lambda_1,\ldots,\lambda_n) = \mathrm{span}\left(\bigcup_{i\in\{1,\ldots,n\}} E(L,\lambda_i) \right)$$

we have:

1. $E(L;\lambda_1,\ldots,\lambda_n)$ *is a sub-space of* X
2. $\forall i\in\{1,\ldots,n\}$ $E(L,\lambda_i)$ *is a sub-space of* $E(L;\lambda_1,\ldots,\lambda_n)$
3. $E(L;\lambda_1,\ldots,\lambda_n)=\bigoplus_{i\in\{1,\ldots,n\}}E(L,\lambda_i)$
4. $\dim(E(L;\lambda_1,\ldots,\lambda_n))=\sum_{i=1}^n\dim(E(L,\lambda_i))$

Proof.

1. This follows from [theorem: 11.108].
2. Let $i\in I$ then by [theorem: 18.73] $E(L,\lambda_i)$ is a sub-space of X, hence $\forall x,y\in E(L,\lambda_i)$ and $\alpha\in\mathbb{F}$ we have
$$x+\alpha\cdot y\in E(L,\lambda_i)\subseteq\bigcup_{i\in\{1,\ldots,n\}}E(L,\lambda_i)\subseteq\operatorname{span}\left(\bigcup_{i\in\{1,\ldots,n\}}E(L,\lambda_i)\right)=E(L;\lambda_1,\ldots,n)$$
which, as also $E(L,\lambda_i)\neq\varnothing$, proves that $E(L,\lambda_i)$ is a sub-space of $E(L;\lambda_1,\ldots,\lambda_n)$.
3. Let $x\in E(L;\lambda_1,\ldots,\lambda_n)=\operatorname{span}\left(\bigcup_{i\in\{1,\ldots,n\}}E(L,\lambda_i)\right)$ then there exists a $m\in\mathbb{N}$, a $\{\alpha_i\}_{i\in\{1,\ldots,m\}}\subseteq\mathcal{F}$ and a $\{x_i\}_{i\in\{1,\ldots,n\}}\in\bigcup_{i\in\{1,\ldots,n\}}E(L,\lambda_i)$ such that
$$x=\sum_{i=1}^m\alpha_i\cdot x_i$$
If $i\in\{1,\ldots,m\}$ then there exist a $k_i\in\{1,\ldots,n\}$ such that $x_i\in E(L,\lambda_{k_i})$, then $\alpha_i\cdot x_i\in E(L,\lambda_{k_i})$. Define now
$$\{w_{i,j}\}_{j\in\{1,\ldots,n\}}\subseteq E(L;\lambda_1,\ldots,\lambda_n)\text{ by }w_{i,j}=\begin{cases}0\text{ if }j\in\{1,\ldots,n\}\setminus\{k_i\}\\ \alpha_i\cdot x_i\text{ if }j=k_i\end{cases}$$
then we have
$$\sum_{j=1}^n w_{i,j}=\sum_{j\in\{1,\ldots,n\}\setminus\{k_i\}}w_{i,j}+\sum_{j\in\{k_i\}}w_{i,j}=\alpha_i\cdot x_i$$
proving that
$$\forall i\in\{1,\ldots,m\}\ \alpha_i\cdot x_i\in\sum_{j\langle 1,\ldots,n\rangle}E(L,\lambda_j)$$
As by (2) and [theorem: 12.4] $\sum_{j\in\{1,\ldots,n\}}E(L,\lambda_j)$ is a vector space it follows from the above that $x=\sum_{i=1}^m\alpha_i\cdot x_i\in\sum_{j\{1,\ldots,n\}}E(L,\lambda_j)$. Hence we have proved that
$$E(L;\lambda_1,\ldots,\lambda_n)\subseteq\sum_{j\in\{1,\ldots,n\}}E(L,\lambda_j)$$
If $x\in\sum_{j=1}^nE(L,\lambda_j)$ then $x=\sum_{j=1}^nv_i$ where $v_j\in E(L,\lambda_j)\subseteq\bigcup_{i\in\{1,\ldots,n\}}E(L,\lambda_i)$ so that $x\in\operatorname{span}\left(\bigcup_{i\in\{1,\ldots,n\}}E(L,\lambda_i)\right)=E(L;\lambda_1,\ldots,n)$, hence $\sum_{j\in\{1,\ldots,n\}}E(L,\lambda_j)\subseteq E(L;\lambda_1,\ldots,n)$. Combining this with the above proves that
$$E(L;\lambda_1,\ldots,\lambda_n)=\sum_{j\in\{1,\ldots,n\}}E(L,\lambda_j)\tag{18.14}$$
Let $k\in\{1,\ldots,n\}$ and assume that $x\in E(L,\lambda_k)\bigcap\left(\sum_{j\in\{1,\ldots,n\}\setminus\{k\}}E(L,\lambda_j)\right)$ then
$$x\in E(L,\lambda_k)\wedge x=\sum_{j\in\{1,\ldots,n\}\setminus\{k\}}v_j\ \text{ where }v_j\in E(L,\lambda_j)\tag{18.15}$$
Define $\{w_i\}_{i\in\{1,\ldots,n\}}$ by $w_i=\begin{cases}-x\text{ if }i=k\\ v_i\text{ if }i\in\{1,\ldots,n\}\setminus\{k\}\end{cases}\in E(L,\lambda_i)$ then we have
$$\begin{aligned}0&=\sum_{i\in\{1,\ldots,n\}}w_i\\&=\sum_{i\in\{j\in\{1,\ldots,n\}|w_i\neq 0\}}w_i+\sum_{i\in\{j\in\{1,\ldots,n\}|w_i=0\}}w_i\\&=\sum_{i\in\{j\in\{1,\ldots,n\}|w_i\neq 0\}}w_i\\&=\sum_{i\in I}w_i\end{aligned}\tag{18.16}$$

where $I=\{i\in\{1,\ldots,n\}|w_i\neq 0\}$. Then $\forall i\in I$ we have $w_i\neq 0\wedge L(w_i)=\lambda_i\cdot w_i$ or w_i is a eigen vector of L. Assume that $I\neq\varnothing$ then there exist a $k\in\{1,\ldots,n\}$ such that $I=\{i_1,\ldots,i_k\}$ and $\forall r,s\in\{1,\ldots,k\}$ with $r\neq s$ we have $i_r\neq i_s$ so that $\lambda_{r_1}\neq\lambda_{i_s}$, hence $\{w_{i_j}\}_{j\in\{1,\ldots,i_k\}}$ is a family of eigenvectors with distinct eigenvalues. Applying then [theorem: 18.74] $\{w_{i_j}\}_{j\in\{1,\ldots,i_k\}}$ is linear independent contradicting that we have proved that $\sum_{i\in I}w_i=0$ [see eq: 18.16] Hence we must have that $I=\varnothing$ and $\forall i\in\{1,\ldots,n\}$ $w_i=0$, in particular $w_k=-x=0\Rightarrow x=0$. So it follows that $E(L,\lambda_k)\bigcap\left(\sum_{j\in\{1,\ldots,n\}\setminus\{k\}}E(L,\lambda_j)\right)\subseteq\{0\}$. As $E(L,\lambda_k)$ and $\sum_{j\in\{1,\ldots,n\}\setminus\{k\}}E(L,\lambda_j)$ are vector spaces we have also that $0\in E(L,\lambda_k)\bigcap\left(\sum_{j\in\{1,\ldots,n\}\setminus\{k\}}E(L,\lambda_j)\right)$. Hence we conclude that

$$E(L,\lambda_k)\bigcap\left(\sum_{j\in\{1,\ldots,n\}\setminus\{k\}}E(L,\lambda_j)\right)=\{0\}$$

Finally using [theorem: 12.8] together with (1),(2) and [eq: 18.14] it follows that

$$E(L;\lambda_1,\ldots,\lambda_n)=\bigoplus_{i\in\{1,\ldots,n\}}E(L,\lambda_i)$$

4. Using (3) and [theorem: 12.15] it follows that

$$\dim(E(L;\lambda_1,\ldots,\lambda_n))=\sum_{i=1}^{n}\dim(E(L,\lambda_i))$$ □

18.4.3 Upper triangular and diagonal matrices

Definition 18.77. *Let X be a vector space, Y a sub-space of X and $L\in\mathrm{Hom}(X)$ then we say that Y is **invariant under L** if $L(Y)\subseteq Y$. In other words every vector in Y is mapped to another vector in Y.*

Definition 18.78. *Let $n\in\mathbb{N}$, $\mathcal{F}$ a field then a matrix $M\in\mathcal{M}_{n,n}(\mathcal{F})$ is a **upper triangular matrix** if $\forall i,j\in\{1,\ldots,n\}$ with $i>j$ we have $M_{i,j}=0$. In other words a matrix is a upper triangular matrix if the matrix is empty below its diagonal.*

Example 18.79. The matrix $M=\begin{pmatrix}1&2&3\\0&4&5\\0&0&6\end{pmatrix}$ is a upper triangular matrix because

$$M_{1,2}=M_{1,3}=M_{3,2}=0$$

The following theorem gives necessary and sufficient conditions for the matrix of a linear operator to be upper triangular.

Theorem 18.80. *Let X be a finite dimensional vector space with $\dim(X)\in\mathbb{N}$ [hence X is not trivial], $E=\{e_1,\ldots,e_n\}$ a basis for X and $L\in\mathrm{Hom}(X)$ a linear operator then we have the following equivalences:*

1. *$\mathcal{M}(L;E,E)$ is upper triangular*
2. *$\forall i\in\{1,\ldots,n\}$ we have $L(e_i)\in\mathrm{span}(\{e_k|k\in\{1,\ldots,i\}\})$*
3. *$\forall i\in\{1,\ldots,n\}$ we have that $\mathrm{span}(\{e_k|k\in\{1,\ldots,i\}\})$ is invariant under L*

Proof. Let $M=\mathcal{M}(L;E,E)$ then we have:

1 ⇒ 2. Let $i\in\{1,\ldots,n\}$ then we have

$$\begin{aligned}L(e_i)&=\sum_{k=1}^{n}M_{k,i}\cdot e_k\\&=\sum_{k\in\{1,\ldots,i\}}M_{k,i}\cdot e_k+\sum_{k\in\{i+1,\ldots,n\}}M_{k,i}\cdot e_k\\&=\sum_{k\in\{1,\ldots,i\}}M_{k,i}\cdot e_k+\sum_{k\in\{i+1,\ldots,n\}}0\cdot e_k\\&=\sum_{k\in\{1,\ldots,i\}}M_{k,i}\cdot e_k\end{aligned}$$

so that $L(e_i)\in\mathrm{span}(\{e_k|k\in\{1,\ldots,i\}\})$.

2 ⇒ 1. Let $i\in\{1,\ldots,n\}$ then, as $L(e_i)\in\mathrm{span}(\{e_k|k\in\{1,\ldots,i\}\})$, there exist a $\{\alpha_k\}_{k\in\{1,\ldots,i\}}$ such that $L(e_i)=\sum_{k=1}^{i}\alpha_k\cdot e_k$. Define

$$\{\beta_k\}_{k\in\{1,\ldots,n\}}\text{ by }\beta_k=\begin{cases}\alpha_k\text{ if }k\in\{1,\ldots,i\}\\0\text{ if }k\in\{i+1,\ldots,n\}\end{cases}$$

then we have

$$\begin{aligned}\sum_{i=1}^{n} M_{k,i}\cdot e_k &= L(e_i)\\ &= \sum_{k=1}^{i}\alpha_k\cdot e_k\\ &= \sum_{k\in\{1,\dots,i\}}\beta_k\cdot e_k+\sum_{k\in\{i+1,\dots,n\}}0\cdot e_k\\ &= \sum_{k\in\{1,\dots,i\}}\beta_k\cdot e_k+\sum_{k\in\{i+1,\dots,n\}}\beta_k\cdot e_k\\ &= \sum_{k=1}^{n}\beta_k\cdot e_k\end{aligned}$$

As $\{e_1,\dots,e_n\}$ is a basis it follows that $\forall k\in\{1,\dots,n\}$ $M_{k,i}=\beta_k$, hence $\forall k\in\{i+1,\dots,n\}$ we have $M_{k,i}=\beta_k=0$. As $i\in\{1,\dots,n\}$ was chosen arbitrary it follows that $M_{k,i}=0$ whenever $k>i$ proving that M is upper triangular.

2 ⇒ 3. Given $i\in\{1,\dots,n\}$ take $x\in\operatorname{span}(\{e_l|l\in\{1,\dots,i\}\})$ then there exist a $\{x_k\}_{k\in\{1,\dots,i\}}$ such that $x=\sum_{k=1}^{i}x_k\cdot e_k$, hence

$$L(x)=L\left(\sum_{k=1}^{i}x_k\cdot e_k\right)=\sum_{k=1}^{i}x_k\cdot L(e_k)$$

so that

$$L(x)\in\operatorname{span}(\{L(e_k)|k\in\{1,\dots,i\}\}) \tag{18.17}$$

Now for every $k\in\{1,\dots,i\}\subseteq\{1,\dots,n\}$ we have by (2) that

$$L(e_k)\in\operatorname{span}(\{e_l|l\in\{1,\dots,k\}\})\subseteq_{\text{[theorem: 11.107]}}\operatorname{span}(\{e_l|l\in\{1,\dots,i\}\})$$

so that $\{L(e_k)|k\in\{1,\dots,i\}\}\subseteq\operatorname{span}(\{e_l|l\in\{1,\dots,i\}\})$ or using [theorem: 11.107] again

$$\operatorname{span}(\{L(e_k)|k\in\{1,\dots,i\}\})\subseteq\operatorname{span}(\operatorname{span}(\{e_l|l\in\{1,\dots,i\}\}))\underset{\text{[theorem: 11.110]}}{=}\operatorname{span}(e_l|l\in\{1,\dots,i\})$$

which combined with [eq: 18.17] proves that

$$L(x)\subseteq\operatorname{span}(e_l|l\in\{1,\dots,i\})$$

As $x\in\operatorname{span}(\{e_k|k\in\{1,\dots,i\}\})$ we have from the above that

$$L(\operatorname{span}(\{e_k|k\in\{1,\dots,i\}\}))\subseteq\operatorname{span}(\{e_k|k\in\{1,\dots,i\}\})$$

showing that $\operatorname{span}(\{e_k|k\in\{1,\dots,i\}\})$ is invariant under L.

3 ⇒ 2. Let $i\in\{1,\dots,n\}$ then as $e_i\in\operatorname{span}(\{e_l|l\in\{1,\dots,n\}\})$ and $\operatorname{span}(\{e_l|l\in\{1,\dots,n\}\})$ is invariant under L we have that $L(e_i)\in\operatorname{span}(\{e_l|l\in\{1,\dots,n\}\})$. □

We show now that in finite dimensional non trivial vector spaces over $\mathbb{C}$ every linear operator can have a upper triangular matrix.

Theorem 18.81. *Let $n\in\mathbb{N}$, X a finite dimensional vector space over $\mathbb{C}$ with $\dim(X)=n$ [hence X is not trivial] and $L\in\operatorname{Hom}(X)$ then there exist a basis $\{e_1,\dots,e_n\}$ for X such that $\mathcal{M}(L;E,E)$ is a upper triangular matrix.*

Proof. We prove this by induction, so define

$S=\{n\in\mathbb{N}|$If X is a finite dimensional vector space over $\mathbb{C}$ with $m=\dim(X)$, $0<m\leqslant n$ then for $L\in\operatorname{Hom}(X)$ there exist a basis $E=\{e_1,\dots,e_m\}$ such that $\mathcal{M}(L;E,E)\}$

then we have:

$1\in S$. If $\dim(X)=1$ then there exist a basis $E=\{e_1\}$ of X and for $L\in\operatorname{Hom}(X)$ the matrix $\mathcal{M}[L;E,E]$ is a 1×1 matrix which is automatically upper diagonal, hence $1\in S$.

$n\in S\Rightarrow n+1\in S$. Let X be a finite dimensional basis with $1<\dim(X)\leqslant n+1$ and $L\in\operatorname{Hom}(X)$. For $\dim(X)$ we have either:

$\dim(X)<n+1$. Then $\dim(X)\leqslant n$ so that, as $n\in S$, there exist a basis $E=\{e_1,\dots,e_{\dim(X)}\}$ such that $\mathcal{M}(L;E,E)$ is upper triangular. Hence in this case we have that $n+1\in S$

$\dim(X)=n+1$. Using [theorem: 18.70] there exist a eigenvector $x\in X$ with eigenvalue λ. So $(L-\lambda\cdot\mathrm{Id}_X)(x)=0$ and $x\neq 0$ hence

$$\ker(L-\lambda\cdot\mathrm{Id}_X)\neq\{0\}$$

By [theorem: 11.190] $\ker(L-\lambda\cdot\mathrm{Id}_X)$ is a sub-space of X, so that by [theorem: 11.157] $\ker(L-\lambda\cdot\mathrm{Id}_X)$ is finite dimensional and together with the above we have

$$0<\dim(\ker(L-\lambda\cdot\mathrm{Id}_X))\leqslant\dim(X)$$

Using [theorem: 11.201] we have that

$$\begin{aligned}\dim(X) &= \dim(\ker(L-\lambda\cdot\mathrm{Id}_X))+\mathrm{rank}(L-\lambda\cdot\mathrm{Id}_x)\\ &= \dim(\ker(L-\lambda\cdot\mathrm{Id}_X))+\dim((L-\lambda\cdot\mathrm{Id}_X)(X))\end{aligned}$$

proving by the above that

$$\dim((L-\lambda\cdot\mathrm{Id}_X)(X))<\dim(X)$$

Summarized

$$U=(L-\lambda\cdot\mathrm{Id}_X)(X)\text{ is a vector space [see theorem: 11.190] with }\dim(U)<\dim(X)$$

If $u\in U$ then $L(u)=L(u)-\lambda\cdot u+\lambda\cdot u=(L-\lambda\cdot\mathrm{Id}_X)(u)+\lambda\cdot u\in U$ [as $(L-\lambda\cdot\mathrm{Id}_X)(u)\in(L-\lambda\cdot\mathrm{Id}_X)(X)=U$ and U is a vector space], hence we have that

$$L(U)\subseteq U$$

From the above combined with the fact that the linear mapping to a subspace is linear [see theorem: 11.167] it follows that

$$L_{|U}\in\mathrm{Hom}(U)$$

Hence, as $\dim(U)<\dim(X)=n+1$ implies $\dim(U)\leqslant n$ and $n\in S$, we have that there exist a basis $V=\{v_1,\ldots,v_{\dim(U)}\}$ for U such that $\mathcal{M}(L_{|U};V,V)$ is upper triangular. Applying then the previous theorem [theorem: 18.80] it follows that

$$\forall j\in\{1,\ldots,\dim(U)\}\ L(v_j)=L_{|U}(v_j)\in\mathrm{span}(\{v_k|k\in\{1,\ldots,j\}\})\tag{18.18}$$

As $\{v_1,\ldots,v_{\dim(U)}\}$ is linear independent we can use [theorem: 11.155] to extend $\{v_1,\ldots,v_{\dim(U)}\}$ to a basis $\{w_1,\ldots,w_{n+1}\}$ where $\forall i\in\{1,\ldots,\dim(U)\}$ we have $w_i=v_i$. Using the above on [eq: 18.18] results in

$$\forall j\in\{1,\ldots,\dim(U)\}\text{ we have }L(w_j)\in\mathrm{span}(\{w_k|k\in\{1,\ldots,j\}\})\tag{18.19}$$

Let $j\in\{\dim(U)+1,\ldots,n+1\}$ then we have

$$L(w_j)=(L-\lambda\cdot\mathrm{Id}_X)(w_j)+\lambda\cdot\mathrm{Id}_X(w_j)=(L-\lambda\cdot\mathrm{Id}_X)(w_j)+\lambda\cdot w_j\tag{18.20}$$

As

$$\begin{aligned}(L-\lambda\cdot\mathrm{Id}_X)(w_j) &\in (L-\lambda\cdot\mathrm{Id}_X)(X)\\ &= U\\ &= \mathrm{span}(\{v_k|k\in\{1,\ldots,\dim(U)\}\})\\ &= \mathrm{span}(\{w_k|k\in\{1,\ldots,\dim(U)\}\})\\ &\subseteq_{\text{[theorem: 11.107]}} \mathrm{span}(\{w_k|k\in\{1,\ldots,j\}\})\end{aligned}$$

and $\mathrm{span}(\{w_k|k\in\{1,\ldots,j\}\})$ is a vector space [see theorem: 11.108] it follows from [eq: 18.20] that $L(w_j)\in\mathrm{span}(\{w_k|k\in\{1,\ldots,j\}\})$. Hence

$$\forall j\in\{\dim(U)+1,\ldots,n+1\}\text{ we have }L(w_j)\in\mathrm{span}(\{w_k|k\in\{1,\ldots,j\}\})$$

Combining the above with [eq: 18.19] that

$$\forall j\in\{1,\ldots,n+1\}\text{ we have }L(w_j)\in\mathrm{span}(\{w_k|k\in\{1,\ldots,j\}\})$$

Applying then the previous theorem [theorem: 18.80] again it follows that for the basis $W=\{w_1,\ldots,w_n\}$ of X we have

$$\mathcal{M}(L;W,W)\text{ is a upper triangular matrix}$$

Hence we conclude that $n+1\in S$. □

We can actual ensure that the basis that makes the matrix of a linear operator upper diagonal is orthonormal.

Theorem 18.82. (Schur's Theorem) *Let $n \in \mathbb{N}$, X a finite dimensional vector space over $\mathbb{C}$ with $\dim(X) = n$ [hence X is not trivial] and $L \in \mathrm{Hom}(X)$ then there exist a orthonormal basis $\{e_1, \dots, e_n\}$ for X such that $\mathcal{M}(L; E, E)$ is a upper triangular matrix.*

Proof. Using the previous theorem [theorem: 18.81] there exist a basis $B = \{b_1, \dots, b_n\}$ of X such that

$$\mathcal{M}(L; B, B) \text{ is upper triangular}$$

By [theorem: 18.80] it follows then that B satisfied

$$\forall i \in \{1, \dots, n\} \text{ we have } L(\mathrm{span}(\{b_k | k \in \{1, \dots, i\}\})) \subseteq \mathrm{span}(\{b_k | k \in \{1, \dots, i\}\}) \tag{18.21}$$

We can now use the Gram-Schmidt procedure [see theorems: 18.31] to find a orthonormal set $E = \{e_1, \dots, e_n\}$ such that

$$\forall i \in \{1, \dots, n\} \ \mathrm{span}(\{e_1, \dots, e_i\}) = \mathrm{span}(\{b_1, \dots, b_i\}) \tag{18.22}$$

As $\{e_1, \dots e_n\}$ is orthonormal it follows from [theorem: 18.33] that

$$E = \{e_1, \dots, e_n\} \text{ is a basis of } X$$

Substituting [eq: 18.22] in [eq: 18.21] results in

$$\forall i \in \{1, \dots, n\} \text{ we have } L(\mathrm{span}(\{e_k | k \in \{1, \dots, i\}\})) \subseteq \mathrm{span}(\{e_k | k \in \{1, \dots, i\}\})$$

which by [theorem: 18.80] proves that

$$\mathcal{M}(L; E, E) \text{ is a upper diagonal matrix}$$

□

18.4.4 Diagonalization and spectral theorems

A special case of a upper triangular matrix is a diagonal matrix.

Definition 18.83. *Let $n \in \mathbb{N}$, $\mathcal{F}$ a field then a matrix $M \in \mathcal{M}_{n,n}(\mathcal{F})$ is **diagonal** if $\forall i, j \in \{1, \dots, n\}$ with $i \neq j$ $M_{i,j} = 0$. In other words a matrix is diagonal if all no diagonal elements are 0.*

Example 18.84. The matrix $M = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 3 \end{pmatrix}$ is diagonal because

$$M_{2,1} = M_{3,1} = M_{1,2} = M_{3,2} = M_{1,3} = M_{2,3} = 0$$

Definition 18.85. (Self-adjoint linear operators) *Let $\langle X, \langle\rangle\rangle$ be a real [or compact] finite dimensional inner product space then $L \in \mathrm{Hom}(X) = \mathrm{Hom}(X, X)$ is **self adjoint***

$$L = L^*$$

*where L^* is defined in [theorem: 18.37] [so $L^* \in \mathrm{Hom}(X, X)$ is the **unique** linear operator such that $\forall y \in X$ we have $\forall x \in X$ that $\langle x, L^*(y)\rangle = \langle L(x), y\rangle$]. In other words L is self-adjoint iff $\forall x, y \in X$ we have $\langle x, L(y)\rangle = \langle L(x), y\rangle$.*

Example 18.86. Let $\langle X, \langle\rangle\rangle$ be a real [or compact] finite dimensional inner product space then Id_X is a self-adjoint transformation.

Proof. Using [theorem: 11.180] $\mathrm{Id}_X \in \mathrm{Hom}(X)$, further $\forall x, y \in X$ we have

$$\langle x, \mathrm{Id}_X(y)\rangle = \langle x, y\rangle = \langle \mathrm{Id}_X(x), y\rangle$$

□

Theorem 18.87. *Let $\langle X, \langle\rangle\rangle$ be a real [or compact] finite dimensional inner product space with a basis $E = \{e_1, \dots, e_n\}$, $n \in \mathbb{N}$ and $L \in \mathrm{Hom}(X)$ then*

$$\begin{gathered} L \text{ is self-adjoint} \\ \Updownarrow \\ \mathcal{M}(L; E, E) \text{ is Hermitian} \end{gathered}$$

Proof.

$\Rightarrow$. This follows from

$$\begin{aligned} \mathcal{M}(L; E, E) &\underset{L = L^*}{=} \mathcal{M}(L^*; E, E) \\ &\underset{\text{[theorem: 18.50]}}{=} \mathcal{M}(L; E, E)^H \end{aligned}$$

so that $\mathcal{M}(L;E,E)$ is Hermitian.

$\Leftarrow$. Let $x\in X$ then there exist a $\{x_i\}_{i\in\{1,\ldots,n\}}\in\mathbb{K}$ such that $x=\sum_{i=1}^n x_i\cdot e_i$. Let $k\in\{1,\ldots,n\}$ then we have

$$\begin{aligned}(L(x))_k &= \sum_{i=1}^n \mathcal{M}(L;E,E)_{k,i}\cdot x_i\\ &= \sum_{i=1}^n (\mathcal{M}(L;E,E)^H)_{k,i}\cdot x_i\\ &\underset{\text{[theorem: 18.50]}}{=} \sum_{i=1}^n \mathcal{M}(L^*;E,E)_{k,i}\cdot x_i\\ &= (L^*(x))_k\end{aligned}$$

proving that $L(x)=L^*(x)$. As $x\in X$ was chosen arbitrary it follows that $L=L^*$ hence L is self-adjoint. □

Corollary 18.88. *Let $\langle X,\langle\rangle\rangle$ be a real finite dimensional inner product space and $L\in\mathrm{Hom}(X)$ a linear operator such that there exist a basis $\{e_1,\ldots,e_n\}$ so that $\mathcal{M}(L;E,E)$ is diagonal then L is self-adjoint/*

Proof. As $\mathcal{M}(L;E,E)$ is real and diagonal we have $\forall i,j\in\{1,\ldots,n\}$ that

$$\begin{aligned}(\mathcal{M}(L;E,E)^H)_{i,j} &= (\mathcal{M}(L;E,E)^\star)_{j,i}\\ &= \mathcal{M}(L;E,E)_{j,i}\\ &= \mathcal{M}(L;E,E)_{i,i}\cdot\delta_{i,j}\\ &= \mathcal{M}(L;E,E)_{i,j}\end{aligned}$$

proving that $\mathcal{M}(L;E,E)$ is Hermitian, hence by [theorem: 18.87] L is self-adjoint. □

All the eigenvalues of a self-adjoint mapping are real as is show in the next theorem.

Theorem 18.89. *Let $\langle X,\langle\rangle\rangle$ be a real [or compact] finite dimensional inner product space and $L\in\mathrm{Hom}(X)$ then every eigenvalue of L is a real number.*

Proof. () If $\langle X,\langle\rangle\rangle$ is a real inner product space then the result is trivial, so consider the case of complex inner product space. Let $x\in X$ be a eigenvector with eigenvalue λ. Then we have $x\neq 0\Rightarrow\|\|$ and $L(x)=\lambda\cdot x$ so that

$$\begin{aligned}\lambda &= \frac{\lambda\cdot\|x\|^2}{\|x\|^2}\\ &= \frac{\lambda\cdot\langle x,x\rangle}{\|x\|^2}\\ &= \frac{\langle\lambda\cdot x,x\rangle}{\|x\|^2}\\ &= \frac{\langle L(x),x\rangle}{\|x\|^2}\\ &= \frac{\langle x,L^\star(x)\rangle}{\|x\|^2}\\ &\underset{L=L^*}{=} \frac{\langle x,L(x)\rangle}{\|x\|^2}\\ &= \frac{\langle x,\lambda\cdot x\rangle}{\|x\|^2}\\ &= \frac{\overline{\lambda}\cdot\langle x,x\rangle}{\|x\|^2}\\ &= \frac{\overline{\lambda}\cdot\|x\|^2}{\|x\|^2}\\ &= \overline{\lambda}\end{aligned}$$

proving that $\lambda\in\mathbb{R}$. □

Theorem 18.90. *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] finite dimensional inner product space with $\dim(X) \in \mathbb{N}$ [so X is non trivial] and $L \in \mathrm{Hom}(X)$ a self-adjoint operator then we have*

$$L = 0$$
$$\Updownarrow$$
$$\forall x \in X \text{ we have } \langle L(x), x\rangle = 0$$

Proof. The complex case was already prove in [theorem: 18.12] so we must only prove the real case.

⇒. Let $x \in X$ then $\langle L(x), x\rangle = \langle 0(x), x\rangle = \langle 0, x\rangle = 0$.

⇐. Let $x, y \in X$ then we have:

$$\begin{aligned}
0 &= \\
\langle L(x+y), x+y\rangle - \langle L(x-y), x-y\rangle & \\
\langle L(x)+L(y), x+y\rangle - \langle L(x)-L(y), x-y\rangle &= \\
\langle L(x), x\rangle + \langle L(x), y\rangle + \langle L(y), x+y\rangle - \langle L(x), x\rangle + \langle L(x), y\rangle - \langle L(y), x-y\rangle &= \\
2\cdot\langle L(x), y\rangle + \langle L(y), x+y\rangle - \langle L(y), x-y\rangle &= \\
2\cdot\langle L(x), y\rangle + \langle L(y), x\rangle + \langle L(y), y\rangle - \langle L(y), x\rangle + \langle L(y), y\rangle &= \\
2\cdot\langle L(x), y\rangle + 2\cdot\langle L(y), x\rangle &\underset{\text{realcase}}{=} \\
2\cdot\langle L(x), y\rangle + 2\cdot\langle x, L(y)\rangle &= \\
2\cdot\langle x, L^*(y)\rangle + 2\cdot\langle x, L(y)\rangle &\underset{L+L^*}{=} \\
2\cdot\langle x, L(y)\rangle + 2\cdot\langle x, L(y)\rangle &= \\
4\cdot\langle x, L(y)\rangle &
\end{aligned}$$

so $\langle L(x), y\rangle = 0$. Take $y = L(x)$ then $\langle L(x), L(x)\rangle = 0$ so that $L(x) = 0$ proving, as $x \in X$ was chosen arbitrary, that $L = 0$. □

Definition 18.91. *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] finite dimensional inner product space then $U \in \mathrm{Hom}(X)$ is **unitary** if $U^* \circ U = \mathrm{Id}_X = U \circ U^*$.*

Theorem 18.92. *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] finite dimensional inner product space and $U \in \mathrm{Hom}(X)$ then we have:*

$$U \text{ is unitary}$$
$$\Updownarrow$$
$$\forall x, y \in X \text{ we have } \langle U(x), U(y)\rangle = \langle x, y\rangle$$

Proof.

⇒. Let $x, y \in X$ then we have

$$\begin{aligned}
\langle x, y\rangle &= \langle \mathrm{Id}_X(x), y\rangle \\
&= \langle (U^* \circ U)(x), y\rangle \\
&= \langle U^*(U(x)), y\rangle \\
&= \langle U(x), U(y)\rangle
\end{aligned}$$

⇐. Given $x, y \in X$ we have

$$\begin{aligned}
\langle x, (U^* \circ U)(y)\rangle &= \langle x, U^*(U(x))\rangle \\
&= \langle U(x), U(x)\rangle \\
&= \langle x, y\rangle \\
&= \langle x, \mathrm{Id}_X(y)\rangle
\end{aligned}$$

Hence we have given $y \in Y$ for $(U^* \circ U)(y), \mathrm{Id}_X(y)$ that $\forall x \in X$ $\langle x, (U^* \circ U)(y)\rangle = \langle x, \mathrm{Id}_X(y)\rangle$ so that by [theorems: 18.3, 18.10] $(U^* \circ U)(y) = \mathrm{Id}_X(y)$ which proves that

$$U^* \circ U = \mathrm{Id}_X \tag{18.23}$$

Further given $x, y \in X$ we have also

$$\begin{aligned}\langle x, (U \circ U^*)(y)\rangle &= \langle x, U(U^*)(y)\rangle \\ &\underset{\text{[theorem: 18.38]}}{=} \langle x, (U^*)^*(U^*(y))\rangle \\ &= \langle U^*(x), U^*(y)\rangle \\ &= \langle x, y\rangle \\ &= \langle x, \mathrm{Id}_X(y)\rangle\end{aligned}$$

Hence we have given $y \in Y$ for $(U \circ U^*)(y), \mathrm{Id}_X(y)$ that $\forall x \in X$ $\langle x, (U \circ U^*)(y)\rangle = \langle x, \mathrm{Id}_X(y)\rangle$ so that by [theorems: 18.3, 18.10] $(U \circ U^*)(y) = \mathrm{Id}_X(y)$ which proves that

$$U \circ U^* = \mathrm{Id}_X \tag{18.24}$$

From [eqs: 18.23,18.24] it follows that U is unitary. □

Theorem 18.93. *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] finite dimensional inner product space and $U \in \mathrm{Hom}(X)$ a unitary operator then we have*

1. *$U^* = U^{-1}$, $U = (U^*)^{-1}$ and U^*, U^{-1} are unitary.*
2. *U is a linear isometric isomorphism [in the normed space with norm $\|x\| = \sqrt{\langle x, x\rangle}$]*

Proof.

1. As $U^* \circ U = \mathrm{Id}_X = U \circ U^*$ it follows that $U^{-1} = U^*$ and $(U^*)^{-1} = U$. Further we have

$$(U^*)^* \circ U^* \underset{\text{[theorem: 18.38]}}{=} U \circ U^* = \mathrm{Id}_X = U^* \circ U \underset{\text{[theorem: 18.38]}}{=} U^* \circ (U^*)^*$$

proving that $U^* = U^{-1}$ is unitary.

2. Using (1) we have that U is a bijection, further $\forall x \in X$ we have that

$$\|U(x)\| = \sqrt{\langle U(x), U(x)\rangle} \underset{\text{[theorem: 18.92]}}{=} \sqrt{\langle x, x\rangle} = \|x\|$$

proving that U is a linear isometric isomorphism. □

Example 18.94. We have the following examples of unitary operators:

1. If $\langle X, \langle\rangle\rangle$ is a real [or complex] inner product space then:
   a. Id_X is unitary operator
   b. $-\mathrm{Id}_X$ is a unitary operator
2. If $\langle X, \langle\rangle\rangle$ is a real [or complex] inner product space then $i \cdot \mathrm{Id}_X$ is a unitary operator.

Note 18.95. In general $i \cdot \mathrm{Id}_X$ is not a self-adjoint operator, for if $i \cdot \mathrm{Id}_X$ was a self-adjoint operator then we would have $i \cdot \langle x, y\rangle = \langle i \cdot \mathrm{Id}_X(x), y\rangle = \langle x, (i \cdot \mathrm{Id}_X)^*(y)\rangle = \langle x, i \cdot \mathrm{Id}_X(y)\rangle = -i \cdot \langle x, y\rangle$ form which it would follow that $\langle x, y\rangle = 0$ for every $x, y \in X$. This can only be true if X is the trivial vector space $\{0\}$. Hence in general it is not true that a unitary operator is self-adjoint.

Proof.

1. We have:
   a. Because $\mathrm{Id}_X \circ (\mathrm{Id}_X)^* = (\mathrm{Id}_X)^* \underset{\text{[example: 18.86]}}{=} \mathrm{Id}_X = (\mathrm{Id}_X)^* = (\mathrm{Id}_X)^* \circ \mathrm{Id}_X$ it follows that Id_X is a unitary operator.
   b. Let $x, y \in X$ then we have $\langle -\mathrm{Id}_X(x), -\mathrm{Id}_X(y)\rangle = \langle \mathrm{Id}_X(x), \mathrm{Id}_X(y)\rangle = \langle x, y\rangle$ so that by [theorem: 18.92] $-\mathrm{Id}_X$ is a unitary operator.
2. Given $x, y \in X$ we have $\langle i \cdot \mathrm{Id}_X(x), i \cdot \mathrm{Id}_Y(y)\rangle = i \cdot (-i) \cdot \langle \mathrm{Id}_X(x), \mathrm{Id}_X(y)\rangle = \langle x, y\rangle$, hence, using [theorem: 18.92], $i \cdot \mathrm{Id}_X$ is a unitary operator. □

Theorem 18.96. *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] finite dimensional inner product space and $U \in \mathrm{Hom}(X)$ a unitary transformation then* $\det(U^*) \underset{\text{[theorem: 18.51]}}{=} \det(U) = \pm 1$.

Proof. We have

$$\begin{aligned}
1 &\underset{\text{[theorem: 11.308]}}{=} \det(\mathrm{Id}_X) \\
&= \det(U^\star \circ U) \\
&\underset{\text{[theorem: 11.310]}}{=} \det(U^*) \cdot \det(U) \\
&\underset{\text{[theorem: 18.51]}}{=} \det(U) \cdot \det(U) \\
&= (\det(U))^2
\end{aligned}$$

so that $\det(U) = \pm 1$. □

The following theorem shows the relation between a unitary transformation and a unitary matrix.

Theorem 18.97. *Let $n \in \mathbb{N}$, $\langle X, \langle\rangle\rangle$ be a real [or complex] finite dimensional inner vector space with $\dim(X) = n$, $B = \{b_1, \ldots, b_n\}$ a basis for X and $U \in \mathrm{Hom}(X)$ then*

$$U \text{ is a unitary transformation}$$

$$\Updownarrow$$

$$\mathcal{M}(U; B, B) \text{ is a unitary matrix [see definition: 18.47]}$$

Proof.

⇒. We have

$$\begin{aligned}
\mathcal{M}(U; B, B)^H \cdot \mathcal{M}(U; B, B) &\underset{\text{[theorem: 18.50]}}{=} \mathcal{M}(U^*; B, B) \cdot \mathcal{M}(U; B, B) \\
&\underset{\text{[theorem: 11.340]}}{=} \mathcal{M}(U^* \circ U; B, B) \\
&= \mathcal{M}(\mathrm{Id}_X; B, B) \\
&\underset{\text{[theorem: 11.320]}}{=} E \\
&= \mathcal{M}(\mathrm{Id}_X; B, B) \\
&= \mathcal{M}(U \circ U^*; B, B) \\
&\underset{\text{[theorem: 11.340]}}{=} \mathcal{M}(U; B, B) \cdot \mathcal{M}(U^*; B, B) \\
&\underset{\text{[theorem: 18.50]}}{=} \mathcal{M}(U; B, B) \cdot \mathcal{M}(U; B, B)^H
\end{aligned}$$

which proves that $\mathcal{M}(U; B, B)$ is a unitary matrix.

⇐. Let $x \in X$ then there exist a $\{x_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{K}$ such that $x = \sum_{i=1}^n x_i \cdot b_i$. The we have

$$\begin{aligned}
((U^* \circ U)(x))_i &= \sum_{j=1}^n \mathcal{M}(U^* \circ U; B, B)_{i,j} \cdot x_j \\
&\underset{\text{[theorem: 18.50]}}{=} \sum_{j=1}^n (\mathcal{M}(U^*; B, B) \cdot \mathcal{M}(U; B, B))_{i,j} \cdot x_j \\
&\underset{\text{[theorem: 18.50]}}{=} \sum_{j=1}^n (\mathcal{M}(U; B, B)^H \cdot \mathcal{M}(U; B, B))_{i,j} \cdot x_j \\
&= \sum_{j=1}^n E_{i,j} \cdot x_j \\
&= \sum_{j=1}^n \delta_{i,j} \cdot x_j \\
&= x_i
\end{aligned}$$

proving that $(U^* \circ U)(x) = x$, hence $U^* \circ U = \mathrm{Id}_X$. □

Definition 18.98. *Let $n \in \mathbb{N}$, X a finite dimensional vector space with two bases $E = \{e_1, \ldots, e_n\}$ and $F = \{f_1, \ldots, f_n\}$ then the mapping L defined by $\forall i \in L(e_i) = f_i$ [see theorem: 11.332] is called a coordinate transformation from E to F.*

Theorem 18.99. *Let $n \in \mathbb{N}$, X a finite dimensional vector space with bases $E = \{e_1, \ldots, e_n\}$ and $F = \{f_1, \ldots, f_n\}$ then for the linear mappings $U, V \in \mathrm{Hom}(X)$ defined by $\forall i \in \{1, \ldots, n\}$ $U(e_i) = f_i$ and $V(f_i) = e_i$ [in other words U is the coordinate transformation from U to V and V is the coordinate transformation from V to U] we have:*

1. *$U \circ V = \mathrm{Id}_X = V \circ U$ [or equivalently $U = V^{-1}$ and $V = U^{-1}$]*
2. *$\mathcal{M}(U; E, E) = \mathcal{M}(V; F, F)^{-1}$ and $\mathcal{M}(V; F, F) = \mathcal{M}(U; E, E)^{-1}$*
3. *$\mathcal{M}(V; E, E) = \mathcal{M}(U; E, E)^{-1}$*
4. *If $L \in \mathrm{Hom}(X)$ then*

$$\mathcal{M}(L; E, E) = \mathcal{M}(U; E, E) \cdot \mathcal{M}(L; F, F) \cdot \mathcal{M}(U; E, E)^{-1}$$
$$\mathcal{M}(L; F, F) = \mathcal{M}(U; E, E)^{-1} \cdot \mathcal{M}(L; E, E) \cdot \mathcal{M}(U; E, E)$$

Proof.

1. Let $x \in X$ then there exist a unique $\{x_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{K}$ and $\{x_i'\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{K}$ such that $x = \sum_{i=1}^n x_i \cdot e_i$ and $x = \sum_{i=1}^n x_i' \cdot f_i$. Hence we have

$$\begin{aligned}
(U \circ V)(x) &= U(V(x)) \\
&= U\left(V\left(\sum_{i=1}^n x_i' \cdot f_i\right)\right) \\
&= U\left(\sum_{i=1}^n x_i' \cdot V(f_i)\right) \\
&= U\left(\sum_{i=1}^n x_i' \cdot e_i\right) \\
&= \sum_{i=1}^n x_i' \cdot U(e_i) \\
&= \sum_{i=1}^n x_i' \cdot f_i \\
&= x \\
&= \mathrm{Id}_X(x)
\end{aligned}$$

proving that

$$U \circ V = \mathrm{Id}_X$$

Further we have

$$\begin{aligned}
(V \circ U)(x) &= V(U(x)) \\
&= V\left(U\left(\sum_{i=1}^n x_i \cdot e_i\right)\right) \\
&= V\left(\sum_{i=1}^n x_i \cdot U(e_i)\right) \\
&= V\left(\sum_{i=1}^n x_i \cdot f_i\right) \\
&= \sum_{i=1}^n x_i \cdot V(f_i) \\
&= \sum_{i=1}^n x_i \cdot e_i \\
&= x \\
&= \mathrm{Id}_X(x)
\end{aligned}$$

so that

$$V \circ U = \mathrm{Id}_X$$

2. Let $i \in \{1, \ldots, n\}$ then we have

$$\begin{aligned}
\sum_{l=1}^{n} E_{l,i} \cdot f_l &= \sum_{l=1}^{n} \delta_{l,j} \cdot f_l \\
&= f_i \\
&= U(e_i) \\
&\underset{\text{[definition: 11.333]}}{=} \sum_{k=1}^{n} \mathcal{M}(U; E, E)_{k,i} \cdot e_k \\
&= \sum_{k=1}^{n} \mathcal{M}(U; E, E)_{k,i} \cdot V(f_k) \\
&= \sum_{k=1}^{n} \mathcal{M}(U; E, E)_{k,i} \cdot \left(\sum_{l=1}^{n} \mathcal{M}(V; F, F)_{l,k} \cdot f_l \right) \\
&= \sum_{k=1}^{n} \left(\sum_{l=1}^{n} \mathcal{M}(V; F, F)_{l,k} \cdot \mathcal{M}(U; E, E)_{k,i} \cdot f_l \right) \\
&\underset{\text{[theorem: 11.45]}}{=} \sum_{l=1}^{n} \left(\sum_{k=1}^{n} \mathcal{M}(V; F, F)_{l,k} \cdot \mathcal{M}(U; E, E)_{k,i} \cdot f_l \right) \\
&= \sum_{l=1}^{n} \left(\sum_{k=1}^{n} \mathcal{M}(V; F, F)_{l,k} \cdot \mathcal{M}(U; E, E)_{k,i} \right) \cdot f_l \\
&= \sum_{l=1}^{n} (\mathcal{M}(V; F, F) \cdot \mathcal{M}(U; E, E))_{l,i} \cdot f_l
\end{aligned}$$

which as F is a basis proves that $\forall l \in \{1, \ldots, n\}$ $E_{l,i} = (\mathcal{M}(V; F, F) \cdot \mathcal{M}(U; E, E))_{l,i}$. As $i \in \{1, \ldots, n\}$ was chosen arbitrary it follows that

$$\mathcal{M}(V; V, F) \cdot \mathcal{M}(U; E, E) = E \tag{18.25}$$

Further we have

$$\begin{aligned}
\sum_{l=1}^{n} E_{l,i} \cdot e_l &= \sum_{l=1}^{n} \delta_{l,i} \cdot e_i \\
&= e_i \\
&= V(f_i) \\
&\underset{\text{[definition: 11.333]}}{=} \sum_{l=1}^{n} \mathcal{M}(V; F, F)_{l,i} \cdot f_l \\
&= \sum_{l=1}^{n} \mathcal{M}(V; F, F)_{l,i} \cdot U(e_l) \\
&\underset{\text{[definition: 11.333]}}{=} \sum_{l=1}^{n} \mathcal{M}(V; F, F)_{l,i} \cdot \left(\sum_{k=1}^{n} \mathcal{M}(U; E, E)_{k,l} \cdot e_k \right) \\
&= \sum_{l=1}^{n} \left(\sum_{k=1}^{n} \mathcal{M}(U; E, E)_{k,l} \cdot \mathcal{M}(V; F, F)_{l,i} \cdot e_k \right) \\
&\underset{\text{[theorem: 11.45]}}{=} \sum_{k=1}^{n} \left(\sum_{l=1}^{n} \mathcal{M}(U; E, E)_{k,l} \cdot \mathcal{M}(V; F, F)_{l,i} \cdot e_k \right) \\
&= \sum_{k=1}^{n} \left(\sum_{l=1}^{n} \mathcal{M}(U; E, E)_{k,l} \cdot \mathcal{M}(V; F, F)_{l,i} \right) \cdot e_k \\
&= \sum_{k=1}^{n} (\mathcal{M}(U; E, E) \cdot \mathcal{M}(V; F, F))_{k,i} \cdot e_k
\end{aligned}$$

which as E is a basis proves that $\forall l \in \{1,\dots,n\}$ $E_{l,i} = (\mathcal{M}(U;E,E)\cdot\mathcal{M}(V;F,F))_{l,i}$. As $i \in \{1,\dots,n\}$ was chosen arbitrary it follows that $E = \mathcal{M}(U;E,E)\cdot\mathcal{M}(V;F,F)$. Combining this result with [eq: 18.25] proves that

$$\mathcal{M}(U;E,E) = \mathcal{M}(V;F,F)^{-1} \text{ and } \mathcal{M}(V;F,F) = \mathcal{M}(U;E,E)^{-1}$$

3. This follows from

$$\begin{aligned}
\mathcal{M}(U;E,E)\cdot\mathcal{M}(V;E,E) &\underset{\text{[theorem: 11.340]}}{=} \mathcal{M}(U\circ V;E,E)\\
&\underset{(1)}{=} \mathcal{M}(\mathrm{Id}_X;E,E)\\
&\underset{\text{[theorem: 11.336]}}{=} E\\
&\underset{\text{[theorem: 11.336]}}{=} \mathcal{M}(\mathrm{Id}_X;E,E)\\
&\underset{(1)}{=} \mathcal{M}(V\circ U;E,E)\\
&\underset{\text{[theorem: 11.340]}}{=} \mathcal{M}(V;E,E)\cdot\mathcal{M}(U;E,E)
\end{aligned}$$

proving that

$$\mathcal{M}(V;E,E) = \mathcal{M}(U;E,E)^{-1}$$

4. Let $i \in \{1,\dots,n\}$ then we have

$$\begin{aligned}
L(e_i) &= L(V(f_i))\\
&\underset{\text{[definition: 11.333]}}{=} L\left(\sum_{k=1}^{n}\mathcal{M}(V;F,F)_{k,i}\cdot f_k\right)\\
&= \sum_{k=1}^{n}\mathcal{M}(V;F,F)_{k,i}\cdot L(f_k)\\
&\underset{\text{[definition: 11.333]}}{=} \sum_{k=1}^{n}\mathcal{M}(V;F,F)_{k,i}\cdot\left(\sum_{l=1}^{n}\mathcal{M}(L;F,F)_{l,k}\cdot f_l\right)\\
&= \sum_{k=1}^{n}\left(\sum_{l=1}^{n}\mathcal{M}(L;F,F)_{l,k}\cdot\mathcal{M}(V;F,F)_{k,i}\cdot f_l\right)\\
&\underset{\text{[theorem: 11.45]}}{=} \sum_{l=1}^{n}\left(\sum_{k=1}^{n}\mathcal{M}(L;F,F)_{l,k}\cdot\mathcal{M}(V;F,F)_{k,i}\cdot f_l\right)\\
&= \sum_{l=1}^{n}\left(\sum_{k=1}^{n}\mathcal{M}(L;F,F)_{l,k}\cdot\mathcal{M}(V;F,F)_{k,i}\right)\cdot f_l\\
&= \sum_{l=1}^{n}(\mathcal{M}(L;F,F)\cdot\mathcal{M}(V;F,F))_{l,i}\cdot f_l\\
&= \sum_{l=1}^{n}(\mathcal{M}(L;F,F)\cdot\mathcal{M}(V;F,F))_{l,i}\cdot U(e_l)\\
&\underset{\text{[definition: 11.333]}}{=} \sum_{l=1}^{n}(\mathcal{M}(L;F,F)\cdot\mathcal{M}(V;F,F))_{l,i}\cdot\left(\sum_{k=1}^{n}\mathcal{M}(U;E,E)_{k,l}\cdot e_k\right)\\
&= \sum_{l=1}^{n}\left(\sum_{k=1}^{n}\mathcal{M}(U;E,E)_{k,l}\cdot(\mathcal{M}(L;F,F)\cdot\mathcal{M}(V;F,F))_{l,i}\cdot e_k\right)\\
&\underset{\text{[theorem: 11.45]}}{=} \sum_{k=1}^{n}\left(\sum_{l=1}^{n}\mathcal{M}(U;E,E)_{k,l}\cdot(\mathcal{M}(L;F,F)\cdot\mathcal{M}(V;F,F))_{l,i}\right)\cdot e_k\\
&= \sum_{k=1}^{n}(\mathcal{M}(U;E,E)\cdot(\mathcal{M}(L;F,F)\cdot\mathcal{M}(V;F,F)))_{k,i}\cdot e_k\\
&\underset{(2)}{=} \sum_{k=1}^{n}(\mathcal{M}(U;E,E)\cdot(\mathcal{M}(L;F,F)\cdot\mathcal{M}(U;E,E)^{-1}))_{k,i}\cdot e_k
\end{aligned}$$

which by [definition: 11.333] proves that

$$\mathcal{M}(L;E,E)=\mathcal{M}(U;E,E)\cdot\mathcal{M}(L;F,F)\cdot\mathcal{M}(U;E,E)^{-1} \tag{18.26}$$

Finally

$$\begin{aligned}\mathcal{M}(U;E,E)^{-1}\cdot\mathcal{M}(L;E,E)\cdot\mathcal{M}(U;E,E) &\underset{\text{[eq: 18.26]}}{=}\\ \mathcal{M}(U;E,E)^{-1}\cdot\mathcal{M}(U;E,E)\cdot\mathcal{M}(L;F,F)\cdot\mathcal{M}(U;E,E)^{-1}\cdot\mathcal{M}(U;E,E) &=\\ \mathcal{M}(L;F,F)\end{aligned}$$

proving that

$$\mathcal{M}(L;F,F)=\mathcal{M}(U;E,E)^{-1}\cdot\mathcal{M}(L;E,E)\cdot\mathcal{M}(U;E,E)$$

□

For inner product spaces we have additionally.

Theorem 18.100. *Let $n\in\mathbb{N}$, $\langle X,\langle\rangle\rangle$ be a real [or complex] finite dimensional inner vector space with two orthonormal bases $E=\{e_1,\ldots,e_n\}$, $F=\{f_1,\ldots,f_n\}$ then for the linear mappings $U,V\in\mathrm{Hom}(X)$ defined by $\forall i\in\{1,\ldots,n\}$ $U(e_i)=f_i$ and $V(f_i)=e_i$ [in other words U is the coordinate transformation from U to V and V is the coordinate transformation from V to U] we have that:*

1. *U is a unitary transformation.*
2. *$\mathcal{M}(U;E,E)^{-1}=\mathcal{M}(U;E,E)^H$ so that*

$$\mathcal{M}(U;E,E)\cdot\mathcal{M}(U;E,E)^H=E=\mathcal{M}(U;E,E)^H\cdot\mathcal{M}(U;E,E)$$

proving that $\mathcal{M}(U;E,E)$ is a unitary matrix.

Proof.

1. Let $x,y\in X$ then there exists $\{x_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{K}$, $\{x_i'\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{K}$, $\{y_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathbb{K}$ and $\{y_i'\}_{i\in\{1,\ldots,n\}}$ such that $x=\sum_{i=1}^n x_i\cdot e_i=\sum_{i=1}^n x_i'\cdot f_i$ and $y=\sum_{i=1}^n y_i\cdot e_i=\sum_{i=1}^n y_i'\cdot f_i$. Then we have two case to consider:

   real case.

$$\begin{aligned}\langle U(x),U(x)\rangle &= \left\langle U\left(\sum_{i=1}^n x_i\cdot e_i\right),U\left(\sum_{k=1}^n y_k\cdot e_k\right)\right\rangle\\ &= \left\langle\sum_{i=1}^n x_i\cdot U(e_i),\sum_{k=1}^n y_k\cdot U(e_k)\right\rangle\\ &= \left\langle\sum_{i=1}^n x_i\cdot f_i,\sum_{k=1}^n y_k\cdot f_k\right\rangle\\ &= \sum_{i=1}^n x_i\cdot\left\langle f_i,\sum_{k=1}^n y_k\cdot f_k\right\rangle\\ &= \sum_{i=1}^n x_i\cdot\sum_{k=1}^n y_k\cdot\langle f_i,f_k\rangle\\ &\underset{\text{orthonormality}}{=} \sum_{i=1}^n x_i\cdot\sum_{k=1}^n y_k\cdot\delta_{i,k}\\ &\underset{\text{orthonormality}}{=} \sum_{i=1}^n x_i\cdot\sum_{k=1}^n y_k\cdot\langle e_i,e_k\rangle\\ &= \sum_{i=1}^n x_i\cdot\left\langle e_i,\sum_{k=1}^n y_k\cdot e_k\right\rangle\\ &= \sum_{i=1}^n x_i\cdot\langle e_i,y\rangle\\ &= \left\langle\sum_{i=1}^n x_k\cdot e_i,y\right\rangle\\ &= \langle x,y\rangle\end{aligned}$$

proving by [theorem: 18.92] that U is a unitary operator.

complex case.

$$\begin{aligned}
\langle U(x), U(x)\rangle &= \left\langle U\left(\sum_{i=1}^{n} x_i \cdot e_i\right), U\left(\sum_{k=1}^{n} y_k \cdot e_k\right)\right\rangle \\
&= \left\langle \sum_{i=1}^{n} x_i \cdot U(e_i), \sum_{k=1}^{n} y_k \cdot U(e_k)\right\rangle \\
&= \left\langle \sum_{i=1}^{n} x_i \cdot f_i, \sum_{k=1}^{n} y_k \cdot f_k\right\rangle \\
&= \sum_{i=1}^{n} x_i \cdot \left\langle f_i, \sum_{k=1}^{n} y_k \cdot f_k\right\rangle \\
&= \sum_{i=1}^{n} x_i \cdot \sum_{k=1}^{n} \overline{y_k} \cdot \langle f_i, f_k\rangle \\
&\underset{\text{orthonormality}}{=} \sum_{i=1}^{n} x_i \cdot \sum_{k=1}^{n} \overline{y_k} \cdot \delta_{i,k} \\
&\underset{\text{orthonormality}}{=} \sum_{i=1}^{n} x_i \cdot \sum_{k=1}^{n} \overline{y_k} \cdot \langle e_i, e_k\rangle \\
&= \sum_{i=1}^{n} x_i \cdot \left\langle e_i, \sum_{k=1}^{n} y_k \cdot e_k\right\rangle \\
&= \sum_{i=1}^{n} x_i \cdot \langle e_i, y\rangle \\
&= \left\langle \sum_{i=1}^{n} x_k \cdot e_i, y\right\rangle \\
&= \langle x, y\rangle
\end{aligned}$$

2. This follows from

$$\begin{aligned}
\mathcal{M}(U; E, E)^H \cdot \mathcal{M}(U; E, E) &\underset{\text{[theorem: 18.50]}}{=} \mathcal{M}(U^*; E, E) \cdot \mathcal{M}(U; E, E) \\
&\underset{\text{[theorem: 11.340]}}{=} \mathcal{M}(U^\star \circ U; E, E) \\
&\underset{(1)}{=} \mathcal{M}(\mathrm{Id}_X; E, E) \\
&\underset{\text{[theorem: 11.336]}}{=} E \\
&\underset{\text{[theorem: 11.336]}}{=} \mathcal{M}(\mathrm{Id}_X; E, E) \\
&\underset{(1)}{=} \mathcal{M}(U \circ U^\star; E, E) \\
&\underset{\text{[theorem: 11.340]}}{=} \mathcal{M}(U; E, E) \cdot \mathcal{M}(U^\star; E, E) \\
&\underset{\text{[theorem: 18.50]}}{=} \mathcal{M}(U; E, E) \cdot \mathcal{M}(U; E, E)
\end{aligned}$$

□

Definition 18.101. (Normal operator) *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] finite dimensional inner product space then $L \in \mathrm{Hom}(X)$ is* ***normal*** *if $L \circ L^* = L^* \circ L$.*

Lemma 18.102. *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] finite dimensional inner product space then every unitary and self-adjoint operator is normal.*

Proof. If L is self adjoint then $L \circ L^\star = L \circ L = L^* \circ L$ proving that L is unitary. Further if L is unitary then $L \circ L^* = \mathrm{Id}_X = L^* \circ L$ proving that L is unitary in this case. □

Theorem 18.103. *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] finite dimensional inner product space and $L \in \mathrm{Hom}(X)$ then we have*

$$\begin{gathered} L \text{ is normal} \\ \Updownarrow \\ \forall x \in X \text{ we have } \|L(x)\| = \|L^*(x)\| \text{ [using the inner product norm]} \end{gathered}$$

Proof. First we have that

$$\begin{aligned} (L \circ L^\star - L^* \circ L)^* &\underset{\text{[theorem: 18.39]}}{=} (L \circ L^*)^* - (L^* \circ L)^* \\ &\underset{\text{[theorem: 18.41]}}{=} (L^*)^\star \circ L^* - L^\star \circ (L^*)^* \\ &\underset{\text{[theorem: 18.38]}}{=} L \circ L^* - L^* \circ L \end{aligned}$$

proving that

$$L \circ L^\star - L^* \circ L \text{ is self-adjoint} \tag{18.27}$$

Further we have

$$\begin{aligned} L \text{ is normal} &\Leftrightarrow L \circ L^* = L^* \circ L \\ &\Leftrightarrow L \circ L^* - L^* \circ L = 0 \\ &\underset{\text{[theorem: 18.90] with [eq: 18.27]}}{\Leftrightarrow} \forall x \in X \text{ we have } \langle (L \circ L^* - L^* \circ L)(x), x\rangle = 0 \\ &\Leftrightarrow \forall x \in X \text{ we have } \langle (L \circ L^*)(x), x\rangle - \langle (L^* \circ L)(x), x\rangle = 0 \\ &\Leftrightarrow \forall x \in X \text{ we have } \langle (L \circ L^*)(x), x\rangle = \langle (L^* \circ L)(x), x\rangle \\ &\Leftrightarrow \forall x \in X \text{ we have } \langle L(L^*(x)), x\rangle = \langle L^*(L(x)), x\rangle \\ &\Leftrightarrow \forall x \in X \text{ we have } \langle L^*(x), L^*(x)\rangle = \langle L(x), (L^*)^*(x)\rangle \\ &\Leftrightarrow \forall x \in X \text{ we have } \langle L^*(x), L^*(x)\rangle = \langle L(x), L(x)\rangle \\ &\Leftrightarrow \forall x \in X \text{ we have } \|L^*(x)\|^2 = \|L(x)\|^2 \\ &\underset{0 \leqslant \|\|\| \wedge \text{[theorem: 10.65]}}{\Leftrightarrow} \forall x \in X \text{ we have } \|L^*(x)\| = \|L(x)\| \end{aligned}$$

proving the theorem. □

The following shows the relation between diagonalization of the matrix of a linear mapping and eigenvalues.

Theorem 18.104. *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] finite dimensional inner product space with $\dim(X) = n \in \mathbb{N}$ and $L \in \mathrm{Hom}(X)$ then the following are equivalent:*

1. *There exist a orthonormal basis $E = \{e_1, \ldots, e_n\}$ of X such that $\mathcal{M}(L; E, E)$ is diagonal.*
2. *X has a orthonormal basis $E = \{e_1, \ldots, e_n\}$ such that $\forall i \in \{1, \ldots, n\}$ e_i is a eigenvector of L.*

Further if (1) or (2) is true the the eigenvalue of e_i is $\mathcal{M}(L; E, E)_{i,i}$.

Proof.

1 ⇒ 2. As there exist a $E = \{e_1, \ldots, e_n\}$ such that $\forall i, j \in \{1, \ldots, n\}$ with $i \neq j$ we have $\mathcal{M}(L; E, E)_{i,j} = 0$. Hence given $i \in \{1, \ldots, n\}$ we have

$$\begin{aligned} L(e_i) &= \sum_{k \in \{1, \ldots, n\}} \mathcal{M}(L; E, E)_{k,i} e_k \\ &= \sum_{k \in \{1, \ldots, n\} \setminus k \neq i} \mathcal{M}(L; E, E)_{k,i} e_k + \sum_{k \in \{i\}} \mathcal{M}(L; E, E)_{k,i} e_k \\ &= \mathcal{M}(L; E, E)_{i,i} \cdot e_i \end{aligned}$$

proving that e_i is a eigenvector of L withe eigenvalue $\mathcal{M}(L; E, E)_{i,i}$

2 ⇒ 1. As $\forall i \in \{1, \ldots, n\}$ e_i is a eigenvector of L, hence there exist a $\lambda_i \in \mathbb{K}$ such that $L(e_i) = \lambda_i \cdot e_i$. Hence

$$\begin{aligned} L(e_i) &= \lambda_i \cdot e_i \\ &= \sum_{k=1}^{n} \lambda_k \cdot \delta_{i,k} \cdot e_k \end{aligned}$$

which proves by [definition: 11.333] that $\forall i, k \in \{1, \ldots, n\}$ $\mathcal{M}(L; E, E)_{k,i} = \lambda_k \cdot \delta_{i,k}$ proving that $\mathcal{M}(L; E, E)$ is diagonal. □

We prove now the Complex Spectral Theorem which proves that the matrix of a normal operator can be diagonlized or equivalent that there exist a basis of X of eigenvectors for the normal operators.

Theorem 18.105. (Complex Spectral Theorem) *Let $\langle X, \langle\rangle\rangle$ be complex finite dimensional inner product space with $\dim(X) = n \in \mathbb{N}$ and $L \in \mathrm{Hom}(X)$ the the following are equivalent*

1. *L is normal*
2. *There exist a orthonormal basis $E = \{e_1, \ldots, e_n\}$ of X such that $\mathcal{M}(L; E, E)$ is diagonal.*
3. *X has a orthonormal basis $E = \{e_1, \ldots, e_n\}$ such that $\forall i \in \{1, \ldots, n\}$ e_i is a eigenvector of L.*

Proof.

$1 \Rightarrow 2$. Using Schur's theorem [see theorem: 18.82] there exist a orthonormal basis $\{e_1, \ldots, e_n\}$ for X such that $M = \mathcal{M}(L; E, E)$ is a upper triangular matrix. We use now a induction argument to prove that

$$\forall m \in \{1, \ldots, n\} \text{ we have } \forall i \in \{1, \ldots, m\} \wedge \forall j \in \{i+1, \ldots, n\} \text{ we have } M_{i,j} = 0 \tag{18.28}$$

So define

$$S_n = \{m \in \mathbb{N} | \text{If } m \leqslant n \text{ then } \forall i \in \{1, \ldots, m\} \wedge \forall j \in \{i+1, \ldots, n\} \ M_{i,j} = 0\}$$

then we have:

$1 \in S_n$. As M is upper triangular we have

$$L(e_1) = \sum_{k \in \{1, \ldots, n\}} M_{k,1} \cdot e_k = M_{1,1} + \sum_{k \in \{2, \ldots, n\}} M_{k,1} \cdot e_k = M_{1,1} + 0 = M_{1,1} \cdot e_1$$

so that $\|L(e_1)\|^2 = \langle L(e_1), L(e_1)\rangle = \langle M_{1,1} \cdot e_1, M_{1,1} \cdot e_1\rangle = M_{1,1} \cdot \overline{M_{1,1}} \cdot \langle e_1, e_1\rangle = |M_{1,1}|^2$ proving that

$$\|L(e_1)\|^2 = |M_{1,1}|^2 \tag{18.29}$$

Further we have

$$\begin{aligned}
\|L^*(e_1)\|^2 &= \langle L^*(e_1), L^*(e_1)\rangle \\
&= \left\langle \sum_{k=1}^n \mathcal{M}(L^*; E, E)_{k,1} \cdot e_k, \sum_{l=1}^n \mathcal{M}(L^\star; E, E)_{l,1} \cdot e_l \right\rangle \\
&\underset{\text{[theorem: 18.50]}}{=} \left\langle \sum_{k=1}^n \mathcal{M}(L; E, E)^H_{k,1} \cdot e_k, \sum_{l=1}^n \mathcal{M}(L; E, E)^H_{l,1} \cdot e_l \right\rangle \\
&= \left\langle \sum_{k=1}^n \overline{\mathcal{M}(L; E, E)_{1,k}} \cdot e_k, \sum_{l=1}^n \overline{\mathcal{M}(L; E, E)_{1,l}} \cdot e_l \right\rangle \\
&= \left\langle \sum_{k=1}^n \overline{M_{1,k}} \cdot e_k, \sum_{l=1}^n \overline{M_{1,l}} \cdot e_l \right\rangle \\
&= \sum_{k=1}^n \overline{M_{1,k}} \cdot \left\langle e_k, \sum_{l=1}^n \overline{M_{1,l}} \cdot e_l \right\rangle \\
&= \sum_{k=1}^n \overline{M_{1,k}} \cdot \left(\sum_{l=1}^n \overline{\overline{M_{1,l}}} \cdot \langle e_k, e_l\rangle \right) \\
&= \sum_{k=1}^n \overline{M_{1,k}} \cdot \left(\sum_{l=1}^n M_{1,l} \cdot \langle e_k, e_l\rangle \right) \\
&= \sum_{k=1}^n \overline{M_{1,k}} \cdot \left(\sum_{l=1}^n M_{1,l} \cdot \delta_{k,l} \right) \\
&= \sum_{k=1}^n \overline{M_{1,k}} \cdot M_{1,k} \\
&= \sum_{k=1}^n |M_{1,k}|^2
\end{aligned}$$

proving that

$$\|L^*(e_1)\|^2 = \sum_{k=1}^{n} |M_{1,k}|^2 \tag{18.30}$$

As L is normal we have by [theorem: 18.103] we have that $\|L(e_1)\| = \|L(e_1)\|$ so that by [eqs: 18.29 and 18.30] we have

$$|M_{1,1}|^2 = \sum_{k=1}^{n} |M_{1,k}|^2 = |M_{1,1}|^2 + \sum_{k\in\{2,\dots,n\}} |M_{1,k}|^2$$

so that $\sum_{k\in\{2,\dots,n\}} |M_{1,k}|^2 = 0$ hence $\forall k \in \{2,\dots,n\}$ we have $M_{1,k} = 0$. In other words $\forall i \in \{1,\dots,1\}$ we have $\forall j \in \{1+1,\dots,n\}$ we have $M_{i,j} = 0$. Hence it is proved that $1 \in S_n$.

$\boldsymbol{m \in S_n \Rightarrow m+a \in S_n}$**.** If $m+1 \leqslant n$ then $m < n$ and as $m \in S$ we have that

$$\forall i \in \{1,\dots,m\} \text{ that } \forall j \in \{m+1,\dots,n\}\ M_{i,j} = 0 \tag{18.31}$$

Further we have

$$\begin{aligned}
L(e_{m+1}) &= \sum_{k\in\{1,\dots,n\}} M_{k,m+1}\cdot e_k \\
&= \sum_{k\in\{1,\dots,m+1\}} M_{k,m+1}\cdot e_k + \sum_{k\in\{m+2,\dots,n\}} M_{k,m+1}\cdot e_k \\
&\underset{M \text{ is upper triangular}}{=} \sum_{k\in\{1,\dots,m+1\}} M_{k,m+1}\cdot e_k + 0 \\
&= \sum_{k\in\{1,\dots,m+1\}} M_{k,m+1}\cdot e_k \\
&= M_{m+1,m+1}\cdot e_{m+1} + \sum_{k\in\{1,\dots,m\}} M_{k,m+1}\cdot e_k \\
&\underset{\text{[eq: 18.31]}}{=} M_{m+1,m+1}\cdot e_{m+1} + 0
\end{aligned}$$

so that

$$\|L(e_{m+1})\|^2 = \langle L(e_{m+1}), L(e_{m+1})\rangle = \langle M_{m+1,m+1}\cdot e_{m+1}, M_{m+1,m+1}\cdot e_{m+1}\rangle = |M_{m+1,m+1}|^2$$

Hence we have

$$\|L(e_{m+1})\|^2 = |M_{m+1,m+1}|^2 \tag{18.32}$$

Further we have

$$\begin{aligned}
\|L^*(e_{m+1})\|^2 &= \langle L^*(e_{m+1}), L^*(e_{m+1})\rangle \\
&= \left\langle \sum_{k=1}^{n} \mathcal{M}(L^\star;E,E)_{k,m+1}\cdot e_k, \sum_{l=1}^{n} \mathcal{M}(L^\star;E,E)_{l,m+1}\cdot e_l \right\rangle \\
&\underset{\text{[theorem: 18.50]}}{=} \left\langle \sum_{k=1}^{n} \mathcal{M}(L;E,E)^H_{k,m+1}\cdot e_k, \sum_{l=1}^{n} \mathcal{M}(L;E,E)^H_{l,m+1}\cdot e_l \right\rangle \\
&= \left\langle \sum_{k=1}^{n} \overline{\mathcal{M}(L;E,E)_{m+1,k}}\cdot e_k, \sum_{l=1}^{n} \overline{\mathcal{M}(L;E,E)_{m+1,l}}\cdot e_l \right\rangle \\
&= \left\langle \sum_{k=1}^{n} \overline{M_{m+1,k}}\cdot e_k, \sum_{l=1}^{n} \overline{M_{m+1,l}}\cdot e_l \right\rangle \\
&= \sum_{k=1}^{n} \overline{M_{m+1,k}}\cdot \left\langle e_k, \sum_{l=1}^{n} \overline{M_{m+1,l}}\cdot e_l \right\rangle \\
&= \sum_{k=1}^{n} \overline{M_{m+1,k}}\cdot \sum_{l=1}^{n} \overline{\overline{M_{m+1,l}}}\cdot \langle e_k, e_l\rangle
\end{aligned}$$

$$\begin{aligned}
&= \sum_{k=1}^{n} \overline{M_{m+1,k}} \cdot \sum_{l=1}^{n} M_{m+1,l} \cdot \delta_{k,l} \\
&= \sum_{k=1}^{n} \overline{M_{m+1,k}} \cdot M_{m+1,k} \\
&= \sum_{k=1}^{n} |M_{m+1,k}|^2
\end{aligned}$$

proving that

$$\|L^\star(e_{m+1})\|^2 = \sum_{k=1}^{n} |M_{m+1,k}|^2 \tag{18.33}$$

As L is normal we have by [theorem: 18.103] we have that $\|L(e_{m+1})\| = \|L(e_{m+1})\|$ we have by [eqs: 18.32 and 18.33] that

$$|M_{m+1,m+1}|^2 = \sum_{k=1}^{n} |M_{m+1,k}|^2 = |M_{m+1,m+1}|^2 + \sum_{k \in \{1,\dots,n\} \setminus \{m+1\}} |M_{m+1,k}|^2$$

so that $\sum_{k \in \{1,\dots,n\} \setminus \{m+1\}} |M_{m+1,k}|^2 = 0$, hence $\forall k \in \{1,\dots,n\} \setminus \{m+1\}$ $M_{m+1,k} = 0$. Hence $\forall j \in \{(m+1)+1,\dots,n\}$ we have $M_{m+1,j} = 0$ which combined with [eq: 18.31] proves that $\forall i \in \{1,\dots,m+1\}$ that $\forall j \in \{(m+1)+1,\dots,i\}$ $M_{i,j} = 0$. Hence we have proved that $m+1 \in S_n$.

Mathematical induction proves that $S_n = \mathbb{N}$ hence for

$$\forall m \in \{1,\dots,n\} \text{ we have } \forall i \in \{1,\dots,m\} \text{ that } \forall j \in \{m+1,\dots,i\} \text{ we have } M_{i,j} = 0 \tag{18.34}$$

Let $k, l \in \{1,\dots,n\}$ with $k \neq l$ then we have either:

k < l. As $k \in \{1,\dots,n\}$, $k \in \{1,\dots,k\}$ and $k+1 \leqslant l \Rightarrow l \in \{k+1,\dots,n\}$ it follows that $M_{k,l} = 0$.

l < k. As $l \in \{1,\dots,n\}$, $l \in \{1,\dots,l\}$ and $l+1 \leqslant k \Rightarrow k \in \{l+1,\dots,n\}$ it follows that $M_{k,l} = 0$.

which proves that

$$\mathcal{M}(L; E, E) = M \text{ is diagonal.}$$

2 ⇒ 1. As there exist a basis $\{e_1,\dots,e_n\}$ such that $\mathcal{M}(L; E, E)$ is diagonal. Let $i, j \in \{1,\dots,n\}$ with $i \neq j$ then $\mathcal{M}(L^*; E, E)_{i,j} \underset{\text{[theorem: 18.50]}}{=} \mathcal{M}(L; E, E)^H_{i,j} = \overline{\mathcal{M}(L; E, E)_{j,i}} = \overline{0} = 0$ so that $\mathcal{M}(L^*; E, E)$ is also diagonal. Let $i \in \{1,\dots,n\}$ then we have

$$\begin{aligned}
(L \circ L^*)(e_i) &= L(L^*(e_i)) \\
&= L\left(\sum_{k=1}^{n} \mathcal{M}(L^*; E, E)_{k,i} \cdot e_k\right) \\
&= L(\mathcal{M}(L^*; E, E)_{i,i} \cdot e_i) \\
&= \mathcal{M}(L^*; E, E) \cdot L(e_i) \\
&= \mathcal{M}(L^*; E, E) \cdot \left(\sum_{k=1}^{n} \mathcal{M}(L; E, E)_{k,i} \cdot e_k\right) \\
&= \mathcal{M}(L^*; E, E) \cdot \mathcal{M}(L; E, E)_{i,i} \cdot e_i \\
&= \mathcal{M}(L; E, E) \cdot \mathcal{M}(L^*; E, E)_{i,i} \cdot e_i \\
&= \mathcal{M}(L; E, E) \cdot \sum_{k=1}^{n} \mathcal{M}(L^*; E, E)_{k,i} \cdot e_k \\
&= \mathcal{M}(L; E, E) \cdot L^*(e_i) \\
&= L^\star(\mathcal{M}(L; E, E) \cdot e_i) \\
&= L^*\left(\sum_{k=1}^{n} \mathcal{M}(L; E, E)_{k,i} \cdot e_i\right) \\
&= L^*(L(e_i)) \\
&= (L^\star \circ L)(e_i)
\end{aligned}$$

So that $\forall i \in \{1, \ldots, n\}$ we have

$$(L \circ L^*)(e_i) = (L^* \circ L)(e_i) \tag{18.35}$$

Let $x \in X$ then we have that $x = \sum_{i=1}^n x_i \cdot e_i$

$$\begin{aligned}
(L \circ L^*)(x) &= (L \circ L^*)\left(\sum_{i=1}^n x_i \cdot e_i\right) \\
&= \sum_{i=1}^n x_i \cdot (L \circ L^*)(e_i) \\
&= \sum_{i=1}^n x_i \cdot (L^* \circ L)(e_i) \\
&= (L^* \circ L)\left(\sum_{i=1}^n x_i \cdot e_i\right) \\
&= (L^* \circ L)(x)
\end{aligned}$$

proving that $L \circ L^* = L^* \circ L$. Hence L is normal.

2 $\Leftrightarrow$ 3. This is actually proved in [theorem: 18.104] □

Corollary 18.106. *Let $\langle X, \langle\rangle\rangle$ be a complete finite dimensional inner product spaces with $\dim(X) = n \in \mathbb{N}$, $E = \{e_1, \ldots, e_n\}$ a orthonormal basis of X, $L \in \mathrm{Hom}(X)$ a normal operator then there exist a unitary operator $U \in \mathrm{Hom}(X)$ such that $\mathcal{M}(U^* \circ L \circ U; E, E)$ is a diagonal matrix.*

Proof. Using the Complex Spectral Theorem there exist a orthonormal basis $F = \{f_1, \ldots, f_n\}$ such that $\mathcal{M}(L; F, F)$ is diagonal. By [theorem: 18.100] there exist a unitary mapping $U \in \mathrm{Hom}(X)$ such that $\forall i \in \{1, \ldots, n\}$ $U(e_i) = f_i$. Then we have $\forall i, j \in \{1, \ldots, n\}$ that

$$\begin{aligned}
\mathcal{M}(U^* \circ L \circ U; E, E)_{i,j} &\underset{\text{[theorem: 18.30]}}{=} \langle (U^* \circ L \circ U)(e_j), e_i \rangle \\
&= \langle U^*(L(U(e_j))), e_i \rangle \\
&= \langle L(U(e_j)), (U^*)^*(e_i) \rangle \\
&\underset{\text{[theorem: 18.38]}}{=} \langle L(U(e_j)), U(e_i) \rangle \\
&= \langle L(f_j), f_i \rangle \\
&\underset{\text{[theorem: 18.30]}}{=} \mathcal{M}(L; F, F)_{i,j}
\end{aligned}$$

so that $\mathcal{M}(U^* \circ L \circ U; E, E) = \mathcal{M}(L; F; F)$ proving that $\mathcal{M}(U^* \circ L \circ U; E, E)$ is diagonal. □

Having proved the spectral theorem in the complex case we proceed now to prove the spectral theorem for the real case/ First we need a little lemma.

Lemma 18.107. *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] finite dimensional inner product space, $L \in \mathrm{Hom}(X)$ a self-adjoint linear operator, b, $c \in \mathbb{R}$ such that $b^2 < 4 \cdot c$ then $L^2 + b \cdot L + c \cdot \mathrm{Id}_X$ is a isomorphism.*

Proof. By [definition: 18.59] it follows that $L^2 + b \cdot L + c \cdot \mathrm{Id}_X \in \mathrm{Hom}(X)$ so that using [theorem: 11.199] we only have to prove that $L^2 + \beta \cdot L + c \cdot \mathrm{Id}_X$ is injective. For every $x \in X$ with $x \neq 0$ we have using the Cauchy Schwarz inequality [see theorem: 18.18] we have

$$-b \cdot \langle L(x), x \rangle = \langle -b \cdot L(x), x \rangle \leqslant \|-b \cdot L(x)\| \cdot \|x\| = |b| \cdot \|L(x)\| \cdot \|x\|$$

or

$$-|b| \cdot \|L(x)\| \cdot \|x\| \leqslant b \cdot \langle L(x), x \rangle \tag{18.36}$$

Further

$$\begin{aligned}
\langle (L^2 + b \cdot L + c \cdot \mathrm{Id}_x)(x), x \rangle &= \langle L^2(x) + b \cdot L(x) + c \cdot x, x \rangle \\
&= \langle L^2(x), x \rangle + b \cdot \langle L(x), x \rangle + c \cdot \langle x, x \rangle \\
&= \langle L(x), L^*(x) \rangle + b \cdot \langle L(x), x \rangle + c \cdot \langle x, x \rangle \\
&\underset{\text{L is adjoint}}{=} \langle L(x), L(x) \rangle + b \cdot \langle L(x), x \rangle + c \cdot \langle x, x \rangle \\
&= \|L(x)\|^2 + b \cdot \langle L(x), x \rangle + c \cdot \|x\|^2 \\
&\geqslant_{\text{[eq: 18.36}} \|L(x)\|^2 - |b| \cdot \|L(x)\| + c \cdot \|x\|^2
\end{aligned}$$

proving

$$\|L(x)\|^2 - |b| \cdot \|L(x)\| + c \cdot \|x\|^2 \leqslant \langle (L^2 + b \cdot L + c \cdot \mathrm{Id}_x)(x), x \rangle \tag{18.37}$$

Next

$$\begin{aligned} \left(\|L(x)\| - \frac{|b| \cdot \|x\|}{2} \right)^2 + \left(c - \frac{b^2}{4} \right) \cdot \|x\|^2 &= \\ \|L(x)\|^2 - |b| \cdot \|L(x)\| \cdot \|x\| + \frac{|b|^2 \cdot \|x\|^2}{4} + c \cdot \|x\|^2 - \frac{b^2}{4} \cdot \|x\|^2 &\underset{b \in \mathbb{R} \Rightarrow b^2 = |b|^2}{=} \\ \|L(x)\|^2 - |b| \cdot \|L(x)\| \cdot \|x\| + c \cdot \|x\|^2 &\leqslant_{[\text{eq: } 18.37]} \\ \langle (L^2 + b \cdot L + c \cdot \mathrm{Id}_x)(x), x \rangle & \end{aligned} \tag{18.38}$$

Now as $0 \leqslant \left(\|L(x)\| - \frac{|b| \cdot \|x\|}{2} \right)^2$ and $b^2 < 4 \cdot c \Rightarrow 0 < c - \frac{b^2}{4}$ so that as $0 < \|x\|$ we have

$$0 < \left(\|L(x)\| - \frac{|b| \cdot \|x\|}{2} \right)^2 + \left(c - \frac{b^2}{4} \right) \cdot \|x\|^2$$

which by [eq: 18.38] results in

$$0 < \langle (L^2 + b \cdot L + c \cdot \mathrm{Id}_x)(x), x \rangle$$

so we must have that $(L^2 + b \cdot L + c \cdot \mathrm{Id}_x)(x) \neq 0$. Hence $\ker(L^2 + b \cdot L + c \cdot \mathrm{Id}_x) = \{0\}$ so that by [theorem: 11.192]

$$L^2 + b \cdot L + c \cdot \mathrm{Id}_x \text{ is injective}$$

□

We are now ready to prove that in the real case self-adjoint operators have a eigenvector with areal eigenvalue.

Theorem 18.108. *Let $\langle X, \langle\rangle \rangle$ be a real [or complex] finite dimensional inner product space and $L \in \mathrm{Hom}(X)$ a self-adjoint operator then L has a eigenvector.*

***Note* 18.109.** *Using [theorem: 18.108] all the eigenvalues are real.*

Proof. By [theorem: 18.70] every $L \in \mathrm{Home}(X)$ in a complex finite dimensional inner product space has a eigenvector, hence this is also true for a self-adjoint operator. So we must only prove the theorem for a real finite dimensional inner product space. Let $n = \dim(X) \in \mathbb{N}$ and choose $x \in X$ with $x \neq 0$ [this exist because $n \in \mathbb{N}$ so that X is non trivial]. Consider now the set $W = \{L^0(x), \ldots, L^n(x)\} \subseteq X$ of $n+1$ vectors in X. As $\dim(X) = n$ W must be linear dependent [see theorem: 11.159]]. So there exist a family $\{a_i\}_{i \in \{0, \ldots, n\}} \subseteq \mathbb{R}$ such that

$$\{i \in \{0, \ldots, n\} | a_i \neq 0\} \neq \varnothing \text{ and } \sum_{i=0}^{n} a_i \cdot L^i(x) = 0$$

As $\{i \in \{0, \ldots, n\} | a_i \neq 0\}$ is non empty and finite $N = \max(\{i \in 0, \ldots, n\} | a_i \neq 0)$ exist. So we have

$$0 = \sum_{i \in \{0, \ldots, n\}} a_i \cdot L^i(x) = \sum_{i \in \{0, \ldots, N\}} a_i \cdot L^i(x) + \sum_{i \in \{0, \ldots, N\}} a_i \cdot L^i(x) = \sum_{i \in \{0, \ldots, N\}} a_i \cdot L^i(x)$$

or

$$\sum_{i=0}^{N} a_i \cdot L^i(x) = 0 \tag{18.39}$$

If $N = 0$ then $0 = \sum_{i=0}^{N} a_i \cdot L^i(x) = a_0 \cdot L^0(x) = a_0 \cdot x$ which as $a_0 \neq 0$ proves that $x = 0$ contradicting $x \neq 0$. Hence we have

$$N \neq 0 \tag{18.40}$$

So if we define the polynomial $p \in \mathcal{P}$ by $p(z) = \sum_{i=0}^{N} a_i \cdot L^i(x)$ then $\mathrm{ord}(p) = N \in \mathbb{N}$. Hence by [theorem: 17.36] there exists a $c \in \mathbb{R} \setminus \{0\}$, $m, M \in \mathbb{N}_0$, $\{b_i\}_{i \in \{1, \ldots, M\}} \subseteq \mathbb{R}$ and $\{c_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R}$ such that $\forall i \in \{1, \ldots, M\}$ we have

$$(b_i)^2 < 4 \cdot c_i$$

$$\forall z \in \mathbb{C} \text{ we have } p(z) = c \cdot \left(\prod_{i \in \{1, \ldots, m\}} (z - \lambda_i) \right) \cdot \prod_{i \in \{1, \ldots, M\}} (z^2 + b_i \cdot z + c_i)$$

Define now

$$\{p_i\}_{i\in\{1,\dots,m+M+1\}} \text{ by } p_i(z)=\begin{cases} c=c\cdot z^0 \text{ if } i=1 \\ z-\lambda_{i-1} \text{ if } i\in\{2,\dots,m+1\} \\ z^2+b_{i-(m+1)}\cdot z+c_{i-m} \text{ if } i\in\{m+2,\dots,m+M+1\} \end{cases}$$

then we have $\forall c\in\mathbb{C}$ that

$$\begin{aligned} \prod_{i\in\{1,\dots,m+M+1\}} p_i(z) &= \\ \left(\sum_{i\in\{1\}} p_i(z)\right)\cdot\left(\prod_{i\in\{2,\dots,m+1\}} p_i(z)\right)\cdot\left(\prod_{i\in\{m+2,\dots,m+M+1\}} p_i(z)\right) &= \\ c\cdot\left(\prod_{i\in\{2,\dots,m+1\}} (z-\lambda_{i-1})\right)\cdot\left(\prod_{i\in\{m+2,\dots,m+M+1\}} (z^2+b_{i-(m+1)}\cdot z+c_{i-(m+1)})\right) &= \\ c\cdot\left(\prod_{i\in\{1,\dots,m\}} (z-\lambda_i)\right)\cdot\left(\prod_{i\in\{1,\dots,M\}} (z^2+b_i\cdot z+c_i)\right) &= \\ p(z) \end{aligned}$$

Using [theorem: 18.63] we have then that

$$\sum_{i=0}^{N} a_i\cdot L^i \underset{\text{[definition: 18.59]}}{=} p[L] \underset{\text{[theorem: 18.63]]}}{=} \bigodot_{i=1}^{n+M+1} p_i[L]$$

Now as for $x\neq 0$ we have $p[L](x)=\sum_{i=0}^{N} a_i\cdot L^i(x) \underset{\text{[eq: 18.39]}}{=} 0$ it follows that $\ker(\bigodot_{i=1}^{n+M+1} p_i[L])\neq 0$, hence using [theorem: 18.58] there exist a $k\in\{1,\dots,m+M+1\}$ such that $\ker(p_k[L])\neq\varnothing$ or

$$p_k[L](y) \text{ is not injective} \tag{18.41}$$

For k we have to consider the following cases

- $\boldsymbol{k=1}$. Then as p_1 is defined by $p_1(z)=c\cdot z^0$ we have $p_1[L]=c\cdot \mathrm{Id}_X$. As $p_1[L]$ is not injective $\ker(p_1[L])\neq 0$ so that there exist a $x\neq 0$ such that $0=p_k[L](x)=c\cdot x$ which as $c\neq 0$ leads to the contradiction $0\neq x=0$. Hence this case will never occur.
- $\boldsymbol{k\in\{m+2,\dots,m+M+1\}}$. Then as p_k is defined by $p_k(z)=z^2+b_k\cdot z+c_k$ we have that

  $$p_k[L]=L^2+b_k\cdot L+c_k\cdot \mathrm{Id}_X$$

  which as $(b_i)^2<4\cdot c_i$ proves by [lemma: 18.107] that $p_k[L]$ is a bijection hence injective contradicting [eq: 18.41]. So this case never occurs.

So the only valid case is the case where $k\in\{2,\dots,m+1\}$. Then $p_k(z)=z-\lambda_k$ and $p_k[L]=L-\lambda_k\cdot \mathrm{Id}_X$. As $\ker(p_k[L])\neq 0$ there exist a $x\in X$ with $x\neq 0$ such that $0=p_k[L](x)=L(x)-\lambda_k\cdot x$ or $L(x)=\lambda_k\cdot x$. Hence we found a eigenvector of L. □

Definition 18.110. *Let $\langle X,\langle\rangle\rangle$ be a real [or complex] inner product space, $U\subseteq X$ then the* ***orthogonal complement*** *of U noted by $U^\perp$ is defined by*

$$U^\perp=\{x\in X|\forall y\in U \text{ we have } \langle x,y\rangle=0\}\subseteq X$$

In other words the orthogonal complement of a set is the collection of all elements in X that are orthogonal to every element of the given set.

Theorem 18.111. *Let $\langle X,\langle\rangle\rangle$ be a real [or complex] inner product space then we have:*

1. *If $U\subseteq X$ then $U^\perp$ is a sub-space of X.*
2. $\{0\}^\perp=X$
3. $X^\perp=\{0\}$
4. *If $U\subseteq X$ then $U\bigcap U^\perp\subseteq\{0\}$*
5. *If $U\subseteq X$ is a sub-space then $U\bigcap U^\perp=\{0\}$*
6. *If $U,W\subseteq X$ with $U\subseteq W$ then $W^\perp\subseteq U^\perp$*

Proof.

1. If $x, y \in U^\perp$, $\alpha \in \mathbb{K}$ then $\forall u \in U$ we have $\langle x + \alpha \cdot y, u\rangle = \langle x, u\rangle + \alpha \cdot \langle y, u\rangle = 0 + 0 = 0$ proving that $x + \alpha \cdot y \in U^\perp$. Further as $\forall u \in U$ $\langle 0, u\rangle = 0$ it follows that $0 \in U^\perp$, hence $U^\perp \neq \varnothing$.
2. As $\forall x \in X$ we have $\langle x, 0\rangle = 0$ it follows that $X \subseteq \{0\}^\perp \subseteq X$ so that $X = \{0\}^\perp$.
3. First $\forall x \in X$ we have $\langle 0, x\rangle$ so that $\{0\} \subseteq X^\perp$, second if $y \in X^\perp$ then as $X^\perp \subseteq X$ $y \in X$, so $\langle y, y\rangle = 0$, hence $y = 0 \in \{0\}$ proving that $X^\perp \subseteq \{0\}$. Hence it follows that
$$X^\perp = \{0\}$$
4. Let $x \in U \bigcap U^\perp$ then $x \in U$ and as also $x \in U^\perp$ we have $\langle x, x\rangle = 0$ so that $x = 0 \in \{0\}$. Hence it follows that $U \bigcap U^\perp \subseteq \{0\}$.
5. As U is a sub-space it follows that $0 \in U$, as by (1) $U^\perp$ is a sub-space we have also a $0 \in U^\perp$, so $\{0\} \subseteq U \bigcap U^\perp$. Combining this with (4) results in $U \bigcap U^\perp = \{0\}$.
6. If $x \in W^\perp$ then $\forall u \in U$ we have, as $U \subseteq W$ that $u \in W$ hence $\langle x, u\rangle = 0$ proving that $x \in U^\perp$, hence $W^\perp \subseteq U^\perp$. □

Theorem 18.112. *Let $\langle X, \langle\rangle\rangle$ be a real [or complex] inner product space, U a finite dimensional sup-space of X then*
$$X = U \oplus U^\perp$$

Proof. We have the following cases to consider for U:

***U* is trivial.** Then $U = \{0\}$ and $U^\perp = \{0\}^\perp \underset{\text{[theorem: 18.111]}}{=} X$ so that
$$U \oplus U^\perp = \{0\} \oplus X \underset{\text{[example: 11.209]}}{=} X$$

***U* is not trivial.** As U is finite dimensional there exist [theorem: 18.32] a orthonormal basis $E = \{e_1, \ldots, e_n\}$, $n \in \mathbb{N}$ for U. Let $x \in X$ then we have for $y = \sum_{i=1}^n \langle x, e_i\rangle \cdot e_i$ and $z = x - y$ that clearly
$$x = y + z \text{ and } y \in U$$
Further if $u \in U$ then we have by [theorem: 18.29] $u = \sum_{i=1}^n \langle u, e_i\rangle \cdot e_i$ then we have:

real case.
$$\begin{aligned}
\langle z, u\rangle &= \langle x - y, u\rangle \\
&= \langle x, u\rangle - \langle y, u\rangle \\
&= \langle x, u\rangle - \left\langle \sum_{i=1}^n \langle x, e_i\rangle \cdot e_i, u \right\rangle \\
&= \langle x, u\rangle - \sum_{i=1}^n \langle x, e_i\rangle \cdot \langle e_i, u\rangle \\
&= \langle x, u\rangle - \sum_{i=1}^n \langle x, e_i\rangle \cdot \left\langle e_i, \sum_{k=1}^n u_k \cdot e_k \right\rangle \\
&= \langle x, u\rangle - \sum_{i=1}^n \langle x, e_i\rangle \cdot \sum_{k=1}^n u_k \cdot \langle e_i, e_k\rangle \\
&= \langle x, u\rangle - \sum_{i=1}^n \langle x, e_i\rangle \cdot \sum_{k=1}^n u_k \cdot \delta_{i,k} \\
&= \langle x, u\rangle - \sum_{i=1}^n u_i \cdot \langle x, e_i\rangle \\
&= \langle x, u\rangle - \left\langle x, \sum_{i=1}^n u_i \cdot e_i \right\rangle \\
&= \langle x, u\rangle - \langle x, u\rangle \\
&= 0
\end{aligned}$$

complex case.

$$\begin{aligned}
\langle z,u\rangle &= \langle x-y,u\rangle \\
&= \langle x,u\rangle-\langle y,u\rangle \\
&= \langle x,u\rangle-\left\langle\sum_{i=1}^{n}\langle x,e_i\rangle\cdot e_i,u\right\rangle \\
&= \langle x,u\rangle-\sum_{i=1}^{n}\langle x,e_i\rangle\cdot\langle e_i,u\rangle \\
&= \langle x,u\rangle-\sum_{i=1}^{n}\langle x,e_i\rangle\cdot\left\langle e_i,\sum_{k=1}^{n}u_k\cdot e_k\right\rangle \\
&= \langle x,u\rangle-\sum_{i=1}^{n}\langle x,e_i\rangle\cdot\sum_{k=1}^{n}\overline{u_k}\cdot\langle e_i,e_k\rangle \\
&= \langle x,u\rangle-\sum_{i=1}^{n}\langle x,e_i\rangle\cdot\sum_{k=1}^{n}\overline{u_k}\cdot\delta_{i,k} \\
&= \langle x,u\rangle-\sum_{i=1}^{n}\overline{u_i}\cdot\langle x,e_i\rangle \\
&= \langle x,u\rangle-\left\langle x,\sum_{i=1}^{n}u_i\cdot e_i\right\rangle \\
&= \langle x,u\rangle-\langle x,u\rangle \\
&= 0
\end{aligned}$$

so we have in all cases that $\langle z,u\rangle=0$, proving that $z\in U^{\perp}$. Hence we have that

$$X=U+U^{\perp}$$

As by [theorem: 18.111] $U\bigcap U^{\perp}=\{0\}$ it follows from [theorem: 11.206] that

$$X=U\oplus U^{\perp}$$

□

Theorem 18.113. *Let $\langle X,\langle\rangle\rangle$ be a real [or complex] finite dimensional space, $L\in\mathrm{Hom}(X)$ a self-adjoint operator and $U\subseteq X$ a sub-space of X so that $L(U)\subseteq U$ then*

1. $L(U^{\perp})\subseteq U^{\perp}$
2. $L_{|U}\in\mathrm{Hom}(U)$ *is self-adjoint in* $\langle U,\langle\rangle_{|U\times U}\rangle$
3. $L_{|U}\in\mathrm{Hom}(U^{\perp})$ *is self-adjoint in* $\langle U^{\perp},\langle\rangle_{U^{\perp}\times U^{\perp}}\rangle$

Using [theorems: 18.2, 18.8] for a proof that $\langle U,\langle\rangle_{|U\times U}\rangle$ and $\langle U^{\perp},\langle\rangle_{U^{\perp}\times U^{\perp}}\rangle$ are inner product space.

Proof.

1. Let $y\in L(U^{\perp})$ then there exist a $x\in U^{\perp}$ such that $y=L(x)$. If $u\in U$ then $L(u)\in U$ and we have $\langle y,u\rangle=\langle L(x),u\rangle=\langle x,L^*(u)\rangle=\langle x,L(u)\rangle\underset{L(u)\subseteq U\wedge x\in U^{\perp}}{=}0$, hence $y\in U^{\perp}$. So $L(U^{\perp})\subseteq U^{\perp}$.
2. Let $x,y\in U$ then $L_{|U}(x)=L(x)\in U$ and $L_{|U}(y)=L(y)\in U$ so that

$$\langle L_{|U}(x),y\rangle_{|U\times U}=\langle L(x),y\rangle=\langle x,L(y)\rangle=\langle x,L_{|U}(y)\rangle_{|U\times U}$$

   proving by [theorem: 18.85] that $L_{|U}$ is self-adjoint.
3. This follows from (2) by replacing U by $U^{\perp}$ and the fact that $U^{\perp}$ is also a subspace in X [see theorem: 18.111]. □

We are now ready to prove the Spectral Theorem in the real case.

Theorem 18.114. (Real Spectral Theorem) *Let $\langle X, \langle\rangle\rangle$ be a real finite dimensional space with $\dim(X) \in \mathbb{N}$ and $L \in \mathrm{Hom}(X)$ then the following are equivalent:*

1. *L is self-adjoint*
2. *There exist a orthonormal base $\{e_1, \ldots, e_n\}$ for X such that $\forall i \in \{1, \ldots, n\}$ e_i is a eigenvector of L.*
3. *There exists a orthonormal basis $E = \{e_1, \ldots, e_n\}$ for X such that $\mathcal{M}(L; E, E)$ is diagonal.*

Proof.

$1 \Rightarrow 2$. We prove this by induction on $\dim(X)$ so define

$S = \{n \in \mathbb{N} | \text{If } \langle X, \langle\rangle\rangle \text{ is a real inner product space with } \dim(X) = n \text{ and } L \in \mathrm{Hom}(X) \text{ is self-adjoint then there exist a orthonormal base } \{e_1, \ldots, e_n\} \text{ for X such that } \forall i \in \{1, \ldots, n\}\ e_i \text{ is a eigenvector of } L\}$

then we have:

$1 \in S$. If $\dim(X) = 1$ then there exist by [theorem: 18.32] a orthonormal basis $\{e_1\}$ for X. As $L(e_1) \in X$ there exist a $\lambda_1 \in \mathbb{R}$ such that $L(e_1) = \lambda_1 \cdot e_1$ proving that e_1 is a eigenvector of X. Hence $1 \in S$.

$n \in S \Rightarrow n + 1 \in S$. Let $\langle X, \langle\rangle\rangle$ be a real finite inner product space with $\dim(X) = n + 1$

and take $L \in \mathrm{Hom}(X)$. As L is self-adjoint there exist by [theorem: 18.108] a eigenvector x with a real eigenvalue λ, so that

$$x \neq 0,\ L(x) = \lambda \cdot x \text{ and } \lambda \in \mathbb{R}$$

Define $e_{n+1} = \frac{x}{\|x\|}$ then we have

$$e_{n+1} \neq 0,\ \|e_{n+1}\| = 1 \text{ and } L(e_{n+1}) = \frac{L(x)}{\|x\|} = \lambda \cdot \frac{x}{\|x\|} = \lambda \cdot e_{n+1}$$

Define now $U = \mathrm{span}(\{e_{n+1}\}) = \{\alpha \cdot e_{n+1} | \alpha \in \mathbb{R}\}$ which is a vector space with $\dim(U) = 1$. Using [theorem: 18.110 we have then that

$$X = U \oplus U^{\perp}$$

As $U^{\perp} \in X$ we have by [theorem: 11.157] that $U^{\perp}$ is finite dimensional, so we can use [theorem: 11.208[to get $n + 1 = \dim(X) = \dim(U \oplus U^{\perp}) = \dim(U) + \dim(U^{\perp}) = 1 + \dim(U^{\perp})$, hence $\dim(U^{\perp}) = n$. So by [theorem: 18.2] we have that

$$\langle U^{\perp}, \langle\rangle_{|U^{\perp}}\rangle \text{ is a real inner product space with } \dim(U^{\perp}) = n$$

Further by the previous theorem [theorem: 18.113] we have that $L_{|U^{\perp}}$ is a self-adjoint operator in $\langle U^{\perp}, \langle\rangle_{|U^{\perp}}\rangle$. Hence as $n \in \mathcal{S}$ there exist a orthonormal basis $\{e_1, \ldots, e_n\}$ for $U^{\perp}$ such that $\forall i \in \{e_1, \ldots, e_n\}$ e_i is a eigenvector of $U^{\perp}$ with eigenvector λ_i. Consider now

$$E = \{e_1, \ldots, e_n, e_{n+1}\}$$

Let $i, j \in \{1, \ldots, n + 1\}$ with $i \neq j$ then we have either:

$i, j \in \{1, \ldots, n\}$. Then as $\{e_1, \ldots, e_n\}$ is orthonormal $\langle e_i, e_j\rangle = 0$

$i = n + 1 \wedge j \in \{1, \ldots, n\}$. Then as $e_j \in U^{\perp}$ and $e_{n+1} \in U$ $\langle e_i, e_j\rangle = \langle e_{n+1}, e_j\rangle = 0$

$i \in \{1, \ldots, n\} \wedge j = n + 1$. Then as $e_i \in U^{\perp}$ and $e_{n+1} \in U$ $\langle e_i, e_j\rangle = \langle e_i, e_{n+1}\rangle = 0$

hence we have that $\{e_1, \ldots, e_n, e_{n+1}\}$ is a orthonormal set. Using then [theorem: 18.33] it follows that

$$\{e_1, \ldots, e_{n+1}\} \text{ is a orthonormal basis for } X$$

Further if $i \in \{1, \ldots, n + 1\}$ then we have either:

$i \in \{1, \ldots, n\}$. Then $L(e_i) = L_{|U^{\perp}}(e_i) = \lambda_i \cdot e_i$ so that e_i is a eigenvector of L

$i = n + 1$. Then $L(e_i) = L(e_{n+1}) = \lambda \cdot e_{n+1}$ so that e_i is a eigenvector of L

hence $\forall i \in \{1, \ldots, n + 1\}$ e_i is a eigenvector of L. So $n + 1 \in S$.

2 ⇒ 1. Let $\{e_1,\dots,e_n\}$ be a orthonormal basis for X such that $\forall i\in\{1,\dots,n\}$ e_i is a eigenvector of L. Then if $x,y\in X$ there exist $\{x_i\}_{i\in\{1,\dots,n\}}\subseteq\mathbb{R}$, $\{y_i\}_{i\in\{1,\dots,n\}}\subseteq\mathbb{R}$ such that $x=\sum_{i=1}^n x_i\cdot e_i$ and $y=\sum_{i=1}^n y_i\cdot e_i$. So

$$\begin{aligned}
\langle L(x),y\rangle &= \left\langle L\left(\sum_{i=1}^n x_i\cdot e_i\right),\sum_{j=1}^n y_j\cdot e_j\right\rangle\\
&= \left\langle \sum_{i=1}^n x_i\cdot L(e_i),\sum_{j=1}^n y_j\cdot e_j\right\rangle\\
&= \left\langle \sum_{i=1}^n x_i\cdot \lambda_i\cdot e_i,\sum_{j=1}^n y_j\cdot e_j\right\rangle\\
&= \sum_{i=1}^n x_i\cdot\lambda_i\cdot\left\langle e_i,\sum_{j=1}^n y_j\cdot e_j\right\rangle\\
&= \sum_{i=1}^n \left(x_i\cdot\lambda_i\cdot\sum_{j=1}^n y_j\cdot\langle e_i,e_j\rangle\right)\\
&= \sum_{i=1}^n \left(x_i\cdot\lambda_i\cdot\sum_{j=1}^n y_j\cdot\delta_{i,j}\right)\\
&= \sum_{i=1}^n \lambda_i\cdot x_i\cdot y_i\\
\langle x,L(y)\rangle &= \left\langle \sum_{i=1}^n x_i\cdot e_i, L\left(\sum_{j=1}^n y_j\cdot e_j\right)\right\rangle\\
&= \sum_{i=1}^n x_i\cdot\left\langle e_i,\sum_{j=1}^n y_j\cdot L(e_j)\right\rangle\\
&= \sum_{i=1}^n x_i\cdot\left(\sum_{j=1}^n y_j\cdot\lambda_j\cdot\langle e_i,e_j\rangle\right)\\
&= \sum_{i=1}^n x_i\cdot\left(\sum_{j=1}^n y_j\cdot\lambda_j\cdot\delta_{i,j}\right)\\
&= \sum_{i=1}^n \lambda_i\cdot x_i\cdot y_i
\end{aligned}$$

From the above it follows that $\langle L(x),y\rangle=\langle x,L(y)\rangle$ which as $x,y\in X$ where chosen arbitrary proves that L is self-adjoint.

2 ⇔ 3. This is actually proved in [theorem: 18.104]. □

Corollary 18.115. *Let $\langle X,\langle\rangle\rangle$ be a real finite dimensional space with $\dim(X)\in\mathbb{N}$ with $\dim(X)=n\in\mathbb{N}$, $E=\{e_1,\dots,e_n\}$ a orthonormal basis and $L\in\mathrm{Hom}(X)$ a self-adjoint operator then there exist a unitary operator $U\in\mathrm{Hom}(X)$ such that $\mathcal{M}(U^\star\circ L\circ U;E,E)$ is diagonal.*

Proof. Using the real spectral theorem [theorem: 18.114] there exist a orthonormal basis $F=\{f_1,\dots,f_n\}$ such $\mathcal{M}(L;F,F)$ is diagonal. Take now the unitary mapping $U\in\mathrm{Hom}(X)$ defined by $\forall i\in\{1,\dots,n\}$ $U(e_i)=f_i$ [see theorem: 18.100] then we have for $i,j\in\{1,\dots,n\}$ that

$$\begin{aligned}
\mathcal{M}(U^*\circ L\circ U;E,E)_{i,j} &\underset{\text{[theorem: 18.30]}}{=} \langle (U^*\circ L\circ U)(e_j),e_i\rangle\\
&= \langle U^*(L(U(e_j))),e_i\rangle\\
&= \langle L(U(e_j)),(U^*)^*(e_i)\rangle\\
&\underset{\text{[theorem: 18.38]}}{=} \langle L(U(e_j)),U(e_i)\rangle\\
&= \langle L(f_j),f_i\rangle\\
&\underset{\text{[theorem: 18.30]}}{=} \mathcal{M}(L;F,F)_{i,j}
\end{aligned}$$

So $\mathcal{M}(U^* \circ L \circ U; E, E) = \mathcal{M}(L; F, F)$ which, as $\mathcal{M}(L; F, F)$ is diagonal, proves that $\mathcal{M}(U^* \circ L \circ U; E, E)$ is diagonal. □

Theorem 18.116. *Let $n \in \mathbb{N}$ then we have:*

1. *If $M \in \mathcal{M}_{n,n}(\mathbb{R})$ is a symmetric matrix then there exist a unitary matrix U such that $U^T \cdot M \cdot U \underset{U \text{ is unitary}}{=} U^{-1} \cdot M \cdot U$ is diagonal.*
2. *If $M \in \mathcal{M}_{n,n}(\mathbb{C})$ is a hermitian matrix then there exist a unitary matrix U such that $U^H \cdot M \cdot U \underset{U \text{ is unitary}}{=} U^{-1} \cdot M \cdot U$ is diagonal.*

Proof.

1. Take the inner product vector space $\langle \mathbb{R}^n, \langle\rangle\rangle$ defined in [example: 18.4] together with the canonical orthonormal basis $E = \{e_1, \ldots, e+n\}$ defined by $(e_i)_j = \delta_{i,j}$ [see example: 18.27]. Define $L \in \text{Hom}(\mathbb{R})$ by $\forall i \in \{1, \ldots, n\}$ $L(e_i) = \sum_{k=1}^n M_{i,k} \cdot e_k$ so that
$$\mathcal{M}(L; E, E) = M \tag{18.42}$$
As M is symmetric it is Hermitian [see definition: 18.45] we have by [theorem: 18.87] that L is a self-adjoint operator. Using the real spectral theorem [see theorem: 18.114] there exist a orthonormal basis $F = \{f_1, \ldots, f_n\}$ such that $\mathcal{M}(L; F, F)$ is diagonal. Let V be the coordinate transformation from E to F then using [theorem: 18.99]
$$\mathcal{M}(L; F, F) = \mathcal{M}(V; E, E)^{-1} \cdot \mathcal{M}(L; E, E) \cdot \mathcal{M}(V; E, E)$$
so that
$$\mathcal{M}(V; E, E)^{-1} \cdot M \cdot \mathcal{M}(V; E, E) \text{ is a diagonal matrix}$$
Using [theorem: 18.100] it follows that $\mathcal{M}(V; E, E)$ is unitary. So if we take $U = \mathcal{M}(V; E, E)$ then we found a unitary matrix U such that $U^{-1} \cdot M \cdot U$ is diagonal.
2. Take the inner product vector space $\langle \mathbb{C}^n, \langle\rangle\rangle$ defined in [example: 18.9] together with the canonical orthonormal basis $E = \{e_1, \ldots, e+n\}$ defined by $(e_i)_j = \delta_{i,j}$ [see example: 18.27]. Define $L \in \text{Hom}(\mathbb{R})$ by $\forall i \in \{1, \ldots, n\}$ $L(e_i) = \sum_{k=1}^n M_{i,k} \cdot e_k$ so that
$$\mathcal{M}(L; E, E) = M \tag{18.43}$$
As M is Hermitian [see definition: 18.45] we have by [theorem: 18.87] that L is a self-adjoint operator hence normal by [theorem: 18.102]. Using the complex spectral theorem [see theorem: 18.105] there exist a orthonormal basis $F = \{f_1, \ldots, f_n\}$ such that $\mathcal{M}(L; F, F)$ is diagonal. Let V be the coordinate transformation from E to F then using [theorem: 18.99]
$$\mathcal{M}(L; F, F) = \mathcal{M}(V; E, E)^{-1} \cdot \mathcal{M}(L; E, E) \cdot \mathcal{M}(V; E, E)$$
so that
$$\mathcal{M}(V; E, E)^{-1} \cdot M \cdot \mathcal{M}(V; E, E) \text{ is a diagonal matrix}$$
Using [theorem: 18.100] it follows that $\mathcal{M}(V; E, E)$ is unitary. So if we take $U = \mathcal{M}(V; E, E)$ then we found a unitary matrix U such that $U^{-1} \cdot M \cdot U$ is diagonal. □

Chapter 19
The exponential function

19.1 Power series

19.1.1 Definition and converge domain

TODO cheched untill this

Definition 19.1. (Power Series) *A **power series** is a expression of the form*

$$\sum_{i=0}^{\infty} a_i \cdot z^i$$

where $\{a_i\}_{i\in\mathbb{N}_0} \subseteq \mathbb{C}$ is a sequence of complex numbers. If for a given $z \in \mathbb{C}$ $\sum_{i=0}^{\infty} a_i \cdot z^i$ converges then $\sum_{i=0}^{\infty} a_i \cdot z^i$ refers to the limit $\lim_{n\to\infty} \sum_{i=1}^{n} a_i \cdot z^i$.

Note 19.2. We have bit of notation overloading here the same expression $\sum_{i=0}^{\infty} a_i \cdot z^i$ stands for

1. A **power series** which is essential another notation of a family $\{a_i\}_{i\in\mathbb{N}_0} \subseteq \mathbb{C}$
2. A series if we have chosen a certain a complex number z.
3. The $\lim_{n\to\infty} \sum_{i=1}^{n} a_i \cdot z^i$ [which is a value in $\mathbb{C}$] if the series $\sum_{i=0}^{\infty} a_i \cdot z^i$ converges.

We use context to figure out which meaning must be attached to the expression $\sum_{i=0}^{\infty} a_i \cdot z^i$.

Given a sequence $\{a_i\}_{i\in\mathbb{N}_0} \subseteq \mathbb{C}$ then the convergence of $\sum_{i=0}^{\infty} a_i \cdot z^i$ depends on the value of z, the convergence domain captures this idea.

Definition 19.3. *Let $\sum_{i=0}^{\infty} a_i \cdot z^i$ be a power series then*

1. *The **convergence domain of** $\sum_{i=0}^{\infty} a_i \cdot z^i$ noted as $\mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i]$ is defined by*

$$\mathcal{D}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] = \left\{ z \in \mathbb{C} | \sum_{i=0}^{\infty} a_i \cdot z^i \text{ converges} \right\}$$

2. *The **absolute convergence domain of** $\sum_{i=0}^{\infty} a_i \cdot z^i$ noted as $\overline{\mathcal{D}}[\sum_{i=0}^{\infty} a_i \cdot z^i]$ is defined by*

$$\overline{\mathcal{D}}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] = \left\{ z \in \mathbb{C} | \sum_{i=0}^{\infty} |a_i| \cdot |z|^i \text{ converges} \right\}$$

Example 19.4. Let $\sum_{i=0}^{\infty} a_i \cdot z^i$ be a power series then if $z = 0$ it follows that $\sum_{i=0}^{\infty} a_i \cdot z^i$ converges and

$$\sum_{i=0}^{\infty} a_i \cdot z^i = a_0$$

Proof. If $z = 0$ then $\forall i \in \mathbb{N}$ we have $\alpha_i \cdot z^i = 0$ so that for $n \in \mathbb{N}$ we have that

$$\sum_{i=0}^{n} a_i \cdot z^i = a_0 \cdot z^0 + \sum_{i=1}^{n} a_i \cdot z^i = a_0$$

so that by [example: 14.295] $\lim_{n\to\infty} \sum_{i=0}^{n} a_i \cdot z^i$ converges to a_0. □

Theorem 19.5. *Let $\sum_{i=0}^{\infty} a_i \cdot z^i$ be a power series then we have*

$$0 \in \overline{\mathcal{D}}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \mathcal{D}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]$$

Proof. First if $z=0$ then $|z|=0$ and by [example: 19.4]we have that $\sum_{i=0}^{\infty}|\alpha_i|^i$ converges to $|a_o|$ proving that

$$0\in\overline{\mathcal{D}}\left[\sum_{i=0}^{\infty}a_i\cdot z^i\right]$$

Second if $z\in\overline{\mathcal{D}}[\sum_{i=0}^{\infty}a_i\cdot z^i]$ then $\sum_{i=0}^{\infty}|a_i|\cdot|z|^i$ converges, as $\forall i\in\mathbb{N}_0$ we have that $|a_i\cdot z^i|\underset{\text{[theorem: 10.84}}{=}|a_i|\cdot|z|^i$ it follows from [theorem: 14.377] that $\sum_{i=0}^{\infty}a_i\cdot z^i$ converges. Hence $z\in\mathcal{D}(\sum_{i=0}^{\infty}a_i\cdot z^i)$ so that

$$\overline{\mathcal{D}}\left[\sum_{i=0}^{\infty}a_i\cdot z^i\right]\subseteq\mathcal{D}\left[\sum_{i=0}^{\infty}a_i\cdot z^i\right]$$ □

Theorem 19.6. *Let $\sum_{i=0}^{\infty}a_i\cdot z^i$ a power series and $0\neq z_0\in\mathcal{D}[\sum_{i=0}^{\infty}a_i\cdot z^i]$ then $\forall\rho\in\mathbb{R}$ with $0\leqslant\rho<|z_0|$ we have that $\sum_{i=0}^{\infty}|a_i|\cdot\rho^i$ converges.*

Proof. Let $0\leqslant\rho<|z+0|$ then we have for ρ either:

- $\boldsymbol{\rho=0}$. Then by [example: 19.4] $\sum_{i=0}^{\infty}|a_i|\cdot\rho^i$ converges.
- $\boldsymbol{0<\rho}$. As $z_0\in\mathcal{D}[\sum_{i=0}^{\infty}a_i\cdot z^i]$ we have that $\sum_{i=0}^{\infty}a_i\cdot {z_0}^i$ converges. Using [theorem: 14.354] it follow then that $\lim\limits_{i\to\infty}a_i\cdot z^i=0$, hence by [theorem: 14.327] $\{a_i\}_{i\in\mathbb{N}_0}$ is Cauchy and thus bounded by [theorem: 14.326]. So we have

$$\exists K\in\mathbb{R}^+\text{ such that }\forall i\in\mathbb{N}_0\text{ we have }|a_i\cdot {z_0}^i|\leqslant K \tag{19.1}$$

Now $\forall i\in\mathbb{N}_0$ we have $|a_n|\cdot\rho^n\underset{0\neq|z_0|}{=}|a_i|\cdot|z_0|^i\cdot\left(\frac{\rho}{|z_0|}\right)^i=|a_i\cdot {z_0}^i|\cdot q^i$ where $q=\left|\frac{\rho}{|z_0|}\right|<1$. Combining this with [eq: 19.1] gives

$$\forall i\in\mathbb{N}_0\text{ we have }|a_i|\cdot\rho^i\leqslant K\cdot q^i\text{ where }q_i<1 \tag{19.2}$$

Using [example: 14.353] it follows that $\sum_{i=0}^{\infty}q^i$ converges and thus by [theorem: 14.359] $\sum_{i=0}^{\infty}K\cdot q^i$ converges. Hence by dominant convergence [theorem: 14.380] and [eq: 19.2] we have that $\sum_{i=1}^{\infty}|a_i|\cdot\rho^i$. □

Corollary 19.7. *Let $\sum_{i=0}^{\infty}a_i\cdot z^i$ be a power series, $0\neq z_0\in\overline{\mathcal{D}}[\sum_{i=0}^{\infty}a_i\cdot z^i]$ then*

$$B_{||}(0,|z_0|)\subseteq\overline{\mathcal{D}}\left[\sum_{i=0}^{\infty}a_i\cdot z^i\right]$$

Proof. Take $z\in B_{||}(0,|z_0|)$ then $0\leqslant|z|<|z_0|$ so that by the previous theorem [theorem: 19.6] $\sum_{i=0}^{\infty}|a_i|\cdot|z|^i$ converges. Hence by definition $x\in\overline{\mathcal{D}}[\sum_{i=0}^{\infty}a_i\cdot z^i]$. □

The above suggests the following definition

Definition 19.8. (Convergence Radius) *Let $\sum_{i=0}^{\infty}a_i\cdot z^i$ a power series then the **convergence radius of** $\sum_{i=0}^{\infty}a_i\cdot z^i$ noted as $\mathcal{R}[\sum_{i=0}^{\infty}a_i\cdot z^i]$ is defined by*

$$\mathcal{R}\left[\sum_{i=0}^{\infty}a_i\cdot z^i\right]=\begin{cases}\sup\left(\mathcal{D}[\sum_{i=0}^{\infty}a_i\cdot z^i]\bigcap[0,\infty[\right)\text{ if }\mathcal{D}[\sum_{i=0}^{\infty}a_i\cdot z^i]\bigcap[0,\infty[\text{ is bounded above}\\ \infty\text{ if }\mathcal{D}[\sum_{i=0}^{\infty}a_i\cdot z^i]\bigcap[0,\infty[\text{ is not bounded above}\end{cases}$$

***Note* 19.9.** *As by [theorem: 19.5] $0\in\mathcal{D}[\sum_{i=0}^{\infty}a_i\cdot z^i]\bigcap[0,\infty[$ and $\mathbb{R}$ is conditional complete [see theorem: 10.18] $\sup\left(\mathcal{D}[\sum_{i=0}^{\infty}a_i\cdot z^i]\bigcap[0,\infty[\right)$ exist if $\mathcal{D}[\sum_{i=0}^{\infty}a_i\cdot z^i]\bigcap[0,\infty[$ is bounded above, hence the definition is valid. Further as $0<\infty$ and $0\in\mathcal{D}[\sum_{i=0}^{\infty}a_i\cdot z^i]\bigcap[0,\infty[$ it follows that $0\leqslant\mathcal{R}[\sum_{i=0}^{\infty}a_i\cdot z^i]$.*

Given the above definition we have following properties of the convergence radius of a power series.

Theorem 19.10. *Let $\sum_{i=0}^{\infty}a_i\cdot z^i$ be a power series then we have for $\mathcal{R}[\sum_{i=0}^{\infty}a_i\cdot z^i]$*

1. *If $\mathcal{R}[\sum_{i=0}^{\infty}a_i\cdot z^i]<\infty$ then*

$$B_{||}\left(0,\mathcal{R}\left[\sum_{i=0}^{\infty}a_i\cdot z^i\right]\right)\subseteq\overline{\mathcal{D}}\left[\sum_{i=0}^{\infty}a_i\cdot z^i\right]\subseteq\mathcal{D}\left[\sum_{i=0}^{\infty}a_i\cdot z^i\right]\subseteq\overline{B_{||}\left(0,\mathcal{R}\left[\sum_{i=0}^{\infty}a_i\cdot z^i\right]\right)}$$

2. $$\mathcal{R}\left[\sum_{i=0}^{\infty}a_i\cdot z^i\right]=\infty$$
$$\Updownarrow$$

$$\mathcal{D}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] = \mathbb{C} = \overline{\mathcal{D}}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]$$

Proof.

1. If $\mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i] < \infty$ then we have either:

   $\boldsymbol{\mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i] = 0}$**.** Let $z \in \mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i]$, Assume that $z \neq 0$ then $0 < |z|$ so there exist a $\rho \in \mathbb{R}^+$ such that $0 < \rho < |z|$. Hence

   $$\rho \in [0, \infty[\bigcap B_{||}(0, |z|) \subseteq_{[\text{theorem: } 19.7]} [0, \infty[\bigcap \mathcal{D}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]$$

   so that $0 < \rho < \sup\left([0, \infty[\bigcap \mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i]\right) = \mathcal{R}(\sum_{i=0}^{\infty} a_i \cdot z^i) = 0$ leading to the contradiction $0 < 0$. Hence the assumption is wrong and we must have $z = 0$. So we have

   $$\begin{aligned} B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right) &= \varnothing \\ &\subseteq \overline{\mathcal{D}}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \\ &\subseteq \mathcal{D}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \\ &= \{0\} \\ &= \overline{B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right)} \end{aligned}$$

   proving

   $$B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right) \subseteq \overline{\mathcal{D}}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \mathcal{D}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \overline{B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right)}$$

   $\boldsymbol{0 < \mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i]}$**.** Let $z \in B_{||}(0, \mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i])$ then we have either:

   $\boldsymbol{z = 0}$**.** Then $z = 0 \in \overline{\mathcal{D}}[\sum_{i=0}^{\infty} a_i \cdot z^i]$.

   $\boldsymbol{z \neq 0}$**.** Then $0 < |z| < \mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i] = \sup\left(\mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i] \bigcap [0, \infty[\right)$, so there exist a $z' \in \mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i] \bigcap [0, \infty[$ such that $|z| < |z'| \leqslant \mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i]$. Hence $z \in B_{||}(0, z') \subseteq_{[\text{corollary: } 19.7]} \overline{\mathcal{D}}[\sum_{i=0}^{\infty} a_i \cdot z^i]$.

   So in all cases we have

   $$B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right) \subseteq \overline{\mathcal{D}}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \mathcal{D}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \tag{19.3}$$

   Let $z \in \mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i]$. Assume that $z \notin \overline{B_{||}(0, \mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i])}$ then we have $\mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i] < |z|$, hence there exist a ρ such that $\mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i] < \rho < |z|$. As $z \in \mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i]$ it follows from [theorem: 19.7] that $\rho \in \mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i] \bigcap [0, \infty[$ so that $\rho \leqslant \sup\left(\mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i] \bigcap [0, \infty[\right) = \mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i]$ contradicting $\mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i] < \rho$. So the assumption is wrong and we must have that $z \in \overline{B_{||}(0, \mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i])}$. Hence $\mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i] \subseteq \overline{B_{||}(0, \mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i])}$ which combined with [eq: 19.3] proves that

   $$B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right) \subseteq \overline{\mathcal{D}}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \mathcal{D}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \overline{B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right)}$$

2. $\boldsymbol{\Rightarrow}$**.** If $z \in \mathbb{C}$ then as $\mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i] = \infty$, $\mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i] \bigcap [0, \infty[$ is not bounded above so that there exist a $r \in \mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i] \bigcap [0, \infty[$ such that $|z| < r = |r|$ proving that $z \in B_{||}(0, |r|) \subseteq_{[\text{eq: } 19.7]} \overline{\mathcal{D}}[\sum_{i=0}^{\infty} a_i \cdot z^i]$ proving that

   $$\mathbb{C} \subseteq \overline{\mathcal{D}}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \mathcal{D}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \mathbb{C}$$

   so that

   $$\mathcal{D}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] = \mathbb{C} = \overline{\mathcal{D}}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]$$

⇐. Assume that $\mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i] < \infty$. As $\mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i] = \mathbb{C} = \overline{\mathcal{D}}[\sum_{i=0}^{\infty} a_i \cdot z^i]$ it follows from (1) that

$$B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right) \subseteq \overline{\mathcal{D}}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \mathcal{D}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \overline{B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right)}$$

which as $\mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i] = \mathbb{C} = \overline{\mathcal{D}}[\sum_{i=0}^{\infty} a_i \cdot z^i]$ proves that $\mathbb{C} \subseteq \overline{B_{||}(0, \mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i])}$, so that as $\mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i] \in \mathbb{C}$ we have the contradiction $\mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i] < \mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i]$. Hence the assumption is wrong and we must have that $\mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i] = \infty$. □

To simplify theorems we extend the concept of a open and closed ball to the case where the radius is ∞.

Definition 19.11. *Let $r \in [0, \infty[$ and $z \in \mathbb{C}$ then we define the open and closed ball $B_{||}(z, r)$ and $\overline{B_{||}(z, r)}$ by*

$$B_{||}(z, r) = \begin{cases} \mathbb{C} \text{ if } r = \infty \\ \{y \in \mathbb{C} \mid |y - z| < r\} \end{cases}$$

$$\overline{B_{||}(z, r)} = \begin{cases} \mathbb{C} \text{ if } r = \infty \\ \{y \in \mathbb{C} \mid |y - z| \leqslant r\} \end{cases}$$

***Note* 19.12.** *If $r \in [0, \infty[$ then this reduces to the definition of a open or closed ball in $\mathbb{C}$. Note also as $\mathbb{C}$ is open and closed that $B_{||}(z, r)$ is open and by [theorem: 14.65] $\overline{B_{||}(z, r)}$ is closed.*

Using this definition we can simplify [theorem: 19.10] to the following theorem.

Theorem 19.13. *Let $\sum_{i=0}^{\infty} a_i \cdot z^i$ be a power series then we have*

$$B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right) \subseteq \overline{\mathcal{D}}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \mathcal{D}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \overline{B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right)}$$

Proof. For $\mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i]$ we have either:

$\mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i] < \infty$. Then we have by [theorem: 19.10] we have that

$$B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right) \subseteq \overline{\mathcal{D}}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \mathcal{D}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \overline{B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right)}$$

$\mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i] = \infty$. Then by [theorem: 19.10] $\overline{\mathcal{D}}[\sum_{i=0}^{\infty} a_i \cdot z^i] = \mathbb{C} = \mathcal{D}[\sum_{i=0}^{\infty} a_i \cdot z^i]$ and by definition $B_{||}(0, \mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i]) = \mathbb{C} = \overline{B_{||}(0, \mathcal{R}[\sum_{i=0}^{\infty} a_i \cdot z^i])}$. So that

$$B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right) \subseteq \overline{\mathcal{D}}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \mathcal{D}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right] \subseteq \overline{B_{||}\left(0, \mathcal{R}\left[\sum_{i=0}^{\infty} a_i \cdot z^i\right]\right)}$$

□

Lemma 19.14. *Let $\rho, \rho' \in [0, \infty]$ then if $B_{||}(0, \rho) \subseteq \overline{B_{||}(0, \rho')}$ we have $\rho \leqslant \rho'$.*

Proof. For δ' we have the following possibilities:

$\rho' \in]0, \infty[$. If $\rho = \infty$ then $\rho' \in \mathbb{C} = B_{||}(x, \rho) \subseteq B_{||}(x, \rho)$ leading to the contradiction $\rho' < \rho'$ hence we must have that $\rho \in [0, \rho[$. Assume that $\rho' < \rho$ then there exist a δ such that $\rho' < \delta < \rho$ so that $\delta \in B_{||}(z, \rho) \subseteq \overline{B_{||}(z, \rho')}$ hence $\rho' < \delta \leqslant \rho'$ giving the contradiction $\rho' < \rho'$. Hence we must have in this case that $\rho \leqslant \rho'$.

$\rho' = 0$. Then $B_{||}(z, \rho) \subseteq \overline{B_{||}(z, \rho')} = \{0\}$. Assume that $0 < \rho$ then there exist a δ such that $0 < \delta < \rho$ then $\delta \in \{0\}$ giving the contradiction $0 < 0$. Hence we must have that $\rho = 0$.

$\rho' = \infty$. Then $\rho \leqslant \rho'$ □

The concept of convergence domain of a power series allows us to define the power function that maps a complex number in the conversion domain to the convergence limit of the polynomial.

Definition 19.15. *Let $\sum_{n=0}^{\infty} \frac{z^n}{n!}$ be a power series then we define*

$$\sum_{n=0}^{\infty} a_n \cdot (*)^n : \mathcal{D}\left(\sum_{n=0}^{\infty} a_n \cdot z^n\right) \to \mathbb{C} \text{ by } \left(\sum_{n=0}^{n} a_n \cdot (*)^n\right)(z) = \sum_{n=0}^{\infty} a_n \cdot z^n$$

19.1.2 Convergence criteria

We introduce now different criteria for a series to be convergent.

Lemma 19.16. *Let* $n \in \mathbb{N}$, $\{z_i\}_{i\in\{0,\ldots,n\}} \subseteq \mathbb{C}$, $\{\alpha_i\}_{i\in\{0,\ldots,n\}} \subseteq \mathbb{C}$ *and define*

$$\{s_i\}_{i\in\{0,\ldots,n\}} \text{ by } s_i = \sum_{j=0}^{i} z_j$$

then we have

$$\sum_{i=0}^{n} \alpha_i \cdot z_i = \left(\sum_{i=0}^{n-1} s_i \cdot (\alpha_i - \alpha_{i+1})\right) + \alpha_n \cdot s_n$$

Proof. We use induction on n for this proof, so define

$$S = \left\{ n \in \mathbb{N} | \text{If } \{z_i\}_{i\in\{0,\ldots,n\}} \subseteq \mathbb{C},\ \{\alpha_i\}_{i\in\{0,\ldots,n\}} \subseteq \mathbb{C} \text{ and } \{s_i\}_{i\in\{0,\ldots,m\}} \text{ defined by } s_i = \sum_{j=0}^{i} z_j \text{ then } \sum_{i=0}^{n} \alpha_i \cdot z_i = \left(\sum_{i=0}^{n-1} s_i \cdot (\alpha_i - \alpha_{i+1})\right) + \alpha_n \cdot s_n \right\}$$

then we have:

$1 \in S$. Then we have

$$\begin{aligned}
\left(\sum_{i=0}^{0} s_i \cdot (\alpha_i - \alpha_{i+1})\right) + \alpha_1 \cdot s_1 &= s_0 \cdot (\alpha_0 - \alpha_1) + \alpha_1 \cdot s_1 \\
&= \left(\sum_{i=0}^{0} z_i\right) \cdot (a_0 - \alpha_1) + \alpha_1 \cdot \sum_{i=0}^{1} z_i \\
&= z_0 \cdot (\alpha_0 - \alpha_1) + \alpha_1 \cdot (z_0 + z_1) \\
&= z_0 \cdot \alpha_0 + \alpha_1 \cdot z_1 \\
&= \sum_{i=0}^{1} \alpha_i \cdot z_i
\end{aligned}$$

so that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. We have

$$\begin{aligned}
\sum_{i=0}^{n+1} \alpha_i \cdot z_i &= \left(\sum_{i=0}^{n} \alpha_i \cdot z_i\right) + \alpha_{n+1} \cdot z_{n+1} \\
&\underset{n\in S}{=} \left(\sum_{i=0}^{n-1} s_i \cdot (\alpha_i - \alpha_{i+1})\right) + \alpha_n \cdot s_n + \alpha_{n+1} \cdot z_{n+1} \\
&= \left(\sum_{i=0}^{n-1} s_i \cdot (\alpha_i - \alpha_{i+1})\right) + (\alpha_n \cdot s_n - \alpha_{n+1} \cdot s_n) + (\alpha_{n+1} \cdot z_{n+1} + \alpha_{n+1} \cdot s_n) \\
&= \left(\sum_{i=0}^{n-1} s_i \cdot (\alpha_i - \alpha_{i+1})\right) + (\alpha_n - a_{n+1}) \cdot s_n + \alpha_{n+1} \cdot (z_{n+1} + s_n) \\
&= \left(\sum_{i=0}^{n} s_i \cdot (\alpha_i - \alpha_{i+1})\right) + \alpha_{n+1} \cdot \left(z_{n+1} + \sum_{i=0}^{n} z_i\right) \\
&= \left(\sum_{i=0}^{n} s_i \cdot (\alpha_i - \alpha_{i+1})\right) + \alpha_{n+1} \cdot \sum_{i=0}^{n+1} z_i \\
&= \left(\sum_{i=0}^{n} s_i \cdot (\alpha_i - \alpha_{i+1})\right) + \alpha_{n+1} \cdot s_{n+1}
\end{aligned}$$

proving that $n+1\in S$. $\square$

Lemma 19.17. (Inequality of Abel) *Let $n\in\mathbb{N}_0$, $\{z_i\}_{i\in\{0,\ldots,n\}}\subseteq\mathbb{C}$, $\{\alpha_i\}_{i\in\{0,\ldots,n\}}\subseteq[0,\infty[$ be such that $\forall i\in\{0,\ldots,n-1\}$ we have $\alpha_{i+1}\leqslant\alpha_i$, $\{s_i\}_{i\in\{0,\ldots,n\}}$ defined by $s_i=\sum_{j=0}^{i}z_j$ and $\mu\in[0,\infty[$ such that $\forall i\in\{0,\ldots,n\}$ we have $|s_i|\leqslant\mu$ then we have for $\sigma=\sum_{i=0}^{n}\alpha_i\cdot z_i$ that $|\alpha|\leqslant\alpha_0\cdot\mu$.*

Proof. For $n\in\mathbb{N}_0$ we have two cases to consider:

$\boldsymbol{n=0}$. Then $|\sigma|=|\sum_{i=0}^{0}\alpha_i\cdot z_i|=|\alpha_0\cdot z_0|=|\alpha_0\cdot\sum_0^0 z_i|=|\alpha_0\cdot s_0|=|\alpha_0|\cdot|s_0|<|\alpha_0|\cdot\mu$ proving that

$$|\sigma|\leqslant|\alpha_0|\cdot\mu$$

$\boldsymbol{n\neq 0}$. Then $n\in\mathbb{N}$ so we can use the previous lemma [lemma: 19.16] in the following

$$\begin{aligned}
|\sigma| &= \left|\sum_{i=0}^{n}\alpha_i\cdot z_i\right| \\
&\underset{\text{[lemma: 19.16]}}{=} \left|\left(\sum_{i=0}^{n-1}s_i\cdot(\alpha_i-\alpha_{i+1})\right)+\alpha_n\cdot s_n\right| \\
&\leqslant \left|\sum_{i=0}^{n-1}s_i\cdot(\alpha_i-\alpha_{i+1})\right|+|\alpha_n|\cdot|s_n| \\
&\leqslant \sum_{i=0}^{n-1}|s_i|\cdot|\alpha_i-\alpha_{i+1}|+|\alpha_n|\cdot|s_n| \\
&\underset{\alpha_n\in[0,\infty[}{=} \sum_{i=0}^{n-1}|s_i|\cdot|\alpha_i-\alpha_{i+1}|+\alpha_n\cdot|s_n| \\
&\underset{\alpha_{i+1}<\alpha_i}{=} \sum_{i=0}^{n-1}|s_i|\cdot(\alpha_i-\alpha_{i+1})+\alpha_n\cdot|s_n| \\
&\leqslant \sum_{i=0}^{n-1}\mu\cdot(\alpha_i-\alpha_{i+1})+\mu\cdot\alpha_n \\
&= \mu\cdot\left(\left(\sum_{i=0}^{n-1}(\alpha_i-\alpha_{i+1})\right)+\alpha_n\right) \\
&\underset{\text{[theorem: 11.10]}}{=} \mu\cdot((\alpha_0-\alpha_n)+\alpha_n) \\
&= \mu\cdot\alpha_0
\end{aligned}$$

$\square$

We use now the above lemma to prove the convergence criteria of Abel Dirichlet.

Theorem 19.18. (Criteria of Abel-Dirichlet) *Let $\{z_i\}_{i\in\mathbb{N}_0}\subseteq\mathbb{C}$ and $\{\varepsilon_i\}_{i\in\mathbb{N}_0}\subseteq[0,\infty[$ such that $\forall i\in\mathbb{N}$ we have $\varepsilon_{i+1}\leqslant\varepsilon_i$ then we have*

1. *If there exist a $C\in[0,\infty[$ such that $\forall i\in\mathbb{N}_0$ we have $|\sum_{j=0}^{i}z_j|\leqslant C$ and $\lim_{i\to\infty}\varepsilon_i=0$ then $\sum_{i=0}^{\infty}\varepsilon_i\cdot z_i$ is convergent.*
2. *If $\sum_{i=0}^{\infty}z_i$ is convergent then $\sum_{i=1}^{\infty}\varepsilon_i\cdot z_i$ is convergent.*

Proof.

1. Given $n,m\in\mathbb{N}$ with $n\leqslant m$ define

$$\begin{aligned}
\left\{x_i^{(n)}\right\}_{i\in\{0,\ldots,m-n\}}&\subseteq\mathbb{C} \quad\text{by}\quad x_i^{(n)}=z_{n+i}\\
\left\{s_i^{(n)}\right\}_{i\in\{0,\ldots,m-n\}}&\subseteq\mathbb{C} \quad\text{by}\quad s_i^{[n]}=\sum_{j=0}^{i}x_j^{(n)}\\
\left\{\alpha_i^{(n)}\right\}_{i\in\{0,\ldots,m-n\}}&\quad\text{by}\quad \alpha_i^{(n)}=\varepsilon_{i+n}
\end{aligned}$$

Then we have

$$\forall i\in\{1,\ldots,m-n-1\}\text{ that }\alpha_{i+1}^{(n)}=\varepsilon_{(i+n)+1}\leqslant\varepsilon_{i+n}=\alpha_i^{(n)}\text{ and }\alpha_i^{(n)}=\varepsilon_{i+n}\in[0,\infty[\tag{19.4}$$

Further given $i \in \{1, \ldots, m-n\}$ we have

$$s_i^{(n)} = \sum_j^i x_j^{(n)} = \sum_{j=0}^i z_{n+j} = \sum_{j=n}^{i+n} z_j = \sum_{j=0}^{i+n} z_i - \sum_{j=0}^{n-1} z_j = s_{n+i} - s_{n-i}$$

so that $\left|s_i^{(n)}\right| = |s_{n+i}| + |s_{n-i}| \leqslant C + C = 2 \cdot C$. Hence we have

$$\forall i \in \{1, \ldots, m-n-1\} \text{ that } s_i^{(n)} = s_{n+i} - s_{n-i} \text{ and } \forall i \in \{0, \ldots, m-n\} \text{ that } \left|s_i^{(n)}\right| \leqslant 2 \cdot C$$

Using then the inequality of Abel [see theorem: 19.17] we have that

$$\left|\sum_{i=0}^{m-n} \alpha_i \cdot x_i^{(n)}\right| \leqslant \alpha_0 \cdot 2 \cdot C = \varepsilon_n \cdot 2 \cdot C$$

As $\sum_{i=0}^{m-n} \alpha_i \cdot x_i^{(n)} = \sum_{i=0}^{m-n} \varepsilon_{n+i} \cdot z_{n+i} = \sum_{i=n}^{m} \varepsilon_i \cdot z_i$ we have, using the above, that

$$\left|\sum_{i=n}^{m} \varepsilon_i \cdot z_i\right| \leqslant \varepsilon_n \cdot 2 \cdot C \tag{19.5}$$

Take now $\varepsilon \in \mathbb{R}^+$ then as $\lim_{i \to \infty} \varepsilon_i = 0$ there exist a $N \in \mathbb{N}$ such that $\forall n \geqslant N$ $\varepsilon_n = |\varepsilon_n - 0| < \frac{\varepsilon}{2 \cdot C + 1}$, combining this with [eq: 19.5] gives $|\sum_{i=n}^{m} \varepsilon_i \cdot z_i| < \frac{2 \cdot C}{2 \cdot C + 1} \cdot \varepsilon < \varepsilon$. Hence we have proved that

$$\forall \varepsilon > 0 \text{ there exist a } N \in \mathbb{N} \text{ such that } \forall n \geqslant N \text{ and } m \geqslant n \left|\sum_{i=n}^{m} \varepsilon_i \cdot z_i\right| < \varepsilon$$

As $\langle \mathbb{C}, \|\rangle$ is a Banach space [see corollary: 14.338] we can use [theorem: 14.355] to prove that

$$\sum_{i=0}^{\infty} \varepsilon_i \cdot z_i \text{ converges}$$

2. As $\{\varepsilon_i\}_{i \in \mathbb{N}_0}$ is a decreasing sequence and $\forall i \in \mathbb{N}_0$ $0 \leqslant \varepsilon_i$ it follows from [theorem: 14.317] it follows that $\alpha = \lim_{i \to \infty} \varepsilon_i$ exist. Hence by [theorem: 14.294] it follows that

$$\lim_{i \to \infty} (\varepsilon_i - \alpha) = 0 \tag{19.6}$$

Further as $\sum_{i=0}^{\infty} z_i$ converges it follows that $\lim_{n \to \infty} \sum_{i=0}^{n} z_i$ exist, hence by [theorem: 14.306] there exist a $C \in \mathbb{R}^+$ such that

$$\forall i \in \mathbb{N}_0 \text{ we have that } \left|\sum_{j=0}^{i} z_i\right| \leqslant C \tag{19.7}$$

Using (1) together with [eqs: 19.6, 19.7] proves that

$$\sum_{i=0}^{\infty} (\varepsilon_i - \alpha) \cdot z_i \text{ converges}$$

As by the hypothesis $\sum_{i=0}^{\infty} z_i$ converges it follows from [theorem: 14.359] that

$$\sum_{i=0}^{\infty} \alpha \cdot z_i \text{ converges}$$

Using [theorem: 14.359] again it follows that $\sum_{i=0}^{\infty} ((\varepsilon_i - \alpha) \cdot z_i + \alpha \cdot z_i)$ converges hence

$$\sum_{i=0}^{\infty} \varepsilon_i \cdot z_i \text{ converges}$$

□

Lemma 19.19. *Let $k \in \mathbb{N}_0$, $\{x_i\}_{i \in \{k, \ldots, \infty\}} \subseteq \mathbb{R}^+, \{y_i\}_{i \in \{k, \ldots, \infty\}} \subseteq \mathbb{R}^+$ be such that $\forall i \in \{k, \ldots, \infty\}$ we have $\frac{x_{i+1}}{y_{i+1}} \leqslant \frac{x_i}{y_i}$ then if $\sum_{i=k}^{\infty} y_i$ converges it follows that $\sum_{i=k}^{\infty} x_i$ converges.*

Proof. Take $\alpha = \frac{x_k}{y_k}$ then we have $\forall i \in \{k, \ldots, \infty\}$ that $\frac{x_i}{y_i} \leqslant \frac{x_k}{y_k} = \alpha \underset{0 < y_i}{\Rightarrow} x_i \leqslant \alpha \cdot y_i$ or as $0 < x_i$ we have that $|x_i| \leqslant \alpha \cdot y_i$. As $\sum_{i=k}^{\infty} y_i$ is convergent it follows by [theorem: 14.359] that $\sum_{i=k}^{\infty} \alpha \cdot y_i$ is convergent. Hence using dominant convergence [see theorem: 14.380] it follows that $\sum_{i=k}^{\infty} |x_i|$ converges. Finally, as $\forall i \in \{k, \ldots, \infty\}$ we have $0 < x_i \Rightarrow x_i = |x_i|$, it follows that $\sum_{i=k}^{\infty} x_i$ converges. □

Theorem 19.20. (d'Alembert) *Let $k \in \mathbb{N}_0$, $\{x_i\}_{i \in \{k,\ldots,\infty\}} \subseteq]0,\infty[$ then we have*

1. *If $\alpha = \liminf_{i\to\infty} \frac{x_{i+1}}{x_i}$ exist and $1 < \alpha$ then $\sum_{i=k}^{\infty} x_i$ is not convergent.*
2. *If $\beta = \limsup_{i\to\infty} \frac{x_{i+1}}{x_i}$ exist and $\beta < 1$ then $\sum_{i=k}^{\infty} x_i$ is convergent.*

Proof.

1. If $1 < \alpha$ then $1 < \sup\left(\left\{\inf\left(\left\{\frac{x_{i+1}}{x_i} | i \in \{n,\ldots,\infty\}\right\}\right) | n \in k,\ldots,\infty\right\}\right)$ hence there exist a $n \in \{k,\ldots,n\}$ such that $1 < \inf\left(\left\{\frac{x_{i+1}}{x_i} | i \in \{n,\ldots,\infty\}\right\}\right)$, so $\forall i \in \{n,\ldots,\infty\}$ we have $1 < \frac{x_{i+1}}{x_i}$ or $x_i < x_{i+1}$ hence
$$\forall i \in \{n+1,\ldots,\infty\} \text{ we have } 0 < x_n < x_i \tag{19.8}$$
Assume now that $\sum_{i=k}^{\infty} x_i$ converges then by [theorem: 14.354] $\lim_{i\to\infty} x_i = 0$ so there exist a $N \in \{k,\ldots,\infty\}$ such that $\forall i \geqslant N$ we have that $x_i = |x_i - 0| < x_n$. Hence for $m = \max(n+1, N)$ it follows that $x_n <_{\text{[eq: 19.8]}} x_i < x_n$ leading to the contradiction $x_n < x_n$. Hence $\sum_{i=k}^{\infty} x_i$ does not converges.
2. As $\beta < 1$ it follows that there exist a ρ such that $0 \leqslant \beta < \rho < 1$ or
$$\inf\left(\left\{\sup\left(\left\{\frac{x_{i+1}}{x_i} | i \in \{n,\ldots,\infty\}\right\}\right) | n \in \{k,\ldots,\infty\}\right\}\right) < \rho \tag{19.9}$$
hence there exist a $n \in \{k,\ldots,\infty\}$ such that $\sup\left(\left\{\frac{x_{i+1}}{x_i} | i \in \{n,\ldots,\infty\}\right\}\right) < \rho$ hence
$$\forall i \in \{n,\ldots,\infty\} \text{ we have that } \frac{x_{i+1}}{x_i} < \rho = \frac{\rho^{i+1}}{\rho^i} \tag{19.10}$$
Now as $\rho < 1$ we have by [example: 14.353] that $\sum_{i=1}^{\infty} \rho^i$ is convergent, hence, using [theorem: 14.357], $\sum_{i=n}^{\infty} \rho^i$ is convergent. Using [lemma: 19.19] together with [eqs: 19.9, 19.10] proves then that $\sum_{i=n}^{n} x_i$ is convergent. Finally, by [theorem: 14.357] again, we have that
$$\sum_{i=k}^{\infty} x_i \text{ converges.}$$
□

19.1.3 Definition of exp(z)

We will define the exponential function $\exp(x)$ as $\exp(z) = \sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n$ so we have to look at the convergence domain of the power series $\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n$.

Theorem 19.21. *Let $z \in \mathbb{C}$ then*

1. *$\overline{\mathcal{D}}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right] = \mathbb{C} = \mathcal{D}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right]$ [in other words $\forall z \in \mathbb{C}$ we have that $\sum_{n=0}^{\infty} \frac{1}{n!} \cdot |z|^n$ and $\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n$ converges]*
2. *$\mathcal{R}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right] = \infty$*
3. *$B_{||}\left(0, \mathcal{R}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right]\right) = \overline{\mathcal{D}}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right] = \mathcal{D}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right] = \overline{B_{||}\left(0, \mathcal{R}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right]\right)} = \mathbb{C}$*
4. *If $z = 0$ then $\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n = 1$*

Proof.

1. Let $z \in \mathbb{C}$ then we have either:

   $z = 0$. Then $|z| = 0$ and by [example: 19.4] $\sum_{n=0}^{\infty} \left|\frac{1}{n!}\right| \cdot |z|^n$ converges.

   $z \neq 0$. Then we have $\forall n \in \mathbb{N}_0$ that
$$0 < \left|\frac{1}{n!} \cdot z^n\right| \text{ and } \frac{\left|\frac{1}{(n+1)!} \cdot z^{n+1}\right|}{\left|\frac{1}{n!} \cdot z^n\right|} = \frac{z}{n+1} \tag{19.11}$$
   Using a consequence of the Archimedean property of the real numbers [see theorem: 10.30] there exist a $N \in \mathbb{N}_0$ such that $2 \cdot |z| < N$ so that $\forall n \in \{N,\ldots,\infty\}$ we have $2 \cdot |z| < N \leqslant n+1$ hence $\frac{|z|}{n+1} < \frac{1}{2}$. So
$$\forall n \in \{N,\ldots,\infty\} \text{ we have that } 0 < \frac{|z|}{n+1} \leqslant \frac{1}{2} \tag{19.12}$$
   and further
$$\forall n \in \{0,\ldots,\infty\} \text{ we have } 0 < \frac{|z|}{n+1} \leqslant \max\left(\frac{1}{2}, \max\left(\frac{|z|}{n+1} | n \in \{1,\ldots,N-1\}\right)\right) \tag{19.13}$$

So $\forall k \in \{0,\dots,\infty\}$ the set $\left\{\frac{|z|}{n+1} | n \in \{0,\dots,\infty\}\right\}$ is bounded above hence by the conditional completeness of $\mathbb{R}$ [see theorem: 10.18] it follows that

$$\forall k \in \{0,\dots,\infty\}\ 0 \leqslant \sup\left(\left\{\frac{|z|}{n+1} | n \in \{k,\dots,\infty\}\right\}\right) \tag{19.14}$$

In particular we have using [eq: 19.12] that

$$\forall k \in \{N,\dots,\infty\}\ 0 \leqslant \sup\left(\left\{\frac{|z|}{n+1} | n \in \{k,\dots,\infty\}\right\}\right) \leqslant \frac{1}{2} \tag{19.15}$$

Using [eq: 19.14] it follows that $\left\{\sup\left(\left\{\frac{|z|}{n+1} | n \in \{k,\dots,\infty\}\right\}\right) | n \in \{0,\dots,\infty\}\right\}$ is bounded below by 0 so that

$$\inf\left(\left\{\sup\left(\left\{\frac{|z|}{n+1} | n \in \{k,\dots,\infty\}\right\}\right) | n \in \{0,\dots,\infty\}\right\}\right) \text{ exist}$$

Further using [eq: 19.15] it follows that $\left\{\sup\left(\left\{\frac{|z|}{n+1} | n \in \{k,\dots,\infty\}\right\}\right) | n \in \{N,\dots,\infty\}\right\}$ is bounded below by 0 but also above by $\frac{1}{2}$ so that

$$\inf\left(\left\{\sup\left(\left\{\frac{|z|}{n+1} | n \in \{k,\dots,\infty\}\right\}\right) | n \in \{N,\dots,\infty\}\right\}\right) \leqslant \frac{1}{2}$$

As $\left\{\sup\left(\left\{\frac{|z|}{n+1} | n \in \{k,\dots,\infty\}\right\}\right) | n \in \{N,\dots,\infty\}\right\} \subseteq \left\{\sup\left(\left\{\frac{|z|}{n+1} | n \in \{k,\dots,\infty\}\right\}\right) | n \in \{0,\dots,\infty\}\right\}$ it follows that

$$\inf\left(\left\{\sup\left(\left\{\frac{|z|}{n+1} | n \in \{k,\dots,\infty\}\right\}\right) | n \in \{0,\dots,\infty\}\right\}\right) \leqslant \frac{1}{2}$$

or

$$\limsup_{n\to\infty} \frac{|z|}{n+1} \leqslant \frac{1}{2} < 1$$

Using then [eq: 19.11] it follows that

$$\limsup_{n\to\infty} \frac{\left|\frac{1}{(n+1)!} \cdot z^{n+1}\right|}{\left|\frac{1}{n!} \cdot z^{n}\right|} < 1 \text{ and } \left\{\frac{\left|\frac{1}{(n+1)!} \cdot z^{n+1}\right|}{\left|\frac{1}{n!} \cdot z^{n}\right|}\right\}_{n\in\mathbb{N}_0} \subseteq]0,\infty[$$

Applying then d'Alembert [see theorem: 19.20] proves that

$$\sum_{n=0}^{\infty} \frac{|z|^n}{|n!|} \text{ converges}$$

Hence $\mathbb{C} \subseteq \overline{\mathcal{D}}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right] \subseteq \mathcal{D}\left(\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right) \subseteq \mathbb{C}$ or

$$\overline{\mathcal{D}}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right] = \mathbb{C} = \mathcal{D}\left(\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right)$$

2. Combining (1) with [theorem: 19.10] results in $\mathcal{R}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right] = \infty$.
3. As by (2) $\mathcal{R}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right] = \infty$ we have by definition [see definition: 19.11] that $B_{||}\left(0, \mathcal{R}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right]\right) = \overline{B_{||}\left(0, \mathcal{R}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right]\right)} = \mathbb{C}$. Hence combining this with (1) gives

$$B_{||}\left(0, \mathcal{R}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right]\right) = \overline{\mathcal{D}}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right] = \mathcal{D}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right] = \overline{B_{||}\left(0, \mathcal{R}\left[\sum_{n=0}^{\infty} \frac{1}{n!} \cdot z^n\right]\right)}$$

4. If $z = 0$ then by [example: 19.4] we have that $\sum_{n=0}^{\infty} \frac{z^n}{n!} = \frac{1}{0!} = 1$ □

As $\mathcal{D}\left[\sum_{n=0}^{\infty} \frac{z^n}{n!}\right] = \mathbb{C}$ we can define a function that maps every complex number z to $\sum_{n=0}^{\infty} \frac{z^n}{n!}$ this function is the exponential function.

Definition 19.22. (Exponential function) *The exponential function* $\exp: \mathbb{C} \to \mathbb{C}$ *is defined by*

$$\exp: \mathbb{C} \to \mathbb{C} \text{ where } \exp(x) = \sum_{n=0}^{\infty} \frac{z^n}{n!}$$

***Note* 19.23.** *Using the definition of the power function [see definition: 19.15] the exponential function is a example of a power function, in fact* $\exp = \sum_{n=0}^{\infty} \frac{1}{n!} \cdot (*)^n$.

19.1.4 Differentiation of the exponential function

Given a power series $\sum_{n=0}^{\infty} a_n \cdot z^n$ with $0 < \mathcal{R}[\sum_{n=0}^{\infty} a_n \cdot z^n]$ we have by [theorem: 19.13] that

$$0 \in B_{||}\left(0, \mathcal{R}\left[\sum_{n=0}^{\infty} a_n \cdot z^n\right]\right) \subseteq \mathcal{D}\left(\left[\sum_{n=0}^{\infty} a_n \cdot z^n\right]\right) = \mathrm{dom}\left(\sum_{n=0}^{\infty} a_n \cdot (*)^n\right)$$

it make sense to talk about differentiation of the power function $(\sum_{n=0}^{\infty} a_n \cdot (*)^n)_{|B_{||}(0,\mathcal{R}[\sum_{n=0}^{\infty} a_n \cdot z^n])}$ at 0. If we would naively extend differentiation of a finite sum of a function then we would have

$$\begin{aligned} D\left(\sum_{n=0}^{\infty} a_n \cdot (*)^n\right) &= \sum_{n=0}^{\infty} a_n \cdot D((*)^n) \\ &= \sum_{n=0}^{\infty} a_n \cdot n \cdot (*)^{n-1} \\ &= a_0 \cdot 0 \cdot (*)^0 + \sum_{n=1}^{\infty} a_n \cdot n \cdot (*)^{n-1} \\ &= \sum_{n=1}^{\infty} a_n \cdot n \cdot (*)^{n-1} \\ &= \sum_{n=0}^{\infty} a_{n+1} \cdot (n+1) \cdot (*)^n \end{aligned}$$

which is again a power function. Of course we must ensure that $\sum_{n=0}^{\infty} a_{n+1} \cdot (n+1) \cdot z^n$ is a convergence power series and prove that we can differentiate under a infinite sum which is actually a limit of partial sums. Nevertheless $\sum_{n=0}^{\infty} a_{n+1} \cdot (n+1) \cdot z^n$ is a power series.

Definition 19.24. (Derived Power Series) *Let* $\sum_{n=0}^{\infty} a_n \cdot z^n$ *be a power series then the* ***derived power series*** *of* $\sum_{n=0}^{\infty} a_n \cdot z^n$ *is the series* $\sum_{n=0}^{\infty} (n+1) \cdot a_{n+1} \cdot z^n$.

We have the following usefully properties of the derived power series of a power series.

Lemma 19.25. *Let* $\sum_{n=0}^{\infty} a_n \cdot z^n$ *be a power series then*

1. $\mathcal{D}[\sum_{n=0}^{\infty} (n+1) \cdot a_{n+1} \cdot z^n] \subseteq \mathcal{D}[\sum_{n=0}^{\infty} a_n \cdot z^n]$
2. $\mathcal{R}[\sum_{n=0}^{\infty} (n+1) \cdot a_{n+1} \cdot z^n] = \mathcal{R}[\sum_{n=0}^{\infty} a_n \cdot z^n]$

Proof.

1. Let $z \in \mathcal{D}[\sum_{n=0}^{\infty} (n+1) \cdot a_{n+1} \cdot z^n]$ then by definition $\sum_{n=0}^{\infty} (n+1) \cdot a_{n+1} \cdot z^n$ is convergent. Given $\left\{\frac{1}{n+1}\right\}_{n \in \mathbb{N}_0} \subseteq \mathbb{R}$ we have $\forall n \in \mathbb{N}_0$ that $\frac{1}{(n+1)+1} < \frac{1}{n+1}$ so by Abel Dirichlet [theorem: 19.18 (2)] we have that $\sum_{n=0}^{\infty} \frac{1}{n+1} \cdot (n+1) \cdot a_{n+1} \cdot z^n$ is convergent, hence
$$\sum_{n=0}^{\infty} a_{n+1} \cdot z^n \text{ is convergent}$$
Using [theorem: 14.359] on the above proves that $\sum_{n=0}^{\infty} z \cdot a_{n+1} \cdot z^n$ is convergent, hence
$$\sum_{n=0}^{\infty} a_{n+1} \cdot z^{n+1} \text{ is convergent}$$
Using then [theorem: 14.356] it follows that
$$\sum_{n=0}^{\infty} a_n \cdot z^n \text{ is convergent}$$
hence $z \in \mathcal{D}[\sum_{n=0}^{\infty} a_n \cdot z^n]$. So we have that
$$\mathcal{D}\left[\sum_{n=0}^{\infty} (n+1) \cdot a_{n+1} \cdot z^n\right] \subseteq \mathcal{D}\left[\sum_{n=0}^{\infty} a_n \cdot z^n\right]$$

2. Using [theorem: 19.13] we have

$$B_{||}\left(0,\mathcal{R}\left[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right]\right)\subseteq\overline{\mathcal{D}}\left[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right]\subseteq\mathcal{D}\left[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right]$$

by (1) we have

$$\mathcal{D}\left[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right]\subseteq\mathcal{D}\left[\sum_{n=0}^{\infty}a_n\cdot z^n\right]$$

and by [theorem: 19.13] again we have

$$\mathcal{D}\left[\sum_{n=0}^{\infty}a_n\cdot z^n\right]\subseteq\overline{B_{||}\left(0,\mathcal{R}\left[\sum_{n=0}^{\infty}a_n\cdot z^n\right]\right)}$$

it follows that

$$B_{||}\left(0,\mathcal{R}\left[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right]\right)\subseteq\overline{B_{||}\left(0,\mathcal{R}\left[\sum_{n=0}^{\infty}a_n\cdot z^n\right]\right)}$$

so that by [theorem: 19.14⟨⟩ we have that

$$\mathcal{R}\left[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right]\leqslant\mathcal{R}\left[\sum_{n=0}^{\infty}a_n\cdot z^n\right]\tag{19.16}$$

Let $z\in\mathbb{C}$ such that $0<|z|<\mathcal{R}[\sum_{n=0}^{\infty}a_n\cdot z^n]$ then there exist a $\rho\in\mathbb{R}$ such that

$$0<|z|<\rho<\mathcal{R}\left[\sum_{n=0}^{\infty}a_n\cdot z^n\right]$$

By the above $\rho\in B_{||}(0,\mathcal{R}[\sum_{n=0}^{\infty}a_n\cdot z^n])\subseteq_{\text{[theorem: 19.13]}}\mathcal{D}[\sum_{n=0}^{\infty}a_n\cdot z^n]$ so that

$$\sum_{n=0}^{\infty}a_n\cdot\rho^n\text{ is convergent}$$

So, by [theorem: 14.354], there exist a $K\in\mathbb{R}^+$ such that

$$\forall n\in\mathbb{N}_0\ |a_n|\cdot\rho^n=|a_n\cdot\rho^n|\leqslant K\tag{19.17}$$

Now for $n\in\mathbb{N}_0$ we have that

$$\begin{aligned}|(n+1)\cdot a_{n+1}\cdot z^n| &= (n+1)\cdot|a_{n+1}|\cdot z^n\\ &= \frac{n+1}{\rho}\cdot\left(\frac{|z|}{\rho}\right)^n\cdot a_{n+1}\cdot\rho^{n+1}\\ &\leqslant_{\text{[eq: 19.17]}} K\cdot\frac{n+1}{\rho}\cdot\left(\frac{|z|}{\rho}\right)^n\\ &= K\cdot\frac{n+1}{\rho}\cdot q^n\end{aligned}$$

where $q=\frac{|z|}{\rho}<1$. To summarize we have proved that

$$\forall n\in\mathbb{N}_0\vDash|(n+1)\cdot a_{n+1}\cdot z^n|\leqslant K\cdot\frac{n+1}{\rho}\cdot q^n\text{ where }0<q<1\tag{19.18}$$

Now for the power series $\sum_{n=0}^{\infty}(n+1)\cdot q^n$ we have that $\forall n\in\mathbb{N}_0\ \frac{((n+1)+1)\cdot q^{n+1}}{(n+1)\cdot q^n}=\frac{n+2}{n+1}\cdot q$. By [example: 14.298] $\lim_{n\to\infty}\frac{n+2}{n+1}=1$ so that by [theorem: 14.302] $\lim_{n\to\infty}\left(\frac{n+2}{n+1}\cdot q\right)=q<1$, using [theorem: 14.321] it follows that $\limsup_{n\to\infty}\left(\frac{n+2}{n+1}\cdot q\right)$ exist and $\limsup_{n\to\infty}\left(\frac{n+2}{n+1}\cdot q\right)<1$. Hence we can use d'Alembert [theorem: 19.20] proving that $\sum_{n=0}^{\infty}(n+1)\cdot q^n$ converges. Using then [theorem: 14.359] together with [eq: 19.18] it follows that $\sum_{n=0}^{\infty}K\cdot\frac{n+1}{\rho}\cdot q^n$ is convergent. Using then dominant convergence [see theorem: 14.377] we conclude that $\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n$ converges, hence $z\in\mathcal{D}[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n]$. To summarize

$$\forall z\in\mathbb{C}\text{ with }0<|z|<\mathcal{R}\left[\sum_{n=0}^{\infty}a_n\cdot z^n\right]\text{ we have that }z\in\mathcal{D}\left[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right]$$

As also $0 \in \mathcal{D}[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n]$ it follows that

$$B_{||}\left(0,\mathcal{R}\left[\sum_{n=0}^{\infty} a_n\cdot z^n\right]\right)\subseteq \mathcal{D}\left[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right]\subseteq \overline{B_{||}\left(0,\mathcal{R}\left[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right]\right)}$$

So by [theorem: 19.14] it follows that $\mathcal{R}[\sum_{n=0}^{\infty} a_n\cdot z^n]\leqslant \mathcal{R}[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n]$ which together with [eq: 19.16] proves that

$$\mathcal{R}\left[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right]=\mathcal{R}\left[\sum_{n=0}^{\infty} a_n\cdot z^n\right] \qquad \square$$

Hence we have found the conditions where a derived power series converges. We prove now that the derived power series of a power series is indeed its derivative.

Theorem 19.26. *Let $\sum_{n=0}^{\infty} a_n\cdot z^n$ be a power series with $0<\mathcal{R}[\sum_{n=0}^{\infty} a_n\cdot z^n]$ then we have*

1. *$\forall z\in B_{||}(0,\mathcal{R}[\sum_{n=0}^{\infty} a_n\cdot z^n])$ we have that $\sum_{n=0}^{\infty} a_n\cdot z^n$ and $\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n$ converges*
2. *$\forall z\in B_{||}(0,\mathcal{R}[\sum_{n=0}^{\infty} a_n\cdot z^n])$ the function*

$$\sum_{n=0}^{\infty} a_n\cdot(*)^n\colon B_{||}\left(0,\mathcal{R}\left[\sum_{n=0}^{\infty} a_n\cdot z^n\right]\right)\to\mathbb{C} \text{ defined by } \left(\sum_{n=0}^{\infty} a_n\cdot(*)^n\right)(z)=\sum_{n=0}^{\infty} a_n\cdot z^n$$

has a derivative $(\sum_{n=0}^{\infty} a_n\cdot(*)^n)'_z$ at z and

$$\left(\sum_{n=0}^{\infty} a_n\cdot(*)^n\right)'_z=\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n$$

Proof.

1. As $\mathcal{R}[\sum_{n=0}^{\infty} a_n\cdot z^n]\underset{\text{[theorem: 19.25]}}{=}\mathcal{R}[\sum_{n=0}(n+1)\cdot a_{n+1}\cdot z^n]$ it follows that

$$B_{||}\left(0,\mathcal{R}\left[\sum_{n=0}^{\infty} a_n\cdot z^n\right]\right)=B_{||}\left(0,\mathcal{R}\left[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right]\right)\subseteq\mathcal{D}\left[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right]$$

$$B_{||}\left(0,\mathcal{R}\left[\sum_{n=0}^{\infty} a_n\cdot z^n\right]\right)\subseteq\mathcal{D}\left[\sum_{n=0}^{\infty} a_n\cdot z^n\right]$$

So that $\forall z\in B_{||}(0,\mathcal{R}[\sum_{n=0}^{\infty} a_n\cdot z^n])$ we have that $\sum_{n=0}^{\infty} a_n\cdot z^n$ and $\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n$ converges.

2. Define $f=\sum_{n=0}^{\infty} a_n\cdot(*)^n$ and $g=\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n$. Given $z\in B_{||}(0,\mathcal{R}[\sum_{n=0}^{\infty} a_n\cdot z^n])$ take $\varepsilon\in\mathbb{R}^+$. As $|z|<\mathcal{R}[\sum_{n=0}^{\infty} a_n\cdot z^n]$ there exist a $\delta'\in\mathbb{R}^+$ such that $|z|<\delta'<\mathcal{R}[\sum_{n=0}^{\infty} a_n\cdot z^n]$, further, as $B_{||}(0,\mathcal{R}[\sum_{n=0}^{\infty} a_n\cdot z^n])$ is open there exist a $\delta''\in\mathbb{R}^+$ such that $B_{||}(z,\delta'')\subseteq B_{||}(0,\mathcal{R}[\sum_{n=0}^{\infty} a_n\cdot z^n])$. Hence if we take $\delta=\min(\delta',\delta'')$ then we have

$$|z|<\delta<\mathcal{R}\left[\sum_{n=0}^{\infty} a_n\cdot z^n\right] \text{ and } z\in B_{||}(z,\delta)\subseteq B_{||}\left(0,\mathcal{R}\left[\sum_{n=0}^{\infty} a_n\cdot z^n\right]\right)$$

Let $h\in\mathbb{C}$ with $0<|h|<\min(\delta,\delta-|z|)$ then $|h+z|\leqslant|h|+|z|<\delta-|z|+|z|=\delta<\delta''$ so that $h+z\in B_{||}(z,\delta'')\subseteq B_{||}(0,\mathcal{R}[\sum_{n=0}^{\infty} a_n\cdot z^n])$ or $h\in(B_{||}(0,\mathcal{R}[\sum_{n=0}^{\infty} a_n\cdot z^n]))_z$. Then we have

$$\begin{aligned}
\frac{f(z+h)-f(z)}{h}-g(z) &= \\
\frac{1}{h}\cdot(f(z+h)-g(z)-h\cdot g(z)) &= \\
\frac{1}{h}\cdot\left(\sum_{n=0}^{\infty} a_n\cdot(z+h)^n-\sum_{n=0}^{\infty} a_n\cdot z^n-h\cdot\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) &\underset{\text{[theorem: 17.24]}}{=} \\
\frac{1}{h}\cdot\left(\sum_{n=0}^{\infty} a_n\cdot\left(\sum_{i=0}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-\sum_{n=0}^{\infty} a_n\cdot z^n-h\cdot\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) &= \\
\frac{1}{h}\cdot\left(\sum_{n=0}^{\infty} a_n\cdot\left(\left(\sum_{i=0}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-z^n\right)-h\cdot\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) &=
\end{aligned}$$

$$\frac{1}{h}\cdot\left(\sum_{n=0}^{\infty} a_n\cdot\left(\left(\sum_{i=0}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-z^n\right)-h\cdot\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) \underset{\text{[theorem: 14.357]}}{=}$$

$$\frac{1}{h}\cdot\left(a_0\cdot\left(\left(\sum_{i=0}^{0}\binom{0}{i}\cdot h^i\cdot z^{0-i}\right)-z^0\right)+\sum_{n=1}^{\infty} a_n\cdot\left(\left(\sum_{i=0}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-z^n\right)-h\cdot\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) \underset{\text{[theorem: 14.357]}}{=}$$

$$\frac{1}{h}\cdot\left(a_0\cdot\left(\binom{0}{0}\cdot h^0\cdot z^{0-0}-z^0\right)+\sum_{n=1}^{\infty} a_n\cdot\left(\left(\sum_{i=0}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-z^n\right)-h\cdot\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) =$$

$$\frac{1}{h}\cdot\left(a_0\cdot 0+\sum_{n=1}^{\infty} a_n\cdot\left(\left(\sum_{i=0}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-z^n\right)-h\cdot\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) =$$

$$\frac{1}{h}\cdot\left(\sum_{n=1}^{\infty} a_n\cdot\left(\left(\sum_{i=0}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-z^n\right)-h\cdot\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) =$$

$$\frac{1}{h}\cdot\left(\sum_{n=1}^{\infty} a_n\cdot\left(\left(\sum_{i=0}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-\binom{0}{0}\cdot h^0 z^{n-0}\right)-h\cdot\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) =$$

$$\frac{1}{h}\cdot\left(\sum_{n=1}^{\infty} a_n\cdot\left(\sum_{i=1}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-h\cdot\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) \underset{\text{[theorem: 14.357]}}{=}$$

$$\frac{1}{h}\cdot\left(a_1\cdot\left(\sum_{i=1}^{1}\binom{1}{i}\cdot h^i\cdot z^{1-i}\right)+\sum_{n=2}^{\infty} a_n\cdot\left(\sum_{i=1}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-h\cdot\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) =$$

$$\frac{1}{h}\cdot\left(a_1\cdot\left(\binom{1}{1}\cdot h^1\cdot z^{1-1}\right)+\sum_{n=2}^{\infty} a_n\cdot\left(\sum_{i=1}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-h\cdot\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) =$$

$$\frac{1}{h}\cdot\left(a_1\cdot h+\sum_{n=2}^{\infty} a_n\cdot\left(\sum_{i=1}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-h\cdot\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) \underset{\text{[theorem: 14.357]}}{=}$$

$$\frac{1}{h}\cdot\left(a_1\cdot h+\sum_{n=2}^{\infty} a_n\cdot\left(\sum_{i=1}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-h\cdot(0+1)\cdot a_{0+1}\cdot z^0-h\cdot\sum_{n=1}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) =$$

$$\frac{1}{h}\cdot\left(a_1\cdot h+\sum_{n=2}^{\infty} a_n\cdot\left(\sum_{i=1}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-h\cdot a_1-h\cdot\sum_{n=1}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) =$$

$$\frac{1}{h}\cdot\left(\sum_{n=2}^{\infty} a_n\cdot\left(\sum_{i=1}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-h\cdot\sum_{n=1}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right) \underset{\text{[theorem: 14.356]}}{=}$$

$$\frac{1}{h}\cdot\left(\sum_{n=2}^{\infty} a_n\cdot\left(\sum_{i=1}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-h\cdot\sum_{n=2}^{\infty} n\cdot a_n\cdot z^{n-1}\right) \underset{\text{[theorem: 14.359]}}{=}$$

$$\frac{1}{h}\cdot\left(\sum_{n=2}^{\infty} a_n\cdot\left(\sum_{i=1}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-\sum_{n=2}^{\infty} n\cdot a_n\cdot h\cdot z^{n-1}\right) \underset{\text{[theorem: 14.359]}}{=}$$

$$\frac{1}{h}\cdot\left(\sum_{n=2}^{\infty}\left(a_n\cdot\left(\sum_{i=1}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-n\cdot a_n\cdot h\cdot z^{n-1}\right)\right) =$$

$$\frac{1}{h}\cdot\left(\sum_{n=2}^{\infty}\left(a_n\cdot\left(\sum_{i=1}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)-\binom{n}{1}\cdot a_n\cdot h^1\cdot z^{n-1}\right)\right) =$$

$$\frac{1}{h}\cdot\left(\sum_{n=2}^{\infty} a_n\cdot\left(\sum_{i=2}^{n}\binom{n}{i}\cdot h^i\cdot z^{n-i}\right)\right) \underset{\text{[theorem: 14.359]}}{=}$$

$$\sum_{n=2}^{\infty} a_n\cdot\left(\sum_{i=2}^{n}\binom{n}{i}\cdot h^{i-1}\cdot z^{n-i}\right)$$

To summarize the above lengthy computation we have proved that

$$\frac{f(z+h)-f(z)}{h}-g(z)=\sum_{n=2}^{\infty}a_n\cdot\left(\sum_{i=2}^{n}\binom{n}{i}\cdot h^{i-1}\cdot z^{n-i}\right) \tag{19.19}$$

Now let $n\in\{2,\ldots,\infty\}$ then we have

$$\begin{aligned}
\left|\sum_{i=2}^{n}\binom{n}{i}\cdot h^{i-1}\cdot z^{n-i}\right| &= \\
|h|\cdot\left|\sum_{i=2}^{n}\binom{n}{i}\cdot h^{i-2}\cdot z^{n-i}\right| &\leqslant \\
|h|\cdot\sum_{i=2}^{n}\binom{n}{i}\cdot |h|^{i-2}\cdot |z|^{n-i} &= \\
|h|\cdot\sum_{i=2}^{n}\frac{n!}{(n-i)!\cdot i!}\cdot |h|^{i-2}\cdot |z|^{n-i} &\underset{n,i\geqslant 2}{=} \\
|h|\cdot\sum_{i=2}^{n}\frac{n\cdot(n-1)\cdot(n-2)!}{(n-i)!\cdot i\cdot(i-1)\cdot(i-2)!}\cdot |h|^{i-2}\cdot |z|^{n-i} &\leqslant_{i\geqslant 2\Rightarrow i\cdot(i-1)\geqslant 1} \\
|h|\cdot\sum_{i=2}^{n}\frac{n\cdot(n-1)\cdot(n-2)!}{(n-i)!\cdot(i-2)!}\cdot |h|^{i-2}\cdot |z|^{n-i} &= \\
|h|\cdot n\cdot(n-1)\cdot\sum_{i=2}^{n}\frac{(n-2)!}{(n-i)!\cdot(i-2)!}\cdot |h|^{i-2}\cdot |z|^{n-i} &= \\
|h|\cdot n\cdot(n-1)\cdot\sum_{i=2}^{n}\frac{(n-2)!}{((n-2)-(i-2))!\cdot(i-2)!}\cdot |h|^{i-2}\cdot |z|^{(n-2)-(i-2)} &= \\
|h|\cdot n\cdot(n-1)\cdot\sum_{i=0}^{n-2}\frac{(n-2)!}{((n-2)-i)!\cdot i!}\cdot |h|^{i}\cdot |z|^{(n-2)-i} &\underset{\text{[theorem: 17.24]}}{=} \\
|h|\cdot n\cdot(n-1)\cdot(|z|+|h|)^{n-2} &
\end{aligned}$$

proving

$$\sum_{i=2}^{n}\binom{n}{i}\cdot |h|^{i-2}\cdot |z|^{n-i}\leqslant |h|\cdot n\cdot(n-1)\cdot(|z|+|h|)^{n-2} \tag{19.20}$$

As

$$\begin{aligned}
|z|+|h| &< \delta-|z|+|z| \\
&= \delta \\
&< \mathcal{R}\left[\sum_{n=0}^{\infty}a_n\cdot z^n\right] \\
&\underset{\text{[theorem: 19.25]}}{=} \mathcal{R}\left[\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n\right] \\
&\underset{\text{[theorem: 19.25]}}{=} \mathcal{R}\left[\sum_{n=0}^{\infty}((n+1)+1)\cdot(n+1)\cdot a_{(n+1)+1}\cdot z^n\right] \\
&= \mathcal{R}\left[\sum_{n=0}^{\infty}(n+2)\cdot(n+1)\cdot a_{n+2}\cdot z^n\right]
\end{aligned}$$

so that $|z|+|h|\in B_{||}(\mathcal{R}[\sum_{n=0}^{\infty}(n+2)\cdot(n+1)\cdot a_{n+2}\cdot z^n])\subseteq\overline{\mathcal{D}}[\sum_{n=0}^{\infty}(n+2)\cdot(n+1)\cdot a_{n+2}\cdot z^n]$. Hence we have that $\sum_{n=0}^{\infty}(n+2)\cdot(n+1)\cdot|a_{n+2}|\cdot(|z|+|h|)^n$ converges, using [theorem: 14.356] it follows that $\sum_{n=2}^{\infty}n\cdot(n-1)\cdot|a_n|\cdot(|z|+|h|)^{n-2}$ converges. Further using [theorem: 14.359] it follows that $\sum_{n=0}^{\infty}|h|\cdot n\cdot(n-1)\cdot|a_n|\cdot(|z|+|h|)^{n-2}$ converges. As by [eq: 19.20]

$$\sum_{i=2}^{n}\binom{n}{i}\cdot |h|^{i-2}\cdot |z|^{n-i}\leqslant |h|\cdot n\cdot(n-1)\cdot(|z|+|h|)^{n-2}$$

we can use dominant convergence [see theorem: 14.377] proving that

$$\sum_{n=2}^{\infty}\left(\sum_{i=2}^{n}\binom{n}{i}\cdot|h|^{i-2}\cdot|z|^{n-i}\right)$$

converges and that

$$\left|\sum_{n=2}^{\infty}\left(\sum_{i=2}^{n}\binom{n}{i}\cdot|h|^{i-2}\cdot|z|^{n-i}\right)\right|\leqslant\sum_{n=0}^{\infty}|h|\cdot n\cdot(n-1)\cdot|a_n|\cdot(|z|+|h|)^{n-2}$$

Hence we have

$$\begin{aligned}\left|\frac{f(z+h)-f(z)}{h}-g(z)\right| &\underset{\text{[eq: 19.19]}}{=} \left|\sum_{n=2}^{\infty}a_n\cdot\left(\sum_{i=2}^{n}\binom{n}{i}\cdot h^{i-1}\cdot z^{n-i}\right)\right|\\ &\leqslant \sum_{n=0}^{\infty}|h|\cdot n\cdot(n-1)\cdot|a_n|\cdot(|z|+|h|)^{n-2}\\ &\underset{\text{[theorem: 14.359}}{=} |h|\cdot\sum_{n=0}^{\infty}|h|\cdot n\cdot(n-1)\cdot|a_n|\cdot(|z|+|h|)^{n-2}\end{aligned}$$

Take now $\delta_\varepsilon=\min\left(\delta,\frac{\varepsilon}{1+\sum_{n=0}^{\infty}|h|\cdot n\cdot(n-1)\cdot|a_n|\cdot(|z|+|h|)^{n-2}}\right)$ then if $0<|h|<\delta_\varepsilon$ it follows that

$$\left|\frac{f(z+h)-f(z)}{h}-g(z)\right|<\varepsilon$$

which proves that

$$f'_z \text{ exist and } f'_z=g(z)$$

Using the definition of f and g we have finally that $(\sum_{n=0}^{\infty}a_n\cdot(*)^n)'_z$ exist and

$$\left(\sum_{n=0}^{\infty}a_n\cdot(*)^n\right)'_z=\sum_{n=0}^{\infty}(n+1)\cdot a_{n+1}\cdot z^n$$ □

We can use the above theorem to prove that the exponential function has a derivative at every complex number.

Theorem 19.27. *$\forall z\in\mathbb{C}$ the exponential function*

$$\exp:\mathbb{C}\to\mathbb{C} \text{ defined by } \exp(z)=\sum_{n=0}^{\infty}\frac{z^n}{n!}$$

or

$$\exp=\sum_{n=0}^{\infty}\frac{1}{n!}\cdot(*)^n$$

has a derivative $\exp'_z$ where

$$\exp'_z=\exp(z)$$

In other words if we define $\exp'$ by

$$\exp':\mathbb{C}\to\mathbb{C}\text{ by }\exp'(x)=\exp'_x$$

then

$$\exp'=\exp$$

Proof. Using [theorem: 19.21] it follows that $B_{||}\left(0, \mathcal{D}\left[\sum_{n=0}^{\infty} \frac{z^n}{n!}\right]\right) = \mathbb{C}$ then by the previous theorem [theorem: 19.26] we have that $\forall z \in \mathbb{C}$ $\left(\sum_{n=0}^{\infty} \frac{1}{n!} \cdot (*)^n\right)'_z$ exist and

$$\exp'_z = \left(\sum_{n=0}^{\infty} \frac{1}{n!} \cdot (*)^n\right)'_z = \sum_{n=0}^{\infty} \frac{n+1}{(n+1)!} \cdot z^n = \sum_{n=0}^{\infty} \frac{z^n}{n!} = \left(\sum_{n=0}^{\infty} \frac{(*)^n}{n!}\right)(z) = \exp(z)$$ □

A direct consequence of the above is that the exponential function is continuous.

Theorem 19.28. *For* $\exp: \mathbb{C} \to \mathbb{C}$ *we have:*

1. $\exp$ *is continuous*
2. $\forall z \in \mathbb{C}$ *we have* $\forall n \in \mathbb{N}$ *that* $\exp$ *has a* n*-th derivative at* z *and* $\exp_z^{(n)} = \exp(z)$

Proof.

1. As $\forall z \in \mathbb{C}$ $\exp'_z$ exist it follows from [theorem: 16.32] that exp is differentiable at z, hence, using [theorem: 16.31], exp is continuous at x.
2. The prove is easily done by induction, so let $z \in \mathbb{C}$ and define

$$S_z = \left\{n \in S | \exp_z^{(n)} \text{ exist and } \exp_z^{(n)} = \exp(z)\right\}$$

then we have:

$1 \in S$. As $\exp'_z$ exist and $\exp_z^{(1)} = \exp'_z = \exp(z)$ we have that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. As $n \in S$ it follows that $\forall z \in \mathbb{C}$ $\exp_z^{(n)}$ exist and $\exp_z^{(n)} = \exp(z)$ so that the function

$$\exp^{(n)}: \mathbb{C} \to \mathbb{C} \ \exp^{(n)}(z) = \exp_z^n$$

is equal to $\exp: \mathbb{C} \to \mathbb{C}$, hence $\exp^{(n)} = \exp$. Let $z \in \mathbb{C}$ then as $\exp'_z$ exist and $\exp'_z = \exp(z)$ it follows by definition that $\exp_z^{(n+1)}$ exist and that

$$\exp_z^{(n+1)} = (\exp^{(n)})'_z = \exp'_z = \exp(z)$$

So it follows that $n+1 \in S$. □

19.1.5 Properties of the exponential function

Next we show that the exponential behaves a lot like a power of a number. This motivates the common notation to write $\exp(z)$ as e^z. First we need some theorems about series.

Theorem 19.29. (Mertens) *Let* $\sum_{i=0}^{\infty} a_i$ *be a absolute convergent series in* $\mathbb{C}$ *and* $\sum_{i=0}^{\infty} b_i$ *a convergent series in* $\mathbb{C}$*. If* $\{c_i\}_{i \in \mathbb{N}_0} \subseteq \mathbb{C}$ *is defined by* $c_i = \sum_{j=0}^{i} a_j \cdot b_{i-j}$ *them* $\sum_{i=0}^{\infty} c_i$ *converges and*

$$\sum_{i=0}^{\infty} c_i = \left(\sum_{i=0}^{\infty} a_i\right) \cdot \left(\sum_{i=0}^{\infty} b_i\right)$$

Proof. Let $A = \sum_{i=0}^{\infty} a_i$ and $B = \sum_{i=0}^{\infty} b_i$. We prove now by induction that

$$\forall n \in \mathbb{N}_0 \sum_{i=0}^{n} c_i = \sum_{i=0}^{n} a_i \cdot \left(\sum_{j=0}^{n-i} b_j\right) \tag{19.21}$$

Proof. Let $S = \{n \in \mathbb{N}_0 | \sum_{i=0}^{n} c_i = \sum_{i=0}^{n} a_i \cdot (\sum_{j=0}^{n-i} b_j)\}$ then we have:

$0 \in S$. $\sum_{i=0}^{0} c_i = c_0 = \sum_{j=0}^{0} a_j \cdot b_{0-j} = a_0 \cdot b_0 = \sum_{i=0}^{0} a_i \cdot b_0 = \sum_{i=0}^{0} a_i \cdot (\sum_{j=0}^{o-i} b_j)$ proving that $0 \in S$.

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$**.** Then

$$\begin{aligned}
\sum_{i=0}^{(n+1)} a_i \cdot \left(\sum_{j=0}^{(n+1)-i} b_j \right) &= \\
a_{n+1} \cdot \sum_{j=0}^{(n+1)-(n+1)} b_j + \sum_{i=0}^{n} a_i \cdot \left(\sum_{j=0}^{(n+1)-i} b_j \right) &= \\
a_{n+1} \cdot b_0 + \sum_{i=0}^{n} a_i \cdot \left(b_{n+1-i} + \sum_{j=0}^{n-i} b_j \right) &= \\
a_{n+1} \cdot b_0 + \sum_{i=0}^{n} a_i \cdot b_{n+1-i} + \sum_{i=0}^{n} a_i \cdot \left(\sum_{j=0}^{n-i} b_j \right) &\underset{n \in S}{=} \\
a_{n+1} \cdot b_0 + \sum_{i=0}^{n} a_i \cdot b_{n+1-i} + \sum_{i=0}^{n} c_i &= \\
a_{n+1} \cdot b_{(n+1)-(n+1)} + \sum_{i=0}^{n} a_i \cdot b_{n+1-i} + \sum_{i=0}^{n} c_i &= \\
\sum_{i=0}^{n+1} a_i \cdot b_{n+1-i} + \sum_{i=0}^{n} c_i &= \\
c_{n+1} + \sum_{i=0}^{n} c_i &= \\
\sum_{i=0}^{n+1} c_i &
\end{aligned}$$

which proves that $n+1 \in S$.

Mathematical induction proves then [eq: 19.21]. □

By [theorem: 14.357] we have for $n \in \mathbb{N}_0$ that $B = \sum_{i=0}^{\infty} b_i = \sum_{i=0}^{n-i} b_i + \sum_{i=n-i+1}^{\infty} b_i$, hence $B - \sum_{i=n-i+1}^{\infty} b_i = \sum_{i=0}^{n-i} b_i$. Substituting this in [eq: 19.21] gives that $\forall n \in \mathbb{N}_0$

$$\sum_{i=0}^{n} c_i = \sum_{i=0}^{n} a_i \cdot \left(B - \sum_{i=n-i+1}^{\infty} b_i \right) = B \cdot \sum_{i=0}^{n} a_i - \sum_{i=0}^{n} a_i \cdot \left(\sum_{j=n-i+1}^{\infty} b_j \right)$$

Hence

$$\begin{aligned}
\left| \sum_{i=0}^{n} c_i - A \cdot B \right| &= \left| B \cdot \sum_{i=0}^{n} a_i - A \cdot B - \sum_{i=0}^{n} a_i \cdot \left(\sum_{j=n-i+1}^{\infty} b_j \right) \right| \\
&= \left| \left(\sum_{i=0}^{n} a_i - A \right) \cdot B - \sum_{i=0}^{n} a_i \cdot \left(\sum_{j=n-i+1}^{\infty} b_j \right) \right| \\
&\leqslant \left| \sum_{i=0}^{n} a_i - A \right| + \left| \sum_{i=0}^{n} a_i \cdot \left(\sum_{j=n-i+1}^{\infty} b_j \right) \right| \\
&\leqslant \left| \sum_{i=0}^{n} a_i - A \right| + \sum_{i=0}^{n} \left| a_i \cdot \left(\sum_{j=n-i+1}^{\infty} b_j \right) \right| \\
&= \left| \sum_{i=0}^{n} a_i - A \right| + \sum_{i=0}^{n} \left(|a_i| \cdot \left| \sum_{j=n-i+1}^{\infty} b_j \right| \right)
\end{aligned}$$

so that

$$\left|\sum_{i=0}^{n} c_i - A\cdot B\right| \leqslant \left|\sum_{i=0}^{n} a_i - A\right| + \sum_{i=0}^{n}\left(|a_i|\cdot\left|\sum_{j=n-i+1}^{\infty} b_j\right|\right) \tag{19.22}$$

Let $\varepsilon\in\mathbb{R}^+$ then as $\sum_{i=0}^{\infty} a_i = A$ there exist a $N_1\in\mathbb{N}_0$ such that

$$\forall n\geqslant N_1 \text{ we have } \left|\sum_{i=0}^{n} a_i - A\right| < \frac{\varepsilon}{2} \tag{19.23}$$

Further as $\sum_{i=0}^{\infty} b_i$ converges it follow from [theorem: 14.358]

$$\lim_{n\to\infty}\sum_{i=n}^{\infty} b_i = 0 \tag{19.24}$$

Using then [theorem: 14.306] on the above proves that there exist a $M\in\mathbb{R}^+$ such that

$$\forall n\in\mathbb{N}_0 \text{ we have } \left|\sum_{i=n}^{\infty} b_i\right| \leqslant M \tag{19.25}$$

As $\sum_{i=0}^{\infty} a_i$ is absolute convergent $\sum_{i=0}^{n}|a_i|$ is convergent, given that $\lim\limits_{n\to\infty}\sum_{i=n}^{\infty} b_i = 0$ there exist a $N_2\in\mathbb{N}_0$ such that

$$\forall n\geqslant N_2 \text{ we have that } \left|\sum_{i=n}^{\infty} b_i\right| < \frac{\varepsilon}{4\cdot\left(\sum_{i=1}^{\infty}|\alpha_i|+1\right)} \tag{19.26}$$

Further as by [theorem: 14.358] $\lim\limits_{n\to\infty}\sum_{i=n}^{\infty}|a_i| = 0$ there exist a $N_3\in\mathbb{N}_0$ such that

$$\sum_{i=N_3+1}^{\infty}|a_i| < \frac{\varepsilon}{4\cdot M} \tag{19.27}$$

Let $N_4 = \max(N_2, N_3)$ and $N = \max(N_1, 2\cdot N_4)$ then for $n\geqslant N$ we have that $n\geqslant 2\cdot N_4$, so that $\forall i\in\{1,\ldots,N_4\}$ we have that $n-i\geqslant 2\cdot N_4 - N_4 = N_4\geqslant N_2$. Hence if $n\geqslant N$ then we have

$$\forall i\in\{1\ldots,N_4\} \text{ that } n-i+1\geqslant N_2 \tag{19.28}$$

and

$$\begin{aligned}
\sum_{i=0}^{n}\left(|a_i|\cdot\left|\sum_{j=n-i+1}^{\infty} b_j\right|\right) &= \\
\sum_{i=0}^{N_4}\left(|a_i|\cdot\left|\sum_{j=n-i+1}^{\infty} b_j\right|\right) + \sum_{i=N_4+1}^{n}\left(|a_i|\cdot\left|\sum_{j=n-i+1}^{\infty} b_j\right|\right) &\leqslant_{\text{[eqs: 19.28, 19.26]}} \\
\sum_{i=0}^{N_4}\left(|a_i|\cdot\frac{\varepsilon}{4\cdot\left(\sum_{i=1}^{\infty}|\alpha_i|+1\right)}\right) + \sum_{i=N_4+1}^{n}\left(|a_i|\cdot\left|\sum_{j=n-i+1}^{\infty} b_j\right|\right) &= \\
\frac{\varepsilon}{4\cdot\left(\sum_{i=1}^{\infty}|\alpha_i|+1\right)}\cdot\sum_{i=0}^{N_4}|a_i| + \sum_{i=N_4+1}^{n}\left(|a_i|\cdot\left|\sum_{j=n-i+1}^{\infty} b_j\right|\right) &\leqslant_{\text{[theorem: 14.357]}} \\
\frac{\varepsilon}{4\cdot\left(\sum_{i=1}^{\infty}|\alpha_i|+1\right)}\cdot\sum_{i=0}^{\infty}|a_i| + \sum_{i=N_4+1}^{n}\left(|a_i|\cdot\left|\sum_{j=n-i+1}^{\infty} b_j\right|\right) &< \\
\frac{\varepsilon}{4} + \sum_{i=N_4+1}^{n}\left(|a_i|\cdot\left|\sum_{j=n-i+1}^{\infty} b_j\right|\right) &\leqslant_{\text{[eq: 19.25]}}
\end{aligned}$$

$$\begin{aligned}
\frac{\varepsilon}{4}+\sum_{i=N_4+1}^{n}(|a_i|\cdot M) &= \\
\frac{\varepsilon}{4}+M\cdot\sum_{i=N_4+1}^{n}|a_i| &\leqslant_{\text{[theorem: 14.357]}} \\
\frac{\varepsilon}{4}+M\cdot\sum_{i=N_4+1}^{\infty}|a_i| &\leqslant_{\text{[eq: 19.27]}} \\
\frac{\varepsilon}{4}+M\cdot\frac{\varepsilon}{4\cdot M} &= \\
\frac{\varepsilon}{2}&
\end{aligned}$$

proving that

$$\sum_{i=0}^{n}\left(|a_i|\cdot\left|\sum_{j=n-i+1}^{\infty}b_j\right|\right)<\frac{\varepsilon}{2}$$

Combining the above with [eq: 19.22] and [eq: 19.23] it follows that

$$\forall n\geqslant N \text{ we have } \left|\sum_{i=0}^{n}c_i-A\cdot B\right|<\varepsilon$$

Hence

$$\sum_{i=0}^{\infty}c_i \text{ converges and } \sum_{i=0}^{\infty}c_i=A\cdot B=\left(\sum_{i=0}^{\infty}a_i\right)\cdot\left(\sum_{i=0}^{\infty}b_i\right)$$ □

We apply now the above theorem to the product of power series.

Theorem 19.30. *Let* $\sum_{n=0}^{\infty}a_n\cdot z^n$, $\sum_{n=0}^{\infty}b_n\cdot z^n$ *then if* $z\in\overline{\mathcal{D}}(\sum_{n=0}^{\infty}a_n\cdot z^n)\bigcap\mathcal{D}(\sum_{n=0}^{\infty}b_n\cdot z^n)$ *we have that* $z\in\mathcal{D}(\sum_{i=0}^{\infty}c_i\cdot z^i)$ *where* $c_i=\sum_{j=0}^{i}a_j\cdot b_{i-j}$. *Further*

$$\sum_{i=0}^{\infty}c_i=\left(\sum_{n=0}^{\infty}a_n\cdot z^n\right)\cdot\left(\sum_{n=0}^{\infty}b_n\cdot z^n\right)$$

Proof. Let $z\in\overline{\mathcal{D}}(\sum_{n=0}^{\infty}a_n\cdot z^n)\bigcap\mathcal{D}(\sum_{n=0}^{\infty}b_n\cdot z^n)$ then $\sum_{n=0}^{\infty}a_n\cdot z^n$ is absolute convergent and $\sum_{n=0}^{\infty}b_n\cdot z^n$ is convergent. By the previous theorem [theorem: 19.29] it follows that

$$\sum_{i=0}^{\infty}\left(\sum_{j=0}^{i}(a_j\cdot z^j)\cdot(b_{i-j}\cdot z^{i-j})\right)$$

converges and

$$\sum_{i=0}^{\infty}\left(\sum_{j=0}^{i}(a_j\cdot z^j)\cdot(b_{i-j}\cdot z^{i-j})\right)=\left(\sum_{n=0}^{\infty}a_n\cdot z^n\right)\cdot\left(\sum_{n=0}^{\infty}b_n\cdot z^n\right)$$

Further we have

$$\begin{aligned}
\sum_{i=0}^{\infty}\left(\sum_{j=0}^{i}(a_j\cdot z^j)\cdot(b_{i-j}\cdot z^{i-j})\right) &= \sum_{i=0}^{\infty}\left(\sum_{j=0}^{i}a_j\cdot b_{i-j}\cdot z^i)\right) \\
&= \sum_{i=0}^{\infty}\left(\sum_{j=0}^{i}a_j\cdot b_{i-j}\right)\cdot z^i \\
&= \sum_{i=0}^{\infty}c_i\cdot z^i
\end{aligned}$$

proving that $\sum_{i=0}^{\infty}c_i\cdot z^i$ converges and $\sum_{i=0}^{\infty}c_i\cdot z^i=(\sum_{n=0}^{\infty}a_n\cdot z^n)\cdot(\sum_{n=0}^{\infty}b_n\cdot z^n)$. □

Theorem 19.31. *Let* $x,y\in\mathbb{C}$ *then* $\exp(x+y)=\exp(x)\cdot\exp(y)$

Proof. Let $x, y \in \mathbb{C}$ then as $\mathbb{C} \underset{\text{[theorem: 19.21]}}{=} \overline{\mathcal{D}}\left[\sum_{n=0}^{\infty} \frac{z^n}{n!}\right]$ it follows that $\sum_{n=0}^{\infty} \frac{x^n}{n!}$ and $\sum_{n=0}^{\infty} \frac{y^n}{n!}$ are absolute convergent [see definition: 14.376]. Hence we can use the above theorem [theorem: 19.30] giving that

$$\begin{aligned}
\exp(x) \cdot \exp(y) &= \left(\sum_{n=0}^{\infty} \frac{x^n}{n!}\right) \cdot \left(\sum_{n=0}^{\infty} \frac{y^n}{n!}\right) \\
&\underset{\text{[theorem: 19.29]}}{=} \sum_{n=0}^{\infty} \left(\sum_{i=0}^{n} \frac{x^i}{i!} \cdot \frac{y^{i-j}}{(i-j)!}\right) \\
&= \sum_{n=0}^{\infty} \frac{1}{n!} \cdot \sum_{i=0}^{n} \left(\frac{n!}{i! \cdot (i-j)!} \cdot x^i \cdot y^{i-j}\right) \\
&\underset{\text{[theorem: 17.24]}}{=} \sum_{n=0}^{\infty} \frac{(x+y)^i}{n!} \\
&= \exp(x+y)
\end{aligned}$$

□

Theorem 19.32. *The exponential function* $\exp: \mathbb{C} \to \mathbb{C}$ *has the following properties:*

1. $\exp(0) = 1$
2. $\forall z \in \mathbb{C}$ *we have* $\exp(z) \neq 0$.
3. $\forall z \in \mathbb{C}$ *we have* $\exp(-z) = \frac{1}{\exp(z)}$.
4. $\forall z \in \mathbb{R}$ *we have* $0 < \exp(z)$ *or in other words* $\exp(\mathbb{R}) \subseteq \mathbb{R}^+$.
5. $\forall z \in \mathbb{R}$ *with* $0 < z$ *we have* $1 < \exp(z)$.
6. $\forall x, y \in \mathbb{R}$ *with* $x < y$ *we have* $\exp(x) < \exp(y)$ *[*$\exp$ *is strictly increasing].*
7. $\forall x, y \in \mathbb{R}$ *with* $x < y$ *it follows that* $\exp$ *is convex on* $[x, y]$ *[see definition: 16.155].*

Proof.

1. If $z = 0$ then $\exp(0) = \exp(z) = \sum_{i=0}^{\infty} \frac{1}{i!} \cdot z^i \underset{\text{[[example: 19.4]]}}{=} \frac{1}{0!} = 1$.
2. Assume that $\exists z \in \mathbb{C}$ such that $\exp(z) = 0$. Then
$$1 = \exp(0) = \exp(z + (-z)) \underset{\text{[theorem: 19.31]}}{=} \exp(z) \cdot \exp(-z) = 0 \cdot \exp(-z) = 0$$
leading to the contradiction $1 = 0$. So the assumption is wrong and we have $\forall z \in \mathbb{C}$ that $\exp(z) \neq 0$.
3. $1 = \exp(0) = \exp(z + (-z)) = \exp(z) \cdot \exp(-z)$ so using (2) we have $\exp(-z) = \frac{1}{\exp(z)}$.
4. If $z \in \mathbb{R}$ then we have 3 cases to consider for z:

   $\boldsymbol{z \in \mathbb{R}^+}$**.** Then $\forall i \in \mathbb{N}_0$ we have $0 < \frac{z^i}{i!}$ [see theorem: 10.51] so that by [theorem: 14.362] $0 < \sum_{i=0}^{\infty} \frac{z^i}{i!} = \exp(z)$.

   $\boldsymbol{z = 0}$**.** Then $0 < 1 = \exp(0) = \exp(z)$.

   $\boldsymbol{z \in \mathbb{R}^-}$**.** Then $-z \in \mathbb{R}^+$ then $0 < \frac{1}{\exp(-z)} \underset{(3)}{=} \exp(z)$.

   Hence in all cases we have $0 < \exp(z)$.
5. If $0 < z$ then $\forall i \in \mathbb{N}_0$ we have $0 < \frac{z^i}{i!}$ [see theorem: 10.51] so that by [theorem: 14.362] $0 < \sum_{i=1}^{\infty} \frac{z^i}{i!} = \exp(z)$. Hence $\exp(z) = \sum_{i=0}^{\infty} \frac{z^i}{i!} \underset{\text{[theorem: 14.357]}}{=} \frac{z^0}{0!} + \sum_{i=1}^{\infty} \frac{z^i}{i!} = 1 + \sum_{i=}^{\infty} \frac{z^i}{i!} > 1$.
6. Let $x < y$ then $0 < y - x$ so that by (5) $1 < \exp(y - x)$, as $0 < \exp(x)$ it follows that
$$\exp(x) < \exp(x) \cdot \exp(y - x) \cdot \exp(x + y - x) = \exp(y)$$

7. Let $x \in \mathbb{R}$ then $\exp_x^{(2)} \underset{\text{[theorem: 19.28]}}{=} \exp(x) > 0$ [by (4) so that by [theorem: 16.157] is convex. □

We introduce now what is probably the most interesting number in mathematics [maybe with the exception of π which we will also define in this chapter] which is Euler's number.

Definition 19.33. (Euler's number) *Euler's number noted as* e *is defined as*

$$\mathrm{e} = \exp(1) = \sum_{n=1}^{\infty} \frac{1}{n!}$$

Using Euler's number we see that the exponential of natural numbers behaves as a power of Euler's number.

Theorem 19.34. $\forall n \in \mathbb{N}_0$ *we have*

1. $\mathrm{e} \in \mathbb{R}^+$ *and* $1 < \mathrm{e}$
2. $\exp(n) = \mathrm{e}^n$
3. $\exp(-n) = \frac{1}{\mathrm{e}^n}$

Proof.

1. As $1 \in \mathbb{R}^+$ it follows from [theorem: 19.32 (5)] that $1 < \exp(1) = \mathrm{e}$
2. We prove this by induction so define:

$$S = \{n \in \mathbb{N}_0 | \exp(n) = \mathrm{e}^n\}$$

then we have:

$0 \in S$. As $\exp(0) \underset{\text{[theorem: 19.32]}}{=} 1 = \mathrm{e}^0$ it follows that $0 \in S$.

$n \in S \Rightarrow n+1 \in S$. As $\exp(n+1) \underset{\text{[theorem: 19.31]}}{=} \exp(n) \cdot \exp(1) \underset{n \in S}{=} \mathrm{e}^n \cdot \mathrm{e} = \mathrm{e}^{n+1}$ it follows that $n+1 \in S$.

3. $\exp(-n) \underset{\text{[theorem: 19.32]}}{=} \frac{1}{\exp(n)} \underset{(1)}{=} \frac{1}{\mathrm{e}^n}$ □

The above theorem suggest that we could extend this to $\exp(z) = \mathrm{e}^z$ where z is not a whole number. To be able to do this we must find a inverse of the exponential function which will be only possible on real numbers.

Theorem 19.35. *Let* $y \in \mathbb{R}^+$ *then there exist a* $x \in \mathbb{R}$ *such that* $y < \exp(x)$

Proof. By [theorem: 19.34] it follows that $1 < \mathrm{e}$ so that by [theorem: 10.61] there exist a $n \in \mathbb{N}$ such that $y \leqslant \mathrm{e}^n$. As by [theorem: 19.34] $\mathrm{e}^n = \exp(n)$ it follows that $y \leqslant \exp(n)$ where $n \in \mathbb{N} \subseteq \mathbb{R}$. □

Theorem 19.36. $\exp_{|\mathbb{R}}: \mathbb{R} \to \mathbb{R}^+$ *is a bijection,* $\exp(\mathbb{R}^+) =]1, \infty[$ *and* $\exp(\mathbb{R}^-) =]0, 1[$

Proof. First we have to prove that $\exp_{|\mathbb{R}}: \mathbb{R} \to \mathbb{R}^+$ is a bijection.

injectivity. Let $x, y \in \mathbb{R}$ such that $\exp(x) = \exp_{|\mathbb{R}}(x) = \exp_{|\mathbb{R}}(y) = \exp(y)$. Assume that $x \neq y$ then we may without loss of generality assume that $x < y$. Then by [theorem: 19.32 (6)] it follows that $\exp(x) < \exp(y)$ contradicting $\exp(x) = \exp(Y)$. Hence the assumption must be wrong and we must have that $x = y$.

surjectivity. Let $y \in \mathbb{R}^+ =]0, \infty[$ then we have the following possibilities:

$y = 1$. Then $\exp(0) = 1 = y$.

$1 < y$. Then by [theorem: 19.35] there exist a $z \in \mathbb{R}$ such that $y < \exp(z)$ hence we have as $1 = \exp(0)$ that $\exp(0) < y < \exp(z)$. Further by [theorem: 19.28] on $\mathbb{R}$ hence continuous on $[0, z]$. Using the intermediate value theorem [see theorem: 14.403] there exist a $x \in [0, y]$ such that $\exp(x) = y$.

$0 < y < 1$. Then $1 < \frac{1}{y}$ so that by the previous case there exist a $z \in \mathbb{R}$ such that $\exp(z) = \frac{1}{y}$. Take $x = -z$ then $\exp(x) = \exp(-y) \underset{\text{[theorem: 19.32 (3)]}}{=} \frac{1}{\exp(y)} = \frac{1}{\frac{1}{y}} = y$

So in all cases we found a $x \in \mathbb{R}$ such that $\exp(x) = y$ which proves surjectivity.

For the remainder of the theorem. Let $x \in \mathbb{R}^+$ then by [theorem: 19.32(5)] we have that $1 < \exp(x)$ hence

$$\exp(\mathbb{R}^+) \subseteq]1, \infty[\tag{19.29}$$

If $x \in \mathbb{R}^-$ then $-x \in \mathbb{R}^+$ so that by [theorem: 19.32(5)] we have $1 < \exp(-x) = \frac{1}{\exp(x)}$ so that $\exp(x) < 1$. Hence we have proved that

$$\exp(\mathbb{R}^-) \subseteq]0, 1[\tag{19.30}$$

If $y \in]1, \infty[\subseteq \mathbb{R}^+$ then by surjectivity of $\exp_{|\mathbb{R}}$ there exist a $x \in \mathbb{R}$ such that $\exp(x) = y$. Assume that $x \in \mathbb{R}^-$ then by [eq: 19.30] $y = \exp(x) \in]0, 1[$ contradicting $y \in]1, \infty[$ hence we must have that $x \in \mathbb{R}_0^+$ or as $\exp(0) = 1 \neq y$ we must have $x \in \mathbb{R}^+$, hence $y \in \exp(\mathbb{R}^+)$. So $]1, \infty[\subseteq \exp(\mathbb{R}^+)$ which combined with [eq: 19.29] gives

$$\exp(\mathbb{R}) =]1, \infty[\tag{19.31}$$

If $y \in]0, 1[\subseteq \mathbb{R}^+$ then by surjectivity there exist a $x \in \mathbb{R}$ such that $\exp(x) = y$. Assume that $x \in \mathbb{R}^+$ then by [eq: 19.29] $y = \exp(x) \subseteq]1, \infty[$ contradicting $y \in]0, 1[$. Hence we must have that $x \in \mathbb{R}_0^-$, which, as $\exp(0) = 1 \neq y$, means that $x \in \mathbb{R}^-$, hence $y \in \exp(\mathbb{R}^-)$. So $]0, 1[\subseteq \exp(\mathbb{R}^-)$ which combined with [eq: 19.30] proves

$$\exp(\mathbb{R}^-) =]0, 1[$$

□

As every bijection has a inverse the function $\exp_{|\mathbb{R}}: \mathbb{R} \to \mathbb{R}^+$ has a inverse called the natural logarithm.

Definition 19.37. (Natural Logarithm) *The natural logarithm noted as* $\log$ *is the inverse of* $\exp_{|\mathbb{R}}: \mathbb{R} \to \mathbb{R}^+$. *In other words*

$$\log: \mathbb{R}^+ \to \mathbb{R} \text{ is defined by } \log = (\exp_{|\mathbb{R}})^{-1}$$

Based on the definition of the logarithm and the properties of the exponential function we have the following properties of the logarithm.

Theorem 19.38. $\log: \mathbb{R}^+ \to \mathbb{R}$ *has the following properties:*

1. $\forall x \in \mathbb{R}^+$ *we have* $\exp(\log(x)) = x$.
2. $\forall x \in \mathbb{R}$ *we have* $\log(\exp(x)) = x$.
3. $\log(e) = 1$.
4. $\log(1) = 0$.
5. $\forall x, y \in \mathbb{R}^+$ *we have* $\log(x \cdot y) = \log(x) + \log(y)$.
6. $\forall x \in \mathbb{R}^+$ *we have* $\log\left(\frac{1}{x}\right) = -\log(x)$.
7. $\forall x \in \mathbb{R}^+$ $\log$ *has a derivative* $\log'_x$ *where* $\log'_x = \frac{1}{x}$.
8. $\log: \mathbb{R}^+ \to \mathbb{R}$ *is strictly increasing and* $\forall x < 1$ *we have* $\log(x) < 0$.

Proof.

1. Let $x \in \mathbb{R}^+$ then $\exp(\log(x)) = \exp_{|\mathbb{R}}((\exp_{|\mathbb{R}})^{-1}(x)) = x$.
2. Let $x \in \mathbb{R}$ then $\log(\exp(x)) = (\exp_{|\mathbb{R}})^{-1}(\exp_{|\mathbb{R}}(x)) = x$.
3. $\log(e) = (\exp_{|\mathbb{R}})^{-1}(\exp(1)) = (\exp_{|\mathbb{R}})^{-1}(\exp_{|\mathbb{R}}(1)) = 1$.
4. $\log(1) = (\exp_{|\mathbb{R}})^{-1}(\exp(0)) = (\exp_{|\mathbb{R}})^{-1}(\exp_{|\mathbb{R}}(0)) = 0$.
5. Let $x, y \in \mathbb{R}^+$ then
$$\exp_{|\mathbb{R}}(\log(x) + \log(y)) = \exp(\log(x) + \log(y)) = \exp(\log(x)) \cdot \exp(\log(y)) \underset{(1)}{=} x \cdot y$$
so that $\log(x) + \log(y) = (\exp_{|\mathbb{R}})^{-1}(x \cdot y) = \log(x \cdot y)$.
6. Let $x \in \mathbb{R}^+$ then by (1) $\exp_{|\mathbb{R}}(-\log(x)) = \exp(-\log(x)) \underset{\text{[theorem: 19.32]}}{=} \frac{1}{\exp(\log(x))} \underset{(1)}{=} \frac{1}{x}$ so that $-\log(x) = (\exp_{|\mathbb{R}})^{-1}\left(\frac{1}{x}\right) = \log\left(\frac{1}{x}\right)$.

7. Let $x \in \mathbb{R}^+$ and take $y = \log(x)$. As $\exp'_y = \exp(y) > 0$ and $\exp' = \exp$ is continuous we have by the inverse function theorem [see theorem: 16.270(3)] that there exist a open $U \subseteq \mathbb{R}$ and $V \subseteq \mathbb{R}^+$ with $y \in U$ and $\exp(y) \in V \underset{\exp(y)=\exp(\log(x))}{\Rightarrow} x \in V$ such that $\exp_{|U}: U \to V$ has a inverse $(\exp_{|U})^{-1}: V \to U$ and
$$\forall z \in U \text{ we have } ((\exp_{|U})^{-1})'_{\exp(z)} = \frac{1}{\exp'_z} \tag{19.32}$$
As $\forall v \in V$ we have $(\exp_{|U} \circ \log_{|V})(v) = \exp_{|U}(\log_{|V}(v)) = \exp(\log(v)) = v = \mathrm{Id}_V(u)$ and $\forall u \in U$ we have $(\log_{|V} \circ \exp_{|U|})(u) = \log_{|V}(\exp_{|U}(u)) = \log(\exp(u)) = u = \mathrm{Id}_U(u)$ so that $(\exp_{|U})^{-1} = \log_{|V}$. Substituting this in [eq: 19.32] we have
$$\forall z \in V \text{ we have } (\log_{|V})'_{\exp(z)} = \frac{1}{\exp'_z} \underset{\text{[theorem: 19.27]}}{=} \frac{1}{\exp(z)}$$
As $\log(x) = y \in U$ we have by the above that $((\log_{|V})'_{\exp(\log(x))} = \frac{1}{\exp(\log(x))}$ so that
$$(\log_{|V})'_x = \frac{1}{x}$$
Finally using the locality of the derivative [theorem: 16.33] it follows that log has a derivative at x and $\log'_x = \frac{1}{x}$.
8. Let $x, y \in \mathbb{R}^+$ with $x < y$. Assume that $\log(y) \leqslant \log(x)$ then as by [theorem: 19.32] exp is strict increasing it follows that $y = \exp(\log(y)) \leqslant \exp(\log(x)) = x$ contradicting $x < y$. Hence the assumption is wrong and we must have that $\log(x) < \log(y)$. Further if $x < 1$ then $\log(x) < \log(1) \underset{(4)}{=} 0$. □

19.1.6 Generalized power

We are now ready to extend the n-th power of a real number where n is a natural number to the cases where n is not a natural number.

Definition 19.39. (Generalized Power) *Let $a \in [0, \infty[$ and $p \in \mathbb{R}$ then we define a^p as follows*
$$a^p = \begin{cases} \exp(p \cdot \log(a)) \text{ if } a \in]0, \ldots, \infty[\\ 0 \text{ if } a = 0 \wedge p \neq 0 \\ 1 \text{ if } a = 0 \wedge p = 0 \end{cases}$$

***Note* 19.40.** *In this text $0^0 = 1$ because we have for $n \in \mathbb{N}_0$ defined a^n algebraic by $a^n = \begin{cases} 1 \text{ if } n = 0 \\ a \cdot a^{n-1} \text{ if } n \in \mathbb{N} \end{cases}$ [see definition: 10.48]. Many mathematical text argue that if $n \in \mathbb{N}$ then $0^n = 0 \cdot 0^{n-1} = 0$ so that 0^0 should be 0 instead or that 0^0 is undefined. As we have already used the algebraic definition $0^0 = 1$ in polynomial power series we adopt the convention that $0^0 = 1$.*

***Note* 19.41.** *As the domain of the natural logarithm is $\mathbb{R}^+$ we define a^p only for $a \in \mathbb{R}_0^+$ another reason is that we will show later that $a^{\frac{1}{2}} = \sqrt{a}$ and $\sqrt{-1}$ is not defined in $\mathbb{R}$.*

Having defined a^p we have the following properties of a^p

Theorem 19.42. *We have the following properties for the generalized power*

1. $\forall a \in [0, \infty[\ a^0 = 1$.
2. $\forall a \in]0, \infty[$ *and* $\forall x \in \mathbb{R}$ *we have that* $0 < a^x$
3. $\forall a \in [0, \infty[$ *and* $\forall x \in \mathbb{R} \setminus \{0\}$ *we have that* $a^x = 0 \Leftrightarrow a = 0$.
4. $\forall a \in [0, \infty[$ *and* $\forall n \in \mathbb{N}_0$ *we have* $a^n = \begin{cases} 1 \text{ if } n = 1 \\ a \cdot a^{n-1} \text{ if } n \in \mathbb{N} \end{cases} = \underbrace{a \ldots a}_{n}$ *[see definition: 10.48].*
5. $\forall x \in \mathbb{R}$ *we have* $1^x = 1$.
6. $\forall x \in \mathbb{R}$ *we have* $e^x = \exp(x)$.
7. $\forall a \in]0, \infty[$ *we have* $a^{-1} = \frac{1}{a}$.

***Note* 19.43.** *For $a = 0$ we have $a^{-1} = 0$ and $\frac{1}{a}$ is undefined so the condition $0 < a$ is required.*

8. *$\forall a \in]0,\infty[$ we have $\frac{a^x}{a} = a^{x-1}$.*

   ***Note* 19.44.** *For $a=0$ we have $\frac{a^n}{a}$ is undefined so the condition $0<a$ is needed.*

9. *$\forall a \in]0,\infty[$ and $\forall x \in \mathbb{R}$ we have $a^{-x} = \frac{1}{a^x}$.*

   ***Note* 19.45.** *For $a=0$ we have $\frac{1}{a^n}$ is undefined so the condition $0<a$ is needed.*

10. *$\forall a \in]0,\infty[$ and $\forall x, y \in \mathbb{R}$ we have $(a^x)^y = a^{x \cdot y}$.*

    ***Note* 19.46.** *$0<a$ is essential because $0^1 \cdot 0^0 = 0 \cdot 1 = 0 \neq 1 = 0^0 = 0^{1 \cdot 0}$.*

11. *$\forall a \in]0,\infty[$ and $\forall x \in \mathbb{R}$ we have $\log(a^x) = x \cdot \log(a)$*

    ***Note* 19.47.** *If $a=0$ then $a^1 = 0^1 = 0$ so that $\log(a^x)$ is not defined, hence $0<a$ is a needed condition.*

12. *$\forall a, b \in]0,\infty[$ we have $\forall x \in \mathbb{R}$ that $(a \cdot b)^x = a^x \cdot b^x$.*

    ***Note* 19.48.** *If $a=0$ and $b=1$ then for $p=0$ we have $(a \cdot b)^x = 0^0 = 1$ and $a^x \cdot b^x = 0^0 \cdot 1^0 = 0$ so that $a, b \in]0,\infty[$ is indeed required.*

13. *$\forall a, b \in]0,\infty[$ we have $\forall x \in \mathbb{R}$ that $\left(\frac{a}{b}\right)^x = \frac{a^x}{b^z}$.*
14. *$\forall x, y \in \mathbb{R}$ we have $a^{x+y} = a^x \cdot a^y$.*
15. *$\forall x \in]0,\infty[$ we have that $(*)^x :]0,\ldots,\infty[\to \mathbb{R}$ defined by $(*)^x(y) = y^x$ is strictly increasing.*

Proof.

1. For $a \in [0,\ldots,\infty[$ we have either:

   $a=0$. Then $a^0 = 1$

   $]0,\infty[$. Then $a^0 = \exp(0 \cdot \log(a)) = \exp(0) \underset{[\text{theorem: } 19.32]}{=} 1$

2. If $]0,\infty[$ then $a^x = \exp(x \cdot \log(a)) > 0$ [because [theorem: 19.32(4)]]
3. Let $a^x = 0$ and assume that $a \neq 0$ then $]0,\infty[$ so that $0 = \exp(x \cdot \log(a))$. As by [theorem: 19.32 (4)] $0 < \exp(x \cdot \log(a))$ we reach the contradiction $0>0$. Hence we have

   $$a^x = 0 \Rightarrow a = 0$$

   If $a=0$ then as $x \neq 0$ we have that $a^x = 0$ so that

   $$a = 0 \Rightarrow a^x = 0$$

4. To avoid confusion of notation write $a^{[n]}$ for the old definition of the power [see definition: 10.48] so $a^{[n]} = \begin{cases} 1 \text{ if } n=0 \\ a \cdot a^{n-1} \text{ if } n \in \mathbb{N} \end{cases}$. Let $n \in \mathbb{N}_0$ then for $a \in [0,\ldots,\infty]$ we have either:

   $a=0$. Then for $n \in \mathbb{N}_0$ we have either:

   $n=0$. Then $a^n = a^0 = \begin{cases} \exp(n \cdot \log(a)) \text{ if } a \in]0,\infty[\\ 0 \text{ if } a=0 \wedge n \neq 0 \\ 1 \text{ if } a=0 \wedge n=0 \end{cases} = 1 = a^{[n]}$.

   $n \neq 0$. Then $a^n = 0^n = \begin{cases} \exp(n \cdot \log(a)) \text{ if } a \in]0,\infty[\\ 0 \text{ if } a=0 \wedge n \neq 0 \\ 1 \text{ if } a=0 \wedge n=0 \end{cases} = 0 = a^{[n]}$

   $a \in]0,\ldots,\infty[$. We use now induction to prove this, so define

   $$S_a = \{n \in \mathbb{N}_0 | a^n = a^{[n]}\}$$

   then we have:

   $0 \in S$. As $a^0 \underset{a \in]0,\infty[}{=} \exp(0 \cdot \log(a)) = \exp(0) = 1 = a^{[0]}$, it follows that $0 \in S$.

$\boldsymbol{n \in S \Rightarrow n+1 \in S}$. We have then

$$\begin{aligned}
a^{n+1} &\underset{a\in]0,\infty[}{=} \exp((n+1)\cdot\log(a)) \\
&= \exp(n\cdot\log(a)+\log(a)) \\
&\underset{\text{[theorem: 19.31]}}{=} \exp(n\cdot\log(a))\cdot\exp(\log(a)) \\
&\underset{n\in S}{=} a^{[n]}\cdot\exp(\log(a)) \\
&\underset{\text{[theorem: 19.38]}}{=} a^{[n]}\cdot a \\
&= a^{[n+1]}
\end{aligned}$$

proving that $n+1\in S$.

Mathematical induction proves then that in this case $\forall n\in\mathbb{N}_0$ we have that $a^n = a^{[n]}$.

So in all possible cases we have

$$a^n = a^{[n]} = \begin{cases} 1 \text{ if } n=0 \\ a\cdot a^{n-1} \text{ if } n\in\mathbb{N} \end{cases}$$

5. As $1\in]0,\ldots,\infty[$ we have that
$$1^x = \exp(x\cdot\log(1)) \underset{\text{[theorem: 19.38]}}{=} \exp(x\cdot 0) = \exp(0) \underset{\text{[theorem: 19.32]}}{=} 1$$
6. As by [theorem: 19.34] $1<e$ we have that $e\in]0,\ldots,\infty[$ so that
$$e^x = \exp(x\cdot\log(e)) \underset{\text{[theorem: 19.38]}}{=} \exp(x\cdot 1) = \exp(x)$$
7. If $a\in]0,\ldots,\infty[$ then
$$a^{-1} = \exp((-1)\cdot\log(a)) = \exp(-\log(a)) \underset{\text{[theorem: 19.32]}}{=} \frac{1}{\exp(\log(a))} \underset{\text{[theorem: 19.38]}}{=} \frac{1}{a}$$
8. If $a\in]0,\ldots,\infty[$ then
$$\begin{aligned}
\frac{a^x}{a} &= \frac{\exp(x\cdot\log(a))}{a} \\
&= \frac{\exp(((x-1)+1)\cdot\log(a))}{a} \\
&= \frac{\exp((x-1)\cdot\log(a)+\log(a))}{a} \\
&\underset{\text{[theorem: 19.32]}}{=} \frac{\exp((x-1)\cdot\log(a))\cdot\exp(\log(a))}{a} \\
&= \frac{a^{x-1}\cdot\exp(\log(a))}{a} \\
&\underset{\text{[theorem: 19.38]}}{=} \frac{a^{x-1}\cdot a}{a} \\
&= a^{x-1}
\end{aligned}$$
9. If $a\in]0,\infty[$ then
$$\begin{aligned}
a^{-x} &= \exp(-x\cdot\log(a)) \\
&\underset{\text{[theorem: 19.32]}}{=} \frac{1}{\exp(x\cdot\log(a))} \\
&= \frac{1}{a^x}
\end{aligned}$$
10. As $a\in]0,\infty[$ we have
$$\begin{aligned}
(a^x)^y &= \exp(y\cdot\log(a^x)) \\
&= \exp(y\cdot\log(\exp(x\cdot\log(a)))) \\
&\underset{\text{[theorem: 19.38]}}{=} \exp(y\cdot x\cdot\log(a)) \\
&= \exp((x\cdot y)\cdot\log(a)) \\
&= a^{x\cdot y}
\end{aligned}$$

11. Let $a \in]0,\infty[$ and $x \in \mathbb{R}$ then
$$\begin{aligned}\log(a^x) &= \log(\exp(x \cdot \log(a))) \\ &\underset{\text{[theorem: 19.38]}}{=} x \cdot \log(a)\end{aligned}$$
12. As $a, b \in]0,\infty[$ then $a \cdot b \in]0,\infty[$ so that
$$\begin{aligned}(a \cdot b)^x &= \exp(x \cdot \log(a \cdot b)) \\ &\underset{\text{[theorem: 19.38]}}{=} \exp(x \cdot (\log(a) + \log(b))) \\ &= \exp(x \cdot \log(a) + x \cdot \log(b)) \\ &\underset{\text{[theorem: 19.31]}}{=} \exp(x \cdot \log(a)) \cdot \exp(x \cdot \log(b)) \\ &= a^x \cdot b^x\end{aligned}$$
13. As $a, b \in]0,\infty[$ $\frac{a}{b}$ is defined and $\frac{a}{b} \in]0,\infty[$ so that
$$\begin{aligned}\left(\frac{a}{b}\right)^x &= \exp\left(x \cdot \log\left(\frac{a}{b}\right)\right) \\ &= \exp\left(x \cdot \log\left(a \cdot \frac{1}{b}\right)\right) \\ &\underset{\text{[theorem: 19.38]}}{=} \exp\left(x \cdot \left(\log(a) + \log\left(\frac{1}{b}\right)\right)\right) \\ &\underset{\text{[theorem: 19.38]}}{=} \exp(x \cdot (\log(a) + (-\log(b)))) \\ &= \exp(x \cdot \log(a) + (-x \cdot \log(b))) \\ &\underset{\text{[theorem: 19.32]}}{=} \exp(x \cdot \log(a)) \cdot \exp(-x \cdot \log(b)) \\ &\underset{\text{[theorem: 19.32]}}{=} \frac{\exp(x \cdot \log(a))}{\exp(x \cdot \log(b))} \\ &= \frac{a^x}{b^x}\end{aligned}$$
14. Let $a, b \in]0,\infty[$ then
$$\begin{aligned}a^{x+y} &= \exp((x+y) \cdot \log(a)) \\ &= \exp(x \cdot \log(a) + y \cdot \log(a)) \\ &\underset{\text{[theorem: 19.31]}}{=} \exp(x \cdot \log(a)) \cdot \exp(y \cdot \log(a)) \\ &= x^a \cdot y^a\end{aligned}$$
15. Let $y, z \in]0,\infty[$ such that $y < z$ then as log is strictly increasing [see theorem: 19.38] it follows that $\log(y) < \log(z)$ and as $0 < \log(y)$, $\log(z)$ and $0 < x$ we have $x \cdot \log(y) < x \cdot \log(z)$. Further, as exp is strictly increasing [see theorem: 19.32], it follows that
$$y^x = \exp(x \cdot \log(y)) < \exp(x \cdot \log(z)) = z^x$$

□

Theorem 19.49. *Let $x \in \mathbb{R}$ then the function*
$$(\star)^x :]0,\infty[= \mathbb{R}^+ \to \mathbb{R} \text{ defined by } (*)^x(y) = y^x$$
has a derivative $((\star)^x)'_y$ at every $y \in]0,\infty[$ with $((*)^x)'_y = x \cdot y^{x-1}$

Proof. Let $x \in \mathbb{R}$ and define
$$\varphi : \mathbb{R} \to \mathbb{R} \text{ defined by } \varphi(y) = x \cdot y$$
then by [example: 16.131] it follows that $\forall y \in \mathbb{R}$ has a derivative at y and
$$\varphi'_y = x$$
Further if $z \in \mathbb{R}^+$ then
$$(\exp \circ \varphi \circ \log)(z) = \exp(\varphi(\log(z))) = \exp(x \cdot \log(z)) = z^x = (*)^x(z)$$
proving that
$$(*)^x = \exp \circ \varphi \circ \log$$

As by [theorem: 19.27] exp has a derivative at every $y \in \mathbb{R}$ with $\exp'_y = \exp(y)$ and by [theorem: 19.38] log has a derivative at every y with $\log'_y = \frac{1}{y}$ we can use the chain rule [see theorem:16.41] twice proving that $(\star)^x = \exp \circ \varphi \circ \log$ has a derivative for every $y \in \mathbb{R}^+$ and

$$\begin{array}{rcl}
((*)^x)'_y & = & (\exp \circ \varphi \circ \log)'_y \\
& = & (\exp \circ (\varphi \circ \log))'_y \\
& = & \exp'_{(\varphi \circ \log)(y)} \cdot (\varphi \circ \log)'_y \\
& = & \exp((\varphi \circ \log)(y)) \cdot (\varphi \circ \log)'_y \\
& = & \exp(\varphi(\log(y))) \cdot (\varphi \circ \log)'_y \\
& = & \exp(x \cdot \log(y)) \cdot (\varphi \circ \log)'_y \\
& = & y^x \cdot (\varphi'_{\log(y)} \cdot \log'_y) \\
& = & y^x \cdot x \cdot \dfrac{1}{y} \\
& \underset{\text{[theorem: 19.42 (8)]}}{=} & x \cdot y^{x-1}
\end{array}$$

□

Theorem 19.50. *Let $a \in]0, \infty[$ then $\forall y \in \mathbb{R}$ we have that the function*

$$a^{(*)}: \mathbb{R} \to \mathbb{R} \text{ defined by } a^{(*)}(x) = a^x$$

has a derivative at y and $(a^{(*)})'_x = \log(a) \cdot a^x$.

Proof. Define

$$\varphi: \mathbb{R} \to \mathbb{R} \text{ by } \varphi(x) = x \cdot \log(a)$$

then by [example: 16.131] it follows that $\forall x \in \mathbb{R}$ has a derivative at x and

$$\varphi'_x = \log(a)$$

Further we have for $x \in \mathbb{R}$ that $(\exp \circ \varphi)(x) = \exp(\varphi(x)) = \exp(x \cdot \log(a)) = a^x = a^{(*)}(x)$ proving that

$$a^{(*)} = \exp \circ \varphi$$

As by [theorem: 19.27] exp has a derivative at every $x \in \mathbb{R}$ with $\exp'_x = \exp(x)$ we can use the chain rule [see theorem:16.41] to prove that $a^{(*)}$ has a derivative at every $x \in \mathbb{R}$ and that

$$\begin{array}{rcl}
(a^{(*)})'_x & = & (\exp \circ \varphi)'_x \\
& = & \exp'_{\varphi(x)} \cdot \varphi'_x \\
& = & \exp(\varphi(x)) \cdot \varphi'_x \\
& = & \exp(x \cdot \log(a)) \cdot \varphi'_x \\
& = & a^x \cdot \varphi'_x \\
& = & \log(a) \cdot a^x
\end{array}$$

□

Theorem 19.51. *Let $x \in]0, \infty[$ then $(*)^x: [0, \ldots, \infty[\to \mathbb{R}$ defined by $(*)^x(y) = y^x$ is continuous on $[0, \infty[$ [where we use the sub-space topology of $\langle \mathbb{R}, \|\rangle$ on the $[0, \ldots, \infty[$*

Proof. Let $y \in [0, \infty[$ then we have either:

- $\boldsymbol{y = 0}$. Let $\varepsilon \in \mathbb{R}^+$ take then $\delta_1 = \log(\varepsilon) \in \mathbb{R}$ and $\delta = \exp\left(\frac{\delta_1}{x}\right)$. If $z \in B_{||}(0, \delta) \bigcap [0, \infty[$ then we have either:
  - $\boldsymbol{z = 0}$. Then $(\star)^x(z) \underset{x \neq 0}{=} 0 < \varepsilon$
  - $\boldsymbol{z \neq 0}$. Then $0 < z < \delta$ and, as log is strictly increasing by [theorem: 19.38], we have that $\log(z) < \log(\delta)$. As $0 < x, \log(z), \log(\delta)$ it follows that $x \cdot \log(z) < x \cdot \log(\delta)$. Further, as exp is strictly increasing by [theorem: 19.32], we have that

    $$\exp(x \cdot \log(z)) < \exp(x \cdot \log(\delta))$$

    Now $(*)^x(z) = x^x = \exp(x \cdot \log(z))$ and

    $$\exp(x \cdot \log(\delta)) = \exp\left(x \cdot \log\left(\exp\left(\frac{\delta_1}{x}\right)\right)\right) = \exp\left(x \cdot \frac{\delta_1}{x}\right) = \exp(\delta_1) = \exp(\log(\varepsilon)) = \varepsilon$$

so that $(*)^x(z) < \varepsilon$.

So in all cases we have that $(*)^x(z) < \varepsilon$, as further by [theorem: 19.42 (2,3)] $0 \leqslant (\star)^x(x)$ it follows that $|(*)^x(z)| < \varepsilon$ so that $(*)^x(z) \in B_{||}(0,\varepsilon)$. This proves that

$$(*)^x\big(B_{||}(0,\delta)\bigcap [0,\infty[\big) \subseteq B_{||}(0,\varepsilon) \underset{(*)^x(0)}{=} B_{||}((\star)^x(0),\varepsilon)$$

so that $(*)^x$ is continuous at 0.

$y \neq 0$. Let $\varepsilon \in \mathbb{R}^+$. Then $y \in]0,\infty[$ and, as $f\colon]0,\infty[\to \mathbb{R}$ defined by $f^x(z) = z^x$ has a derivative at y [see theorem: 19.49], f is continuous at y [see theorems: 16.31, 16.32]. So there exist a $\delta_1 \in \mathbb{R}^+$ such that

$$f\big(B_{||}(y,\delta_1)\bigcap]0,\infty[\big) \subseteq B_{||}(f(y),\varepsilon)$$

As $0 < y$ we have that $\delta = \min(\delta_1, y) \in \mathbb{R}^+$ if now $0 \in B_{||}(y,\delta)$ then $y = |y| = |y-0| < \delta_1 \leqslant y$ leading to the contradiction $y < y$. Hence $0 \notin B_{||}(y,\delta)$ so that for $z \in B_{||}(y,\delta)\bigcap [0,\infty[$ we have $z \in B_{||}(y,\delta)\bigcap]0,\infty[\subseteq B_{||}(y,\delta)\bigcap [0,\infty[$ or

$$B_{||}(y,\delta)\bigcap [0,\infty[= B_{||}(y,\delta)\bigcap]0,\infty[$$

Hence if $z \in (*)^x(B_{||}(y,\delta)\bigcap [0,\infty[) = (*)^x(B_{||}(y,\delta)\bigcap]0,\infty[)$ then there exist a $u \in B_{||}(y,\delta)\bigcap]0,\infty[$ such that $z = (*)^x(u) = u^x = f(u) \in f(B_{||}(y,\delta_1)\bigcap]0,\infty[)$ proving that

$$(*)^x\big(B_{||}(y,\delta)\bigcap [0,\infty[\big) \subseteq f\big(B_{||}(y,\delta_1)\bigcap]0,\infty[\big) \subseteq B_{||}(f(y),\varepsilon)$$

As $y \neq 0$ then $f(y) = y^x = (*)^x(y)$ we have proved that

$$(*)^x\big(B_{||}(y,\delta)\bigcap [0,\infty[\big) \subseteq B_{||}((*)^x(y),\varepsilon)$$

so that $(*)^x$ is continuous at y. □

The above theorem is needed to prove a important inequality using generalized powers, first we have to prove a little lemma.

Lemma 19.52. *Let $p \in]1,\infty[$ and define*

$$f_p\colon]0,\infty[\to \mathbb{R} \text{ by } f_p(x) = (1 - x^{1-p}) + (p-1)\cdot(1-x)$$

then we have for $x \in]0,\infty[$

$$x = 1 \Leftrightarrow f_p(x) = 0$$

Proof.

$\Rightarrow$. If $x = 1$ then

$$f_p(x) = f_p(1) = (1 - 1^{1-p}) + (p-1)\cdot(1-1) \underset{\text{[theorem: 19.42(5)]}}{=} (1-1) + (p-1)\cdot(1-1) = 0$$

$\Leftarrow$. As

$$\begin{aligned}
(-(\star)^{1-p} + C_p + (1-p)\cdot \mathrm{Id}_{]0,\infty[})(x) &= -(*)^{1-p}(x) + C_p(x) + (1-p)\cdot \mathrm{Id}_{]0,\infty[}(x) \\
&= -x^{1-p} + p + (1-p)\cdot x \\
&= (1 - x^{1-p}) + p - 1 - (p-1)\cdot x \\
&= (1 - x^{1-p}) + (p-1)\cdot(1-x) \\
&= f_p(x)
\end{aligned}$$

so that

$$f_p = -(\star)^{1-p} + C_p + (1-p)\cdot \mathrm{Id}_{]0,\infty[} \tag{19.33}$$

As $(\star)^{(1-p)}$, C_p and $\mathrm{Id}_{]0,\infty[}$ has a derivative at every $x \in]0,\infty[$ [see examples: 19.49, 16.36, 16.37] it follows that f_p has a derivative at every $x \in]0,\infty[$ and

$$\begin{aligned}
(f_p)'_x &= -((\star)^{1-p})'_x + (1-p)\cdot(\mathrm{Id}_{]0,\infty[})'_x \\
&= -(1-p)\cdot x^{(1-p)-1} + (1-p) \\
&= (p-1)\cdot x^{-p} - (p-1) \\
&= ((p-1)\cdot(*)^{-p} + C_{-(p-1)})(x)
\end{aligned}$$

So that

$$(f_p)'_1 = (p-1)\cdot 1^{-p} - (p-1) = 0 \tag{19.34}$$

Further if we define $(f_p)' :]0,\infty[\to \mathbb{R}$ by $(f_p)'(x) = (f_p)'_x$ then

$$(f_p)' = (p-1)\cdot(*)^{-p} + C_{-(p-1)}$$

Using [examples: 19.49, 16.36] again it follows that $(f_p)'$ has a derivative at every $x \in]0,\infty[$ and

$$(f_p)^{(2)}_x = (p-1)\cdot(-p)\cdot x^{-p-1} = p\cdot(1-p)\cdot x^{-p-1}$$

As $0 < x$ we have by [theorem: 19.42] that $0 < x^{-p-1}$, further as $p \in]1,\infty[$ we have $0 < p\cdot(p-1)$ so that

$$\forall x \in]0,\infty[\text{ we have } 0 < (f_p)^2_x$$

Hence using [theorem: 16.154] it follows that

$$(f_{|p})' \text{ is strictly increasing} \tag{19.35}$$

As $(*)^{1-p}$ is continuous [see theorem: 19.51], C_p is continuous and $\mathrm{Id}_{]0,\infty[}$ is continuous [see examples: 14.132, 14.133] we can use [theorem: 14.145] proving that $f_{|p}$ is continuous,

$$f_{|p} \text{ is continuous on }]0,\infty[\tag{19.36}$$

Let $x \in]0,\infty[$ such that $f_p(x) = 0$. Assume that $x \neq 1$ then we have either:

$x < 1$. Then by [eq: 19.36] and [theorem: 14.136] $(f_p)_{|[x,1]}$ is continuous, further $\forall z \in]x,1[$ we have that $f_{|]x,1[}$ has a derivative on $]x,1[$ and $f_{|[x,1]}(x) = f(x) = 0 = f(1) = f_{|[1,x]}(1)$ so that we can apply Rolle's theorem [theorem: 16.151] to find a $\zeta \in]x,1[$ such that $(f_{|p|})'_\zeta = 0$. As $(f_p)'$ is strict increasing we have

$$0 = (f_p)'_\zeta = (f_p)'(\zeta) < (f_p)'(1) = (f_p)'_1 \underset{\text{[eq: 19.34]}}{=} 0$$

leading to the contradiction $0 < 0$.

$1 < x$. Then by [eq: 19.36] and [theorem: 14.136] $(f_p)_{|[1,x]}$ is continuous, further $\forall z \in]1,x[$ we have that $f_{|]1,x[}$ has a derivative on $]1,x[$ and $f_{|[1,x]}(x) = f(x) = 0 = f(1) = f_{|[1,x]}(1)$ so that we can apply Rolle's theorem [theorem: 16.151] to find a $\zeta \in]1,x[$ such that $(f_{|p|})'_\zeta = 0$. As $(f_p)'$ is strict increasing we have

$$0 \underset{\text{[eq: 19.34]}}{=} (f_p)'_1 = (f_p)'(1) < (f_p)'(\zeta) = (f_p)'_\zeta = 0$$

leading to the contradiction $0 < 0$.

As in ail cases we have a contradiction the assumption is wrong and we must have

$$x = 1$$

□

Theorem 19.53. (Young's inequality) *Let $p, q \in]0,\infty[$ such that $\frac{1}{p} + \frac{1}{q} = 1$ and $a, b \in]0,\infty[= \mathbb{R}^+$ then we have:*

1. $a\cdot b \leqslant \frac{a^p}{p} + \frac{b^q}{q}$
2. *Further for equality the following are equivalent*
   a. $a\cdot b = \frac{a^p}{p} + \frac{b^q}{q}$
   b. $b = a^{p-1}$
   c. $a^p = b^q$

***Note* 19.54.** *If $p \leqslant 1$ then $\frac{1}{p} \geqslant 1$ so that $\frac{1}{q} = 1 - \frac{1}{p} \leqslant 0$ contradicting $0 < q \Rightarrow 0 < \frac{1}{q}$ and if $q \leqslant 1$ then $\frac{1}{q} \geqslant 1$ so that $\frac{1}{p} = 1 - \frac{1}{q} \leqslant 0$ contradicting $0 < p \Rightarrow 0 < \frac{1}{p}$. Hence the condition $\frac{1}{p} + \frac{1}{q} = 1 \wedge p, q \in]0,1[$ automatically includes $a, b \in]1,\infty[$.*

Proof.

1. We have

$$\begin{aligned} a\cdot b &\underset{\text{[theorem: 19.38]}}{=} \exp(\log(a\cdot b)) \\ &\underset{\text{[theorem: 19.38]}}{=} \exp(\log(a) + \log(b)) \\ &= \exp\left(\frac{1}{p}\cdot p\cdot\log(a) + \frac{1}{q}\cdot q\cdot\log(b)\right) \\ &\underset{\text{[theorem: 19.42]}}{=} \exp\left(\frac{1}{p}\cdot\log(a^p) + \frac{1}{q}\cdot\log(b^q)\right) \end{aligned} \tag{19.37}$$

For $\log(a^p)$, $\log(b^q)$ we have either:

$\log(a^p)=\log(b^q)$. Then

$$\begin{aligned}\exp\left(\frac{1}{p}\cdot\log(a^p)+\frac{1}{q}\cdot\log(b^q)\right) &= \exp\left(\left(\frac{1}{p}+\frac{1}{q}\right)\cdot\log(a^p)\right)\\ &= \exp(\log(a^p))\\ &= \left(\frac{1}{p}+\frac{1}{q}\right)\cdot\exp(\log(a^p))\\ &= \frac{1}{p}\cdot\exp(\log(a^p))+\frac{1}{q}\cdot\exp(\log(a^p))\\ &= \frac{1}{p}\cdot\exp(\log(a^p))+\frac{1}{q}\cdot\exp(\log(b^q))\end{aligned}$$

$\log(a^p)<\log(b^q)$. Then as exp is convex [see theorem: 19.32] it follows from [theorem: 16.156] that

$$\exp\left(\frac{1}{p}\cdot\log(a^p)+\frac{1}{q}\cdot\log(b^q)\right)\leqslant\frac{1}{p}\cdot\exp(\log(a^p))+\frac{1}{q}\cdot\exp(\log(b^q))$$

$\log(a^p)>\log(b^q)$. hen as exp is convex [see theorem: 19.32] it follows from [theorem: 16.156] that

$$\begin{aligned}\exp\left(\frac{1}{p}\cdot\log(a^p)+\frac{1}{q}\cdot\log(b^q)\right) &= \exp\left(\frac{1}{q}\cdot\log(b^q)+\frac{1}{p}\cdot\log(a^p)\right)\\ &\leqslant \frac{1}{q}\cdot\exp(\log(b^q))+\frac{1}{p}\cdot\exp(\log(a^p))\\ &= \frac{1}{p}\cdot\exp(\log(a^p))+\frac{1}{q}\cdot\exp(\log(b^q))\end{aligned}$$

so in all cases we have $\exp\left(\frac{1}{p}\cdot\log(a^p)+\frac{1}{q}\cdot\log(b^q)\right)\leqslant\frac{1}{p}\cdot\exp(\log(a^p))+\frac{1}{q}\cdot\exp(\log(b^q))$ which combined with [eq: 19.37] gives

$$\begin{aligned}a\cdot b &\leqslant \frac{1}{p}\cdot\exp(\log(a^p))+\frac{1}{q}\cdot\exp(\log(b^q))\\ &\underset{\text{[eq: 19.38}}{=} \frac{a^p}{p}+\frac{b^q}{q}\end{aligned}$$

2. First for $p,q\in]0,\infty[$ we have

$$\begin{aligned}\frac{1}{p}+\frac{1}{q}=1 &\underset{p\neq0}{\Leftrightarrow} p\cdot\left(\frac{1}{p}+\frac{1}{q}\right)=p\\ &\Leftrightarrow 1+\frac{p}{q}=p\\ &\Leftrightarrow \frac{p}{q}=p-1\\ \frac{1}{p}+\frac{1}{q}=1 &\underset{p\neq0}{\Leftrightarrow} q\cdot\left(\frac{1}{p}+\frac{1}{q}\right)=q\\ &\Leftrightarrow \frac{q}{p}+1=q\\ &\Leftrightarrow \frac{q}{p}=q-1\end{aligned}$$

so that if $\frac{1}{p}+\frac{1}{q}=1$ then

$$\frac{p}{q}=p-1\wedge\frac{q}{p}=q-1\Rightarrow(p-1)\cdot(q-1)=1 \tag{19.38}$$

Now for the equivalences:

$a\Rightarrow b$. As $a\cdot b=\frac{a^p}{p}+\frac{b^q}{q}$ then we have

$$\begin{aligned}a\cdot b &= \frac{a^p}{p}+\frac{b^q}{q}\\ &= \frac{q\cdot a^p+p\cdot b^q}{p\cdot q}\\ &\underset{\frac{1}{p}+\frac{1}{q}=1\Rightarrow\frac{p+q}{p\cdot q}=1\Rightarrow\frac{1}{p\cdot q}=\frac{1}{p+q}}{=} \frac{q\cdot a^p+p\cdot b^q}{p+q}\end{aligned}$$

so that [as $a \cdot b \in]0, \infty[$] we have

$$\begin{aligned}
p+q &= \frac{q \cdot a^p + p \cdot b^q}{a \cdot b} && \Rightarrow \\
p+q &= q \cdot \frac{a^p}{a \cdot b} + p \cdot \frac{b^q}{a \cdot b} && \underset{0<a,b \wedge \text{[theorem: 19.42(8)]}}{\Rightarrow} \\
p+q &= q \cdot \frac{a^{p-1}}{b} + p \cdot \frac{b^{q-1}}{b} && \Rightarrow \\
p \cdot \left(1 - \frac{b^{q-1}}{b}\right) &= q \cdot \left(\frac{a^{p-1}}{b} - 1\right) && \Rightarrow \\
\frac{a^{p-1}}{b} - 1 &= \frac{p}{q} \cdot \left(1 - \frac{b^{q-1}}{b}\right) && \underset{\text{[eq: 19.38]}}{\Rightarrow} \\
\frac{a^{p-1}}{b} - 1 &= (p-1) \cdot \left(1 - \frac{b^{q-1}}{b}\right) && \underset{\text{[theorem: 19.42(9)]}}{\Rightarrow} \\
\frac{b^{-1}}{a^{-(p-1)}} - 1 &= (p-1) \cdot \left(1 - \frac{b^{q-1}}{b}\right) && \underset{\text{[eq: 19.38]}}{\Rightarrow} \\
\frac{b^{-(q-1)\cdot(p-1)}}{a^{-(p-1)}} - 1 &= (p-1) \cdot \left(1 - \frac{b^{q-1}}{b}\right) && = \\
\frac{b^{(q-1)\cdot(1-p)}}{a^{(1-p)}} - 1 &= (p-1) \cdot \left(1 - \frac{b^{q-1}}{b}\right) && \underset{\text{[theorem: 19.42]}}{\Rightarrow} \\
\left(\frac{b^{q-1}}{a}\right)^{1-p} - 1 &= (p-1) \cdot \left(1 - \frac{b^{q-1}}{b}\right) && = \\
0 &= \left(1 - \left(\frac{b^{q-1}}{a}\right)^{1-p} + (p-1) \cdot \left(1 - \frac{b^{q-1}}{b}\right)\right) && \underset{\text{[lemma: 19.52]}}{=} \\
0 &= f_p\left(\frac{b^{q-1}}{a}\right)
\end{aligned}$$

so that by [lemma: 19.52] we conclude that $\frac{b^{q-1}}{a} = 1$ or $a = b^{q-1}$. Hence

$$a^{p-1} = (b^{q-1})^{1-q} \underset{\text{[theorem: 19.42]}}{=} b^{(q-1)\cdot(p-1)} \underset{\text{[eq: 19.38]}}{\Rightarrow} b^1 = b$$

proving that

$$b = a^{p-1}$$

***b* ⇒ *a*.** If $b = a^{p-1}$ then

$$\begin{aligned}
\frac{a^p}{p} + \frac{b^q}{q} &= \frac{a^p}{p} + \frac{(a^{p-1})^q}{q} \\
&\underset{\text{[eq: 19.38]}}{=} \frac{a^p}{p} + \frac{\left(a^{\frac{p}{q}}\right)^q}{q} \\
&\underset{\text{[theorem: 19.42]}}{=} \frac{a^p}{p} + \frac{a^{\frac{p}{q}\cdot q}}{q} \\
&= \frac{a^p}{p} + \frac{a^p}{q} \\
&= \left(\frac{1}{p} + \frac{1}{q}\right) \cdot a^p \\
&= a^p \\
&= a^{(p-1)+1} \\
&\underset{\text{[theorem: 19.42]}}{=} a^{(p-1)} \cdot a^1 \\
&= b \cdot a^1 \\
&= a \cdot b
\end{aligned}$$

***b* ⇒ *c*.** If $b = a^{p-1}$ then we have

$$\begin{aligned} b^q &= (a^{p-1})^q \\ &\underset{\text{[eq: 19.38]}}{=} \left(a^{\frac{p}{q}}\right)^q \\ &\underset{\text{[theorem: 19.42]}}{=} a^{\frac{p}{q}\cdot q} \\ &= a^p \end{aligned}$$

***c* ⇒ *b*.** If $a^p = b^q$ then

$$\begin{aligned} b &= b^{q\cdot\frac{1}{q}} \\ &\underset{\text{[theorem: 19.42]}}{=} (b^q)^{\frac{1}{q}} \\ &= (a^p)^{\frac{1}{q}} \\ &\underset{\text{[theorem: 19.42]}}{=} a^{\frac{p}{q}} \\ &\underset{\text{[eq: 19.38]}}{=} a^{p-1} \end{aligned}$$

□

19.1.7 Trigonometric functions

For the generalized powers and the natural logarithm we studied the behavior of the exponential function in the real domain. For trigonometric functions we consider the behavior of the exponential function in the complex domain.

Theorem 19.55.

1. *$\forall z \in \mathbb{C}$ we have that $\overline{\exp(z)} = \exp(z)$*
2. *$\forall z \in \mathbb{C}$ we have that $|\exp(z)| = \exp(\mathrm{Re}(z))$*
3. *$\forall x + i\cdot y \in \mathbb{C}$ we have that $|\exp(z)| = \exp(x)$ and $|\exp(i\cdot y)| = \exp(0) = 1$*

Proof.

1. We have

$$\begin{aligned} \exp(\overline{z}) &= \sum_{i=0}^{n} \frac{\overline{z}^i}{i!} \\ &= \lim_{n\to\infty} \sum_{i=0}^{n} \frac{\overline{z}^i}{i!} \\ &\underset{\text{[theorem: 10.82]}}{=} \lim_{n\to\infty} \overline{\sum_{i=0}^{n} \frac{z^i}{i!}} \\ &\underset{\text{[theorem: 14.304]}}{=} \overline{\lim_{n\to\infty} \sum_{i=n}^{\infty} \frac{z^i}{i!}} \\ &= \overline{\exp(z)} \end{aligned}$$

2. We have

$$\begin{aligned} |\exp(z)|^2 &\underset{\text{[theorem: 10.84]}}{=} \exp(z)\cdot\overline{\exp(z)} \\ &\underset{(1)}{=} \exp(z)\cdot\exp(\overline{z}) \\ &\underset{\text{[theorem: 19.31]}}{=} \exp(z+\overline{z}) \\ &\underset{\text{[theorem: 10.82]}}{=} \exp(2\cdot\mathrm{Re}(z)) \\ &= \exp(\mathrm{Re}(z)+\mathrm{Re}(z)) \\ &\underset{\text{[theorem: 19.31]}}{=} \exp(\mathrm{Re}(z))\cdot\exp(\mathrm{Re}(z)) \\ &= \exp(\mathrm{Re}(z))^2 \end{aligned}$$

Now as $|\exp(z)| \in \mathbb{R}^+$ and $\exp(\mathrm{Re}(z)) \in \mathbb{R}^+$[see theorem: 19.32] it follows from [theorem: 10.66] that $\exp(z) = \exp(\mathrm{Re}(z))$.

3. If $z = x + i \cdot y$ then $|\exp(z)| \underset{(2)}{=} \exp(\mathrm{Re}(z)) = \exp(x)$, further

$$|\exp(i \cdot y)| \underset{(2)}{=} \exp(\mathrm{Re}(i \cdot y)) = \exp(0) \underset{\text{[theorem: 19.32]}}{=} 1$$

□

We define now the trigonometric functions in terms of the exponential functions=.

Definition 19.56. (Trigonometric functions)

1. $\cos: \mathbb{C} \to \mathbb{C}$ *is defined by* $\cos(z) = \frac{\exp(i \cdot z) + \exp(-i \cdot z)}{2} \underset{\text{[theorem: 19.42(6)]}}{=} \frac{\mathrm{e}^{i \cdot z} + \mathrm{e}^{-i \cdot z}}{2}$
2. $\sin: \mathbb{C} \to \mathbb{C}$ *is defined by* $\sin(z) = \frac{\exp(i \cdot z) - \exp(-i \cdot z)}{2 \cdot i} \underset{\text{[theorem: 19.42(6)]}}{=} \frac{\mathrm{e}^{i \cdot z} - \mathrm{e}^{-i \cdot z}}{2 \cdot i}$

Theorem 19.57. *We have the following properties for the trigonometric function.*

1. $\forall z \in \mathbb{C}$ *we have* $\cos(z) + i \cdot \sin(z) = \exp(i \cdot z) \underset{\text{[theorem: 19.42(6)]}}{=} \mathrm{e}^{i \cdot z}$.
2. $\cos: \mathbb{C} \to \mathbb{C}$ *and* $\sin: \mathbb{C} \to \mathbb{C}$ *are continuous.*
3. $\cos(0) = 1$.
4. $\sin(0) = 0$.
5. $\forall z \in \mathbb{C}$ *we have:*
   a. $\cos(-z) = \cos(z)$.
   b. $\mathrm{sim}(-z) = -\sin(z)$.
6. $\forall z \in \mathbb{C}$ *we have* $\cos^2(z) + \mathrm{sim}^2(z) = 1$
7. $\forall x, y \in \mathbb{C}$ *we have:*
   a. $\cos(x + y) = \cos(x) \cdot \cos(y) - \sin(x) \cdot \sin(y)$.
   b. $\sin(x + y) = \sin(x) \cdot \cos(y) + \cos(x) \cdot \sin(y)$.
8. $\forall x \in \mathbb{R}$ *we have:*
   a. $\cos(x) \in \mathbb{R}$ *and* $\mathrm{Re}(\mathrm{e}^{i \cdot x}) \underset{\text{[theorem: 19.42(6)]}}{=} \mathrm{Re}(\exp(i \cdot x)) = \cos(x)$
   b. $\sin(x) \in \mathbb{R}$ *and* $\mathrm{Img}(\mathrm{e}^{i \cdot x}) \underset{\text{[theorem: 19.42(6)]}}{=} \mathrm{Img}(\exp(i \cdot x)) = \mathrm{sim}(x)$
9. $\forall x \in \mathbb{R}$ *we have*
$$|\mathrm{e}^{i \cdot x}| \underset{\text{[theorem: 19.42(6)]}}{=} |\exp(i \cdot x)| = 1 \text{ and } |e^{-i \cdot z}| \underset{\text{[theorem: 19.42(6)]}}{=} |\exp(-i \cdot x)| = 1$$
10. $\forall x \in \mathbb{R}$ *we have* $|\cos(x)| \in [0, 1]$ *and* $|\sin(x)| \in [0, 1]$ *or in other words as* $\cos(x), \sin(x) \in \mathbb{R}$ $-1 \leqslant \cos(x), \sin(x) \leqslant 1$

Proof.

1. Let $z \in \mathbb{C}$ then
$$\begin{aligned} \cos(z) + i \cdot \sin(z) &= \frac{\exp(i \cdot z) + \exp(-i \cdot z)}{2} + i \cdot \frac{\exp(i \cdot z) - \exp(-i \cdot z)}{2 \cdot i} \\ &= \frac{\exp(i \cdot z) + \exp(-i \cdot z) + \exp(i \cdot z) - \exp(-i \cdot z)}{2} \\ &= \exp(i \cdot z) \end{aligned}$$
2. Note that $h: \mathbb{C} \to \mathbb{C}$ defined by $f = i \cdot \mathrm{Id}_{\mathbb{C}}$ and $g: \mathbb{C} \to \mathbb{C}$ defined by $g = -i \cdot \mathrm{Id}_{\mathbb{C}}$ are continuous [see example: 14.133] and theorem: 14.145]. As exp is continuous [see theorem: 19.28] it follows from [theorem: 14.139] that $\exp \circ f$ and $\exp \circ g$ are continuous. Hence using [theorem: 14.145] $\frac{1}{2} \cdot (\exp \circ f + \exp \circ g)$ and $\frac{1}{2 \cdot i} \cdot (\exp \circ f - \exp \circ g)$ are continuous. Let $z \in \mathbb{C}$ then
$$\left(\frac{1}{2} \cdot (\exp \circ f + \exp \circ g)\right)(z) = \frac{\exp(f(z)) + \exp(g(z))}{2} = \frac{\exp(i \cdot z) + \exp(-i \cdot z)}{2} = \cos(z)$$

and

$$\left(\frac{1}{2\cdot i}\cdot(\exp\circ f-\exp\circ g)\right)(z)=\frac{\exp(f(z))-\exp(g(z))}{2\cdot i}=\frac{\exp(i\cdot z)-\exp(-i\cdot z)}{2\cdot i}=\sin(z)$$

proving that $\frac{1}{2}\cdot(\exp\circ f+\exp\circ g)=\cos$ and $\frac{1}{2\cdot i}\cdot(\exp\circ f-\exp\circ g)=\sin$. Hence cos and sin are continuous.

3. $\cos(0)=\frac{\exp(i\cdot 0)+\exp(i\cdot 0)}{2}=\frac{\exp(0)+\text{ecp}(0)}{2}\underset{\text{[theorem: 19.32]}}{=}\frac{1+1}{2}=1.$

4. $\sin(0)=\frac{\exp(i\cdot 0)-\exp(i\cdot 0)}{2\cdot i}=\frac{\exp(0)-\exp(0)}{2\cdot i}=0.$

5. Let $z\in\mathbb{C}$ then we have:

   a. $\cos(z)=\frac{\exp(-i\cdot z)+\exp(-(-i\cdot z))}{2}=\frac{\exp(i\cdot z)+\exp(-i\cdot z)}{2}=\cos(z).$

   b. $\sin(z)=\frac{\exp(-i\cdot z)-\exp(-(-i\cdot z))}{2\cdot i}=\frac{\exp(-i\cdot z)-\exp(i\cdot z)}{2\cdot i}=-\frac{\exp(i\cdot z)-\exp(-i\cdot z)}{2\cdot i}=-\sin(z)$

6. Let $z\in\mathbb{C}$ then

$$\begin{aligned}
\cos^2(z)+\sin^2(z) &= \frac{(\exp(i\cdot z)+\exp(-i\cdot z))^2}{4}+\frac{(\exp(i\cdot z)-\exp(-i\cdot z))^2}{-4}\\
&= \frac{1}{4}\cdot((\exp(i\cdot z)+\exp(-i\cdot z))^2-(\exp(i\cdot z)-\exp(-i\cdot z))^2)\\
&= \frac{1}{4}\cdot((\exp(i\cdot z))^2+(\exp(-i\cdot z))^2+2\cdot\exp(i\cdot z)\cdot\exp(-i\cdot z)-(\exp(i\cdot z))^2-(\exp(-i\cdot z))^2+2\cdot\exp(i\cdot z)\cdot\\
&\quad\exp(-i\cdot z))\\
&= \frac{1}{4}\cdot 4\cdot\exp(i\cdot z)\cdot\exp(-i\cdot z)\\
&= \exp(i\cdot z)\cdot\exp(-i\cdot z)\\
&\underset{\text{[theorem: 19.31]}}{=} \exp(i\cdot z-i\cdot z)\\
&= \exp(0)\\
&\underset{\text{[theorem: 19.32]}}{=} 1
\end{aligned}$$

7. Let $a_x=\exp(i\cdot x)$, $b_x=\exp(-i\cdot x)$, $a_y=\exp(i\cdot y)$ and $b_y=\exp(-i\cdot y)$ then we have

   a.

$$\begin{aligned}
\cos(x)\cdot\cos(y)-\sin(x)\cdot\sin(y) &=\\
\frac{1}{4}\cdot(a_x+b_x)\cdot(a_y+b_y)+\frac{1}{4}\cdot(a_x-b_x)\cdot(a_y-b_y) &=\\
\frac{1}{4}\cdot[(a_x\cdot a_y+a_x\cdot b_y+b_x\cdot a_y+b_x\cdot b_y)+(a_x\cdot a_y-a_x\cdot b_y-b_x\cdot a_y+b_x\cdot b_y)] &=\\
\frac{1}{4}\cdot[(a_x\cdot a_y+a_x\cdot b_y+b_x\cdot a_y+b_x\cdot b_y)+(a_x\cdot a_y-a_x\cdot b_y-b_x\cdot a_y+b_x\cdot b_y)] &=\\
\frac{1}{4}\cdot[a_x\cdot a_y+a_x\cdot b_y+b_x\cdot a_y+b_x\cdot b_y+a_x\cdot a_y-a_x\cdot b_y-b_x\cdot a_y+b_x\cdot b_y] &=\\
\frac{1}{4}\cdot(2\cdot a_x\cdot a_y+2\cdot b_x\cdot b_y) &=\\
\frac{1}{2}\cdot(\exp(i\cdot x)\cdot\exp(i\cdot y)+\exp(-i\cdot x)\cdot\exp(-i\cdot y)) &=\\
\frac{1}{2}\cdot(\exp(i\cdot x+i\cdot y)+\exp(-i\cdot x-i\cdot y)) &=\\
\frac{1}{2}\cdot(\exp(i\cdot(x+y))+\exp(-i\cdot(x+y))) &=\\
\cos(x+y)
\end{aligned}$$

b.

$$\begin{aligned}
\sin(x)\cdot\cos(y)+\cos(x)\cdot\sin(y) &= \\
\frac{1}{4\cdot i}\cdot((a_x-b_x)\cdot(a_y+b_y)+(a_x+b_x)\cdot(a_y-b_y)) &= \\
\frac{1}{4\cdot i}\cdot(a_x\cdot a_y+a_x\cdot b_y-b_x\cdot a_y-b_x\cdot b_y+a_x\cdot a_y-a_x\cdot b_y+b_x\cdot a_y-b_x\cdot b_y) &= \\
\frac{1}{4\cdot i}\cdot(2\cdot a_x\cdot a_y-2\cdot b_x\cdot b_y) &= \\
\frac{1}{2\cdot i}\cdot(\exp(i\cdot x)\cdot\exp(i\cdot y)-\exp(-i\cdot x)\cdot\exp(-i\cdot y)) &= \\
\frac{1}{2\cdot i}\cdot(\exp(i\cdot x+i\cdot y)-\exp(-i\cdot x-i\cdot y)) &= \\
\frac{1}{2\cdot i}\cdot(\exp(i\cdot(x+y))+\exp(-i\cdot(x+y))) &= \\
\sin(x+y)
\end{aligned}$$

8. Let $x\in\mathbb{R}$ then

a.

$$\begin{aligned}
\cos(x) &= \frac{\exp(i\cdot x)+\exp(-i\cdot x)}{2} \\
&= \frac{\exp(i\cdot x)+\exp(\overline{i\cdot x})}{2} \\
&\underset{\text{[theorem: 19.55]}}{=} \frac{\exp(i\cdot x)+\overline{\exp(i\cdot x)}}{2} \\
&\underset{\text{[theorem: 10.82]}}{=} \frac{2\cdot\mathrm{Re}(\exp(i\cdot x))}{2} \\
&= \mathrm{Re}(\exp(i\cdot x))\in\mathbb{R}
\end{aligned}$$

b.

$$\begin{aligned}
\sin(x) &= \frac{\exp(i\cdot x)-\exp(-i\cdot x)}{2\cdot i} \\
&= \frac{\exp(i\cdot x)-\exp(\overline{i\cdot x})}{2\cdot i} \\
&\underset{\text{[theorem: 19.55]}}{=} \frac{2\cdot i\cdot\mathrm{Img}(\exp(i\cdot x))}{2\cdot i} \\
&= \mathrm{Img}(\exp(i\cdot x))\in\mathbb{R}
\end{aligned}$$

9. Let $x\in\mathbb{R}$ then

$$|e^{i\cdot x}|\underset{\text{[theorem: 19.42(6)]}}{=}|\exp(i\cdot x)|\underset{\text{[theorem: 19.55 (3)]}}{=}=1$$

further

$$|\exp(-i\cdot x)|\underset{x\in\mathbb{R}}{=}|\exp(\overline{i\cdot x})|\underset{\text{[theorem: 19.55]}}{=}|\overline{\exp(i\cdot x)}|\underset{\text{[theorem: 10.84]}}{=}|\exp(i\cdot z)|=1$$

10. Let $x\in\mathbb{R}$ then we have:

$$|\cos(x)|=\frac{1}{2}\cdot|e^{i\cdot x}+e^{-i\cdot x}|\leqslant\frac{1}{2}\cdot(|e^{i\cdot x}|+|e^{-i\cdot x}|)\underset{(9)}{=}\frac{1}{2}\cdot 2=1$$

and

$$|\cos(x)|=\left|\frac{1}{2\cdot i}\right|\cdot|e^{i\cdot x}-e^{-i\cdot x}|\leqslant\frac{1}{2}\cdot(|e^{i\cdot x}|+|e^{-i\cdot x}|)\underset{(9)}{=}\frac{1}{2}\cdot 2=1$$

□

Theorem 19.58. *$\forall z\in\mathbb{C}$ we have that $\cos:\mathbb{C}\to\mathbb{C}$ has a derivative at z with*

$$\cos'_z=-\sin(z)$$

and $\sin:\mathbb{C}\to\mathbb{C}$ has a derivative at z with

$$\sin'_z=\cos(z)$$

Proof. As $\forall z \in \mathbb{C}$ we have that

$$\left(\frac{1}{2} \cdot (\exp \circ (i \cdot \mathrm{Id}_C) + \exp \circ (-i \cdot \mathrm{Id}_{\mathbb{C}}))\right)(z) = \frac{1}{2} \cdot (\exp(i \cdot x) + \exp(-i \cdot x)) = \cos(x)$$

hence

$$\cos = \frac{1}{2} \cdot (\exp \circ (i \cdot \mathrm{Id}_C) + \exp \circ (-i \cdot \mathrm{Id}_{\mathbb{C}}))$$

Likewise we have that

$$\left(\frac{1}{2 \cdot i} \cdot (\exp \circ (i \cdot \mathrm{Id}_C) - \exp \circ (-i \cdot \mathrm{Id}_{\mathbb{C}}))\right)(z) = \frac{1}{2 \cdot i} \cdot (\exp(i \cdot x) - \exp(-i \cdot x)) = \sin(x)$$

hence

$$\sin = \frac{1}{2} \cdot (\exp \circ (i \cdot \mathrm{Id}_C) - \exp \circ (-i \cdot \mathrm{Id}_{\mathbb{C}}))$$

Let $z \in \mathbb{C}$ then by [theorem: 19.27], [examples: 16.37], [theorem: 16.166] and the chain rule [theorem: 16.41] it follows that sin and cos has a derivative at z and

$$\begin{aligned}
\cos'_z &= \left(\frac{1}{2} \cdot (\exp \circ (i \cdot \mathrm{Id}_{\mathbb{C}}) + \exp \circ (-i \cdot \mathrm{Id}_{\mathbb{C}}))\right)'_z \\
&= \frac{1}{2} \cdot ((\exp \circ (i \cdot \mathrm{Id}_{\mathbb{C}}))'_z + (\exp \circ (-i \cdot \mathrm{Id}_{\mathbb{C}}))'_z) \\
&= \frac{1}{2} \cdot (\exp'_{(i \cdot \mathrm{Id}_{\mathbb{C}})(z)} \cdot i \cdot (\mathrm{Id}_{\mathbb{C}})'_c + \exp'_{(-i \cdot \mathrm{Id}_{\mathbb{C}})(z)} \cdot (-i) \cdot (\mathrm{Id}_{\mathbb{C}})'_z) \\
&= \frac{1}{2} \cdot (\exp'_{i \cdot z} \cdot i \cdot 1 + \exp'_{-i \cdot z} \cdot (-i) \cdot 1) \\
&= \frac{1}{2} \cdot (i \cdot \exp(i \cdot z) - i \cdot \exp(-i \cdot z)) \\
&= \frac{1}{2} \cdot \frac{i}{i} \cdot i \cdot (\exp(i \cdot z) - \exp(-i \cdot z)) \\
&= -\frac{1}{2 \cdot i} \cdot (\exp(i \cdot x) - \exp(-i \cdot z)) \\
&= \sin(z) \\
\sin'_z &= \left(\frac{1}{2 \cdot i} \cdot (\exp \circ (i \cdot \mathrm{Id}_{\mathbb{C}}) - \exp \circ (-i \cdot \mathrm{Id}_{\mathbb{C}}))\right)'_z \\
&= \frac{1}{2 \cdot i} \cdot ((\exp \circ (i \cdot \mathrm{Id}_{\mathbb{C}}))'_z - (\exp \circ (-i \cdot \mathrm{Id}_{\mathbb{C}}))'_z) \\
&= \frac{1}{2 \cdot i} \cdot (\exp'_{(i \cdot \mathrm{Id}_{\mathbb{C}})(z)} \cdot i \cdot (\mathrm{Id}_{\mathbb{C}})'_c - \exp'_{(-i \cdot \mathrm{Id}_{\mathbb{C}})(z)} \cdot (-i) \cdot (\mathrm{Id}_{\mathbb{C}})'_z) \\
&= \frac{1}{2 \cdot i} \cdot (\exp'_{i \cdot z} \cdot i \cdot 1 + \exp'_{-i \cdot z} \cdot i \cdot 1) \\
&= \frac{1}{2 \cdot i} \cdot i \cdot (\exp(i \cdot z) + \exp(-i \cdot z)) \\
&= \frac{1}{2} \cdot (\exp(i \cdot z) + \exp(-i \cdot z)) \\
&= \cos(z)
\end{aligned}$$

□

The next theorem shows that there exist a $x_0 \in \mathbb{R}$ such that $\cos(x_0)$. This will be used to define the π and show that sin and cos are periodic.

Theorem 19.59. $\exists x_0 \in [0, \infty[$ *such that* $\cos(x_0) = 0$.

Proof. We proceed by contradiction. So assume that

$$\textbf{(assumption)}\ \forall x \in [0, \infty[\ \cos(x) \neq 0 \tag{19.39}$$

Assume that there exist $x \in [0, \infty[$ such that $\cos(x) < 0 < 1 \underset{\text{[theorem: 19.57]}}{=} \cos(0)$ then

$$\cos_{|[0,x]}(x) = \cos(x) \leqslant 0 < \cos_{|[0,z]}$$

Further as $\cos: \mathbb{R} \to \mathbb{R}$ is continuous it follows from [theorem: 14.136] that $\cos_{[0,x]}$ is continuous. So we can use the intermediate value theorem [theorem: 14.403] to find a $y \in [0, x]$ such that $\cos(y) = \cos_{|[0,1]}(y) = 0$ which contradicts [eq: 19.39]. So $\forall x \in [0, \infty[$ we must have that $0 \leqslant \cos(x)$ or using [eq: 19.39] that $0 < \cos(x)$, as by [theorem: 19.58] $\sin'_x$ exist and $\sin'_x = \cos(x) > 0$ it follows from [theorem: 16.154]

$$\sin \text{ is strictly increasing on } [0, \infty[\tag{19.40}$$

As $\sin(0) \underset{\text{[theorem: 19.57]}}{=} 0$ we conclude that

$$\forall x \in]0, \infty[\text{ we have } 0 < \sin(x) \tag{19.41}$$

As $\forall x, y \in \mathbb{R}$ we have by [theorem: 19.57] that $\cos(x) < 1$ and $-\cos(y) < 1$ it follows that

$$\forall x, y \in \mathbb{R} \text{ we have } \cos(x) - \cos(y) < 1 + 1 = 2 \tag{19.42}$$

Let $x, y \in \mathbb{R}$ with $0 < x < y$. By [theorem: 19.58] we have that $\forall t \in \mathbb{R}$ $\cos'_t$ exist and $\cos'_t = -\sin(t)$ so that if we define

$$\cos': \mathbb{R} \to \mathbb{R} \text{ by } \cos'(t) = \cos'_t$$

it follows that

$$\cos' = -\sin \text{ which is continuous [see theorem: 19.57(2)]}$$

So using [theorem: 16.167] it follows that

$$\cos_{|[x,y]} \text{ has a derivative at every } t \in [x, y] \text{ and } (\cos_{|[x,y]})' = \sin_{|[x,y]} \tag{19.43}$$

As sin is continuous on $\mathbb{R}$, hence by [theorem: 14.136] on $[x, y]$ the Riemann integral exist [see theorem: 15.25] and we have

$$\begin{aligned}
\int_x^y \sin_{|[x,y]} &= \int_x^y -(\cos_{|[x,y]})' \\
&\underset{\text{[theorem: 15.28]}}{=} -\int_x^y (\cos_{|[x,y]})' \\
&\underset{\text{[eq: 19.43] and [theorem: 16.170]}}{=} -(\cos_{|[x,y]}(y) - \cos_{|[x,y]}(x)) \\
&= \cos(x) = \cos(y) \\
&\leqslant_{\text{[eq: 19.42]}} 2
\end{aligned}$$

proving that

$$\int_x^y \sin_{|[x,y]} \leqslant 2 \tag{19.44}$$

Define now the constant function

$$C_{\sin(x)}: [x, y] \to \mathbb{R} \text{ by } C_{\sin(x)} = \sin(x)$$

Then

$$\forall t \in [x, y] \text{ we have } C_{\sin(x)}(t) = \sin(x) \leqslant_{\text{[eq: 19.40]}} \sin(t) = \sin_{[x,y]}(t) \tag{19.45}$$

Now

$$\begin{aligned}
\sin(x) \cdot (y - x) &\underset{\text{[theorem: 15.29]}}{=} \int_x^y C_{\sin(x)} \\
&\leqslant_{\text{[eq: 19.45] and [theorem: 15.26]}} \int_x^y \sin_{|[x,y]} \\
&\leqslant_{\text{[eq: 19.44]}} 2
\end{aligned}$$

Hence taking in account that by [eq: 19.41] $0 < \sin(x)$ it follows that

$$\forall x, y \in \mathbb{R} \text{ with } 0 < x < y \text{ we have } y - x < \frac{2}{\sin(x)}$$

Take now $x \in \mathbb{R}^+$ and $y = \frac{2}{\sin(x)} + x + 1$ then, as $0 < \sin(x)$, we have that $0 < x < y$ so that $\frac{2}{\sin(x)} + 1 = y - x < \frac{2}{\sin(x)}$ leading to the contradiction $1 < 0$. Hence the assumption [eq: 19.39] is wrong and there exist a $x_0 \in [0, \infty[$ such that $\cos(x_0) = 0$. □

Lemma 19.60. $\{x \in [0, \infty[| \cos(x) = 0\} = \cos^{-1}(\{0\}) \bigcap [0, \infty[$ *has a minimum.*

Proof. Using [theorem: 19.59] it follows that $\cos^{-1}(\{0\}) \bigcap [0, \infty[\neq 0$, further $\cos^{-1}(\{0\}) \bigcap [0, \infty[$ is bounded below by 0, hence, as $\mathbb{R}$ is conditional complete [see theorem: 10.18], it follows that

$$x_0 = \inf\left(\cos^{-1}(\{0\}) \bigcap [0, \infty[\right) \text{ exist and } 0 \leqslant x_0$$

As $\{0\}$ is closed [see theorems: 14.204, 14.206] and cos is continuous it follows from [theorem: 14.137] that $\cos^{-1}(\{0\})$. Further by [theorems: 14.100] $[0,\infty[$ is closed so that

$$\cos^{-1}(\{0\})\bigcap [0,\infty[\text{ is closed}$$

Assume now that $x_0 \notin \cos^{-1}(\{0\})\bigcap [0,\infty[$ then $x_0 \in \mathbb{R}\setminus\cos^{-1}(\{0\})\bigcap [0,\infty[$ a open set, so there exist a $\delta \in \mathbb{R}^+$ such that $x_0 \in]x_0-\delta, x_0+\delta[\subseteq \mathbb{R}\setminus\cos^{-1}(\{0\})\bigcap [0,\infty[$ or

$$]x_0-\delta, x_0+\delta[\bigcap \cos^{-1}(\{0\})\bigcap [0,\infty[= \varnothing \tag{19.46}$$

As $\inf(\cos^{-1}(\{0\})\bigcap [0,\infty[) = x_0 < x_0+\delta$ we have that there exist a $y \in \cos^{-1}(\{0\})\bigcap [0,\infty[$ such that $x_0-\delta < x_0 \leqslant y < x_0+\delta$ so that $y \in]x_0-\delta, x_0+\delta[\bigcap \cos^{-1}(\{0\})\bigcap [0,\infty[$ contradicting [eq: 19.46]. Hence we have that $x_0 \in \cos^{-1}(\{0\})\bigcap [0,\infty[$ or

$$x_0 = \min\left(\cos^{-1}(\{0\})\bigcap [0,\infty[\right)$$ □

The above allows us to finally define π.

Definition 19.61. *π is defined by*

$$\pi = 2\cdot\min\left(\cos^{-1}(\{0\})\bigcap [0,\infty[\right)$$

so that

$$\frac{\pi}{2} = \min\left(\cos^{-1}(\{0\})\bigcap [0,\infty[\right)$$

In other words $\frac{\pi}{2}$ is the smallest positive real number x_0 such that $\cos(x_0)=0$.

***Note* 19.62.** *As $\cos(0) \underset{[\text{theorem: } 19.57]}{=} 1$ we must have that $0<\pi$.*

Next we prove that π and the trigonometric functions have the usual properties.

Theorem 19.63.

1. *$\forall x \in \left[0,\frac{\pi}{2}\right[$ we have $0<\cos(x)$ and by the above definition $\cos\left(\frac{\pi}{2}\right)=0$.*
2. *$\forall x \in \left]0,\frac{\pi}{2}\right]$ we have $0<\sin(x)$ and $\sin\left(\frac{\pi}{2}\right)=1$.*

Proof.

1. Assume that $\exists x \in \left[0,\frac{\pi}{2}\right[$ such that $\cos(x)\leqslant 0$. If $\cos(x)=0$ then as $\frac{\pi}{2}=\min\left(\cos^{-1}(\{0\})\bigcap [0,\infty[\right)$ we have $\frac{\pi}{2}\leqslant x<\frac{\pi}{2}$ a contradiction, so we must have that $\cos(x)<0$. Then we have

$$\cos_{|[0,\frac{\pi}{2}[}(x) < 0 < 1 \underset{[\text{eq: } 19.57]}{=} \cos(0) = \cos_{|[0,\frac{\pi}{2}]}(0)$$

As $\cos_{|[0,\frac{\pi}{2}]}$ is continuous on $\left[0,\frac{\pi}{2}\right]$ [see theorems: 19.57(2)] we can use the intermediate value theorem [theorem: 14.403] to find a $z \in [0,x]$ such that $\cos(z)=\cos_{|[0,x]}(z)=0$ hence $z \in \cos^{-1}(\{0\})\bigcap [0,\infty[$. So we have

$$z \leqslant x < \frac{\pi}{2} = \min\left(\cos^{-1}(\{0\})\bigcap [0,\infty[\right) \leqslant z$$

a contradiction. So the assumption is wrong and we must have that $\forall x \in \left[0,\frac{\pi}{2}\right[$ we have $0<\cos(x)$.

2. As $\forall x \in \left[0,\frac{\pi}{2}\right[$ we have $\sin'_x \underset{[\text{theorem: } 19.58]}{=} \cos(x) > 0$ [by (1)] it follows from [theorem: 16.154] that sin is strictly increasing on $\left[0,\frac{\pi}{2}\right[$. Hence if $x \in \left]0,\frac{\pi}{2}\right[$ we have $0<x$ so that $0 \underset{[\text{theorem: } 19.57]}{=} \sin(0) < \sin(x)$. So

$$\forall x \in \left]0,\frac{\pi}{2}\right[\text{ we have } 0<\sin(x) \tag{19.47}$$

As $\forall x \in \left[0,\frac{\pi}{2}\right] = \left[0,\frac{\pi}{2}\right[\bigcup\left\{\frac{\pi}{2}\right\}$ we have $0\leqslant\cos(x) \underset{[\text{theorem: } 19.58]}{=} \sin'_x$ it follows from [theorem: 16.154] sin is increasing on $\left[0,\frac{\pi}{2}\right]$ so that $\forall x \in \left[0,\frac{\pi}{2}\right]$ we have that $0=\sin(0)\leqslant\sin(x)$. More specific

$$0 \leqslant \sin\left(\frac{\pi}{2}\right)$$

Now $1 \underset{[\text{theorem: } 19.57(6)]}{=} \sin^2\left(\frac{\pi}{2}\right)+\cos^2\left(\frac{\pi}{2}\right) = \sin^2\left(\frac{\pi}{2}\right)+0^2 = \sin^2(x)$ proving that $\sin^2(x)=1$. Using then [definition: 10.66] together with $0\leqslant\sin\left(\frac{\pi}{2}\right)$ proves that

$$\sin\left(\frac{\pi}{2}\right)=1$$

Combining this with [eq: 19.47] gives

$$\forall x \in \left]0, \frac{\pi}{2}\right] \text{ we have } 0 < \sin(x) \text{ and } \sin\left(\frac{\pi}{2}\right) = 1$$

□

Theorem 19.64. *We have for* sin *and* cos *the following properties:*

1. $\cos(0) = 1$
2. $\cos\left(\frac{\pi}{2}\right) = 0$
3. $\sin(0) = 0$
4. $\sin\left(\frac{\pi}{2}\right) = 1$
5. $\cos(\pi) = -1$
6. $\sin(\pi) = 0$
7. $\cos(2 \cdot \pi) = 1$
8. $\sin(2 \cdot \pi) = 0$
9. $\cos\left(\frac{\pi}{4}\right) = \sin\left(\frac{\pi}{4}\right) = \sqrt{\frac{1}{2}}$
10. $\forall x \in \mathbb{C}$ *we have* $\cos\left(x + \frac{\pi}{2}\right) = -\sin(x)$
11. $\forall x \in \mathbb{C}$ *we have* $\sin\left(x + \frac{\pi}{2}\right) = \cos(x)$
12. $\forall x \in \mathbb{C}\ \forall n \in \mathbb{N}_0$ *we have* $\cos(x \pm 2 \cdot n \cdot \pi) = \cos(x)$
13. $\forall x \in \mathbb{C}\ \forall n \in \mathbb{N}_0$ *we have* $\sin(x \pm 2 \cdot n \cdot \pi) = \sin(x)$
14. $\forall x \in \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$ *we have that* $0 < \cos(x)$ *and* $\forall x \in]0, \pi[$ *we have* $0 < \sin(x)$
15. $\forall x \in]0, \pi[$ *we have* $\cos(x) \neq 1 \wedge \sin(x) \neq -1$ *and* $\forall x \in \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$ *we have* $\sin(x) \neq 1 \wedge \sin(x) \neq -1$
16. $\forall x \in \mathbb{C}\ \forall n \in \mathbb{N}_0$ *we have* $e^{i \cdot (x \pm 2 \cdot n \cdot \pi)} \underset{\text{[theorem: 19.42]}}{=} \exp(i \cdot (x \pm 2 \cdot n \cdot \pi)) = \exp(i \cdot x)$

Proof.

1. This was proved in [theorem: 19.57].
2. As $\frac{\pi}{2} = \min\left(\cos^{-1}(\{0\}) \bigcap [0, \infty[\right)$ it follows that $\cos\left(\frac{\pi}{2}\right) = 0$.
3. This was proved in [theorem: 19.57].
4. This is proved in [theorem: 19.63].
5. $\cos(\pi) = \cos\left(\frac{\pi}{2} + \frac{\pi}{2}\right) \underset{\text{[theorem: 19.57]}}{=} \cos\left(\frac{\pi}{2}\right) \cdot \cos\left(\frac{\pi}{2}\right) - \sin\left(\frac{\pi}{2}\right) \cdot \sin\left(\frac{\pi}{2}\right) \underset{(2,4)}{=} 0 \cdot 0 - 1 \cdot 1 = -1$
6. $\sin(\pi) = \sin\left(\frac{\pi}{2} + \frac{\pi}{2}\right) \underset{\text{[theorem: 19.57]}}{=} \sin\left(\frac{\pi}{2}\right) \cdot \cos\left(\frac{\pi}{2}\right) - \cos\left(\frac{\pi}{2}\right) \cdot \sin\left(\frac{\pi}{2}\right) \underset{(2,4)}{=} 1 \cdot 0 - 0 \cdot 1 = 0$
7. $\cos(2 \cdot \pi) = \cos(\pi + \pi) \underset{\text{[theorem: 19.57]}}{=} \cos(\pi) \cdot \cos(\pi) - \sin(\pi) \cdot \sin(\pi) \underset{(5,6)}{=} -1 \cdot -1 = 0 \cdot 0 = 1$
8. $\sin(2 \cdot \pi) = \sin(\pi + \pi) \underset{\text{[theorem: 19.57]}}{=} \sin(\pi) \cdot \cos(\pi) - \cos(\pi) \cdot \sin(\pi) \underset{(5,6)}{=} 0 \cdot -1 - (-1) \cdot 0 = 0$
9. We have

$$\begin{aligned} 0 &= \cos\left(\frac{\pi}{2}\right) \\ &= \cos\left(\frac{\pi}{4} + \frac{\pi}{4}\right) \\ &\underset{\text{[theorem: 19.57(7)]}}{=} \cos\left(\frac{\pi}{4}\right) \cdot \cos\left(\frac{\pi}{4}\right) - \sin\left(\frac{\pi}{4}\right) \cdot \sin\left(\frac{\pi}{4}\right) \\ &= \cos^2\left(\frac{\pi}{4}\right) - \sin^2\left(\frac{\pi}{4}\right) \end{aligned}$$

so that $\cos^2\left(\frac{\pi}{4}\right) = \sin^2\left(\frac{\pi}{4}\right)$. As by [theorem: 19.63] $0 \leqslant \cos\left(\frac{\pi}{4}\right), \sin\left(\frac{\pi}{4}\right)$ it follows from [definition: 10.66] that

$$\cos\left(\frac{\pi}{4}\right) = \sin\left(\frac{\pi}{4}\right)$$

Next

$$1 \underset{\text{[theorem: 19.57]}}{=} \sin^2\left(\frac{\pi}{4}\right) + \cos^2\left(\frac{\pi}{4}\right) = 2 \cdot \sin^2\left(\frac{\pi}{4}\right)$$

hence $\sin^2\left(\frac{\pi}{4}\right) = \frac{1}{2}$ which as $0 \leqslant \sin\left(\frac{\pi}{4}\right), \frac{1}{2}$ proves that

$$\sqrt{\frac{1}{2}} = \sin\left(\frac{\pi}{4}\right) = \cos\left(\frac{\pi}{4}\right)$$

10. We have $\forall z \in \mathbb{C}$ that

$$\cos\left(x + \frac{\pi}{2}\right) \underset{\text{[theorem: 19.57]}}{=} \cos(x) \cdot \cos\left(\frac{\pi}{2}\right) - \sin(x) \cdot \sin\left(\frac{\pi}{2}\right) \underset{(2,4)}{=} \cos(x) \cdot 0 - \sin(x) \cdot 1 = -\sin(x)$$

11. We have $\forall z \in \mathbb{C}$ that

$$\sin\left(x + \frac{\pi}{2}\right) \underset{\text{[theorem: 19.57]}}{=} \sin(x) \cdot \cos\left(\frac{\pi}{2}\right) + \cos(x) \cdot \sin\left(\frac{\pi}{2}\right) \underset{(2,4)}{=} \sin(x) \cdot 0 + \cos(x) \cdot 1 = \cos(x)$$

12. We prove this by induction, so let

$$S = \{n \in \mathbb{N}_0 | \cos(x \pm 2 \cdot n \cdot \pi) = \cos(x)\}$$

then we have:

$0 \in S$. As $\cos(x \pm 2 \cdot 0 \cdot \pi) = \cos(x \pm 0) = \cos(x)$ it follows that $0 \in S$

$n \in S \Rightarrow n + 1 \in S$. We have

$$\begin{aligned}
\cos(x \pm 2 \cdot (n+1) \cdot \pi) &= \\
\cos((x \pm 2 \cdot n \cdot \pi) \pm 2 \cdot \pi) &\underset{\text{[theorem: 19.57]}}{=} \\
\cos(x + 2 \cdot n \cdot \pi) \cdot \cos(\pm\pi) - \sin(x + 2 \cdot n \cdot \pi) \cdot \sin(\pm\pi) &\underset{\text{[theorem: 19.57]}}{=} \\
\cos(x + 2 \cdot n \cdot \pi) \cdot \cos(\pi) - \sin(x + 2 \cdot n \cdot \pi) \cdot (\pm\sin(\pi)) &\underset{(7,8)}{=} \\
\cos(x + 2 \cdot n \cdot \pi) \cdot 1 - \sin(x + 2 \cdot n \cdot \pi) \cdot 0 &= \\
\cos(x + 2 \cdot n \cdot \pi) &\underset{n \in S}{=} \\
\cos(x)
\end{aligned}$$

proving that $n + 1 \in \mathbb{N}_0$

13. We prove this by induction, so let

$$S = \{n \in \mathbb{N}_0 | \sin(x \pm 2 \cdot n \cdot \pi) = \sin(x)\}$$

then we have:

$0 \in S$. As $\sin(x \pm 2 \cdot 0 \cdot \pi) = \sin(x \pm 0) = \sin(x)$ it follows that $0 \in S$

$n \in S \Rightarrow n + 1 \in S$. We have

$$\begin{aligned}
\sin(x \pm 2 \cdot (n+1) \cdot \pi) &= \\
\sin((x \pm 2 \cdot n \cdot \pi) \pm 2 \cdot \pi) &\underset{\text{[theorem:19.57]}}{=} \\
\sin(x \pm 2 \cdot n \cdot \pi) \cdot \cos(\pm\pi) + \cos(x \pm 2 \cdot n \cdot \pi) \cdot \sin(\pm\pi) &\underset{\text{[theorem:19.57]}}{=} \\
\sin(x \pm 2 \cdot n \cdot \pi) \cdot \cos(\pi) + \cos(x \pm 2 \cdot n \cdot \pi) \cdot (\pm\sin(\pi)) &\underset{(7,8)}{=} \\
\sin(x + 2 \cdot n \cdot \pi) \cdot 1 - \sin(x + 2 \cdot n \cdot \pi) \cdot 0 &= \\
\sin(x + 2 \cdot n \cdot \pi) &\underset{n \in S}{=} \\
\sin(x)
\end{aligned}$$

proving that $n + 1 \in \mathbb{N}_0$

14. Using [theorem: 19.63] we have

$$\forall x \in \left[0, \frac{\pi}{2}\right[\text{ we have } 0 < \cos(x) \text{ and } \forall x \in \left]0, \frac{\pi}{2}\right] \text{ we have } 0 < \sin(x) \tag{19.48}$$

Let $x \in \left]-\frac{\pi}{2}, 0\right]$ then $x+\frac{\pi}{2} \in \left]0, \frac{\pi}{2}\right]$ so that $0 <_{\text{[eq: 19.48]}} \sin\left(x+\frac{\pi}{2}\right) \underset{(11)}{=} \cos(x)$ hence

$$\forall x \in \left]-\frac{\pi}{2}, 0\right] \text{ we have } 0 < \cos(x) \tag{19.49}$$

Let $x \in \left[\frac{\pi}{2}, \pi\right[$ then $x-\frac{\pi}{2} \in \left[0, \frac{\pi}{2}\right[$ so that $0 < \cos\left(x-\frac{\pi}{2}\right) \underset{(11)}{=} \sin\left(\left(x-\frac{\pi}{2}\right)+\frac{\pi}{2}\right) = \sin(x)$ hence

$$\forall x \in \left[\frac{\pi}{2}, \pi\right[\text{ we have } 0 < \sin(x) \tag{19.50}$$

Combining [eqs: 19.48, 19.49 and 19.50] results in

$$\forall x \in \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[\text{ we have } 0 < \cos(x) \text{ and } \forall x \in]0, \pi[\text{ we have } 0 < \sin(x)$$

15. Assume that there exist a $x \in]0, \pi[$ such that $\cos(x) = 1$ or $\cos(x) = -1$. Then as by (14) $0 < \sin(x)$ we have that $0 < \sin^2(x) \underset{\text{[theorem: 19.57(6)]}}{=} 1-\cos^2(x) = 1-1 = 0$ giving the contradiction $10 < 0$. Hence the assumption is wrong and we must have that

$$\forall x \in]0, \pi[\text{ we have } \cos(x) \neq 1 \text{ and } \cos(x) \neq -1 \tag{19.51}$$

Let $x \in \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$ then $x+\frac{\pi}{2} \in]0, \pi[$ so that $-\sin(x) \underset{(10)}{=} \cos(x)$ which as by [eq: 19.51] $\cos(x) \neq 1$ and $\cos(x) \neq -1$ proves that $\sin(x) \neq -1$ and $\sin(x) \neq 1$. Hence

$$\forall x \in \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[\text{ we have } \sin(x) \neq 1 \text{ and } \sin(x) \neq -1$$

16. We have

$$\begin{aligned}
\exp(i \cdot (x \pm 2 \cdot n \cdot p)) &\underset{\text{[theorem: 19.57]}}{=} \cos(x \pm 2 \cdot n \cdot p) + i \cdot \sin(x \pm 2 \cdot n \cdot p) \\
&\underset{(12,13)}{=} \cos(x) + i \cdot \sin(x) \\
&\underset{\text{[theorem: 19.57]}}{=} \exp(i \cdot x)
\end{aligned}$$

□

We have also what is probably the most beautiful mathematical equations (because it combines the fundamental constants 0, 1, π and e).

Theorem 19.65. (Euler's equation) *We have* $e^{i \cdot \pi} + 1 = 0$

Proof. We have

$$\begin{aligned}
e^{i \cdot \pi} &\underset{\text{[theorem: 19.42]}}{=} \exp(i \cdot \pi) \\
&\underset{\text{[theorem: 19.57]}}{=} \cos(\pi) + i \cdot \sin(\pi) \\
&\underset{\text{[theorem: 19.64]}}{=} -1
\end{aligned}$$

hence

$$e^{i \cdot x} + 1 = 0$$

□

Next we introduce the inverses of the functions $\cos_{|[0,\pi]}$ and $\sin_{|\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]}$. Of course we must first prove that $\cos_{|[0,\pi]}$ and $\sin_{|\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]}$ are indeed bijections.

Theorem 19.66.

1. *The function* $\cos_{|[0,\pi]}: [0,\pi] \to [-1, 1]$ *is a bijection.*
2. *The function* $\sin_{|\left]-\frac{\pi}{2}, \frac{\pi}{2}\right[}: \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] \to [-1, 1]$ *is a bijection.*

Proof.

1. We have

   injectivity. Let $x, y \in [0, \pi]$ with $\cos(x) = \cos(y)$. Without loosing generality we can take $x \leqslant y$ [if not interchange x and y]. Assume that $x \neq y$ then we have $x < y$ and we must look at the following cases:

   $\boldsymbol{x = 0 < y = \pi}$**.** Then we would have

$$1 = \cos(0) \underset{\text{[theorem: 19.64]}}{=} \cos(x) = \cos(y) \underset{\text{[theorem: 19.64]}}{=} 0$$

leading to the contradiction $1 \neq 0$.

$\boldsymbol{x = 0 < y < \pi}$. As $y \in]0, \pi[$ it follows from [theorem: 19.64(15)] that $\cos(y) \neq 1$ which as $1 \underset{\text{[theorem: 19.64]}}{=} \cos(0) = \cos(x) = \cos(y)$ leads to the contradiction $1 \neq 1$.

$\boldsymbol{0 < x < y = \pi}$. As $x \in]0, \pi[$ it follows from [theorem: 19.64(155)] that $\cos(x) \neq -1$ which as $-1 \underset{\text{[theorem: 19.64]}}{=} \cos(\pi)$ leads to the contradiction $-1 \neq -1$.

$\boldsymbol{0 < x < y < \pi}$. As $\forall z \in]0, \pi[$ we have $\cos'_z \underset{\text{[theorem: 19.58]}}{=} \sin(z) > 0$ [see theorem: 19.64] it follows from [theorem: 16.154] that cos is strictly increasing on $]0, \pi[$. Hence $\cos(x) < \cos(y)$ contradicting $\cos(x) = \cos(y)$.

As in all cases we have a contradiction the assumption is wrong and we must have that $x = y$ proving injectivity.

surjectivity. Let $y \in [-1, 1]$ then we have either:

$\boldsymbol{y = -1}$. Then for $\pi \in [0, \pi]$ we have $\cos(\pi) \underset{\text{[theorem: 19.64]}}{=} -1 = y$.

$\boldsymbol{y = 1}$. Then $0 \in [0, \pi]$ we have $\cos(0) \underset{\text{[theorem: 19.64]}}{=} 1 = y$.

$\boldsymbol{y \in]-1, 1[}$. By [theorem: 19.57] and [theorem: 14.136] it follows that $\cos_{|[0,\pi]}$ is continuous, further we have

$$\cos_{|[0,\pi]}(\pi) = \cos(\pi) = -1 < y < 1 = \cos(0) = \cos_{|[0,\pi]}(0)$$

So we can use the intermediate value theorem [theorem: 14.403] to find a $x \in [0, \pi]$ such that $\cos(x) = y$

So in all cases we have found a $x \in [0, \pi]$ such that $\cos(x) = y$ proving surjectivity.

2. We have

injectivity. Let $x, y \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ with $\sin(x) = \sin(y)$. Without loosing generality we can take $x \leqslant y$ [if not interchange x and y]. Assume that $x \neq y$ then we have $x < y$ and we must look at the following cases:

$\boldsymbol{x = -\frac{\pi}{2} < y = \frac{\pi}{2}}$. Then we would have

$$\begin{aligned} -1 &\underset{\text{[theorem: 19.64]}}{=} -\sin\left(\frac{\pi}{2}\right) \\ &\underset{\text{[theorem: 19.57]}}{=} \sin\left(-\frac{\pi}{2}\right) \\ &= \sin(x) \\ &= \sin(y) \\ &= \sin\left(\frac{\pi}{2}\right) \\ &\underset{\text{[theorem: 19.64]}}{=} 1 \end{aligned}$$

leading to the contradiction $-1 \neq 1$.

$\boldsymbol{x = -\frac{\pi}{2} < y < \frac{\pi}{2}}$. As $y \in \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$ it follows from [theorem: 19.64(15)] that $\sin(y) \neq -1$ which as $-1 \underset{\text{[theorem: 19.64]}}{=} \sin\left(-\frac{\pi}{2}\right) = \sin(x) = \sin(y)$ leads to the contradiction $-1 \neq -1$.

$\boldsymbol{-\frac{\pi}{2} < x < y = \frac{\pi}{2}}$. As $x \in \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$ it follows from [theorem: 19.64(15)] that $\sin(x) \neq -1$ which as $-1 \underset{\text{[theorem: 19.64]}}{=} \sin\left(\frac{\pi}{2}\right)$ leads to the contradiction $-1 \neq -1$.

$\boldsymbol{-\frac{\pi}{2} < x < y < \frac{\pi}{2}}$. As $\forall z \in \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$ we have $\sin'_z \underset{\text{[theorem: 19.58]}}{=} \cos(z) > 0$ [see theorem: 19.64] it follows from [theorem: 16.154] that sin is strictly increasing on $\left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$. Hence $\sin(x) < \sin(y)$ contradicting $\sin(x) = \sin(y)$.

As in all cases we have a contradiction the assumption is wrong and we must have that $x = y$ proving injectivity.

surjectivity. Let $y \in [-1, 1]$ then we have either:

$\boldsymbol{y = -1}$. Then for $-\frac{\pi}{2} \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ we have

$$\sin\left(-\frac{\pi}{2}\right) \underset{\text{[theorem: 19.57]}}{=} -\sin\left(\frac{\pi}{2}\right) \underset{\text{[theorem: 19.64]}}{=} -1 = y.$$

$\boldsymbol{y = 1}$. Then for $\frac{\pi}{2} \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ we have $\sin\left(\frac{\pi}{2}\right) \underset{\text{[theorem: 19.64]}}{=} 1 = y$.

$\boldsymbol{y \in]-1,1[}$. By [theorem: 19.57] and [theorem: 14.136] it follows that $\sin_{|[-\frac{\pi}{2},\frac{\pi}{2}]}$ is continuous, further we have

$$\sin_{|[-\frac{\pi}{2},\frac{\pi}{2}]}\left(-\frac{\pi}{2}\right) = \sin\left(-\frac{\pi}{2}\right) = -1 < y < 1 = \sin\left(\frac{\pi}{2}\right) = \sin_{|[-\frac{\pi}{2},\frac{\pi}{2}]}\left(\frac{\pi}{2}\right)$$

So we can use the intermediate value theorem [theorem: 14.403] to find a $x \in \left[-\frac{\pi}{2},\frac{\pi}{2}\right]$ such that $\cos(x) = y$.

So in all cases we have found a $x \in \left[-\frac{\pi}{2},\frac{\pi}{2}\right]$ such that $\cos(x) = y$ proving surjectivity. □

Definition 19.67. *The above theorem allows us to define* arccosine *and* arcsine *as follows*

$$\text{arccosine}: [-1,1] \to [0,\pi] \text{ is defined by } \text{arccosine} = (\cos_{|[0,\pi]})^{-1}$$

and

$$\text{arcsine}: [-1,1] \to \left[-\frac{\pi}{2},\frac{\pi}{2}\right] \text{ is defined by } \text{arcsine} = \left(\sin_{|[-\frac{\pi}{2},\frac{\pi}{2}]}\right)^{-1}$$

We have then the following trivial properties for arccosine or arcsine

Theorem 19.68. *We have for* arccosine *and* arcsine

1. $\forall x \in [-1,1]$ *we have* $\cos(\text{arccosine}(x)) = x$ *and* $\sin(\text{arcsine}(x))$
2. $\forall x \in [0,\pi]$ *we have* $\text{arccosine}(\cos(x)) = x$
3. $\forall x \in \left[-\frac{\pi}{2},\frac{\pi}{2}\right]$ *we have* $\text{arcsine}(\sin(x)) = x$
4. $\text{arcosine}(-1) = \pi$
5. $\text{arcosine}(0) = \frac{\pi}{2}$
6. $\text{arccose}(1) = 0$
7. $\text{arcsine}(-1) = -\frac{\pi}{2}$
8. $\text{arcsine}(0) = 0$
9. $\text{arcsine}(1) = \frac{\pi}{2}$

Proof.

1. If $x \in [-1,1]$ then
$$\cos(\text{arccosine}(x)) \underset{\text{arccosine}([-1,1])=[0,\pi]}{=} \cos_{|[0,\pi]}(\text{arcosine}(x)) = \cos_{|[0,\pi]}((\cos_{|[0.\pi]})^{-1}(x)) = x$$
Further
$$\begin{aligned}\sin(\text{arcsine}(x)) &\underset{\text{arcsine}([-1,1])=[-\frac{\pi}{2},\frac{\pi}{2}]}{=} \sin_{|[-\frac{\pi}{2},\frac{\pi}{2}]}(\text{arcsine}(x)) \\ &= \sin_{|[-\frac{\pi}{2},\frac{\pi}{2}]}\left(\left(\sin_{[-\frac{\pi}{2},\frac{\pi}{2}]}\right)^{-1}(x)\right) \\ &= x\end{aligned}$$
2. Let $x \in [0,\pi]$ then
$$\arccos(\cos(x)) = \arccos(\cos_{|[0,\pi]}(x)) = (\cos_{|[0,\pi]})^{-1}(\cos_{|[0,\pi]}(x)) = x$$
3. Let $x \in \left[-\frac{\pi}{2},\frac{\pi}{2}\right]$ then
$$\arcsin(\sin(x)) = \arcsin\left(\sin_{|[-\frac{\pi}{2},\frac{\pi}{2}]}(x)\right) = \left(\sin_{|[-\frac{\pi}{2},\frac{\pi}{2}]}\right)^{-1}\left(\sin_{\backslash[-\frac{\pi}{2},\frac{\pi}{2}]}(x)\right) = x$$
4. As $\cos(\pi) = -1$ and $\pi \in [0,\pi]$ we have $\pi \underset{(1)}{=} \text{arccosin}(\cos(\pi)) = \text{arccosine}(-1)$.
5. As $\cos\left(\frac{\pi}{2}\right) = 0$ and $\frac{\pi}{2} \in [0,\pi]$ we have $\frac{\pi}{2} \underset{(1)}{=} \text{arccosin}\left(\cos\left(\frac{\pi}{2}\right)\right) = \text{arccosine}(0)$.
6. As $\cos(0) = 1$ and $0 \in [0,\pi]$ we have $0 \underset{(1)}{=} \text{arccosin}(\cos(0)) = \text{arccosine}(1)$.
7. As $\sin\left(-\frac{\pi}{2}\right) = -\sin\left(\frac{\pi}{2}\right) = -1$ and $-\frac{\pi}{2} \in \left[-\frac{\pi}{2},\frac{\pi}{2}\right]$ we have $-\frac{\pi}{2} \underset{(1)}{=} \text{arcsine}\left(\sin\left(-\frac{\pi}{2}\right)\right) = \arcsin(-1)$
8. As $\sin(0) = 0$ and $0 \in \left[-\frac{\pi}{2},\frac{\pi}{2}\right]$ we have $0 \underset{(1)}{=} \text{arcsine}(\sin(0)) = \arcsin(0)$

9. As $\sin\left(\frac{\pi}{2}\right)=1$ and $\frac{\pi}{2}\in\left[-\frac{\pi}{2},\frac{\pi}{2}\right]$ we have $\frac{\pi}{2}\underset{(1)}{=}\text{arcsine}\left(\sin\left(\frac{\pi}{2}\right)\right)=\arcsin(1)$ □

Once we have defined the sinus and cosinus we can define the tangent as follows:

Definition 19.69. *The tangent function noted as* tan *is defined by*

$$\tan\colon \left]-\frac{\pi}{2},\frac{\pi}{2}\right[\to\mathbb{R} \text{ where } \tan(x)=\frac{\sin(x)}{\cos(x)}$$

in other words

$$\tan=\frac{\sin_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}}{\cos_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}}$$

Note 19.70. As by [theorem: 19.64(14)] $0<\cos(x)$ for every x in $\left]-\frac{\pi}{2},\frac{\pi}{2}\right[$ this function is well defined.

Theorem 19.71. *The tangent function has the following properties:*

1. $\tan(0)=0$
2. $\forall x\in\left]-\frac{\pi}{2},\frac{\pi}{2}\right[$ tan *has a derivative* $\tan'_x$ where $\tan'_x=\frac{1}{\cos^2(x)}>0$
3. tan *is strictly increasing on* $\left]-\frac{\pi}{2},\frac{\pi}{2}\right[$
4. tan *is a continuous function*
5. $\tan\colon\left]-\frac{\pi}{2},\frac{\pi}{2}\right[\to\mathbb{R}$ *is a bijective function*

Proof.

1. $\tan(0)=\frac{\sin(0)}{\cos(0)}\underset{\text{[theorem: 19.57]}}{=}\frac{0}{1}=1$
2. Let $x\in\left]-\frac{\pi}{2},\frac{\pi}{2}\right[$. Using [theorem: 19.58] and [theorem: 16.33] it follows that $\sin_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}$ and $\cos_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}$ has a derivative at x with $\left(\sin_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}\right)'_x=\cos(x)$ and $\left(\cos_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}\right)'_x=-\sin(x)$. As $\tan=\frac{\sin_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}}{\cos_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}}$ it follows from [theorem: 16.74] that tan has a derivative at x and that
$$\begin{aligned}\tan'_x &= \left(\frac{\sin_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}}{\cos_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}}\right)'_x\\ &= \frac{\left(\sin_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}\right)'_x\cdot\cos_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}(x)-\left(\cos_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}(x)\right)'_x\cdot\sin_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}(x)}{\left(\cos_{|\left]-\frac{\pi}{2},\frac{\pi}{2}\right[}(x)\right)^2}\\ &= \frac{\cos(x)\cdot\cos(x)+\sin(x)\cdot\sin(x)}{\cos^2(x)}\\ &= \frac{\cos^2(x)+\sin^2(x)}{\cos^2(x)}\\ &\underset{\text{[theorem: 19.57]}}{=} \frac{1}{\cos^2(x)}\end{aligned}$$
Further for $x\in\left]-\frac{\pi}{2},\frac{\pi}{2}\right[$ we have by [theorem: 19.64] that $0<\cos(x)$ so that $\frac{1}{\cos^2(x)}>0$.
3. Let $x\in\left]-\frac{\pi}{2},\frac{\pi}{2}\right[$ then, as $\tan'_x=\frac{1}{\cos^2(x)}$ and $0<\cos(x)$ [see theorem: 19.64(14)] it follows that $0<\tan(x)$. Hence using [theorem: 16.154] it follows that tan is strictly increasing on $\left]-\frac{\pi}{2},\frac{\pi}{2}\right[$,
4. As $\forall x\in\left]-\frac{\pi}{2},\frac{\pi}{2}\right[$ $\tan'_x$ exist it follows from [theorem: 16.32] that tan is differentiable at x, hence, using [theorem: 16.31], tan is continuous at x.
5. We have for $\tan\colon\left]-\frac{\pi}{2},\frac{\pi}{2}\right[\to\mathbb{R}$

   injectivity. Let $x,y\in\left]-\frac{\pi}{2},\frac{\pi}{2}\right[$ be such that $\tan(x)=\tan(y)$. Assume that $x\neq y$ then we have either $x<y$ or $y<z$. As tan is strictly increasing by (3) we would then have that $\tan(x)<\tan(y)$ or $\tan(y)<\tan(x)$ which contradicts $\tan(x)=\tan(y)$. Hence we must have that $x=y$.

surjectivity. Let $y \in \mathbb{R}^+$. Take $z = \frac{y}{\sqrt{2}} + 1$ then $0 < \frac{1}{z} < 1$. As by [theorem: 19.66] $\cos\colon \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] \to \mathbb{R}$ is a bijection there exist a $x' \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ such that

$$\frac{1}{z} = \cos(x')$$

Further as $\cos(0) = 1$ and $\cos\left(\frac{\pi}{2}\right) = 0$ and $\frac{1}{z} \neq 0, 1$ we must have that

$$x_1 \in \left]0, \frac{\pi}{2}\right[$$

As by [theorems: 19.58, 19.64] $\forall t \in \left]0, \frac{\pi}{2}\right[\subseteq \left]0, \pi\right[$ $\sin'_t = \cos(t) > 0$ and $\cos'_t = -\sin(t) < 0$ it follows by [theorem: 16.154] that sin is strictly increasing and cos is strictly decreasing. So if we take

$$x_2 = \max\left(\frac{\pi}{4}, x_1\right) \in \left]0, \frac{\pi}{2}\right[$$

then we have

$$\frac{1}{\sqrt{2}} \underset{\text{[theorem: 19.64]}}{=} \sin\left(\frac{\pi}{4}\right) \leqslant \sin(x_2) \text{ and } \frac{1}{z} = \cos(x_1) \geqslant \cos(x_2) \text{ or } z \leqslant \frac{1}{\cos(x_2)}$$

hence

$$\begin{aligned} \tan(x_2) &= \frac{\sin(x_2)}{\cos(x_2)} \\ &\geqslant \sqrt{2} \cdot \frac{1}{\cos(x_2)} \\ &\geqslant \sqrt{2} \cdot z \\ &>_{z = \frac{y}{\sqrt{2}} + 1} \sqrt{2} \cdot \frac{y}{\sqrt{2}} \\ &= y \end{aligned}$$

So we have found a $x_2 \in \left]0, \frac{\pi}{2}\right[$ such that

$$\tan_{|[0,x_2]}(0) = \tan(0) = 0 < y < \tan(x_2) = \tan_{|[0,x_2]}(x_2)$$

By [theorem: 14.136] and (3) it follows that $\tan_{|[0,x_2]}$ is continuous. So we can use the intermediate value theorem [see theorem: 14.403] to find a $x_3 \in [0, x_2]$ such that $\tan(x_3) = \tan_{|[0,x_2]}(x) = y$. As $\tan(0) \underset{(1)}{=} 0 \neq y$ and $x_2 < \frac{\pi}{2}$ we have found a $x_3 \in \left]0, \frac{\pi}{2}\right[$ such that $\tan(x_3)$. To summarize

$$\forall y \in \mathbb{R}^+ \text{ there exist a } x \in \left]0, \frac{\pi}{2}\right[\text{ such that } \tan(x) = y \tag{19.52}$$

Now to prove surjectivity: Let $y \in \mathbb{R}$ then we have either:

$y = 0$. Then by (1) $\tan(0) = 0 = y$.

$0 < y$. Then by [eq: 19.52] there exist a $x \in \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$ such that $\tan(x) = y$

$y < 0$. Then $-\frac{1}{y} \in \mathbb{R}^+$ and by [eq: 19.52] there exist a $x' \in \left]0, \frac{\pi}{2}\right[$ such that $\tan(x') = -\frac{1}{y}$. Take $x = x' - \frac{\pi}{2}$ then $x \in \left]-\frac{\pi}{2}, 0\right[\subseteq \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$ and

$$y = -\frac{1}{\tan(x')} = \frac{\cos(x')}{\sin(x')} = \frac{\cos\left(x + \frac{\pi}{2}\right)}{\sin\left(x + \frac{\pi}{2}\right)} \underset{\text{[theorem: 19.64}}{=} -\frac{-\sin(x)}{\cos(x)} = \tan(x)$$

So in all cases we there exist a $x \in \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$ such that $y = \tan(x)$ proving surjectivity □

As by the previous theorem $\tan\colon \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[\to \mathbb{R}$ is a bijection it has a inverse called the arctan.

Definition 19.72. *The arctangent function is defined by*

$$\arctan\colon \mathbb{R} \to \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[\text{ is defined by } \arctan = \tan^{-1}$$

which as the inverse of a bijection is itself a bijection.

Theorem 19.73. *The arctangent function* $\arctan\colon \mathbb{R} \to \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$ *has the following properties:*

1. $\forall x \in \mathbb{R}$ $\tan(\arctan(x)) = x$

2. $\forall x \in \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$ $\arctan(\tan(x)) = x$
3. $\arctan(0) = 0$
4. $\forall x \in \mathbb{R}$ arctan *has a derivative at* x *where* $\arctan'_x = \frac{1}{1+x^2}$

Proof.

1. Let $x \in \mathbb{R}$ then $\tan(\arctan(x)) = \tan(\tan^{-1}(x)) = x$
2. Let $x \in \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$ then $\arctan(\tan(x)) = \tan^{-1}(\tan(x)) = x$
3. As $\tan(0) \underset{\text{[theorem: 19.71]}}{=} 0$ it follows that $\arctan(0) = \tan^{-1}(0) = 0$
4. Let $x \in \mathbb{R}$ and take $y = \arctan(x) \in \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$. We want to apply the inverse function theorem [see theorem: 16.270] so we must prove that

$$\tan' \colon \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[\to \mathbb{R} \text{ by } \tan'(x) = \tan'_x$$

is continuous and that $\tan'_y \neq 0$. Using [theorem: 19.71(2)] it follows that $\tan' = \frac{1}{\left(\cos_{|\left]-\frac{\pi}{2}, \frac{p}{2}\right[}\right)^2}$, as $\cos_{|\left]-\frac{\pi}{2}, \frac{\pi}{2}\right[}$ is continuous [see theorems: 19.57, 14.136], so by [theorem: 14.151] it follows that $\tan' = \frac{1}{\left(\cos_{|\left]-\frac{\pi}{2}, \frac{p}{2}\right[}\right)^2}$ is continuous, further $\tan'_y \underset{\text{[theorem: 19.71(2)]}}{=} \frac{1}{\cos^2(y)} > 0$. By the inverse function theorem [see theorem: 16.270(3)] there exist a open $U \subseteq \left]-\frac{\pi}{2}, \frac{\pi}{2}\right[$ and $V \subseteq \mathbb{R}$ with $y \in U$ and $\tan(y) \in V \underset{\tan(y)=\tan(\arctan(x))=x}{\Rightarrow} x \in V$ such that $\tan_{|U} \colon U \to V$ has a inverse $(\tan_{|U})^{-1} \colon V \to U$ and

$$\forall z \in V \text{ we have } ((\tan_{|U})^{-1})'_{\tan(z)} = \frac{1}{\tan'_z} \tag{19.53}$$

As $\forall v \in V$ we have $(\tan_{|U} \circ \arctan_{|V})(v) = \tan_{|U}(\arctan_{|V}(v)) = \tan(\arctan(v)) = v = \mathrm{Id}_V(u)$ and $\forall u \in U$ we have $(\arctan_{|V} \circ \tan_{|U|})(u) = \arctan_{|V}(\tan_{|U}(u)) = \arctan(\tan(u)) = u = \mathrm{Id}_U(u)$ so that $(\tan_{|U})^{-1} = \arctan_{|V}$. Substituting this in [eq: 19.53] we have

$$\forall z \in V \text{ we have } (\arctan_{|V})'_{\tan(z)} = \frac{1}{\tan'_z} \underset{\text{[theorem: 19.71]}}{=} \frac{1}{\left(\frac{1}{\cos^2(z)}\right)} = \frac{1}{\left(\frac{\cos^2(z)+\sin^2(z)}{\cos^2(x)}\right)} = \frac{1}{1+(\tan(z))^2}$$

As $\arctan(x) = y \in V$ we have by the above that $(\arctan_{|V})'_{\tan(\arctan(x))} = \frac{1}{1+(\tan(\arctan(s)))^2}$ so that

$$(\arctan_{|V})'_x = \frac{1}{1+x^2}$$

Finally using the locality of the derivative [theorem: 16.33] it follows that arctan has a derivative at x and $\arctan'_x = \frac{1}{1+x^2}$. □

Chapter 20
Measures and Integration

20.1 Extended real numbers

Measure Theory deals with measuring sets which is the act of assigning to a set a non negative number, the measure of the set, that somehow quantify how big this set is. This process of measuring satisfies countable additivity meaning that the measure of the countable unit of sets is the sum of the measures of each set in this union. Hence we have to deal with series of non negative numbers which are not always convergent in $\mathbb{R}$ meaning that the measure of a set would not be always defined as a real number. To solve this problem we extend the set of real numbers by adding two elements, ∞ which will be bigger then every real number and $-\infty$ which will be smaller then every real number.

Definition 20.1. *The set of extended real numbers $\overline{\mathbb{R}}$ is defined as*

$$\overline{\mathbb{R}} = \mathbb{R} \bigcup \{\infty, -\infty\}$$

where $\infty, -\infty \notin \mathbb{R}$ and $\infty \neq -\infty$. In other words we have that

$$\overline{\mathbb{R}} = \mathbb{R} \bigsqcup \{\infty\} \bigsqcup \{-\infty\}$$

***Note* 20.2.** *Using [lemma: 10.97] there exist two elements $(\varnothing, 0)$, $(\mathbb{Q}, 0)$ such that $(\varnothing, 0) \notin \mathbb{R}$, $(\mathbb{Q}, 0) \notin \mathbb{R}$ and $(\varnothing, 0) \neq (\mathbb{Q}, 0)$. So we can choose $\infty = (\varnothing, 0)$ and $-\infty = (\mathbb{Q}, 0)$. However we never make use of the exact nature of ∞, $-\infty$ the only thing that matters is that ∞, $-\infty \notin \mathbb{R}$ and that $\infty \neq -\infty$.*

20.1.1 Order relation in $\overline{\mathbb{R}}$

Definition 20.3. *A $x \in \overline{\mathbb{R}}$ is a called a finite real number if $x \in \mathbb{R}$ so $\mathbb{R}$ is the set of finite real numbers.*

We introduce now a fully order on $\overline{\mathbb{R}}$ based on the order defined on the set of real numbers. To avoid confusion with notation, $\leqslant$ will be the order relation on $\overline{\mathbb{R}}$ and $\leqslant_{\mathbb{R}}$ is the order relation on $\mathbb{R}$.

Definition 20.4. *The relation $\leqslant \subseteq \overline{\mathbb{R}} \times \overline{\mathbb{R}}$ is defined by*

$$\leqslant = \leqslant_{\mathbb{R}} \bigcup (\bar{\mathbb{R}} \times \{\infty\}) \bigcup (\{-\infty\} \times \overline{\mathbb{R}})$$

where $\leqslant_{\mathbb{R}} \subseteq \mathbb{R} \times \mathbb{R}$ is the order relation on $\mathbb{R}$.

***Notation* 20.5.** *As usual $x \leqslant y$ is another notation for $(x, y) \in \leqslant$*

***Note* 20.6.** *As $\infty \notin \mathbb{R}$, $-\infty \notin \mathbb{R}$ and $-\infty \neq \infty$ we have that*

$$\begin{gathered} \leqslant_{\mathbb{R}} \bigcap (\bar{\mathbb{R}} \times \{\infty\}) = \varnothing \\ \leqslant_{\mathbb{R}} \bigcap (\{-\infty\} \times \overline{\mathbb{R}}) = \varnothing \\ (\bar{\mathbb{R}} \times \{\infty\}) \bigcap (\{-\infty\} \times \overline{\mathbb{R}}) = \{(-\infty, \infty)\} \end{gathered}$$

***Note* 20.7.** *Using the definition we have that $\forall x \in \overline{\mathbb{R}}$ we have that $(x, \infty) \in \overline{\mathbb{R}} \times \{\infty\}$ and $(-\infty, x) \in \{-\infty\} \times \overline{\mathbb{R}}$ so that*

$$\forall x \in \overline{\mathbb{R}} \text{ we have } -\infty \leqslant x \text{ and } x \leqslant \infty$$

So in essence ∞ is a number that is bigger then all numbers in $\overline{\mathbb{R}}$ and $-\infty$ is a number that is less than every number in $\overline{\mathbb{R}}$.

***Note* 20.8.** *If $x, y \in \mathbb{R}$ then if $x \leqslant y$ it follows that $x \leqslant_{\mathbb{R}} y$*

Proof. *As $x, y \in \mathbb{R}$ $\infty, -\infty \notin \mathbb{R}$ $(x, y) \notin (\bar{\mathbb{R}} \times \{\infty\}) \bigcup (\{-\infty\} \times \overline{\mathbb{R}})$ so we must have that $(x, y) \in \leqslant_{\mathbb{R}}$ or $x \leqslant_{\mathbb{R}} y$.* □

We proof now that $\langle \overline{\mathbb{R}}, \leqslant \rangle$ is fully ordered partial ordered set

Theorem 20.9. *$\langle \overline{\mathbb{R}}, \leqslant \rangle$ is totally ordered.*

Proof. First we have to prove that $\leqslant$ is a partial ordered.

reflectivity. Let $x \in \overline{\mathbb{R}}$ then we have either:

- $\boldsymbol{x = \infty}$**.** Then $(x, x) = (\infty, \infty) \in \bar{\mathbb{R}} \times \{\infty\} \subseteq \leqslant$ proving that $x \leqslant x$.
- $\boldsymbol{x = -\infty}$**.** Then $(x, x) = (-\infty, -\infty) \in \{-\infty\} \times \overline{\mathbb{R}} \subseteq \leqslant$ proving that $x \leqslant x$.
- $\boldsymbol{x \in \mathbb{R}}$**.** Then as $\leqslant_{\mathbb{R}}$ is a partial order it follows that $(x, x) \in \leqslant_{\mathbb{R}} \subseteq \leqslant$ proving that $x \leqslant x$.

anti-symmetry. If $x \leqslant y \wedge y \leqslant x$ then $(x, y), (y, x) \in \leqslant_{\mathbb{R}} \bigsqcup (\bar{\mathbb{R}} \times \{\infty\}) \bigsqcup (\{-\infty\} \times \overline{\mathbb{R}})$ and we have for (x, y) the following cases:

- $\boldsymbol{(x, y) \in \leqslant_{\mathbb{R}}}$**.** Then as $(y, x) \in \leqslant_{\mathbb{R}} \bigsqcup (\bar{\mathbb{R}} \times \{\infty\}) \bigsqcup (\{-\infty\} \times \overline{\mathbb{R}})$ we have either:
  - $\boldsymbol{(y, x) \in \leqslant_{\mathbb{R}}}$**.** As $\leqslant_{\mathbb{R}}$ is a partial order we have that $x = y$.
  - $\boldsymbol{(y, x) \in \overline{\mathbb{R}} \times \{\infty\}}$**.** This can not occur because $(x, y) \in \leqslant_{\mathbb{R}} \subseteq \mathbb{R} \times \mathbb{R}$ so that $x \neq \infty \wedge x = \infty$.
  - $\boldsymbol{(y, x) \in \{-\infty\} \times \overline{\mathbb{R}}}$**.** This can not occur because $(x, y) \in \leqslant_{\mathbb{R}} \subseteq \mathbb{R} \times \mathbb{R}$ so that $y \neq -\infty \wedge y = -\infty$.
- $\boldsymbol{(x, y) \in \overline{\mathbb{R}} \times \{\infty\}}$**.** Then as $(y, x) \in \leqslant_{\mathbb{R}} \bigsqcup (\bar{\mathbb{R}} \times \{\infty\}) \bigsqcup (\{-\infty\} \times \overline{\mathbb{R}})$ we have either:
  - $\boldsymbol{(y, x) \in \leqslant_{\mathbb{R}}}$**.** As $(y, x) \in \leqslant_{\mathbb{R}} \subseteq \mathbb{R} \times \mathbb{R}$ $y \neq \infty$ so this can not occur.
  - $\boldsymbol{(y, x) \in \overline{\mathbb{R}} \times \{\infty\}}$**.** Then $y = \infty \wedge x = \infty$ so that $x = y$.
  - $\boldsymbol{(y, x) \in \{-\infty\} \times \overline{\mathbb{R}}}$**.** Then $y = \infty \wedge y = -\infty$ which as $\infty \neq -\infty$ can not occur.
- $\boldsymbol{(x, y) \in \{-\infty\} \times \overline{\mathbb{R}}}$**.** Then as $(y, x) \in \leqslant_{\mathbb{R}} \bigsqcup (\bar{\mathbb{R}} \times \{\infty\}) \bigsqcup (\{-\infty\} \times \overline{\mathbb{R}})$ we have either:
  - $\boldsymbol{(y, x) \in \leqslant_{\mathbb{R}}}$**.** As $(y, x) \in \leqslant_{\mathbb{R}} \subseteq \mathbb{R} \times \mathbb{R}$ $y \neq -\infty \wedge y = \infty$ so this can not occur.
  - $\boldsymbol{(y, x) \in \overline{\mathbb{R}} \times \{\infty\}}$**.** Then $x = -\infty \wedge x = \infty$ which can not occur as $\infty \neq -\infty$.
  - $\boldsymbol{(y, x) \in \{-\infty\} \times \overline{\mathbb{R}}}$**.** Then $x = -\infty \wedge y = -\infty$ so that $x = y$.

Hence in all valid cases we have that $x = y$.

transitivity. If $x \leqslant y \wedge y \leqslant z$ then $(x, y), (y, z) \in \leqslant_{\mathbb{R}} \bigsqcup (\bar{\mathbb{R}} \times \{\infty\}) \bigsqcup (\{-\infty\} \times \overline{\mathbb{R}})$ and we have for (x, y) either:

- $\boldsymbol{(x, y) \in \leqslant_{\mathbb{R}}}$**.** Then for (y, z) we have either:
  - $\boldsymbol{(y, z) \in \leqslant_{\mathbb{R}}}$**.** Then $x \leqslant_{\mathbb{R}} y \wedge y \leqslant_{\mathbb{R}} z$ and as $\leqslant_{\mathbb{R}}$ is a partial order it follows that $x \leqslant_{\mathbb{R}} z$ hence $(x, z) \in \leqslant$ so that $x \leqslant z$.
  - $\boldsymbol{(y, z) \in \overline{\mathbb{R}} \times \{\infty\}}$**.** As $z = \infty$ we have that $(x, z) \in \overline{\mathbb{R}} \times \{\infty\} \subseteq \leqslant$ so that $x \leqslant z$.
  - $\boldsymbol{(y, z) \in \{-\infty\} \times \overline{\mathbb{R}}}$**.** As $(x, y) \in \leqslant_{\mathbb{R}} \subseteq \mathbb{R} \times \mathbb{R}$ we have that $y \neq -\infty \wedge y = -\infty$ so this case can never occur.
- $\boldsymbol{(x, y) \in \overline{\mathbb{R}} \times \{\infty\}}$**.** Then for (y, z) we have either:
  - $\boldsymbol{(y, z) \in \leqslant_{\mathbb{R}}}$**.** Then as $(y, z) \in \leqslant_{\mathbb{R}} \subseteq \mathbb{R} \times \mathbb{R}$ we have that $y \neq \infty \wedge y = \infty$ so this case can never occur.
  - $\boldsymbol{(y, z) \in \overline{\mathbb{R}} \times \{\infty\}}$**.** As $z = \infty$ we have $(x, z) \in \overline{\mathbb{R}} \times \{\infty\} \subseteq \leqslant$ so that $x \leqslant z$.
  - $\boldsymbol{(y, z) \in \{-\infty\} \times \overline{\mathbb{R}}}$**.** As $y = \infty \wedge y = -\infty$ and $-\infty \neq \infty$ so that this case never occurs.
- $\boldsymbol{(x, y) \in \{-\infty\} \times \overline{\mathbb{R}}}$**.** Then for (y, z) we have either:
  - $\boldsymbol{(y, z) \in \leqslant_{\mathbb{R}}}$**.** As $x = -\infty$ we have that $(x, z) \in \{-\infty\} \times \overline{\mathbb{R}} \subseteq \leqslant$ so that $x \leqslant z$.
  - $\boldsymbol{(y, z) \in \overline{\mathbb{R}} \times \{\infty\}}$**.** As $z = \infty$ we have that $(x, z) \in \overline{\mathbb{R}} \times \{\infty\} \subseteq \leqslant$ so that $x \leqslant z$.
  - $\boldsymbol{(y, z) \in \{-\infty\} \times \overline{\mathbb{R}}}$**.** As $x = -\infty$ we have that $(x, z) \in \{-\infty\} \times \overline{\mathbb{R}} \subseteq \leqslant$ so that $x \leqslant z$.

Hence in all valid cases we have that $x \leqslant z$.

Next we have to prove that $\leqslant$ is a total order. So let $x, y \in \overline{\mathbb{R}}$ then we have to consider the following cases:

- $\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R}}$**.** Then as $\leqslant_{\mathbb{R}}$ is a total order we have $(x, y) \in \leqslant_{\mathbb{R}} \subseteq \leqslant$ so that $x \leqslant y$.

$\boldsymbol{x=\infty \wedge y \in \mathbb{R}}$. Then $(y,x) \in \overline{\mathbb{R}} \times \{\infty\} \subseteq \leqslant$ so that $y \leqslant x$.

$\boldsymbol{x=-\infty \wedge y \in \mathbb{R}}$. Then $(x,y) \in \{-\infty\} \times \overline{\mathbb{R}} \subseteq \leqslant$ so that $x \leqslant y$.

$\boldsymbol{x \in \mathbb{R} \wedge y=\infty}$. Then $(x,y) \in \overline{\mathbb{R}} \times \{\infty\} \subseteq \leqslant$ so that $x \leqslant y$.

$\boldsymbol{x=\infty \wedge y=\infty}$. Then $(x,y) \in \overline{\mathbb{R}} \times \{\infty\} \subseteq \leqslant$ so that $x \leqslant y$.

$\boldsymbol{x=-\infty \wedge y=\infty}$. Then $(x,y) \in \overline{\mathbb{R}} \times \{\infty\} \subseteq \leqslant$ so that $x \leqslant y$.

$\boldsymbol{x \in \mathbb{R} \wedge y=-\infty}$. Then $(y,x) \in \{-\infty\} \times \overline{\mathbb{R}} \subseteq \leqslant$ so that $y \leqslant x$.

$\boldsymbol{x=\infty \wedge y=-\infty}$. Then $(y,x) \in \{-\infty\} \times \overline{\mathbb{R}} \subseteq \leqslant$ so that $y \leqslant x$.

$\boldsymbol{x=-\infty \wedge y=-\infty}$. Then $(y,x) \in \{-\infty\} \times \overline{\mathbb{R}} \subseteq \leqslant$ so that $y \leqslant x$. □

Theorem 20.10. *Let $x \in \mathbb{R}$ then we have $-\infty < x < \infty$*

Proof. As $(x,\infty) \in \mathbb{R} \times \{\infty\} \subseteq \leqslant$ we have $x \leqslant \infty$ and $x \neq \infty$ so that $x < \infty$. Further as $(-\infty,x) \in \{-\infty\} \times \mathbb{R}$ we have that $-\infty \leqslant x$ and $x \neq -\infty$ so that $-\infty < x$. □

Theorem 20.11. *Let $x,y \in \overline{\mathbb{R}}$ with $x<y$ then $x \neq \infty$ and $y \neq -\infty$.*

Proof. Assume that $x=\infty$ then by definition $y \leqslant x \underset{x<y}{\Rightarrow} y<y$ a contradiction so we must have that $x \neq \infty$. Assume that $y=-\infty$ then by definiton $y \leqslant x \underset{x<y}{\Rightarrow} y<y$ a contradiction so we must have that $y \neq -\infty$. □

The rational numbers are still dense in $\overline{\mathbb{R}}$ as the following theorem shows.

Theorem 20.12. *Let $x,y \in \overline{\mathbb{R}}$ with $x<y$ then $\exists q \in \mathbb{Q}$ such that $x<q<y$.*

Proof. As $x<y$ we have by the previous theorem [theorem: 20.11] $x \neq \infty \wedge y \neq -\infty$ so we must consider only the following cases for x,y:

$\boldsymbol{x \in \mathbb{R} \wedge y=\infty}$. Then as $x, x+1 \in \mathbb{R}$ and $x<x+1$ we can use [theorem: 10.32] to find a $q \in \mathbb{Q}$ such that $x<q<x+1<\infty=y$ hence $x<q<y$.

$\boldsymbol{x=-\infty \wedge y=\infty}$. Then for $q=0 \in \mathbb{Q}$ we have $x<q<y$.

$\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R}}$. Then using [theorem: 10.32] there exist a $q \in \mathbb{Q}$ such that $x<q<y$.

$\boldsymbol{x=-\infty \wedge y \in \mathbb{R}}$. Then $y, y-1 \in \mathbb{R}$ and $y-1<y$ we can use [theorem: 10.32] to find a $q \in \mathbb{Q}$ such that $x=-\infty<y-1<q<y$ hence $x<q<y$. □

The primary reason for the extended real is that every non empty set has a supremum and infinum.

Theorem 20.13. *Let $\varnothing \neq A \subseteq \overline{\mathbb{R}}$ then $\sup(A)$ and $\inf(A)$ exist. Further we have:*

1. $\sup(A)$ *has the following values for the possible cases of A:*

   $\boldsymbol{A=\{-\infty\}}$. *Then* $\sup(A)=-\infty$

   $\boldsymbol{A \neq \{-\infty\}}$. *Then we have the following possible sub-cases:*

   $\boldsymbol{\infty \in A}$. *Then* $\sup(A)=\infty$

   $\boldsymbol{\infty \notin A}$. *Then we have the following sub-cases:*

   $\boldsymbol{\exists u \in \mathbb{R} \vdash \forall x \in A \text{ we have } x \leqslant u}$. *Then* $\sup(A)=\sup_{\mathbb{R}}(A \bigcap \mathbb{R}) \in \mathbb{R}$

   $\boldsymbol{\forall u \in R \vdash \exists x \in A \text{ we have } x \nleqslant u}$. *Then* $\sup(A)=\infty$

2. $\inf(A)$ *has the following values for the possible cases of A:*

   $\boldsymbol{A=\{\infty\}}$. *Then* $\inf(A)=\infty$

   $\boldsymbol{A \neq \{\infty\}}$. *Then we have the following possible sub-cases:*

   $\boldsymbol{-\infty \in A}$. *Then* $\inf(A)=-\infty$

   $\boldsymbol{-\infty \notin A}$. *Then we have the following sub-cases:*

   $\boldsymbol{\exists l \in \mathbb{R} \vdash \forall x \in A \text{ we have } l \leqslant x}$. *Then* $\inf(A)=\inf_{\mathbb{R}}(A \bigcap \mathbb{R}) \in \mathbb{R}$

$$\forall \boldsymbol{l} \in \boldsymbol{R} \vdash \exists \boldsymbol{x} \in \boldsymbol{A} \textbf{ we have } \boldsymbol{l} \nleqslant \boldsymbol{x}. \textit{ Then } \inf(A) = -\infty$$

Where $\sup(A)$ *is the supremum of* A *using* $\leqslant$, $\sup_{\mathbb{R}}(A \bigcap \mathbb{R})$ *is the supremum of* $A \bigcap \mathbb{R}$ *using* $\leqslant_{\mathbb{R}}$, $\inf(A)$ *is the infinum of* A *using* $\leqslant$ *and* $\inf_{\mathbb{R}}(A \bigcap \mathbb{R})$ *is the infinum of* $A \bigcap \mathbb{R}$ *using* $\leqslant_{\mathbb{R}0}$.

Proof. First we proof that $\sup(A)$ exist. For A we have either:

$\boldsymbol{A = \{-\infty\}}$**.** As $-\infty \leqslant -\infty$ $-\infty$ is a upper bound of A. If $u \in \overline{\mathbb{R}}$ is another upper bound then, as $-\infty \leqslant u$ it follows that $-\infty$ is the lowest upper bound of A hence $\sup(A) = -\infty$ and

$$\sup(\{-\infty\}) = -\infty$$

$\boldsymbol{A \neq \{-\infty\}}$**.** Then we have either:

$\boldsymbol{\infty \in A}$**.** As $\forall x \in A$ we have $x \leqslant \infty$ so ∞ is clearly a upper bound for A. If u is a another upper bound for A then, as $\infty \in A$, we must have that $\infty \leqslant u$ so ∞ is the lowest upper bound of A. Hence $\sup(A) = \infty$ or

$$\text{If } \infty \in A \text{ then } \sup(A) = \infty$$

$\boldsymbol{\infty \notin A}$**.** As $A \neq \varnothing$ and $A \neq \{-\infty\}$ there must be a $z \in A$ with $z \neq -\infty$, as $\infty \notin A$ it follows that $z \in \mathbb{R}$. Hence we conclude that

$$A \bigcap \mathbb{R} \neq \varnothing$$

Consider now for A the following cases:

$\boldsymbol{\exists u \in \mathbb{R} \vdash \forall x \in A}$ **we have** $\boldsymbol{x \leqslant u}$**.** Then $\forall x \in A \bigcap \mathbb{R}$ we have $x \leqslant u$ or, as $x, u \in \mathbb{R}$ that $x \leqslant_{\mathbb{R}} u$, so $\varnothing \neq A \bigcap \mathbb{R}$ is bounded above by u. As $\langle \mathbb{R}, \leqslant_{\mathbb{R}} \rangle$ is conditional complete [see theorem: 10.18] $A \bigcap \mathbb{R}$ has a supremum $S = \sup_{\mathbb{R}}(A \bigcap \mathbb{R}) \in \mathbb{R}$. Let $x \in A$, then, given that $\infty \notin A$, we have either:

$\boldsymbol{x \in A \bigcap \mathbb{R}}$**.** Then $x \leqslant_{\mathbb{R}} S$ so that $x \leqslant S$

$\boldsymbol{x = -\infty}$**.** Then $-\infty \leqslant S$

So in all cases we have $x \leqslant S$ which proves that

$$S \text{ is a upper bound of } A \,[\text{using} \leqslant]$$

Let U be another upper bound of A [using $\leqslant$] then we have either:

$\boldsymbol{U \in \mathbb{R}}$**.** Then $\forall x \in A \bigcap \mathbb{R} \subseteq A$ we have $x \leqslant U$, hence, as $x, U \in \mathbb{R}$, $x \leqslant_{\mathbb{R}} U$ so that U is another upper bound of $A \bigcap \mathbb{R}$ using $\leqslant_{\mathbb{R}}$. So we must have that $S \leqslant U$.

$\boldsymbol{U = \infty}$**.** Then trivially $S \leqslant U$.

$\boldsymbol{U = -\infty}$**.** Then $\forall x \in A$ we have $-\infty \leqslant x \leqslant -\infty \Rightarrow x = -\infty$ so that $A \subseteq \{-\infty\}$ or $A \bigcap \mathbb{R} \subseteq \{-\infty\} \bigcap \mathbb{R} = \varnothing$ contradicting the fact that $A \bigcap \mathbb{R} = \varnothing$. So this case will never occur.

As in all valid cases $S \leqslant U$ it follows that S is the lowest upper bound of A or S is the supremum of A. So

$$\sup(A) = \sup_{\mathbb{R}}\left(A \bigcap \mathbb{R}\right)$$

$\boldsymbol{\forall u \in \mathbb{R} \vdash \exists x \in A}$ **with** $\boldsymbol{x \nleqslant u}$**.** As $\forall x \in \overline{\mathbb{R}}$ we have that $x \leqslant \infty$ it follows that ∞ is a upper bound of A [using $\leqslant$]. Let u be another upper bound of A. Assume that $\infty \nleqslant u$ then by [theorem: 3.39] $u < \infty$ or $u \neq \infty$ so that u is either:

$\boldsymbol{u = -\infty}$**.** Then $\forall x \in A$ we have $-\infty \leqslant x \leqslant u = -\infty \Rightarrow x = -\infty$ so that $A \subseteq \{-\infty\}$ or $A \bigcap \mathbb{R} \subseteq \{-\infty\} \bigcap \mathbb{R} = \varnothing$ contradicting the fact that $A \bigcap \mathbb{R} = \varnothing$.

$\boldsymbol{u \in \mathbb{R}}$**.** Then $\exists x \in A$ such that $x \nleqslant u$ contradicting the fact that u is a upper bound.

As in all cases we have a contradiction we must have that the assumption is wrong and that $\infty \leqslant u$. Hence ∞ is the lowest upper bound of A [using $\leqslant$] or ∞ is the supremum of A, so

$$\sup(A) = \infty$$

So in all possible cases of A we have found that $\sup(A)$ exists. Next we prove that $\inf(A)$ exist, for A we have either:

$\boldsymbol{A = \{\infty\}}$**.** As $\infty \leqslant \infty$ ∞ is a lower bound of A. If $l \in \overline{\mathbb{R}}$ is another lower bound then, as $l \leqslant \infty$ it follows that ∞ is the greatest upper bound of A hence $\inf(A) = \infty$ and

$$\inf(\{\infty\}) = \infty$$

$\boldsymbol{A \neq \{\infty\}}$**.** Then we have either:

$\boldsymbol{-\infty \in A}$**.** As $\forall x \in A$ we have $-\infty \leqslant x$ so $-\infty$ is clearly a lower bound for A. If l is a another lower bound for A then, as $-\infty \in A$, we must have that $u \leqslant -\infty$ so $-\infty$ is the greatest lower bound of A. Hence $\inf(A) = -\infty$ or

$$\text{If } -\infty \in A \text{ then } \inf(A) = -\infty$$

$\boldsymbol{-\infty \notin A}$**.** As $A \neq \varnothing$ and $A \neq \{\infty\}$ there must be a $z \in A$ with $z \neq \infty$, as $-\infty \notin A$ it follows that $z \in \mathbb{R}$. Hence we conclude that

$$A \bigcap \mathbb{R} \neq \varnothing$$

Consider now for A the following cases:

$\boldsymbol{\exists l \in \mathbb{R} \vdash \forall x \in A}$ **we have** $\boldsymbol{l \leqslant x}$**.** Then $\forall x \in A \bigcap \mathbb{R}$ we have $l \leqslant x$ or, as $x, l \in \mathbb{R}$ that $l \leqslant_{\mathbb{R}} x$, so $\varnothing \neq A \bigcap \mathbb{R}$ is bounded below by l. As $\langle \mathbb{R}, \leqslant_{\mathbb{R}} \rangle$ is conditional complete [see theorem: 10.18] $A \bigcap \mathbb{R}$ has a infinum $I = \inf_{\mathbb{R}}(A \bigcap \mathbb{R}) \in \mathbb{R}$. Let $x \in A$, then, given that $-\infty \notin A$, we have either:

$\boldsymbol{x \in A \bigcap \mathbb{R}}$**.** Then $I \leqslant_{\mathbb{R}} x$ so that $I \leqslant x$

$\boldsymbol{x = \infty}$**.** Then $I \leqslant x$

So in all cases we have $I \leqslant x$ which proves that

$$I \text{ is a lower bound of } A \,[\text{using} \leqslant]$$

Let L be another lower bound of A [using $\leqslant$] then we have either:

$\boldsymbol{L \in \mathbb{R}}$**.** Then $\forall x \in A \bigcap \mathbb{R} \subseteq A$ we have $L \leqslant x$, hence, as $x, L \in \mathbb{R}$, $L \leqslant_{\mathbb{R}} x$ so that L is another lower bound of $A \bigcap \mathbb{R}$ using $\leqslant_{\mathbb{R}}$. So we must have that $L \leqslant I$.

$\boldsymbol{L = \infty}$**.** Then $\forall x \in A$ we have $\infty \leqslant x \leqslant \infty \Rightarrow x = \infty$ so that $A \subseteq \{\infty\}$ or $A \bigcap \mathbb{R} \subseteq \{\infty\} \bigcap \mathbb{R} = \varnothing$ contradicting the fact that $A \bigcap \mathbb{R} = \varnothing$. So this case will never occur.

$\boldsymbol{L = -\infty}$**.** Then $L \leqslant I$

As in all valid cases $L \leqslant I$ it follows that I is the greatest lower bound of A or I is the infinum of A. So

$$\inf(A) = \inf_{\mathbb{R}}\left(A \bigcap \mathbb{R}\right)$$

$\boldsymbol{\forall l \in \mathbb{R} \vdash \exists x \in A}$ **with** $\boldsymbol{l \nleqslant x}$**.** As $\forall x \in \overline{\mathbb{R}}$ we have that $-\infty \leqslant x$ it follows that $-\infty$ is a lower bound of A [using $\leqslant$]. Let l be another lower bound of A. Assume that $l \nleqslant -\infty$ then by [theorem: 3.39] $-\infty < l$ or $l \neq -\infty$ so that l is either:

$\boldsymbol{l = \infty}$**.** Then $\forall x \in A$ we have $\infty = l \leqslant x \leqslant \infty \Rightarrow x = \infty$ so that $A \subseteq \{\infty\}$ or $A \bigcap \mathbb{R} \subseteq \{\infty\} \bigcap \mathbb{R} = \varnothing$ contradicting the fact that $A \bigcap \mathbb{R} = \varnothing$.

$\boldsymbol{l \in \mathbb{R}}$**.** Then $\exists x \in A$ such that $l \nleqslant x$ contradicting the fact that l is a lower bound.

As in all cases we have a contradiction we must have that the assumption is wrong and that $l \leqslant -\infty$. Hence $-\infty$ is the greatest lower bound of A [using $\leqslant$] or $-\infty$ is the infinum of A. So

$$\inf(A) = -\infty$$

So in all possible cases of A we have proved that $\inf(A)$ exist. □

Corollary 20.14. *If* $\varnothing \neq A \subseteq \mathbb{R}$ *then* $\sup(A) \neq -\infty$ *and* $\inf(A) \neq \infty$

Proof. If $\sup(A) = -\infty$ then $\forall x \in A$ we have $-\infty \leqslant x \leqslant -\infty$ so that $x = -\infty$, hence $A \subseteq \{-\infty\}$ so that we get $\varnothing \neq A = A \bigcap \mathbb{R} \subseteq \{-\infty\} \bigcap \mathbb{R} = \varnothing$ a contradiction. Hence

$$\sup(A) \neq -\infty$$

Likewise if $\inf(A) = \infty$ then $\forall x \in A$ we have $\infty \leqslant x \leqslant \infty$ so that $x = \infty$, hence $A \subseteq \{\infty\}$ so that we get $\varnothing \neq A = A \bigcap \mathbb{R} \subseteq \{\infty\} \bigcap \mathbb{R} = \varnothing$ a contradiction. Hence

$$\inf(A) \neq \infty$$

□

The next theorem shows the necessary and sufficient constraint for the supremum and infinum to be not finite.

Corollary 20.15. *Let* $\varnothing \neq A \subseteq \overline{\mathbb{R}}$ *then*

1. $\sup(A) = \infty \Leftrightarrow \infty \in A$ *or* $\forall u \in \mathbb{R}$ *there exist a* $x \in A \bigcap \mathbb{R}$ *with* $x \nleqslant u$ *or* $u < x$.

2. $\inf(A) = -\infty \Leftrightarrow -\infty \in A$ *or* $\forall \in \mathbb{R}$ *there exist a* $x \in A \bigcap \mathbb{R}$ *with* $l \nleq x$ *or* $x < l$.
3. $\sup(A) = -\infty \Leftrightarrow A = \{-\infty\}$
4. $\inf(A) = \infty \Leftrightarrow A = \{\infty\}$

Proof.

1. From [theorem: 20.13 (1)] it follows that the only possible cases where $\sup(A) = \infty$ are that either $\infty \in A$ or $\forall u \in \mathbb{R}$ there exist a $x \in A \bigcap \mathbb{R}$ with $x \nleq u$.
2. From [theorem: 20.13 (2)] it follows that the only possible cases where $\inf(A) = -\infty$ are that either $-\infty \in A$ or $\forall l \in \mathbb{R}$ there exist a $x \in A \bigcap \mathbb{R}$ with $l \nleq x$.
3. From [theorem: 20.13 (1)] it follows that the only possible cases where $\sup(A) = -\infty$ is the case where $A = \{-\infty\}$.
4. From [theorem: 20.13 (2)] it follows that the only possible cases where $\inf(A) = \infty$ is the case where $A = \{\infty\}$. □

20.1.2 Arithmetic operations on $\overline{\mathbb{R}}$

The sum operator on $\overline{\mathbb{R}}$ is a extension of the sum on $\mathbb{R}$ such that most inequalities involving sums are still satisfied.

Definition 20.16. *The sum operator is defined by*

$$(+): (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(\infty, -\infty), (-\infty, \infty)\} \to \overline{\mathbb{R}} \text{ by } (+)(x, y) \underset{\text{notation}}{=} x + y$$

where

$$x + y = \begin{cases} \infty \text{ if } x = \infty \wedge y \in \overline{\mathbb{R}} \setminus \{-\infty\} \\ \infty \text{ if } y = \infty \wedge x \in \overline{\mathbb{R}} \setminus \{-\infty\} \\ -\infty \text{ if } x = -\infty \wedge y \in \overline{\mathbb{R}} \setminus \{\infty\} \\ -\infty \text{ if } y = -\infty \wedge x \in \overline{\mathbb{R}} \setminus \{\infty\} \\ x +_{\mathbb{R}} y \text{ if } x, y \in \mathbb{R} \text{ where } +_{\mathbb{R}} \text{ is the sum defined for the real numbers} \end{cases}$$

***Note* 20.17.** $\infty + (-\infty)$ *and* $-\infty + \infty$ *are not defined at all.*

Note 20.18. Let $x \in \overline{\mathbb{R}}$ then for $0 \in \mathbb{R} \subseteq \overline{\mathbb{R}}$ we have that $0 + x = x = x + 0$

Proof. For $x \in \overline{\mathbb{R}}$ we have either:

$\boldsymbol{x \in \mathbb{R}}$**.** Then $x + 0 = x +_{\mathbb{R}} 0 = x$ and $0 + x = 0 +_R x = x$.

$\boldsymbol{x = -\infty}$**.** Then $x + 0 = -\infty + 0 = -\infty = x$ and $0 + x = 0 + (-\infty) = -\infty = x$.

$\boldsymbol{x = \infty}$**.** Then $x + 0 = \infty + 0 = \infty = x$ and $0 + x = 0 + \infty = \infty = x$. □

Definition 20.19. *The multiplication operator* $\cdot$ *is defined by*

$$(\cdot): \overline{\mathbb{R}} \times \overline{\mathbb{R}} \to \overline{\mathbb{R}} \text{ by } (\cdot)(x, y) \underset{\text{notation}}{=} x \cdot y$$

where for $(x, y) \in \overline{\mathbb{R}} \times \overline{\mathbb{R}}$ *we define* $x \cdot y$ *as follows:*

$\boldsymbol{x = 0 \vee y = 0}$**.** *Then* $x \cdot y = 0$

$\boldsymbol{x < 0 \wedge y = \infty}$**.** *Then* $x \cdot y = -\infty$

$\boldsymbol{0 < x \wedge y = \infty}$**.** *Then* $x \cdot y = \infty$

$\boldsymbol{x < 0 \wedge y = -\infty}$**.** *Then* $x \cdot y = \infty$

$\boldsymbol{0 < x \wedge y = -\infty}$**.** *Then* $x \cdot y = -\infty$

$\boldsymbol{x = -\infty \wedge y \in]-\infty, 0[}$**.** *Then* $x \cdot y = \infty$

$\boldsymbol{x = \infty \wedge y \in]-\infty, 0[}$**.** *Then* $x \cdot y = -\infty$

$\boldsymbol{x \in \mathbb{R} \setminus \{0\} \wedge y \in]-\infty, 0[}$**.** *Then* $x \cdot y = x \cdot_{\mathbb{R}} y$

$\boldsymbol{x = -\infty \wedge y \in]0, \infty[}$**.** *Then* $x \cdot y = -\infty$

$\boldsymbol{x = \infty \wedge y \in]0, \infty[}$**.** *Then* $x \cdot y = \infty$

$\boldsymbol{x \in \mathbb{R} \setminus \{0\} \wedge y \in]0, \infty[}$. *Then* $x \cdot y = x \cdot_{\mathbb{R}} y$
where $x \cdot_{\mathbb{R}} y$ *is the product in* $\mathbb{R}$.

***Note* 20.20.** *In contrast with the sum the product in* $\overline{\mathbb{R}}$ *is defined* $\forall x, y \in \overline{\mathbb{R}}$.

Next we define the inverse operator.

Definition 20.21. *The inverse operator* $(\cdot)^{-1}$ *is defined by*

$$(\cdot)^{-1}: \overline{\mathbb{R}} \setminus \{0\} \to \overline{\mathbb{R}} \text{ by } (\cdot)^{-1} = \begin{cases} 0 \text{ if } x = -\infty \\ 0 \text{ if } x = \infty \\ x^{-1} \text{ if } x \in \mathbb{R} \text{ where } x^{-1} \text{ is the inverse defined in } \mathbb{R} \end{cases}$$

***Notation* 20.22.** *As usually we note* $(\cdot)^{-1}(x)$ *as* x^{-1}, $1/x$ *or* $\frac{1}{x}$

Note 20.23. In contrast with real numbers where for $x \in \mathbb{R} \setminus \{0\}$ we have $x \cdot \frac{1}{x} = 1 = \frac{1}{x} \cdot x$ this is not the case for $x = -\infty$ and $x = \infty$ because we have $\infty \cdot \frac{1}{\infty} = \infty \cdot 0 = 0$ and $(-\infty) \cdot \frac{1}{-\infty} = (-\infty) \cdot 0 = 0$.

Definition 20.24. *The negate operator* $-$ *is defined by*

$$(-): \overline{\mathbb{R}} \to \overline{\mathbb{R}} \text{ where } (-)(x) \underset{notation}{=} -x \underset{\text{defined}}{=} (-1) \cdot x$$

So as $(-1) \in]0, \infty[$ *we have that*

$$-x = \begin{cases} \infty \text{ if } x = -\infty \\ -\infty \text{ if } x = \infty \\ (-1) \cdot_{\mathbb{R}} x \text{ if } x \in \mathbb{R} \end{cases}$$

As the sum is not defined for every $x, y \in \overline{\mathbb{R}}$ $\langle \overline{\mathbb{R}}, + \rangle$ is not a group however if we restrict ourselves to non negative numbers then we have a Abelian semi group which allows us to work with generalized sums [see section: 11.1].

Definition 20.25. *The set of positive extended real numbers noted as* $\overline{\mathbb{R}}^+$ *and the set of non negative extended real numbers noted as* $\overline{\mathbb{R}}_0^+$ *are defined by*

$$\overline{\mathbb{R}}^+ =]0, \infty] = \{x \in \overline{\mathbb{R}} | 0 < x\}$$

and

$$\overline{\mathbb{R}}_0^+ = [0, \infty] = \{x \in \overline{\mathbb{R}} | 0 \leqslant x\}$$

Theorem 20.26. $\langle \overline{\mathbb{R}}_0^+, + \rangle$ *is a Abelian semi-group with neutral element* $0 \in \mathbb{R}$ *where* $+$ *is the restriction to* $\overline{\mathbb{R}}_0^+$ *of the sum defined in [definition: 20.16].*

Proof. First for $x, y \in \overline{\mathbb{R}}_0^+$ we have $0 \leqslant x \wedge 0 \leqslant y$ so that $0 \leqslant y \underset{\text{[note: 20.18]}}{=} 0 + y \underset{\text{[theorem: 20.29]}}{\leqslant} x + y$ proving that $x + y \in \overline{\mathbb{R}}_0^+$. Hence

$$+: \overline{\mathbb{R}}_0^+ \times \overline{\mathbb{R}}_0^+ \to \overline{\mathbb{R}}_0^+ \text{ defined by } +(x, y) \in x + y$$

is a well defined function. Next we need to prove the Abelian semi-group axioms:

neutral element. This was proved in [note: 20.18].

associativity. Let $x, y, z \in \overline{\mathbb{R}}_0^+$ then we have as $-\infty \notin \overline{\mathbb{R}}_0^+$ [because $-\infty < 0$] that

$\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R} \wedge z \in \mathbb{R}}$. Then $x + (y + z) = x +_{\mathbb{R}} (y +_{\mathbb{R}} z) = (x +_{\mathbb{R}} y) +_{\mathbb{R}} z = (x + y) + z$.

$\boldsymbol{x = \infty \wedge y \in \mathbb{R} \wedge z \in \mathbb{R}}$. Then

$$x + (y + z) = \infty + (y + z) = \infty = \infty + z = (x + \infty) + z = (x + y) + z$$

$\boldsymbol{x \in \mathbb{R} \wedge y = \infty \wedge z \in \mathbb{R}}$. Then

$$x + (y + y) = x + (\infty + z) = x + \infty = \infty + z = (x + \infty) + z = (x + y) + z$$

$\boldsymbol{x = \infty \wedge y = \infty \wedge z \in \mathbb{R}}$. Then

$$x + (y + z) = \infty + (y + z) = \infty = \infty + z = (x + y) + z$$

$\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R} \wedge z = \infty}$. Then

$$x + (y + z) = x + (y + \infty) = x + \infty = \infty = (x + y) + \infty = (x + y) + z$$

$\boldsymbol{x = \infty \wedge y \in \mathbb{R} \wedge z = \infty}$. Then

$$x + (y + z) = \infty + (y + z) = \infty = (x + y) + \infty = (x + y) + z$$

$\boldsymbol{x \in \mathbb{R} \wedge y = \infty \wedge z = \infty}$. Then

$$x + (y + z) = x + (\infty + \infty) = x + \infty = \infty = (x + y) + \infty = (x + y) + z$$

$\boldsymbol{x = \infty \wedge y = \infty \wedge z = \infty}$. Then

$$x + (y + z) = x + (\infty + \infty) = x + \infty = \infty = (x + y) + \infty = (x + y) + z$$

So in all cases we have $x + (y + z) = (x + y) + z$.

commutativity. Let $x, y \in \overline{\mathbb{R}}_0^+$ then we have either:

$\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R}}$. Then $x + y = x +_{\mathbb{R}} y = y +_{\mathbb{R}} x = y + x$.

$\boldsymbol{x = \infty \wedge y \in \mathbb{R}}$. Then $x + y = \infty + y = \infty = y + \infty = y + x$.

$\boldsymbol{x \in \mathbb{R} \wedge y = \infty}$. Then $x + y = x + \infty = \infty = \infty + x = y + x$.

$\boldsymbol{x = \infty \wedge y = \infty}$. Then $x + y = \infty + \infty = y + x$.

So in all valid cases we have $x + y = y + x$. □

We have to be very careful if we combine sums and inequalities on $\overline{\mathbb{R}}$ the reasoning that works in $\mathbb{R}$ does not work always in $\overline{\mathbb{R}}$. For example if $x = 10, y = 4$ and $z = \infty$ then $x + z = y + z = \infty$ but $x \neq y$, also we have that $x + z \leqslant y + z$ but $x \nleqslant y$. The following theorems shows what is possible.

Theorem 20.27. *Let $x, y \in \overline{\mathbb{R}}$ be such that $0 \leqslant x \wedge 0 \leqslant y$ and one of x, y is finite [so that $x - y$ is well defined] then $x - y \leqslant x$*

Proof. As either x or y are finite we have to consider two cases:

$\boldsymbol{x \in \mathbb{R}}$. then for y we have either:

$\boldsymbol{y \in \mathbb{R}}$. then by the properties of the real numbers we have $x - y \leqslant x$

$\boldsymbol{y = \infty}$. then $x - y = x + (-y) = x + (-\infty) = -\infty < x$ so that $x - y \leqslant y$

$\boldsymbol{y \in \mathbb{R}}$. then for x we have either:

$\boldsymbol{x \in \mathbb{R}}$. then by the properties of the real numbers we have $x - y \leqslant x$

$\boldsymbol{x = \infty}$. then $x - y = x + (-y) = \infty \leqslant \infty = x$ giving $x - y \leqslant x$ □

Theorem 20.28. *If $x, y \in \overline{\mathbb{R}}$ and $z \in \mathbb{R}$ [so that $x + z$ and $y + z$ are well defined] then we have*

1. *if $x + z = y + z$ we have $x = y$*
2. *if $x + z \leqslant y + z$ we have $x \leqslant y$*
3. *if $x + z < y + z$ we have $x < y$*
4. *if $x + z = y$ we have $x = y - z \underset{\text{def}}{=} y + (-z)$ [where $y - z$ is well defined]*
5. *if $x + z \leqslant y$ we have $x \leqslant y - z \underset{\text{def}}{=} y + (-z)$ [where $y - z$ is well defined]*
6. *if $x + z < y$ we have $x < y - x \underset{\text{def}}{=} y + (-z)$ [where $y - z$ is well defined]*
7. *if $x \leqslant y + z$ we have $x + (-z) \leqslant y$*
8. *if $x < y + z$ we have $x + (-z) < y$*

Proof.

1. For x, y we have either:

   $\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R}}$. Then using the properties of the real numbers we have $x = y$.

$\boldsymbol{x = \infty \wedge y \in \mathbb{R}}$. Then $\infty = x + z = y + z \in \mathbb{R}$ which as $\infty \notin \mathbb{R}$ is not a valid case.

$\boldsymbol{x = -\infty \wedge y \in \mathbb{R}}$. Then $-\infty = x + z = y + z \in \mathbb{R}$ which as $-\infty \notin \mathbb{R}$ is not a valid case.

$\boldsymbol{x \in \mathbb{R} \wedge y = \infty}$. Then $\infty = y + z = x + z \in \mathbb{R}$ which as $\infty \notin \mathbb{R}$ is not a valid case.

$\boldsymbol{x = \infty \wedge y = \infty}$. Then $x = y$.

$\boldsymbol{x = -\infty \wedge y = \infty}$. Then $-\infty = x + z = y + z = \infty$ which as $-\infty \neq \infty$ is not a valid case.

$\boldsymbol{x \in \mathbb{R} \wedge y = -\infty}$. Then $-\infty = y + z = x + z \in \mathbb{R}$ which as $-\infty \notin \mathbb{R}$ is not a valid case.

$\boldsymbol{x = \infty \wedge y = -\infty}$. Then $\infty = x + z = y + z = -\infty$ which as $-\infty \neq \infty$ is not a valid case.

$\boldsymbol{x = -\infty \wedge y = -\infty}$. Then $x = y$

So in all valid cases we have $x = y$.

2. For x, y we have either:

$\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R}}$. Then using the properties of the real numbers we have $x \leqslant y$.

$\boldsymbol{x = \infty \wedge y \in \mathbb{R}}$. Then $\infty = x + z \leqslant y + z \in \mathbb{R}$ which as $y + z < \infty$ proves that $\infty = x + y \subset \mathbb{R}$ which as $\infty \notin \mathbb{R}$ is not a valid case.

$\boldsymbol{x = -\infty \wedge y \in \mathbb{R}}$. Then $x = -\infty \leqslant y$.

$\boldsymbol{x \in \mathbb{R} \wedge y = \infty}$. Then $x \leqslant \infty = y$,

$\boldsymbol{x = \infty \wedge y = \infty}$. Then $x = \infty = y$ so that $x \leqslant y$.

$\boldsymbol{x = -\infty \wedge y = \infty}$. Then $x = -\infty \leqslant \infty = y$.

$\boldsymbol{x \in \mathbb{R} \wedge y = -\infty}$. As $x + z \in \mathbb{R}$ we have $-\infty \leqslant x + z \leqslant y + z \leqslant -\infty$ so that $-\infty = x + z \in \mathbb{R}$ which as $-\infty \notin \mathbb{R}$ is not a valid case.

$\boldsymbol{x = \infty \wedge y = -\infty}$. As $\infty = x + z \leqslant y + z = -\infty$ and $-\infty \leqslant \infty$ we would have $-\infty = \infty$ so this is not a valid case.

$\boldsymbol{x = -\infty \wedge y = -\infty}$. Then $x = -\infty = y$ so that $x \leqslant y$.

So in all valid cases we have $x \leqslant y$.

3. For x, y we have either:

$\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R}}$. Then using the properties of the real numbers we have $x \leqslant y$.

$\boldsymbol{x = \infty \wedge y \in \mathbb{R}}$. Then $\infty = x + z < y + z \in \mathbb{R}$ which as $y + z < \infty$ proves that $\infty = x + y \subset \mathbb{R}$ which as $\infty \notin \mathbb{R}$ is not a valid case.

$\boldsymbol{x = -\infty \wedge y \in \mathbb{R}}$. Then $x = -\infty < y$.

$\boldsymbol{x \in \mathbb{R} \wedge y = \infty}$. Then $x < \infty = y$.

$\boldsymbol{x = \infty \wedge y = \infty}$. Then $\infty = x + z < y + z = \infty$ so this case does not apply.

$\boldsymbol{x = -\infty \wedge y = \infty}$. Then $x = -\infty < \infty = y$.

$\boldsymbol{x \in \mathbb{R} \wedge y = -\infty}$. Then $x + z \in \mathbb{R}$ so that $-\infty < x + z < y + z = -\infty$ so this case does not apply.

$\boldsymbol{x = \infty \wedge y = -\infty}$. Then $\infty = x + z < y + z - \infty$ so this case does not apply.

$\boldsymbol{x = -\infty \wedge y = -\infty}$. Then $-\infty = x + z < y + z = -\infty$ so this case does not apply.

So in all valid cases we have $x < y$.

4. For x, y we have either:

$\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R}}$. Then using the properties of the real numbers we have $x = y - z$.

$\boldsymbol{x = \infty \wedge y \in \mathbb{R}}$. Then $\infty = x + z = y \in \mathbb{R}$ which as $\infty \notin \mathbb{R}$ is not a valid case.

$\boldsymbol{x = -\infty \wedge y \in \mathbb{R}}$. Then $-\infty = x + z = y \in \mathbb{R}$ which as $-\infty \notin \mathbb{R}$ is not a valid case.

$\boldsymbol{x \in \mathbb{R} \wedge y = \infty}$. Then $\infty = y = x + z \in \mathbb{R}$ which as $\infty \notin \mathbb{R}$ is not a valid case.

$\boldsymbol{x = \infty \wedge y = \infty}$. Then $y - z = \infty = x$.

$\boldsymbol{x = -\infty \wedge y = \infty}$. Then $-\infty = x + z = y = \infty$ which as $-\infty \neq \infty$ is not a valid case.

$\boldsymbol{x \in \mathbb{R} \wedge y = -\infty}$. Then $-\infty = y = x + z \in \mathbb{R}$ which as $-\infty \notin \mathbb{R}$ is not a valid case.

$\boldsymbol{x = \infty \wedge y = -\infty}$. Then $\infty = x + z = y = -\infty$ which as $-\infty \neq \infty$ is not a valid case.

$\boldsymbol{x = -\infty \wedge y = -\infty}$**.** Then $y - z = -\infty = x$ so that $x = y - z$.

So in all valid cases we have $x = y - z$.

5. For x, y we have either:

   $\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R}}$**.** Then using the properties of the real numbers we have $x \leqslant y - z$.

   $\boldsymbol{x = \infty \wedge y \in \mathbb{R}}$**.** Then $\infty = x + z \leqslant y \leqslant \infty$ [as $y \in \mathbb{R}$] so $\infty = y \in \mathbb{R}$ which as $\infty \notin \mathbb{R}$ is not a valid case.

   $\boldsymbol{x = -\infty \wedge y \in \mathbb{R}}$**.** Then $x = -\infty < y - z$ so that $x \leqslant y - z$.

   $\boldsymbol{x \in \mathbb{R} \wedge y = \infty}$**.** Then $x \leqslant \infty = y - z$.

   $\boldsymbol{x = \infty \wedge y = \infty}$**.** Then $y - z = \infty = x$ so that $x \leqslant y - z$.

   $\boldsymbol{x = -\infty \wedge y = \infty}$**.** Then $x = -\infty < \infty = y - z$ so that $x \leqslant y - z$.

   $\boldsymbol{x \in \mathbb{R} \wedge y = -\infty}$**.** As $x + z \in \mathbb{R}$ we have $-\infty < x + z \leqslant y = -\infty$ so this is not a valid case.

   $\boldsymbol{x = \infty \wedge y = -\infty}$**.** Then $\infty = x + z \leqslant y = -\infty < \infty$ so this is not a valid case.

   $\boldsymbol{x = -\infty \wedge y = -\infty}$**.** Then $x = -\infty = y - z$ so that $x \leqslant y - z$.

   So in all valid cases we have $x \leqslant y - z$.

6. For x, y we have either:

   $\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R}}$**.** Then using the properties of the real numbers we have $x < y - z$.

   $\boldsymbol{x = \infty \wedge y \in \mathbb{R}}$**.** Then $\infty = x + z < y \leqslant \infty$ [as $y \in \mathbb{R}$] so this case is not valid.

   $\boldsymbol{x = -\infty \wedge y \in \mathbb{R}}$**.** Then $x = -\infty < y - z$.

   $\boldsymbol{x \in \mathbb{R} \wedge y = \infty}$**.** Then $x < \infty = y - z$ so that $x < y - z$.

   $\boldsymbol{x = \infty \wedge y = \infty}$**.** Then $\infty = x + z < y = \infty$ so this case is not valid.

   $\boldsymbol{x = -\infty \wedge y = \infty}$**.** Then $x = -\infty < \infty = y - z$ so that $x < y - z$.

   $\boldsymbol{x \in \mathbb{R} \wedge y = -\infty}$**.** As $x \in \mathbb{R}$ we have $-\infty < x + z < y = -\infty$ so this case is not valid.

   $\boldsymbol{x = \infty \wedge y = -\infty}$**.** Then $-\infty < \infty = x + z < y = -\infty$ so this case is not valid.

   $\boldsymbol{x = -\infty \wedge y = -\infty}$**.** Then $-\infty = x + z < y = -\infty$ so this case is not valid.

   So in all valid cases we have$x < y - z$.

7. For x, y we have either:

   $\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R}}$**.** Then using the properties of the real numbers we have $x - z \leqslant y$.

   $\boldsymbol{x = \infty \wedge y \in \mathbb{R}}$**.** Then $\infty = x \leqslant y + z < \infty$ [as $x + z \in \mathbb{R}$] so this case is not valid.

   $\boldsymbol{x = -\infty \wedge y \in \mathbb{R}}$**.** Then $x - z = -\infty < y$ so that $x - z \leqslant y$.

   $\boldsymbol{x \in \mathbb{R} \wedge y = \infty}$**.** Then $x - z < \infty = y$.

   $\boldsymbol{x = \infty \wedge y = \infty}$**.** Then $x - z = \infty = y$ so that $x - z \leqslant y$.

   $\boldsymbol{x = -\infty \wedge y = \infty}$**.** Then $x - z = -\infty < \infty = y$ so that $x - z \leqslant y$.

   $\boldsymbol{x \in \mathbb{R} \wedge y = -\infty}$**.** Then $-\infty < x \leqslant y + z = -\infty$ so this case is not valid.

   $\boldsymbol{x = \infty \wedge y = -\infty}$**.** Then $-\infty < \infty = x \leqslant y + z = -\infty$ so this case is not valid.

   $\boldsymbol{x = -\infty \wedge y = -\infty}$**.** Then $-\infty = x \leqslant y + z = -\infty$ so this case is not valid.

   So in all valid cases we have $x - z \leqslant y$.

8. For x, y we have either:

   $\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R}}$**.** Then using the properties of the real numbers we have $x - z < y$.

   $\boldsymbol{x = \infty \wedge y \in \mathbb{R}}$**.** Then $\infty = x < y + z < \infty$ [as $x + z \in \mathbb{R}$] so this case is not valid.

   $\boldsymbol{x = -\infty \wedge y \in \mathbb{R}}$**.** Then $x - z = -\infty < y$.

   $\boldsymbol{x \in \mathbb{R} \wedge y = \infty}$**.** Then $x - z < \infty$.

$\boldsymbol{x=\infty \wedge y=\infty}$. Then $\infty = x < y+z = \infty$ so this case is not valid.

$\boldsymbol{x=-\infty \wedge y=\infty}$. Then $x-z=-\infty<\infty=y$.

$\boldsymbol{x\in\mathbb{R} \wedge y=-\infty}$. Then $x<\infty<y+z=-\infty<\infty$ so this case is not valid.

$\boldsymbol{x=\infty \wedge y=-\infty}$. Then $-\infty<\infty=x<y+z=-\infty$ so this case is not valid.

$\boldsymbol{x=-\infty \wedge y=-\infty}$. Then $-\infty=x<y+z=-\infty$ so this case is not valid.

So in all valid cases we have $x-z<y$. □

Theorem 20.29. *Let*

$$(x,z)\in\overline{\mathbb{R}}\times\overline{\mathbb{R}}\setminus\{(-\infty,\infty),(\infty,-\infty)\}$$

and

$$(y,z)\in\overline{\mathbb{R}}\times\overline{\mathbb{R}}\setminus\{(-\infty,\infty),(\infty,-\infty)\}$$

[so that $x+z$ and $y+z$ are well defined] then we have:

1. *If $x\leqslant y$ then $x+z\leqslant y+z$.*
2. *If $0\leqslant x$ then $z\leqslant z+x$*
3. *If $x<y$ and $z\in\mathbb{R}$ then $x+z<y+z$*

***Note* 20.30.** *The condition $z\in\mathbb{R}$ in (3) is necessary, for example if $x=2$, $y=3$ and $z=\infty$ then $x<y$ but $x+z=\infty=y+z$ so that $x+z\not<y+z$.*

Proof.

1. We have the following cases to check for x,y,z:

$\boldsymbol{x\in\mathbb{R}\wedge y\in\mathbb{R}\wedge z\in\mathbb{R}}$. Then using the properties of $\mathbb{R}$ we have $x+z\leqslant y+z$.

$\boldsymbol{x=-\infty\wedge y\in\mathbb{R}\wedge z\in\mathbb{R}}$. Then $x+y=-\infty<y+z$ [as $y+z\in\mathbb{R}$].

$\boldsymbol{x=\infty\wedge y\in\mathbb{R}\wedge z\in\mathbb{R}}$. Then $-\infty<\infty=x\leqslant y<\infty$ so this is not a valid case.

$\boldsymbol{x\in\mathbb{R}\wedge y=-\infty\wedge z\in\mathbb{R}}$. Then $-\infty<x\leqslant y=-\infty$ so this is not a valid case.

$\boldsymbol{x\in-\infty\wedge y=-\infty\wedge z\in\mathbb{R}}$. Then $x+z=-\infty=y+z$ so that $x+z\leqslant y+z$

$\boldsymbol{x\in\infty\wedge y=-\infty\wedge z\in\mathbb{R}}$. Then $\infty=x\leqslant y=-\infty<\infty$ so this is not a valid case.

$\boldsymbol{x\in\mathbb{R}\wedge y=\infty\wedge z\in\mathbb{R}}$. Then as $x+z\in\mathbb{R}$ we have $x+z<\infty=y+z$.

$\boldsymbol{x=-\infty\wedge y=\infty\wedge z\in\mathbb{R}}$. Then $x+z=-\infty<\infty=y+z$,

$\boldsymbol{x=\infty\wedge y=\infty\wedge z\in\mathbb{R}}$. Then $x+z=\infty=y+z$ so that $x+y\leqslant y+z$.

$\boldsymbol{x\in\mathbb{R}\wedge y\in\mathbb{R}\wedge z=-\infty}$. Then $x+z=-\infty=y+z$ so that

$\boldsymbol{x=-\infty\wedge y\in\mathbb{R}\wedge z=-\infty}$. Then $x+z=-\infty=y+z$ so that $x+y\leqslant y+z$.

$\boldsymbol{x=\infty\wedge y\in\mathbb{R}\wedge z=-\infty}$. This cases is excluded because

$$(x,z)\in\overline{\mathbb{R}}\setminus\{(-\infty,\infty),(\infty,-\infty)\}.$$

$\boldsymbol{x\in\mathbb{R}\wedge y=-\infty\wedge z=-\infty}$. Then $-\infty<x\leqslant y=-\infty$ so this is not a valid case.

$\boldsymbol{x=-\infty\wedge y=-\infty\wedge z=-\infty}$. Then $x+z=-\infty=y+z$ so that $x+z\leqslant y+z$.

$\boldsymbol{x=\infty\wedge y=-\infty\wedge z=-\infty}$. This cases is excluded because

$$(x,z)\in\overline{\mathbb{R}}\setminus\{(-\infty,\infty),(\infty,-\infty)\}.$$

$\boldsymbol{x\in\mathbb{R}\wedge y=\infty\wedge z=-\infty}$. This cases is excluded because

$$(y,z)\in\overline{\mathbb{R}}\setminus\{(-\infty,\infty),(\infty,-\infty)\}.$$

$\boldsymbol{x=-\infty\wedge y=\infty\wedge z=-\infty}$. This cases is excluded because

$$(y,z)\in\overline{\mathbb{R}}\setminus\{(-\infty,\infty),(\infty,-\infty)\}.$$

$\boldsymbol{x=\infty \wedge y=\infty \wedge z=-\infty}$. This cases is excluded because

$$(x,z),(y,z)\in\overline{\mathbb{R}}\setminus\{(-\infty,\infty),(\infty,-\infty)\}.$$

$\boldsymbol{x\in\mathbb{R}\wedge y\in\mathbb{R}\wedge z=\infty}$. Then $x+z=\infty=y+z$ so that $x+z\leqslant y+z$.

$\boldsymbol{x=-\infty\wedge y\in\mathbb{R}\wedge z=\infty}$. This cases is excluded because

$$(x,z)\in\overline{\mathbb{R}}\setminus\{(-\infty,\infty),(\infty,-\infty)\}.$$

$\boldsymbol{x=\infty\wedge y\in\mathbb{R}\wedge z=\infty}$. Then $\infty=x<y<\infty$ so this is not a valid case.

$\boldsymbol{x\in\mathbb{R}\wedge y=-\infty\wedge z=\infty}$. This cases is excluded because

$$(y,z)\in\overline{\mathbb{R}}\setminus\{(-\infty,\infty),(\infty,-\infty)\}.$$

$\boldsymbol{x=-\infty\wedge y=-\infty\wedge z=\infty}$. This cases is excluded because

$$(x,z)(y,z)\in\overline{\mathbb{R}}\setminus\{(-\infty,\infty),(\infty,-\infty)\}.$$

$\boldsymbol{x=\infty\wedge y=-\infty\wedge z=\infty}$. This cases is excluded because

$$(y,z)\in\overline{\mathbb{R}}\setminus\{(-\infty,\infty),(\infty,-\infty)\}.$$

$\boldsymbol{x\in\mathbb{R}\wedge y=\infty\wedge z=\infty}$. Then $x+z=\infty-y+z$ so that $x+z\leqslant y+z$.

$\boldsymbol{x=-\infty\wedge y=\infty\wedge z=\infty}$. This cases is excluded because

$$(x,z)\in\overline{\mathbb{R}}\setminus\{(-\infty,\infty),(\infty,-\infty)\}.$$

$\boldsymbol{x=\infty\wedge y=\infty\wedge z=\infty}$. Then $x+z=\infty=y+z$ so that $x+y\leqslant y+z$.

Hence in all valid cases we have $x+y\leqslant y+z$.

2. As $0\leqslant x$ we have $z=0+z\underset{(1)}{\leqslant}x+z$
3. As $x<y$ implies $x\leqslant y$ it follows from (1) that

$$x+z\leqslant y+z$$

Assume that $x+z=y+z$ then, as $z\in\mathbb{R}$, it follows from [theorem: 20.28(1)] that $x=y$ contradicting $x<y$. Hence the assumption is wrong and $x+y\neq y+z$ so that

$$x+y<y+z$$

□

Theorem 20.31. *Let $x,y\in\overline{\mathbb{R}}$ with $0<x\wedge 0\leqslant y$ then $0<x+y$*

Proof. As $0<x$ and $0\leqslant y$ then we have that $x\neq-\infty\neq y$ so that for x,y we have either:

$\boldsymbol{x\in\mathbb{R}\wedge y\in\mathbb{R}}$. Then by the properties of the real numbers we have $0<x+y$.

$\boldsymbol{x=\infty\wedge y\in\mathbb{R}}$. Then $0<\infty=x+y$.

$\boldsymbol{x\in\mathbb{R}\wedge y=\infty}$. Then $0<\infty=x+y$

$\boldsymbol{x=\infty\wedge y=\infty}$. Then $0<\infty=x+y$ □

Theorem 20.32. *Let $x,y\in\overline{\mathbb{R}}$ such that $0\leqslant x\wedge 0\leqslant y\wedge z=x+y$ then $x\leqslant z$.*

Proof. As $0\leqslant x$ and $0\leqslant y$ then we have that $x\neq-\infty\neq y$ so that for x,y we have either:

$\boldsymbol{x\in\mathbb{R}\wedge y\in\mathbb{R}}$. Then by the properties of the real numbers we have $x\leqslant x+y=z$.

$\boldsymbol{x=\infty\wedge y\in\mathbb{R}}$. Then $x=\infty=\infty+y=z$.

$\boldsymbol{x\in\mathbb{R}\wedge y=\infty}$. Then $x<\infty=x+\infty=x+y=z$.

$\boldsymbol{x=\infty\wedge y=\infty}$. Then $x=\infty=x+y=z$. □

Theorem 20.33. *Let $x,y\in\overline{\mathbb{R}}$ then we have:*

1. *If $0<x\wedge 0<y$ then $0<x\cdot y$.*

2. *If* $0 \leqslant x \wedge 0 \leqslant y$ *then* $0 \leqslant x \cdot y$.
3. *If* $x < 0 \wedge 0 < y$ *then* $x \cdot y < 0$.
4. *If* $0 < x \wedge y < 0$ *then* $x \cdot y < 0$.
5. *If* $x < 0 \wedge y < 0$ *then* $0 < x \cdot y$.
6. *If* $x, y \in \overline{\mathbb{R}}$ *with* $0 < x \leqslant y$ *then* $\frac{1}{y} \leqslant \frac{1}{x}$

Proof.

1. For $0 < x \wedge 0 < y$ we have either:

   $\boldsymbol{x \in \mathbb{R}^+ \wedge y \in \mathbb{R}^+}$**.** Then by the properties of the real numbers we have $0 < x \cdot y$.

   $\boldsymbol{x = \infty \wedge y \in \mathbb{R}^+}$**.** Then $0 < \infty = \infty \cdot y = x \cdot y$.

   $\boldsymbol{x = \mathbb{R}^+ \wedge y = \infty}$**.** Then $0 < \infty = x \cdot \infty = x \cdot y$.

   $\boldsymbol{x = \infty \wedge y = \infty}$**.** Then $0 < \infty = \infty \cdot \infty = x \cdot y$.
2. For $0 \leqslant x \wedge 0 \leqslant y$ we have either:

   $\boldsymbol{x = 0 \vee y = 0}$**.** Then $x \cdot y = 0$ so that $0 \leqslant x \cdot y$

   $\boldsymbol{x \neq 0 \wedge y \neq 0}$**.** Then $0 < x$ and $0 < y$ so that by (1) $0 < x \cdot y$ hence $0 \leqslant x \cdot y$.
3. For $x < 0 \wedge 0 < y$ we have either:

   $\boldsymbol{x \in \mathbb{R}^- \wedge y \in \mathbb{R}^+}$**.** Then by the properties of the real numbers we have $x \cdot y < 0$.

   $\boldsymbol{x = -\infty \wedge y \in \mathbb{R}^+}$**.** Then $x \cdot y = -\infty < 0$.

   $\boldsymbol{x \in \mathbb{R}^- \wedge y = \infty}$**.** Then $x \cdot y = -\infty < 0$

   $\boldsymbol{x = -\infty \wedge y = \infty}$**.** Then $x \cdot y = -\infty < 0$
4. For $0 < x \wedge y < 0$ we have either:

   $\boldsymbol{x \in \mathbb{R}^+ \wedge y \in \mathbb{R}^-}$**.** Then by the properties of the real numbers $x \cdot y < 0$.

   $\boldsymbol{x = \infty \wedge y \in \mathbb{R}^-}$**.** Then $x \cdot y = -\infty < 0$.

   $\boldsymbol{x \in \mathbb{R}^+ \wedge y = -\infty}$**.** Then $x \cdot y = -\infty < 0$.

   $\boldsymbol{x = \infty \wedge y = -\infty}$**.** Then $x \cdot y = -\infty < 0$.
5. For $x < 0 \wedge y < 0$ we have either:

   $\boldsymbol{x \in \mathbb{R}^- \wedge y \in \mathbb{R}^-}$**.** Then by the properties of the real numbers $0 < x \cdot y$.

   $\boldsymbol{x = -\infty \wedge y \in \mathbb{R}^-}$**.** Then $0 < \infty = x \cdot y$.

   $\boldsymbol{x \in \mathbb{R}^- \wedge y = -\infty}$**.** Then $0 < \infty = x \cdot y$.

   $\boldsymbol{x = -\infty \wedge y = -\infty}$**.** Then $0 < \infty = x \cdot y$.
6. If $x, y \in \overline{\mathbb{R}}$ with $0 < x \leqslant y$ we have for x either:

   $\boldsymbol{x \in \mathbb{R}^+}$**.** As $x \leqslant y$ we have for y either:

   $\boldsymbol{y \in \mathbb{R}^+}$**.** Then by the properties of the real numbers we have $\frac{1}{y} \leqslant \frac{1}{x}$.

   $\boldsymbol{y = \infty}$**.** Then $\frac{1}{y} = \frac{1}{\infty} = 0 < \frac{1}{x}$.

   $\boldsymbol{x = \infty}$**.** Then $y = \infty$ so that $\frac{1}{y} = \frac{1}{\infty} = \frac{1}{x}$ so that $\frac{1}{y} \leqslant \frac{1}{x}$. □

Corollary 20.34. *If* $x \in \overline{\mathbb{R}}$ *then we have:*

1. *If* $0 < x$ *then* $-x < 0$
2. *If* $0 \leqslant x$ *then* $-x \leqslant 0$
3. *If* $x < 0$ *then* $0 < -x$

4. *If* $x \leqslant 0$ *then* $0 \leqslant -x$

Proof. As $-1 < 0$ we have:

1. $-x = (-1) \cdot x \underset{\text{[theorem: 20.33]}}{<} (-1) \cdot 0 = 0$
2. $-x = (-1) \cdot x \underset{\text{[theorem: 20.33]}}{\leqslant} (-1) \cdot 0 = 0$
3. $-x = (-1) \cdot x \underset{\text{[theorem: 20.33]}}{>} (-1) \cdot 0 = 0$
4. $-x = (-1) \cdot x \underset{\text{[theorem: 20.33]}}{\geqslant} (-1) \cdot 0 = 0$ □

Although the product $x \cdot y$ is defined for every $x, y \in \overline{\mathbb{R}}$ $\langle \overline{\mathbb{R}}, \cdot \rangle$ is not a group, for example 0 has still no inverse. However $\langle \overline{\mathbb{R}}, \cdot \rangle$ is a Abelian semi group.

Theorem 20.35. $\langle \overline{\mathbb{R}}, \cdot \rangle$ *is a Abelian semi-group with neutral element* 1

Proof. We have to prove the semi-group axioms for $(\cdot) \colon \overline{\mathbb{R}} \times \overline{\mathbb{R}} \to \overline{\mathbb{R}}$.

associativity. Let x, y, z then we have either:

$\boldsymbol{x = 0 \vee y = 0}$**.** Then $x \cdot (y \cdot z) = 0 \cdot (y \cdot z) = 0 = 0 \cdot z = (x \cdot 0) \cdot z = (x \cdot y) \cdot z$

$\boldsymbol{x < 0 \wedge y = \infty}$**.** Then for z we have either:

$\boldsymbol{z = 0}$**.** Then $x \cdot (y \cdot z) = x \cdot (y \cdot 0) = x \cdot 0 = 0 = (x \cdot y) \cdot 0 = (x \cdot y) \cdot z$

$\boldsymbol{z < 0}$**.** Then

$$x \cdot (y \cdot z) = x \cdot (-\infty) = (-\infty) \cdot (-\infty) = \infty = (-\infty) \cdot z = (x \cdot y) \cdot z$$

$\boldsymbol{0 < z}$**.** Then

$$x \cdot (y \cdot z) = x \cdot \infty = -\infty = \infty \cdot z = (x \cdot y) \cdot z$$

$\boldsymbol{0 < x \wedge y = \infty}$**.** Then for z we have either:

$\boldsymbol{z = 0}$**.** Then $x \cdot (y \cdot z) = x \cdot (y \cdot 0) = x \cdot 0 = 0 = (x \cdot y) \cdot 0 = (x \cdot y) \cdot z$

$\boldsymbol{z < 0}$**.** Then $x \cdot (y \cdot z) = x \cdot (-\infty) = -\infty = \infty \cdot z = (x \cdot y) \cdot z$

$\boldsymbol{0<z}$**.** Then by [theorem: 20.33] $0<y\cdot z$ so that

$$x\cdot(y\cdot z)=-\infty=-\infty\cdot z=(x\cdot y)\cdot z$$

$\boldsymbol{x=\infty\wedge y\in\,]0,\infty[}$**.** Then for z we have either:

$\boldsymbol{z=0}$**.** Then $x\cdot(y\cdot z)=x\cdot 0=0=(x\cdot y)\cdot 0=(x\cdot y)\cdot z$

$\boldsymbol{z<0}$**.** Then by [theorem: 20.33] $y\cdot z<0$ so that

$$x\cdot(y\cdot z)=-\infty=\infty\cdot z=(x\cdot y)\cdot z$$

$\boldsymbol{0<z}$**.** Then by [theorem: 20.33] $0<y\cdot z$ so that

$$x\cdot(y\cdot z)=\infty=\infty\cdot z=(x\cdot y)\cdot z$$

$\boldsymbol{x\in\mathbb{R}\setminus\{0\}\wedge y\in\,]0,\infty[}$**.** Then for z we have either:

$\boldsymbol{z=\infty}$**.** Then for x we have either:

$\boldsymbol{x<0}$**.** Then by [theorem: 20.33] $x\cdot y<0$ so that

$$x\cdot(y\cdot z)=x\cdot\infty=-\infty=(x\cdot y)\cdot\infty=(x\cdot y)\cdot z$$

$\boldsymbol{0<x}$**.** Then by [theorem: 20.33] $0<x\cdot y$ so that

$$x\cdot(y\cdot z)=x\cdot\infty=\infty=(x\cdot y)\cdot\infty=(x\cdot y)\cdot z$$

$\boldsymbol{z=-\infty}$**.** Then for x we have either:

$\boldsymbol{x<0}$**.** Then by [theorem: 20.33] $x\cdot y<0$ so that

$$x\cdot(y\cdot z)=x\cdot(-\infty)=\infty=(x\cdot y)\cdot(-\infty)=(x\cdot y)\cdot z$$

$0 < x$. Then by [theorem: 20.33] $0 < x \cdot y$ so that

$$x \cdot (y \cdot z) = x \cdot (-\infty) = -\infty = (x \cdot y) \cdot (-\infty) = (x \cdot y) \cdot z$$

$z \in \mathbb{R}$. Then

$$x \cdot (y \cdot z) = x \cdot_{|\mathbb{R}} (y \cdot_{\mathbb{R}} z) = (x \cdot_{\mathbb{R}} y) \cdot_{\mathbb{R}} z = (x \cdot y) \cdot z$$

So in all cases we have $(x \cdot y) \cdot z = x \cdot (y \cdot z)$

neutral element. Let $x \in \overline{\mathbb{R}}$ then we have for x either:

$x = \infty$. Then $1 \cdot \infty = \infty = \infty \cdot 1$

$x = -\infty$. Then $1 \cdot (-\infty) = -\infty = (-\infty) \cdot 1$

$x \in \mathbb{R}$. Then $1 \cdot x = 1 \cdot_{\mathbb{R}} x = x = x \cdot_{\mathbb{R}} 1 = x \cdot 1$

commutativity. Then for $x, y \in \overline{\mathbb{R}}$ we have either

$x = 0 \vee y = 0$. Then $x \cdot y = 0 = y \cdot x$

$x < 0 \wedge y = \infty$. Then $x \cdot y \underset{\text{def}}{=} -\infty$ and for x we have either:

$x = -\infty$. Then $y \cdot x \underset{0 < \infty = y}{=} -\infty = x \cdot y$

$x \in]-\infty, 0[$. Then $y \cdot x = -\infty = x \cdot y$.

$0 < x \wedge y = \infty$. Then $x \cdot y \underset{\text{def}}{=} \infty$ and for x we have either:

$x = \infty$. Then $y \cdot x \underset{0 < \infty = y}{=} \infty = x \cdot y$.

$x \in]0, \infty[$. Then $y \cdot x = \infty = x \cdot y$.

$x < 0 \wedge y = -\infty$. Then $x \cdot y \underset{\text{def}}{=} \infty$ and for x we have either:

$x = -\infty$. Then $y \cdot x \underset{y = -\infty < 0}{=} \infty = x \cdot y$.

$x \in]-\infty, 0[$. Then $y \cdot x = \infty = x \cdot y$.

$0 < x \wedge y = -\infty$. Then $x \cdot y = -\infty$ and for x we have either:

$x = \infty$. Then $y \cdot x \underset{y = -\infty < 0}{=} -\infty = x \cdot y$

$x \in]0, \infty[$. Then $y \cdot x = -\infty = x \cdot y$

$x = -\infty \wedge y \in]-\infty, 0[$. Then $x \cdot y = \infty \underset{y < 0}{=} y \cdot x$

$x = \infty \wedge y \in]-\infty, 0[$. Then $x \cdot y = -\infty \underset{y < 0}{=} y \cdot x$

$x \in \mathbb{R} \setminus \{0\} \wedge y \in]-\infty, 0[$. Then $x \cdot y = x \cdot_{\mathbb{R}} y = y \cdot_{\mathbb{R}} x = y \cdot x$

$x = -\infty \wedge y \in]0, \infty[$. Then $x \cdot y = -\infty \underset{0 < y}{=} y \cdot x$

$x = \infty \wedge y \in]0, \infty[$. Then $x \cdot y = \infty \underset{0 < y}{=} y \cdot x$

$x \in \mathbb{R} \setminus \{0\} \wedge y \in]0, \infty[$. Then $x \cdot y = x \cdot_{\mathbb{R}} y = y \cdot_{\mathbb{R}} x = y \cdot x$ □

Corollary 20.36. *Let $x, y \in \overline{\mathbb{R}}$ then $-(x \cdot y) = (-x) \cdot y = x \cdot (-y)$*

Proof. We have

$$-(x \cdot y) = (-1) \cdot (x \cdot y) \underset{\text{[theorem: 20.35]}}{=} ((-1) \cdot x) \cdot y = (-x) \cdot y$$

and

$$-(x \cdot y) = (-1) \cdot (x \cdot y) \underset{\text{[theorem: 20.35]}}{=} (-1) \cdot (y \cdot x) \underset{\text{[theorem: 20.35]}}{=} ((-1) \cdot y) \cdot x \underset{\text{[theorem: 20.35]}}{=} x \cdot (-y)$$

□

Theorem 20.37. *If $x, y \in \overline{\mathbb{R}}$ with $x \leqslant y$ then for $\lambda \in \overline{\mathbb{R}}$ we have*

1. *If $0 \leqslant \lambda$ then $\lambda \cdot x \leqslant \lambda \cdot y$*
2. *If $\lambda \leqslant 0$ then $\lambda \cdot y \leqslant \lambda \cdot x$*

Proof.

1. For $0 \leqslant \lambda$ we have either:

   $\boldsymbol{\lambda = 0}$**.** Then $\lambda \cdot x = 0 \cdot x = 0 = 0 \cdot y = \lambda \cdot y$ so that $\lambda \cdot x \leqslant \lambda \cdot y$.

   $\boldsymbol{\lambda \in \mathbb{R}^+}$**.** Then for x we have either:

   $\boldsymbol{x \in \mathbb{R}}$**.** Then for y we have as $-\infty < x \leqslant y$ that

   $\boldsymbol{y \in \mathbb{R}}$**.** Then using [theorem: 10.14] we have

   $$\lambda \cdot x = \lambda \cdot_{\mathbb{R}} x \underset{\text{[theorem: 10.14]}}{\leqslant_{\mathbb{R}}} \lambda \cdot_{\mathbb{R}} y = \lambda \cdot y$$

   so that

   $$\lambda \cdot x \leqslant \lambda \cdot y$$

   $\boldsymbol{y = \infty}$**.** Then $\lambda \cdot x \in \mathbb{R}$ so that $\lambda \cdot x \leqslant \infty = \lambda \cdot \infty = \lambda \cdot y$ so that $\lambda \cdot x \leqslant \lambda \cdot y$.

   $\boldsymbol{x = -\infty}$**.** Then for y we have either:

   $\boldsymbol{y \in \mathbb{R}}$**.** Then $\lambda \cdot y \in \mathbb{R}$ so that $\lambda \cdot x = \lambda \cdot (-\infty) = -\infty < \lambda \cdot y$ hence $\lambda \cdot x \leqslant \lambda \cdot y$.

   $\boldsymbol{y = -\infty}$**.** Then $\lambda \cdot x = \lambda \cdot (-\infty) = -\infty = \lambda \cdot y$ so that $\lambda \cdot x \leqslant \lambda \cdot y$.

   $\boldsymbol{y = \infty}$**.** Then $\lambda \cdot x = \lambda \cdot (-\infty) = -\infty < \infty = \lambda \cdot y$ so that $\lambda \cdot x \leqslant \lambda \cdot y$.

   $\boldsymbol{x = \infty}$**.** Then as $x \leqslant y$ we have that $y = \infty$ hence $\lambda \cdot x = \infty = \lambda \cdot y$ so that $\lambda \cdot x \leqslant \lambda \cdot y$.

   $\boldsymbol{\lambda = \infty}$**.** Then for x we have either:

   $\boldsymbol{x < 0}$**.** Then for y we have either:

   $\boldsymbol{y < 0}$**.** Then $\lambda \cdot x = -\infty = \lambda \cdot y$ so that $\lambda \cdot x \leqslant \lambda \cdot y$.

   $\boldsymbol{y = 0}$**.** Then $\lambda \cdot x = -\infty < 0 = \lambda \cdot \infty = \lambda \cdot y$ so that $\lambda \cdot x \leqslant \lambda \cdot y$.

   $\boldsymbol{0 < y}$**.** Then $\lambda \cdot x = -\infty < \infty = \lambda \cdot \infty = \lambda \cdot y$ so that $\lambda \cdot x \leqslant \lambda \cdot y$.

   $\boldsymbol{x = 0}$**.** Then as $x \leqslant y$ we have that y is either:

   $\boldsymbol{y = 0}$**.** Then $\lambda \cdot x = 0 = \lambda \cdot y$ so that $\lambda \cdot x \leqslant \lambda \cdot y$.

   $\boldsymbol{0 < y}$**.** Then $\lambda \cdot x = 0 < \infty = \lambda \cdot y$ so that $\lambda \cdot x \leqslant \lambda \cdot y$.

   $\boldsymbol{0 < x}$**.** Then as $x \leqslant y$ we have that $0 < y$ so that $\lambda \cdot x = \infty = \lambda \cdot y$ so that $\lambda \cdot x \leqslant \lambda \cdot y$.

2. For $\lambda \leqslant 0$ we have either:

   $\boldsymbol{\lambda = 0}$**.** Then $\lambda \cdot x = 0 \cdot x = 0 = 0 \cdot y = \lambda \cdot y$ so that $\lambda \cdot x \leqslant \lambda \cdot y$.

   $\boldsymbol{\lambda \in \mathbb{R}^-}$**.** Then for x we have either:

   $\boldsymbol{x \in \mathbb{R}}$**.** Then for y we have as $-\infty < x \leqslant y$ that

   $\boldsymbol{y \in \mathbb{R}}$**.** Then using [theorem: 10.14] we have

   $$\lambda \cdot y = \lambda \cdot_{\mathbb{R}} y \underset{\text{[theorem: 10.14]}}{\leqslant_{\mathbb{R}}} \lambda \cdot_{\mathbb{R}} x = \lambda \cdot x$$

   so that

   $$\lambda \cdot y \leqslant \lambda \cdot x$$

   $\boldsymbol{y = \infty}$**.** Then $\lambda \cdot x \in \mathbb{R}$ so that $\lambda \cdot y = -\infty < \lambda \cdot x$ so that $\lambda \cdot y \leqslant \lambda \cdot x$.

   $\boldsymbol{x = -\infty}$**.** Then for y we have either:

   $\boldsymbol{y \in \mathbb{R}}$**.** Then $\lambda \cdot y \in \mathbb{R}$ so that $\lambda \cdot y < \infty = \lambda \cdot x$ hence $\lambda \cdot y \leqslant \lambda \cdot x$.

   $\boldsymbol{y = -\infty}$**.** Then $\lambda \cdot y = \infty = \lambda \cdot x$ so that $\lambda \cdot y \leqslant \lambda \cdot x$.

   $\boldsymbol{y = \infty}$**.** Then $\lambda \cdot y = -\infty < \infty = \lambda \cdot x$ so that $\lambda \cdot y \leqslant \lambda \cdot x$.

   $\boldsymbol{x = \infty}$**.** Then as $x \leqslant y$ we have that $y = \infty$ hence $\lambda \cdot y = -\infty = \lambda \cdot x$ so that $\lambda \cdot y \leqslant \lambda \cdot x$.

   $\boldsymbol{\lambda = -\infty}$**.** Then for x we have either:

   $\boldsymbol{x < 0}$**.** Then for y we have either:

   $\boldsymbol{y < 0}$**.** Then $\lambda \cdot y = \infty = \lambda \cdot x$ so that $\lambda \cdot y \leqslant \lambda \cdot x$.

$y=0$. Then $\lambda\cdot y=0<\infty=\lambda\cdot(-\infty)=\lambda\cdot x$ so that $\lambda\cdot y\leqslant\lambda\cdot x$.

$0<y$. Then $\lambda\cdot y=-\infty<\infty=\lambda\cdot x$ so that $\lambda\cdot y\leqslant\lambda\cdot x$.

$x=0$. Then as $x\leqslant y$ we have that y is either:

$y=0$. Then $\lambda\cdot y=0=\lambda\cdot x$ so that $\lambda\cdot y\leqslant\lambda\cdot x$.

$0<y$. Then $\lambda\cdot y=-\infty<0=\lambda\cdot x$ so that $\lambda\cdot y\leqslant\lambda\cdot x$.

$0<x$. Then as $x\leqslant y$ we have that $0<y$ so that $\lambda\cdot y=-\infty=\lambda\cdot x$ so that $\lambda\cdot y\leqslant\lambda\cdot x$. □

Corollary 20.38. *If $x,y\in\overline{\mathbb{R}}$ then we have*

1. *If $-x=-y$ then $x=y$*
2. *If $x\leqslant y$ then $-y\leqslant -x$*
3. *If $x<y$ then $-y<-x$*

Proof.

1. We have

$$\begin{aligned}
x &\underset{\text{[theorem: 20.35]}}{=} 1\cdot x\\
&= ((-1)\cdot(-1))\cdot x\\
&\underset{\text{[theorem: 20.35]}}{=} (-1)\cdot((-1)\cdot x)\\
&= (-1)\cdot(-x)\\
&= (-1)\cdot(-y)\\
&= (-1)\cdot((-1)\cdot y)\\
&\underset{\text{[theorem: 20.35]}}{=} ((-1)\cdot(-1))\cdot y\\
&= 1\cdot y\\
&= y
\end{aligned}$$

2. Take $\lambda=-1\leqslant 0$ then $-y=\lambda\cdot y \underset{\text{[theorem: 20.37]}}{\leqslant} \lambda\cdot x=-x$
3. If $x<y$ then $x\neq y$ and $x<y$, using (2) we have then that $(-y)\leqslant -x$ and using (1) that $-x\neq -y$ proving that $-y<-x$ □

We have also a variant of the distributive law in $\overline{\mathbb{R}}$ but again we must be careful. For example $\infty\cdot(1-3)=\infty\cdot(-2)=-\infty$ but $\infty\cdot 1+\infty\cdot(-3)$ is not defined because $\infty\cdot 1=\infty$ and $\infty\cdot(-3)=-\infty$.

Theorem 20.39. *Let $\alpha\in\mathbb{R}$, $(x,y)\in(\overline{\mathbb{R}}\times\overline{\mathbb{R}})\setminus\{(-\infty,\infty)\}$ then $\alpha\cdot(x+y)=\alpha\cdot x+\alpha\cdot y$*

Proof. For (x,y) we have either:

$x\in\mathbb{R}\wedge y\in\mathbb{R}$. then $\alpha\cdot(x+y)=\alpha\cdot_{\mathbb{R}}(x+_{\mathbb{R}}y)=\alpha\cdot_{\mathbb{R}}x+_{\mathbb{R}}\alpha\cdot_{\mathbb{R}}y=\alpha\cdot x+\alpha\cdot y$

$x\in\mathbb{R}\wedge y=\infty$. then for α we have either

$\alpha=0$. then $\alpha\cdot(x+y)=0=0+0=\alpha\cdot x+\alpha\cdot y$.

$0<\alpha$. then $\alpha\cdot(x+y)=\alpha\cdot\infty=\infty=\alpha\cdot x+\infty=\alpha\cdot x+\alpha\cdot y$

$\alpha<0$. then $\alpha\cdot(x+y)=\alpha\cdot\infty=-\infty=\alpha\cdot x+(-\infty)=\alpha\cdot x+\alpha\cdot y$

$x\in\mathbb{R}\wedge y=-\infty$. then for α we have either

$\alpha=0$. then $\alpha\cdot(x+y)=0=0+0=\alpha\cdot x+\alpha\cdot y$.

$0<\alpha$. then $\alpha\cdot(x+y)=\alpha\cdot(-\infty)=-\infty=\alpha\cdot x+(-\infty)=\alpha\cdot x+\alpha\cdot y$

$\alpha<0$. then $\alpha\cdot(x+y)=\alpha\cdot(-\infty)=\infty=\alpha\cdot x+\infty=\alpha\cdot x+\alpha\cdot y$

$x=\infty\wedge y\in\mathbb{R}$. then for α we have either

$\alpha=0$. then $\alpha\cdot(x+y)=0=0+0=\alpha\cdot x+\alpha\cdot y$.

$0<\alpha$. then $\alpha\cdot(x+y)=\alpha\cdot\infty=\infty=\infty+\alpha\cdot y=\alpha\cdot x+\alpha\cdot y$

$\alpha < 0$. then $\alpha \cdot (x+y) = \alpha \cdot \infty = -\infty = -\infty + \alpha \cdot y = \alpha \cdot x + \alpha \cdot y$

$x = \infty \wedge y = \infty$. then for α we have either

$\alpha = 0$. then $\alpha \cdot (x+y) = 0 = 0 + 0 = \alpha \cdot x + \alpha \cdot y$.

$0 < \alpha$. then $\alpha \cdot (x+y) = \alpha \cdot \infty = \infty = \infty + \infty = \alpha \cdot x + \alpha \cdot y$

$\alpha < 0$. then $\alpha \cdot (x+y) = \alpha \cdot \infty = -\infty = -\infty + (-\infty) = \alpha \cdot x + \alpha \cdot y$

$x = -\infty \wedge y \in \mathbb{R}$. then for α we have either

$\alpha = 0$. then $\alpha \cdot (x+y) = 0 = 0 + 0 = \alpha \cdot x + \alpha \cdot y$.

$0 < \alpha$. then $\alpha \cdot (x+y) = \alpha \cdot (-\infty) = -\infty = -\infty + \alpha \cdot y = \alpha \cdot x + \alpha \cdot y$

$\alpha < 0$. then $\alpha \cdot (x+y) = \alpha \cdot (-\infty) = \infty = \infty + \alpha \cdot y = \alpha \cdot x + \alpha \cdot y$

$x = -\infty \wedge y = -\infty$. then for α we have either

$\alpha = 0$. then $\alpha \cdot (x+y) = 0 = 0 + 0 = \alpha \cdot x + \alpha \cdot y$.

$0 < \alpha$. then $\alpha \cdot (x+y) = \alpha \cdot (-\infty) = -\infty = -\infty + (-\infty) = \alpha \cdot x + \alpha \cdot y$

$\alpha < 0$. then $\alpha \cdot (x+y) = \alpha \cdot (-\infty) = \infty = -\infty + \infty = \alpha \cdot x + \alpha \cdot y$

so in all cases we have $\alpha \cdot (x+y) = \alpha \cdot x + \alpha \cdot y$. □

Theorem 20.40. *Let $x, y \in \overline{\mathbb{R}}$ such that $\forall \varepsilon \in \mathbb{R}^+$ we have $x \leqslant y + \varepsilon$ then $x \leqslant y$.*

Proof. If $\forall \varepsilon \in \mathbb{R}^+$ we have $x \leqslant y + \varepsilon$ then we have for x, y to verify the following cases:

$x = -\infty \wedge y = -\infty$. Then $x = y$ so that $x \leqslant y$

$x \in \mathbb{R} \wedge y = -\infty$. Then $-\infty < x \leqslant y + \varepsilon = (-\infty) + \varepsilon = -\infty$ leading to the contradiction $-\infty < -\infty$, hence this cases never materilize.

$x = \infty \wedge y = -\infty$. Then $\infty = x \leqslant y + \varepsilon = -\infty + \varepsilon = -\infty$ leading to the contradiction $\infty < -\infty$ so this case never occurs.

$x = -\infty \wedge y \in \mathbb{R}$. Then $x = -\infty < y$ so that $x \leqslant y$.

$x \in \mathbb{R} \wedge y \in \mathbb{R}$. Then by [theorem: 10.31 (2)] it follows that $x \leqslant y$

$x = \infty \wedge y \in \mathbb{R}$. Then $\infty = x \leqslant y + \varepsilon < \infty$ leading to the contradiction $\infty < \infty$, hence this cases never occurs.

$x = -\infty \wedge y = \infty$. Then $x = -\infty < \infty = y$ so that $x \leqslant y$.

$x \in \mathbb{R} \wedge y = \infty$. Then $x < \infty = y$ so that $x \leqslant y$

$x = \infty \wedge y = \infty$. Then $x = y$ so that $x \leqslant y$

So in all valid cases we have that $x \leqslant y$ □

20.1.3 Topology on $\overline{\mathbb{R}}$

First we define the absolute value on $\overline{\mathbb{R}}$.

Definition 20.41. *Let $x \in \overline{\mathbb{R}}$ then the absolute value noted as $|x|$ is defined in analogy of the absolute value on $\mathbb{R}$ as follows*

$$|x| = \begin{cases} x \text{ if } 0 \leqslant x \\ -x \text{ if } x < 0 \end{cases}$$

Note 20.42. $\forall x \in \overline{\mathbb{R}}$ we have that $x \leqslant |x|$

Note 20.43. If $x \in \mathbb{R}$ then $|x| = |x|_{\mathbb{R}}$ where $||_{\mathbb{R}}$ is the absolute value defined in $\mathbb{R}$ [see example: 14.97].

Proof. For $x \in \overline{\mathbb{R}}$ we have either:

$0 \leqslant x$. Then $x = |x|$ so that $x \leqslant |x|$

$x < 0$. Then by [theorem: 20.34] $0 < -x = |x|$ so that $x < 0 < |x|$ or $x \leqslant |x|$ □

The absolute value of the extended real numbers has similar properties as the absolute value on the real numbers.

Theorem 20.44. *The absolute value has the following properties:*

1. $|\infty| = \infty$
2. $|-\infty| = \infty$
3. *For* $x \in \overline{\mathbb{R}}$ *we have* $|x| = 0 \Leftrightarrow x = 0$.
4. $\forall x, y \in \overline{\mathbb{R}}$ *we have* $|x \cdot y| = |x| \cdot |y|$.
5. $\forall (x, y) \in (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ *we have* $|x + y| \leqslant |x| + |y|$

Proof.

1. As $0 < \infty$ it follows that $|\infty| = \infty$.
2. As $-\infty < 0$ it follows that $|-\infty| = -(-\infty) = (-1) \cdot (-\infty) = \infty$
3. We have

   $\Rightarrow$. Assume that $x \neq 0$ then we have either $0 < x \Rightarrow 0 \neq x = |x| \neq 0$ leading to the contradiction $0 \neq 0$ or $x < 0 \underset{\text{[theorem: 20.34]}}{\Rightarrow} 0 < -x = |x| = 0$ leading to the contradiction $0 < 0$. Hence the assumption is false and we must have that $x = 0$.

   $\Leftarrow$. As $0 \leqslant 0$ it follows that $|0| = 0$.
4. For $x, y \in \overline{\mathbb{R}}$ we have the following cases to consider:

   $\boldsymbol{x = 0 \wedge y = 0}$**.** Then $|x \cdot y| = |0| \underset{(3)}{=} 0$.

   $\boldsymbol{x < 0 \wedge y = 0}$**.** Then $|x \cdot y| = |0| \underset{(3)}{=} 0$.

   $\boldsymbol{0 < x \wedge y = 0}$**.** Then $|x \cdot y| = |0| \underset{(3)}{=} 0$.

   $\boldsymbol{x = 0 \wedge y < 0}$**.** Then $|x \cdot y| = |0| \underset{(3)}{=} 0$.

   $\boldsymbol{x < 0 \wedge y < 0}$**.** Then by [theorem: 20.33] $0 < x \cdot y$ so that $|x \cdot y| = x \cdot y = |x| \cdot |y|$.

   $\boldsymbol{0 < x \wedge y < 0}$**.** Then by [theorem: 20.33] $x \cdot y < 0$ so that

   $$|x \cdot y| = -(x \cdot y) \underset{\text{[theorem: 20.36]}}{=} x \cdot (-y) = |x| \cdot |y|$$

   $\boldsymbol{x = 0 \wedge 0 < y}$**.** Then $|x \cdot y| = |0| \underset{(3)}{=} 0$.

   $\boldsymbol{x < 0 \wedge 0 < y}$**.** Then by [theorem: 20.33] $x \cdot y < 0$ so that

   $$|x \cdot y| = -(x \cdot y) = (-x) \cdot y = |x| \cdot |y|$$

   $\boldsymbol{0 < x \wedge 0 < y}$**.** Then by [theorem: 20.33] $0 < x \cdot y$ so that

   $$|x \cdot y| = x \cdot y = |x| \cdot |y|$$
5. For $(x, y) \in (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ we have either:

   $\boldsymbol{x = -\infty \wedge y = -\infty}$**.** Then $|x + y| = |-\infty| \underset{(2)}{=} \infty = \infty + \infty = |-\infty| + |-\infty| = |x| + |y|$

   $\boldsymbol{x \in \mathbb{R} \wedge y = -\infty}$**.** Then $|x + y| = |-\infty| \underset{(2)}{=} |x| + \infty \underset{(2)}{=} |x| + |-\infty| = |x| + |y|$

   $\boldsymbol{x = \infty \wedge y = \infty}$**.** Then $|x + y| = |\infty| \underset{(1)}{=} \infty = \infty + \infty \underset{(1)}{=} |\infty| + |\infty| = |x| + |y|$

   $\boldsymbol{x \in \mathbb{R} \wedge y = \infty}$**.** Then $|x + y| = |\infty| \underset{(1)}{=} \infty = |x| + \infty \underset{(1)}{=} |x| + |\infty| = |x| + |y|$

   $\boldsymbol{x = \infty \wedge y \in \mathbb{R}}$**.** Then $|x + y| = |\infty| \underset{(1)}{=} \infty = \infty + |y| \underset{(1)}{=} |\infty| + |y| = |x| + |y|$

   $\boldsymbol{x = -\infty \wedge y \in \mathbb{R}}$**.** Then $|x + y| = |-\infty| \underset{(2)}{=} \infty = \infty + |y| \underset{(2)}{=} |-\infty| + |y| = |x| + |y|$

   $\boldsymbol{x \in \mathbb{R} \wedge y \in \mathbb{R}}$**.** Then $|x + y| = |x + y|_{\mathbb{R}} \leqslant |x|_{\mathbb{R}} + |y|_{\mathbb{R}} = |x| + |y|$ □

Unfortunately $\langle \overline{\mathbb{R}}, \|\rangle$ is not a normed space because $\overline{\mathbb{R}}$ is not a vector space [remember $\infty + (-\infty)$ and $(-\infty) + \infty$ are not defined. So we can not base a topology on a norm instead we use a generating basis [see theorem: 14.39].

Definition 20.45. *The following sets are defined*

1. $\mathcal{B}_{||} = \{]a,b[|a,b \in \mathbb{R} \wedge a < b\}$ *which is the generating basis for the natural topology* $\mathcal{T}_{||}$ *on* $\mathbb{R}$ *[see theorem 14.99].*
2. $\mathcal{B}_{\infty} = \{]x,\infty]|x \in \mathbb{R}\}$
3. $\mathcal{B}_{-\infty} = \{[-\infty,x[|x \in \mathbb{R}\}$
4. $\mathcal{B}_{\overline{\mathbb{R}}} = \mathcal{B}_{||} \bigcup \mathcal{B}_{\infty} \bigcup \mathcal{B}_{-\infty}$

We prove now that $\mathcal{B}_{\overline{\mathbb{R}}}$ satisfies the conditions to be a generating basis [see theorem: 14.39].

Lemma 20.46. *The set* $\mathcal{B}_{\overline{\mathbb{R}}}$ *satisfies*

1. $\forall x \in \overline{\mathbb{R}}$ *there exist a* $B \in \mathcal{B}_{\overline{\mathbb{R}}}$ *such that* $x \in B$.
2. $\forall B_1, B_2 \in \mathcal{B}_{\overline{\mathbb{R}}}$ *we have that* $\forall x \in B_1 \bigcap B_2$ *there exist a* $B \in \mathcal{B}_{\overline{\mathbb{R}}}$ *such that* $x \in B \subseteq B_1 \bigcap B_2$

Proof.

1. If $x \in \overline{\mathbb{R}}$ then we have either

   $\boldsymbol{x \in \mathbb{R}}$**.** Then $x \in]x-1, x+1[\in \mathcal{B}_{\overline{\mathbb{R}}}$

   $\boldsymbol{x = -\infty}$**.** Then $x = -\infty \in [-\infty, 0[\in \mathcal{B}_{\overline{\mathbb{R}}}$

   $\boldsymbol{x = \infty}$**.** Then $x = \infty \in]0, \infty] \in \mathcal{B}_{\overline{\mathbb{R}}}$

2. If $B_1, B_2 \in \mathcal{B}_{\overline{\mathbb{R}}}$ and $x \in B_1 \bigcap B_2$ then we have for B_1, B_2 either:

   $\boldsymbol{B_1 \in \mathcal{B}_{||} \wedge B_2 \in \mathcal{B}_{||}}$**.** Then there exists a_1, b_1, a_2, b_2 with $B_1 =]a_1, b_1[\wedge B_2 =]a_2, b_2[$, as $x \in B_1 \bigcap B_2$ $a_1 < x < b_1$ and $a_2 < x < b_2$. Define $B =]a, b[$ where $a = \max(a_1, a_2)$ and $b = \min(b_1, b_2)$ then $a < x < b$ or $x \in B \in \mathcal{B}_{||}$. Further if $y \in B$ then a_1, $a_2 \leqslant a < y < b \leqslant b_1, b_2$ so that $y \in B_1 \bigcap B_2$. Hence $x \in B \subseteq B_1 \bigcap B_2$ where $B \in \mathcal{B}_{||} \subset -\mathcal{B}_{\overline{\mathbb{R}}}$.

   $\boldsymbol{B_1 \in \mathcal{B}_{-\infty} \wedge B_2 \in \mathcal{B}_{||}}$**.** Then there exists $a, b, c \in \mathbb{R}$ such that $B_2 =]a, b[$ and $B_1 = [-\infty, c[$, as $x \in B_1 \bigcap B_2$ we have that $x < c$ and $a < x < b$. Define $B =]a, d[$ where $d = \min(c, b)$ then $a < x < d$ so that $x \in B \in \mathcal{B}_{||}$. Further if $y \in B$ then $a < y < d \leqslant c, b$ so that $y \in B_1 \bigcap B_2$. Hence $x \in B \subseteq B_1 \bigcap B_2$ where $B \in \mathcal{B}_{||} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$.

   $\boldsymbol{B_1 \in \mathcal{B}_{\infty} \wedge B_2 \in \mathcal{B}_{||}}$**.** Then there exists $a, b, c \in \mathbb{R}$ such that $B_2 =]a, b[$ and $B_1 =]c, \infty]$, as $x \in B_1 \bigcap B_2$ we have that $c < x$ and $a < x < b$. Define $B =]d, b[$ where $d = \max(c, a)$ then $d < x < b$ so that $x \in B \in \mathcal{B}_{||}$. Further if $y \in B$ then $c, a \leqslant d < y < b$ so that $y \in B_1 \bigcap B_2$. Hence $x \in B \subseteq B_1 \bigcap B_2$ where $B \in \mathcal{B}_{||} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$.

   $\boldsymbol{B_1 \in \mathcal{B}_{||} \wedge B_2 \in \mathcal{B}_{-\infty}}$**.** Then there exists $a, b, c \in \mathbb{R}$ such that $B_1 =]a, b[$ and $B_2 = [-\infty, c[$, as $x \in B_1 \bigcap B_2$ we have $a < x < b$ and $x < c$. Define $B =]a, d[$ where $d = \min(b, c)$ then $a < x < d$ so that $x \in B \in \mathcal{B}_{||}$. Further if $y \in B$ then $a < y < d \leqslant b, c$ so that $y \in B_1 \bigcap B_2$. Hence $x \in B \subseteq B_1 \bigcap B_2$ where $B \in \mathcal{B}_{||} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$.

   $\boldsymbol{B_1 \in \mathcal{B}_{-\infty} \wedge B_2 \in \mathcal{B}_{-\infty}}$**.** Then there exists $c_1, c_2 \in \mathbb{R}$ such that $B_1 = [-\infty, c_1[$ and $B_2 = [-\infty, c_2[$, as $x \in B_1 \bigcap B_2$ we have that $x < c_1, c_2$ hence if we define $B = [-\infty, c[$ where $c = \min(c_1, c_2) \in \mathbb{R}$ then $x < c$ so that $x \in B \in \mathcal{B}_{-\infty}$. Further if $y \in B$ then $y < c \leqslant c_1, c_2$ so that $y \in B_1 \bigcap B_2$. Hence $x \in B \subseteq B_1 \bigcap B_2$ where $B \in \mathcal{B}_{-\infty} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$.

   $\boldsymbol{B_1 \in \mathcal{B}_{\infty} \wedge B_2 \in \mathcal{B}_{-\infty}}$**.** Then there exists $c_1, c_2 \in \mathbb{R}$ such that $B_1 =]c_1, \infty]$ and $B_2 = [-\infty, c_2[$, as $x \in B_1 \bigcap B_2$ we have that $c_1 < x < c_2$. Define $B =]c_1, c_2[$ then $x \in B \in \mathcal{B}_{||}$. Further if $y \in B$ then $c_1 < y < c_2$ so that $y \in B_1 \bigcap B_2$. Hence $x \in B \subseteq B_1 \bigcap B_2$ where $B \in \mathcal{B}_{||} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$.

   $\boldsymbol{B_1 \in \mathcal{B}_{||} \wedge B_2 \in \mathcal{B}_{\infty}}$**.** Then there exists $a, b, c \in \mathbb{R}$ such that $B_1 =]a, b[$ and $B_2 =]c, \infty]$, as $x \in B_1 \bigcap B_2$ we have that $a < x < b$ and $c < x$. Define $B =]d, b[$ where $d = \max(a, c)$ then we have $d < x < b$ so that $x \in B \in \mathcal{B}_{||}$. Further if $y \in B$ then $a, c \leqslant d < y < b$ so that $y \in B_1 \bigcap B_2$. Hence $x \in B \subseteq B_1 \bigcap B_2$ where $B \in \mathcal{B}_{||} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$.

   $\boldsymbol{B_1 \in \mathcal{B}_{-\infty} \wedge B_2 \in \mathcal{B}_{\infty}}$**.** Then there exists $c_1, c_2 \in \mathbb{R}$ such that $B_1 = [-\infty, c_1[$ and $B_2 =]c_2, \infty]$, as $x \in B_1 \bigcap B_2$ we have $c_2 < x < c_1$. Define $B =]c_2, c_1[$ then $x \in B \in \mathcal{B}_{||}$. Further if $y \in B$ then $c_2 < y < c_1$ so that $y \in B_1 \bigcap B_2$. Hence $x \in B \subseteq B_1 \bigcap B_2$ where $B \in \mathcal{B}_{||} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$.

   $\boldsymbol{B_1 \in \mathcal{B}_{\infty} \wedge B_2 \in \mathcal{B}_{\infty}}$**.** Then there exists $c_1, c_2 \in \mathbb{R}$ such that $B_1 =]c_1, \infty] \wedge B_2 =]c_2, \infty]$, as $x \in B_1 \bigcap B_2$ we have $c_1 < x \wedge c_2 < x$. Define $B =]c, \infty]$ where $c = \max(c_1, c_2) \in \mathbb{R}$ then $c < x$ so that $x \in B_{\infty}$. Further if $y \in B$ then $c_1, c_2 \leqslant c < y$ so that $y \in B_1 \bigcap B_2$. Hence $x \in B \subseteq B_1 \bigcap B_2$ where $B \in \mathcal{B}_{||} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$. □

We use now $\mathcal{B}_{\overline{\mathbb{R}}}$ to generate the canonical topology on $\overline{\mathbb{R}}$.

Definition 20.47. *The canonical topology on $\overline{\mathbb{R}}$ noted as $\mathcal{T}_{\overline{\mathbb{R}}}$ is defined as*

$$\mathcal{T}_{\overline{\mathbb{R}}} = \{U \subseteq \overline{\mathbb{R}} | \forall x \in U \text{ we have that } \exists B \in \mathcal{B}_{\overline{\mathbb{R}}} \text{ such that } x \in B \subseteq U\}$$

which is indeed a topology by [theorem: 14.39] and [lemma: 20.46].

It turns out that the subspace topology of $\mathcal{T}_{\overline{\mathbb{R}}}$ [see theorem: 14.8] is equal to the canonical topology $\mathcal{T}_{||}$ on $\mathbb{R}$.

Theorem 20.48. *Let $\mathcal{T}_{\overline{\mathbb{R}}}$ be the canonical topology on $\overline{\mathbb{R}}$ and $\mathcal{T}_{||}$ the canonical topology on $\mathbb{R}$ [see theorem: 14.99] then*

$$\mathcal{T}_{||} \subseteq \mathcal{T}_{\overline{\mathbb{R}}}$$

and

$$\mathcal{T}_{||} = \left\{U \bigcap \mathbb{R} | U \in \mathcal{T}_{\overline{\mathbb{R}}}\right\} \underset{[\text{theorem: } 14.8]}{=} (\mathcal{T}_{\overline{\mathbb{R}}})_{|\mathbb{R}}$$

Proof. By definition

$$\mathcal{T}_{\overline{\mathbb{R}}} = \{U \subseteq \overline{\mathbb{R}} | \forall x \in U \text{ we have that } \exists B \in \mathcal{B}_{\overline{\mathbb{R}}} \text{ such that } x \in B \subseteq U\}$$

Further by [theorem: 14.99]

$$\mathcal{T}_{||} = \{U \subseteq \mathbb{R} | \forall x \in U \text{ we have that } \exists B \in \mathcal{B}_{||} \text{ such that } x \in B \subseteq U\}$$

where

$$\mathcal{B}_{||} = \{]a,b[| a,b \in \mathbb{R} \wedge a < b\} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$$

Let $U \in \mathcal{T}_{||}$ then $\forall x \in U\ \exists B \in \mathcal{B}_{||} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$ such that $x \in B \subseteq U$ proving that $U \in \mathcal{T}_{\overline{\mathbb{R}}}$, hence we have

$$\mathcal{T}_{||} \subseteq \mathcal{T}_{\overline{\mathbb{R}}} \tag{20.1}$$

If $U \in \mathcal{T}_{||}$ then $U \subseteq \mathbb{R} \Rightarrow U = U \bigcap \mathbb{R}$ and by [eq: 20.1] $U \in \mathcal{T}_{\overline{\mathbb{R}}}$ so that $U \in \{U \bigcap \mathbb{R} | U \in \mathcal{T}_{\overline{\mathbb{R}}}\}$ hence

$$\mathcal{T}_{||} \subseteq \left\{U \bigcap \mathbb{R} | U \in \mathcal{T}_{\overline{\mathbb{R}}}\right\} \tag{20.2}$$

If $U \in \{U \bigcap \mathbb{R} | U \in \mathcal{T}_{\overline{\mathbb{R}}}\}$ then there exist a $V \in \mathcal{T}_{\overline{\mathbb{R}}}$ such that

$$U = V \bigcap \mathbb{R} \tag{20.3}$$

If $x \in U$ then $x \in \mathbb{R}$ and $x \in V \in \mathcal{T}_{\overline{\mathbb{R}}}$, so there exists a $B'_x \in \mathcal{B}_{\overline{\mathbb{R}}}$ such that $x \in B'_x \subseteq V$. For B'_x we have then either:

$B'_x \in \mathcal{B}_{||}$. Then there exist a $a,b \in \mathbb{R}$ such that $B'_x =]a,b[\subseteq \mathbb{R}$ hence if we take $B_x = B'_x$ then

$$x \in B_x = B_x \bigcap \mathbb{R} \subseteq V \bigcap \mathbb{R} = U$$

$B'_x \in \mathcal{B}_{-\infty}$. Then $\exists c \in \mathbb{R}$ such that $B'_x = [-\infty, c[$. Define $B_x =]x-1, c[\subseteq \mathbb{R}$ then $x-1 < x < c$ so that $x \in B_x \in \mathcal{B}_{||}$. Further for $y \in B_x$ we have $y < c$ so that $y \in B'_x$ proving that $x \in B_x \subseteq B'_x$. Hence

$$x \in B_x = B_x \bigcap \mathbb{R} \subseteq V \bigcap \mathbb{R} = U$$

$B'_x \in \mathcal{B}_{\infty}$. Then $\exists c \in \mathbb{R}$ such that $B'_\infty =]c, \infty]$. Define $B_x =]c, x+1[\subseteq \mathbb{R}$ then $c < x < x+1$ so that $x \in B_x \in \mathcal{B}_{||}$. Further for $y \in B_x$ we have $c < y$ so that $y \in B'_x$ proving that $x \in B_x \subseteq B'_x$. Hence

$$x \in B_x = B_x \bigcap \mathbb{R} \subseteq V \bigcap \mathbb{R} = U$$

so in all cases we found a $B_x \in \mathcal{B}_{||}$ such that $x \in B_x \subseteq U$. As x was choose arbitrary it follows that $U \in \mathcal{T}_{||}$. Hence $\{U \bigcap \mathbb{R} | U \in \mathcal{T}_{\overline{\mathbb{R}}}\} \subseteq \mathcal{T}_{||}$ which combined with [eq: 20.2] gives

$$\mathcal{T}_{||} = \left\{U \bigcap \mathbb{R} | U \in \mathcal{T}_{\overline{\mathbb{R}}}\right\}$$

□

Theorem 20.49. *We have the following closed sets in $\mathcal{T}_{\overline{\mathbb{R}}}$*

1. *$\forall x \in \mathbb{R}\ [-\infty, x]$ is closed.*
2. *$\forall x \in \mathbb{R}\ [x, \infty]$ is closed,*
3. *$\forall x \in \mathbb{R}\ \{x\}$ is closed.*
4. *$[-\infty, \infty]$ is closed.*

5. $\{-\infty,\infty\}$ *is closed*
6. $\{-\infty\}$ *is closed.*
7. $\{\infty\}$ *is closed.*

Proof.

1. As
$$\begin{aligned} y\in\overline{\mathbb{R}}\setminus[-\infty,x] &\Leftrightarrow y\in\overline{\mathbb{R}}\wedge\neg(-\infty\leqslant y\leqslant x)\\ &\Leftrightarrow y\in\overline{\mathbb{R}}\wedge(y<-\infty\vee x<y)\\ &\Leftrightarrow y\in\overline{\mathbb{R}}\wedge x<y\\ &\Leftrightarrow y\in\,]x,\infty] \end{aligned}$$
so that $\overline{\mathbb{R}}\setminus[-\infty,x]=\,]x,\infty]\in\mathcal{T}_{\overline{\mathbb{R}}}$, hence $[-\infty,x]$ is closed.
2. As
$$\begin{aligned} y\in\overline{\mathbb{R}}\setminus[x,\infty] &\Leftrightarrow y\in\overline{\mathbb{R}}\wedge\neg(x\leqslant y\geqslant\infty)\\ &\Leftrightarrow y\in\overline{\mathbb{R}}\wedge(y<x\vee\infty<y)\\ &\Leftrightarrow y\in\overline{\mathbb{R}}\wedge y<x\\ &\Leftrightarrow y\in[-\infty,x[\end{aligned}$$
so that $\overline{\mathbb{R}}\setminus[x,\infty]=[-\infty,x[\in\mathcal{T}_{\overline{\mathbb{R}}}$ which proves that $[x,\infty]$ is closed.
3. As $\{x\}=[-\infty,x]\bigcap[x,\infty]$ it follows from (1) and (2) that $\{x\}$ is closed.
4. This is trivial as $\overline{\mathbb{R}}=[-\infty,\infty]$.
5. As $\overline{\mathbb{R}}\setminus\{-\infty,\infty\}=\mathbb{R}\in\mathcal{T}_{||}\subseteq\mathcal{T}_{\overline{\mathbb{R}}}$ it follows that $\{-\infty,\infty\}$ is closed.
6. As $\{-\infty\}=\{-\infty,\infty\}\bigcap[-\infty,0]$ it follows from (2) and (5) that $\{-\infty\}$ is closed.
7. As $\{\infty\}=\{-\infty,\infty\}\bigcap[0,\infty]$ it follows form (1) and (5) that $\{\infty\}$ is closed. □

Theorem 20.50.

1. *If $x\in\mathbb{R}$ then and $U\in\mathcal{T}_{\overline{\mathbb{R}}}$ with $x\in U$ then $\exists\varepsilon\in\mathbb{R}^+$ such that $x\in\,]x-\varepsilon,x+\varepsilon[\subseteq U$.*
2. *If $U\in\mathcal{T}_{\overline{\mathbb{R}}}$ with $-\infty\in U$ then $\exists\varepsilon\in\mathbb{R}^+$ such that $-\infty\in[-\infty,-\varepsilon[\subseteq U$.*
3. *f $U\in\mathcal{T}_{\overline{\mathbb{R}}}$ with $\infty\in U$ then $\exists\varepsilon\in\mathbb{R}^+$ such that $\infty\in\,]\varepsilon,\infty]\subseteq U$.*

Proof.

1. If $x\in U$ then as $\mathcal{B}_{\overline{\mathbb{R}}}$ is the generating basis for $\mathcal{T}_{\overline{\mathbb{R}}}$ there exist a $B\in\mathcal{B}_{\overline{\mathbb{R}}}$ such that $x\in B\subseteq U$. For B we have either:

   $\boldsymbol{B\in\mathcal{B}_{||}}$**.** As $\mathcal{B}_{||}\underset{\text{[theorem: 14.99]}}{=}\{]y-\varepsilon,y+\varepsilon[|y\in\mathbb{R}\wedge\varepsilon\in\mathbb{R}^+\}$ there exists a $y\in\mathbb{R}$ and a $\delta\in\mathbb{R}^+$ so that $B=\,]y-\delta,y+\delta[$. As $x\in B$ we have $y-\delta<x<y+\delta$, define $\varepsilon=\min(x-(y-\delta),(y+\delta)-x)$ then if $z\in\,]x-\varepsilon,x+\varepsilon[$ we have
$$y-\delta=x-(x-(y-\delta))\leqslant x-\varepsilon<z<x+\varepsilon\leqslant x+(y+\delta)-x=y+\delta$$
   so that $x\in B$. Hence $x\in\,]x-\varepsilon,x+\varepsilon[\subseteq B\subseteq U$.

   $\boldsymbol{B\in\mathcal{B}_{-\infty}}$**.** Then there exist a $c\in\mathbb{R}$ such that $B=[-\infty,c[$, as $x\in\mathbb{R}$ and $x\in B$ we have $-\infty<x<c$. Take $\varepsilon=c-x\in\mathbb{R}^+$ then if $y\in\,]x-\varepsilon,x+\varepsilon[\subseteq\mathbb{R}$ we have $-\infty<y<x+\varepsilon=x+(c-x)=c$ so that $x\in\,]x-\varepsilon,x+\varepsilon[\subseteq\,]-\infty,c[=B\subseteq U$.

   $\boldsymbol{B\in\mathcal{B}_{||}}$**.** Then there exist a $c\in\mathbb{R}$ such that $B=\,]c,\infty]$, as $x\in\mathbb{R}$ and $x\in B$ we have $c<x<\infty$. Take $\varepsilon=x-c\in\mathbb{R}$ then if $y\in\,]x-\varepsilon,x+\varepsilon[\subseteq\mathbb{R}$ we have $c=x-(x-c)=x-\varepsilon<y<\infty$ so that $x\in\,]x-\varepsilon,x+\varepsilon[\subseteq\,]c,\infty]=B\subseteq U$.
2. As $\mathcal{B}_{\overline{\mathbb{R}}}$ is the generating basis for $\mathcal{T}_{\overline{\mathbb{R}}}$ there exists a $B\in\mathcal{B}_{\overline{\mathbb{R}}}$ such that $-\infty\in B\subseteq U$. For B we have either:

   $\boldsymbol{B\in\mathcal{B}_{||}}$**.** Then there exists $a,b\in\mathbb{R}$ such that $B=\,]a,b[$, as $-\infty\in B$ we have $-\infty<a<-\infty$ a contradiction. So this case does not apply.

   $\boldsymbol{B\in\mathcal{B}_{-\infty}}$**.** Then there exists a $c\in\mathbb{R}$ such that $B=[-\infty,c[$, take $\varepsilon=-\min(c,-1)\in\mathbb{R}^+$. If $y\in[-\infty,-\varepsilon[$ we have that $-\infty\leqslant y<-\varepsilon=\min(c,-1)\leqslant c$ so that $-\infty\in[-\infty,-\varepsilon[\subseteq B\subseteq U$.

$B \in \mathcal{B}_\infty$. Then there exists a $c \in \mathbb{R}$ such that $B =]c, \infty]$, as $-\infty \in B$ we have that $-\infty < c < -\infty$ a contradiction. So this case does not apply.

3. As $\mathcal{B}_{\overline{\mathbb{R}}}$ is the generating basis for $\mathcal{T}_{\overline{\mathbb{R}}}$ there exists a $B \in \mathcal{B}_{\overline{\mathbb{R}}}$ such that $\infty \in B \subseteq U$. For B we have either:

   $B \in \mathcal{B}_{||}$. Then there exists $a, b \in \mathbb{R}$ such that $B =]a, b[$, as $\infty \in B$ we have $\infty < b < \infty$ a contradiction. So this case does not apply.

   $B \in \mathcal{B}_{-\infty}$. Then there exists a $c \in \mathbb{R}$ such that $B = [-\infty, c[$, as $\infty \in B$ we have that $\infty < c < \infty$ a contradiction. So this case does not apply.

   $B \in \mathcal{B}_\infty$. Then there exists a $c \in \mathbb{R}$ such that $B =]c, \infty]$, take $\varepsilon = \max(1, c) \in \mathbb{R}^+$. If $y \in]\varepsilon, \infty]$ then $c \leqslant \varepsilon < y \leqslant \infty$ so that $\infty \in]\varepsilon, \infty] \subseteq B \subseteq U$. □

We show now that continuous functions with codomain $\mathbb{R}$ are also continuous if we use the codomain $\overline{\mathbb{R}}$.

Theorem 20.51. *Let $\langle X, \mathcal{T} \rangle$ be a topological space and let $f: X \to \mathbb{R}$ be a continuous function [using the topology $\mathcal{T}_{||}$] then $f: X \to \overline{\mathbb{R}}$ is also continuous using the topology $\mathcal{T}_{\overline{\mathbb{R}}}$.*

Proof. Let $x \in X$ and let $U \in \mathcal{T}_{\overline{\mathbb{R}}}$ be such that $f(x) \in U$. As $f(X) \subseteq \mathbb{R}$ we have that $f(x) \in \mathbb{R}$, then by [theorem: 20.50] there exist a $\varepsilon \in \mathbb{R}^+$ such that $f(x) \in]f(x) - \varepsilon, f(x) + \varepsilon[\subseteq U$. As $f: X \to \mathbb{R}$ is continuous and $]f(x) - \varepsilon, f(x) + \varepsilon[$ is open in $\mathbb{R}$ it follows that $V = f^{-1}(]f(x) - \varepsilon, f(x) + \varepsilon[) \in \mathcal{T}$. As $f(x) \in]f(x) - \varepsilon, f(x) + \varepsilon[$ we have that $x \in V$, further

$$f(V) = f(f^{-1}(]f(x) - \varepsilon, f(x) + \varepsilon[)) \subseteq]f(x) - \varepsilon, f(x) + \varepsilon[\subseteq U$$

So using [theorem: 14.124] f is continuous at x, as $x \in X$ was chosen arbitrary it follows that $f: X \to \overline{\mathbb{R}}$ is continuous. □

Theorem 20.52. *If $U \in \mathcal{T}_{\overline{\mathbb{R}}}$ then for $x \in \mathbb{R}$ we have that*

1. *$x + U = \{x + u | u \in U\} \in \mathcal{T}_{\overline{\mathbb{R}}}$ [in other words if U is open then $x + U$ is open]*
2. *If $x \neq 0$ then $x \cdot U = \{x \cdot u | u \in U\} \in \mathcal{T}_{\overline{\mathbb{R}}}$ [in other words is U is open then $x \cdot U$ is open]*

Proof.

1. Let $y \in x + U$ then there exist a $u \in U$ such that $y = x + u$. For $u \in U$ we have either:

   $u \in \mathbb{R}$. Using [theorem: 20.50] there exists a $\varepsilon \in \mathbb{R}^+$ such that

   $$u \in]u - \varepsilon, u + \varepsilon[\subseteq U$$

   Let $z \in]y - \varepsilon, y + \varepsilon[$ then $(x + u) - \varepsilon = y - \varepsilon < z < y + \varepsilon = (x + u) + \varepsilon$ hence $u - \varepsilon < z - x < u + \varepsilon$ or $z - x \in]u - \varepsilon, u + \varepsilon[\subseteq U$ so that $z = z + (z - x) \in x + U$, hence $y \in]y - \varepsilon, y + \varepsilon[\subseteq x + U$ As $]y - \varepsilon, y + \varepsilon[\in \mathcal{B}_{||} \subseteq B_{\overline{\mathbb{R}}}$ we have by taking $B =]y - \varepsilon, y + \varepsilon[$ we have that

   $$\exists B \in \mathcal{B}_{\overline{\mathbb{R}}} \text{ such that } y \in B \subseteq x + U$$

   $u = -\infty$. Using [theorem: 20.50] there exists a $\varepsilon \in \mathbb{R}^+$ such that

   $$u = -\infty \in [-\infty, -\varepsilon[\subseteq U$$

   Let $z \in [-\infty, -\varepsilon + x[$ then $-\infty \leqslant z < -\varepsilon + x$ so that $-\infty \leqslant z - x < -\varepsilon$ proving that $z - x \in [-\infty, -\varepsilon[\subseteq U$, hence $z = x + (z - x) \in x + U$ or $[-\infty, -\varepsilon + x[\subseteq x + U$. As $y = x + u = x + (-\infty) = -\infty$ it follows that $y \in [-\infty, -\varepsilon + x[\subseteq x + U$. Hence if we take $B = [-\infty, -\varepsilon + x[\in \mathcal{B}_{-\infty} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$ we have that

   $$\exists B \in \mathcal{B}_{\overline{\mathbb{R}}} \text{ such that } y \in B \subseteq x + U$$

   $u \in \infty$. Using [theorem: 20.50] there exists a $\varepsilon \in \mathbb{R}^+$ such that

   $$u = \infty \in]\varepsilon, \infty] \subseteq U$$

   Let $z \in]\varepsilon + x, \infty]$ then $\varepsilon + x < z \leqslant \infty$ so that $\varepsilon < z - x \leqslant \infty$ proving that $z - x \in]\varepsilon, \infty] \subseteq U$, hence $z = x + (z - x) \in x + U$ or $]\varepsilon + x, \infty] \subseteq x + U$. As $y = x + u = x + \infty = \infty$ it follows that $y \in]\varepsilon + x, \infty] \subseteq x + U$. Hence if we take $B =]\varepsilon + x, \infty] \in \mathcal{B}_{-\infty} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$ we have that

   $$\exists B \in \mathcal{B}_{\overline{\mathbb{R}}} \text{ such that } y \in B \subseteq x + U$$

   As $y \in x + U$ was chosen arbitrary and in all cases we found a $B \in \mathcal{B}_{\overline{\mathbb{R}}}$ [the generating basis of $\mathcal{T}_{\overline{\mathbb{R}}}$] such that $y \in B \subseteq x + U$ it follows that $x + U \in \mathcal{T}_{\overline{\mathbb{R}}}$.

2. If $y \in x \cdot U$ then there exist a $u \in U$ such that $y = x \cdot y$. For $u \in U$ we have the following possibilities.

$u \in \mathbb{R}$. Using [theorem: 20.50] there exist a $\varepsilon \in \mathbb{R}^+$ such that

$$u \in]u - \varepsilon, u + \varepsilon[\subseteq U$$

For $x \neq 0$ we have now either:

$0 < x$. Then $x \cdot \varepsilon \in \mathbb{R}^+$ so that $x \cdot u - x \cdot \varepsilon < x \cdot u < x \cdot u + x \cdot \varepsilon$. so that

$$y = x \cdot u \in]x \cdot u - x \cdot \varepsilon, x \cdot u + x \cdot \varepsilon[$$

Further if $z \in]x \cdot u - x \cdot \varepsilon, x \cdot u + x \cdot \varepsilon[$ then $x \cdot u - x \cdot \varepsilon < z < x \cdot u + x \cdot \varepsilon$ so, as $0 < x$, $u - \varepsilon < \frac{z}{x} < x + \varepsilon$. Hence $\frac{z}{x} \in]u - \varepsilon, u + \varepsilon[\subseteq U$ so that $z = x \cdot \frac{z}{x} \in x \cdot U$ proving that

$$y = x \cdot u \in]x \cdot u - x \cdot \varepsilon, x \cdot u + x \cdot \varepsilon[\subseteq x \cdot U$$

Take $B =]x \cdot u - x \cdot \varepsilon, x \cdot u + x \cdot \varepsilon[\in \mathcal{B}_{||} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$ then we have that

$$\exists B \in \mathcal{B}_{\overline{\mathbb{R}}} \text{ such that } y \in B \subseteq x \cdot U$$

$x < 0$. Then $-x \cdot \varepsilon \in \mathbb{R}^+$ so that $x \cdot u + x \cdot \varepsilon < x \cdot u < x \cdot u - x \cdot \varepsilon$, so that

$$y = x \cdot u \in]x \cdot u + x \cdot \varepsilon, x \cdot u - x \cdot \varepsilon[$$

Further if $z \in]x \cdot u + x \cdot \varepsilon, x \cdot u - x \cdot \varepsilon[$ then $x \cdot u + x \cdot \varepsilon < z < x \cdot u - x \cdot \varepsilon$ or, as $x < 0 \Rightarrow \frac{1}{x} < 0$ that $u - \varepsilon < \frac{z}{x} < u + \varepsilon$. Hence $\frac{z}{x} \in]u - \varepsilon, u + \varepsilon[\subseteq U$ so that $z = x \cdot \frac{z}{x} \in x \cdot U$ proving that

$$y \in]x \cdot u + x \cdot \varepsilon, x \cdot u - x \cdot \varepsilon[\subseteq x \cdot U$$

Take $B =]x \cdot u + x \cdot \varepsilon, x \cdot u - x \cdot \varepsilon[\in \mathcal{B}_{||} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$ then we have that

$$\exists B \in \mathcal{B}_{\overline{\mathbb{R}}} \text{ such that } y \in B \subseteq x \cdot U$$

As $y \in x \cdot U$ was chosen arbitrary and in all cases we found a $B \in \mathcal{B}_{\overline{\mathbb{R}}}$ [the generating basis of $\mathcal{T}_{\overline{\mathbb{R}}}$] such that $y \in B \subseteq x \cdot U$ it follows that $x \cdot U \in \mathcal{T}_{\overline{\mathbb{R}}}$.

$u = -\infty$. Using [theorem: 20.50] there exist a $\varepsilon \in \mathbb{R}^+$ such that

$$-\infty \in [-\infty, -\varepsilon[\subseteq U$$

For $x \neq 0$ we have either:

$0 < x$. then

$$y = x \cdot (-\infty) = -\infty \in [-\infty, -x \cdot \varepsilon[\text{ where } x \cdot \varepsilon \in \mathbb{R}^+$$

further if $z \in [-\infty, -x \cdot \varepsilon[$ then $-\infty \leqslant z < -x \cdot \varepsilon$ so that $-\infty \leqslant \frac{z}{x} < -\varepsilon$ proving that $\frac{z}{x} \in [-\infty, -\varepsilon[\subseteq U$ or that $z = x \cdot \frac{z}{x} \in x \cdot U$. Hence

$$y \in [-\infty, -x \cdot \varepsilon[\subset x \cdot U$$

Take $B = [-\infty, -x \cdot \varepsilon[\in \mathcal{B}_{-\infty} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$ then we have

$$\exists B \in \mathcal{B}_{\overline{\mathbb{R}}} \text{ such that } y \in B \subseteq x \cdot U$$

$x < 0$. then

$$y = x \cdot (-\infty) = \infty \in]-x \cdot \varepsilon, \infty] \text{ where } -x \cdot \varepsilon \in \mathbb{R}^+$$

further if $z \in]-x \cdot \varepsilon, \infty]$ then $-x \cdot \varepsilon < z \leqslant \infty$ so that $-\infty = \frac{1}{x} \cdot \infty \leqslant \frac{z}{x} < -x \cdot \varepsilon$ proving that $\frac{z}{x} \in [-\infty, -x \cdot \varepsilon[\subseteq U$ so that $z = x \cdot \frac{z}{x} \in x \cdot U$. Hence

$$y \in]-x \cdot \varepsilon, \infty] \subset x \cdot U$$

Take $B =]-x \cdot \varepsilon, \infty] \in \mathcal{B}_{\infty} \subseteq \mathcal{B}_{\overline{\mathbb{R}}}$ then we have

$$\exists B \in \mathcal{B}_{\overline{\mathbb{R}}} \text{ such that } y \in B \subseteq x \cdot U$$

As $y \in x \cdot U$ was chosen arbitrary and in all cases we found a $B \in \mathcal{B}_{\overline{\mathbb{R}}}$ [the generating basis of $\mathcal{T}_{\overline{\mathbb{R}}}$] such that $y \in B \subseteq x \cdot U$ it follows that $x \cdot U \in \mathcal{T}_{\overline{\mathbb{R}}}$.

$\boldsymbol{u=\infty}$. Using [theorem: 20.50] there exist a $\varepsilon\in\mathbb{R}^+$ such that

$$\infty\in\,]\varepsilon,\infty]\subseteq U$$

For $x\neq 0$ we have either:

$\boldsymbol{0<x}$. then

$$y=x\cdot\infty=\infty\in\,]x\cdot\varepsilon,\infty]\text{ where }x\cdot\varepsilon\in\mathbb{R}^+$$

further if $z\in\,]x\cdot\varepsilon,\infty]$ then $x\cdot\varepsilon<z\leqslant\infty$ so that $\varepsilon<\frac{z}{x}\leqslant\infty$, proving that $\frac{z}{x}\in\,]\varepsilon,\infty]\subseteq U$ or that $z=x\cdot\frac{z}{x}\in x\cdot U$. Hence

$$y\in\,]x\cdot\varepsilon,\infty]\subset x\cdot U$$

Take $B=\,]x\cdot\varepsilon,\infty]\in\mathcal{B}_\infty\subseteq\mathcal{B}_{\overline{\mathbb{R}}}$ then we have

$$\exists B\in\mathcal{B}_{\overline{\mathbb{R}}}\text{ such that }y\in B\subseteq x\cdot U$$

$\boldsymbol{x<0}$. then

$$y=x\cdot\infty=-\infty\in[-\infty,x\cdot\varepsilon[\text{ where }-x\cdot\varepsilon\in\mathbb{R}^+$$

further if $z\in[-\infty,x\cdot\varepsilon[$ then $-\infty\leqslant z<x\cdot\varepsilon$ so that $\varepsilon<\frac{z}{x}\leqslant\infty$, proving that $\frac{z}{x}\in\,]\varepsilon,\infty]\subseteq U$ so that $z=x\cdot\frac{z}{x}\in x\cdot U$. Hence

$$y\in[-\infty,x\cdot\varepsilon[\subset x\cdot U$$

Take $B=[-\infty,x\cdot\varepsilon[\in\mathcal{B}_{-\infty}\subseteq\mathcal{B}_{\overline{\mathbb{R}}}$ then we have that

$$\exists B\in\mathcal{B}_{\overline{\mathbb{R}}}\text{ such that }y\in B\subseteq x\cdot U$$

As $y\in x\cdot U$ was chosen arbitrary and in all cases we found a $B\in\mathcal{B}_{\overline{\mathbb{R}}}$ [the generating basis of $\mathcal{T}_{\overline{\mathbb{R}}}$] such that $y\in B\subseteq x\cdot U$ it follows that $x\cdot U\in\mathcal{T}_{\overline{\mathbb{R}}}$. □

Theorem 20.53. *$\mathfrak{T}_{\overline{\mathbb{R}}}$ is Hausdorff [see definition: 14.203].*

Proof. Let $x,y\in\overline{\mathbb{R}}$ with $x\neq y$ then we have to check the following cases for x,y:

$\boldsymbol{x\in\mathbb{R}\wedge y\in\mathbb{R}}$. Then we have as $x\neq y$ we have either:

$\boldsymbol{x<y}$. Take $\varepsilon=\frac{y-x}{2}\in\mathbb{R}^+$ then $x\in\,]x-\varepsilon,x+\varepsilon[\in\mathcal{T}_{\overline{\mathbb{R}}}$ and $y\in\,]y-\varepsilon,y+\varepsilon[\in\mathcal{T}_{\overline{\mathbb{R}}}$. Further

$$]x-\varepsilon,x+\varepsilon[=\left]x-\varepsilon,x+\frac{y-x}{2}\right[=\left]x-\varepsilon,\frac{x+y}{2}\right[$$

and

$$]y-\varepsilon,y+\varepsilon[=\left]y-\frac{y-x}{2},y+\varepsilon\right[=\left]\frac{x+y}{2},y+\varepsilon\right[$$

so that $]x-\varepsilon,x+\varepsilon[\bigcap\,]y-\varepsilon,y+\varepsilon[=\varnothing$.

$\boldsymbol{y<x}$. Take $\varepsilon=\frac{x-y}{2}\in\mathbb{R}^+$ then $x\in\,]x-\varepsilon,x+\varepsilon[\in\mathcal{T}_{\overline{\mathbb{R}}}$ and $y\in\,]y-\varepsilon,y+\varepsilon[\in\mathcal{T}_{\overline{\mathbb{R}}}$. Further

$$]x-\varepsilon,x+\varepsilon[=\left]x-\frac{x-y}{2},x+y\right[=\left]\frac{x+y}{2},x+y\right[$$

and

$$]y-\varepsilon,y+\varepsilon[=\left]y-\varepsilon,y+\frac{x-y}{2}\right[=\left]y-\varepsilon,\frac{x+y}{2}\right[$$

so that $]x-\varepsilon,x+\varepsilon[\bigcap\,]y-\varepsilon,y+\varepsilon[=\varnothing$.

$\boldsymbol{x=-\infty\wedge y\in\mathbb{R}}$. Then $x=-\infty\in[-\infty,y-1[\in\mathcal{T}_{\overline{\mathbb{R}}}$, $y\in\,]y-1,y+1[\in\mathcal{T}_{\overline{\mathbb{R}}}$ and $[-\infty,y-1[\bigcap\,]y-1,y+1[=\varnothing$.

$\boldsymbol{x=\infty\wedge y\in\mathbb{R}}$. Then $x=\infty\in\,]y+1,\infty]\in\mathcal{T}_{\overline{\mathbb{R}}}$, $y\in\,]y-1,y+1[\in\mathcal{T}_{\overline{\mathbb{R}}}$ and $]y+1,\infty[\bigcap\,]y-1,y+1[=\varnothing$.

$\boldsymbol{x\in\mathbb{R}\wedge y=-\infty}$. Then $x\in\,]x-1,x+1[\in\mathcal{T}_{\overline{\mathbb{R}}}$, $y=-\infty\in[-\infty,x-1[\in\mathcal{T}_{\overline{\mathbb{R}}}$ and $]x-1,x+1[\bigcap[-\infty,x-1[=\infty$.

$\boldsymbol{x=-\infty\wedge y=-\infty}$. As $x\neq y$ this is not a valid case.

$\boldsymbol{x=\infty\wedge y=-\infty}$. Then $x\in\,]1,\infty]\in\mathcal{T}_{\overline{\mathbb{R}}}$, $y\in[-\infty,1[\in\mathcal{T}_{\overline{\mathbb{R}}}$ and $]1,\infty]\bigcap[-\infty,1[=\infty$.

$\boldsymbol{x\in\mathbb{R}\wedge y=\infty}$. Then $x\in\,]x-1,x+1[\in\mathcal{T}_{\overline{\mathbb{R}}}$, $y\in\,]x+1,\infty]\in\mathcal{T}_{\overline{\mathbb{R}}}$ and $]x-1,x+1[\bigcap\,]x+1,\infty]=\varnothing$.

$\boldsymbol{x=-\infty\wedge y=\infty}$. Then $x\in[-\infty,1[\in\mathcal{T}_{\overline{\mathbb{R}}}$, $\in]1,\infty]\in\mathcal{T}_{\overline{\mathbb{R}}}$ and $[-\infty,1[\bigcap\,]1,\infty]=\varnothing$.

$\boldsymbol{x=\infty\wedge y=\infty}$. As $x\neq y$ this is not a valid case □

20.1.4 Sequences in $\overline{\mathbb{R}}$

We will now extend the concept of a limit of sequences in $\mathbb{R}$ to the limit of sequences in $\overline{\mathbb{R}}$ in such a way that the limit of increasing/decreasing sequences always exists. So if we have a series of non negative numbers then the limit of the partial sums will always have a limit, in other words series of non negative numbers always converges. To do this we make use of the fact that in $\overline{\mathbb{R}}$ every non empty subset has a supremum and infinum and define the limit of a sequence in terms of supremum and infinum.

Theorem 20.54. *Let $k \in \mathbb{N}_0$, $\{x_i\}_{i \in \{k,\dots,\infty\}} \subseteq \overline{\mathbb{R}}$ be a sequence of extended real numbers then we have:*

1. $\inf(\{x_i | i \in \{k,\dots,\infty\}\})$ *and* $\sup(\{x_i | i \in \{k,\dots,\infty\}\})$ *exists*
2. $\inf(\{\sup(\{x_i | i \in \{l,\dots,\infty\}\}) | l \in \{k,\dots,\infty\}\})$ *exists*
3. $\sup(\{\inf(\{x_i | i \in \{l,\dots,\infty\}\}) | l \in \{k,\dots,\infty\}\})$ *exists*
4. $\forall m \in \{k,\dots,\infty\}$ *we have*
$$\sup(\{\inf(\{x_i | i \in \{l,\dots,\infty\}\}) | l \in \{k,\dots,\infty\}\}) = \sup(\{\inf(\{x_i | i \in \{l,\dots,\infty\}\}) | l \in \{m,\dots,\infty\}\}$$
5. $\forall m \in \{k,\dots,\infty\}$ *we have*
$$\inf(\{\sup(\{x_i | i \in \{l,\dots,\infty\}\}) | l \in \{k,\dots,\infty\}\}) = \inf(\{\sup(\{x_i | i \in \{l,\dots,\infty\}\}) | l \in \{m,\dots,\infty\}\}$$

Proof.

1. As $\{x_i | i \in \{k,\dots,\infty\}\} \neq \varnothing$ this follows from [theorem: 20.13].
2. As $\{\inf(\{x_i | i \in \{l,\dots,\infty\}\}) | l \in \{k,\dots,\infty\}\} \neq \varnothing$ this this follows from [theorem: 20.13].
3. As $\{\sup(\{x_i | i \in \{l,\dots,\infty\}\}) | l \in \{k,\dots,\infty\}\} \neq \varnothing$ this follows from [theorem: 20.13].
4. Given $l \in \{k,\dots,\infty\}$ take $S_l = \inf(\{x_i | i \in \{l,\dots,\infty\}\})$ then we have
$$\{S_l | l \in \{m,\dots,\infty\}\} \subseteq \{S_l | l \in \{k,\dots,\infty\}\}$$
so that by [theorem: 3.77]
$$\sup(\{S_l | l \in \{m,\dots,\infty\}\}) \leqslant \sup(\{S_l | l \in \{k,\dots,\infty\}\}) \tag{20.4}$$
For the opposite inclusion, given $l \in \{k,\dots,\infty\}$ take $n = \max(m,l)$ then $m,l \leqslant n$ so that
$$\{x_i | i \in \{l,\dots,\infty\}\} \subseteq \{x_i | i \in \{n,\dots,\infty\}\}$$
or using [theorem: 20.13]
$$S_n = \inf(\{x_i | i \in \{n,\dots,\infty\}\}) \leqslant \inf(\{x_i | i \in \{l,\dots,\infty\}\}) = S_l$$
Hence for every $S_l \in \{S_l | l \in \{k,\dots,\infty\}\}$ we find a $S_n \in \{S_l | l \in \{m,\dots,\infty\}\}$ such that $S_n \leqslant S_l$ which by [theorem: 3.78] proves that $\sup(\{S_l | l \in \{k,\dots,\infty\}\}) \leqslant \sup(\{S_l | l \in \{m,\dots,\infty\}\})$. Combining this result with [eq: 20.4] gives
$$\sup(\{S_l | l \in \{m,\dots,\infty\}\}) = \sup(\{S_l | l \in \{k,\dots,\infty\}\})$$
or
$$\sup(\{\inf(\{x_i | i \in \{l,\dots,\infty\}\}) | l \in \{k,\dots,\infty\}\}) = \sup(\{\inf(\{x_i | i \in \{l,\dots,\infty\}\}) | l \in \{m,\dots,\infty\}\}$$
5. Given $l \in \{k,\dots,\infty\}$ take $S_l = \sup(\{x_i | i \in \{l,\dots,\infty\}\})$ then we have
$$\{S_l | l \in \{m,\dots,\infty\}\} \subseteq \{S_l | l \in \{k,\dots,\infty\}\}$$
so that by [theorem: 3.77]
$$\inf(\{S_l | l \in \{k,\dots,\infty\}\}) \leqslant \inf(\{S_l | l \in \{m,\dots,\infty\}\}) \tag{20.5}$$
For the opposite inclusion, given $l \in \{k,\dots,\infty\}$ take $n = \max(m,l)$ then $m,l \leqslant n$ so that
$$\{x_i | i \in \{l,\dots,\infty\}\} \subseteq \{x_i | i \in \{n,\dots,\infty\}\}$$
or using [theorem: 20.13]
$$S_n = \sup(\{x_i | i \in \{l,\dots,\infty\}\}) \leqslant \sup(\{x_i | i \in \{n,\dots,\infty\}\}) = S_l$$
Hence for every $S_l \in \{S_l | l \in \{k,\dots,\infty\}\}$ we find a $S_n \in \{S_l | l \in \{m,\dots,\infty\}\}$ such that $S_l \leqslant S_n$ which by [theorem: 3.78] proves that $\inf(\{S_l | l \in \{m,\dots,\infty\}\}) \leqslant \inf(\{S_l | l \in \{k,\dots,\infty\}\})$. Combining this result with [eq: 20.5] gives
$$\inf(\{S_l | l \in \{m,\dots,\infty\}\}) = \inf(\{S_l | l \in \{k,\dots,\infty\}\})$$

or

$$\inf(\{\sup(\{x_i|i\in\{l,\ldots,\infty\}\})|l\in\{k,\ldots,\infty\}\})=\inf(\{\sup(\{x_i|i\in\{l,\ldots,\infty\}\})|l\in\{m,\ldots,\infty\}\} \qquad \square$$

Using the above theorem we can then define:

Definition 20.55. *Let $k\in\mathbb{N}_0$, $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ be a sequence of extended real numbers then we define:*

$$\liminf_{i\to\infty} x_i=\sup(\{\inf(\{x_i|i\in\{l,\ldots,\infty\}\})|l\in\{k,\ldots,\infty\}\})$$

$$\limsup_{i\to\infty} x_i=\inf(\{\sup(\{x_i|i\in\{l,\ldots,\infty\}\})l\in\{k,\ldots,\infty\}\})$$

***Note* 20.56.** *() The previous theorem [theorem: 20.54] ensures that the above definition is well defined for every sequence of extended real numbers. Note also that the notations $\liminf_{i\to\infty} x_i$, $\limsup_{i\to\infty} x_i$ do not mention the starting index k, which is indeed not needed because of [theorem: 20.54 (4),(5)].*

Example 20.57. Let $k\in\mathbb{N}_0$, $x\in\overline{\mathbb{R}}$ then for $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ defined by $x_i=x$ we have that

$$\liminf_{i\to\infty} x_i=x=\limsup_{i\to\infty} x_i$$

Proof.

$$\begin{aligned}
\liminf_{i\to\infty} x_i &= \sup(\{\inf(\{x_i|i\in\{l,\ldots,\infty\}\})|l\in\{k,\ldots,\infty\}\})\\
&= \sup(\{\inf(\{x\})|l\in\{k,\ldots,\infty\}\})\\
&= \sup(\{x|n\in\{k,\ldots,\infty\}\})\\
&= \sup(\{x\})\\
&= x\\
&= \inf(\{x\})\\
&= \inf(\{x|n\in\{k,\ldots,\infty\}\})\\
&= \inf(\{\sup(\{x\})|l\in\{k,\ldots,\infty\}\})\\
&= \inf(\{\sup(\{x_i|i\in\{l,\ldots,\infty\}\})|l\in\{k,\ldots,\infty\}\})\\
&= \limsup_{n\to\infty} x_n
\end{aligned}$$

$\square$

Theorem 20.58. *Let $k\in\mathbb{N}_0$, $x\in\overline{\mathbb{R}}$ then for $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ we have $\forall n\in\{k,\ldots,\infty\}$ that*

$$\liminf_{i\to\infty} x_i=\liminf_{i\to\infty} x_{i+n} \text{ and } \limsup_{i\to\infty} x_i=\limsup_{i\to\infty} x_{i+n}$$

Proof. Let $l\in\{k,\ldots,\infty\}$ then we have

$$\begin{aligned}
x\in\{x_{i+n}|i\in\{l,\ldots,\infty\}\} &\Leftrightarrow x=x_{i+n} \text{ where } i\in\{l,\ldots,\infty\}\\
&\Leftrightarrow x=x_i \text{ where } i\in\{l+n,\ldots,\infty\}\\
&\Leftrightarrow x\in\{x_i|i\in\{l+n,\ldots,\infty\}\}
\end{aligned}$$

so that

$$\forall l\in\{k,\ldots,\infty\}\ \{x_{i+n}|i\in\{l,\ldots,\infty\}\}=\{x_i|i\in\{l+n,\ldots,\infty\}\} \tag{20.6}$$

Let $l\in\{k,\ldots,\infty\}$ and define $I_l=\inf(\{x_i|i\in\{l,\ldots,\infty\}\})$ and $S_l=\sup(\{x_i|i\in\{l,\ldots,\infty\}\})$ then we have

$$\begin{aligned}
x\in\{I_{l+n}|l\in\{k,\ldots,\infty\}\} &\Leftrightarrow x=I_{l+n} \text{ where } l\in\{k,\ldots,\infty\}\\
&\Leftrightarrow x=I_l \text{ where } l\in\{k+n,\ldots,\infty\}\\
&\Leftrightarrow x\in\{I_l|l\in\{k+n,\ldots,\infty\}\}\\
x\in\{S_{l+n}|l\in\{k,\ldots,\infty\}\} &\Leftrightarrow x=S_{l+n} \text{ where } l\in\{k,\ldots,\infty\}\\
&\Leftrightarrow x=S_l \text{ where } l\in\{k+n,\ldots,\infty\}\\
&\Leftrightarrow x\in\{S_l|l\in\{k+n,\ldots,\infty\}\}
\end{aligned}$$

so that

$$\{I_{l+n}|l\in\{k,\dots,\infty\}\}=\{I_l|l\in\{k+n,\dots,\infty\}\}\wedge\{S_{l+n}|l\in\{k,\dots,n\}\}=\{S_l|l\in\{k+n,\dots,\infty\}\} \tag{20.7}$$

So

$$\begin{aligned}\liminf_{i\to\infty} x_{i+n} &= \sup(\{\inf(\{x_{i+n}|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &\underset{\text{[eq: 20.6]}}{=} \sup(\{\inf(\{x_i|i\in\{l+n,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &\underset{\text{[eq: 20.7]}}{=} \sup(\{\inf(\{x_i|i\in\{l,\dots,\infty\}\})|l\in\{k+n,\dots,\infty\}\})\\ &\underset{\text{[theorem: 20.54]}}{=} \sup(\{\inf(\{x_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &= \liminf_{i\to\infty} x_i\end{aligned}$$

and

$$\begin{aligned}\limsup_{i\to\infty} x_{i+n} &= \inf(\{\sup(\{x_{i+n}|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &\underset{\text{[eq: 20.6]}}{=} \inf(\{\sup(\{x_i|i\in\{l+n,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &\underset{\text{[eq: 20.7]}}{=} \inf(\{\sup(\{x_i|i\in\{l,\dots,\infty\}\})|l\in\{k+n,\dots,\infty\}\})\\ &\underset{\text{[theorem: 20.54]}}{=} \inf(\{\sup(\{x_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &= \limsup_{i\to\infty} x_i\end{aligned}$$

□

Theorem 20.59. *Let $k\in\mathbb{N}_0$, $\{x_i\}_{i\in\{k,\dots,\infty\}}\subseteq\overline{\mathbb{R}}$ and $\{y_i\}_{i\in\{k,\dots,\infty\}}\subseteq\overline{\mathbb{R}}$ be such that $\forall i\in\{k,\dots,\infty\}$ $x_i\leqslant y_i$ then*

1. $\liminf_{i\to\infty} x_i\leqslant\liminf_{i\to\infty} y_i$.
2. $\limsup_{i\to\infty} x_i\leqslant\limsup_{i\to\infty} y_i$.

Proof.

1. Let $l\in\{k,\dots,\infty\}$ then using [theorem: 3.78] we have that

$$\inf(\{x_i|i\in\{l,\dots,\infty\}\})\leqslant\inf(\{y_i|i\in\{l,\dots,\infty\}\})$$

Applying [theorem: 3.78] again we have that

$$\begin{aligned}\liminf_{n\to\infty} x_n &\underset{\text{def}}{=} \sup(\{\inf(\{x_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &\leqslant \sup(\{\inf(\{y_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}|\})\\ &= \liminf_{n\to\infty} y_n\end{aligned}$$

2. Let $l\in\{k,\dots,\infty\}$ then using [theorem: 3.78] we have that

$$\sup(\{x_i|i\in\{l,\dots,\infty\}\})\leqslant\sup(\{y_i|i\in\{l,\dots,\infty\}\})$$

Applying [theorem: 3.78] again we have that

$$\begin{aligned}\liminf_{n\to\infty} x_n &\underset{\text{def}}{=} \sup(\{\inf(\{x_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &\leqslant \sup(\{\inf(\{y_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}|\})\\ &= \liminf_{n\to\infty} y_n\end{aligned}$$

□

Theorem 20.60. *Let $k\in\mathbb{N}_0$, $\{x_i\}_{i\in\{k,\dots,\infty\}}\subseteq\overline{\mathbb{R}}$ and $x\in\overline{\mathbb{R}}$ then we have:*

1. *If $\forall i\in\{k,\dots,\infty\}$ we have $x\leqslant x_i$ then $x\leqslant\liminf_{i\to\infty} x_i$ and $x\leqslant\limsup_{i\to\infty} x_i$.*

2. *If* $\forall i \in \{k, \ldots, \infty\}$ *we have* $x_i \leqslant x$ *then* $\liminf_{i \to \infty} x_i \leqslant x$ *and* $\limsup_{i \to \infty} x_i \leqslant x$.

Proof.

1. Let $l \in \{k, \ldots, \infty\}$ then $\forall i \in \{l, \ldots, \infty\} \subseteq \{k, \ldots, \infty\}$ we have $x \leqslant x_i$ so that
$$x \leqslant \inf(\{x_i | i \in \{l, \ldots, \infty\}\}) \text{ and } x \leqslant \sup(\{x_i | i \in \{l, \ldots, \infty\}\})$$
hence we have that
$$x \leqslant \sup(\{\inf(\{x_i | i \in \{l, \ldots, \infty\}\}) | l \in \{k, \ldots, \infty\}\}) = \liminf_{i \to \infty} x_i$$
and
$$x \leqslant \inf(\{\sup(\{x_i | i \in \{l, \ldots, \infty\}\}) | l \in \{k, \ldots, \infty\}\}) = \limsup_{i \to \infty} x_i$$
2. Let $l \in \{k, \ldots, \infty\}$ then $\forall i \in \{l, \ldots, \infty\} \subseteq \{k, \ldots, \infty\}$ we have $x_i \leqslant x$ so that
$$\inf(\{x_i | i \in \{l, \ldots, \infty\}\}) \leqslant x \text{ and } \sup(\{x_i | i \in \{l, \ldots, \infty\}\}) \leqslant x$$
hence we have that
$$\liminf_{i \to \infty} x_i = \sup(\{\inf(\{x_i | i \in \{l, \ldots, \infty\}\}) | l \in \{k, \ldots, \infty\}\}) \leqslant x$$
and
$$\limsup_{i \to \infty} x_i = \inf(\{\sup(\{x_i | i \in \{l, \ldots, \infty\}\}) | l \in \{k, \ldots, \infty\}\}) \leqslant x$$
□

Lemma 20.61. *Let* $\varnothing \neq S \subseteq \overline{\mathbb{R}}$ *then we have:*

1. *If* $y \in \mathbb{R}$ *then*
   a. $\sup(S) + y$ *is well defined then for* $S + y = \{s + y = s \in S\}$ *we have that*
   $$\sup(S + y) = \sup(S) + y$$
   b. $\inf(S) + y$ *is well defined then for* $S + y = \{s + y = s \in S\}$ *we have that*
   $$\inf(S + y) = \inf(S) + y$$
2. *If* $y \in [0, \infty]$ *and* $S \subseteq [0, \infty]$ *we have that* $\sup(S) + y$ *is well defined and for* $S + y = \{s + y | s \in S\}$ *we have that*
$$\sup(S + y) = \sup(S) + y$$
3. *If* $y \in [0, \infty]$ *and* $S \subseteq [0, \infty]$ *we have that* $\inf(S) + y$ *is well defined and for* $S + y = \{s + y | s \in S\}$ *we have that*
$$\inf(S + y) = \inf(S) + y$$

Proof.

1. As $y \in \mathbb{R}$ we have $\forall x \in \overline{\mathbb{R}}$ that $x + y$ is well defined, $\sup(S)$ exists and $\sup(S) \in \overline{\mathbb{R}}$ it follows that $\sup(S + y)$ is well defined and $S + y$ is well defined.
   a. $\forall s \in S$ we have that $s \leqslant \sup(S)$ so by [theorem: 20.29] $s + y \leqslant \sup(S)$ so that
   $$\sup(\{s + y | s \in S\}) \leqslant \sup(S) + y \tag{20.8}$$
   Assume that $\sup(\{s + y | s \in S\}) < \sup(S) + y$ then by [theorem: 20.28]
   $$\sup(\{s + y | s \in S\}) - y < \sup(S)$$
   so there exist a $s \in S$ such that $\sup(\{s + y | s \in S\}) - y < s$ so that by [theorem: 20.29] $\sup(\{s + y | s \in S\}) < s + y \leqslant \sup(\{s + y | s \in S\})$ leading to the contradiction $\sup(\{s + y | s \in S\}) < \sup(\{s + y | s \in S\})$. Hence the assumption is wrong and we must have $\sup(S) + y \leqslant \sup(\{s + y | s \in S\})$. Combining this with [eq: 20.8] gives
   $$\sup(S + y) = \sup(\{s + y | s \in S\}) = \sup(S) + y$$
   b. $\forall s \in S$ we have that $\inf(S) \leqslant s$ so by [theorem: 20.29] $\inf(S) + y \leqslant s + y$ so that
   $$\inf(S) + y \leqslant \inf(\{s + y | s \in S\}) \tag{20.9}$$

Assume that $\inf(S)+y<\inf(\{s+y|s\in S\})$ then by [theorem: 20.28]

$$\inf(S)<\inf(\{s+y|s\in S\})-y$$

so there exist a $s\in S$ such that $s<\inf(\{s+y|s\in S\})-y$ so that by [theorem: 20.29] $\inf(\{s+y|s\in S\})\leqslant s+y<\inf(\{s+y|s\in S\})$ leading to the contradiction $\inf(\{s+y|s\in S\})<\inf(\{s+y|s\in S\})$. Hence the assumption is wrong and we must have $\inf(\{s+y|s\in S\})\leqslant\inf(S)+y$. Combining this with [eq: 20.9] gives

$$\inf(S+y)=\inf(\{s+y|s\in S\})=\inf(S)+y$$

2. For $y\in[0,\infty]$ we have either:

   $y\in\mathbb{R}$. Then by (1.a) we have that $\sup(A)+y$ is well defined and

   $$\sup(\{s+y|s\in S\})=\sup(S)+y$$

   $y=\infty$. Then as $S\subseteq[0,\infty]$ we have $\forall s\in S$ that $s+y=\infty$ so that $\{s+y|s\in S\}=\{\infty\}$ so that $\sup(\{s+y|s\in S\})=\infty$. Further as $\forall s\in S$ we have $0\leqslant s$ it follows that $-\infty<0\leqslant\sup(S)$ so that $\infty=\sup(S)+\infty=\sup(S)+y$ is well defined. Hence

   $$\sup(\{s+y|s\in S\})=\infty=\sup(S)+\infty=\sup(S)+y$$

3. For $y\in[-\infty,0]$ we have either:

   $y\in\mathbb{R}$. Then by (1.b) we have that $\inf(A)+y$ is well defined and

   $$\inf(\{s+y|s\in S\})=\inf(S)+y$$

   $y=-\infty$. Then as $S\subseteq[-\infty,0]$ we have $\forall s\in S$ that $s+y=-\infty$ so that $\{s+y|s\in S\}=\{-\infty\}$ so that $\inf(\{s+y|s\in S\})=-\infty$. Further as $\forall s\in S$ we have $s\leqslant 0$ it follows that $\inf(S)\leqslant 0<\infty$ so that $-\infty=\inf(S)+(-\infty)=\inf(S)+y$ is well defined. Hence

   $$\inf(\{s+y|s\in S\})=-\infty=\inf(S)+(-\infty)=\sup(S)+y$$ □

Theorem 20.62. *Let $k\in\mathbb{N}_0$, $\{x_i\}_{i\in\{k,\dots,\infty\}}\subseteq\overline{\mathbb{R}}$, $x\in\mathbb{R}$ [hence $\forall i\in\{k,\dots,\infty\}$ we have that x_i+x is well defined] then for $\{x_i+x\}_{i\in\{k,\dots,\infty\}}\subseteq\overline{\mathbb{R}}$ we have*

1. $\liminf\limits_{i\to\infty}(x_i+x)=\left(\liminf\limits_{i\to\infty}x_i\right)+x$
2. $\limsup\limits_{i\to\infty}(x_i+x)=\left(\limsup\limits_{i\to\infty}x_i\right)+x$

Proof.

1. We have

$$\begin{aligned}\liminf_{i\to\infty}(x_i+x) &= \sup(\{\inf(\{x_i+x|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &\underset{\text{[theorem: 20.61]}}{=} \sup(\{\inf(\{x_i|i\in\{l,\dots,\infty\}\})+x|l\in\{k,\dots,\infty\}\})\\ &\underset{\text{[theorem: 20.61]}}{=} \sup(\{\inf(\{x_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})+x\\ &= \left(\liminf_{i\to\infty}x_i\right)+x\end{aligned}$$

2. We have

$$\begin{aligned}\limsup_{i\to\infty}(x_i+x) &= \inf(\{\sup(\{x_i+x|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &\underset{\text{[theorem: 20.61]}}{=} \inf(\{\sup(\{x_i|i\in\{l,\dots,\infty\}\})+x|l\in\{k,\dots,\infty\}\})\\ &\underset{\text{[theorem: 20.61]}}{=} \inf(\{\sup(\{x_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})+x\\ &= \left(\limsup_{i\to\infty}x_i\right)+x\end{aligned}$$

□

Theorem 20.63. *Let $\varnothing\neq S\subseteq\overline{\mathbb{R}}$ then*

1. $-\sup(S)=\inf(\{-s|s\in S\})$

2. $-\inf(S) = \sup(\{-s|s \in S\})$
3. *If* $\alpha \in [0, \infty[$ *then* $\alpha \cdot \sup(S) = \sup(\{\alpha \cdot s|s \in S\})$
4. *If* $\alpha \in [0, \infty[$ *then* $\alpha \cdot \inf(S) = \inf(\{\alpha \cdot s|s \in S\})$

Proof.

1. Let $s \in S$ then by [theorem: 20.34 $s \leqslant \sup(S)$ so that $-\sup(S) \leqslant -s$ so that

$$-\sup(S) \leqslant \inf(\{-s|s \in S\} \tag{20.10}$$

Assume that $-\sup(S) < \inf(\{-s|s \in S\}$ then by [corollary: 20.38] $-\inf(\{-s|s \in S\}) < \sup(S)$ so that there exist a $s \in S$ such that $-\inf(\{-s|s \in S\}) < s$ so that by [corollary: 20.38] again we have $-s < \inf(\{-s|s \in S\})$, hence $\inf(\{-s|s \in S\}) < -s < \inf(\{-s|s \in S\})$ a contradiction. So the assumption must be false and we have $\inf(\{-s|s \in S\}) \leqslant -\sup(S)$, combining this with [eq: 20.10] proves that

$$-\sup(S) = \inf(\{-s|s \in S\})$$

2. Take $A = \{-s|s \in S\}$ then $S = \{-s|s \in A\}$ then

$$-\inf(S) = -\inf(\{-s|s \in A\}) \underset{(1)}{=} -(-\sup(A)) = \sup(\{-s|s \in S\})$$

3. For $\alpha \in [0, \infty[$ we have either:

   $\boldsymbol{\alpha = 0}$**.** Then $\{\alpha \cdot s|s \in S\} = \{0\}$ so that

$$\sup(\{\alpha \cdot s|s \in S\}) = \sup(\{0\}) = 0 = 0 \cdot \sup(S) = \alpha \cdot \sup(S)$$

   proving that $\alpha \cdot \sup(S) = \sup(\{\alpha \cdot s|s \in S\})$.

   $\boldsymbol{\alpha \neq 0}$**.** Let $s \in S$ then $s \leqslant \sup(s)$ then, as $0 < \alpha$, we have by [theorem: 20.37] that $\alpha \cdot s \leqslant \alpha \cdot \sup(S)$. Hence

$$\sup(\{\alpha \cdot s|s \in S\}) \leqslant \alpha \cdot \sup(S) \tag{20.11}$$

   Assume that $\sup(\{\alpha \cdot s|s \in S\}) < \alpha \cdot \sup(S)$ then as $0 < \alpha \in \mathbb{R}$ we have $0 < \frac{1}{\alpha}$ so that by [theorem: 20.37] $\frac{1}{\alpha} \cdot \sup(\{\alpha \cdot s|s \in S\}) < \sup(S)$. Hence there exist a $s \in S$ such that $\frac{1}{\alpha} \cdot \sup(\{\alpha \cdot s|s \in S\}) < s$ so that by [theorem: 20.37] again we have $\sup(\{\alpha \cdot s|s \in S\}) < \alpha \cdot s \leqslant \sup(\{\alpha \cdot s|s \in S\})$ a contradiction. Hence the assumption must be false and we have that $\alpha \cdot \sup(S) \leqslant \sup(\{\alpha \cdot s|s \in S\})$, combining this with [eq: 20.11] we have

$$\alpha \cdot \sup(S) = \sup(\{\alpha \cdot s|s \in S\})$$

4. For $\alpha \in [0, \infty[$ we have either:

   $\boldsymbol{\alpha = 0}$**.** Then $\{\alpha \cdot s|s \in S\} = \{0\}$ so that

$$\inf(\{\alpha \cdot s|s \in S\}) = \inf(\{0\}) = 0 = 0 \cdot \inf(S) = \alpha \cdot \inf(S)$$

   proving that $\alpha \cdot \inf(S) = \inf(\{\alpha \cdot s|s \in S\})$.

   $\boldsymbol{\alpha \neq 0}$**.** Let $s \in S$ then $\inf(s) \leqslant s$ then, as $0 < \alpha$, we have by [theorem: 20.37] that $\alpha \cdot \inf(S) \leqslant \alpha \cdot s$. Hence

$$\alpha \cdot \inf(S) \leqslant \inf(\{\alpha \cdot s|s \in S\}) \tag{20.12}$$

   Assume that $\alpha \cdot \inf(S) < \inf(\{\alpha \cdot s|s \in S\})$ then as $0 < \alpha \in \mathbb{R}$ we have $0 < \frac{1}{\alpha}$ so that by [theorem: 20.37] $\inf(S) < \frac{1}{\alpha} \cdot \inf(\{\alpha \cdot s|s \in S\})$. Hence there exist a $s \in S$ such that $s < \frac{1}{\alpha} \cdot \inf(\{\alpha \cdot s|s \in S\})$ so that by [theorem: 20.37] again we have $\inf(\{\alpha \cdot s|s \in S\}) \leqslant \alpha \cdot s < \inf(\{\alpha \cdot s|s \in S\})$ a contradiction. Hence the assumption must be false and we have that $\inf(\{\alpha \cdot s|s \in S\}) \leqslant \alpha \cdot \inf(S)$, combining this with [eq: 20.12] we have

$$\alpha \cdot \inf(S) = \inf(\{\alpha \cdot s|s \in S\})$$

□

Theorem 20.64. *Let* $k \in \mathbb{N}_0$, $\{x_i\}_{i \in \{k, \ldots, \infty\}} \subseteq \overline{\mathbb{R}}$ *then we have:*

1. $\liminf\limits_{i \to \infty}(-x_i) = -\limsup\limits_{i \to \infty} x_i$.
2. $\limsup\limits_{i \to \infty}(-x_i) = -\liminf\limits_{i \to \infty} x_i$.

Proof.

1.
$$\begin{aligned}\liminf_{i\to\infty}(-x_i) &= \sup(\{\inf(\{-x_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &\underset{\text{[theorem: 20.63]}}{=} \sup(\{-\sup(\{x_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &\underset{\text{[theorem: 20.63]}}{=} -\inf(\{\sup(\{x_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &= -\limsup_{i\to\infty} x_i\end{aligned}$$

2.
$$\begin{aligned}\limsup_{i\to\infty}(-x_i) &= \inf(\{\sup(\{-x_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &\underset{\text{[theorem: 20.63]}}{=} \inf(\{-\inf(\{x_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &\underset{\text{[theorem: 20.63]}}{=} -\sup(\{\inf(\{x_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\})\\ &= -\liminf_{i\to\infty} x_i\end{aligned}$$

□

Lemma 20.65. *Let $k\in\mathbb{N}_0$, $\{x_i\}_{i\in\{k,\dots,\infty\}}\subseteq\mathbb{R}$, $\{y_i\}_{i\in\{k,\dots,\infty\}}\subseteq\mathbb{R}$ such that $\forall i\in\{k,\dots,\infty\}$ we have [so that x_i+y_i is well defined] then we have:*

1. *If $\forall i\in\{k,\dots,\infty\}$ $x_i\leqslant x_{i+1}\wedge y_i\leqslant y_{i+1}$ then*
$$\sup(\{x_i|i\in\{k,\dots,\infty\}\})+\sup(\{y_i|i\in\{k,\dots,\infty\}\})=\sup(\{x_i+y_i|i\in\{k,\dots,\infty\}\})$$
2. *If $\forall i\in\{k,\dots,\infty\}$ $x_{i+1}\leqslant x_i\wedge y_{i+1}\leqslant y_i$ then*
$$\inf(\{x_i|i\in\{k,\dots,\infty\}\})+\inf(\{y_i|i\in\{k,\dots,\infty\}\})=\inf(\{x_i+y_i|i\in\{k,\dots,\infty\}\})$$

Proof.

1. As $\forall i\in\{k,\dots,\infty\}$ $x_i\leqslant\sup(\{x_i|i\in\{k,\dots,\infty\}\})$ and $y_i\leqslant\sup(\{y_i|i\in\{k,\dots,\infty\}\})$ so that by [theorem: 20.29] that
$$x_i+y_i\leqslant\sup(\{x_i|i\in\{k,\dots,\infty\}\})+y_i \tag{20.13}$$
By [theorem: 20.14] and the fact that $\{x_i|i\in\{k,\dots,\infty\}\},\{y_i|i\in\{k,\dots,\infty\}\}\neq-\infty$ so that
$$(y_i,\sup(\{x_i|i\in\{k,\dots,\infty\}\}))\in(\overline{\mathbb{R}}\times\overline{\mathbb{R}})\setminus\{(-\infty,\infty),(\infty,-\infty)\}$$
and
$$(\sup(\{y_i|i\in\{k,\dots,\infty\}\}),\sup(\{x_i|i\in\{k,\dots,\infty\}\}))\in(\overline{\mathbb{R}}\times\overline{\mathbb{R}})\setminus\{(-\infty,\infty),(\infty,-\infty)\}$$
Hence by [theorem: 20.29] we have that
$$y_i+\sup(\{x_i|i\in\{k,\dots,\infty\}\})\leqslant\sup(\{y_i|i\in\{k,\dots,\infty\}\})+\sup(\{x_i|i\in\{k,\dots,\infty\}\})$$
Using the above, [eq: 20.13] and commutativity we have that
$$x_i+y_i\leqslant\sup(\{y_i|i\in\{k,\dots,\infty\}\})+\sup(\{x_i|i\in\{k,\dots,\infty\}\})$$
$$\sup(\{x_i+y_i|i\in\{k,\dots,\infty\}\})\leqslant\sup(\{x_i|i\in\{k,\dots,\infty\}\})+\sup(\{y_i|i\in\{k,\dots,\infty\}\}) \tag{20.14}$$
Let $m\in\{k,\dots,\infty\}$ then for every $n\in\{k,\dots,\infty\}$ we have either:

n < m. Then $x_m+y_n\leqslant x_m+y_m\leqslant\sup(\{x_i+y_i|i\in\{k,\dots,n\}\})$ so that
$$y_n\leqslant\sup(\{x_i+y_i|i\in\{k,\dots,\infty\}\})-x_m$$

m ⩽ n. Then $x_m+y_n\leqslant x_n+y_n\leqslant\sup(\{x_i+y_i|i\in\{k,\dots,n\}\})$ so that
$$y_n\leqslant\sup(\{x_i+y_i|i\in\{k,\dots,\infty\}\})-x_m$$

As in all cases we have $y_n\leqslant\sup(\{x_i+y_i|i\in\{k,\dots,\infty\}\})-x_m$ it follows that
$$\forall m\in\{k,\dots,\infty\}\ \sup(\{y_i|i\in\{k,\dots,\infty\}\})\leqslant\sup(\{x_i+y_i|i\in\{k,\dots,\infty\}\})-x_m \tag{20.15}$$

As $\forall i \in \{k, \ldots, \infty\}$ $x_i \in \mathbb{R}$ we have by [theorem: 20.14] only the following possibilities for $\sup(\{y_i | i \in \{k, \ldots, \infty\}\})$:

$\sup(\{y_i | i \in \{k, \ldots, \infty\}\}) = \infty$. Then by [eq: 20.15] $\sup(\{x_i + y_i | i \in \{k, \ldots, \infty\}\}) = \infty$ so that

$$\sup(\{x_i | i \in \{k, \ldots, \infty\}\}) + \sup(\{y_i | i \in \{k, \ldots, \infty\}\}) = \infty = \sup(\{x_i + y_i | i \in \{k, \ldots, \infty\}\})$$

hence

$$\sup(\{x_i | i \in \{k, \ldots, \infty\}\}) + \sup(\{y_i | i \in \{k, \ldots, \infty\}\}) \leqslant \sup(\{x_i + y_i | i \in \{k, \ldots, \infty\}\})$$

$\sup(\{y_i | i \in \{k, \ldots, \infty\}\}) \in \mathbb{R}$. Then by [theorems: 20.28, 20.29] and [eq: 20.15] we have

$$x_m \leqslant \sup(\{x_i + y_i | i \in \{k, \ldots, \infty\}\}) - \sup(\{y_i | i \in \{k, \ldots, \infty\}\})$$

so that

$$\sup(\{x_i | i \in \{k, \ldots, \infty\}\}) \leqslant \sup(\{x_i + y_i | i \in \{k, \ldots, \infty\}\}) - \sup(\{y_i | i \in \{k, \ldots, \infty\}\})$$

which by [theorems: 20.28] proves that

$$\sup(\{x_i | i \in \{k, \ldots, \infty\}\}) + \sup(\{y_i | i \in \{k, \ldots, \infty\}\}) \leqslant \sup(\{x_i + y_i | i \in \{k, \ldots, \infty\}\})$$

So in all cases we have

$$\sup(\{x_i | i \in \{k, \ldots, \infty\}\}) + \sup(\{y_i | i \in \{k, \ldots, \infty\}\}) \leqslant \sup(\{x_i + y_i | i \in \{k, \ldots, \infty\}\})$$

which combined with [eq: 20.14] proves that

$$\sup(\{x_i | i \in \{k, \ldots, \infty\}\}) + \sup(\{y_i | i \in \{k, \ldots, \infty\}\}) = \sup(\{x_i + y_i | i \in \{k, \ldots, \infty\}\})$$

2. Consider the sequences $\{-x_i\}_{i \in \{k, \ldots, \infty\}} \subseteq \mathbb{R}$, $\{-y_i\}_{i \in \{k, \ldots, \infty\}} \subseteq \mathbb{R}$ then as $\forall i \in \{k, \ldots, \infty\}$ $x_{i+1} \leqslant x_i \wedge y_{i+1} \leqslant y_i$ it follows from [theorem: 20.38] that $-x_i \leqslant -x_{i+1} \wedge -y_i \leqslant -y_{i+1}$. Hence we can use (1) to get

$$\sup(\{-x_i | i \in \{k, \ldots, \infty\}\}) + \sup(\{-y_i | i \in \{k, \ldots, \infty\}\}) = \sup(\{-(x_i + y_i) | i \in \{k, \ldots, \infty\}\})$$

Then using [theorem: 20.63] on the above we have

$$-\inf(\{x_i | i \in \{k, \ldots, \infty\}\}) - \inf(\{x_i | i \in \{k, \ldots, \infty\}\}) = -\inf(\{x_i + y_i | i \in \{k, \ldots, \infty\}\})$$

hence

$$\inf(\{x_i | i \in \{k, \ldots, \infty\}\}) + \inf(\{x_i | i \in \{k, \ldots, \infty\}\}) = \inf(\{x_i + y_i | i \in \{k, \ldots, \infty\}\})$$

□

Theorem 20.66. *Let $k \in \mathbb{N}_0$ then $\liminf_{i \to \infty}$ and $\limsup_{i \to \infty}$ have the following properties*

1. *If $\{x_i\}_{i \in \{k, \ldots, \infty\}} \subseteq \overline{\mathbb{R}}$ is a sequence of extended reals and $0 \leqslant \alpha \in \mathbb{R}$ then*
   a. $\liminf_{i \to \infty}(\alpha \cdot x_i) = \alpha \cdot \liminf_{i \to \infty} x_i$
   b. $\limsup_{i \to \infty}(\alpha \cdot x_i) = \alpha \cdot \limsup_{i \to \infty} x_i$

2. *If $\{x_i\}_{i \in \{k, \ldots, n\}}, \{y_i\}_{i \in \{k, \ldots, n\}} \subseteq \mathbb{R}$ are sequences of **real numbers** such that $\left(\liminf_{i \to \infty} x_i\right) + \left(\liminf_{i \to \infty} y_i\right)$ are well defined then*
   a. $\left(\liminf_{i \to \infty} x_i\right) + \left(\liminf_{i \to \infty} y_i\right) \leqslant \liminf_{i \to \infty}(x_i + y_i)$
   b. $\limsup_{i \to \infty}(x_i + y_i) \leqslant \left(\liminf_{i \to \infty} x_i\right) + \left(\liminf_{i \to \infty} y_i\right)$

Proof.

1.

$$\begin{aligned}
\liminf_{i \to \infty}(\alpha \cdot x_i) &= \sup(\{\inf(\{\alpha \cdot x_i | i \in \{l, \ldots, \infty\}\}) | l \in \{k, \ldots, \infty\}\}) \\
&\underset{\text{[theorem: 20.63]}}{=} \sup(\{\alpha \cdot \inf(\{x_i | i \in \{l, \ldots, \infty\}\}) | l \in \{k, \ldots, \infty\}\}) \\
&\underset{\text{[theorem: 20.63]}}{=} \alpha \cdot \sup(\{\inf(\{x_i | i \in \{l, \ldots, \infty\}\}) | l \in \{k, \ldots, \infty\}\}) \\
&= \alpha \cdot \liminf_{i \to \infty} x_i
\end{aligned}$$

and

$$\begin{aligned}\limsup_{i\to\infty}(\alpha\cdot x_i) &= \inf(\{\sup(\{\alpha\cdot x_i|i\in\{l,\ldots,\infty\}\})|l\in\{k,\ldots,\infty\}\})\\ &\underset{\text{[theorem: 20.63]}}{=} \inf(\{\alpha\cdot\sup(\{x_i|i\in\{l,\ldots,\infty\}\})|l\in\{k,\ldots,\infty\}\})\\ &\underset{\text{[theorem: 20.63]}}{=} \alpha\cdot\inf(\{\sup(\{x_i|i\in\{l,\ldots,\infty\}\})|l\in\{k,\ldots,\infty\}\})\\ &= \alpha\cdot\liminf_{i\to\infty} x_i\end{aligned}$$

2. Let $l\in\{k,\ldots,\infty\}$ then we have that $\forall i\in\{l,\ldots,\infty\}$ $\inf(\{x_i|i\in\{k,\ldots,\infty\}\})\leqslant x_i\in\mathbb{R}$ and $\inf(\{y_i|i\in\{k,\ldots,\infty\}\})\leqslant y_i\in\mathbb{R}$ so that by [theorem: 20.29]

$$\inf(\{x_i|i\in\{l,\ldots,\infty\}\})+y_i\leqslant x_i+y_i \tag{20.16}$$

Further by [theorem: 20.14] we have that $\inf(\{x_i|i\in\{l,\ldots,\infty\}\})$,$\inf(\{y_i|i\in\{l,\ldots,\infty\}\})\neq\infty$ so that

$$(y_i,\inf(\{x_i|i\in\{l,\ldots,\infty\}\}))\in(\overline{\mathbb{R}}\times\overline{\mathbb{R}})\setminus\{(-\infty,\infty),(\infty,-\infty)\}$$

and

$$(\inf(\{y_i|i\in\{l,\ldots,\infty\}\}),\inf(\{x_i|i\in\{l,\ldots,\infty\}\}))\in(\overline{\mathbb{R}}\times\overline{\mathbb{R}})\setminus\{(-\infty,\infty),(\infty,-\infty)\}$$

Hence using [theorem: 20.29] we have that

$$\inf(\{y_i|i\in\{l,\ldots,\infty\}\})+\inf(\{x_i|i\in\{l,\ldots,\infty\}\})\leqslant y_i+\inf(\{x_i|i\in\{l,\ldots,\infty\}\})$$

Using the above, [eq: 20.16] and commutativity we have that

$$\inf(\{x_i|i\in\{l,\ldots,\infty\}\})+\inf(\{y_i|i\in\{l,\ldots,\infty\}\})\leqslant x_i+y_i$$

So that

$$\inf(\{x_i|i\in\{l,\ldots,\infty\}\})+\inf(\{y_i|i\in\{l,\ldots,\infty\}\})\leqslant\inf(\{x_i+y_i|i\in\{l,\ldots,\infty\}\})$$

Hence

$$\begin{aligned}\sup(\{\inf(\{x_i|i\in\{l,\ldots,\infty\}\})+\inf(\{y_i|i\in\{l,\ldots,\infty\}\})|l\in\{k,\ldots,\infty\}\}) &\leqslant\\ \sup(\{\inf(\{x_i+y_i|i\in\{l,\ldots,\infty\}\})|l\in\{k,\ldots,\infty\}\}) &=\\ \liminf_{i\to\infty}(x_i+y_i)\end{aligned} \tag{20.17}$$

Now $\forall l\in\{k,\ldots,\infty\}$ we have that

$$\inf(\{x_i|i\in\{l,\ldots,\infty\}\})\leqslant\inf(\{x_i|i\in\{l+1,\ldots,\infty\}\})$$

and

$$\inf(\{y_i|i\in\{l,\ldots,\infty\}\})\leqslant\inf(\{y_i|i\in\{l+1,\ldots,\infty\}\})$$

so that by [theorem: 20.65]

$$\begin{aligned}\sup(\{\inf(\{x_i|i\in\{l,\ldots,\infty\}\})+\inf(\{y_i|i\in\{l,\ldots,\infty\}\})|l\in\{k,\ldots,\infty\}\}) &=\\ \sup(\{\{x_i|i\in\{l+1,\ldots,\infty\}\}|l\in\{k,\ldots,\infty\}\})+\sup(\{\{y_i|i\in\{l+1,\ldots,\infty\}\}|l\in\{k,\ldots,\infty\}\}) &=\\ \liminf_{i\to\infty}x_i+\liminf_{i\to\infty}y_i\end{aligned}$$

Substituting the above in [eq: 20.17] gives finally

$$\forall\{x_i\}_{i\in\{k,\ldots,\infty\}},\{y_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\mathbb{R}\ \liminf_{i\to\infty}x_i+\liminf_{i\to\infty}y_i\leqslant\liminf_{i\to\infty}(x_i+y_i) \tag{20.18}$$

Consider the sequences $\{-x_i\}_{i\in\{k,\ldots,\infty\}},\{-y_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\mathbb{R}$ then by [eq: 20.18] we have that

$$\liminf_{i\to\infty}(-x_i)+\liminf_{i\to\infty}(-y_i)\leqslant\liminf_{i\to\infty}(-(x_i+y_i))$$

Then using [theorem: 20.63] on the above gives

$$-\limsup_{i\to\infty}x_i+\left(-\limsup_{i\to\infty}y_i\right)\leqslant-\limsup_{i\to\infty}(x_i+y_i)$$

hence

$$\limsup_{i\to\infty}(x_i+y_i)\leqslant\limsup_{i\to\infty}x_i+\limsup_{i\to\infty}y_i$$

□

Theorem 20.67. *Let* $k\in\mathbb{N}_0$, $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ *then* $\liminf_{i\to\infty}x_i\leqslant\limsup_{i\to\infty}x_i$

Proof. Fix $n \in \{k, \ldots, \infty\}$ then $\forall m \in \{k, \ldots, \infty\}$ we have either:

$\boldsymbol{m \in \{k, \ldots, n-1\}}$. then $m < n$ so that $\{x_i | i \in \{n, \ldots, \infty\}\} \subseteq \{x_i | i \in \{m, \ldots, \infty\}|\}$ hence

$$\inf(\{x_i | i \in \{m, \ldots, \infty\}\}) \leqslant \inf(\{x_i | i \in \{n, \ldots, \infty\}\}) \leqslant x_n \leqslant \sup(\{x_i | i \in \{n, \ldots, \infty\}\})$$

$\boldsymbol{m \in \{n, \ldots, \infty\}}$. then $\inf(\{x_i | i \in \{m, \ldots, \infty\}\}) \underset{m \in \{n, \ldots, \infty\}}{\leqslant} x_n \leqslant \sup(\{x_i | i \in \{n, \ldots, \infty\}\})$

hence we have

$$\forall m \in \{k, \ldots, \infty\} \text{ we have } \inf(\{x_i | i \in \{m, \ldots, \infty\}\}) \leqslant \sup(\{x_i | i \in \{n, \ldots, \infty\}\})$$

so we have

$$\sup(\{\inf(\{x_i | i \in \{m, \ldots, \infty\}\}) | m \in \{k, \ldots, \infty\}\}) \leqslant \sup(\{x_i | i \in \{n, \ldots, \infty\}\})$$

or

$$\forall n \in \{k, \ldots, \infty\} \liminf_{i \to \infty} x_i \leqslant \sup(\{x_i | i \in \{n, \ldots, \infty\}\})$$

so that

$$\liminf_{i \to \infty} x_i \leqslant \inf(\{\sup(\{x_i | i \in \{n, \ldots, \infty\}\}) | n \in \{k, \ldots, \infty\}\}) = \limsup_{i \to \infty} x_i$$

□

Remark 20.68. If we note $\leqslant_{\mathbb{R}}$ as the order relation on $\mathbb{R}$, $\sup_{\mathbb{R}}$ and $\inf_{\mathbb{R}}$ the supremum and infinum in $\mathbb{R}$ and $\lim_{\mathbb{R}}$ the limit in $\langle \mathbb{R}, \|_{\mathbb{R}} \rangle$ where $||_{\mathbb{R}}$ is the absolute value on $\mathbb{R}$ then we have in [definition: 14.318] defined $\lim_{\mathbb{R}} \inf_{i \to \infty}$ and $\lim_{\mathbb{R}} \sup_{i \to \infty}$ defined by

1. $\lim_{\mathbb{R}} \sup_{n \to \infty} x_n$ exist if
   a. $\forall n \in \{k, \ldots, \infty\}$ $\sup_{\mathbb{R}}(\{x_i | i \in \{n, \ldots, \infty\}\})$ exist
   b. $\lim_{\mathbb{R}} \sup_{n \to \infty} \sup_{\mathbb{R}}(\{x_i | i \in \{n, \ldots, \infty\}\})$ exist

   If $\lim_{\mathbb{R}} \sup_{n \to \infty} x_n$ exist then $\lim_{\mathbb{R}} \sup_{n \to \infty} x_n = \lim_{\mathbb{R}} \sup_{m \to \infty} \sup_{\mathbb{R}}(\{x_i | i \in \{n, \ldots, \infty\}\})$
2. $\lim_{\mathbb{R}} \inf_{n \to \infty} x_n$ exist if
   a. $\forall n \in \{k, \ldots, \infty\}$ $\inf_R(\{x_i | i \in \{n, \ldots, \infty\}\})$ exist
   b. $\lim_{\mathbb{R}} \inf_{n \to \infty} \inf_{\mathbb{R}}(\{x_i | i \in \{n, \ldots, \infty\}\})$ exist

   If $\lim_{\mathbb{R}} \inf_{n \to \infty} x_n$ exist then $\lim_{\mathbb{R}} \inf_{n \to \infty} x_n = \lim_{\mathbb{R}} \inf_{m \to \infty} \inf_{\mathbb{R}}(\{x_i | i \in \{n, \ldots, \infty\}\})$

Using [theorem: 14.320] the above definition is equivalent with

1. $$\lim_{\mathbb{R}} \sup_{n \to \infty} x_n \text{ exist}$$
   $$\Updownarrow$$
   $$\forall n \in \{k, \ldots, \infty\} \ \sup_{\mathbb{R}}(\{x_i | i \in \{n, \ldots, \infty\}\}) \text{ exist}$$
   and
   $$\inf_{\mathbb{R}}(\sup_{\mathbb{R}}(\{x_i | i \in \{n, \ldots, \infty\}\}) | n \in \{k, \ldots, \infty\}\}) \text{ exist}$$
   Further if $\lim_{\mathbb{R}} \sup_{n \to \infty} x_n$ exist then
   $$\lim_{\mathbb{R}} \sup_{n \to \infty} x_n = \inf(\{\sup_{\mathbb{R}}(\{x_i | i \in \{n, \ldots, \infty\}\}) | n \in \{k, \ldots, \infty\}\})$$
2. $$\lim_{\mathbb{R}} \inf_{n \to \infty} x_n \text{ exist}$$
   $$\Updownarrow$$
   $$\forall n \in \{k, \ldots, \infty\} \ \inf_{\mathbb{R}}(\{x_i | i \in \{n, \ldots, \infty\}\}) \text{ exist}$$
   and
   $$\sup_{\mathbb{R}}(\{\inf(\{x_i | i \in \{n, \ldots, \infty\}\}) | n \in \{k, \ldots, \infty\}\}) \text{ exist}$$

Further if $\lim_{\mathbb{R}}\inf_{n\to\infty} x_n$ exist then

$$\lim_{\mathbb{R}}\inf_{n\to\infty} x_n = \sup_{\mathbb{R}}(\{\inf_{\mathbb{R}}(\{x_i|i\in\{n,\dots,\infty\}\})|n\in\{k,\dots,\infty\}\})$$

Using [theorem: 14.321] we have that

$$\lim_{\mathbb{R}}\limits_{n\to\infty} x_n \text{ exist} \Leftrightarrow \lim_{\mathbb{R}}\inf_{n\to\infty} x_n \text{ and } \lim_{\mathbb{R}}\sup_{n\to\infty} x_n \text{ exists and } \lim_{\mathbb{R}}\inf_{n\to\infty} x_n = \lim_{\mathbb{R}}\sup_{n\to\infty} x_n$$

Further if $\lim_{\mathbb{R}}\limits_{n\to\infty} x_i$ exist then

$$\lim_{\mathbb{R}}\limits_{n\to\infty} x_n = \lim_{\mathbb{R}}\inf_{n\to\infty} x_i = \lim_{\mathbb{R}}\sup_{n\to\infty} x_n$$

This suggest the following extension of a limit in $\mathbb{R}$ to the limit in $\overline{\mathbb{R}}$

Definition 20.69. *Let $k\in\mathbb{N}_0$ and $\{x_i\}_{i\in\{k,\dots,\infty\}}\subseteq\overline{\mathbb{R}}$ such that $\liminf_{i\to\infty} x_i = \limsup_{i\to\infty} x_i$ then we say that $\lim_{i\to\infty} x_i$ exist and we have by definition that*

$$\lim_{i\to\infty} x_i = \liminf_{i\to\infty} x_i = \limsup_{i\to\infty} x_i$$

***Note* 20.70.** *In this chapter we use $\lim$ for the $\lim$ in $\overline{\mathbb{R}}$ which is defined using only the order relation $\leqslant$. As for $\mathbb{R}$ $\lim_{\mathbb{R}}$ represents the limit in $\mathbb{R}$ which is based on the absolute value $||_{\mathbb{R}}$ in $\mathbb{R}$ but can be defined by the order relation $\leqslant_{\mathbb{R}}$ in $\mathbb{R}$ where $\leqslant_{\mathbb{R}}\subseteq\leqslant$. Further $\sup$, $\inf$, $\liminf$, $\limsup$ are all defined in $\overline{\mathbb{R}}$ using the order relation $\leqslant$ on $\overline{\mathbb{R}}$ and $\sup_{\mathbb{R}}$, $\inf_{\mathbb{R}}$ are defined on $\mathbb{R}$ using the order relation $\leqslant_{\mathbb{R}}$ on $\mathbb{R}$ and $\lim_{\mathbb{R}}\inf$, $\lim_{\mathbb{R}}\sup$ are defined in [definition: 14.318] or [theorem: 14.320].*

Example 20.71. Let $k\in\mathbb{N}_0$ and $\{x_i\}_{i\in\{k,\dots,\infty\}}\subseteq\overline{\mathbb{R}}$ is defined by $x_i = x$ where $x\in\overline{\mathbb{R}}$ then $\lim_{i\to\infty} x_i = x$.

Proof. This follows from the definition and [example: 20.57]. □

Example 20.72. Let $k\in\mathbb{N}_0$ then the sequence $\{(-\infty)^i\}_{i\in\{k,\dots,\infty\}}$ has no limit

Proof. Let $l\in\{1,\dots,\infty\}$ then we have $\{(-\infty)^i|i\in\{l,\dots,\infty\}\} = \{-\infty,\infty\}$ so that

$$\{\sup(\{(-\infty)^i|i\in\{l,\dots,\infty\}\})\} = \{\infty\} \text{ and } \{\sup(\{(-\infty)^i|i\in\{l,\dots,\infty\}\})\} = \{-\infty\}$$

hence

$$\limsup_{i\to\infty}(-\infty)^i = \inf(\{\sup(\{(-\infty)^i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\} = \infty$$

and

$$\liminf_{i\to\infty}(-\infty)^i = \sup(\{\inf(\{(-\infty)^i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\} = -\infty$$

so that

$$\limsup_{i\to\infty}(-\infty)^i \neq \liminf_{i\to\infty}(-\infty)^i$$ □

We have the following relation between $\lim_{\mathbb{R}}$ the limit in $\mathbb{R}$ and $\lim$ the limit in $\overline{\mathbb{R}}$.

Theorem 20.73. *Let $k\in\mathbb{N}_0$, $\{x_i\}_{i\in\{k,\dots,\infty\}}\subseteq\mathbb{R}$ a sequence of **real** numbers then we have:*

1. *If $\lim_{\mathbb{R}}\limits_{i\to\infty} x_i$ exists then $\liminf_{i\to\infty} x_i = \lim_{\mathbb{R}}\limits_{i\to\infty} x_i = \limsup_{i\to\infty} x_i$*
2. *If $\liminf_{i\to\infty} x_i = \limsup_{i\to\infty} x_i\in\mathbb{R}$ then $\lim_{\mathbb{R}}\limits_{i\to\infty} x_i$ exists and $\liminf_{i\to\infty} x_i = \lim_{\mathbb{R}}\limits_{i\to\infty} x_i = \limsup_{i\to\infty} x_i$*

Proof.

1. Let $x = \lim_{\mathbb{R}}\limits_{i\to\infty} x_i\in\mathbb{R}$. Assume that $\liminf_{i\to\infty} x_i < x$ then as $x\in\mathbb{R}\Rightarrow x<\infty$ we have either:

   $\boldsymbol{\liminf_{i\to\infty} x_i = -\infty}$**.** Then $\sup(\{\inf(\{x_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\}) = -\infty$ so that by [theorem: 20.15] it follows that $\{\inf(\{x_i|i\in\{l,\dots,\infty\}\})|l\in\{k,\dots,\infty\}\} = \{-\infty\}$ hence

$$\inf(\{x_i|i\in\{k,\dots,\infty\}\}) = -\infty \tag{20.19}$$

As $\lim_{\mathbb{R}}\limits_{i\to\infty} x_i$ exist it follows from [theorem: 14.306] that there exists a $L\in\mathbb{R}$ such that $\forall i\in\{k,\ldots,\infty\}$ $|x_i|_{\mathbb{R}}\leqslant L<L+1$. So if we take $K=L+1\in\mathbb{R}$ then we have

$$\forall i\in\{k,\ldots,\infty\}\text{ we have }-K<x_i<K$$

So $-\infty<-K<x_i$ $\forall i\in\{k,\ldots,\infty\}$ hence $-\infty<-K\leqslant\inf(\{x_i|i\in\{k,\ldots,\infty\}\})$ contradicting [eq: 20.19].

$\liminf\limits_{i\to\infty} x_i\in\mathbb{R}$. As $\mathbb{R}\ni\liminf\limits_{i\to\infty} x_i<x\in\mathbb{R}$ we have that $\varepsilon=x-\liminf\limits_{i\to\infty} x_i\in\mathbb{R}^+$. As $\lim_{\mathbb{R}}\limits_{i\to\infty}=x$ there exist a $N\in\{k,\ldots,\infty\}$ such that

$$\forall n\in\{N,\ldots,\infty\}\text{ we have }|x_n-x|_{\mathbb{R}}<_{\mathbb{R}}\varepsilon \tag{20.20}$$

Now

$$\begin{aligned}\inf(\{x_i|i\in\{N,\ldots,\infty\}\}) &\leqslant \sup(\{\inf(\{x_i|i\in\{l,\ldots,\infty\}\})|l\in\{k,\ldots,\infty\}\})\\ &= \liminf_{i\to\infty} x_i\\ &= x-\varepsilon\\ &< x-\frac{\varepsilon}{2}\end{aligned}$$

Hence by the definition of the infinum there exist a $M\in\{N,\ldots,\infty\}$ such that $x_M<x-\frac{\varepsilon}{2}\underset{x_M,x\in\mathbb{R}}{\Rightarrow}x_M<_{\mathbb{R}}x-\frac{\varepsilon}{2}$. Hence $|x_M-x|_{\mathbb{R}}\geqslant_{\mathbb{R}}x-x_M>_{\mathbb{R}}\frac{\varepsilon}{2}$ contradicting [20.20].

So in all cases we reach a a contradiction proving that the assumption is wrong, hence we have that

$$x\leqslant\liminf_{i\to\infty} x_i\underset{\text{[theorem: 20.67]}}{\leqslant}\limsup_{i\to\infty} x_i \tag{20.21}$$

Assume that $x<\limsup\limits_{i\to\infty} x_i$. Then as $-\infty<x<\limsup\limits_{i\to\infty} x_i$ we have for $\limsup\limits_{i\to\infty} x_i$ either:

$\limsup\limits_{i\to\infty} x_i=\infty$. Then $\inf(\{\sup(\{x_i|i\in\{l,\ldots,\infty\}\})|l\in\{k,\ldots,\infty\}\})=\infty$ so that by [theorem: 20.15] it follows that $\{\sup(\{x_i|i\in\{l,\ldots,\infty\}\})|l\in\{k,\ldots,\infty\}\}=\{\infty\}$. Hence

$$\sup(\{x_i|i\in\{k,\ldots,\infty\}\})=\infty \tag{20.22}$$

As $\lim_{\mathbb{R}}\limits_{i\to\infty} x_i$ exist it follows from [theorem: 14.306] that there exists a $L\in\mathbb{R}$ such that $\forall i\in\{k,\ldots,\infty\}$ $|x_i|_{\mathbb{R}}\leqslant L<L+1$. So if we take $K=L+1\in\mathbb{R}$ then we have

$$\forall i\in\{k,\ldots,\infty\}\text{ we have }-K<x_i<K$$

So $\sup(\{x_i|i\in\{k,\ldots,\infty\}\})\leqslant K<\infty$ contradiction [eq: 20.22].

$\limsup\limits_{i\to\infty} x_i\in\mathbb{R}$. As $\mathbb{R}\ni x<\limsup\limits_{i\to\infty} x_i\in\mathbb{R}$ we have that $\varepsilon=\limsup\limits_{i\to\infty} x_i-x\in\mathbb{R}^+$. As $\lim_{\mathbb{R}}\limits_{i\to\infty} x_i=x$ there exist a $N\in\{k,\ldots,\infty\}$ such that

$$\forall n\in\{N,\ldots,\infty\}\text{ we have }|x_n-x|_{\mathbb{R}}<\varepsilon \tag{20.23}$$

Now

$$\begin{aligned}\sup(\{x_i|i\in\{N,\ldots,\infty\}\}) &\geqslant \inf(\{\sup(\{x_i|i\in\{l,\ldots,\infty\}\})|l\in\{k,\ldots,\infty\}\})\\ &= \limsup_{i\to\infty} x_i\\ &= x+\varepsilon\\ &> x+\frac{\varepsilon}{2}\end{aligned}$$

So using the definition of the supremum there exist a $M\in\{N,\ldots,\infty\}$ such that $x_M>x+\frac{\varepsilon}{2}\underset{x_M,x\in\mathbb{R}}{\Rightarrow}x_M>_{\mathbb{R}}x+\frac{\varepsilon}{2}$. Hence $|x_M-x|\geqslant_{\mathbb{R}}x_M-x>_{\mathbb{R}}\frac{\varepsilon}{2}$ contradicting [eq: 20.23].

As in all cases we have a contradiction the assumption must be wrong so that

$$\limsup_{i\to\infty} x_i\leqslant x.$$

Combining this with [eq: 20.21] we have

$$\liminf_{i\to\infty} x_i\underset{\text{[theorem: 20.67]}}{\leqslant}\limsup_{i\to\infty} x_i\leqslant x\leqslant\liminf_{i\to\infty} x_i\underset{\text{[theorem: 20.67]}}{\leqslant}\limsup_{i\to\infty} x_i$$

so that

$$\liminf_{i\to\infty} x_i=\lim_{\mathbb{R}}\limits_{i\to\infty} x_i=\limsup_{i\to\infty} x_i$$

2. Let $x = \liminf_{i\to\infty} x_i = \limsup_{i\to\infty} x_i \in \mathbb{R}$. Take $\varepsilon \in \mathbb{R}^+$ then we have
$$x - \varepsilon < x = \liminf_{i\to\infty} x_i = \sup\left(\left\{\inf\left(\left\{x_i | i \in \{l, \ldots, \infty\}\right\}\right) | l \in \{k, \ldots, \infty\}\right\}\right)$$
Hence by the definition of the supremum there exist a $M_1 \in \{k, \ldots, \infty\}$ such that
$$x - \varepsilon < \inf\left(\left\{x_i | i \in \{M_1, \ldots, \infty\}\right\}\right)$$
Hence
$$\forall n \in \{M_1, \ldots, \infty\} \text{ we have } x - \varepsilon < x_n \tag{20.24}$$
Further as $x = \limsup_{i\to\infty} x_i$ we have that $\inf\left(\left\{\sup\left(\left\{x_i | i \in \{l, \ldots, \infty\}\right\}\right) | l \in \{k, \ldots, \infty\}\right\}\right) = x < x + \varepsilon$ so that by the definition of the infinum there exist a $M_2 \in \{k, \ldots, \infty\}$ such that
$$\sup\left(\left\{x_i | i \in \{M_2, \ldots, \infty\}\right\}\right) < x + \varepsilon$$
Hence
$$\forall n \in \{M_2, \ldots, \infty\} \text{ we have } x_n < x + \varepsilon \tag{20.25}$$
Take $M = \max(M_1, M_2)$ then we have by [eqs: 20.24, 20.25] that $\forall n \in \{M, \ldots, \infty\} \quad x - \varepsilon < x_n < x + \varepsilon$ or as $x, \varepsilon \in \mathbb{R}$ that $x - \varepsilon <_{\mathbb{R}} x_n <_{\mathbb{R}} x + \varepsilon \Rightarrow |x_n - x|_R <_{\mathbb{R}} \varepsilon$ proving that
$$\lim_{i\to\infty}{}_{\mathbb{R}}\, x_i \text{ exists and } \lim_{i\to\infty}{}_{\mathbb{R}}\, x_i = x = \liminf_{i\to\infty} x_i = \limsup_{i\to\infty} x_i$$
□

A consequence of the above theorem is that $\lim_{i\to\infty}$ is a extension of $\lim_{i\to\infty}{}_{\mathbb{R}}$ to $\overline{\mathbb{R}}$.

Corollary 20.74. *Let $k \in \mathbb{N}_0$, $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq \mathbb{R}$ a sequence of **real** numbers then we have*
$$\lim_{i\to\infty}{}_{\mathbb{R}} x_i \text{ exists} \Leftrightarrow \lim_{i\to\infty} x_i \text{ exist and } \lim_{i\to\infty} x_i \in \mathbb{R}$$
Further if $\lim_{i\to\infty}{}_{\mathbb{R}}\, x_i$ exists or $\lim_{i\to\infty} x_i$ exists then $\lim_{i\to\infty}{}_{\mathbb{R}}\, x_i = \lim_{i\to\infty} x_i$

Proof.

⇒. Using [theorem: 20.73] it follows that $\liminf_{i\to\infty} x_i = \lim_{i\to\infty}{}_{\mathbb{R}}\, x_i = \limsup_{i\to\infty} x_i$ so that by definition $\lim_{i\to\infty} x_i$ exists and $\mathbb{R} \ni \lim_{i\to\infty}{}_{\mathbb{R}}\, x_i = \lim_{i\to\infty} x_i$.

⇐. If $\lim_{i\to\infty} x_i$ exists and $\lim_{i\to\infty} x_i \in \mathbb{R}$ we have that $\liminf_{i\to\infty} x_i = \limsup_{i\to\infty} x_i = \lim_{i\to\infty} x_i \in \mathbb{R}$. Hence by [theorem: 20.73] $\lim_{i\to\infty}{}_{\mathbb{R}}\, x_i$ exists and $\lim_{i\to\infty} x_i = \liminf_{i\to\infty} x_i = \limsup_{i\to\infty} x_i$. □

Example 20.75. We have

1. For $\left\{\frac{1}{i}\right\}_{i\in\{1,\ldots,\infty\}}$ we have that $\lim_{i\to\infty} \frac{1}{i}$ exist and $\lim_{i\to\infty} \frac{1}{i} = 0$
2. For $\left\{\frac{1}{i}\right\}_{i\in\{1,\ldots,\infty\}}$ we have that $\lim_{i\to\infty} \frac{(-1)^i}{i}$ exist and $\lim_{i\to\infty} \frac{(-1)^i}{i} = 0$

Proof.

1. Note that $\left\{\frac{1}{i}\right\}_{i\in\{1,\ldots,\infty\}} \subseteq \mathbb{R}$ and by [example: 14.297] $\lim_{i\to\infty}{}_{\mathbb{R}} \frac{1}{i} = 0$ exist. Hence by the previous corollary [corollary: 20.74] $\lim_{i\to\infty} \frac{1}{i} = 0$ exist.
2. Note that $\left\{\frac{1}{i}\right\}_{i\in\{1,\ldots,\infty\}} \subseteq \mathbb{R}$ and by [example: 14.308] $\lim_{i\to\infty}{}_{\mathbb{R}} \frac{(-1)^i}{i} = 0$ exist. Hence by the previous corollary [corollary: 20.74] $\lim_{i\to\infty} \frac{(-1)^i}{i} = 0$ exist. □

The idea of a limit in $\mathbb{R}$ is that the sequence approaches its limit the higher the index is, we show now that the limit in $\overline{\mathbb{R}}$.

Theorem 20.76. *Let $k \in \mathbb{N}_0$, $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq \overline{\mathbb{R}}$ then we have the following equivalences.*

1.
$$\lim_{i\to\infty} x_i = \infty \Leftrightarrow \forall C \in \mathbb{R}^+ \ \exists N \in \{k, \ldots, \infty\} \text{ such that } \forall n \in \{N, \ldots, \infty\} \text{ we have } C < x_n$$

2.

$$\lim_{i\to\infty} x_i = -\infty \Leftrightarrow \forall C \in \mathbb{R}^+ \ \exists N \in \{k,\ldots,\infty\} \textit{ such that } \forall n \in \{N,\ldots,\infty\} \textit{ we have } x_n < -C$$

3. If $x \in \mathbb{R}$ then

$$\lim_{i\to\infty} x_i = x \in \mathbb{R} \Leftrightarrow \forall \varepsilon \in \mathbb{R}^+ \ \exists N \in \{k,\ldots,\infty\} \textit{ such that } \forall n \in \{N,\ldots,\infty\} \ |x_n - x| < \varepsilon$$

Proof.

1.

$\Rightarrow$. If $\lim_{i\to\infty} x_i = \infty$ then $\liminf_{i\to\infty} x_i = \limsup_{i\to\infty} x_i = \infty$ so that

$$\sup\left(\{\inf\left(\{x_i | i \in \{l,\ldots,\infty\}\}\right) | l \in \{k,\ldots,\infty\}\}\right) = \infty$$

Hence using [theorem: 20.15] we have that either:

$\infty \in \{\inf\left(\{x_i | i \in \{l,\ldots,\infty\}\}\right) | l \in \{k,\ldots,\infty\}\}$. Then there exist a $N \in \{k,\ldots,\infty\}$ such that $\inf\left(\{x_i | i \in \{N,\ldots,\infty\}\}\right) = \infty$. Using [theorem: 20.15] again it follows that $\{x_i | i \in \{N,\ldots,\infty\}\} = \{\infty\}$ so that $\forall n \in \{N,\ldots,\infty\}$ we have $x_n = \infty$. Hence if $C \in \mathbb{R}^+$ then $\forall n \in \{N,\ldots,\infty\}$ then $C < \infty = x_n$.

$\forall u \in \mathbb{R} \exists x \in \{\inf\left(\{x_i | i \in \{l,\ldots,\infty\}\}\right) | l \in \{k,\ldots,\infty\}\} \bigcap \mathbb{R} \vdash u < x$. Then given $C \in \mathbb{R}^+$ there exist a $N \in \{k,\ldots,\infty\}$ such that $C < \inf\left(\{x_i | i \in \{N,\ldots,\infty\}\}\right)$ hence $\forall n \in \{N,\ldots,\infty\}$ we have $C < \inf\left(\{x_i | i \in \{N,\ldots,\infty\}\}\right) \leqslant x_n$.

so in all cases we have that

$$\forall C \in \mathbb{R}_+ \text{ there } \exists N \in \{k,\ldots,\infty\} \text{ such that } \forall n \geqslant N \text{ we have } C < x_n$$

$\Leftarrow$. Assume that $\liminf_{i\to\infty} x_i < \infty$. Take $C = \max\left(\liminf_{i\to\infty} x_i, 1\right) \in \mathbb{R}^+$ then by the hypothesis there exists a $N \in \{k,\ldots,n\}$ such that $\forall n \in \{N,\ldots,\infty\}$ we have $C + 1 < x_n$. Hence $C+1$ is a lower bound of $\{x_i | i \in \{N,\ldots,\infty\}\}$ so that

$$C + 1 \leqslant \inf\left(\{x_i | i \in \{N,\ldots,\infty\}\}\right) \tag{20.26}$$

So

$$\begin{aligned}
\liminf_{i\to\infty} x_i &\leqslant \max\left(\liminf_{i\to\infty} x_i, 1\right) \\
&= C \\
&< C + 1 \\
&\underset{\text{[eq: 20.26]}}{\leqslant} \inf\left(\{x_i | i \in \{N,\ldots,\infty\}\}\right) \\
&\leqslant \sup\left(\{\inf\left(\{x_i | i \in \{l,\ldots,\infty\}\}\right) | l \in \{k,\ldots,\infty\}\}\right) \\
&= \liminf_{i\to\infty} x_i
\end{aligned}$$

leading to the contradiction $\liminf_{i\to\infty} x_i < \liminf_{i\to\infty} x_i$. Hence

$$\infty \leqslant \liminf_{i\to\infty} x_i \underset{\text{[theorem: 20.67]}}{\leqslant} \limsup_{i\to\infty} x_i \leqslant \infty$$

proving that $\liminf_{i\to\infty} x_i = \limsup_{i\to\infty} x_i = \infty$ so that

$$\lim_{i\to\infty} x_i \text{ exist and } \lim_{i\to\infty} x_i = \infty$$

2.

$\Rightarrow$. If $\lim_{i\to\infty} x_i = -\infty$ then $\liminf_{i\to\infty} x_i = \limsup_{i\to\infty} x_i = -\infty$ so that

$$\inf\left(\{\sup\left(\{x_i | i \in \{l,\ldots,\infty\}\}\right) | l \in \{k,\ldots,\infty\}\}\right) = -\infty$$

Hence using [theorem: 20.15] we have that either:

$-\infty \in \{\sup\left(\{x_i | i \in \{l,\ldots,\infty\}\}\right) | l \in \{k,\ldots,\infty\}\}$. Then there exist a $N \in \{k,\ldots,\infty\}$ such that $\sup\left(\{x_i | i \in \{N,\ldots,\infty\}\}\right) = -\infty$. Using [theorem: 20.15] again it follows that $\{x_i | i \in \{N,\ldots,\infty\}\} = \{-\infty\}$ so that $\forall n \in \{N,\ldots,\infty\}$ we have $x_n = -\infty$. Hence if $C \in \mathbb{R}^+$ then $\forall n \in \{N,\ldots,\infty\}$ then $x_n = -\infty < -C$.

$\forall u \in \mathbb{R} \exists x \in \{\sup\left(\{x_i | i \in \{l,\ldots,\infty\}\}\right) | l \in \{k,\ldots,\infty\}\} \bigcap \mathbb{R} \vdash x < u$. Then given $C \in \mathbb{R}^+$ there exist a $N \in \{k,\ldots,\infty\}$ such that $\sup\left(\{x_i | i \in \{N,\ldots,\infty\}\}\right) < -C$ hence $\forall n \in \{N,\ldots,\infty\}$ we have $x_n < \sup\left(\{x_i | i \in \{N,\ldots,\infty\}\}\right) < -C$.

so in all cases we have that

$$\forall C \in \mathbb{R}_+ \text{ there } \exists N \in \{k, \ldots, \infty\} \text{ such that } \forall n \geqslant N \text{ we have } x_n < -C$$

⇐. Assume that $-\infty < \limsup_{i\to\infty} x_i$. Take $C = -\min\left(\limsup_{i\to\infty} x_i, -1\right) \in \mathbb{R}^+$ then by the hypothesis there exists a $N \in \{k, \ldots, n\}$ such that $\forall n \in \{N, \ldots, \infty\}$ we have $x_n < -(C+1)$. Hence $-(C+1)$ is a upper bound for $\{x_i | i \in \{N, \ldots, \infty\}\}$ so that

$$\sup\left(\{x_i | i \in \{N, \ldots, \infty\}\}\right) \leqslant -(C+1) \tag{20.27}$$

hence

$$\begin{aligned}
\limsup_{i\to\infty} x_i &\geqslant \min\left(\limsup_{i\to\infty} x_i, -1\right) \\
&= -C \\
&> -(C+1) \\
&\underset{\text{[eq: 20.27]}}{\geqslant} \sup\left(\{x_i | i \in \{N, \ldots, \infty\}\}\right) \\
&\geqslant \inf\left(\{\sup\left(\{x_i | i \in \{l, \ldots, \infty\}\}\right) | l \in \{k, \ldots, \infty\}\}\right) \\
&= \limsup_{i\to\infty} x_i
\end{aligned}$$

leading to the contradiction $\limsup_{i\to\infty} x_i < \limsup_{i\to\infty} x_i$. Hence

$$-\infty \leqslant \liminf_{i\to\infty} x_i \underset{\text{[theorem: 20.67]}}{\leqslant} \limsup_{i\to\infty} x_i \leqslant -\infty$$

proving that $\liminf_{i\to\infty} x_i = \limsup_{i\to\infty} x_i = -\infty$ so that

$$\lim_{i\to\infty} x_i \text{ exist and } \lim_{i\to\infty} x_i = -\infty$$

3.

⇒. If $\lim_{i\to\infty} x_i = x \in \mathbb{R}$ exist then $\liminf_{i\to\infty} x_i = \limsup_{i\to\infty} x_i$ so that

$$x = \inf\left(\{\sup\left(\{x_i | i \in \{l, \ldots, \infty\}\}\right) | l \in \{k, \ldots, \infty\}\}\right)$$

and

$$x = \sup\left(\{\inf\left(\{x_i | i \in \{l, \ldots, \infty\}\}\right) | l \in \{k, \ldots, \infty\}\}\right)$$

Let $\varepsilon \in \mathbb{R}^+$ then we have $x - \varepsilon < x = \sup\left(\{\inf\left(\{x_i | i \in \{l, \ldots, \infty\}\}\right) | l \in \{k, \ldots, \infty\}\}\right)$ so that there exist a $N_1 \in \{k, \ldots, \infty\}$ such that

$$x - \varepsilon < \inf\left(\{x_i | i \in \{N_1, \ldots, \infty\}\}\right)$$

hence for $n \in \{N_1, \ldots, \infty\}$ we have that

$$x - \varepsilon < \inf\left(\{x_i | i \in \{N_1, \ldots, \infty\}\}\right) < x_n$$

Likewise, as $\inf(\{\sup\left(\{x_i | i \in \{l, \ldots, \infty\}\}\right) | l \in \{k, \ldots, \infty\}\}) = x < x + \varepsilon$ there exist a $N_2 \in \{k, \ldots, \infty\}$ such that $\sup\left(\{x_i | i \in \{N, \ldots, \infty\}\}\right) < x + \varepsilon$ hence for $n \in \{N_2, \ldots, \infty\}$we have

$$x_n \leqslant \sup\left(\{x_i | i \in \{N, \ldots, \infty\}\}\right) < x + \varepsilon$$

Take $N = \max(N_1, N_2)$ then for $n \in \{N, \ldots, \infty\}$ we have

$$x - \varepsilon < x_n < x + \varepsilon \text{ or equivalently } |x_n - x| < \varepsilon$$

⇐. Let $\varepsilon \in \mathbb{R}^+$ then by the hypothesis there exist a N_ε such that $\forall n \in \{N_\varepsilon, \ldots, \infty\}$ we have $x - \varepsilon < x_n < x + \varepsilon$. Hence we have that $\{x_i | i \in \{N_\varepsilon, \ldots, \infty\}\}$ has a lower bound $x - \varepsilon$ and a upper bound $x + \varepsilon$. Hence

$$x - \varepsilon \leqslant \inf\left(\{x_i | i \in \{N_\varepsilon, \ldots, \infty\}\}\right) \text{ and } \sup\left(\{x_i | i \in \{N_\varepsilon, \ldots, \infty\}\}\right) < x + \varepsilon$$

As

$$\inf\left(\{x_i | i \in \{N_\varepsilon, \ldots, \infty\}\}\right) \leqslant \sup\left(\{\inf\left(\{x_i | i \in \{l, \ldots, \infty\}\}\right) | l \in \{k, \ldots, \infty\}\}\right) = \liminf_{i\to\infty} x_i$$

and

$$\limsup_{i\to\infty} x_i = \inf\left(\{\sup\left(\{x_i | i \in \{l, \ldots, \infty\}\}\right) | l \in \{k, \ldots, \infty\}\}\right) \leqslant \sup\left(\{x_i | i \in \{N_\varepsilon, \ldots, \infty\}\}\right)$$

it follows that $x-\varepsilon<\liminf_{i\to\infty} x_i \underset{\text{[theorem: 20.67]}}{\leqslant} \limsup_{i\to\infty} x_i<x+\varepsilon$. Given that $x\in\mathbb{R}$ we have that

$$x-\varepsilon<_{\mathbb{R}}\liminf_{i\to\infty} x_i \underset{\text{[theorem: 20.67]}}{\leqslant_{\mathbb{R}}} \limsup_{i\to\infty} x_i<_{\mathbb{R}} x+\varepsilon$$

So as $\varepsilon\in\mathbb{R}^+$ was chosen arbitrary it follows from [theorem: 10.31] that

$$x\leqslant_{\mathbb{R}}\liminf_{i\to\infty} x_i\leqslant_{\mathbb{R}}\limsup_{i\to\infty} x_i\leqslant_{\mathbb{R}} x$$

so that $\liminf_{i\to\infty} x_i=\limsup_{i\to\infty} x_i=x$ proving that

$$\lim_{i\to\infty} x_i \text{ exists and that } \lim_{i\to\infty} x_i=x$$ □

We can now derive the different properties of the limit in $\overline{\mathbb{R}}$ based on the properties of $\limsup_{i\to\infty}$ and $\liminf_{i\to\infty}$.

Theorem 20.77. *Let $k\in\mathbb{N}_0$, $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ and $n\in\mathbb{N}_0$ then if $\lim_{i\to\infty} x_i$ exists we have that $\lim_{i\to\infty} x_{i+n}$ exists and $\lim_{i\to\infty} x_{i+n}=\lim_{i\to\infty} x_i$.*

Proof. As $\lim_{i\to\infty} x_i$ we have that $\liminf_{i\to\infty} x_i=\limsup_{i\to\infty} x_i=\lim_{i\to\infty} x_i$. Using [theorem: 20.58] it follows that $\liminf_{i\to\infty} x_{i+n}=\limsup_{i\to\infty} x_{i+n}$ so that $\lim_{i\to\infty} x_{i+n}$ exists and $\lim_{i\to\infty} x_{i+n}=\lim_{i\to\infty} x_{i+n}$. □

Theorem 20.78. *The limit in $\overline{\mathbb{R}}$ has the following properties where $k\in\mathbb{N}_0$*

1. *Let $x\in\overline{\mathbb{R}}$ and $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ then we have*
   a. *If $\forall i\in\{k,\ldots,\infty\}$ $x\leqslant x_i$ then $x\leqslant\lim_{i\to\infty} x_i$*
   b. *If $\forall i\in\{k,\ldots,\infty\}$ $x_i\leqslant x$ then $\lim_{i\to\infty} x_i\leqslant x$*
2. *Let $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ and $\{y_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ be such that $\lim_{i\to\infty} x_i$, $\lim_{i\to\infty} y_i$ exist and $\forall i\in\{k,\ldots,\infty\}$ $x_i\leqslant y_i$ then $\lim_{i\to\infty} x_i\leqslant\lim_{i\to\infty} y_i$.*
3. *If $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ has a limit and $\alpha\in\mathbb{R}$ then $\{\alpha\cdot x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ has a limit and $\lim_{i\to\infty}(\alpha\cdot x_i)=\alpha\cdot\lim_{i\to\infty} x_i$.*
4. *If $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ has a limit, $x\in\overline{\mathbb{R}}$ and we have that $\forall i\in\{k,\ldots,\infty\}$ $(x_i,x)\in(\overline{\mathbb{R}}\times\overline{\mathbb{R}})\setminus\{(-\infty,\infty),(\infty,-\infty)\}$ then $\lim_{i\to\infty}(x_i+x)$ exists and $\lim_{i\to\infty}(x_i+x)=\lim_{i\to\infty} x_i+x$.*
5. *Let $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ and $\{y_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ be sequences with limits, $\left(\lim_{i\to\infty} x_i,\lim_{i\to\infty} y_i\right)\in(\overline{\mathbb{R}}\times\overline{\mathbb{R}})\setminus\{(-\infty,\infty),(\infty,-\infty)\}$ [so that $\lim_{i\to\infty} x_i+\lim_{i\to\infty} y_i$ is well defined] then there exist a $n\in\{k,\ldots,\infty\}$ such that $\forall i\in\{n,\ldots,\infty\}$ $(x_i,y_i)\in(\overline{\mathbb{R}}\times\overline{\mathbb{R}})\setminus\{(-\infty,\infty),(\infty,-\infty)\}$ [hence x_i+y_i is defined] and $\{x_i+y_i\}_{i\in\{n,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ has a limit with*
$$\lim_{i\to\infty}(x_i+y_i)=\lim_{i\to\infty} x_i+\lim_{i\to\infty} y_i$$
6. *Let $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ and $\{y_i\}_{i\in\{k,\ldots,\infty\}}\subseteq\overline{\mathbb{R}}$ be sequences of extended reals with limits such that for $x=\lim_{i\to\infty} x_i$ and $y=\lim_{i\to\infty}$ we have*
$$(x,y)\in(\overline{\mathbb{R}}\times\overline{\mathbb{R}})\setminus\{(0,-\infty),(0,\infty),(-\infty,0),(\infty,0)\}$$
then $\lim_{i\to\infty}(x_i\cdot y_i)=\left(\lim_{i\to\infty} x_i\right)\cdot\left(\lim_{i\to\infty} y_i\right)$
7. *Let $\{x_i\}_{i\in\{k,\ldots,\infty\}},\{y_i\}_{i\in\{k,\ldots,\infty\}}$ be sequences of extended reals with limits then we have*
   a. $\lim_{i\to\infty}(\min(x_i,y_i))=\min\left(\lim_{i\to\infty} x_i,\lim_{i\to\infty} y_i\right)$
   b. $\lim_{i\to\infty}(\max(x_i,y_i))=\max\left(\lim_{i\to\infty} x_i,\lim_{i\to\infty} y_i\right)$

***Note* 20.79.** *The condition in (3) that $\alpha\in\mathbb{R}$ is required. For example the sequence $\left\{\frac{(-1)^i}{i}\right\}_{i\in\{1,\ldots,\infty\}}$ converges to 0 but $\left\{\infty\cdot\frac{(-1)^i}{i}\right\}_i=\{(-\infty)^i\}_{i\in\{1,\ldots,\infty\}}$ does not converges [see examples: 20.72, 20.75].*

***Note* 20.80.** *The extra conditions in (5) are needed, for example take* $\{x_i\}_{i\in\mathbb{N}_0}$ *defined by* $x_i=\frac{1}{i}$ *and* $\{y_i\}_{i\in\mathbb{N}_0}$ *defined by* $y_i=i^2$ *then* $\lim\limits_{i\to\infty} x_i=0$ *and* $\lim\limits_{i\to\infty} y_i=\infty$ *but* $\lim\limits_{i\to\infty}(x_i\cdot y_i)=\lim\limits_{i\to\infty} i=\infty\neq\infty\cdot 0=0$

Proof.

1.
   a. As $\forall i\in\{k,\ldots,\infty\}$ $x\leqslant x_i$ it follows from [theorem: 20.60] that $x\leqslant\liminf\limits_{i\to\infty} x_i$ proving, as $\liminf\limits_{i\to\infty} x_i=\lim\limits_{i\to\infty} x_i$, that $x\leqslant\lim\limits_{i\to\infty} x_i$.
   b. As $\forall i\in\{k,\ldots,\infty\}$ $x_i\leqslant x$ it follows from [theorem: 20.60] that $\liminf\limits_{i\to\infty} x_i\leqslant x$ proving, as $\liminf\limits_{i\to\infty} x_i=\lim\limits_{i\to\infty} x_i$, that $x\leqslant\lim\limits_{i\to\infty} x_i$.
2. As $\forall i\in\{k,\ldots,\infty\}$ $x_i\leqslant y_i$ we have by [theorem: 20.59] that $\liminf\limits_{i\to\infty} x_i\leqslant\liminf\limits_{i\to\infty} y_i$. Hence
$$\lim_{i\to\infty} x_i \underset{\text{def}}{=} \liminf_{i\to\infty} x_i \leqslant \liminf_{i\to\infty} y_i \underset{\text{def}}{=} \lim_{i\to\infty} y_i$$
3. For $\alpha\in\mathbb{R}$ we have the following cases to consider:

   $0\leqslant\alpha$. Then we have
$$\begin{aligned}\liminf_{i\to\infty}(\alpha\cdot x_i) &\underset{\text{[theorem: 20.66]}}{=} \alpha\cdot\liminf_{i\to\infty} x_i\\ &\underset{\text{def}}{=} \alpha\cdot\lim_{i\to\infty} x_i\\ &\underset{\text{def}}{=} \alpha\cdot\limsup_{i\to\infty} x_i\\ &\underset{\text{[theorem: 20.66]}}{=} \limsup_{i\to\infty}(\alpha\cdot x_i)\end{aligned}$$
   so that $\lim\limits_{i\to\infty}(\alpha\cdot x_i)$ exists and $\lim\limits_{i\to\infty}(\alpha\cdot x_i)=\alpha\cdot\lim\limits_{i\to\infty} x_i$

   $\alpha<0$. Then $0<-\alpha$ so that
$$\begin{aligned}\liminf_{i\to\infty}(\alpha\cdot x_i) &\underset{\text{[theorem: 20.64]}}{=} -\limsup_{i\to\infty}((-\alpha)\cdot x_i)\\ &\underset{\text{[theorem: 20.66]}}{=} -\left((-\alpha)\cdot\limsup_{i\to\infty} x_i\right)\\ &= \alpha\cdot\limsup_{i\to\infty} x_i\\ &\underset{\text{def}}{=} \alpha\cdot\lim_{i\to\infty} x_i\\ &\underset{\text{def}}{=} \alpha\cdot\liminf_{i\to\infty} x_i\\ &= -\left((-\alpha)\cdot\liminf_{i\to\infty} x_i\right)\\ &\underset{\text{[theorem: 20.66]}}{=} -\liminf_{i\to\infty}((-\alpha)\cdot x_i)\\ &\underset{\text{[theorem: 20.64]}}{=} \limsup_{i\to\infty}(\alpha\cdot x_i)\end{aligned}$$
   so that $\liminf\limits_{i\to\infty}(\alpha\cdot x_i)=\limsup\limits_{i\to\infty}(\alpha\cdot x_i)=\alpha\cdot\lim\limits_{i\to\infty} x_i$. Hence
$$\lim_{i\to\infty}(\alpha\cdot x_i)\text{ exist and }\lim_{i\to\infty}(\alpha\cdot x_i)=\alpha\cdot\lim_{i\to\infty} x_i$$
4. Using [theorem: 20.62] we have that
$$\begin{aligned}\liminf_{i\to\infty}(x_i+x) &\underset{\text{[theorem: 20.62]}}{=} \left(\liminf_{i\to\infty} x_i\right)+x\\ &\underset{\text{def}}{=} \left(\lim_{i\to\infty} x_i\right)+x\\ &\underset{\text{def}}{=} \left(\limsup_{i\to\infty} x_i\right)+x\\ &\underset{\text{[theorem: 20.62]}}{=} \limsup_{i\to\infty}(x_i+x)\end{aligned}$$
   Hence
$$\lim_{i\to\infty}(x_i+x)\text{ exist and }\lim_{i\to\infty}(x_i+x)=\left(\lim_{i\to\infty} x_i\right)+x$$

5. As $\left(\lim_{i\to\infty} x_i, \lim_{i\to\infty} y_i\right) \in (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty,\infty),(\infty,-\infty)\}$ we have the following cases to consider:

$\boldsymbol{\lim_{i\to\infty} x_i \in \mathbb{R} \wedge \lim_{i\to\infty} y_i \in \mathbb{R}}$. Let $x = \lim_{i\to\infty} x_i$ and $y = \lim_{i\to\infty} y_i$ then by [theorem: 20.76] there exists $N_1, N_2 \in \{k,\ldots,\infty\}$ such that

$$\forall i \in \{N_1,\ldots,\infty\}\ |x_i - x| < 1 \Rightarrow -\infty < x-1 < x_i < x+1 < \infty$$

and

$$\forall i \in \{N_2,\ldots,\infty\}\ |y_i - y| < 1 \Rightarrow -\infty < y-1 < x = y_i < y+1 < \infty$$

Hence if take $n = \max(N_1, N_2)$ then we have

$$\forall i \in \{n,\ldots,\infty\} \text{ that } (x_i, y_i) \in \mathbb{R}\times\mathbb{R} \subseteq (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty,\infty),(\infty,-\infty)\}$$

Let $\varepsilon \in \mathbb{R}^+$ then [theorem: 20.76] there exists $M_1, M_2 \in \{k,\ldots,\infty\}$ such that

$$\forall i \in \{M_1,\ldots,\infty\}\ |y_i - y| < \frac{\varepsilon}{2}$$

and

$$\forall i \in \{M_1,\ldots,\infty\}\ |y_i - y| < \frac{\varepsilon}{2}$$

Take $N = \max(M_1, M_2, n)$ then $\forall i \in \{N,\ldots,\infty\}$ we have that $x_i + y_i$ is well defined and

$$|x_i + y_i - (x+y)| \leqslant |x_i - x| + |y_i - y| = \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$$

Hence using [theorem: 20.76] it follows that $\{x_i + y_i\}_{i\in\{n,\ldots,\infty\}}$ has a limit

$$\lim_{i\to\infty}(x_i + y_i) = x + y = \lim_{i\to\infty} x_i + \lim_{i\to\infty} y_i$$

$\boldsymbol{\lim_{i\to\infty} x_i = -\infty \wedge \lim_{i\to\infty} y_i \in \mathbb{R}}$. Let $y = \lim_{i\to\infty} y_i$ then by [theorem: 20.76] there exists $N_1, N_2 \in \{k,\ldots,\infty\}$ such that

$$\forall i \in \{N_1,\ldots,\infty\} \text{ we have } x_i < -1 < \infty$$

$$\forall i \in \{N_2,\ldots,\infty\} \text{ we have } |y-1| < 1 \Rightarrow -\infty < y-1 < y_i < y+1 < \infty$$

Hence if we take $n = \max(N_1, N_2)$ we have that

$$\forall i \in \{n,\ldots,\infty\} \text{ that } (x_i, y_i) \in (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty,\infty),(\infty,-\infty)\}$$

Further take $C \in \mathbb{R}^+$ and take $C' = \max(C + (y+1), 1) \in \mathbb{R}^+$ then $C + (y+1) \leqslant C'$ or $-C' \leqslant -C - (y+1)$. By [theorem: 20.76] there exist a $N_3 \in \{k,\ldots,\infty\}$ such that $\forall i \in \{N_3,\ldots,\infty\}$ we have that $x_i < -C'$. Hence if $N = \max(n, N_3) \in \{n,\ldots,\infty\}$ then we have for $i \in \{N,\ldots,\infty\}$ that $x_i < -C'$ and as $y_i \in \mathbb{R}$ it follows from [theorem: 20.29] that $x_i + y_i < -C' + y_i$. Hence

$$\begin{aligned} x_i + y_i &< -C' + y_i \\ &\leqslant -C - (y+1) + y_i \\ &< -C - (y+1) + y + 1 \\ &= -C \end{aligned}$$

Using [theorem: 20.76] it follows then that $\{x_i + y_i\}_{i\in\{n,\ldots,\infty\}}$ has a limit and $\lim_{i\to\infty}(x_i + y_i) = -\infty$. As $\lim_{i\to\infty} x_i = -\infty$ and $\lim_{i\to\infty} y_i \in \mathbb{R}$ it follows that $\lim_{i\to\infty} x_i + \lim_{i\to\infty} y_i = -\infty$. So

$$\lim_{i\to\infty}(x_i + y_i) \text{ exist and } \lim_{i\to\infty}(x_i + y_i) = \lim_{i\to\infty} x_i + \lim_{i\to\infty} y_i$$

$\boldsymbol{\lim_{i\to\infty} x_i = \infty \wedge \lim_{i\to\infty} y_i \in \mathbb{R}}$. Let $y = \lim_{i\to\infty} y_i$ then by [theorem: 20.76] there exists $N_1, N_2 \in \{k,\ldots,\infty\}$ such that

$$\forall i \in \{N_1,\ldots,\infty\} \text{ we have } -\infty < 1 < x_i$$

$$\forall i \in \{N_2,\ldots,\infty\} \text{ we have } |y-1| < 1 \Rightarrow -\infty < y-1 < y_i < y+1 < \infty$$

Hence if we take $n = \max(N_1, N_2)$ we have that

$$\forall i \in \{n,\ldots,\infty\} \text{ that } (x_i, y_i) \in (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty,\infty),(\infty,-\infty)\}$$

Further take $C \in \mathbb{R}^+$ and take $C' = \max(C-(y-1),1) \in \mathbb{R}^+$ then $C-(y-1) \leqslant C'$. By [theorem: 20.76] there exist a $N_3 \in \{k,\ldots,\infty\}$ such that $\forall i \in \{N_3,\ldots,\infty\}$ we have that $C' < x$. Hence if $N = \max(n, N_3) \in \{n,\ldots,\infty\}$ then we have for $i \in \{N,\ldots,\infty\}$ that $C' < x_i$ and as $y_i \in \mathbb{R}$ it follows from [theorem: 20.29] that $C' + y_i < x_i + y_i$. Hence

$$\begin{aligned} x_i + y_i &> C' + y_i \\ &\geqslant C - (y-1) + y_i \\ &> C - (y-1) + (y-1) \\ &= C \end{aligned}$$

Using [theorem: 20.76] it follows then that $\{x_i + y_i\}_{i \in \{n,\ldots,\infty\}}$ has a limit and $\lim\limits_{i\to\infty}(x_i + y_i) = \infty$. As $\lim\limits_{i\to\infty} x_i = \infty$ and $\lim\limits_{i\to\infty} y_i \in \mathbb{R}$ it follows that $\lim\limits_{i\to\infty} x_i + \lim\limits_{i\to\infty} y_i = \infty$. So

$$\lim_{i\to\infty}(x_i + y_i) \text{ exist and } \lim_{i\to\infty}(x_i + y_i) = \lim_{i\to\infty} x_i + \lim_{i\to\infty} y_i$$

$\boldsymbol{\lim\limits_{i\to\infty} x_i \in \mathbb{R} \wedge \lim\limits_{i\to\infty} y_i = -\infty}$**.** Let $x = \lim\limits_{i\to\infty} x_i$ then by [theorem: 20.76] there exists $N_1, N_2 \in \{k,\ldots,\infty\}$ such that

$$\forall i \in \{N_1,\ldots,\infty\} \text{ we have } y_i < -1 < \infty$$

$$\forall i \in \{N_2,\ldots,\infty\} \text{ we have } |x-1| < 1 \Rightarrow -\infty < x-1 < x_i < x+1 < \infty$$

Hence if we take $n = \max(N_1, N_2)$ we have that

$$\forall i \in \{n,\ldots,\infty\} \text{ that } (x_i, y_i) \in (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty,\infty),(\infty,-\infty)\}$$

Further take $C \in \mathbb{R}^+$ and take $C' = \max(C+(x+1),1) \in \mathbb{R}^+$ then $C+(x+1) \leqslant C'$ or $-C' \leqslant -C-(x+1)$. By [theorem: 20.76] there exist a $N_3 \in \{k,\ldots,\infty\}$ such that $\forall i \in \{N_3,\ldots,\infty\}$ we have that $y_i < -C'$. Hence if $N = \max(n, N_3) \in \{n,\ldots,\infty\}$ then we have for $i \in \{N,\ldots,\infty\}$ that $y_i < -C'$ and as $y_i \in \mathbb{R}$ it follows from [theorem: 20.29] that $x_i + y_i < -C' + x_i$. Hence

$$\begin{aligned} x_i + y_i &< -C' + x_i \\ &\leqslant -C - (x+1) + x_i \\ &< -C - (x+1) + x + 1 \\ &= -C \end{aligned}$$

Using [theorem: 20.76] it follows then that $\{x_i + y_i\}_{i \in \{n,\ldots,\infty\}}$ has a limit and $\lim\limits_{i\to\infty}(x_i + y_i) = -\infty$. As $\lim\limits_{i\to\infty} y_i = -\infty$ and $\lim\limits_{i\to\infty} x_i \in \mathbb{R}$ it follows that $\lim\limits_{i\to\infty} x_i + \lim\limits_{i\to\infty} y_i = -\infty$. So

$$\lim_{i\to\infty}(x_i + y_i) \text{ exist and } \lim_{i\to\infty}(x_i + y_i) = \lim_{i\to\infty} x_i + \lim_{i\to\infty} y_i$$

$\boldsymbol{\lim\limits_{i\to\infty} x_i = -\infty \wedge \lim\limits_{i\to\infty} y_i = -\infty}$**.** Using [theorem: 20.76] there exists $N_1, N_2 \in \{k,\ldots,\infty\}$ such that

$$\forall i \in \{N_1,\ldots,\infty\}\ x_i < -1 < \infty \text{ and } \forall i \in \{N_2,\ldots,\infty\}\ y_i < -1 < \infty$$

So if we take $n = \max(N_1, N_2)$ then for $i \in \{n,\ldots,\infty\}$ we have

$$(x_i, y_i) \in (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty,\infty),(\infty,-\infty)\}$$

Further if $C \in \mathbb{R}^+$ then there exists $N_3, N_4 \in \{n,\ldots,\infty\}$ such that

$$\forall i \in \{N_3,\ldots,\infty\}\ x_i < -\frac{C}{2} \text{ and } \forall i \in \{N_4,\ldots,\infty\}\ y_i < -\frac{C}{2}$$

Take $N = \max(N_3, N_4) \in \{n,\ldots,\infty\}$ then $\forall i \in \{N,\ldots,\infty\}$ we have by [theorem: 20.29] that

$$x_i + y_i < -\frac{C}{2} + \left(-\frac{C}{2}\right) = -C$$

So that by [theorem: 20.76] $\{x_i + y_i\}_{i \in \{n,\ldots,\infty\}}$ has a limit and $\lim\limits_{i\to\infty}(x_i + y_i) = -\infty$, hence, as $\lim\limits_{i\to\infty} x_i + \lim\limits_{i\to\infty} y_i = -\infty + (-\infty) = -\infty$, it follows that

$$\lim_{i\to\infty}(x_i + y_i) \text{ exist and } \lim_{i\to\infty}(x_i + y_i) = \lim_{i\to\infty} x_i + \lim_{i\to\infty} y_i$$

$\lim\limits_{i\to\infty} x_i \in \mathbb{R} \wedge \lim\limits_{i\to\infty} y_i = \infty$. Let $x = \lim\limits_{i\to\infty} x_i$ then by [theorem: 20.76] there exists $N_1, N_2 \in \{k, \ldots, \infty\}$ such that

$$\forall i \in \{N_1, \ldots, \infty\} \text{ we have } -\infty < 1 < y_i$$

$$\forall i \in \{N_2, \ldots, \infty\} \text{ we have } |x-1| < 1 \Rightarrow -\infty < x-1 < x_i < x+1 < \infty$$

Hence if we take $n = \max(N_1, N_2)$ we have that

$$\forall i \in \{n, \ldots, \infty\} \text{ that } (x_i, y_i) \in (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty, \infty), (\infty, -\infty)\}$$

Further take $C \in \mathbb{R}^+$ and take $C' = \max(C-(x-1), 1) \in \mathbb{R}^+$ then $C-(x-1) \leqslant C'$. By [theorem: 20.76] there exist a $N_3 \in \{k, \ldots, \infty\}$ such that $\forall i \in \{N_3, \ldots, \infty\}$ we have that $C' < y$. Hence if $N = \max(n, N_3) \in \{n, \ldots, \infty\}$ then we have for $i \in \{N, \ldots, \infty\}$ that $C' < y_i$ and as $x_i \in \mathbb{R}$ it follows from [theorem: 20.29] that $C' + x_i < x_i + y_i$. Hence

$$\begin{aligned} x_i + y_i &> C' + x_i \\ &\geqslant C - (x-1) + x_i \\ &> C - (x-1) + (x-1) \\ &= C \end{aligned}$$

Using [theorem: 20.76] it follows then that $\{x_i + y_i\}_{i \in \{n, \ldots, \infty\}}$ has a limit and $\lim\limits_{i\to\infty}(x_i + y_i) = \infty$. As $\lim\limits_{i\to\infty} y_i = \infty$ and $\lim\limits_{i\to\infty} x_i \in \mathbb{R}$ it follows that $\lim\limits_{i\to\infty} x_i + \lim\limits_{i\to\infty} y_i = \infty$. So

$$\lim_{i\to\infty}(x_i + y_i) \text{ exist and } \lim_{i\to\infty}(x_i + y_i) = \lim_{i\to\infty} x_i + \lim_{i\to\infty} y_i$$

$\lim\limits_{i\to\infty} x_i = \infty \wedge \lim\limits_{i\to\infty} y_i = \infty$. Using [theorem: 20.76] there exists $N_1, N_2 \in \{k, \ldots, \infty\}$ such that

$$\forall i \in \{N_1, \ldots, \infty\} \ -\infty < 1 < x_i \text{ and } \forall i \in \{N_2, \ldots, \infty\} \ -\infty < 1 < y_i$$

So if we take $n = \max(N_1, N_2)$ then for $i \in \{n, \ldots, \infty\}$ we have

$$(x_i, y_i) \in (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty, \infty), (\infty, -\infty)\}$$

Further if $C \in \mathbb{R}^+$ then there exists $N_3, N_4 \in \{n, \ldots, \infty\}$ such that

$$\forall i \in \{N_3, \ldots, \infty\} \ \frac{C}{2} < x_i \text{ and } \forall i \in \{N_4, \ldots, \infty\} \ \frac{C}{2} < y_i$$

Take $N = \max(N_3, N_4) \in \{n, \ldots, \infty\}$ then $\forall i \in \{N, \ldots, \infty\}$ we have by [theorem: 20.29] that

$$C = \frac{C}{2} + \frac{C}{2} < x_i + y_i$$

So that by [theorem: 20.76] $\{x_i + y_i\}_{i \in \{n, \ldots, \infty\}}$ has a limit and $\lim\limits_{i\to\infty}(x_i + y_i) = \infty$, hence, as $\lim\limits_{i\to\infty} x_i + \lim\limits_{i\to\infty} y_i = \infty + \infty = \infty$, it follows that

$$\lim_{i\to\infty}(x_i + y_i) \text{ exist and } \lim_{i\to\infty}(x_i + y_i) = \lim_{i\to\infty} x_i + \lim_{i\to\infty} y_i$$

6. As $\left(\lim\limits_{i\to\infty} x_i, \lim\limits_{i\to\infty} y_i\right) \in (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(0, -\infty), (0, \infty), (-\infty, 0), (\infty, 0)\}$ we have either:

$\lim\limits_{i\to\infty} x_i \in \mathbb{R} \wedge \lim\limits_{i\to\infty} y_i \in \mathbb{R}$. Let $x = \lim\limits_{i\to\infty} x_i$ and $y = \lim\limits_{i\to\infty} y_i$. Take $\varepsilon \in \mathbb{R}^+$. Using [theorem: 20.76] there exists a $N_1 \in \{k, \ldots, \infty\}$ such that

$$\forall i \in \{N_1, \ldots, \infty\} \text{ we have } |x - x_i| < 1 \Rightarrow |x_i| = |x - x_i| + |x| < 1 + |x|$$

Further as $1 + |x| \in \mathbb{R}^+$ there exists a $N_2 \in \{k, \ldots, \infty\}$ such that

$$\forall i \in \{N_2, \ldots, \infty\} \ |x_i - x| < \frac{\varepsilon}{2 \cdot (1 + |y|)} < \infty$$

and there exist a $N_3 \in \{k, \ldots, \infty\}$ such that

$$\forall i \in \{N_3, \ldots, \infty\} \ |y_i - y| < \frac{\varepsilon}{2 \cdot (1 + |x|)} < \infty$$

Let $N=\max(N_1,N_2,N_3)$ then we have for $i\in\{N,\ldots,\infty\}$ that $-\infty<x-\varepsilon<x_i<x+\varepsilon<\infty$ and $-\infty<y-\varepsilon<y_i<y+\varepsilon<\infty$ so that $x_i,y_i\in\mathbb{R}$ hence

$$0\leqslant|x_i|,|y_i|,|x|,|y|\in\mathbb{R}$$

$$\begin{aligned}
|x_i\cdot y_i-x\cdot y| &= |x_i\cdot y_i-x_i\cdot y+x_i\cdot y-x\cdot y|\\
&= |x_i\cdot(y_i-y)+(x_i-x)\cdot y|\\
&\leqslant |x_i\cdot(y_i-y)|+|(x_i-x)\cdot y|\\
&= |x_i|\cdot|y_i-y|+|x_i-x|\cdot|y|\\
&\leqslant |x_i|\cdot\frac{\varepsilon}{2\cdot(1+|x|)}+\frac{\varepsilon}{2\cdot(1+|y|)}\cdot|y|\\
&< (1+|x_i|)\cdot\frac{\varepsilon}{2\cdot(1+|x|)}+\frac{\varepsilon}{2\cdot(1+|y|)}\cdot|y|\\
&< \frac{\varepsilon}{2}+\frac{\varepsilon}{2}\\
&= \varepsilon
\end{aligned}$$

Using [theorem: 20.76] again it follows that

$$\lim_{i\to\infty}(x_i\cdot y_i)\text{ exists and }\lim_{i\to\infty}(x_i\cdot y_i)=\left(\lim_{i\to\infty}x_i\right)\cdot\left(\lim_{i\to\infty}y_i\right)$$

$\boldsymbol{\lim_{i\to\infty}x_i=\infty\wedge\lim_{i\to\infty}y_i\in\mathbb{R}\setminus\{0\}}$**.** Let $C\in\mathbb{R}^+$. For $y=\lim_{i\to\infty}y_i$ we have either:

$\boldsymbol{0<y}$**.** For $\frac{y}{2}\in\mathbb{R}^+$ we have by [theorem: 20.76] that there exist a N_1 such that

$$\forall i\in\{N_1,\ldots,\infty\}\text{ we have }-\infty<\frac{y}{2}=y-\frac{y}{2}<y_i<y+\frac{y}{2}<\infty \tag{20.28}$$

Let $C\in\mathbb{R}^+$ then $\frac{2\cdot(C+1)}{y}\in\mathbb{R}^+$ so by [theorem: 20.76] there exist a $N_2\in\{k,\ldots,\infty\}$ such that

$$\forall i\in\{N_2,\ldots,\infty\}\text{ we have }\frac{2\cdot(C+1)}{y}<x_i \tag{20.29}$$

Let $N=\max(N_1,N_2)$ then $\forall i\in\{N,\ldots,\infty\}$ we have as $\frac{2\cdot(C+1)}{y}\in\mathbb{R}^+$ by [theorem: 20.37] that

$$C+1=\frac{y}{2}\cdot\frac{2\cdot(C+1)}{y}\underset{\text{[eq: 20.28]}}{\leqslant}\frac{2\cdot(C+1)}{y}\cdot y_i$$

Further as by [eq: 20.28] $0<y_i$ we have by [theorem: 20.37] and [eq: 20.29] that

$$\frac{2\cdot(C+1)}{y}\cdot y_i<x_i\cdot y_i=\left(\lim_{i\to\infty}x_i\right)\cdot\left(\lim_{i\to\infty}y_i\right)$$

So that $C<C+1<x_i\cdot y_i\ \forall i\in\{N,\ldots,\infty\}$, hence using [theorem: 20.76] we have that

$$\lim_{i\to\infty}(x_i\cdot y_i)\text{ exists and }\lim_{i\to\infty}(x_i\cdot y_i)=\infty=\infty\cdot y=x\cdot y$$

$\boldsymbol{y<0}$**.** By (3) we have that $-y\in\lim_{i\to\infty}(-y_1)$. For $-\frac{y}{2}\in\mathbb{R}^+$ we have by [theorem: 20.76] that there exist a N_1 such that

$$\forall i\in\{N_1,\ldots,\infty\}\text{ we have }-\infty<-\frac{y}{2}=-y-\left(-\frac{y}{2}\right)<-y_i<-y+\left(-\frac{y}{2}\right) \tag{20.30}$$

Let $C\in\mathbb{R}^+$ then $-\frac{2\cdot(C+1)}{y}\in\mathbb{R}^+$ so by [theorem: 20.76] there exist a $N_2\in\{k,\ldots,\infty\}$ such that

$$\forall i\in\{N_2,\ldots,\infty\}\text{ we have }-\frac{2\cdot(C+1)}{y}<x_i \tag{20.31}$$

Let $N=\max(N_1,N_2)$ then $\forall i\in\{N,\ldots,\infty\}$ we have as $-\frac{2\cdot(C+1)}{y}\in\mathbb{R}^+$ by [theorem: 20.37] that

$$C+1=\left(-\frac{y}{2}\right)\cdot\left(-\frac{2\cdot(C+1)}{y}\right)\underset{\text{[eq: 20.30]}}{<}\left(-\frac{2\cdot(C+1)}{y}\right)\cdot(-y_i)$$

Further as by [eq: 20.30] $0 < -y_i$ so that by [theorem: 20.37] and [eq: 20.31]

$$-\frac{2\cdot(C+1)}{y}\cdot(-y_i) < x_i\cdot(-y_i) = -(x_i\cdot y_i)$$

hence

$$C < C+1 < -(x_i\cdot y_i)$$

Hence by [theorem: 20.76] $\lim\limits_{i\to\infty}(-(x_i\cdot y_i))$ exists and $\lim\limits_{i\to\infty}(-(x_i\cdot y_i)) = \infty$, using (3) it follows that $\lim\limits_{i\to\infty}(x_i\cdot y_i)$ exist and

$$\lim_{i\to\infty}(x_i\cdot y_i) = -\lim_{i\to\infty}(-(x_i\cdot y_i)) = -\infty = \infty\cdot y = x\cdot y$$

or

$$\lim_{i\to\infty}(x_i\cdot y_i) \text{ exists and } \lim_{i\to\infty}(x_i\cdot y_i) = x\cdot y = \left(\lim_{i\to\infty} x_i\right)\cdot\left(\lim_{i\to\infty} y_i\right)$$

$\boldsymbol{\lim\limits_{i\to\infty} x_i = -\infty \wedge \lim\limits_{i\to\infty} y_i \in \mathbb{R}\setminus\{0\}}$**.** Define $\{x_i'\}_{i\in\{k,\ldots,\infty\}}$ by $x_i' = -x_i$ then $\lim\limits_{i\to\infty} x_i' \underset{(2)}{=} -\lim\limits_{i\to\infty} x_i = \infty$. Hence this reduces to the case $\lim\limits_{i\to\infty} x_i = -\infty \wedge \lim\limits_{i\to\infty} y_i \in \mathbb{R}\setminus\{0\}$ by substituting x_i by x_i'. So we have that $\lim\limits_{i\to\infty}(x_i'\cdot y_i) = \left(\lim\limits_{i\to\infty} x_i'\right)\cdot\left(\lim\limits_{i\to\infty} y_i\right)$ so

$$\begin{aligned}
\lim_{i\to\infty}(x_i\cdot y_i) &\underset{(3)}{=} -\lim_{i\to\infty}(-(x_i\cdot y_i)) \\
&= \lim_{i\to\infty}(x_i'\cdot y_i) \\
&= \left(\lim_{i\to\infty} x_i'\right)\cdot\left(\lim_{i\to\infty} y_i\right) \\
&= \left(\lim_{i\to\infty}(-x_i)\right)\cdot\left(\lim_{i\to\infty} y_i\right) \\
&= -\left(\lim_{i\to\infty} x_i\right)\cdot\left(\lim_{i\to\infty} y_i\right)
\end{aligned}$$

Hence

$$\lim_{i\to\infty}(x_i\cdot y_i) \text{ exists and } \lim_{i\to\infty}(x_i\cdot y_i) = \left(\lim_{i\to\infty} x_i\right)\cdot\left(\lim_{i\to\infty} y_i\right)$$

$\boldsymbol{\lim\limits_{i\to\infty} x_i \in \mathbb{R}\setminus\{0\} \wedge \lim\limits_{i\to\infty} y_i = \infty}$**.** Define $\{x_i'\}_{i\in\{k,\ldots,\infty\}}$, $\{y_i'\}_{i\in\{k,\ldots,\infty\}}$ by $x_i' = y_i \wedge y_i' = x_i$. Then this cases reduces to the case $\lim\limits_{i\to\infty} x_i = \infty \wedge \lim\limits_{i\to\infty} y_i \in \mathbb{R}\setminus\{0\}$ hence

$$\lim_{i\to\infty}(x_i'\cdot y_i') \text{ exists and } \lim_{i\to\infty}(x_i'\cdot y_i') = \left(\lim_{i\to\infty} x_i'\right)\cdot\left(\lim_{i\to\infty} y_i'\right) = \left(\lim_{i\to\infty} y_i\right)\cdot\left(\lim_{i\to\infty} x_i\right)$$

so that

$$\lim_{i\to\infty}(x_i\cdot y_i) = \lim_{i\to\infty}(y_i\cdot x_i) = \lim_{i\to\infty}(x_i'\cdot y_i') \text{ exist and } \lim_{i\to\infty}(x_i\cdot y_i) = \left(\lim_{i\to\infty} y_i\right)\cdot\left(\lim_{i\to\infty} x_i\right)$$

$\boldsymbol{\lim\limits_{i\to\infty} x_i = \infty \wedge \lim\limits_{i\to\infty} y_i = \infty}$**.** Let $C \in \mathbb{R}^+$ then by [theorem: 20.76] there exists $N_1, N_2 \in \{k,\ldots,\infty\}$ such that

$$\forall i \in \{N_1,\ldots,\infty\}\ 1 < x_i \text{ and } \forall i \in \{N_2,\ldots,\infty\}\ (C+1) < y_i$$

Take $N = \max(N_1, N_2)$ then we have by [theorem: 20.37] that $C+1 \leqslant (C+1)\cdot x_i$ and $(C+1)\cdot x_i \leqslant x_i\cdot y_i$ so that

$$C < C+1 \leqslant x_i\cdot y_i$$

Hence using [theorem: 20.76] it follows that $\lim\limits_{i\to\infty}(x_i\cdot y_i)$ exists and

$$\lim_{i\to\infty}(x_i\cdot y_i) = \infty = \infty\cdot\infty = \left(\lim_{i\to\infty} x_i\right)\cdot\left(\lim_{i\to\infty} y_i\right)$$

$\boldsymbol{\lim\limits_{i\to\infty} x_i - \infty \wedge \lim\limits_{i\to\infty} y_i = \infty}$**.** Let $C \in \mathbb{R}^+$ then by [theorem: 20.76] there exists $N_1, N_2 \in \{k,\ldots,\infty\}$ such that

$$\forall i \in \{N_1,\ldots,\infty\}\ x_i < -1 \Rightarrow 1 < -x_i \text{ and } \forall i \in \{N_2,\ldots,\infty\}\ (C+1) < y_i$$

Let $N = \max(N_1, N_2)$ then by [theorem: 20.37] $(C+1) \leqslant (-x_i)\cdot(C+1)$ and $(-x_i)\cdot(C+1) \leqslant (-x_i)\cdot y_i = -(x_i\cdot y_i)$, hence

$$C < C+1 \leqslant -(x_i\cdot y_i)$$

By [theorem: 20.76] it follows that $\lim\limits_{i\to\infty}(-(x_i\cdot y_i)) = \infty$, hence by (3) we have that

$$\lim_{i\to\infty}(x_i\cdot y_i) = -\infty = -\infty\cdot\infty = \left(\lim_{i\to\infty} x_i\right)\cdot\left(\lim_{i\to\infty} y_i\right)$$

$\boldsymbol{\lim_{i\to\infty} x_i \in \mathbb{R}\setminus\{0\} \wedge \lim_{i\to\infty} y_i = -\infty}$**.** Define $\{x_i'\}_{i\in\{k,\ldots,\infty\}}$, $\{y_i'\}_{i\in\{k,\ldots,\infty\}}$ by $x_i' = y_i \wedge y_i' = x_i$. Then this cases reduces to the case $\lim_{i\to\infty} x_i = -\infty \wedge \lim_{i\to\infty} y_i \in \mathbb{R}\setminus\{0\}$ hence

$$\lim_{i\to\infty}(x_i'\cdot y_i') \text{ exists and } \lim_{i\to\infty}(x_i'\cdot y_i') = \left(\lim_{i\to\infty} x_i'\right)\cdot\left(\lim_{i\to\infty} y_i'\right) = \left(\lim_{i\to\infty} y_i\right)\cdot\left(\lim_{i\to\infty} x_i\right)$$

so that

$$\lim_{i\to\infty}(x_i\cdot y_i) = \lim_{i\to\infty}(y_i\cdot x_i) = \lim_{i\to\infty}(x_i'\cdot y_i') \text{ exist and } \lim_{i\to\infty}(x_i\cdot y_i) = \left(\lim_{i\to\infty} y_i\right)\cdot\left(\lim_{i\to\infty} x_i\right)$$

$\boldsymbol{\lim_{i\to\infty} x_i = -\infty \wedge \lim_{i\to\infty} y_i = -\infty}$**.** Let $C \in \mathbb{R}^+$ then by [theorem: 20.76] there exists $N_1, N_2 \in \{k,\ldots,\infty\}$ such that

$$\forall i \in \{N_1,\ldots,\infty\}\ x_i < -1 \Rightarrow 1 < -x_i \text{ and } \forall i \in \{N_2,\ldots,\infty\}\ y_i < -(C+1) \Rightarrow C+1 < -y_i$$

Take $N = \max(N_1, N_2)$ then we have by [theorem: 20.37] that $C+1 \leqslant (C+1)\cdot(-x_i)$ and $(C+1)\cdot(-x_i) \leqslant (-x_i)\cdot(-y_i) = x_i\cdot y_i$ so that

$$C < C+1 \leqslant x_i\cdot y_i$$

Hence using [theorem: 20.76] it follows that $\lim_{i\to\infty}(x_i\cdot y_i)$ exists and

$$\lim_{i\to\infty}(x_i\cdot y_i) = \infty = (-\infty)\cdot(-\infty) = \left(\lim_{i\to\infty} x_i\right)\cdot\left(\lim_{i\to\infty} y_i\right)$$

$\boldsymbol{\lim_{i\to\infty} x_i = \infty \wedge \lim_{i\to\infty} y_i = -\infty}$**.** Define $\{x_i'\}_{i\in\{k,\ldots,\infty\}}$, $\{y_i'\}_{i\in\{k,\ldots,\infty\}}$ by $x_i' = y_i \wedge y_i' = x_i$. Then this cases reduces to the case $\lim_{i\to\infty} x_i = -\infty \wedge \lim_{i\to\infty} y_i = \infty$ hence

$$\lim_{i\to\infty}(x_i'\cdot y_i') \text{ exists and } \lim_{i\to\infty}(x_i'\cdot y_i') = \left(\lim_{i\to\infty} x_i'\right)\cdot\left(\lim_{i\to\infty} y_i'\right) = \left(\lim_{i\to\infty} y_i\right)\cdot\left(\lim_{i\to\infty} x_i\right)$$

so that

$$\lim_{i\to\infty}(x_i\cdot y_i) = \lim_{i\to\infty}(y_i\cdot x_i) = \lim_{i\to\infty}(x_i'\cdot y_i') \text{ exist and } \lim_{i\to\infty}(x_i\cdot y_i) = \left(\lim_{i\to\infty} y_i\right)\cdot\left(\lim_{i\to\infty} x_i\right)$$ □

Next we prove that if $\lim_{i\to\infty} x_i$ exists then $\lim_{i\to\infty}\frac{1}{x^i}$ exist and $\lim_{i\to\infty}\frac{1}{x^i} = \frac{1}{\lim_{i\to\infty} x_i}$. To do this we must first prove a little lemma.

Lemma 20.81. *Let $k \in \mathbb{N}_0$ and $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq \overline{\mathbb{R}}$ be sequence of extended real numbers such that $\forall i \in \{k,\ldots,\infty\}\ x_i \neq 0$ and $\lim_{i\to\infty} x_i$ exists and $0 \neq \lim_{i\to\infty} x_i \in \mathbb{R}$ then $0 < \inf(\{|x_i| | i \in \{k,\ldots,\infty\}\})$*

Proof. Take $x = \lim_{i\to\infty} x_i$ and define $\varepsilon = \frac{|x|}{2} \in \mathbb{R}^+$. As $\lim_{i\to\infty} x_i \in \mathbb{R}$ if follows from [theorem: 20.76] that there exist a $N \in \{k,\ldots,\infty\}$ such that

$$\forall i \in \{N,\ldots,\infty\} \text{ we have } |x_i - x| < \varepsilon$$

Assume that $\exists i \in \{N,\ldots,\infty\}$ such that $|x_i| < \varepsilon$ then we have

$$|x| = |x - x_i + x_i| \leqslant |x - x_i| + |x_i| < \varepsilon + \varepsilon = 2\cdot\varepsilon = 2\cdot\frac{|x|}{2} = |x|$$

giving the contradiction $|x| < |x$. Hence the assumption is wrong and we must have that

$$\forall i \in \{N,\ldots,\infty\}\ \varepsilon \leqslant |x_i|$$

Take $M' = \min(\{|x_i| | i \in \{k,\ldots,N\}\})$ then as $\forall i \in \{k,\ldots,\infty\}\ x_i \neq 0$ it follows that $M' \in \mathbb{R}^+$. Take $M = \min(M',\varepsilon) \in \mathbb{R}^+$ then we have for $i \in \{k,\ldots,\infty\}$ either:

$\boldsymbol{i \in \{k,\ldots,N\}}$**.** Then $|x_i| \geqslant M' \geqslant M$

$\boldsymbol{i \in \{N+1,\ldots,\infty\}}$**.** Then $i \in \{N,\ldots,\infty\}$ so that $|x_i| \geqslant \varepsilon \geqslant M$

hence $\forall i \in \{k,\ldots,\infty\}\ |x_i| \geqslant M$ or M is a lower bound of $\{|x_i| | i \in \{k,\ldots,\infty\}\}$ proving that

$$\inf(\{|x_i| | i \in \{k,\ldots,\infty\}\}) \geqslant M > 0$$ □

Theorem 20.82. *Let $k \in \mathbb{N}_0$ and $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq \overline{\mathbb{R}}$ be sequence of extended real numbers such that $\lim_{i\to\infty} x_i$ exists and $\lim_{i\to\infty} x_i \neq 0$ then there exist a $n \in \{k,\ldots,\infty\}$ such that $\forall i \in \{n,\ldots,\infty\}\ x_i \neq 0$ and for $\left\{\frac{1}{x_i}\right\}_{i\in\{n,\ldots,\infty\}} \subseteq \overline{\mathbb{R}}$ we have that*

$$\lim_{i\to\infty}\frac{1}{x_i} \text{ exists and } \lim_{i\to\infty}\frac{1}{x_i} = \frac{1}{\lim_{i\to\infty} x_i}$$

Proof. Let $x = \lim_{i\to\infty} x_i$ then we have either:

$\boldsymbol{x=\infty}$**.** Then by [theorem: 20.76] there exists a $n \in \{k,...,\infty\}$ such that $\forall i \in \{n,\ldots,\infty\}$ we have $0<1<x_i$ hence $\left\{\frac{1}{x_i}\right\}_{i\in\{n,\ldots,\infty\}}$ is well defined. Take $\varepsilon \in \mathbb{R}^+$ then by [theorem: 10.30] there exist a $C \in \mathbb{N}$ such that $0<\frac{1}{C}<\varepsilon$. As $\lim_{i\to\infty} x_i = \infty$ there exist a $m \in \{k,\ldots,\infty\}$ such that $\forall i \in \{m,\ldots,\infty\}$ $0<C<x_i$. Take $N = \max(m,n)$ then for $i \in \{N,\ldots,\infty\}$ we have by [theorem: 20.33] that $0<\frac{1}{x_i} \leqslant \frac{1}{C} < \varepsilon$, as $\frac{1}{x_i} = \left|\frac{1}{x_i} - 0\right|$, that $\left|\frac{1}{x_i} - 0\right| < \varepsilon$. Hence by [theorem: 20.76] it follows that

$$\lim_{i\to\infty} \frac{1}{x_i} \text{ exist and } \lim_{i\to\infty} \frac{1}{x_i} = 0 = \frac{1}{\infty} = \frac{1}{\lim_{i\to\infty} x_i}$$

$\boldsymbol{x=-\infty}$**.** Let $\varepsilon \in \mathbb{R}^+$. Then by [theorem: 20.76] there exists a $n \in \{k,\ldots,\infty\}$ such that $\forall i \in \{n,\ldots,\infty\}$ we have $x_i < -1 < 0$ hence $\left\{\frac{1}{x_i}\right\}_{i\in\{n,\ldots,\infty\}}$ is well defined. Take $\varepsilon \in \mathbb{R}^+$ then by [theorem: 10.30] there exist a $C \in \mathbb{N}$ such that $0<\frac{1}{C}<\varepsilon$. As $\lim_{i\to\infty} x_i = -\infty$ there exist a $m \in \{k,\ldots,\infty\}$ such that $x_i < -C$. Take $N = \max(m,n)$ then for $i \in \{N,\ldots,\infty\}$ we have that $x_i < 0 \Rightarrow 0 < -x_i$ and $x_i < -C \Rightarrow 0 < C < -x_i$. Applying [theorem: 20.33] it follows that $0 < -\frac{1}{x_i} < \frac{1}{C}$ so that $\left|\frac{1}{x_i} - 0\right| = -\frac{1}{x_i} < \frac{1}{C} = \varepsilon$. Hence by [theorem: 20.76] it follows that

$$\lim_{i\to\infty} \frac{1}{x_i} \text{ exist and } \lim_{i\to\infty} \frac{1}{x_i} = 0 = \frac{1}{-\infty} = \frac{1}{\lim_{i\to\infty} x_i}$$

$\boldsymbol{x \in \mathbb{R}\setminus\{0\}}$**.** Let $\delta = \frac{|x|}{2}$ then as $x \neq 0$ we have that $\delta \in \mathbb{R}^+$so that by [theorem: 20.76] there exist a $n \in \{k,\ldots,\infty\}$ such that $\forall i \in \{n,...,\infty\}$ we have $|x - x_i| < \delta = \frac{|x|}{2}$. Assume that there exist a $i \in \{n,...,\infty\}$ such that $x_i = 0$ then $|x| = |x-0| = |x - x_i| < \delta = \frac{|x|}{2}$ a contradiction. So the assumption is false and we must have that $\forall i \in \{n,\ldots,\infty\}$ $|x_i| \neq 0$. By [lemma: 20.81] we have that $I = \inf(\{|x_i| | i \in \{n,\ldots,\infty\}\}) \in \mathbb{R}^+$. Hence

$$\forall i \in \{n,\ldots,\infty\}\, 0<\text{I}<=|\text{x_i}$$

Take now $\varepsilon \in \mathbb{R}^+$ then by [theorem: 20.76] there exist a $M \in \{n,\ldots,\infty\}$ such that

$$\forall i \in \{M,\ldots,\infty\}\, |x_i - x| < \varepsilon \cdot |x| \cdot I$$

Take $M = \max(n,M)$ then $\forall i \in \{N,\ldots,\infty\}$ we have $|x_i - x| < \varepsilon \cdot |x| \cdot I < \varepsilon \cdot |x| \cdot |x_i|$ so that

$$\left|\frac{1}{x_i} - \frac{1}{x}\right| = \left|\frac{x - x_i}{x_i \cdot x}\right| = \frac{|x - x_i|}{|x| \cdot |x_i|} \leqslant \frac{|x - x_i|}{|x| \cdot I} < \frac{\varepsilon \cdot |x| \cdot |x_i|}{|x| \cdot |x_i|} = \varepsilon$$

which by [theorem: 20.76] proves that

$$\lim_{i\to\infty} \frac{1}{x_i} \text{ exist and } \lim_{i\to\infty} \frac{1}{x_i} = \frac{1}{x} = \frac{1}{\lim_{i\to\infty} x_o}$$

□

20.1.5 Series of non negative sequences

We want to deal with series in $\overline{\mathbb{R}}$ however there is a complication $\langle\overline{\mathbb{R}},+\rangle$ is not a semi-group so that a partial sum $\sum_{i=0}^{n} x_i$ is not always defined. However by [theorem: 20.26] $\langle\mathbb{R}_0^+,+\rangle$ is a commutative semi-group so if we limit ourselves to non negative extended real numbers than we can use everything defined in [Section: 11.1]. If we limit ourselves to non negative extended real numbers then if $\{x_i\}_{i\in\mathbb{N}_0} \subseteq \mathbb{R}_0^+$ $\{\sum_{i=0}^{n} x_i\}_{n\in\mathbb{N}_0}$ is a increasing sequence, as series are defined as $\lim_{n\to\infty} \sum_{i=0}^{\infty} x_i$ it makes sense to study first limits of increasing/decreasing sequences.

Lemma 20.83. *Let $k \in \mathbb{N}_0$, $\{x_i\}_{i\in\{k,\ldots,\infty\}} \subseteq \overline{\mathbb{R}}$ then we have:*

1. *If $\{x_i\}_{i\in\{k,\ldots,\infty\}}$ is increasing [in other words $\forall i \in \{k,\ldots,\infty\}$ we have $x_i \leqslant x_{i+1}$] then*

$$\forall n \in \{k,\ldots,\infty\} \text{ we have } \sup(\{x_i | i \in \{n,\ldots,\infty\}\}) = \sup(\{x_i | i \in \{k,\ldots,\infty\}\})$$

2. *If $\{x_i\}_{i\in\{k,\ldots,\infty\}}$ is decreasing [in other words $\forall i \in \{k,\ldots,\infty\}$ we have $x_{i+1} \leqslant x_i$] then*

$$\forall n \in \{k,\ldots,\infty\} \text{ we have } \inf(\{x_i | i \in \{n,\ldots,\infty\}\}) = \inf(\{x_i | i \in \{k,\ldots,\infty\}\})$$

Proof. Let $n \in \{k, \ldots, \infty\}$ then we have:

1. As $\{x_i | i \in \{n, \ldots, \infty\}\} \subseteq \{x_i | i \in \{k, \ldots, \infty\}\}$we have by [theorem: 3.77] that

$$\sup(\{x_i | i \in \{n, \ldots, \infty\}\}) \leqslant \sup(\{x_i | i \in \{k, \ldots, \infty\}\}) \tag{20.32}$$

Next if $x \in \{x_i | i \in \{k, \ldots, \infty\}\}$ then there exist a $i \in \{k, \ldots, \infty\}$ such that $x = x_i$, for i we have either:

$i \in \{k, \ldots, n-1\}$. Then $x = x_i \underset{i \leqslant n-1 < n}{\leqslant} x_n \in \{x_i | i \in \{n, \ldots, \infty\}\}$

$i \in \{n, \ldots, \infty\}$. Then $x = x_i \in \{x_i | i \in \{n, \ldots, \infty\}\}$

so in all cases there exist a $y \in \{x_i | i \in \{n, \ldots, \infty\}\}$ such that $x \leqslant y$. Hence by [theorem: 3.78] it follows that $\sup(\{x_i | i \in \{k, \ldots, \infty\}\}) \leqslant \sup(\{x_i | i \in \{n, \ldots, \infty\}\})$. Combining this with [eq: 20.32] proves that

$$\sup(\{x_i | i \in \{n, \ldots, \infty\}\}) = \sup(\{x_i | i \in \{k, \ldots, \infty\}\})$$

2. As $\{x_i | i \in \{n, \ldots, \infty\}\} \subseteq \{x_i | i \in \{k, \ldots, \infty\}\}$we have by [theorem: 3.77] that

$$\inf(\{x_i | i \in \{k, \ldots, \infty\}\}) \leqslant \inf(\{x_i | i \in \{n, \ldots, \infty\}\}) \tag{20.33}$$

Next if $x \in \{x_i | i \in \{k, \ldots, \infty\}\}$ then there exist a $i \in \{k, \ldots, \infty\}$ such that $x = x_i$, for i we have either:

$i \in \{k, \ldots, n-1\}$. Then $x = x_i \underset{i \leqslant n-1 < n}{\geqslant} x_n \in \{x_i | i \in \{n, \ldots, \infty\}\}$

$i \in \{n, \ldots, \infty\}$. Then $x = x_i \in \{x_i | i \in \{n, \ldots, \infty\}\}$

so in all cases there exist a $y \in \{x_i | i \in \{n, \ldots, \infty\}\}$ such that $y \leqslant x$. Hence by [theorem: 3.78] it follows that $\inf(\{x_i | i \in \{k, \ldots, \infty\}\}) \geqslant \inf(\{x_i | i \in \{n, \ldots, \infty\}\})$. Combining this with [eq: 20.33] proves that

$$\inf(\{x_i | i \in \{n, \ldots, \infty\}\}) = \inf(\{x_i | i \in \{k, \ldots, \infty\}\})$$

□

Theorem 20.84. *Let $k \in \mathbb{N}_0$, $\{x_i\}_{i \in \{k, \ldots, \infty\}} \subseteq \overline{\mathbb{R}}$ then we have:*

1. *If $\{x_i\}_{i \in \{k, \ldots, \infty\}}$ is increasing [in other words $\forall i \in \{k, \ldots, \infty\}$ we have $x_i \leqslant x_{i+1}$] then*

$$\lim_{i \to \infty} x_i \text{ exist and } \lim_{i \to \infty} x_i = \sup(\{x_i | i \in \{k, \ldots, \infty\}\})$$

2. *If $\{x_i\}_{i \in \{k, \ldots, \infty\}}$ is decreasing [in other words $\forall i \in \{k, \ldots, \infty\}$ we have $x_{i+1} \leqslant x_i$] then*

$$\lim_{i \to \infty} x_i \text{ exist and } \lim_{i \to \infty} x_i = \inf(\{x_i | i \in \{k, \ldots, \infty\}\})$$

Proof.

1. First

$$\begin{aligned} \limsup_{i \to \infty} x_i &= \inf(\{\sup(\{x_i | i \in \{l, \ldots, \infty\}\}) | l \in \{k, \ldots, \infty\}\}) \\ &\underset{\text{[lemma: 20.83]}}{=} \inf(\{\sup(\{x_i | i \in \{k, \ldots, \infty\}\})\}) \\ &= \sup(\{x_i | i \in \{k, \ldots, \infty\}\}) \end{aligned} \tag{20.34}$$

Next as $\{x_i\}_{i \in \{k, \ldots, \infty\}}$ is increasing we have for $l \in \{k, \ldots, \infty\}$ that $\forall i \in \{l, \ldots, \infty\}$ that $x_l \leqslant x_i$ so that $\inf(\{x_i | i \in \{l, \ldots, \infty\}\}) \leqslant x_l \leqslant \inf(\{x_i | i \in \{l, \ldots, \infty\}\})$ proving that

$$x_l = \inf(\{x_i | i \in \{l, \ldots, \infty\}\}) \tag{20.35}$$

So

$$\begin{aligned} \liminf_{i \to \infty} x_i &= \sup(\{\inf(\{x_i | i \in \{l, \ldots, \infty\}\}) | l \in \{k, \ldots, \infty\}\}) \\ &\underset{\text{[eq: 20.35]}}{=} \sup(\{x_l | l \in \{k, \ldots, \infty\}\}) \\ &\underset{\text{[eq: 20.34]}}{=} \limsup_{i \to \infty} x_i \end{aligned}$$

so that

$$\lim_{i \to \infty} x_i \text{ exist and } \lim_{i \to \infty} x_i = \sup(\{x_l | l \in \{k, \ldots, \infty\}\})$$

2. First

$$\begin{aligned}\liminf_{i\to\infty} x_i &= \sup\left(\left\{\inf\left(\left\{x_i | i\in\{l,\ldots,\infty\}\right\}\right) | l\in\{k,\ldots,\infty\}\right\}\right)\\ &\underset{\text{[lemma: 20.83]}}{=} \sup\left(\left\{\inf\left(\left\{x_i | i\in\{k,\ldots,\infty\}\right\}\right)\right\}\right)\\ &= \inf\left(\left\{x_i | i\in\{k,\ldots,\infty\}\right\}\right) \end{aligned} \tag{20.36}$$

Next as $\{x_i\}_{i\in\{k,\ldots,\infty\}}$ is decreasing we have for $l\in\{k,\ldots,\infty\}$ that $\forall i\in\{l,\ldots,\infty\}$ that $x_i\leqslant x_l$ so that $\sup\left(\left\{x_i | i\in\{l,\ldots,\infty\}\right\}\right)\leqslant x_l\leqslant\sup\left(\left\{x_i | i\in\{l,\ldots,\infty\}\right\}\right)$ proving that

$$x_l=\sup\left(\left\{x_i | i\in\{l,\ldots,\infty\}\right\}\right) \tag{20.37}$$

So

$$\begin{aligned}\limsup_{i\to\infty} x_i &= \inf\left(\left\{\sup\left(\left\{x_i | i\in\{l,\ldots,\infty\}\right\}\right) | l\in\{k,\ldots,\infty\}\right\}\right)\\ &\underset{\text{[eq: 20.37]}}{=} \inf\left(\left\{x_l | l\in\{k,\ldots,\infty\}\right\}\right)\\ &\underset{\text{[eq: 20.36]}}{=} \liminf_{i\to\infty} x_i \end{aligned}$$

so that

$$\lim_{i\to\infty} x_i \text{ exist and } \lim_{i\to\infty} x_i=\inf\left(\left\{x_l | l\in\{k,\ldots,\infty\}\right\}\right)$$ □

To be able to define the infinite sum of non negative extended we must prove that the partial sums area increasing. For this we extend [theorem: 11.55] to be valid for the extended real numbers.

Theorem 20.85. *We have for families of non negative numbers [members of* $[0,\infty]=\mathbb{R}^+\bigcup\{0\}$ *that:*

1. *If* $n\in\mathbb{N}_0$ *and* $\{x_i\}_{i\in\{0,\ldots,n\}}\subseteq[0,\infty]$ *a finite family of non negative extended real numbers then*
$$0\leqslant\sum_{i=0}^{n} x_i$$
2. *If* I *is a finite set and* $\{x_i\}_{i\in I}\subseteq[0,\infty]$ *a finite family of non negative extended real numbers then*
$$0\leqslant\sum_{i\in I} x_i$$
3. *If* $n\in\mathbb{N}_0$ *and* $\{x_i\}_{i\in\{0,\ldots,n\}}\subseteq[0,\infty]$, $\{y_i\}_{i\in\{0,\ldots,n\}}\subseteq[0,\infty]$ *be finite families of non negative extended real numbers such that* $\forall i\in\{0,\ldots,n\}$ $x_i\leqslant y_i$ *then*
$$\sum_{i=0}^{n} x_i\leqslant\sum_{i=0}^{n} y_i$$
4. *If* I *is a finite set and* $\{x_i\}_{i\in I}\subseteq[0,\infty]$, $\{y_i\}_{i\in I}\subseteq[0,\infty]$ *be finite families of non negative extended real numbers such that* $\forall i\in I$ $x_i\leqslant y_i$ *then*
$$\sum_{i=0}^{n} x_i\leqslant\sum_{i=0}^{n} y_i$$
5. *If* $n,m\in\mathbb{N}_0$ *and* $\{x_i\}_{i\in n+m}\subseteq[0,\ldots,\infty]$ *then*
$$\sum_{i=0}^{n} x_i\leqslant\sum_{i=0}^{n+m} x_i$$
6. *If* I *is a finite set,* $J\subseteq I$ *and* $\{x_i\}_{i\in I}\subseteq[0,\infty]$ *a finite family of non negative extended real numbers then*
$$\sum_{i\in J} x_i\leqslant\sum_{i\in I} x_i$$

Proof.

1. We use induction to prove this, so define
$$S=\left\{n\in\mathbb{N}_0 | \text{For every } \{x_i\}_{i\in\{0,\ldots,\infty\}}\subseteq[0,\infty] \text{ we have } 0\leqslant\sum_{i=0}^{n} x_i\right\}$$

then we have:

$0 \in S$. For $\{x_i\}_{i\in\{0\}} \subseteq [0,\infty]$ we have $0 \leqslant x_0$ so that $\sum_{i=0}^{0} x_i = x_0 \geqslant 0$ hence $0 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $\{x_i\}_{i\in\{0,\dots,n+1\}} \subseteq [0,\infty]$ be a family of non negative numbers then we have $0 \leqslant x_{n+1}$ and, as $n \in S$, that $0 \leqslant \sum_{i=0}^{n} x_i$. Hence we have

$$0 \underset{\text{[theorem: 20.29]}}{\leqslant} x_{n+1} + \sum_{i=0}^{n} x_i = \sum_{i=0}^{n+1} x_i$$

proving that $n+1 \in S$.

2. For I we have either

$I = \varnothing$. Then by [definition: 11.32] $0 = \sum_{i\in I} x_i$.

$I \neq \varnothing$. Then by [definition: 11.32] there exist a $n \in \mathbb{N}$ and a bijection $\beta\colon \{0,\dots,n-1\} \to I$ such that $\sum_{i\in I} x_i = \sum_{i=0}^{n-1} x_{\beta(i)}$. As by (1) we have that $0 \leqslant \sum_{i=0}^{n-1} x_{\beta(i)}$ so that $0 \leqslant \sum_{i\in I} x_i$.

Hence in all cases we have $0 \leqslant \sum_{i\in I} x_i$.

3. We use induction to prove this, so let

$$S = \left\{ n \in \mathbb{N}_0 \middle| \text{For every } \{x_i\}_{i\in\{0,\dots,\infty\}} \subseteq [0,\infty],\ \{y_i\}_{i\in\{0,\dots,\infty\}} \subseteq [0,\infty] \text{ with } \forall i \in \{0,\dots,n\}\ x_i \leqslant y_i \text{ we have } \sum_{i=0}^{n} x_i \leqslant \sum_{i=0}^{n} y_i \right\}$$

then we have:

$0 \in S$. For $\{x_i\}_{i\in\{0\}} \subseteq [0,\infty]$, $\{y_i\}_{i\in\{0\}} \subseteq [0,\infty]$ we have that $\sum_{i=0}^{0} x_i = x_0 \leqslant y_0 = \sum_{i=0}^{0} y_i$ proving that $0 \in S$.

$n \in S \Rightarrow n+1 \in S$. As $x_{n+1} \leqslant y_{n+1}$ and $\sum_{i=0}^{n} x_i \underset{n\in S}{\leqslant} \sum_{i=0}^{n} y_i$ we have

$$\sum_{i=0}^{n+1} x_i = x_{n+1} + \sum_{i=0}^{n} x_i \underset{\text{[theorem: 20.29]}}{\leqslant} y_{n+1} + \sum_{i=0}^{n} y_i = \sum_{i=0}^{n+1} y_i$$

proving that $n+1 \in S$.

4. For I we have either

$I = \varnothing$. Then by [definition: 11.32] $\sum_{i\in I} x_i = \sum_{i\in I} y_i$.

$I \neq \varnothing$. Then by [definition: 11.32] there exist a $n \in \mathbb{N}$ and a bijection $\beta\colon \{0,\dots,n-1\} \to I$ such that $\sum_{i\in I} x_i = \sum_{i=0}^{n-1} x_{\beta(i)}$ and $\sum_{i\in I} y_i = \sum_{i=0}^{n-1} y_{\beta(i)}$ As by (3) we have that $\sum_{i=0}^{n-1} x_{\beta(i)} \leqslant \sum_{i=0}^{n-1} y_{\beta(i)}$ so that $\sum_{i\in I} x_i \leqslant \sum_{i\in I} y_i$.

5.

$$\begin{aligned}
\sum_{i=0}^{n} x_i &\underset{\text{[theorem: 11.35]}}{=} \sum_{i\in\{0,\dots,n\}} x_i \\
&\underset{(2)\wedge\text{[theorem: 20.29]}}{\leqslant} \sum_{i\in\{0,\dots,n\}} x_i + \sum_{i\in\{n+1,\dots,n+m\}} x_i \\
&\underset{\text{[theorem: 11.43]}}{=} \sum_{i\in\{0,\dots,n+m\}} x_i \\
&\underset{\text{[theorem: 11.35]}}{=} \sum_{i=0}^{n+m} x_i
\end{aligned}$$

6.

$$\begin{aligned}
\sum_{i\in J} x_i &\underset{(2)\ \text{[theorem: 20.29]}}{\leqslant} \sum_{i\in J} x_i + \sum_{i\in I\setminus J} x_i \\
&\underset{\text{[theorem: 11.43]}}{=} \sum_{i\in I} x_i
\end{aligned}$$

□

Theorem 20.86. *Let $k \in \mathbb{N}_0$ and $\{x_i\}_{i \in \{k,\ldots,\infty\}} \subseteq [0,\infty]$ then for $\{\sum_{i=k}^{n} x_k\}_{n \in \{k,\ldots,\infty\}} \subseteq \overline{\mathbb{R}}$ we have*

$$\left\{\sum_{i=k}^{n} x_k\right\}_{n \in \{k,\ldots,\infty\}} \subseteq [0,\infty]$$

and

$$\lim_{n\to\infty}\sum_{i=k}^{n} x_i \text{ exist and } \lim_{n\to\infty}\sum_{i=k}^{n} x_i = \sup\left(\left\{\sum_{i=k}^{n} x_i | n \in \{k,\ldots,\infty\}\right\}\right)$$

Proof. Let $n \in \{k,\ldots,\infty\}$ then we have by [theorem: 20.85] that

$$0 \leqslant \sum_{i=0}^{n-k} x_{i+k} \underset{\text{[definition: 11.12]}}{=} \sum_{i=k}^{n} x_i$$

and

$$\begin{aligned}\sum_{i=k}^{n} x_i &\underset{\text{[definition: 11.12]}}{=} \sum_{i=0}^{n-k} x_{i+k} \\ &\underset{\text{[theorem: 20.85]}}{\leqslant} \sum_{i=0}^{(n-k)+1} x_{i+k} \\ &= \sum_{i=0}^{(n+1)-k} x_{i+k} \\ &= \sum_{i=k}^{n+1} x_i\end{aligned}$$

proving that $\{\sum_{i=k}^{n} x_i\}_{n \in \{k,\ldots,\infty\}} \subseteq [0,\infty]$ is a increasing sequence. By [theorem: 20.84] it follows then that

$$\lim_{n\to\infty}\sum_{i=k}^{n} x_i \text{ exist and } \lim_{n\to\infty}\sum_{i=k}^{n} x_n = \sup\left(\left\{\sum_{i=k}^{n} x_i | n \in \{k,\ldots,\infty\}\right\}\right)$$

□

The above theorem motivates the following definition for a denumerable sums.

Definition 20.87. *Let $k \in \mathbb{N}_0$ and let $\{x_i\}_{i \in \{k,\ldots,\infty\}} \subseteq [0,\infty]$ be a family of non negative extended real numbers then $\sum_{i=k}^{\infty} x_i$ is defined by*

$$\sum_{i=k}^{\infty} x_i = \lim_{n\to\infty}\sum_{i=k}^{n} x_i$$

***Note* 20.88.** *By [theorem: 20.86] $\lim_{n\to\infty}\sum_{i=k}^{n} x_i$ always exist so that $\sum_{i=k}^{\infty} x_i$ is always defined and that*

$$\sum_{i=k}^{\infty} x_i = \sup\left(\left\{\sum_{i=k}^{n} x_i | n \in \{k,\ldots,\infty\}\right\}\right) \in [0,\infty]$$

Example 20.89. Let $\{x_i\}_{i \in \{1,\ldots,\infty\}} \subseteq [0,\infty]$ defined by $x_i = 0$ then $\sum_{i=1}^{\infty} x_i = 0$

Proof. We have

$$\sum_{i=1}^{\infty} x_i = \sup\left(\left\{\sum_{i=k}^{n} x_i | n \in \{k,\ldots,\infty\}\right\}\right) = \sup(\{0\}) = 0$$

□

We prove now the usual properties for $\sum_{i=k}^{\infty} x_i$, first we extend [theorem: 11.8] to the set of extended real numbers:

Theorem 20.90. *Let $\alpha \in \mathbb{R}$ then we have:*

1. *If $k \in \mathbb{N}_0$, $n \in \{k,\ldots,\infty\}$ and $\{x_i\}_{i \in \{k,\ldots,n\}} \subseteq [0,\infty]$ then $\sum_{i=k}^{n} (\alpha \cdot x_i) = \alpha \cdot \sum_{i=k}^{\infty} x_i$*
2. *If I is a finite set, $\{x_i\}_{i \in I} \subseteq [0,\infty]$ then $\sum_{i \in I} (\alpha \cdot x_i) = \alpha \cdot \sum_{i \in I} x_i$*

Proof.

1. We use induction in the proof, so let

$$S=\left\{n\in\mathbb{N}_0|\text{For every }\{x_i\}_{i\in\{0,\ldots,n\}}\subseteq[0,\infty]\text{ we have }\sum_{i=0}^{n}(\alpha\cdot x_i)=\alpha\cdot\sum_{i=0}^{n}x_i\right\}$$

then we have:

$0\in S$. If $\{x_i\}_{i\in\{0\}}\subseteq[0,\infty]$ then $\sum_{i=0}^{0}(\alpha\cdot x_i)=\alpha\cdot x_0=\alpha\cdot\sum_{i=0}^{0}x_i$ proving that $0\in S$.

$n\in S\Rightarrow n+1\in S$. If $\{x_i\}_{i\in\{0,\ldots,n+1\}}\subseteq[0,\infty]$ then we have

$$\begin{aligned}\sum_{i=0}^{n+1}(\alpha\cdot x_i) &= \alpha\cdot x_{n+1}+\sum_{i=0}^{n}(\alpha\cdot x_i)\\ &\underset{n\in S}{=} \alpha\cdot x_{n+1}+\alpha\cdot\sum_{i=0}^{n}x_i\\ &\underset{\text{[theorem: 20.39]}}{=} \alpha\cdot\left(x_{n+1}+\sum_{i=0}^{n}x_i\right)\\ &= \alpha\cdot\sum_{i=0}^{n+1}x_i\end{aligned}$$

Hence using mathematical induction we have that

$$\forall\{x_i\}_{i\in\{0,\ldots,n\}}\subseteq[0,\infty],\ n\in\mathbb{N}_0\text{ we have }\sum_{i=0}^{n}(\alpha\cdot x_i)=\alpha\cdot\sum_{i=0}^{n}x_i \tag{20.38}$$

Let $k\in\mathbb{N}_0, n\in\{k,\ldots,\infty\}$ then we have

$$\sum_{i=k}^{n}(\alpha\cdot x_i)\underset{\text{[definition: 11.12]}}{=}\sum_{i=0}^{n-k}(\alpha\cdot x_{i+k})\underset{\text{[eq: 20.38]}}{=}\alpha\cdot\sum_{i=0}^{n-k}x_{i+k}\underset{\text{[definition: 11.12]}}{=}\alpha\cdot\sum_{i=k}^{n}x_i$$

2. For I we have either

$I=\varnothing$. Then by [definition: 11.32]

$$\alpha\cdot\sum_{i\in I}x_i=\alpha\cdot\sum_{i\in\varnothing}x_i=0=\sum_{i\in\varnothing}(\alpha\cdot x_i)=\sum_{i\in I}(\alpha\cdot x_i)$$

$I\neq\varnothing$. Then by [definition: 11.32] there exist a $n\in\mathbb{N}$ and a bijection $\beta:\{0,\ldots,n-1\}\to I$ such that $\sum_{i\in I}(\alpha\cdot x_i)=\sum_{i=0}^{n-1}(\alpha\cdot x_{\beta(i)})$ and $\sum_{i\in I}x_i=\sum_{i=0}^{n-1}x_{\beta(i)}$. As by (1) we have $\sum_{i=0}^{n-1}(\alpha\cdot x_{\beta(i)})=\alpha\cdot\sum_{i=0}^{n-1}x_{\beta(i)}$ it follows that $\sum_{i\in I}(\alpha\cdot x_i)=\alpha\cdot\sum_{i\in I}x_i$. □

Theorem 20.91. *Let $k\in\mathbb{N}_0$ then we have*

1. *If $\alpha\in\mathbb{R}$ and $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq[0,\infty]$ then $\sum_{i=k}^{\infty}(\alpha\cdot x_i)=\alpha\cdot\sum_{i=k}^{\infty}x_i$*
2. *If $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq[0,\infty]$, $\{y_i\}_{i\in\{k,\ldots,\infty\}}\subseteq[0,\infty]$ then $\sum_{i=k}^{\infty}(x_i+y_i)=\sum_{i=k}^{\infty}x_i+\sum_{i=k}^{\infty}y_i$.*
3. *If $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq[0,\infty]$, $\{y_i\}_{i\in\{k,\ldots,\infty\}}\subseteq[0,\infty]$ are such that $\forall i\in\{k,\ldots,\infty\}$ we have $x_i\leqslant y_i$ then $\sum_{i=k}^{\infty}x_i\leqslant\sum_{i=k}^{\infty}y_i$.*

Proof.

1. We have

$$\begin{aligned}\sum_{i=k}^{\infty}(\alpha\cdot x_i) &= \lim_{n\to\infty}\sum_{i=k}^{n}(\alpha\cdot x_i)\\ &\underset{\text{[theorem: 20.90]}}{=} \lim_{n\to\infty}\left(\alpha\cdot\sum_{i=k}^{n}x_i\right)\\ &\underset{\text{[theorem: 20.78]}}{=} \alpha\cdot\lim_{n\to\infty}\sum_{i=k}^{n}x_i\\ &= \alpha\cdot\sum_{i=k}^{\infty}x_i\end{aligned}$$

2. We have

$$\begin{aligned}\sum_{i=k}^{\infty}(x_i+y_i) &= \lim_{n\to\infty}\sum_{i=k}^{n}(x_i+y_i)\\ &\underset{\text{[theorem: 11.17]}}{=} \lim_{n\to\infty}\left(\sum_{i=k}^{n}x_i+\sum_{i=k}^{n}y_i\right)\\ &\underset{\text{[theorem: 20.78]}}{=} \lim_{n\to\infty}\sum_{i=k}^{\infty}x_i+\lim_{n\to\infty}\sum_{i=k}^{n}y_i\\ &= \sum_{i=k}^{\infty}x_i+\sum_{i=k}^{\infty}y_i\end{aligned}$$

3. Let $n\in\{k,\ldots,\infty\}$ then we have by [theorem: 20.85] that $\sum_{i=k}^{n}x_i\leqslant\sum_{i=k}^{n}y_k$ so that

$$\sum_{i=k}^{\infty}x_i=\lim_{n\to\infty}\sum_{i=k}^{n}x_i\underset{\text{[theorem: 20.78]}}{\leqslant}\lim_{n\to\infty}\sum_{i=k}^{n}y_i=\sum_{i=k}^{\infty}y_i$$

□

Theorem 20.92. *Let $k\in\mathbb{N}_0$, $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq[0,\infty]$ then for $l\in\{k,\ldots,\infty\}$ we have*

$$\sum_{i=k}^{\infty}x_i=\sum_{i=k}^{l}x_i+\sum_{i=l+1}^{\infty}x_i$$

Proof. Let $n\in\{l+1,\ldots,\infty\}$ then by [theorem: 11.23]

$$\sum_{i=k}^{n}x_i=\sum_{i=k}^{l}x_i+\sum_{i=l+1}^{n}x_i \tag{20.39}$$

Next we have

$$\begin{aligned}\sum_{i=k}^{\infty}x_i &= \lim_{n\to\infty}\sum_{i=k}^{n}x_i\\ &\underset{\text{[theorem: 20.77]}}{=} \lim_{n\to\infty}\sum_{i=k}^{n+(l+1)}x_i\\ &\underset{\text{[eq: 20.39]}}{=} \lim_{n\to\infty}\left(\sum_{i=k}^{l}x_i+\sum_{i=l+1}^{n+(l+1)}x_i\right)\\ &\underset{\text{[theorem: 20.78 (4)]}}{=} \sum_{i=k}^{l}x_i+\lim_{n\to\infty}\sum_{i=l+1}^{n+(l+1)}x_i\\ &\underset{\text{[theorem: 20.77]}}{=} \sum_{i=k}^{l}x_i+\lim_{n\to\infty}\sum_{i=l+1}^{n}x_i\\ &= \sum_{i=k}^{l}x_i+\sum_{i=l+1}^{\infty}x_i\end{aligned}$$

□

Theorem 20.93. *Let $k\in\mathbb{N}_0$, $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq[0,\infty]$ then if $\sigma:\{k,\ldots,\infty\}\to\{k,\ldots,\infty\}$ is a permutation then*

$$\sum_{i=k}^{\infty}x_i=\sum_{i=k}^{\infty}x_{\sigma(i)}$$

Proof. Let $\sigma:\{k,\ldots,\infty\}\to\{k,\ldots,\infty\}$ be a bijection. Let $s\in\{\sum_{i=k}^{n}x_{\sigma(i)}|n\in\{k,\ldots,\infty\}\}$ then there exist a $n\in\{k,\ldots,\infty\}$ such that

$$s=\sum_{i=k}^{n}x_{\sigma(i)}$$

Let $m_n = \max(\{\sigma(i)|i \in \{k,\dots,n\}\})$ then $\forall i \in \{k,\dots,n\}$ we have $\sigma(i) \leqslant m_n \Rightarrow \sigma(i) \in \{k,\dots,m_n\}$. Hence we have that

$$\sigma(\{k,\dots,n\}) = \{\sigma(i)|i \in \{k,\dots,n\}\} \subseteq \{k,\dots,m_n\} \tag{20.40}$$

As σ is injective it follows that

$$\sigma_{|\{k,\dots,n\}}: \{k,\dots,n\} \to \sigma(\{k,\dots,n\}) \text{ is a bijection}$$

$$\begin{aligned}
s &= \sum_{i=k}^{n} x_{\sigma(i)} \\
&\underset{\text{[theorem: 11.35]}}{=} \sum_{i \in \{k,\dots,n\}} x_{\sigma(i)} \\
&= \sum_{i \in \{k,\dots,m\}} x_{\sigma_{|\{k,\dots,n\}}(i)} \\
&\underset{\text{[theorem: 11.36]}}{=} \sum_{i \in \sigma(\{x,\dots,n\})} x_i \\
&\underset{\text{[eq: 20.40]\&[theorem: 20.85]}}{\leqslant} \sum_{i \in \{k,\dots,m_n\}} x_i \in \left\{\sum_{i=k}^{n} x_i | n \in \{k,\dots,\infty\}\right\}
\end{aligned}$$

So $\forall s \in \{\sum_{i=k}^{n} x_{\sigma(i)} | n \in \{k,\dots,\infty\}\}$ we found a $\sum_{i \in \{k,\dots,m_n\}} x_i \in \{\sum_{i=k}^{n} x_i | n \in \{k,\dots,\infty\}\}$ such that

$$s \leqslant \sum_{i \in \{k,\dots,m_n\}} x_i$$

Hence using [theorem: 3.78] it follows that

$$\sum_{i=k}^{\infty} x_{\sigma(i)} = \sup\left(\left\{\sum_{i=k}^{n} x_{\sigma(i)} | n \in \{k,\dots,\infty\}\right\}\right) \leqslant \sup\left(\left\{\sum_{i=k}^{n} x_i | n \in \{k,\dots,\infty\}\right\}\right) = \sum_{i=k}^{\infty} x_i$$

So we have proved that

$$\text{If } \sigma: \{k,\dots,\infty\} \to \{k,\dots,\infty\} \text{ is a bijection, } \{x_i\}_{i \in \{k,\dots,\infty\}} \subseteq [0,\infty] \text{ we have } \sum_{i=k}^{\infty} x_{\sigma(i)} \leqslant \sum_{i=k}^{\infty} x_i \tag{20.41}$$

For the opposite inequality if $\sigma: \{k,\dots,\infty\} \to \{k,\dots,\infty\}$ is a bijection then

$$\sum_{i=k}^{\infty} x_{\sigma(i)} \leqslant \sum_{i=k}^{\infty} x_i \tag{20.42}$$

and as $\sigma^{-1}: \{k,\dots,\infty\} \to \{k,\dots,\infty\}$ is a bijection we have also

$$\sum_{i=k}^{\infty} x_i = \sum_{i=k}^{\infty} x_{\sigma^{-1}(\sigma(i))} \leqslant \sum_{i=k}^{\infty} x_{\sigma(i)}$$

which combined with [eq: 20.42] gives

$$\sum_{i=k}^{\infty} x_i = \sum_{i=k}^{\infty} x_{\sigma(i)}$$

□

In analogy with [definition: 11.32] the above theorem allows us to define the sum of a denumerable set of extended non negative numbers.

Definition 20.94. *Let I be a denumerable set and $\{x_n\}_{n \in I}$ then $\sum_{i \in I} x_i$ is defined by*

$$\sum_{i \in I} x_i = \sum_{i=0}^{\infty} x_{\beta(i)}$$

where

$$\beta: \mathbb{N}_0 \to I \text{ is a bijection}$$

***Note* 20.95.** *As I is denumerable there exist a bijection from $\mathbb{N}_0$ to I. Further if $\gamma\colon \mathbb{N}_0 \to I$ is another bijection then we have that $\beta^{-1}\circ\gamma\colon \mathbb{N}_0 \to \mathbb{N}_0$ is a bijection so that*

$$\sum_{i=0}^{\infty} x_{\beta(i)} \underset{[theorem:\ 20.93]}{=} \sum_{i=0}^{\infty} x_{\beta((\beta^{-1}\circ\gamma)(i))} = \sum_{i=0}^{\infty} x_{\gamma(i)}$$

so that this definition is independent of the chosen bijection.

The next theorem shows how we can interchange sums.

Theorem 20.96. *Let $k, l \in \mathbb{N}$ then we have:*

1. *If $n \in \{k, \ldots, \infty\}$, $m \in \{l, \ldots, \infty\}$ and $\{x_{i,j}\}_{(i,j)\in\{k,\ldots,n\}\times\{l,\ldots,m\}} \subseteq [0,\infty]$ then*

$$\sum_{i=k}^{n}\left(\sum_{j=l}^{m} x_{i,j}\right) = \sum_{j=k}^{m}\left(\sum_{i=l}^{n} x_{i,j}\right)$$

2. *Let $n \in \{l, \ldots, \infty\}$ and $\{x_{i,j}\}_{(i,j)\in\{k,\ldots,\infty\}\times\{l,\ldots,n\}} \subseteq [0,\infty]$ then*

$$\sum_{i=k}^{\infty}\left(\sum_{j=l}^{n} x_{i,j}\right) = \sum_{j=k}^{n}\left(\sum_{i=l}^{\infty} x_{i,j}\right)$$

3. *Let $n \in \{l, \ldots, \infty\}$ and $\{x_{i,j}\}_{(i,j)\in\{l,\ldots,n\}\times\{k,\ldots,\infty\}} \subseteq [0,\infty]$ then*

$$\sum_{i=l}^{n}\left(\sum_{j=k}^{\infty} x_{i,j}\right) = \sum_{j=k}^{\infty}\left(\sum_{i=l}^{n} x_{i,j}\right)$$

4. *Let $\{x_{i,j}\}_{(i,j)\in\{k,\ldots,\infty\}\times\{l,\ldots,\infty\}} \subseteq [0,\infty]$ then*

$$\sum_{i=k}^{\infty}\left(\sum_{j=l}^{\infty} x_{i,j}\right) = \sum_{j=k}^{\infty}\left(\sum_{i=l}^{\infty} x_{i,j}\right)$$

Proof.

1. This was already proved in [theorem: 11.19].
2. We prove this by induction, so let

$$S = \left\{ n \in \{l, \ldots, \infty\} \text{If } \{x_{i,j}\}_{(i,j)\in\{k,\ldots,\infty\}\times\{l,\ldots,n\}} \subseteq [0,\infty] \text{ then } \sum_{i=k}^{\infty}\left(\sum_{j=l}^{n} x_{i,j}\right) = \sum_{j=k}^{n}\left(\sum_{i=l}^{\infty} x_{i,j}\right) \right\}$$

then we have:

***l* ∈ *S*.** Let $\{x_{i,j}\}_{(i,j)\in\{k,\ldots,\infty\}\times\{l\}} \subseteq [0,\infty]$ then we have

$$\begin{aligned}\sum_{i=k}^{\infty}\left(\sum_{j=l}^{l} x_{i,j}\right) &= \sum_{i=k}^{\infty} x_{i,l} \\ &= \sum_{j=l}^{l}\left(\sum_{i=k}^{\infty} x_{i,j}\right)\end{aligned}$$

so that $l \in S$.

$\boldsymbol{n \in S \to n+1 \in S}$**.** Let $\{x_{i,j}\}_{(i,j)\in\{k,\ldots,\infty\}\times\{l,\ldots,n+1\}} \subseteq [0,\infty]$ then we have

$$\begin{aligned}
\sum_{i=k}^{\infty}\left(\sum_{j=l}^{n+1} x_{i,j}\right) &= \sum_{i=k}^{\infty}\left(\sum_{j=l}^{n} x_{i,j} + x_{i,n+1}\right) \\
&\underset{\text{[theorem: 20.91]}}{=} \sum_{i=k}^{\infty}\left(\sum_{j=l}^{n} x_{i,j}\right) + \sum_{i=k}^{\infty} x_{i,n+1} \\
&\underset{n\in S}{=} \sum_{j=l}^{n}\left(\sum_{i=k}^{\infty} x_{i,j}\right) + \sum_{i=k}^{\infty} x_{i,n+1} \\
&= \sum_{j-l}^{n+1}\left(\sum_{i=k}^{\infty} x_{i,j}\right)
\end{aligned}$$

proving that $n+1 \in S$

3. Define $\{y_{(i,j)}\}_{(i,j)\in\{k,\ldots,n\}\times\{l,\ldots,\infty\}}$ by $y_{(i,j)} = x_{(j,i)}$ then we have

$$\begin{aligned}
\sum_{i=k}^{n}\left(\sum_{j=l}^{\infty} x_{i,j}\right) &= \sum_{i=k}^{n}\left(\sum_{j=l}^{\infty} y_{j,i}\right) \\
&\underset{(2)}{=} \sum_{j=l}^{\infty}\left(\sum_{i=k}^{n} y_{j,i}\right) \\
&= \sum_{j=l}^{\infty}\left(\sum_{i=k}^{n} x_{i,j}\right)
\end{aligned}$$

4. Let $n \in \{k,\ldots,\infty\}$ then

$$\begin{aligned}
\sum_{i=k}^{n}\left(\sum_{j=l}^{\infty} x_{i,j}\right) &\underset{(3)}{=} \sum_{j=l}^{\infty}\left(\sum_{i=k}^{n} x_{i,j}\right) \\
&\underset{\text{[theorem: 20.91]}}{\leqslant} \sum_{j=l}^{\infty} \sup\left(\left\{\sum_{i=k}^{n} x_{i,j} | n \in \{k,\ldots,\infty\}\right\}\right) \\
&\underset{\text{[definition: 20.87]}}{=} \sum_{j=l}^{\infty}\left(\sum_{i=k}^{\infty} x_{i,j}\right)
\end{aligned}$$

So $\sum_{j=l}^{\infty}(\sum_{i=k}^{\infty} x_{i,j})$ is a upper bound of $\{\sum_{i=k}^{n}(\sum_{j=l}^{\infty} x_{i,j}) | n \in \{k,\ldots,\infty\}\}$ from which it follows that

$$\sum_{i=k}^{\infty}\left(\sum_{j=l}^{\infty} x_{i,j}\right) = \sup\left(\sum_{i=k}^{n}\left(\sum_{j=l}^{\infty} x_{i,j}\right) | n \in \{k,\ldots,\infty\}\right) \leqslant \sum_{j=l}^{\infty}\left(\sum_{i=k}^{\infty} x_{i,j}\right) \tag{20.43}$$

For the opposite inequality take $m \in \{l,\ldots,\infty\}$ then we have

$$\begin{aligned}
\sum_{j=l}^{m}\left(\sum_{i=k}^{\infty} x_{i,j}\right) &\underset{(2)}{=} \sum_{i=k}^{\infty}\left(\sum_{j=l}^{m} x_{i,j}\right) \\
&\underset{\text{[theorem: 20.91]}}{\leqslant} \sum_{i=k}^{\infty} \sup\left(\left\{\sum_{j=l}^{m} x_{i,j} | m \in \{l,\ldots,\infty\}\right\}\right) \\
&\underset{\text{[definition: 20.87]}}{=} \sum_{i=k}^{\infty}\left(\sum_{j=l}^{\infty} x_{i,j}\right)
\end{aligned}$$

So $\sum_{i=k}^{\infty}(\sum_{j=l}^{\infty}x_{i,j})$ is a upper bound of $\{\sum_{j=l}^{m}(\sum_{i=k}^{\infty}x_{i,j})|m\in\{l,\dots,\infty\}\}$ proving that

$$\sum_{j=l}^{\infty}\left(\sum_{i=k}^{\infty}x_{i,j}\right)=\sup\left(\left\{\sum_{j=l}^{m}\left(\sum_{i=k}^{\infty}x_{i,j}\right)|m\in\{l,\dots,\infty\}\right\}\right)\leqslant\sum_{i=k}^{\infty}\left(\sum_{j=l}^{\infty}x_{i,j}\right)$$

Combining this with [eq: 20.43] proves

$$\sum_{i=k}^{\infty}\left(\sum_{j=l}^{\infty}x_{i,j}\right)=\sum_{j=l}^{\infty}\left(\sum_{i=k}^{\infty}x_{i,j}\right)$$

□

Every finite sum of denumerable sums can be written as a denumerable sum.

Lemma 20.97. *Let $k,l,m\in\mathbb{N}_0$ and $n\in\{k,\dots,\infty\}$, $\{x_{i,j}\}_{(i,j)\in\{k,\dots,n\}\times\{l,\dots,\infty\}}\subseteq[0,\infty]$ and*

$$\beta:\{m,\dots,\infty\}\to\{k,\dots,n\}\times\{l,\dots,\infty\}$$

a bijection then

$$\sum_{i=m}^{\infty}x_{\sigma(i)_1,\sigma(i)_2}=\sum_{j=l}^{\infty}\left(\sum_{i=k}^{n}x_{i,j}\right)\underset{[\text{theorem: } 20.96]}{=}\sum_{i=k}^{n}\left(\sum_{j=l}^{\infty}x_{i,j}\right)$$

***Note* 20.98.** *By [theorem: 6.65] there exist always a bijection between $\{m,\dots,\infty\}$ and $\{k,\dots,n\}\times\{l,\dots,\infty\}$ for a given $m\in\mathbb{N}_0$.*

Proof. Let $r\in\{m,\dots,\infty\}$ and define $N_r=\max(\{\beta(i)_2|i\in\{m,\dots,r\}\})\in\{l,\dots,\infty\}$ then if $i\in\{m,\dots,r\}$ we have that $\beta(i)_2\in\{k,\dots,N_r\}$ so that $\beta(i)=(\beta(i)_1,\beta(i)_2)\in\{k,\dots,n\}\times\{l,\dots,N_r\}$. Hence

$$\beta(\{m,\dots,r\})\subseteq\{k,\dots,n\}\times\{l,\dots,N_r\}$$

Further as β is a bijection

$$\beta_{|\{m,\dots,r\}}:\{m,\dots,r\}\to\beta(\{m,\dots,r\})\text{ is a bijection}$$

Next

$$\begin{aligned}
\sum_{i=m}^{r}x_{\beta(i)_1,\beta(i)_2}&\underset{[\text{theorem: } 11.35]}{=}\sum_{i\in\{m,\dots,r\}}x_{\beta(i)_1,\beta(i)_2}\\
&=\sum_{i\in\{m,\dots,r\}}x_{\sigma_{|\{m,\dots,r\}}(i)_1,\sigma_{|\{m,\dots,r\}}(i)_2}\\
&\underset{[\text{theorem: } 11.36]}{=}\sum_{(i,j)\in\beta(\{m,\dots,r\})}x_{(i,j)_1,(i,j)_2}\\
&=\sum_{(i,j)\in\beta(\{m,\dots,r\})}x_{i,j}\\
&\underset{[\text{theorem: } 20.85]}{\leqslant}\sum_{(i,j)\in\{k,\dots,n\}\times\{l,\dots,N_r\}}x_{i,j}\\
&\underset{[\text{theorem: } 11.45]}{=}\sum_{i\in\{k,\dots,n\}}\left(\sum_{j\in\{l,\dots,N_r\}}x_{i,j}\right)\\
&\underset{[\text{theorem: } 11.35]}{=}\sum_{i=k}^{n}\left(\sum_{j=l}^{N_r}x_{i,j}\right)\\
&\underset{[\text{theorem: } 20.91]}{\leqslant}\sum_{i=k}^{n}\sup\left(\left\{\sum_{j=l}^{s}x_{i,j}|s\in\{l,\dots,\infty\}\right\}\right)\\
&=\sum_{i=k}^{n}\left(\sum_{j=l}^{\infty}x_{i,j}\right)
\end{aligned}$$

Hence as $r \in \{m, \ldots, \infty\}$ was chosen arbitrary it follows that

$$\sum_{i=m}^{\infty} x_{\beta(i)_1, \beta(i)_2} = \sup\left(\left\{\sum_{i=m}^{r} x_{\beta(i)_1, \beta(i)_2} | r \in \{m, \ldots, \infty\}\right\}\right) \leqslant \sum_{i=k}^{n}\left(\sum_{j=l}^{\infty} x_{i,j}\right) \tag{20.44}$$

For the opposite inequality. Let $r \in \{l, \ldots, \infty\}$ and take

$$M_r = \max\left((\beta^{-1})(\{k, \ldots, n\} \times \{l, \ldots, r\})\right) \in \{m, \ldots, \infty\}$$

So $(\beta^{-1})(\{k, \ldots, n\} \times \{l, \ldots, r\}) \subseteq \{m, \ldots, M_r\}$ hence

$$\{k, \ldots, n\} \times \{l, \ldots, r\} = \beta((\beta^{-1})(\{k, \ldots, n\} \times \{l, \ldots, r\})) \subseteq \beta(\{m, \ldots, M_r\}) \tag{20.45}$$

As β is a bijection it follows that

$$\beta_{|\{m, \ldots, M_r\}}: \{m, \ldots, M_r\} \to \beta(\{m, \ldots, M_r\})$$

$$\begin{aligned}
\sum_{j=l}^{r}\left(\sum_{i=k}^{n} x_{i,j}\right) &\underset{\text{[theorem: 20.96]}}{=} \sum_{i=k}^{n}\left(\sum_{j=l}^{r} x_{i,j}\right) \\
&\underset{\text{[theorem: 11.35]}}{=} \sum_{i \in \{k, \ldots, n\}}\left(\sum_{j \in \{l, \ldots, r\}} x_{i,j}\right) \\
&\underset{\text{[theorem: 11.45]}}{=} \sum_{(i,j) \in \{k, \ldots, n\} \times \{l, \ldots, r\}} x_{i,j} \\
&\underset{\text{[theorem: 20.91]} \wedge \text{[eq: 20.45]}}{\leqslant} \sum_{(i,j) \in \beta(m, \ldots, M_r)} x_{i,j} \\
&= \sum_{(i,j) \in \beta(m, \ldots, M_r)} x_{(i,j)_1, (i,j)_2} \\
&\underset{\text{[theorem: 11.36]}}{=} \sum_{i \in \{m, \ldots, M_r\}} x_{\beta_{|\{m, \ldots, M_r\}}(i)_1, \beta_{|\{m, \ldots, M_r\}}(i)_2} \\
&= \sum_{i \in \{m, \ldots, M_r\}} x_{\beta(i)_1, \beta(i)_2} \\
&\underset{\text{[theorem: 11.35]}}{=} \sum_{i=m}^{M_r} x_{\beta(i)_1, \beta(i)_2} \\
&\leqslant \sup\left(\left\{\sum_{i=m}^{s} x_{\beta(i)_1, \beta(i)_2} | s \in \{m, \ldots, \infty\}\right\}\right) \\
&= \sum_{i=m}^{\infty} x_{\beta(i)_1, \beta(i)_2}
\end{aligned}$$

Hence as $r \in \{l, \ldots, \infty\}$ was chosen arbitrary we have that

$$\sum_{j=l}^{\infty}\left(\sum_{i=k}^{n} x_{i,j}\right) = \sup\left(\left\{\sum_{j=l}^{s}\left(\sum_{i=k}^{n} x_{i,j}\right) | s \in \{l, \ldots, \infty\}\right\}\right) \leqslant \sum_{i=m}^{\infty} x_{\beta(i)_1, \beta(i)_2}$$

which combined with [eq: 20.44] proves that

$$\sum_{i=m}^{\infty} x_{\beta(i)_1, \beta(i)_2} = \sum_{j=l}^{\infty}\left(\sum_{i=k}^{n} x_{i,j}\right)$$

□

Next we extend the above theorem for arbitrary finite sums of different size.

Theorem 20.99. *Let $k, l \in \mathbb{N}_0$ and $\{x_{(i,j)}\}_{(i,j) \in \bigcup_{i \in \{k, \ldots, \infty\}} \{i\} \times \{n_i, \ldots, m_i\}} \subseteq [0, \infty]$ [where $\forall i \in \{k, \ldots, \infty\}$ we have $n_i \leqslant m_i$] then if*

$$\beta: \{l, \ldots, \infty\} \to \bigcup_{i \in \{k, \ldots, \infty\}} \{i\} \times \{n_i, \ldots, m_i\}$$

is a bijection then we have

$$\sum_{i=l}^{\infty} x_{\beta(i)_1,\beta(i)_2} = \sum_{i=k}^{\infty}\left(\sum_{j=n_i}^{m_i} x_{(i,j)}\right)$$

Proof. Let $i \in \{k,\ldots,\infty\}$ and define

$$\tau_i\colon \{n_i,\ldots,m_i\} \to \{i\} \times \{n_i,\ldots,m_i\} \text{ where } \tau_i(j) = (i,j) \text{ which is a bijection}$$

Proof.

injectivity. If $\tau_i(r) = \tau_i(s)$ then $(i,r) = (i,s)$ so that $r = s$.

surjectivity. If $(r,s) \in \{i\} \times \{n_i,\ldots,m_i\}$ then $s \in \{n_i,\ldots,m_i\}$ and $r = i$ so that $\tau_i(s) = (i,s) = (r,s)$ proving subjectivity. □

Further

$$\begin{aligned}
\sum_{(k,l)\in\tau_i(\{n_i,\ldots,m_i\})} x_{k,l} &\underset{[\text{theorem: } 11.36]}{=} \sum_{j\in\{n_i,\ldots,m_i\}} x_{\tau_i(j)_1,\tau_i(j)_2} \\
&= \sum_{j\in\{n_i,\ldots,m_i\}} x_{i,j} \\
&= \sum_{j=n_i}^{m_i} x_{i,j}
\end{aligned} \tag{20.46}$$

Let $m \in \{l,\ldots,\infty\}$ and define $N_m = \max(\beta(i)_1 | i \in \{l,\ldots,m\})$. If $i \in \{l,\ldots,m\}$ then, as $\beta(i) \in \bigcup_{j\in\{k,\ldots,\infty\}} \{j\} \times \{n_i,\ldots,m_i\}$ there exist a $j \in \{k,\ldots,\infty\}$ such that $j = \beta(i)_1 \leqslant N_m$ and $\beta(i)_2 \in \{n_j,\ldots,m_j\}$ proving that

$$\beta(\{l,\ldots,m\}) \subseteq \bigcup_{i\in\{k,\ldots,N_m\}} \{i\} \times \{n_i,\ldots,m_i\}$$

Further if $i,j \in \{k,\ldots,N_m\}$ with $i \neq j$ then $\{i\} \times \{n_i,\ldots,m_i\} \bigcap \{j\} \times \{n_j,\ldots,m_j\} = \varnothing$ hence we have

$$\beta(\{l,\ldots,m\}) \subseteq \bigsqcup_{i\in\{k,\ldots,N_m\}} \{i\} \times \{n_i,\ldots,m_i\} \text{ a disjoint union}$$

and as β is a bijection

$$\beta_{|\{l,\ldots,m\}}\colon \{l,\ldots,m\} \to \beta(\{l,\ldots,m\}) \text{ is a bijection}$$

$$\begin{aligned}
\sum_{i=l}^{m} x_{\beta(i)_1,\beta(i)_2} &\underset{[\text{theorem: } 11.35]}{=} \sum_{i\in\{l,\ldots,m\}} x_{\beta(i)_1,\beta(i)_2} \\
&= \sum_{i\in\{l,\ldots,m\}} x_{\beta_{|\{l,\ldots,m\}}(i)_1,\beta_{|\{l,\ldots,m\}}(i)_2} \\
&\underset{[\text{theorem: } 11.36]}{=} \sum_{(i,j)\in\beta(\{l,\ldots,m\})} x_{(i,j)_1,(i,j)_2} \\
&\underset{[\text{theorem: } 20.85]}{\leqslant} \sum_{(i,j)\in\bigsqcup_{i\in\{k,\ldots,N_m\}}\{i\}\times\{n_i,\ldots,m_i\}} x_{(i,j)_1,(i,j)_2} \\
&= \sum_{(i,j)\in\bigsqcup_{i\in\{k,\ldots,N_m\}}\{i\}\times\{n_i,\ldots,m_i\}} x_{i,j} \\
&\underset{[\text{theorem: } 11.44]}{=} \sum_{r\in\{k,\ldots,N_m\}}\left(\sum_{(i,j)\in\{r\}\times\{n_r,\ldots,m_r\}} x_{i,j}\right) \\
&= \sum_{r\in\{k,\ldots,N_m\}}\left(\sum_{j\in\{n_r,\ldots,m_r\}} x_{r,j}\right) \\
&\underset{[\text{theorem: } 11.35]}{=} \sum_{r=k}^{N_m}\left(\sum_{j=n_r}^{m_r} x_{r,j}\right)
\end{aligned}$$

$$\begin{aligned}
&\underset{\text{[theorem: 20.85]}}{\leqslant} \sup\left(\left\{\sum_{r=k}^{n}\left(\sum_{j=n_r}^{m_r} x_{r,j}\right)|n\in\{k,\ldots,\infty\}\right\}\right)\\
&= \sum_{r=k}^{\infty}\left(\sum_{j=n_r}^{m_r} x_{r,j}\right)
\end{aligned}$$

So $m\in\{l,\ldots,\infty\}$ was chosen arbitrary we have that

$$\sum_{i=l}^{\infty} x_{\beta(i)_1,\beta(i)_2}=\sup\left(\left\{\sum_{i=l}^{m} x_{\beta(i)_1,\beta(i)_2}|m\in\{l,\ldots,\infty\}\right\}\right)\leqslant\sum_{r=k}^{\infty}\left(\sum_{j=n_r}^{m_r} x_{r,j}\right) \tag{20.47}$$

For the opposite inequality take $m\in\{k,\ldots,\infty\}$ and take

$$M_m=\max\left(\left\{(\beta^{-1})\left(\bigcup_{i\in\{k,\ldots,m\}}\{i\}\times\{n_i,\ldots,m_i\}\right)\right\}\right)$$

then $(\beta^{-1})\left(\bigcup_{i\in\{k,\ldots,m\}}\{i\}\times\{n_i,\ldots,m_i\}\right)\subseteq\{l,\ldots,M_m\}$ then

$$\bigcup_{i\in\{k,\ldots,m\}}\{i\}\times\{n_i,\ldots,m_i\}=\beta\left((\beta^{-1})\left(\bigcup_{i\in\{k,\ldots,m\}}\{i\}\times\{n_i,\ldots,m_i\}\right)\right)\subseteq\beta(\{l,\ldots,M_m\}) \tag{20.48}$$

Next

$$\begin{aligned}
\sum_{r=k}^{m}\left(\sum_{j=n_r}^{m_r} x_{r,j}\right) &\underset{\text{[eq: 20.46]}}{=} \sum_{r=k}^{m}\left(\sum_{(i,j)\in\{r\}\times\{n_r,\ldots,m_r\}} x_{i,j}\right)\\
&= \sum_{r\in\{k,\ldots,m\}}\left(\sum_{(i,j)\in\{r\}\times\{n_r,\ldots,m_r\}} x_{i,j}\right)\\
&\underset{\text{[theorem: 11.44]}}{=} \sum_{(i,j)\in\bigcup_{r\in\{k,\ldots,m\}}(r)\times\{n_r,\ldots,m_r\}} x_{i,j}\\
&\underset{\text{[theorem: 20.85]}\wedge\text{[eq: 20.48]}}{\leqslant} \sum_{(i,j)\in\beta(\{l,\ldots,M_m\})} x_{i.j}\\
&= \sum_{(i,j)\in\beta(\{l,\ldots,M_m\})} x_{(i,j)_1.(i,j)_2}\\
&\underset{\text{[theorem: 11.36]}}{=} \sum_{i\in\{l,\ldots,M_m\}} x_{\beta(i)_1,\beta(i)_2}\\
&= \sum_{i=l}^{M_m} x_{\beta(i)_1,\beta(i)_2}\\
&\leqslant \sup\left(\left\{\sum_{i=l}^{n} x_{\beta(i)_1,\beta(i)_2}|n\in\{l,\ldots,\infty\}\right\}\right)\\
&= \sum_{i=l}^{\infty} x_{\beta(i)_1,\beta(i)_2}
\end{aligned}$$

As $m\in\{k,\ldots,\infty\}$ was chosen arbitrary it follows that

$$\sum_{r=k}^{\infty}\left(\sum_{j=n_r}^{m_r} x_{r,j}\right)=\sup\left(\left\{\sum_{r=k}^{n}\left(\sum_{j=n_r}^{m_r} x_{r,j}\right)|n\in\{r,\ldots,\infty\}\right\}\right)\leqslant\sum_{i=l}^{\infty} x_{\beta(i)_1,\beta(i)_2}$$

which combined with [eq: 20.47] proves that

$$\sum_{i=l}^{\infty} x_{\beta(i)_1,\beta(i)_2}=\sum_{r=k}^{\infty}\left(\sum_{j=n_r}^{m_r} x_{(r,j)}\right)$$

□

Theorem 20.100. *Let $k,l,n\in\mathbb{N}_0$ and $\{x_{i,j}\}_{(i,j)\in\{k,\dots,\infty\}\times\{l,\dots,\infty\}}\subseteq[0,\infty]$ and*

$$\beta\colon\{n,\dots,\infty\}\to\{k,\dots,\infty\}\times\{l,\dots,\infty\}\ \textit{a bijection}$$

then

$$\sum_{i=0}^{\infty}x_{\beta(i)_1,\beta(i)}=\sum_{i=k}^{\infty}\left(\sum_{j=l}^{\infty}x_{i,j}\right)$$

***Note* 20.101.** *By [theorem: 6.65] there exist always a bijection between $\{n,\dots,\infty\}$ and $\{k,\dots,\infty\}\times\{l,\dots,\infty\}$ for a given $m\in\mathbb{N}_0$.*

Proof. Let $m\in\{n,\dots,\infty\}$ and define $N_m=\max(\{\beta(i)_1|i\in\{n,\dots,m\}\})$ and $M_m=\max(\{\beta(i)_2|i\in\{n,\dots,m\}\})$ then we have that

$$\beta(\{n,\dots,m\})\subseteq\{k,\dots,N_m\}\times\{l,\dots,M_m\}\tag{20.49}$$

Then we have

$$\begin{aligned}
\sum_{i=n}^{m}x_{\beta(i)_1,\beta(i)_2} &\underset{\text{[theorem: 11.35]}}{=} \sum_{i\in\{n,\dots,m\}}x_{\beta(i)_1,\beta(i)_2}\\
&\underset{\text{[theorem: 11.36]}}{=} \sum_{(i,j)\in\beta(\{n,\dots,m\})}x_{(i,j)_1,(i,j)_2}\\
&= \sum_{(i,j)\in\beta(\{n,\dots,m\})}x_{i,j}\\
&\underset{\text{[theorem: 20.85]}\wedge\text{[eq: 20.49]}}{\leqslant} \sum_{(i,j)\in\{k,\dots,N_m\}\times\{l,\dots,M_m\}}x_{i,j}\\
&\underset{\text{[theorem: 11.45]}}{=} \sum_{i\in\{k,\dots,N_m\}}\left(\sum_{j\in\{l,\dots,M_m\}}x_{i,j}\right)\\
&\underset{\text{[theorem: 11.35]}}{=} \sum_{i=k}^{N_m}\left(\sum_{j=l}^{M_m}x_{i,j}\right)\\
&\underset{\text{[theorem: 20.85]}}{\leqslant} \sum_{i=k}^{N_m}\sup\left(\left\{\sum_{j=l}^{r}x_{i,j}|r\in\{l,\dots,\infty\}\right\}\right)\\
&= \sum_{i=k}^{N_m}\left(\sum_{j=l}^{M_m}x_{i,j}\right)\\
&\leqslant \sup\left(\left\{\sum_{i=k}^{r}\left(\sum_{j=l}^{M_m}x_{i,j}\right)|r\in\{k,\dots,\infty\}\right\}\right)\\
&= \sum_{i=k}^{\infty}\left(\sum_{j=l}^{\infty}x_{i,j}\right)
\end{aligned}$$

As $m\in\{n,\dots,\infty\}$ was chosen arbitrary it follows that

$$\sum_{i=n}^{\infty}x_{\beta(i)_1,\beta(i)_2}=\sup\left(\left\{\sum_{i=n}^{m}x_{\beta(i)_1,\beta(i)_2}|m\in\{n,\dots,\infty\}\right\}\right)\leqslant\sum_{i=k}^{\infty}\left(\sum_{j=l}^{\infty}x_{i,j}\right)\tag{20.50}$$

For the opposite inequality let $r\in\{k,\dots,\infty\}$, $s\in\{l,\dots,\infty\}$ and take

$$N=\max((\beta^{-1})(\{k,\dots,r\}\times\{l,\dots,s\}))$$

then $(\beta^{-1})(\{k,\dots,r\}\times\{l,\dots,s\})\subseteq\{n,\dots,N\}$ so that

$$\{k,\dots,r\}\times\{l,\dots,s\}=\beta((\beta^{-1})(\{k,\dots,r\}\times\{l,\dots,s\}))\subseteq\beta(n,\dots,N)\tag{20.51}$$

Next

$$\begin{aligned}
\sum_{i=k}^{r}\left(\sum_{j=l}^{s} x_{i,j}\right) &\underset{\text{[theorem: 11.35]}}{=} \sum_{i\in\{k,\dots,r\}}\left(\sum_{j\in\{l,\dots,s\}} x_{i,j}\right)\\
&\underset{\text{[theorem: 11.45]}}{=} \sum_{(i,j)\in\{k,\dots,r\}\times\{l,\dots,s\}} x_{i,j}\\
&\underset{\text{[theorem: 20.85]}\wedge\text{[eq: 20.51]}}{\leqslant} \sum_{(i,j)\in\beta(n,\dots,N)} x_{i,j}\\
&= \sum_{(i,j)\in\beta(n,\dots,N)} x_{(i,j)_1,(i,j)_2}\\
&\underset{\text{[theorem: 11.36]}}{=} \sum_{i\in\{n,\dots,N\}} x_{\beta(i)_1,\beta(i)_2}\\
&= \sum_{i=n}^{N} x_{\beta(i)_1,\beta(i)_2}\\
&\leqslant \sup\left(\left\{\sum_{i=n}^{m} x_{\beta(i)_1,\beta(i)_2} | m\in\{n,\dots,\infty\}\right\}\right)\\
&= \sum_{i=n}^{\infty} x_{\beta(i)_1,\beta(i)_2}
\end{aligned}$$

Hence as $r\in\{k,\dots,\infty\}$ was chosen arbitrary we have that

$$\sum_{i=k}^{\infty}\left(\sum_{j=l}^{s} x_{i,j}\right) = \sup\left(\left\{\sum_{i=k}^{m}\left(\sum_{j=l}^{s} x_{i,j}\right) | m\in\{k,\dots,\infty\}\right\}\right) \leqslant \sum_{i=n}^{\infty} x_{\beta(i)_1,\beta(i)_2} \tag{20.52}$$

Further

$$\begin{aligned}
\sum_{j=l}^{s}\left(\sum_{i=k}^{\infty} x_{i,j}\right) &\underset{\text{[theorem: 20.96]}}{=} \sum_{i=k}^{\infty}\left(\sum_{j=l}^{s} x_{i,j}\right)\\
&\underset{\text{[eq: 20.52]}}{\leqslant} \sum_{i=n}^{\infty} x_{\beta(i)_1,\beta(i)_2}
\end{aligned}$$

So as $s\in\{l,\dots,\infty\}$ is chosen arbitrary we have that

$$\sum_{j=l}^{\infty}\left(\sum_{i=k}^{\infty} x_{i,j}\right) = \sup\left(\left\{\sum_{j=l}^{m}\left(\sum_{i=k}^{\infty} x_{i,j}\right) | m\in\{l,\dots,\infty\}\right\}\right) \leqslant \sum_{i=n}^{\infty} x_{\beta(i)_1,\beta(i)_2}$$

hence

$$\sum_{i=k}^{\infty}\left(\sum_{j=l}^{\infty}\right) \underset{\text{[theorem: 20.96]}}{=} \sum_{j=l}^{\infty}\left(\sum_{i=k}^{\infty} x_{i,j}\right) \leqslant \sum_{i=n}^{\infty} x_{\beta(i)_1,\beta(i)_2}$$

which combined with [eq: 20.50] proves that

$$\sum_{i=0}^{\infty} x_{\beta(i)_1,\beta(i)} = \sum_{i=k}^{\infty}\left(\sum_{j=l}^{\infty} x_{i,j}\right)$$

□

If a series if finite then all the terms in the series are real numbers.

Lemma 20.102. *Let $k\in\mathbb{N}_0$, $n\in\{k,\dots,\infty\}$ and $\{x_i\}_{i\in\{k,\dots,n\}}\subseteq[0,\infty]$ then we have*

$$\sum_{i=k}^{n} x_i = \infty \Leftrightarrow \infty\in\{x_i | i\in\{k,\dots,n\}\}$$

Proof.

$\Rightarrow$. We use induction to prove this, so let

$$S=\left\{n\in\{k,\ldots,\infty\}|\text{If } \{x_i\}_{i\in\{k,\ldots,n\}}\subseteq[0,\infty] \text{ satisfies } \sum_{i=k}^{n} x_i \text{ then } \infty\in\{x_i|i\in\{k,\ldots,\infty\}\}\right\}$$

then we have:

$k\in S$. For $\{x_i\}_{i\in\{k\}}\subseteq[0,\infty]$ we have $x_k=\sum_{i=k}^{k}x_i=\infty$ hence $\infty\in\{x_i|i\in\{k\}\}$ proving that $k\in S$.

$n\in S\Rightarrow n+1\in S$. Let $\{x_i\}_{i\in\{k,\ldots,n+1\}}\subseteq[0,\infty]$ be such that $\sum_{i=k}^{n+1}x_i=\infty$ then, as $\sum_{i=k}^{n+1}x_i=x_{n+1}+\sum_{i=k}^{n}x_i$, we have either:

$x_{n+1=\infty}$. Then $\infty\in\{x_i|i\in\{k,\ldots,n+1\}\}$

$\sum_{i=k}^{n}x_i$. Then as $n\in S$ $\infty\in\{x_i|i\in\{k,\ldots,n\}\}\subseteq\infty\in\{x_i|i\in\{k,\ldots,n+1\}\}$

So in all possible cases we have $\infty\in\{x_i|i\in\{k,\ldots,n+1\}\}$ which proves that $n+1\in S$

$\Leftarrow$. We use also induction for this, so let

$$S=\left\{n\in\{k,\ldots,\infty\}|\text{If } \{x_i\}_{i\in\{k,\ldots,n\}}\subseteq[0,\infty] \text{ satisfies } \infty\in\left\{x_i|i\in\{k,\ldots,n\} \text{ then } \sum_{i=k}^{n} x_i=\infty\right\}\right\}$$

the we have:

$k\in S$. If $\{x_i\}_{i\in\{k\}}\subseteq[0,\infty]$ satisfies $\infty\in\{x_i|i\in\{k,\ldots,k\}\}=\{x_i\}$ then $x_k=\infty$ so that $\sum_{i=k}^{k}x_i=x_k=\infty$. Hence $k\in S$.

$n\in S\Rightarrow n+1\in S$. If $\{x_i\}_{i\in\{k,\ldots,n+1\}}\subseteq[0,\infty]$ satisfies $\infty\in\{x_i|i\in\{k,\ldots,n+1\}$ then there exist a $i\in\{k,\ldots,n+1\}$ such that $x_i=\infty$. For i we have either:

$i=n+1$. Then $\sum_{i=k}^{n+1}x_i=x_{n+1}+\sum_{i=k}^{n}x_i=\infty+\sum_{i=k}^{n}x_i=\infty$

$i\in\{k,\ldots,n\}$. Then $\sum_{i=k}^{n+1}x_i=x_{n+1}+\sum_{i=k}^{n}x_i\underset{n\in S}{=}x_{n+1}+\infty=\infty$

So in all cases we have $\sum_{i=k}^{n+1}x_i=\infty$ proving that $n+1\in S$. □

Theorem 20.103. *Let $k\in\mathbb{N}_0$ and for $\{x_i\}_{i\in\{k,\ldots,\infty\}}\subseteq[0,\infty]$ we have $\sum_{i=k}^{\infty}x_i<\infty$ then $\forall i\in\{k,\ldots,\infty\}$ we have $x_i<\infty$*

Proof. As $\sup\left(\{\sum_{i=k}^{n}x_i|n\in\{k,\ldots,\infty\}\}\right)=\sum_{i=k}^{\infty}x_i<\infty$ it follows from [theorem: 20.15] that $\forall n\in\{k,\ldots,\infty\}$ we have that $\sum_{i=k}^{n}x_i<\infty\underset{\text{[lemma: 20.102]}}{=}x_n=\infty$. □

20.2 Preliminaries

Theorem 20.104. *Let A,B,C,D be sets then*

1. $(A\cdot B)\setminus(C\cdot D)=((A\setminus C)\cdot B)\bigcup(A\cdot(B\setminus D))$
2. $(A\cdot B)\setminus(C\cdot D)=(A\setminus C)\cdot(B\setminus D)\bigcup(A\setminus C)\cdot(B\bigcap D)\bigcup(A\bigcap C)\cdot(B\setminus D)$ *and*
   a. $((A\setminus C)\cdot(B\setminus D))\bigcap((A\setminus C)\cdot(B\bigcap D))=\varnothing$
   b. $((A\setminus C)\cdot(B\setminus D))\bigcap((A\bigcap C)\cdot(B\setminus D))=\varnothing$
   c. $((A\setminus C)\cdot(B\bigcap D))\bigcap((A\bigcap C)\cdot(B\setminus D))=\varnothing$

Proof.

1. We have the following equivalences

$$\begin{aligned}
(x,y)\in(A\cdot B)\setminus(C\cdot D) &\Leftrightarrow (x,y)\in A\cdot B\wedge(x,y)\notin C*D\\
&\Leftrightarrow x\in A\wedge y\in B\wedge\neg(x\in C\wedge y\in D)\\
&\Leftrightarrow x\in A\wedge y\in B\wedge(x\notin C\vee y\notin D)\\
&\Leftrightarrow (x\in A\wedge y\in B\wedge x\notin C)\vee(x\in A\wedge y\in B\wedge y\notin D)\\
&\Leftrightarrow (x\in A\setminus C\wedge y\in B)\vee(x\in A\wedge y\in B\setminus D)\\
&\Leftrightarrow (x,y)\in(A\setminus C)\cdot B\vee(x,y)\in A\cdot(B\setminus D)\\
&\Leftrightarrow (x,y)\in(A\setminus C)\cdot B\bigcup(A\cdot(B\setminus D))
\end{aligned}$$

which proves that

$$(A\cdot B)\setminus(C\cdot D)=((A\setminus C)\cdot B)\bigcup(A\cdot(B\setminus D))$$

2. Next we have

$$\begin{aligned}
(A\cdot B)\setminus(C\cdot D) &= \\
((A\setminus C)\cdot B)\bigcup(A\cdot(B\setminus D)) &\underset{\text{[theorem: 1.35]}}{=} \\
\big((A\setminus C)\cdot\big((B\setminus D)\bigcup(B\bigcap D)\big)\big)\bigcup\big(\big((A\setminus C)\bigcup(A\bigcap C)\big)\cdot(B\setminus D)\big) &\underset{\text{[theorem: 6.84]}}{=} \\
\underbrace{(A\setminus C)\cdot(B\setminus D)}_{1}\bigcup(A\setminus C)\cdot(B\bigcap D)\bigcup\underbrace{(A\setminus C)\cdot(B\setminus D)}_{1}\bigcup(A\bigcap C)\cdot(B\setminus D) &= \\
(A\setminus C)\cdot(B\setminus D)\bigcup(A\setminus C)\cdot(B\bigcap D)\bigcup(A\bigcap C)\cdot(B\setminus D)
\end{aligned}$$

proving

$$(A\cdot B)\setminus(C\cdot D)=(A\setminus C)\cdot(B\setminus D)\bigcup(A\setminus C)\cdot(B\bigcap D)\bigcup(A\bigcap C)\cdot(B\setminus D)$$

a.

$$\begin{aligned}
((A\setminus C)\cdot(B\setminus D))\bigcap((A\setminus C)\cdot(B\bigcap D)) &\underset{\text{[theorem: 6.84]}}{=} \\
(A\setminus C)\cdot((B\setminus D)\bigcap(B\bigcap D)) &= \\
(A\setminus C)\cdot\varnothing &\underset{\text{[theorem: 6.84]}}{=} \\
\varnothing
\end{aligned}$$

b.

$$\begin{aligned}
((A\setminus C)\cdot(B\setminus D))\bigcap((A\bigcap C)\cdot(B\setminus D)) &\underset{\text{[theorem: 6.84]}}{=} \\
((A\setminus C)\bigcap(A\bigcap C))\cdot(B\setminus D) &= \\
\varnothing\bigcap(B\setminus D) &\underset{\text{[theorem: 6.84]}}{=} \\
\varnothing
\end{aligned}$$

c.

$$\begin{aligned}
((A\setminus C)\cdot(B\bigcap D))\bigcap((A\bigcap C)\cdot(B\setminus D)) &\underset{\text{[theorem: 6.84]}}{\subseteq} \\
(A\cdot(B\bigcap D))\bigcap(A\cdot(B\setminus D)) &\underset{\text{[theorem: 6.84]}}{=} \\
A\cdot((B\bigcap D)\bigcap(B\setminus D)) &= \\
A\cdot\varnothing &\underset{\text{[theorem: 6.84]}}{=} \\
\varnothing
\end{aligned}$$

□

Definition 20.105. *Let X be a set, $\mathcal{A}\subseteq\mathcal{P}(X)$, I a set then a family of sets $\{A_i\}_{i\in I}\subseteq\mathcal{A}$ is* ***pairwise disjoint*** *if*

$$\forall i,j\in I \text{ with } i\neq j \text{ we have } A_i\bigcap A_j=\varnothing$$

Notation 20.106. *Let X be a set, $\mathcal{A}\subseteq\mathcal{P}(X)$, I a set and $\{A_i\}_{i\in I}\subseteq\mathcal{A}$ then if we write*

$$\bigsqcup_{i\in I}A_i$$

we mean

$$\bigsqcup_{i\in I}A_i$$

and additional that $\{A_i\}_{i\in I}\subseteq\mathcal{A}$ is pairwise disjoint.

Theorem 20.107. *Let X be a set, $\mathcal{A}\subseteq\mathcal{P}(X)$, I,J sets and $\{A_i\}_{i\in J}\subseteq\mathcal{A}$ be a pairwise disjoint family and $\sigma: I\to J$ a bijection then $\{A_{\sigma(i)}\}_{i\in I}\subseteq\mathcal{A}$ is pairwise disjoint and $\bigcup_{i\in I}A_{\sigma(i)}=\bigcup_{i\in J}A_i$. In other words using the above theorem we have*

$$\bigsqcup_{i\in J}A_i=\bigsqcup_{i\in I}A_{\sigma(i)}$$

Proof. Using [theorem: 2.119] and the fact that a bijection is a surjection we have

$$\bigcup_{i\in I}A_{\sigma(i)}=\bigcup_{i\in J}A_i$$

Let $i,j\in I$ be such that $i\neq j$ then as σ is injective we have $\sigma(i)\neq\sigma(j)$ [if $\sigma(i)=\sigma(j)$ then $i=j$] so that $A_{\sigma(i)}\bigcap A_{\sigma(j)}=\varnothing$. Hence $\{A_{\sigma(i)}\}_{i\in\{1,\ldots,n\}}$ is pairwise disjoint. □

The following set based theorems and lemmas will be usefull later

Lemma 20.108. *Let be N be either ∞ or $N\in\mathbb{N}$ $\{A_i\}_{i\in\{1,\ldots,N\}}\subseteq\mathcal{A}$ be a sequence or finite family of sets then for*

$$\{B_i\}_{i\in\{1,\ldots,N\}} \text{ defined by } B_i=\begin{cases} A_i \text{ if } i=1\\ A_i\setminus\bigcup_{j\in\{1,\ldots,j-1\}}A_j \text{ if } i\in\{2,\ldots,N\}\end{cases}$$

we have

$$\forall i\in\{1,\ldots,N\}\quad B_i\subseteq A_i$$

$$\bigsqcup_{i\in\{1,\ldots,N\}}B_i=\bigcup_{i\in\{1,\ldots,N\}}A_i$$

and

$$\forall i,j\in\{1,\ldots,N\} \text{ with } i\neq j \text{ then } B_i\bigcap B_j\neq\varnothing \text{ [in other words } \{B_i\}_{i\in\{1,\ldots,N\}} \text{ is pairwise disjoint}$$

Proof. We have

$$\forall i\in\{1,\ldots,N\} \text{ that } B_i=\begin{cases} A_1\subseteq A_i \text{ if } i=1\\ A_i\setminus\bigcup_{j\in\{1,\ldots,i-1\}}A_j\subseteq A_i \text{ if } i\in\{2,\ldots,N\}\end{cases}\subseteq A_i$$

From the above it follows that

$$\bigcup_{i\in\{1,\ldots,N\}}B_i\subseteq\bigcup_{i\in\{1,\ldots,N\}}A_i \tag{20.53}$$

If $x\in\bigcup_{i\in\{1,\ldots,N\}}A_i$ then there exist a $k\in\{1,\ldots,N\}$ such that $x\in A_k$. Define $M=\{i\in\{1,\ldots,k\}|x\in A_i\}\subseteq\{1,\ldots,k\}$ then $k\in M$ and M is finite so that

$$m=\min(M) \text{ exist}$$

As $m\in M\subseteq\{1,\ldots,k\}$ we have $x\in A_m$ and for m either:

- $\boldsymbol{m=1}$. Then $x\in A_1=B_1$ so that $x\in\bigcup_{i\in\{1,\ldots,N\}}B_i$.
- $\boldsymbol{1<m}$. Then for $\forall j\in\{1,\ldots,m-1\}$ we have $x\notin A_j$ so that $x\notin\bigcup_{j\in\{1,\ldots,m-1\}}A_j$ hence $x\in A_m\setminus\bigcup_{j\in\{1,\ldots,m-1\}}A_j=B_m$. So $x\in\bigcup_{i\in\{1,\ldots,N\}}B_i$.

As $x\in\bigcup_{i\in\{1,\ldots,N\}}A_i$ was chosen arbitrary it follows that $\bigcup_{i\in\{1,\ldots,N\}}A_i\subseteq\bigcup_{i\in\{1,\ldots,N\}}B_i$ which combined with [eq: 20.53] proves that

$$\bigcup_{i\in\{1,\ldots,N\}}B_i=\bigcup_{i\in\{1,\ldots,N\}}A_i$$

Let $i,j\in\{1,\ldots,N\}$ with $i\neq j$ then we may assume that $i<j$ [otherwise exchange i and j]. Assume that $x\in B_i\bigcap B_j$ then for i we have either:

- $\boldsymbol{i=1}$. Then $x\in B_1=A_1$ and $x\in B_j=A_j\setminus\bigcup_{k\in\{1,\ldots,j-1\}}A_k$. So $\forall k\in\{1,\ldots,j-1\}$ we have that $x\notin A_k$, hence, as $1=i<j\Rightarrow 1\in\{1,\ldots,j-1\}$, it follows that $x\notin A_1$ contradicting $x\in B_1=A_1$.
- $\boldsymbol{1<j}$. Then $x\in B_j=A_j\setminus\bigcup_{k\in\{1,\ldots,j-1\}}A_k\Rightarrow\forall k\in\{1,\ldots,j-1\}$ we have $x\notin A_k$. As $i<j\Rightarrow i\in\{1,\ldots,j-1\}$ it follows that $x\notin A_i$ contradicting $x\in A_i\setminus\bigcup_{k\in\{1,\ldots,i-1\}}A_k\subseteq A_i$.

As in all cases we have a contradiction the assumption is wrong and we must have that

$$B_i\bigcap B_j=\varnothing$$

□

Lemma 20.109. *Let $\{A_i\}_{i\in\mathbb{N}}$ be a sequence of sets then if we define $\{B_i\}_{i\in\mathbb{N}}$ by $B_i=\bigcup_{j\in\{1,\ldots,i\}}A_j$ we have*

$$\bigcup_{i\in\mathbb{N}}A_i=\bigcup_{i\in\mathbb{N}}B_i \text{ and } \forall i\in\mathbb{N} \text{ we have } B_i\subseteq B_{i+1}$$

Proof. First if $i\in\mathbb{N}$ and $x\in B_i$ then there exists a $j\in\{1,\ldots,i\}$ such that

$$x\in A_j\subseteq\bigcup_{j\in\{1,\ldots,i+1\}}A_j=B_{i+1}$$

proving that

$$\forall i\in\mathbb{N}_0 \text{ we have } B_i\subseteq B_{i+1} \tag{20.54}$$

Second if $x\in\bigcup_{i\in\mathbb{N}_0}A_i$ then $\exists i\in\mathbb{N}$ such that $x\in A_i$. So as $i\in\{1,\ldots,i\}$ we have that $x\in\bigcup_{j\in\{1,\ldots,i\}}A_i=B_i$ which proves that $x\in\bigcup_{i\in\mathbb{N}}B_i$, or

$$\bigcup_{i\in\mathbb{N}_0}A_i\subseteq\bigcup_{i\in\mathbb{N}_0}B_i \tag{20.55}$$

Third if $x\in\bigcup_{i\in\mathbb{N}_0}B_i$ then $\exists i\in\mathbb{N}$ such that $x\in B_i=\bigcup_{j\in\{1,\ldots,i\}}A_j$, so there exists a $j\in\{1,\ldots,i\}\subseteq\mathbb{N}$ with $x\in A_j$, proving that $x\in\bigcup_{i\in\mathbb{N}}A_i$. Hence $\bigcup_{i\in\mathbb{N}_0}B_i\subseteq\bigcup_{i\in\mathbb{N}_0}A_i$ which combined with [eq: 20.55] gives

$$\bigcup_{i\in\mathbb{N}_0}A_i=\bigcup_{i\in\mathbb{N}_0}B_i \tag{20.56}$$

The theorem is then proved by [eqs: 20.54, 20.55 and 20.56]. □

Definition 20.110. *Let X be a set and $\mathcal{A}\subseteq\mathcal{P}(X)$ then*

1. *$\mathcal{A}$ is $\cup$-stable if $\forall A,B\in\mathcal{A}$ we have $A\bigcup B\in\mathcal{A}$*
2. *$\mathcal{A}$ is $\cap$-stable if $\forall A,B\in\mathcal{A}$ we have $A\bigcap B\in\mathcal{A}$*

Theorem 20.111. *Let X be a set and $\mathcal{A}\subseteq\mathcal{P}(X)$ then we have:*

1. *$\mathcal{A}$ is $\cup$-stable $\Leftrightarrow\forall\{A_i\}_{\in\{1,\ldots,n\}}\subseteq\mathcal{A}$, $n\in\mathbb{N}$ we have $\bigcup_{i\in\{1,\ldots,n\}}A_i\in\mathcal{A}$*
2. *$\mathcal{A}$ is $\cap$-stable $\Leftrightarrow\forall\{A_i\}_{\in\{1,\ldots,n\}}\subseteq\mathcal{A}$, $n\in\mathbb{N}$ we have $\bigcap_{i\in\{1,\ldots,n\}}A_i\in\mathcal{A}$*

Proof. This is easely proved by induction

1.

   $\Rightarrow$. We prove this by induction so let

$$S=\left\{n\in\mathbb{N}|\text{If } \{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A} \text{ then } \bigcup_{i\in\{1,\ldots,n\}}A_i\in\mathcal{A}\right\}$$

   then we have:

   $1\in S$. If $\{A_i\}_{i\in\{1\}}\subseteq\mathcal{A}$ then $\bigcup_{i\in\{1\}}A_i=A_1\in\mathcal{A}$ so that $1\in S$.

   $n\in S\Rightarrow n+1\in S$. Let $\{A_i\}_{i\in\{1,\ldots,n+1\}}\subseteq\mathcal{A}$ then $A_{n+1}\in\mathcal{A}$ and, as $n\in S$, $\bigcup_{i\in\{1,\ldots,n\}}A_i\in\mathcal{A}$. Hence $\bigcup_{i\in\{1,\ldots,n+1\}}A_i=A_{n+1}\bigcup\left(\bigcup_{i\in\{1,\ldots,n\}}A_i\right)\in\mathcal{A}$ which proves that $n+1\in S$

   $\Leftarrow$. Let $A,B\in\mathcal{A}$ and define $\{A_i\}_{i\in\{1,2\}}\subseteq\mathcal{A}$ by $A_1=A$ and $A_2=B$ then $A\bigcup B=A_1\bigcup A_2=\bigcup_{i\in\{1,2\}}A_i\in\mathcal{A}$.

2.

   $\Rightarrow$. $\Rightarrow$. We prove this by induction so let

$$S=\left\{n\in\mathbb{N}|\text{If } \{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A} \text{ then } \bigcap_{i\in\{1,\ldots,n\}}A_i\in\mathcal{A}\right\}$$

   then we have:

   $1\in S$. If $\{A_i\}_{i\in\{1\}}\subseteq\mathcal{A}$ then $\bigcap_{i\in\{1\}}A_i=A_1\in\mathcal{A}$ so that $1\in S$.

   $n\in S\Rightarrow n+1\in S$. Let $\{A_i\}_{i\in\{1,\ldots,n+1\}}\subseteq\mathcal{A}$ then $A_{n+1}\in\mathcal{A}$ and, as $n\in S$, $\bigcap_{i\in\{1,\ldots,n\}}A_i\in\mathcal{A}$. Hence $\bigcap_{i\in\{1,\ldots,n+1\}}A_i=A_{n+1}\bigcap\left(\bigcap_{i\in\{1,\ldots,n\}}A_i\right)\in\mathcal{A}$ which proves that $n+1\in S$

   $\Leftarrow$. Let $A,B\in\mathcal{A}$ and define $\{A_i\}_{i\in\{1,2\}}\subseteq\mathcal{A}$ by $A_1=A$ and $A_2=B$ then $A\bigcap B=A_1\bigcap A_2=\bigcap_{i\in\{1,2\}}A_i\in\mathcal{A}$. □

Lemma 20.112. *Let $n \in \mathbb{N}$, $\{A_i\}_{i\in\{1,\dots,n\}}$ a finite family of sets such that $\forall i \in \{1,\dots,n\}$ there exist a family $\{B_{i,j}\}_{j\in I_i}$ such that $A_i = \bigcup_{j\in I_i} B_{i,j}$ then we have:*

1. $\bigcap_{i\in\{1,\dots,n\}} A_i = \bigcup_{\sigma\in\prod_{i\in\{1,\dots,n\}} I_i} \left(\bigcap_{k\in\{1,\dots,n\}} B_{k,\sigma_k}\right)$
2. *If $\forall i \in \{1,\dots,n\}$ $\{B_{i,j}\}_{j\in I_i}$ is pairwise disjoint then we have that $\left\{\bigcap_{k\in\{1,\dots,n\}} B_{k,\sigma_k}\right\}_{\sigma\in\prod_{i\in\{1,\dots,n\}} I_i}$ is pairwise disjoint. In other words*

$$\bigcap_{i\in\{1,\dots,n\}} A_i = \bigsqcup_{\sigma\in\prod_{i\in\{1,\dots,n\}} I_i} \left(\bigcap_{k\in\{1,\dots,n\}} B_{k,\sigma_k}\right)$$

Proof.

1. We use induction to prove this, so define

$$S = \left\{ n \in \mathbb{N} | \text{If } \{A_i\}_{i\in\{1,\dots,n\}} \text{ is such that } \forall i \in \{1,\dots,n\}\ \exists \{B_{i,j}\}_{j\in I_i} \text{ with } A_i = \bigcup_{j\in I_i} B_{i,j} \text{ then } \bigcap_{i\in\{1,\dots,n\}} A_i = \bigcup_{\sigma\in\prod_{i\in\{1,\dots,n\}} I_i} \left(\bigcap_{k\in\{1,\dots,n\}} B_{k,\sigma_k}\right)\right\}$$

then we have:

$1 \in S$. If $\{A_i\}_{i\in\{1,1\}}$ satisfies that there exist a $\{B_{1,j}\}_{j\in I_1}$ such that $A_1 = \bigcup_{j\in I_1} B_{1,j}$ then

$$\begin{aligned}
\bigcap_{i\in\{1\}} A_i &= A_1 \\
&= \bigcup_{j\in I_1} B_{1,j} \\
&= \bigcup_{j\in I_1} \left(\bigcap_{k\in\{1\}} B_{k,j}\right) \\
&= \bigcup_{(j)\in\prod_{i\in\{1\}} I_i} \left(\bigcap_{k\in\{1\}} B_{k,j}\right) \\
&= \bigcup_{\sigma\in\prod_{i\in\{1\}} I_i} \left(\bigcap_{k\in\{1\}} B_{k,\sigma_k}\right)
\end{aligned}$$

proving that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $\{A_i\}_{i\in\{1,\dots,n+1\}}$ is such that $\forall i \in \{1,\dots,n+1\}$ $\exists \{B_{i,j}\}_{j\in I_i}$ with $A_i = \bigcup_{j\in I_i} B_{i,j}$. Then as $n \in \mathcal{S}$ we have that

$$\bigcap_{i\in\{1,\dots,n\}} A_i = \bigcup_{\sigma\in\prod_{i\in\{1,\dots,n\}} I_i} \left(\bigcap_{k\in\{1,\dots,n\}} B_{k,\sigma_k}\right) \tag{20.57}$$

Hence

$$\begin{aligned}
\bigcap_{i\in\{1,\dots,n+1\}} A_i &= \\
\left(\bigcap_{i\in\{1,\dots,n\}} A_i\right) \bigcap A_{n+1} &\underset{n\in S}{=} \\
\left(\bigcup_{\sigma\in\prod_{i\in\{1,\dots,n\}} I_i} \left(\bigcap_{k\in\{1,\dots,n\}} B_{k,\sigma_k}\right)\right) \bigcap A_{n+1} &\underset{\text{[theorem: 2.130]}}{=} \\
\bigcup_{\sigma\in\prod_{i\in\{1,\dots,n\}} I_i} \left(\left(\bigcap_{k\in\{1,\dots,n\}} B_{k,\sigma_k}\right) \bigcap A_{n+1}\right) &= \\
\bigcup_{\sigma\in\prod_{i\in\{1,\dots,n\}} I_i} \left(\left(\bigcap_{k\in\{1,\dots,n\}} B_{k,\sigma_k}\right) \bigcap \left(\bigcup_{j\in I_{n+1}} B_{n+1,j}\right)\right) &\underset{\text{[theorem: 2.130]}}{=} \\
\bigcup_{\sigma\in\prod_{i\in\{1,\dots,n\}} I_i} \left(\left(\bigcup_{j\in I_{n+1}} \left(B_{n+1,j} \bigcap \left(\bigcap_{k\in\{1,\dots,n\}} B_{k,\sigma_k}\right)\right)\right)\right) &=
\end{aligned}$$

So that

$$\bigcap_{i\in\{1,\ldots,n+1\}} A_i = \bigcup_{\sigma\in\prod_{i\in\{1,\ldots,n\}}I_i}\left(\left(\bigcup_{j\in I_{n+1}}\left(B_{n+1,j}\bigcap\left(\bigcap_{k\in\{1,\ldots,n\}}B_{k,\sigma_k}\right)\right)\right)\right) \tag{20.58}$$

If $x\in\bigcup_{\sigma\in\prod_{i\in\{1,\ldots,n\}}I_i}\left(\left(\bigcup_{j\in I_{n+1}}\left(B_{n+1,j}\bigcap\left(\bigcap_{k\in\{1,\ldots,n\}}B_{k,\sigma_k}\right)\right)\right)\right)$ then there exist a $\sigma=(\sigma_1,\ldots,\sigma_n)$ such that $x\in\left(\bigcup_{j\in I_{n+1}}\left(B_{n+1,j}\bigcap\left(\bigcap_{k\in\{1,\ldots,n\}}B_{k,\sigma_k}\right)\right)\right)$, hence there exist a $j\in I_{n+1}$ such that

$$x\in B_{n+1,j}\bigcap\left(\bigcap_{k\in\{1,\ldots,n\}}B_{k,\sigma_k}\right)$$

Define

$$\tau\in\bigcup_{i\in\{1,\ldots,n+1\}}I_i \text{ by } \tau_i=\begin{cases}\sigma_i \text{ if } i\in\{1,\ldots,n\}\\ j \text{ if } i=n+1\end{cases}$$

then $x\in B_{n+1,\tau_{n+1}}\bigcap\left(\bigcap_{k\in\{1,\ldots,n\}}B_{k,t_k}\right)=\bigcap_{k\in\{1,\ldots,n+1\}}B_{k,\tau_k}$. Hence

$$x\in\bigcup_{\tau\in\prod_{i\in\{1,\ldots,n+1\}}}\left(\bigcap_{k\in\{1,\ldots,n+1\}}B_{k,\tau_k}\right)$$

whic proves that

$$\bigcup_{\sigma\in\prod_{i\in\{1,\ldots,n\}}I_i}\left(\left(\bigcup_{j\in I_{n+1}}\left(B_{n+1,j}\bigcap\left(\bigcap_{k\in\{1,\ldots,n\}}B_{k,\sigma_k}\right)\right)\right)\right)\subseteq \bigcup_{\sigma\in\prod_{i\in\{1,\ldots,n+1\}}}\left(\bigcap_{k\in\{1,\ldots,n+1\}}B_{k,\sigma_k}\right) \tag{20.59}$$

If $x\in\bigcup_{\sigma\in\prod_{i\in\{1,\ldots,n+1\}}}\left(\bigcap_{k\in\{1,\ldots,n+1\}}B_{k,\sigma_k}\right)$ then there exist a $\sigma\in\prod_{i\in\{1,\ldots,n+1\}}I_i$ such that $x\in\bigcap_{k\in\{1,\ldots,n+1\}}B_{k,\sigma_k}$. Define $\eta\in\prod_{i\in\{1,\ldots,n\}}I_i$ by $\eta_l=\sigma_l$ and $j=\sigma_{n+1}\in I_{n+1}$ then

$$x\in B_{n+1,j}\bigcap\left(\bigcap_{k\in\{1,\ldots,n+1\}}B_{k,\eta_k}\right)\subseteq\bigcup_{j\in I_{n+1}}\left(B_{n+1,j}\bigcap\left(\bigcap_{k\in\{1,\ldots,n+1\}}B_{k,\eta_k}\right)\right)$$

so that $x\in\bigcup_{j\in I_{n+1}}\left(B_{n+1,j}\bigcap\left(\bigcap_{k\in\{1,\ldots,n+1\}}B_{k,\eta_k}\right)\right)$ or as $\eta\in\prod_{i\in\{1,\ldots,n\}}I_i$ we have that $x\in\bigcup_{\eta\in\prod_{i\in\{1,\ldots,n\}}I_i}\left(\bigcup_{j\in I_{n+1}}\left(B_{n+1,j}\bigcap\left(\bigcap_{k\in\{1,\ldots,n+1\}}B_{k,\eta_k}\right)\right)\right)$. Hence

$$\bigcup_{\sigma\in\prod_{i\in\{1,\ldots,n+1\}}}\left(\bigcap_{k\in\{1,\ldots,n+1\}}B_{k,\sigma_k}\right)\subseteq \bigcup_{\sigma\in\prod_{i\in\{1,\ldots,n\}}I_i}\left(\left(\bigcup_{j\in I_{n+1}}\left(B_{n+1,j}\bigcap\left(\bigcap_{k\in\{1,\ldots,n\}}B_{k,\sigma_k}\right)\right)\right)\right)$$

which combined with [eq: 20.59] proves that

$$\bigcup_{\sigma\in\prod_{i\in\{1,\ldots,n\}}I_i}\left(\left(\bigcup_{j\in I_{n+1}}\left(B_{n+1,j}\bigcap\left(\bigcap_{k\in\{1,\ldots,n\}}B_{k,\sigma_k}\right)\right)\right)\right)= \bigcup_{\sigma\in\prod_{i\in\{1,\ldots,n+1\}}}\left(\bigcap_{k\in\{1,\ldots,n+1\}}B_{k,\sigma_k}\right)$$

Combining the above with [eq: 20.58] proves that

$$\bigcap_{i\in\{1,\ldots,n+1\}}A_i=\bigcup_{\sigma\in\prod_{i\in\{1,\ldots,n+1\}}}\left(\bigcap_{k\in\{1,\ldots,n+1\}}B_{k,\sigma_k}\right)$$

Hence we have that $n+1\in\mathcal{S}$

2. Assume that $\sigma,\tau\in\prod_{i\in\{1,\dots,n\}}I_i$ with $\sigma\neq\tau$ then there exist $i\in\{1,\dots,n\}$ such that $\sigma_i\neq\tau_i$. As $\{B_{i,j}\}_{j\in\{1,\dots,I_i\}}$ is pairwise disjoint we have that $B_{i,\sigma_i}\bigcap B_{i,\tau_i}=\varnothing$. Hence

$$\left(\bigcap_{k\in\{1,\dots,n\}}B_{k,\sigma_k}\right)\bigcap\left(\bigcap_{k\in\{1,\dots,n\}}B_{k,\tau_k}\right)\subseteq B_{i,\sigma_i}\bigcap B_{i,\tau_i}=\varnothing$$

proving that $\left\{\bigcap_{k\in\{1,\dots,n\}}B_{k,\sigma_k}\right\}_{\sigma\in\prod_{i\in\{1,\dots,n\}}I_i}$ is pairwise disjoint.

□

Theorem 20.113. *Let $\{A_i\}_{i\in I}$ be a family of sets such that $\forall i\in I$ there exist a $\{B_{i,j}\}_{j\in I_i}$ such that $A_i=\bigcup_{j\in I_i}B_{i,j}$ then*

1. $\bigcup_{i\in I}A_i=\bigcup_{i\in I}(\bigcup_{j\in I_i}B_{i,j})=\bigcup_{\sigma\in\bigcup_{i\in I}\{i\}\times I_i}B_{\sigma_1,\sigma_2}$
2. *If additional $\{A_i\}_{i\in I}$ is pairwise disjoint and $\forall i\in I$ $\{B_{i,j}\}_{j\in I_i}$ is pairwise disjoint then*

$$\{B_{\sigma_1,\sigma_2}\}_{\sigma\in\bigcup_{i\in I}\{i\}\times I_i}\text{ is pairwise disjoint}$$

so that we have

$$\bigsqcup_{i\in I}A_i=\bigsqcup_{i\in I}\left(\bigsqcup_{j\in I_i}B_{i,j}\right)=\bigsqcup_{\sigma\in\bigcup_{i\in I}\{i\}\times I_i}B_{\sigma_1,\sigma_2}$$

Proof.

1. Let $x\in\bigcup_{i\in I}A_i$ then there exist a $i\in I$ such that $x\in A_i$, hence, as $A_i=\bigcup_{j\in I_i}B_{i,j}$ there exist a $j\in I_i$ such that $x\in B_{i,j}$. As $\sigma=(i,j)\in\{i\}\times I_i\subseteq\bigcup_{i\in I}\{i\}\times I_i$ it follows $x\in B_{\sigma_1,\sigma_2}$, hence we have that $\bigcup_{i\in I}A_i\subseteq\bigcup_{\sigma\in\bigcup_{i\in I}\{i\}\times I_i}B_{\sigma_1,\sigma_2}$. Further as for $\sigma\in\bigcup_{i\in I}\{i\}\times I$ we have that $B_{\sigma_1,\sigma_2}\subseteq\bigcup_{j\in I_{\sigma_1}}B_{\sigma_1,j}=A_{\sigma_1}\subseteq\bigcup_{i\in I}A_i$ it follows that $\bigcup_{\sigma\in\bigcup_{i\in I}\{i\}\times I_i}B_{\sigma_1,\sigma_2}\subseteq\bigcup_{i\in I}A_i$. So it follows that

$$\bigcup_{i\in I}A_i=\bigcup_{\sigma\in\bigcup_{i\in I}\{i\}\times I_i}B_{\sigma_1,\sigma_2}$$

2. Let $\sigma,\tau\in\bigcup_{i\in I}\{i\}\times I_i$ with $\sigma\neq\tau$ then we have either:

   $\boldsymbol{\sigma_1=\tau_1}$. Then we must have that $\sigma_2\neq\tau_2$ so that $B_{\sigma_1,\sigma_2}\bigcap B_{\tau_1,\tau_2}=B_{\sigma_1,\sigma_2}\bigcap B_{\sigma_1,\tau_2}=\varnothing$ [because $\{B_{\sigma_1,j}\}_{j\in I_{\sigma_1}}$ is pairwise disjoint].

   $\boldsymbol{\sigma_1\neq\tau_1}$. Then $B_{\sigma_1,\sigma_2}\bigcap B_{\tau_1,\tau_2}\subseteq\left(\bigcup_{j\in I_{\sigma_1}}B_{\sigma_1,j}\right)\bigcap\left(\bigcup_{j\in I_\iota}B_{\tau_1,j}\right)=A_{\sigma_1}\bigcap A_{\tau_1}=\varnothing$ [because $\{A_i\}_{i\in I}$ is pairwise disjoint.

   Hence $\{B_{\sigma_1,\sigma_2}\}_{\sigma\in\bigcup_{i\in I}\{i\}\times I_i}$ is pairwise disjoint. □

Corollary 20.114. *Let $\{A_i\}_{i\in I}$ be a family of sets such that $\forall i\in I$ there exist a $\{B_{i,j}\}_{j\in I_i}$ such that $A_i=\bigcup_{j\in I_i}B_{i,j}$ and $\beta\colon J\to\bigcup_{i\in I}\{i\}\times I_i$ a bijection then*

1. $\bigcup_{i\in I}A_i=\bigcup_{i\in I}(\bigcup_{j\in I_i}B_{i,j})=\bigcup_{j\in J}B_{\beta(j)_1,\beta(j)_2}$
2. *If additional $\{A_i\}_{i\in I}$ is pairwise disjoint and $\forall i\in I$ $\{B_{i,j}\}_{j\in I_i}$ is pairwise disjoint then*

$$\{B_{\beta(j)_1,\beta(j)_2}\}_{j\in J}\text{ is pairwise disjoint}$$

so that

$$\bigsqcup_{i\in I}A_i=\bigsqcup_{i\in I}\left(\bigsqcup_{j\in I_i}B_{i,j}\right)=\bigsqcup_{j\in J}B_{\beta(j)_1,\beta(j)_2}$$

Proof.

1. Using [theorem: 20.113] we have that

$$\bigcup_{i\in I}A_i=\bigcup_{i\in I}\left(\bigcup_{j\in I_i}B_{i,j}\right)=\bigcup_{\sigma\in\bigcup_{i\in I}\{i\}\times I_i}B_{\sigma_1,\sigma_2}\tag{20.60}$$

Let $x\in\bigcup_{\sigma\in\bigcup_{i\in I}\{i\}\times I_i}B_{\sigma_1,\sigma_2}$ then there exist a $\sigma\in\bigcup_{i\in I}\{i\}\times I_i$ such that $x\in B_{\sigma_1,\sigma_2}$. As β is a bijection hence surjective there exist a $j\in J$ such that $\beta(j)=\sigma$ so that $x\in B_{\beta(j)_1,\beta(j)_2}$, hence $x\in\bigcup_{j\in J}B_{\beta(j)_1,\beta(j)_2}$. So

$$\bigcup_{\sigma\in\bigcup_{i\in I}\{i\}\times I_i}B_{\sigma_1,\sigma_2}\subseteq\bigcup_{j\in J}B_{\beta(j)_1,\beta(j)_2}\tag{20.61}$$

If $x \in \bigcup_{j \in J} B_{\beta(j)_1, \beta(j)_2}$ then $\exists j \in J$ such that $x \in B_{\beta(j)_1, \beta(j)_2}$ which as $\beta(j) \in \bigcup_{i \in I} \{i\} \times I_i$ proves that $x \in \bigcup_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} B_{\sigma_1, \sigma_2}$. Hence $\bigcup_{j \in J} B_{\beta(j)_1, \beta(j)_2} \subseteq \bigcup_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} B_{\sigma_1, \sigma_2}$ which combined with [eq: 20.61] results in

$$\bigcup_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} B_{\sigma_1, \sigma_2} = \bigcup_{j \in J} B_{\beta(j)_1, \beta(j)_2} \tag{20.62}$$

Substituting the above in [eq: 20.60] proves finally that

$$\bigcup_{i \in I} A_i = \bigcup_{i \in I} \left(\bigcup_{j \in I_i} B_{i,j} \right) = \bigcup_{j \in J} B_{\beta(j)_1, \beta(j)_2}$$

2. Assume that additional $\{A_i\}_{i \in I}$ is pairwise disjoint and $\forall i \in I$ $\{B_{i,j}\}_{j \in I_i}$ is pairwise disjoint then by [theorem: 20.113]

$$\{B_{\sigma_1, \sigma_2}\}_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} \text{ pairwise disjoint} \tag{20.63}$$

Let $i, j \in J$ with $i \neq j$ then as β is injective we have $\beta(i) \neq \beta(j)$ hence we have by the above $B_{\beta(i)_1, \beta(j)_2} = \varnothing$ proving that

$$\{B_{\beta(i)_1, \beta(i)_2}\}_{i \in J} \text{ is pairwise disjoint}$$

□

Definition 20.115. (Monotone set function) *Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ then a set function $\mu: \mathcal{A} \to [0, \infty]$ is **monotone** if $\forall A, B \in \mathcal{A}$ then $\mu(A) \leqslant \mu(B)$.*

$$\mu\left(\bigcup_{i \in \{1, \ldots, n\}} A \right) \leqslant \sum_{i=1}^{n} \mu(A_i)$$

Definition 20.118. (Countable additive set function) *Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ then a set function $\mu: \mathcal{A} \to [0, \infty]$ is **countable additve on $\mathcal{A}$** if $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$, $n \in \mathbb{N}$ pairwise disjoint with $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$ we have*

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i \right) = \sum_{i=1}^{\infty} \mu(A_i)$$

Definition 20.119. (Countable sub-additive set function) *Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ then a set function $\mu: \mathcal{A} \to [0, \infty]$ is countable sub-additive if $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$ we have*

$$\mu\left(\bigcup_{i \in \mathbb{N}} A \right) \leqslant \sum_{i=1}^{\infty} \mu(A_i)$$

Countable sets are either finite or denumerable,, $n \in \mathbb{N}$ so you can ask yourselve why we talk about countable additivity instead of denumerable additivity [because $\mathbb{N}$ is denumerable]. However the next theorem shows that countable additivity implies finite additivity justifying the use of the term countable additivity.

Theorem 20.120. *Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ such that $\varnothing \in \mathcal{A}$ and $\mu: \mathcal{A} \to [0, \infty]$ a countable additive set function on $\mathcal{A}$ satisfying $\mu(\varnothing) = 0$ is finite additive on $\mathcal{A}$.*

Note 20.121. The requirement that $\varnothing \in \mathcal{A}$ and $\mu(\varnothing) = 0$ is essential for the proof to work.

Proof. Let $n \in \mathbb{N}$, $\{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A}$ be a pairwise disjoint finite family such that $\bigcup_{i \in \{1,\ldots,n\}} A_i \in \mathcal{A}$. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \begin{cases} A_i \text{ if } i \in \{1,\ldots,n\} \\ \varnothing \text{ if } i \in \{n+1,\ldots,\infty\} \end{cases} \underset{\varnothing, A_i \in \mathcal{A}}{\in} \mathcal{A}$$

Let $x \in \bigcup_{i \in \mathbb{N}} B_i$ then there exist a $i \in \mathbb{N}$ such that $x \in B_i$. Assume that $i \in \{n+1,\ldots,\infty\}$ then $x \in B_i = \varnothing$ a contradiction so we must have that $i \in \{1,\ldots,n\}$. Hence $x \in B_i = A_i$ proving that $x \in \bigcup_{i \in \{1,\ldots,n\}} A_i$, so

$$\bigcup_{i \in \mathbb{N}} B_i \subseteq \bigcup_{i \in \{1,\ldots,n\}} A_i \tag{20.64}$$

Further if $x \in \bigcup_{i \in \{1,\ldots,n\}} A_i$ then there exist a $i \in \{1,\ldots,n\}$ such that $x \in A_i = B_i$ so that $x \in \bigcup_{i \in \mathbb{N}} B_i$ proving that $\bigcup_{i \in \{1,\ldots,n\}} A_i \subseteq \bigcup_{i \in \{1,\ldots,n\}} B_i$. Combining this with [eq: 20.64] proves that

$$\bigcup_{i \in \mathbb{N}} B_i = \bigcup_{i \in \{1,\ldots,n\}} A_i \in \mathcal{A} \tag{20.65}$$

Let $i, j \in \mathbb{N}$ with $i \neq j$ then we have the following possible cases:

- $\boldsymbol{i \in \{1,\ldots,n\} \wedge j \in \{1,\ldots,n\}}$. Then $B_i \bigcap B_j = A_i \bigcap A_j \underset{i \neq j}{=} \varnothing$
- $\boldsymbol{i \in \{n+1,\ldots,\infty\} \wedge j \in \{1,\ldots,n\}}$. Then $B_i \bigcap B_j = \varnothing \bigcap A_j = \varnothing$
- $\boldsymbol{i \in \{1,\ldots,n\} \wedge j \in \{n+1,\ldots,\infty\}}$. Then $B_i \bigcap B_j = A_i \bigcap \varnothing = \varnothing$
- $\boldsymbol{i \in \{n+1,\ldots,\infty\} \wedge j \in \{n+1,\ldots,\infty\}}$. Then $B_i \bigcap B_j = \varnothing \bigcap \varnothing = \varnothing$

Hence we conclude that

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ is pairwise disjoint} \tag{20.66}$$

As by [eq: 20.65] $\bigcup_{i \in \mathbb{N}} B_i \in \mathcal{A}$ we have by the above and the countable additivity of μ that

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \sum_{i=1}^{\infty} \mu(B_i) \tag{20.67}$$

Next we have

$$\begin{aligned}
\mu\left(\bigcup_{i \in \{1,\ldots,n\}} A_i\right) &\underset{\text{[eq: 20.65]}}{=} \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \\
&\underset{\text{[eq: 20.67]}}{=} \sum_{i=1}^{\infty} \mu(B_i) \\
&\underset{\text{[theorem: 20.92]}}{=} \sum_{i=1}^{n} \mu(B_i) + \sum_{i=n+1}^{\infty} \mu(B_i) \\
&= \sum_{i=1}^{n} \mu(A_i) + \sum_{i=n+1}^{\infty} \mu(\varnothing) \\
&\underset{\mu(\varnothing)=0 \wedge \text{[theorem: 20.89]}}{=} \sum_{i=1}^{n} \mu(A_i)
\end{aligned}$$

Hence $\forall \{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A}$, $n \in \mathbb{N}$ pairwise disjoint we have $\mu\left(\bigcup_{i \in \{1,\ldots,n\}} A_i\right) = \sum_{i=1}^{n} \mu(A_i)$ proving that μ is finite additive on $\mathcal{A}$. □

Theorem 20.122. *Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ such that $\varnothing \in \mathcal{A}$ and $\mu: \mathcal{A} \to [0,\infty]$ a countable sub-additive function then μ is sub-additivity.*

Proof. Let $n \in \mathbb{N}$, $\{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A}$ be a finite family such that $\bigcup_{i \in \{1,\ldots,n\}} A_i \in \mathcal{A}$. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \begin{cases} A_i \text{ if } i \in \{1,\ldots,n\} \\ \varnothing \text{ if } i \in \{n+1,\ldots,\infty\} \end{cases} \underset{\varnothing, A_i \in \mathcal{A}}{\in} \mathcal{A}$$

Let $x \in \bigcup_{i \in \mathbb{N}} B_i$ then there exist a $i \in \mathbb{N}$ such that $x \in B_i$. Assume that $i \in \{n+1,\ldots,\infty\}$ then $x \in B_i = \varnothing$ a contradiction so we must have that $i \in \{1,\ldots,n\}$. Hence $x \in B_i = A_i$ proving that $x \in \bigcup_{i \in \{1,\ldots,n\}} A_i$, so

$$\bigcup_{i \in \mathbb{N}} B_i \subseteq \bigcup_{i \in \{1,\ldots,n\}} A_i \tag{20.68}$$

Further if $x \in \bigcup_{i\in\{1,\dots,n\}} A_i$ then there exist a $i \in \{1,\dots,n\}$ such that $x \in A_i = B_i$ so that $x \in \bigcup_{i\in\mathbb{N}} B_i$ proving that $\bigcup_{i\in\{1,\dots,n\}} A_i \subseteq \bigcup_{i\in\{1,\dots,n\}} B_i$. Combining this with [eq: 20.68] proves that

$$\bigcup_{i\in\mathbb{N}} B_i = \bigcup_{i\in\{1,\dots,n\}} A_i \in \mathcal{A} \tag{20.69}$$

As $\bigcup_{i\in\mathbb{N}} B_i \in \mathcal{A}$ and μ is countable additive it follows that

$$\mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) \leqslant \sum_{i=1}^{\infty} \mu(B_i) \tag{20.70}$$

$$\begin{aligned}
\mu\left(\bigcup_{i\in\{1,\dots,n\}} A_i\right) &\underset{\text{[eq: 20.69]}}{=} \mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) \\
&\underset{\text{[eq: 20.70]}}{\leqslant} \sum_{i=1}^{\infty} \mu(B_i) \\
&\underset{\text{[theorem: 20.92]}}{=} \sum_{i=1}^{n} \mu(B_i) + \sum_{i=n+1}^{\infty} \mu(B_i) \\
&= \sum_{i=1}^{n} \mu(A_i) + \sum_{i=n+1}^{\infty} \mu(\varnothing) \\
&\underset{\mu(\varnothing)=0\wedge\text{[theorem: 20.89]}}{=} \sum_{i=1}^{n} \mu(A_i)
\end{aligned}$$

□

20.3 Rings, algebras and σ-algebras

Definition 20.123. (Ring) *Let X be a set then $\mathcal{R} \subseteq \mathcal{P}(X)$ [the set of subsets of X] is a **ring** on X if $\mathcal{R}$ satisfies:*

1. *$\mathcal{R} \neq \varnothing$*
2. *If $A, B \in \mathcal{R}$ then $A \bigcup B \in \mathcal{R}$ [in other words $\mathcal{R}$ is $\cup$-stable]*
3. *If A, $B \in \mathcal{R}$ then $A \setminus B \in \mathcal{R}$*

Rather trivial examples of rings are the following:

Example 20.124. Let X be a set then $\{\varnothing\}$ is a ring on X

Proof.

1. As $\varnothing \in \{\varnothing\}$ we have that $\{\varnothing\} \neq \varnothing$
2. If $A, B \in \{\varnothing\}$ then $A = B = \varnothing$ so that $A \bigcup B = \varnothing \in \{\varnothing\}$
3. If If $A, B \in \{\varnothing\}$ then $A = B = \varnothing$ so that $A \setminus B = \varnothing \setminus \varnothing = \varnothing \in \{\varnothing\}$ □

Example 20.125. Let X be a set then $\mathcal{P}(X)$ is a ring on X

Proof. As $X \subseteq X$ $X \in \mathcal{P}(X)$ so that

$$\mathcal{P}(X) \neq \varnothing$$

If $A, B \in \mathcal{P}(X)$ then $A, B \subseteq X$ so that $A \bigcup B \subseteq X$ and $A \setminus B \subseteq X$ so that

$$A \bigcup B \in \mathcal{P}(X) \text{ and } A \setminus B \in \mathcal{P}(X)$$ □

Theorem 20.126. *Let X be a set and $\mathcal{R}$ a ring on X then we have*

1. *$\varnothing \in \mathcal{R}$*

2. *If $n \in \mathbb{N}$ and $\{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{R}$ a finite family of sets in $\mathcal{R}$ then $\bigcup_{i \in \{1,\ldots,n\}} A_i \in \mathcal{R}$*
3. *If $A, B \in \mathcal{R}$ then $A \bigcap B \in \mathcal{R}$ [in other words $\mathcal{R}$ is $\cap$-stable]*
4. *If $n \in \mathbb{N}$ and $\{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{R}$ a finite family of sets in $\mathcal{R}$ then $\bigcap_{i \in \{1,\ldots,n\}} A_i \in \mathcal{R}$*

Proof.

1. As $\mathcal{R} \neq \varnothing$ there exist a $A \in \mathcal{R}$ so that $\varnothing = A \setminus A \in \mathcal{R}$
2. This follows from [theorem: 20.111].
3. If $A, B \in \mathcal{R}$ then $A \setminus B \in \mathcal{R}$ so that $A \setminus (A \setminus B) \in \mathcal{R}$ which as $A \setminus (A \setminus B) \underset{\text{[theorem: 1.33]}}{=} A \bigcap B$ proves that $A \bigcap B \in \mathcal{R}$.
4. This follows from [theorem: 20.111]. □

A algebra on X is a ring such that X is a element of the ring.

Definition 20.127. (Algebra) *Let X be a set then $\mathcal{A} \subseteq \mathcal{P}(X)$ is a **algebra** on X if $\mathcal{A}$ satisfies*

1. *$\mathcal{A}$ is a ring on X*
2. *$X \in \mathcal{R}$*

Example 20.128. Let $X \neq \varnothing$ be a non empty set then $\{\varnothing\}$ is a ring [see example: 20.124] but not a algebra because $X \notin \{\varnothing\}$, however $\{X, \varnothing\}$ is a algebra on X.

Proof.

1. As $X, \varnothing \in \{X, \varnothing\}$ $\{X, \varnothing\} \neq \varnothing$
2. If $A, B \in \{X, \varnothing\}$ then we have either:

   $\boldsymbol{A = X \wedge B = X}$**.** Then $A \bigcup B = X \in \{X, \varnothing\}$ and $A \setminus B = X \setminus X = \varnothing \in \{X, \varnothing\}$

   $\boldsymbol{A = \varnothing \wedge B = X}$**.** Then $A \bigcup B = X \in \{X, \varnothing\}$ and $A \setminus B = \varnothing \setminus X = \varnothing \in \{X, \varnothing\}$

   $\boldsymbol{A = X \wedge B = \varnothing}$**.** Then $A \bigcup B = X \in \{X, \varnothing\}$ and $A \setminus B = X \setminus \varnothing = X \in \{X, \varnothing\}$

   $\boldsymbol{A = \varnothing \wedge B = \varnothing}$**.** Then $A \bigcup B = \varnothing \in \{X, \varnothing\}$ and $A \setminus B = \varnothing \setminus \varnothing = \varnothing \in \{X, \varnothing\}$ □

Example 20.129. Let X be a set then $\mathcal{P}(X)$ is a ring on X

Proof. Using [example: 20.125] it follows that $\mathcal{A}$ is a ring. Further as $X \subset X$ it follows that $X \in \mathcal{P}(X)$. □

The following summarizes some trivial properties of a algebra.

Theorem 20.130. *Let X be a set and $\mathcal{A}$ a algebra on X then we have:*

1. *$\varnothing \in \mathcal{A}$*
2. *$X \in \mathcal{A}$*
3. *$\forall A, B \in \mathcal{A}$ we have that $A \bigcup B \in \mathcal{A}$, $A \bigcap B \in \mathcal{A}$ and $A \setminus B \in \mathcal{A}$*
4. *If $n \in \mathbb{N}$ and $\{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A}$ a finite family of sets in $\mathcal{A}$ then $\bigcup_{i \in \{1,\ldots,n\}} A_i \in \mathcal{A}$*
5. *If $n \in \mathbb{N}$ and $\{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{A}$ a finite family of sets in $\mathcal{A}$ then $\bigcap_{i \in \{1,\ldots,n\}} A_i \in \mathcal{A}$*
6. *$\forall A \in \mathcal{A}$ we have that $X \setminus A \in \mathcal{A}$*

Proof.

1. As $\mathcal{A}$ is a ring this follows from [theorem: 20.126].
2. This is stated in the definition of a algebra.
3. As $\mathcal{A}$ is a ring this follows from [theorem: 20.126] and the definition of a ring.
4. As $\mathcal{A}$ is a ring this follows from [theorem: 20.126].
5. As $\mathcal{A}$ is a ring this follows from [theorem: 20.126].

6. As $X \in \mathcal{A}$ and $A \in \mathcal{A}$ we have by (3) that $X \setminus A \in \mathcal{A}$. □

In most books we have the following equivalent definitons of a algebra

Theorem 20.131. *Let X be a set and $\mathcal{A} \subseteq \mathcal{P}(X)$ then the following are equivalent:*

1. *$\mathcal{A}$ is a algebra on X*
2. *$\mathcal{A}$ satisifes:*
   a. *$X \in \mathcal{A}$*
   b. *$\forall A \in \mathcal{A}$ we have $X \setminus A \in \mathcal{A}$*
   c. *$\forall A, B \in \mathcal{A}$ we have $A \bigcap B \in \mathcal{A}$ [in other words $\mathcal{A}$ is $\cap$-stable]*
3. *$\mathcal{A}$ satisfies:*
   a. *$X \in \mathcal{A}$*
   b. *$\forall A \in \mathcal{A}$ we have $X \setminus A \in \mathcal{A}$*
   c. *$\forall A, B \in \mathcal{A}$ we have $A \bigcup B \in \mathcal{A}$ [in other words $\mathcal{A}$ is $\cup$-stable]*
4. *$\mathcal{A}$ satisfies:*
   a. *$X \in \mathcal{A}$*
   b. *$\forall A, B \in \mathcal{A}$ we have $A \setminus B \in \mathcal{A}$*

Proof.

1 $\Rightarrow$ 2. If $\mathcal{A}$ is a algebra then by definition $\mathcal{A}$ is a ring and $X \in \mathcal{A}$ so that

1. $X \in \mathcal{A}$
2. $\forall A \in \mathcal{A}$ we have, as $X \in \mathcal{A}$, that $X \setminus A \in \mathcal{A}$ [by the definition of a ring].
3. $\forall A, B \in \mathcal{A}$ we have by the definition of a ring that $A \setminus B \in \mathcal{A}$.

2 $\Rightarrow$ 3. We have:

1. $X \in \mathcal{A}$ by the hypothesis.
2. $X \setminus A$ by the hypothesis.
3. Let $A, B \in \mathcal{A}$ then we have that $X \setminus A \in \mathcal{A}$ and $X \setminus B \in \mathcal{A}$ so that $(X \setminus A) \bigcap (X \setminus B) \in \mathcal{A}$, hence
$$X \setminus \big((X \setminus A) \bigcap (X \setminus B)\big) \in \mathcal{A}$$
Further we have
$$\begin{aligned} X \setminus \big((X \setminus A) \bigcap (X \setminus B)\big) &\underset{\text{[theorem: 1.31]}}{=} (X \setminus (X \setminus A)) \bigcup (X \setminus (X \setminus B)) \\ &\underset{A, B \subseteq X \wedge \text{[theorem: 1.33]}}{=} A \bigcup B \end{aligned}$$
so that $A \bigcup B \in \mathcal{A}$.

3 $\Rightarrow$ 4. We have

1. $X \in \mathcal{A}$ by the hypothesis
2. Let $A, B \in \mathcal{A}$ then $X \setminus A \in \mathcal{A}$ so that $(X \setminus A) \bigcup B \in \mathcal{A}$ hence
$$X \setminus \big((X \setminus A) \bigcup B\big) \in \mathcal{A}$$
Further we have
$$\begin{aligned} X \setminus \big((X \setminus A) \bigcup B\big) &\underset{\text{[theorem: 1.31]}}{=} (X \setminus (X \setminus A)) \bigcap (X \setminus B) \\ &\underset{A \subseteq X \wedge \text{[theorem: 1.33]}}{=} A \bigcap (X \setminus B) \\ &\underset{A, B \subseteq X \wedge \text{[theorem: 1.33]}}{=} A \setminus B \end{aligned}$$
so that $A \setminus B \in \mathcal{A}$

4 ⇒ 1. Then we have

1. $X \in \mathcal{A}$ by the hypothesis.
2. If $A, B \in \mathcal{A}$ then by the hypothesis $A \setminus B \in \mathcal{A}$ so that $A \setminus (A \setminus B) \in \mathcal{A}$, as by [theorem: 1.33] $A \setminus (A \setminus B) = A \bigcap B$ it follows that $A \bigcap B \in \mathcal{A}$ hence we have proved that
$$\forall A, B \in \mathcal{A} \text{ we have } A \bigcap B \in \mathcal{A}$$
Further if $A, B \in \mathcal{A}$ then as $X \in \mathcal{A}$ we have that $(X \setminus A), (X \setminus B) \in \mathcal{A}$ so that $(X \setminus A) \bigcap (X \setminus B) \in \mathcal{A}$, hence we have that
$$X \setminus \big((X \setminus A) \bigcap (X \setminus B)\big) \in \mathcal{A}$$
Now
$$\begin{aligned} X \setminus \big((X \setminus A) \bigcap (X \setminus B)\big) &\underset{\text{[theorem: 1.31]}}{=} (X \setminus (X \setminus A)) \bigcup (X \setminus (X \setminus B)) \\ &\underset{A, B \subseteq X \wedge \text{[theorem: 1.33]}}{=} A \bigcup B \end{aligned}$$
proving that
$$\forall A, B \in \mathcal{A} \text{ we have } A \bigcup B \in \mathcal{A}$$

So as $X \in \mathcal{A} \Rightarrow \mathcal{A} \neq \varnothing$ and $\forall A, B \in \mathcal{A}$ we have $A \bigcup B \in \mathcal{A}$ and $A \setminus B \in \mathcal{A}$ it follows that $\mathcal{A}$ is a algebra. □

We also want to deal with countable unions of sets and for this we define a sigma algebra.

Definition 20.132. *Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ then $\mathcal{A}$ is a sigma algebra [noted as σ-algebra] on X if*

1. $X \in \mathcal{A}$
2. $\forall A \in \mathcal{A}$ *we have* $X \setminus A \in \mathcal{A}$
3. *If* $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ *is a countable family of sets in* $\mathcal{A}$ *then* $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$

***Note* 20.133.** *If $A, B \in \mathcal{A}$ then if we define $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ by $A_i = \begin{cases} A & \text{if } i = 1 \\ B & \text{if } i \in \{, \ldots, \infty\} \end{cases}$ then*
$$A \bigcup B = A_1 \bigcup \left(\bigcup_{i \in \{2, \ldots, \infty\}} A_i \right) = \bigcup_{i \in \mathbb{N}} A_i$$
so that every σ-algebra on X is a algebra. So we have
$$\sigma\text{-algebra} \underset{\text{is}\,a}{\Rightarrow} \text{algebra} \underset{\text{is}\,a}{\Rightarrow} \text{ring}$$

Definition 20.134. (Measurable Space) *Let X be a set and $\mathcal{A}$ a σ-algebra on X then the couple $\langle X, \mathcal{A} \rangle$ is called a* ***measurable space****.*

We have the following equivalent definitions of a σ-algebra

Theorem 20.135. *Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ then we have the following equivalences:*

1. *$\mathcal{A}$ is a σ-algebra on X*
2. *$\mathcal{A}$ is a algebra and $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$* ***pairwise disjoint*** *we have $\bigsqcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$*
3. *$\mathcal{A}$ is a algebra and $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$*
4. *$\mathcal{A}$ satisfies:*
   a. $\varnothing \in \mathcal{A}$
   b. $\forall A \in \mathcal{A}$ *we have* $X \setminus A \in \mathcal{A}$
   c. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ *we have* $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$
5. *$\mathcal{A}$ satisfies:*
   a. $\varnothing \in \mathcal{A}$
   b. $\forall A \in \mathcal{A}$ *we have* $X \setminus A \in \mathcal{A}$
   c. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ *we have* $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{A}$

6. *$\mathcal{A}$ satisfies:*
   a. $X \in \mathcal{A}$
   b. $\forall A \in \mathcal{A}$ *we have* $X \setminus A \in \mathcal{A}$
   c. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ *we have* $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{A}$

Proof.

1 ⇒ 2. As $\mathcal{A}$ is a sigma-algebra it follows that

$$\mathcal{A} \text{ is a algebra}$$

Further if $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ is pairwise disjoint then by the definition of a σ-algebra it follows that

$$\bigsqcup_{i \in \mathbb{N}} A_i \underset{\text{def}}{=} \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

2 ⇒ 3. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ and define

$$\{B_i\}_{i \in \mathbb{N}} \text{ by } B_i = \begin{cases} A_1 \text{ if } i = 1 \\ A_i \setminus \bigcup_{j \in \{1, \ldots, i-1\}} A_j \text{ if } i \in \{2, \ldots, \infty\} \end{cases}$$

As $\mathcal{A}$ is a algbra we have by [theorem: 20.130] it follows that $\forall i \in \mathbb{N}$ we have $B_i \in \mathcal{A}$ so that

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$$

Further by [lemma: 20.108] $\{B_i\}_{i \in \mathbb{N}}$ is pairwise disjoint so that by (2)

$$\bigsqcup_{i \in \mathbb{N}} B_i \in \mathcal{A}$$

As further $\bigcup_{i \in \mathbb{N}} A_i \underset{\text{[lemma: 20.108]}}{=} \bigsqcup_{i \in \mathbb{N}} B_i$ it follows that

$$\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

3 ⇒ 4. As $\mathcal{A}$ is a algebra we have by [theorem: 20.130] that

$$\varnothing \in \mathcal{A}$$

$$\forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A}$$

Finally by the definition of a σ-algebra we have

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ we have } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

4 ⇒ 5. We have by (3) that

$$\varnothing \in \mathcal{A} \text{ and } \forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A}$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$. If $i \in \mathbb{N}$ then as $A_i \in \mathcal{A}$ it follows that $X \setminus A_i \in \mathcal{A}$ we have by (3) that $\bigcup_{i \in \mathbb{N}} (X \setminus A_i) \in \mathcal{A}$ so that

$$X \setminus \left(\bigcup_{i \in \mathbb{N}} (X \setminus A_i) \right) \in \mathcal{A}$$

As

$$\begin{aligned} X \setminus \left(\bigcup_{i \in \mathbb{N}} (X \setminus A_i) \right) &\underset{\text{[theorem: 2.132]}}{=} \bigcap_{i \in \mathbb{N}} (X \setminus (X \setminus A_i)) \\ &\underset{A_i \subseteq X \wedge \text{[theorem: 1.33]}}{=} \bigcap_{i \in \mathbb{N}} A_i \end{aligned}$$

it follows that

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ we have } \bigcap_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

5 ⇒ 6. By (4) we have that $\varnothing \in \mathcal{A}$ so that by (4) again we have

$$X = X \setminus \varnothing \in \mathcal{A}$$

further by (4) we have

$$\forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A} \text{ and } \forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ we have } \bigcap_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

6 ⇒ 1. By (1) we have

$$X \in \mathcal{A} \text{ and } \forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A}$$

Further if $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ then $\forall i \in \mathbb{N}$ we have $A_i \in \mathcal{A}$ so that $X \setminus A_i \in \mathcal{A}$. Hence we have

$$X \setminus \left(\bigcap_{i\in\mathbb{N}} (X \setminus A_i) \right) \in \mathcal{A}$$

Now

$$\begin{aligned} X \setminus \left(\bigcap_{i\in\mathbb{N}} (X \setminus A_i) \right) &\underset{\text{[theorem: 2.132]}}{=} \bigcup_{i\in\mathbb{N}} (X \setminus (X \setminus A_i)) \\ &\underset{A_i \subseteq X \wedge \text{[theorem: 1.33]}}{=} \bigcup_{i\in\mathbb{N}} A_i \end{aligned}$$

so that

$$\forall \{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A} \text{ we have } \bigcup_{i\in\mathbb{N}} A_i \in \mathcal{A}$$

This proves that $\mathcal{A}$ is a σ-algebra.

□

Example 20.136. Let $X \neq \varnothing$ be a set then $\{\varnothing\}$ is not a σ-algebra on X [see example: 20.124] but $\{\varnothing, X\}$ is a σ-algebra on X.

Proof. Using [example: 20.124] it follows that $\{\varnothing, X\}$ is a algebra on X so that

$$X \in \mathcal{A} \text{ and } \forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A}$$

Let $\{A_i\}_{i\in\mathbb{N}} \subseteq \{\varnothing, X\}$ then we have two cases to consider:

$\forall i \in \mathbb{N}$ we have $A_i \neq \varnothing$. Then $\forall i \in \mathbb{N}$ $A_i = X$ so that $\bigcap_{i\in\mathbb{N}} A_i = X \in \mathcal{A}$

$\exists i \in \mathbb{N}$ with $A_i = \varnothing$. Then $\bigcap_{i\in\mathbb{N}} A_i = \varnothing \in \mathcal{A}$

so that $\bigcap_{i\in\mathbb{N}} A_i \in \mathcal{A}$. Applying then [theorem: 20.135] proves that $\{\varnothing, X\}$ is a σ-algebra on X. □

Example 20.137. Let X be a set then $\mathcal{P}(X)$ is a σ-algebra on X

Proof. Using [example: 20.129] $\mathcal{P}(X)$ is a algebra on X. Further for $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{P}(X)$ we have $\forall i \in \mathbb{N}$ that $A_i \subseteq X$ so that $\bigcup_{i\in\mathbb{N}} A_i \subseteq X$ proving that $\bigcup_{i\in\mathbb{N}} A_i \in \mathcal{P}(X)$. Applying then [theorem: 20.135] proves that $\mathcal{P}(X)$ is a σ-algebra on X. □

Theorem 20.138. *Let X be a set, $\mathcal{A}$ a σ-algebra on X, I a countable set, $\{A\}_{i\in I} \subseteq \mathcal{A}$ a countable family of element of $\mathcal{A}$ then we have*

1. $\bigcup_{i\in I} A_i \in \mathcal{A}$
2. $\bigcap_{i\in I} A_i \in \mathcal{A}$

Proof.

1. For I we have either

   I is finite. Then there exist a bijection $\beta: \{1,\ldots,n\} \to I$ where $n \in \mathbb{N}_0$. Let $x \in \bigcup_{i\in I} A_i$ then there exist a $i \in I$ such that $x \in A_i$. As β is a bijection hence surjective there exist a $j \in \{1,\ldots,n\}$ such that $i = \beta(j)$ so that $x \in A_{\beta(j)} \subseteq \bigcup_{j\in\{1,\ldots,n\}} A_{\beta(j)}$. Hence we have that

   $$\bigcup_{i\in I} A_i \subseteq \bigcup_{j\in\{1,\ldots,n\}} A_{\beta(i)} \tag{20.71}$$

   Likewise if $x \in \bigcup_{j\in\{1,\ldots,n\}} A_{\beta(i)}$ then there exist a $j \in \{1,\ldots,n\}$ such that $x \in A_{\beta(j)}$ which as $\beta(j) \in I$ proves that $x \in \bigcup_{i\in I} A_i$, hence $\bigcup_{j\in\{1,\ldots,n\}} A_{\beta(i)} \subseteq \bigcup_{i\in I} A_i$. Combining this with [eq: 20.71] proves that

   $$\bigcup_{i\in I} A_i = \bigcup_{j\in\{1,\ldots,n\}} A_{\beta(i)}$$

   As $\forall j \in \{1,\ldots,n\}$ $A_{\beta(i)} \in \mathcal{A}$ [because $\beta(i) \in I$] it follows, as a σ-algebra is a ring, from [theorem: 20.126] that $\bigcup_{j\in\{1,\ldots,n\}} A_{\beta(i)} \in \mathcal{A}$. Hence

   $$\bigcup_{i\in I} A_i \in \mathcal{A}$$

***I* is denumerable.** Then there exist a bijection $\beta: \mathbb{N} \to I$. Let $x \in \bigcup_{i \in I} A_i$ then there exist a $i \in I$ such that $x \in A_i$. As β is a bijection hence surjective there exist a $j \in \mathbb{N}$ such that $i = \beta(j)$ so that $x \in A_{\beta(j)} \subseteq \bigcup_{j \in \mathbb{N}} A_{\beta(j)}$. Hence we have that

$$\bigcup_{i \in I} A_i \subseteq \bigcup_{j \in \mathbb{N}} A_{\beta(i)} \tag{20.72}$$

Likewise if $x \in \bigcup_{j \in \mathbb{N}} A_{\beta(i)}$ then there exist a $j \in \mathbb{N}$ such that $x \in A_{\beta(j)}$ which as $\beta(j) \in I$ proves that $x \in \bigcup_{i \in I} A_i$, hence $\bigcup_{j \in \mathbb{N}} A_{\beta(i)} \subseteq \bigcup_{i \in I} A_i$. Combining this with [eq: 20.72] proves that

$$\bigcup_{i \in I} A_i = \bigcup_{j \in \mathbb{N}} A_{\beta(i)}$$

As $\forall j \in \mathbb{N}\ A_{\beta(i)} \in \mathcal{A}$ [because $\beta(i) \in I$] it follows, as a σ-algebra is a ring, from [theorem: 20.126] that $\bigcup_{j \in \mathbb{N}} A_{\beta(i)} \in \mathcal{A}$. Hence

$$\bigcup_{i \in I} A_i \in \mathcal{A}$$

2. Let $i \in I$ then $A_i \in \mathcal{A}$ hence $X \setminus A_i \in \mathcal{A}$ so that by (1) $\bigcup_{i \in I} (X \setminus A_i) \in \mathcal{A}$ from which it follows that

$$X \setminus \left(\bigcup_{i \in I} (X \setminus A_i) \right) \in \mathcal{A}$$

As we have

$$\begin{aligned} X \setminus \left(\bigcup_{i \in I} (X \setminus A_i) \right) &\underset{\text{[theorem: 2.132]}}{=} \bigcap_{i \in I} (X \setminus (X \setminus A_i)) \\ &\underset{A_i \subseteq X \wedge \text{[theorem: 1.33]}}{=} \bigcap_{i \in I} A_i \end{aligned}$$

it follows that

$$\bigcap_{i \in I} A_n \in \mathcal{A}$$

□

If we have already proved that a subset of $\mathcal{P}(X)$ is a algebra on X then the following theorem will be usefull to prove that this subset is actually a σ-algebra.

Theorem 20.139. *Let X be a set and let $\mathcal{A}$ be a algebra on X then we have:*

1. *If $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N}\ A_i \subseteq A_{i+1}$ we have $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$ then $\mathcal{A}$ is a σ-algebra on X.*
2. *If $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N}\ A_{i+1} \subseteq A_i$ we have $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{A}$ then $\mathcal{A}$ is a σ-algebra on X.*

Proof.

1. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$. Define $\{B_i\}_{i \in \mathbb{N}}$ by $B_i = \bigcup_{j \in \{1, \ldots, i\}} A_i$ then as $\mathcal{A}$ is a algebra we have by [theorem: 20.130] that $\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$. Further for $i \in \mathbb{N}$ we have

$$B_i = \bigcup_{j \in \{1, \ldots, i\}} B_j \subseteq \bigcup_{j \in \{1, \ldots, i+1\}} B_j = B_{i+1}$$

hence by the hypothese we have

$$\bigcup_{i \in \mathbb{N}} B_i \in \mathcal{A} \tag{20.73}$$

As $\forall i \in \mathbb{N}$ we have $A_i \subseteq \bigcup_{j \in \{1, \ldots, i\}} A_j = B_i$ it follows that

$$\bigcup_{i \in \mathbb{N}} A_i \subseteq \bigcup_{i \in \mathbb{N}} B_i \tag{20.74}$$

Further if $x \in \bigcup_{i \in \mathbb{N}} B_i$ then there exist a $i \in \mathbb{N}$ such that $x \in B_i = \bigcup_{j \in \{1, \ldots, i\}} A_j$, hence there exist a $j \in \{1, \ldots, i\}$ such that $x \in A_j \subseteq \bigcup_{i \in \mathbb{N}} A_i$. This proves that $\bigcup_{i \in \mathbb{N}} B_i \subseteq \bigcup_{i \in \mathbb{N}} A_i$ which combined with [eq: 20.74] gives us $\bigcup_{i \in \mathbb{N}} A_i = \bigcup_{i \in \mathbb{N}} B_i$, hence using [eq: 20.73] we have that

$$\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

Applying then [theorem: 20.135] it follows that $\mathcal{A}$ is a σ-algebra.

2. Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ be such that $\forall i\in\mathbb{N}$ we have $A_i\subseteq A_{i+1}$. Let $i\in\mathbb{N}$ then as $\mathcal{A}$ is a algebra $X\setminus A_i\in\mathcal{A}$, further if $x\in X\setminus A_{i+1}$ then $x\in X$ and $x\notin A_i$ [as $A_i\subseteq A_{i+1}$] so that $x\in X\setminus A_i$. Hence $\{X\setminus A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ and $\forall i\in\mathbb{N}$ we have $X\setminus A_{i+1}\subseteq X\setminus A_i$ so by the hypothesis we have that $\bigcap_{i\in\mathbb{N}}(X\setminus A_i)\in\mathcal{A}$. As $\mathcal{A}$ is a algebra we have then that
$$X\setminus\left(\bigcap_{i\in\mathbb{N}}(X\setminus A_i)\right)\in\mathcal{A}$$
Further $X\setminus(\bigcap_{i\in\mathbb{N}}(X\setminus A_i))\underset{\text{[theorem: 2.132]}}{=}\bigcup_{i\in\mathbb{N}}(X\setminus(X\setminus A_i))\underset{A_i\subseteq X\wedge\text{[theorem: 1.33]}}{=}\bigcup_{i\in\mathbb{N}}A_i$ so that $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}$. Hence we have proved that $\forall\{A_i\}_{i\in\mathcal{A}}\subseteq\mathcal{A}$ with $\forall i\in\mathbb{N}$ $A_i\subseteq A_{i+1}$ $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}$ ao that by (1) $\mathcal{A}$ is a σ-algebra. □

We show now how we can generate a σ algebra based on a arbitrary subset of $\mathcal{P}(X)$. First we prove that for a non empty collection of σ-algebra's the intersection of this collection is again a σ-algebra.

Lemma 20.140. *Let X be a set and $\mathfrak{A}$ a non empty set of σ-algebra's on X then $\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$ is a σ-algebra on X.*

Proof. As $\mathfrak{A}\neq\varnothing$ there exist a $\mathcal{S}\in\mathfrak{A}$ with $\mathcal{S}\subseteq\mathcal{P}(X)$ so that we have by [theorem: 1.63] that $\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}\subseteq\mathcal{S}\subseteq\mathcal{P}(X)$ proving that
$$\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}\subseteq\mathcal{P}(X)$$
As $\forall\mathcal{A}\in\mathfrak{A}$ $\mathcal{A}$ is a σ-algebra on X we have by [theorem: 20.135] that $X\in\mathcal{A}$ hence
$$X\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$$
Let $A\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$ then for $\mathcal{A}\in\mathfrak{A}$ we have $A\in\mathcal{A}$ so that $X\setminus A\in\mathcal{A}$ which as $\mathcal{A}\in\mathfrak{A}$ was chosen arbitrary proves that $X\setminus A\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$. Hence as $A\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$ was chosen arbitrary we have that
$$\forall A\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}\text{ we have }X\setminus A\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$$
If $\{A_i\}_{i\in\mathbb{N}}\subseteq\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$ then for $\mathcal{A}\in\mathfrak{A}$ we have $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ so that $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}$ which as $\mathcal{A}\in\mathfrak{A}$ was chosen arbitrary proves that $\bigcup_{i\in\mathbb{N}}A\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$. Hence as $\{A_i\}_{i\in\mathbb{N}}\subseteq\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$ was chosen arbitrary we have that
$$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}\text{ we have }\bigcup_{i\in\mathbb{N}}A\in\bigcap_{\mathcal{A}\in\mathfrak{A}}\mathcal{A}$$
□

We use now the above theorem to show how we can generate a σ-algebra out of a non empty subset of $\mathcal{P}(X)$.

Theorem 20.141. *Let X be a set $\mathcal{A}\subseteq\mathcal{P}(X)$ then there exist a **unique** algebra $\sigma[\mathcal{A}]$ on X such that:*

1. *$\mathcal{A}\subseteq\sigma[\mathcal{A}]$*
2. *If $\mathcal{B}$ is another σ-algebra with $\mathcal{A}\subseteq\mathcal{B}$ then $\sigma[\mathcal{A}]\subseteq\mathcal{B}$*

This unique smallest σ-algebra that contains $\mathcal{A}$ is called the σ-algebra generated by $\mathcal{A}$

Proof. Define $\mathfrak{A}=\{\mathcal{T}\,|\,\mathcal{T}$ is a σ-algebra on X with $\mathcal{A}\subseteq\mathcal{T}\}$. As $\mathcal{A}\subseteq\mathcal{P}(X)$ and $\mathcal{P}(X)$ and $\mathcal{P}(X)$ is a σ-algebra on X [see example: 20.137] it follows that $\mathcal{P}(X)\in\mathfrak{A}$ hence $\mathfrak{A}$ is not empty. Using then previous lemma [lemma: 20.140] it follows that
$$\bigcap_{\mathcal{T}\in\mathfrak{A}}\mathcal{T}\text{ is a }\sigma\text{-algebra on }X$$
As $\forall\mathcal{T}\in\mathfrak{A}$ $\mathcal{A}\subseteq\mathcal{T}$ it follows from [theorem: 1.63] that
$$\mathcal{A}\subseteq\bigcap_{\mathcal{T}\in\mathfrak{A}}\mathcal{T}$$
Finally assume that $\mathcal{B}$ is another σ-algebra on X such that $\mathcal{A}\subseteq\mathcal{B}$ then $\mathcal{B}\in\mathfrak{A}$ so that by [theorem: 1.63]
$$\bigcap_{\mathcal{T}\in\mathfrak{A}}\mathcal{T}\subseteq\mathcal{B}$$
Taking $\sigma[\mathcal{A}]=\bigcap_{\mathcal{T}\in\mathfrak{A}}\mathcal{T}$ then proves the theorem. □

A special case of a σ-algebra in the context of topological spaces is the Borel algebra.

Definition 20.142. *Let $\langle X,\mathcal{T}\rangle$ be a topological space then the Borel algebra on X noted as $\mathcal{B}[X,\mathcal{T}]$ is defined to be $\mathcal{B}[X,\mathcal{T}]=\sigma[\mathcal{T}]$. In other words the Borel algebra on a topological space is the σalgebra generated by $\mathcal{T}$.*

Theorem 20.143. *Let $\langle X,\mathcal{T}\rangle$ be a topological space then $\mathcal{B}[X,\mathcal{T}]=\sigma[\{C\subseteq X|C \text{ is closed}\}]$.*

Proof. If $C\in\{C\subseteq X|C \text{ is closed}\}$ then C is closed, hence there exist a open $U\in\mathcal{T}$ such that $C=X\setminus U$. As $U\in\mathcal{T}\in\sigma[\mathcal{T}]$ it follows that $C=X\setminus U\in\sigma[\mathcal{T}]$. So $\{C\subseteq X|C \text{ is closed}\}\subseteq\sigma[\mathcal{T}]$ a σ-algebra, hence using [theorem: 20.141[we have

$$\sigma[\{C\subseteq X|C \text{ is closed}\}]\subseteq\sigma[\mathcal{T}]$$

If $U\in\mathcal{T}$ then $X\setminus U$ is closed hence $X\setminus U\in\{C\subseteq X|C \text{ is closed}\}\in\sigma[\{C\subseteq X|C \text{ is closed}\}]$, hence $U=X\setminus(X\setminus U)\in\sigma[\{C\subseteq X|C \text{ is closed}\}]$ proving that $\mathcal{T}\subseteq\sigma[\{C\subseteq X|C \text{ is closed}\}]$. So using [theorem: 20.141[we have

$$\sigma[\mathcal{T}]\subseteq\sigma[\{C\subseteq X|C \text{ is closed}\}]$$

This proves that

$$\mathcal{B}[X,\mathcal{T}]=\sigma[\mathcal{T}]=\sigma[\{C\subseteq X|C \text{ is closed}\}]$$ □

Theorem 20.144. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space and $B\in\mathcal{A}$ then $\langle B,\mathcal{A}_{|B}\rangle$ is a measurable space where $\mathcal{A}_{|B}=\{C\in\mathcal{A}|C\subseteq B\}$ is a σ-algebra on B.*

Proof.

1. As $B\in\mathcal{A}$ and $B\subseteq B$ it follows that $B\in\mathcal{A}_{|B}$.
2. Let $A\in\mathcal{A}_{|B}$ then $A\in\mathcal{A}$ and $A\subseteq B$. As also $B\in\mathcal{A}$ it follows from [theorem: 20.135] that $B\bigcap(X\setminus A)\in\mathcal{A}$. Further $B\bigcap(X\setminus A)\underset{\text{[theorem: 1.25]}}{=}(B\bigcap X)\setminus A\underset{B\subseteq X}{=}B\setminus A$ so that $B\setminus A\in\mathrm{A}$ which as $B\setminus A\subseteq B$ proves that
$$B\setminus A\in\mathcal{A}_{|B}$$
3. Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}_{|B}$ then $\forall i\in\mathbb{N}$ we have $A_i\in\mathcal{A}$ and $A_i\subseteq B$ so that $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}$ and $\bigcup_{i\in\mathbb{N}}A_i\subseteq B$. Hence
$$\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}_{|B}$$ □

20.3.1 Borel algebra on $\mathbb{R}$

Definition 20.145. *Let $\langle\mathbb{R},\mathcal{T}_{||}\rangle$ be the set of real numbers with the canonical topology $\mathcal{T}_{||}$ based on the absolute value norm [see theorem: 14.99] then then $\mathcal{B}[\mathbb{R}]$ is the Borel algebra based on $\mathcal{T}_{||}$. In other words*

$$\mathcal{B}[\mathbb{R}]=\mathcal{B}[\mathbb{R},\mathcal{T}_{||}]=\sigma[\mathcal{T}_{||}]$$

We will now find equivalent definitions for $\mathcal{B}[\mathbb{R}]$ that will be usefull if we define a measure. First we introduce the concept of bounded intervals on $\mathbb{R}$.

Definition 20.146. *We define the following set of bounded intervals:*

1. $\mathcal{I}_{[]}=\{[a,b]|a,b\in\mathbb{R}\wedge[a,b]\neq\varnothing\}$ *[the set of non empty closed bounded intervals]*
2. $\mathcal{I}_{[[}=\{[a,b[|a,b\in\mathbb{R}\wedge[a,b[\neq\varnothing\}$ *[the set of non empty right open bounded intervals]*
3. $\mathcal{I}_{]]}=\{]a,b]|a,b\in\mathbb{R}\wedge]a,b]\neq\varnothing\}$ *[the set of non empty left open bounded intervals]*
4. $\mathcal{I}_{][}=\{]a,b[|a,b\in\mathbb{R}\wedge]a,b[\neq\varnothing\}$ *[the set of non empty open bounded intervals]*
5. $\mathcal{I}=\mathcal{I}_{[]}\bigcup\mathcal{I}_{[[}\bigcup\mathcal{I}_{]]}\bigcup\mathcal{I}_{][}$

***Note* 20.147.** *If $b=a$ then $]a,b[=[a,b[=]a,b]=\varnothing$ and if $b<a$ then $[a,b]=[a,b[=]a,b]=]a,b[=\varnothing$ then we have valid bounded intervals but they are not elements of $\mathcal{I}_{[]}$, $\mathcal{I}_{[[}$, $\mathcal{I}_{]]}$ and $\mathcal{I}_{][}$. One reason to exclude these intervals is that the boundary points of these intevals are not well defined [for eample $[1,0[=[2,0[=[0,0[$ which is needed for defining the length of the interval based on the boundary points.*

For case to case analysis the following lemma will be usefull.

Lemma 20.148. *We have that $\mathcal{I}_{[]}$, $\mathcal{I}_{[[}$, $\mathcal{I}_{]]}$ and $\mathcal{I}_{][}$ are pairwise disjoint. In other words we have*

$$\mathcal{I}_{[]}\bigcap\mathcal{I}_{[[}=\varnothing$$
$$\mathcal{I}_{[]}\bigcap\mathcal{I}_{]]}=\varnothing$$
$$\mathcal{I}_{[]}\bigcap\mathcal{I}_{][}=\varnothing$$
$$\mathcal{I}_{[[}\bigcap\mathcal{I}_{[]}=\varnothing$$
$$\mathcal{I}_{[[}\bigcap\mathcal{I}_{]]}=\varnothing$$
$$\mathcal{I}_{[[}\bigcap\mathcal{I}_{][}=\varnothing$$
$$\mathcal{I}_{]]}\bigcap\mathcal{I}_{[]}=\varnothing$$
$$\mathcal{I}_{]]}\bigcap\mathcal{I}_{[[}=\varnothing$$
$$\mathcal{I}_{]]}\bigcap\mathcal{I}_{][}=\varnothing$$
$$\mathcal{I}_{][}\bigcap\mathcal{I}_{[]}=\varnothing$$
$$\mathcal{I}_{][}\bigcap\mathcal{I}_{[[}=\varnothing$$
$$\mathcal{I}_{][}\bigcap\mathcal{I}_{]]}=\varnothing$$

so that

$$\mathcal{I}=\mathcal{I}_{[]}\bigsqcup\mathcal{I}_{[[}\bigsqcup\mathcal{I}_{]]}\bigsqcup\mathcal{I}_{][}$$

Proof. We have to check the following cases:

$\boldsymbol{\mathcal{I}_{[]}\bigcap\mathcal{I}_{[[}}$**.** If $I\in\mathcal{I}_{[]}\bigcap\mathcal{I}_{[[}$ then $\varnothing\neq I=[a,b]=[c,d[$. As $[a,b]\neq\varnothing$ it follows from [theorem: 3.139] that $a\leqslant b$ so that $b\in[a,b]=[c,d[$ hence $c\leqslant b<d$. Using [theorem: 10.32] there exist a $x\in\mathbb{R}$ such that $c\leqslant b<x<d$ proving that $x\in[c,d[=[a,b]$ so that $b<x\leqslant b$ leading to the contradiction $b<b$. Hence we have

$$\mathcal{I}_{[]}\bigcap\mathcal{I}_{[[}=\varnothing \tag{20.75}$$

$\boldsymbol{\mathcal{I}_{[]}\bigcap\mathcal{I}_{]]}}$**.** If $I\in\mathcal{I}_{[]}\bigcap\mathcal{I}_{]]}$ then $\varnothing=[a,b]=]c,d]$. As $[a,b]\neq\varnothing$ it follows from [theorem: 3.139] that $a\leqslant b$ so that $a\in[a,b]=]c,d]$ hence $c<a\leqslant d$. Using [theorem: 10.32] there exist a $x\in\mathbb{R}$ such that $c<x<a\leqslant d$ proving that $x\in]c,d]=[a,b]$ so that $a\leqslant x<a$ leading to the contradiction $a<a$. Hence we have

$$\mathcal{I}_{[]}\bigcap\mathcal{I}_{]]}=\varnothing \tag{20.76}$$

$\boldsymbol{\mathcal{I}_{[]}\bigcap\mathcal{I}_{][}}$**.** If $I\in\mathcal{I}_{[]}\bigcap\mathcal{I}_{][}$ then $\varnothing\neq I=[a,b]=]c,d[$. As As $[a,b]\neq\varnothing$ it follows from [theorem: 3.139] that $a\leqslant b$ so that $b\in[a,b]=]c,d[$ hence $c<b<d$. Using [theorem: 10.32] there exist a $x\in\mathbb{R}$ such that $c<b<x<d$ proving that $x\in]c,d[=[a,b]$ so that $b<x\leqslant b$ leading to the contradiction $b<b$. Hence we have

$$\mathcal{I}_{[]}\bigcap\mathcal{I}_{][}=\varnothing \tag{20.77}$$

$\boldsymbol{\mathcal{I}_{[[}\bigcap\mathcal{I}_{[]}}$**.** Then we have

$$\mathcal{I}_{[[}\bigcap\mathcal{I}_{[]}=\mathcal{I}_{[]}\bigcap\mathcal{I}_{[[}\underset{[\text{eq; }20.75]}{=}\varnothing$$

$\boldsymbol{\mathcal{I}_{[[}\bigcap\mathcal{I}_{]]}}$**.** If $I\in\mathcal{I}_{[[}\bigcap\mathcal{I}_{]]}$ then $\varnothing\neq I=[a,b[=]c,d]$. As $[a,b]\neq\varnothing$ it follows from [theorem: 3.139] that $a<b$ so that $a\in[a,b[=]c,d]$ hence $c<a\leqslant d$. Using [theorem: 10.32] there exist a $x\in\mathbb{R}$ such that $c<x<a\leqslant d$ proving that $x\in]c,d]=[a,b[$ so that $a\leqslant x<a$ leading to the contradiction $a<a$. Hence we have

$$\mathcal{I}_{[[}\bigcap\mathcal{I}_{]]}=\varnothing \tag{20.78}$$

$\boldsymbol{\mathcal{I}_{[[}\bigcap\mathcal{I}_{][}}$**.** If $I\in\mathcal{I}_{[[}\bigcap\mathcal{I}_{][}$ then $\varnothing\neq I=[a,b[=]c,d[$. As $[a,b]\neq\varnothing$ it follows from [theorem: 3.139] that $a<b$ so that $a\in[a,b[=]c,d]$ hence $c<a<d$. Using [theorem: 10.32] there exist a $x\in\mathbb{R}$ such that $c<x<a<d$ proving that $x\in]c,d[=[a,b[$ so that $a\leqslant x<a$ leading to the contradiction $a<a$. Hence we have

$$\mathcal{I}_{[[}\bigcap\mathcal{I}_{][}=\varnothing \tag{20.79}$$

$\boldsymbol{\mathcal{I}_{]]}\bigcap\mathcal{I}_{[]}}$**.** Then we have

$$\mathcal{I}_{]]}\bigcap\mathcal{I}_{[]}=\mathcal{I}_{[]}\bigcap\mathcal{I}_{]]}\underset{[\text{eq: }20.76]}{=}\varnothing$$

$\boldsymbol{\mathcal{I}_{]]}\bigcap\mathcal{I}_{[[}}$**.** If $I\in\mathcal{I}_{]]}\bigcap\mathcal{I}_{[[}$ then $I=]a,b]=[c,d[$. As $]a,b]\neq\varnothing$ we have by [theorem: 3.139] that $a<b$ so that $b\in]a,b]=[c,d[$ hence $c\leqslant b<d$. Using [theorem: 10.32] there exist a $x\in\mathbb{R}$ such that $c\leqslant b<x<d$ proving that $x\in[c,d[=]a,b]$ so that $b<x\leqslant b$ leading to the contradiction $b<b$. Hence we have

$$\mathcal{I}_{]]}\bigcap\mathcal{I}_{[[}=\varnothing \tag{20.80}$$

$\mathcal{I}_{]]}\bigcap\mathcal{I}_{][}$. If $I\in\mathcal{I}_{]]}\bigcap\mathcal{I}_{][}$ then $I=]a,b]=]c,d[$. As $]a,b]\neq\varnothing$ we have by [theorem: 3.139] that $a<b$ so that $b\in]a,b]=]c,d[$ hence $c<b<d$. Using [theorem: 10.32] there exist a $x\in\mathbb{R}$ such that $c<b<x<d$ proving that $x\in]c,d[=]a,b]$ so that $b<x\leqslant b$ leading to the contradiction $b<b$. Hence we have

$$\mathcal{I}_{]]}\bigcap\mathcal{I}_{][}=\varnothing \tag{20.81}$$

$\mathcal{I}_{][}\bigcap\mathcal{I}_{[]}$. Then we have

$$\mathcal{I}_{][}\bigcap\mathcal{I}_{[]}=\mathcal{I}_{[]}\bigcap\mathcal{I}_{][}\underset{\text{[eq: 20.77]}}{=}\varnothing$$

$\mathcal{I}_{][}\bigcap\mathcal{I}_{[[}$. Then we have

$$\mathcal{I}_{][}\bigcap\mathcal{I}_{[[}=\mathcal{I}_{[[}\bigcap\mathcal{I}_{][}\underset{\text{[eq: 20.79]}}{=}\varnothing$$

$\mathcal{I}_{][}\bigcup\mathcal{I}_{]]}$. Then we have

$$\mathcal{I}_{][}\bigcap\mathcal{I}_{]]}=\mathcal{I}_{]]}\bigcap\mathcal{I}_{][}\underset{\text{[eq: 20.81]}}{=}\varnothing$$

□

The following allows us to switch between the different types of non empty bounded intervals.

Lemma 20.149. *Let $a,b\in\mathbb{R}$ the we have*

1. $]a,b]=\bigcap_{n\in\mathbb{N}}\left]a,b+\frac{1}{n}\right[$
2. $[a,b[=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},b\right[$
3. $[a,b]=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},b\right]$
4. $[a,b]=\bigcap_{n\in\mathbb{N}}\left[a,b+\frac{1}{n}\right[$
5. $[a,b]=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},b+\frac{1}{n}\right[$
6. $]-\infty,a]=\bigcap_{n\in\mathbb{N}}\left]-\infty,a+\frac{1}{n}\right[$
7. $[a,\infty[=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},\infty\right[$
8. $]a,b]=\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b\right]$
9. $[a,b[=\bigcup_{n\in\mathbb{N}}\left[a,b-\frac{1}{n}\right]$
10. $]a,b[=\bigcup_{n\in\mathbb{N}}\left]a,b-\frac{1}{n}\right]$
11. $]a,b[=\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b\right[$
12. $]a,b[=\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b-\frac{1}{n}\right]$
13. $]-\infty,a[=\bigcup_{n\in\mathbb{N}}\left]-\infty,a-\frac{1}{n}\right]$
14. $]a,\infty[=\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},\infty\right[$
15. $[a,b[=[a,\infty[\setminus[b,\infty[$
16. $]a,b]=]-\infty,b]\setminus]-\infty,a]$
17. $]a,\infty[=\mathbb{R}\setminus]-\infty,a]$

Proof.

1. Let $x\in]a,b]$ then $a<x\leqslant b$ and as $\forall n\in\mathbb{N}\ b<b+\frac{1}{n}$ we have $a<x<b+\frac{1}{n}$ so it follows that $x\in\left]a,b+\frac{1}{n}\right[$. Hence

$$]a,b]\subseteq\bigcap_{n\in\mathbb{N}}\left]a,b+\frac{1}{n}\right[\tag{20.82}$$

If $x\in\bigcap_{n\in\mathbb{N}}\left]a,b+\frac{1}{n}\right[$ then $\forall n\in\mathbb{N}\ x\in\left]a,b+\frac{1}{n}\right[$ or $a<x<b+\frac{1}{n}$ which by [corollary: 10.31] proves that $a<x\leqslant b$ hence $x\in]a,b]$. So it follows that $\bigcap_{n\in\mathbb{N}}\left]a,b+\frac{1}{n}\right[\subseteq]a,b]$ which using [eq: 20.82] proves that

$$]a,b]=\bigcap_{n\in\mathbb{N}}\left]a,b+\frac{1}{n}\right[$$

2. Let $x \in [a,b[$ then $a \leqslant x < b$ and as $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < a$ it follows that $x \in \left]a - \frac{1}{n}, b\right[$. Hence
$$[a,b[\subseteq \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right[\tag{20.83}$$
If $x \in \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right[$ then $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < x < b \Rightarrow a < x + \frac{1}{n} \wedge x < b$ which by [corollary: 10.31] proves that $a \leqslant x < b$ hence $x \in [a,b[$. So $\bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right[\subseteq [a,b[$ which using [eq: 20.83] prove that
$$[a,b[= \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right[$$
3. Let $x \in [a,b]$ then $a \leqslant x < b$ and as $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < a \Rightarrow x \in \left]a - \frac{1}{n}, b\right]$. Hence
$$[a,b] \subseteq \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right] \tag{20.84}$$
If $x \in \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right]$ then $\forall n \in \mathbb{N}$ then $a - \frac{1}{n} < x \leqslant b$ or $a < x + \frac{1}{n}$ which by [corollary: 10.31] proves that $a \leqslant x$ giving $x \in [a,b]$. So we have $\bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right] \subseteq [a,b]$ which combined with [eq: 20.84] gives
$$[a,b] = \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right]$$
4. Let $x \in [a,b]$ then $a \leqslant x \leqslant b$ then $\forall n \in \mathbb{N}$ we have $a \leqslant x \leqslant b < b + \frac{1}{n}$. Which proves that
$$[a,b] \subseteq \bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n}\right[\tag{20.85}$$
If $x \in \bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n}\right[$ then $\forall n \in \mathbb{N}$ we have $a \leqslant x < b + \frac{1}{n}$. Using [corollary: 10.31] we have $x \leqslant b$ proving that $x \in [a,b]$. Hence $\bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n}\right[\subseteq [a,b]$ which combined with [eq: 20.85] gives
$$[a,b] = \bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n}\right[$$
5. Let $x \in [a,b]$ then $a \leqslant x \leqslant b$ and as $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < x < b + \frac{1}{n}$ it follows that $x \in \left]a - \frac{1}{n}, b + \frac{1}{n}\right[$. Hence
$$[a,b] \subseteq \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b + \frac{1}{n}\right[\tag{20.86}$$
Let $x \in \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b + \frac{1}{n}\right[$ then $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < x \wedge x < b + \frac{1}{n} \Rightarrow a < x + \frac{1}{n} \wedge x < b + \frac{1}{n}$. Using [corollary: 10.31] we have $a \leqslant x \wedge x \leqslant b$ or $x \in [a,b]$. Hence $\bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b + \frac{1}{n}\right[\subseteq [a,b]$ which together with [eq: 20.86] proves
$$[a,b] = \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b + \frac{1}{n}\right[$$
6. Let $x \in]-\infty, a]$ then $x \leqslant a$ and as $\forall n \in \mathbb{N}$ we have $x < a + \frac{1}{n}$ it follows that $x \in \left]-\infty, a + \frac{1}{n}\right[$. Hence
$$]-\infty, a] \subseteq \bigcap_{n \in \mathbb{N}} \left]-\infty, a + \frac{1}{n}\right[\tag{20.87}$$
Let $x \in \bigcap_{n \in \mathbb{N}} \left]-\infty, a + \frac{1}{n}\right[$ then $\forall n \in \mathbb{N}$ we have $x < a + \frac{1}{n}$ which by [corollary: 10.31] gives $x \leqslant a$ or $x \in]-\infty, a]$. Hence $\bigcap_{n \in \mathbb{N}} \left]-\infty, a + \frac{1}{n}\right[\subseteq]-\infty, a]$ which together with [eq: 20.87] proves
$$\bigcap_{n \in \mathbb{N}} \left]-\infty, a + \frac{1}{n}\right[=]-\infty, a]$$
7. Let $x \in [a, \infty[$ then $a \leqslant x$ so that $\forall n \in \mathbb{N}_9$ we have $a - \frac{1}{n} < x$ giving $x \in \left]a - \frac{1}{n}, \infty\right[$ proving that
$$[a, \infty[\subseteq \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, \infty\right[\tag{20.88}$$

Let $x\in\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},\infty\right[$ then $\forall n\in\mathbb{N}$ we have $a-\frac{1}{n}<x\Rightarrow a<x+\frac{1}{n}$ which by [corollary: 10.31] proves that $x\in[a,\infty[$. Hence $\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},\infty\right[\subseteq[a,\infty]$ which together with [eq: 20.88] proves that

$$[a,\infty[=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},\infty\right[$$

8. Let $x\in]a,b]$ then $a<x\leqslant b$ and using [corollary: 10.30] there exists a $n\in\mathbb{N}$ such that $a<a+\frac{1}{n}<x\leqslant b$ proving that $x\in\left[a+\frac{1}{n},b\right]$. Hence

$$]a,b]\subseteq\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b\right] \tag{20.89}$$

Let $x\in\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b\right]$ then there exists a $n\in\mathbb{N}$ such that $x\in\left[a+\frac{1}{n},b\right]\Rightarrow a<a+\frac{1}{n}\leqslant x\leqslant b$. Hence $x\in]a,b]$ proving that $\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b\right]\subseteq]a,b]$ which by [eq: 20.89] gives

$$]a,b]=\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b\right]$$

9. Let $x\in[a,b[$ then $a\leqslant x<b$ and using [corollary: 10.30] there exists a $n\in\mathbb{N}$ such that $a\leqslant x<x+\frac{1}{n}<b\Rightarrow a\leqslant x\wedge x<b-\frac{1}{n}$ proving that $x\in\left[a,b-\frac{1}{n}\right]$. So

$$a,b[\subseteq\bigcup_{n\in\mathbb{N}}\left[a,b-\frac{1}{n}\right] \tag{20.90}$$

If $x\in\bigcup_{n\in\mathbb{N}}\left[a,b-\frac{1}{n}\right]$ then $\exists n\in\mathbb{N}$ such that $x\in\left[a,b-\frac{1}{n}\right]\Rightarrow a\leqslant x\leqslant b-\frac{1}{n}<b$ proving that $x\in[a,b[$. Hence $\bigcup_{n\in\mathbb{N}}\left[a,b-\frac{1}{n}\right]\subseteq[a,b[$ which combined with 20.90 gives

$$[a,b[=\bigcup_{n\in\mathbb{N}}\left[a,b-\frac{1}{n}\right]$$

10. Let $x\in]a,b[$ then $a<x<b$ and using [corollary: 10.30] there exists a $n\in\mathbb{N}$ such that $a<x<x+\frac{1}{n}<b$ hence $a<x<b-\frac{1}{n}$ proving that $x\in\left]a,b-\frac{1}{n}\right]$. So

$$]a,b[\subseteq\bigcup_{n\in\mathbb{N}}\left]a,b-\frac{1}{n}\right] \tag{20.91}$$

If $x\in\bigcup_{n\in\mathbb{N}}\left]a,b-\frac{1}{n}\right]$ then $\exists n\in\mathbb{N}$ such that $a<x\leqslant b-\frac{1}{n}<b\Rightarrow x\in]a,b[$ proving that $\bigcup_{n\in\mathbb{N}}\left]a,b-\frac{1}{n}\right]\subseteq]a,b[$. Combining this with [eq: 20.91] gives

$$]a,b[=\bigcup_{n\in\mathbb{N}}\left]a,b-\frac{1}{n}\right]$$

11. Let $x\in]a,b[$ then $a<x<b$ and using [corollary: 10.30] there exists a $n\in\mathbb{N}$ such that $a<a+\frac{1}{n}<x<b$ proving that $x\in\left[a+\frac{1}{n},b\right[$. Hence

$$]a,b[\subseteq\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b\right[\tag{20.92}$$

If $x\in\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b\right[$ then $\exists n\in\mathbb{N}$ such that $a<a+\frac{1}{n}<x<b\Rightarrow x\in]a,b[$ proving that $\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b\right[\subseteq]a,b[$. Combining this with [eq: 20.92] gives

$$]a,b[=\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n}\right[$$

12. Let $x\in]a,b[$ then $a<x<b$ and using [corollary: 10.30] there exists $n_1,n_2\in\mathbb{N}$ such that $a<a+\frac{1}{n_1}<x<x+\frac{1}{n_2}<b\Rightarrow a+\frac{1}{n_1}<x<b-\frac{1}{n_2}$. Take $m=\max(n_1,n_2)$ then $\frac{1}{m}\leqslant\frac{1}{n_1},\frac{1}{n_2}$ so that $a+\frac{1}{m}\leqslant a+\frac{1}{n_1}<x<b-\frac{1}{n_2}\leqslant b-\frac{1}{m}$ proving that $x\in\left[a+\frac{1}{m},b-\frac{1}{m}\right]$. Hence

$$]a,b[\subseteq\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{m},b-\frac{1}{m}\right] \tag{20.93}$$

If $x\in\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b-\frac{1}{n}\right]$ then $\exists n\in\mathbb{N}$ such that $x\in\left[a+\frac{1}{n},b-\frac{1}{n}\right]\Rightarrow a<a+\frac{1}{n}\leqslant x<b-\frac{1}{n}<b$ proving that $a<x<b$ or $x\in]a,b[$. So $\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{n},b-\frac{1}{n}\right]\subseteq]a,b[$ which together with [eq: 20.93] gives

$$]a,b[=\bigcup_{n\in\mathbb{N}}\left[a+\frac{1}{m},b-\frac{1}{m}\right]$$

13. Let $x \in]-\infty, a[$ then $x < a$ and using [corollary: 10.30] there exists a $n \in \mathbb{N}$ such that $x + \frac{1}{n} < a \Rightarrow x < a - \frac{1}{n} \Rightarrow x \in \left]-\infty, a - \frac{1}{n}\right]$ proving that
$$]-\infty, a[\subseteq \bigcup_{n \in \mathbb{N}} \left]-\infty, a - \frac{1}{n}\right] \tag{20.94}$$
If $x \in \bigcup_{n \in \mathbb{N}} \left]-\infty, a - \frac{1}{n}\right]$ then $\exists n \in \mathbb{N}$ such that $x \in \left]-\infty, a - \frac{1}{n}\right] \Rightarrow x \leqslant a - \frac{1}{n} < a$ giving $x \in]-\infty, a[$ and proving that $\bigcup_{n \in \mathbb{N}}]-\infty, a] \subseteq]-\infty, a[$. Using this together with [eq: 20.94] proves
$$]-\infty, a[= \bigcup_{n \in \mathbb{N}} \left]-\infty, a - \frac{1}{n}\right]$$
14. Let $x \in]a, \infty[$ then $a < x$ and using [corollary: 10.30] there exists a $n \in \mathbb{N}$ such that $a + \frac{1}{n} < x \Rightarrow x \in \left[a + \frac{1}{n}, \infty\right[$. Hence
$$]a, \infty[\subseteq \bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, \infty\right[\tag{20.95}$$
If $x \in \bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, \infty\right[$ then $\exists n \in \mathbb{N}$ such that $x \in \left[a + \frac{1}{n}, \infty\right[\Rightarrow a < a + \frac{1}{n} \leqslant x$ hence $x \in]a, \infty[$. This proves that $\bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, \infty\right[\subseteq]a, \infty[$, combining this with [eq: 20.95] gives
$$]a, \infty[= \bigcup_{n \in \mathbb{N}+0} \left[a + \frac{1}{n}, \infty\right[$$
15. Let $x \in [a, b[$ then $a \leqslant x \wedge x < b \Rightarrow a \leqslant x \wedge \neg(b \leqslant x)$ so that $x \in [a, \infty[$ and $x \notin [b, \infty[$ proving that
$$[a, b[\subseteq [a, \infty[\setminus [b, \infty[\tag{20.96}$$
If $x \in [a, \infty[\setminus [b, \infty[$ then $a \leqslant x \wedge \neg(b \leqslant x)$ or $a \leqslant x$ and $x < b$ proving that $[a, \infty[\setminus [b, \infty[\subseteq [a, b[$. Combining this with [eq: 20.96] proves that
$$[a, b[= [a, \infty[\setminus [b, \infty[$$
16. Let $x \in]a, b]$ then $a < x \wedge x \leqslant b$ then $\neg(x \leqslant a) \wedge x \leqslant b$ so that $x \notin]-\infty, a] \wedge x \in]-\infty, b]$ proving that $x \in]-\infty, b[\setminus]-\infty, a]$. For the opposite inclusion let $x \in]-\infty, b] \setminus]-\infty, a]$ then $x \leqslant b$ and $\neg(x \leqslant a)$ proving that $x \leqslant b$ and $a < x$ or $x \in]a, b]$. Hence
$$]a, b] =]-\infty, b] \setminus]-\infty, a]$$
17. If $x \in]a, \infty[$ then $x \in \mathbb{R} \wedge a < x$ so that $x \nleqslant a \Rightarrow x \notin]-\infty, a]$ hence $x \in \mathbb{R} \setminus]-\infty, a]$, further if $x \in \mathbb{R} \setminus]-\infty, a]$ then $x \in \mathbb{R} \wedge x \notin]-\infty, a] \Rightarrow x \nleqslant a \Rightarrow a < x$ or $x \in]a, \infty[$ hence
$$]a, \infty[= \mathbb{R} \setminus]-\infty, a]$$

□

We are now ready to prove alternative forms for $\mathcal{B}[\mathbb{R}]$.

Theorem 20.150. *We have the following alternative forms for* $\mathcal{B}[\mathbb{R}] \underset{definition}{=} \sigma[\mathcal{T}_{||}]$
$$\begin{aligned}
\sigma[\{C \subseteq \mathbb{R} | C \text{ is closed in } \mathcal{T}_{||}\}] &\underset{[theorem:\ 20.143]}{=} \mathcal{B}[\mathbb{R}] \\
&= \sigma[\mathcal{T}_{||}] \\
&= \sigma[\mathcal{I}_{]|}] \\
&= \sigma[\mathcal{I}_{]]}] \\
&= \sigma[\mathcal{I}_{[]}] \\
&= \sigma[\mathcal{I}_{[|}] \\
&= \sigma[\{[a, \infty[| a \in \mathbb{R}\}] \\
&= \sigma[\{]a, \infty[| a \in \mathbb{R}\}] \\
&= \sigma[\{]-\infty, a] | a \in \mathbb{R}\}] \\
&= \sigma[\{]-\infty, a[| a \in \mathbb{R}\}]
\end{aligned}$$

Proof. Let $U \in \mathcal{T}_{||}$ then by [corollary: 14.105] there exist a countable family $\{]a_i, b_i[\}_{i \in I} \subseteq \mathcal{I}_{]|}$ such that
$$\forall i \in I \ ]a_i, \beta_i[\neq \varnothing \text{ and } U = \bigcup_{i \in I}]a_i, \beta_i[\tag{20.97}$$

As $\mathcal{I}_{][} \subseteq \sigma[\mathcal{I}_{][}]$ which is a σ-algebra it follows from [theorem: 20.138] that $U = \bigcup_{i \in I}]a_i, \beta_i[\in \sigma(\mathcal{I}_{][})$. As $U \in \mathcal{T}_{||}$ was chosen arbitrary it follows that $\mathcal{T}_{||} \subseteq \sigma[\mathcal{I}_{][}]$. Using then [theorem: 20.141] it follows that

$$\mathcal{B}[\mathbb{R}] \underset{\text{def}}{=} \sigma[\mathcal{T}_{||}] \subseteq \sigma[\mathcal{I}_{][}] \tag{20.98}$$

If $]a, b[\in \mathcal{I}_{]][}$ then by [lemma: 20.149] $]a, b[= \bigcup_{n \in \mathbb{N}} \left]a, b - \frac{1}{n}\right]$. Let $n \in \mathbb{N}$ then we have either:

$\boldsymbol{\left]a, b - \frac{1}{n}\right] = \varnothing}$. Then $\left]a, b - \frac{1}{n}\right] = \varnothing \in \sigma[\mathcal{I}_{]]}]$

$\boldsymbol{\left]a, b - \frac{1}{n}\right] \neq \varnothing}$. Then $\left]a, b - \frac{1}{n}\right] \in \sigma[\mathcal{I}_{]]}]$

so that $\left\{\left]a, b - \frac{1}{n}\right]\right\}_{n \in \mathbb{N}} \subseteq \sigma[\mathcal{I}_{]]}]$ from which it follows by [lemma: 20.138] that

$$]a, b[= \bigcup_{n \in \mathbb{N}} \left]a, b - \frac{1}{n}\right] \in \sigma[\mathcal{I}_{]]}]$$

. Hence we have $\mathcal{I}_{]][} \subseteq \sigma[\mathcal{I}_{]]}]$ a σ-algebra on $\mathbb{R}$. Using [theorem: 20.141] it follows then that

$$\sigma[\mathcal{I}_{][}] \subseteq \sigma[\mathcal{I}_{]]}] \tag{20.99}$$

If $]a, b] \in \mathcal{I}_{]]}$ then by [lemma: 20.149] $]a, b] = \bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, b\right]$. For $n \in \mathbb{N}$ we have either:

$\boldsymbol{\left[a + \frac{1}{n}, b\right] = \varnothing}$. Then $\left[a + \frac{1}{n}, b\right] = \varnothing \in \sigma[\mathcal{I}_{[]}]$

$\boldsymbol{\left[a + \frac{1}{n}, b\right] \neq \varnothing}$. Then $\left[a + \frac{1}{n}, b\right] \in \mathcal{I}_{[]} \subseteq \sigma[\mathcal{I}_{[]})[]$

so that $\left\{\left[a + \frac{1}{n}, b\right]\right\}_{n \in \mathbb{N}} \subseteq \sigma[\mathcal{I}_{[]}]$ from which it follows by [theorem: 20.138] that

$$]a, b] = \bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, b\right] \in \sigma[\mathcal{I}_{[]}]$$

Hence we have $\mathcal{I}_{]]} \subseteq \sigma[\mathcal{I}_{[]}]$ a σ-algebra on $\mathbb{R}$ so that by [theorem: 20.141]

$$\sigma[\mathcal{I}_{]]}] \subseteq \sigma[\mathcal{I}_{[]}] \tag{20.100}$$

If $[a, b] \in \mathcal{I}_{[]}$ then by [lemma: 20.149] $[a, b] = \bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n}\right[$. For $n \in \mathbb{N}$ we have either:

$\boldsymbol{\left[a, b + \frac{1}{n}\right[= \varnothing}$. Then $\left[a, b + \frac{1}{n}\right[= \varnothing \in \sigma[\mathcal{I}_{[[}]$

$\boldsymbol{\left[a, b + \frac{1}{n}\right[\neq \varnothing}$. Then $\left[a, b + \frac{1}{n}\right[\in \sigma[\mathcal{I}_{[[}]$

so that $\left\{\left[a, b + \frac{1}{n}\right[\right\}_{n \in \mathbb{N}} \subseteq \sigma[\mathcal{I}_{[[}]$ form which it it follows by [theorem: 20.138] that

$$[a, b] = \bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n}\right[\in \sigma[\mathcal{I}_{[[}]$$

Hence we have $\mathcal{I}_{[]} \subseteq \sigma[\mathcal{I}_{[[}]$ a σ-algebra on $\mathbb{R}$ so that by [theorem: 20.141]

$$\sigma[\mathcal{I}_{[]}] \subseteq \sigma[\mathcal{T}_{[[}] \tag{20.101}$$

If $[a, b[\in \mathcal{I}_{[[}$ then by [lemma: 20.149] $[a, b[= \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right[$. As $\forall n \in \mathbb{N}$ $\left]a - \frac{1}{n}, b\right[$ is open it follows that $\left\{\left]a - \frac{1}{n}, b\right[\right\}_{n \in \mathbb{N}} \subseteq \mathcal{T}_{||}$ so that by [theorem 20.138] $[a, b[= \bigcap_{n \in \mathbb{N}} \left]a - \frac{1}{n}, b\right[\in \sigma[\mathcal{T}_{||}]$. Hence we have that $\mathcal{I}_{[[} \subseteq \sigma[\mathcal{T}_{||}]$ so that

$$\sigma[\mathcal{I}_{[[}] \subseteq \sigma[\mathcal{T}_{||}] \underset{\text{def}}{=} \mathcal{B}[\mathbb{R}] \tag{20.102}$$

Combining [eqs: 20.98, 20.99, 20.100, 20.101 and 20.102] it follows that

$$\mathcal{B}[\mathbb{R}] = \sigma[\mathcal{T}_{||}] = \sigma[\mathcal{I}_{][}] = \sigma[\mathcal{I}_{]]}] = \sigma[\mathcal{I}_{[]}] = \sigma[\mathcal{I}_{[[}] \tag{20.103}$$

If $[a, b[\in \mathcal{I}_{[[}$ then using [lemma: 20.149] we have that

$$[a, b] = [a, \infty] \setminus [b, \infty[\underset{\text{[theorem: 20.130]}}{\in} \sigma[\{[a, \infty[| a \in \mathbb{R}\}]$$

proving $\mathcal{I}_{[[} \subseteq \sigma[\{[a, \infty[| a \in \mathbb{R}\}]$ a σ-algebra. Hence using [theorem: 20.141] we have

$$\sigma[\mathcal{I}_{[[}] \subseteq \sigma[\{[a, \infty[| a \in \mathbb{R}\}] \tag{20.104}$$

If $[a,\infty[\in\{[a,\infty[|a\in\mathbb{R}\}$ then using [lemma: 20.149] we have that $[a,\infty[=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},\infty\right[$. As $\left\{\left]a-\frac{1}{n},\infty\right[\right\}_{n\in\mathbb{N}}\subseteq\left\{\left]a-\frac{1}{n},\infty\right[|n\in\mathbb{N}\right\}\subseteq\sigma[\{]a,\infty[|a\in\mathbb{R}\}]$ it follows from [theorem: 20.138] that

$$[a,\infty[=\bigcap_{n\in\mathbb{N}}\left]a-\frac{1}{n},\infty\right[\in\sigma[\{]a,\infty[|a\in\mathbb{R}\}]$$

Hence $\{[a,\infty[|a\in\mathbb{R}\}\subseteq\sigma[\{]a,\infty[|a\in\mathbb{R}\}]$ so that by [theorem: 20.141]

$$\sigma[\{[a,\infty[|a\in\mathbb{R}\}]\subseteq\sigma[\{]a,\infty[|a\in\mathbb{R}\}] \tag{20.105}$$

Let $]a,\infty[\in\{]a,\infty[|a\in\mathbb{R}\}$ then by [lemma: 20.149] $]a,\infty[=\mathbb{R}\backslash]-\infty,a]\in\sigma[\{]-\infty,a]|a\in\mathbb{R}\}]$ so that $\{]a,\infty[|a\in\mathbb{R}\}\subseteq\sigma[\{]-\infty,a]|a\in\mathbb{R}\}]$. Using [theorem: 20.141] it follows that

$$\sigma[\{]a,\infty[|a\in\mathbb{R}\}]\subseteq\sigma[\{]-\infty,a]|a\in\mathbb{R}\}] \tag{20.106}$$

Let $]-\infty,a]\in\{]-\infty,a]|a\in\mathbb{R}\}$ then by [lemma: 20.149] $]-\infty,a]=\bigcap_{n\in\mathbb{N}}\left]-\infty,a+\frac{1}{n}\right[$. As $\left\{\left]-\infty,a+\frac{1}{n}\right[\right\}_{n\in\mathbb{N}}\subseteq\{]-\infty,a[|a\in\mathbb{R}\}\subseteq\sigma[\{]-\infty,a[|a\in\mathbb{R}\}]$ it follows from [theorem: 20.138] that $]-\infty,a]=\bigcap_{n\in\mathbb{N}}\left]-\infty,a+\frac{1}{n}\right[\in\sigma[\{]-\infty,a[|a\in\mathbb{R}\}]$. Hence

$$\{]-\infty,a]|a\in\mathbb{R}\}\subseteq\sigma[\{]-\infty,a[|a\in\mathbb{R}\}]$$

which by [theorem: 20.141] proves that

$$\sigma[\{]-\infty,a]|a\in\mathbb{R}\}]\subseteq\sigma[\{]-\infty,a[|a\in\mathbb{R}\}] \tag{20.107}$$

Let $]-\infty,a[\in\{]-\infty,a[|a\in\mathbb{R}\}$ then as $]-\infty,a[$ is open it follows that $\{]-\infty,a[|a\in\mathbb{R}\}\subseteq\mathcal{T}_{||}\subseteq\sigma[\mathcal{T}_{||}]$ and using [theorem: 20.141] it follows that

$$\sigma[\{]-\infty,a[|a\in\mathbb{R}\}]\subseteq\sigma[\mathcal{T}_{||}]\underset{\text{[eq: 20.103]}}{=}\sigma[\mathcal{I}_{[[}] \tag{20.108}$$

Combining [eqs: 20.104, 20.105, 20.106, 20.107 and 20.108] gives

$$\sigma[\mathcal{I}_{[[}]=\sigma[\{[a,\infty[|a\in\mathbb{R}\}]=\sigma[\{]a,\infty[|a\in\mathbb{R}\}]=\sigma[\{]-\infty,a]|a\in\mathbb{R}\}]=\sigma[\{]-\infty,a[|a\in\mathbb{R}\}]$$

Finally combining the above with [eq: 20.103] proves that

$$\begin{aligned}\mathcal{B}[\mathbb{R}] &= \sigma[\mathcal{T}_{||}]\\ &= \sigma[\mathcal{I}_{]]}]\\ &= \sigma[\mathcal{I}_{]]}]\\ &= \sigma[\mathcal{I}_{[]}]\\ &= \sigma[\mathcal{I}_{[[}]\\ &= \sigma[\{[a,\infty[|a\in\mathbb{R}\}]\\ &= \sigma[\{]a,\infty[|a\in\mathbb{R}\}]\\ &= \sigma[\{]-\infty,a]|a\in\mathbb{R}\}]\\ &= \sigma[\{]-\infty,a[|a\in\mathbb{R}\}]\end{aligned}$$

□

20.3.2 Borel algebra on $\overline{\mathbb{R}}$

Definition 20.151. *Let $\langle\overline{\mathbb{R}},\mathcal{T}_{\overline{\mathbb{R}}}\rangle$ be the topological space consisting of the extended real numbers with the canonical topology $\mathcal{T}_{\overline{\mathbb{R}}}$ [see definition: 20.47] then the Borel algebra on $\overline{\mathbb{R}}$ is noted as $\mathcal{B}[\overline{\mathbb{R}}]$ hence*

$$\mathcal{B}[\overline{\mathbb{R}}]=\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$$

Just as in the real case we formulate some alternative definitions for the Borel algebra on the extended real numbers.

Lemma 20.152. *We have*

1. $\forall a\in\mathbb{R}$ *we have* $[a,\infty]=\bigcap_{n\in\mathbb{N}_0}\left]a-\frac{1}{n},\infty\right]$
2. $\{\infty\}=\bigcap_{n\in\mathbb{N}_0}]n,\infty]$
3. $\{-\infty\}=\bigcap_{n\in\mathbb{N}_0}[-\infty,-n[$

Proof.

1. Let $n \in \mathbb{N}$ then if $x \in [a,\infty]$ $a \leqslant x \leqslant \infty \Rightarrow a - \frac{1}{n} < a \leqslant x \leqslant \infty$ so that $[a,\infty] \subseteq \left]a - \frac{1}{n}, \infty\right]$, hence
$$[a,\infty] \subseteq \bigcap_{n\in\mathbb{N}} \left]a - \frac{1}{n}, \infty\right] \tag{20.109}$$
If $x \in \bigcap_{n\in\mathbb{N}} \left]a - \frac{1}{n}, \infty\right]$. Assume that $x < a$ then using [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $x + \frac{1}{n} < a$ or $x < a - \frac{1}{n}$ so that $x \notin \left]a - \frac{1}{n}, \infty\right]$ contradicting $x \in \bigcap_{n\in\mathbb{N}} \left]a - \frac{1}{n}, \infty\right]$. Hence the assumption is wrong and we have $a \leqslant x \leqslant \infty$ so that $x \in [a,\infty]$ proving that $\bigcap_{n\in\mathbb{N}} \left]a - \frac{1}{n}, \infty\right] \subseteq [a,\infty[$, combining this with [eq: 20.109] results in
$$[a,\infty] = \bigcap_{n\in\mathbb{N}} \left]a - \frac{1}{n}, \infty\right]$$
2. As $\forall n \in \mathbb{N}$ we have $n < \infty \leqslant \infty$ it follows that $\infty \in \bigcap_{n\in\mathbb{N}}]n,\infty]$ so that
$$\{\infty\} \subseteq \bigcap_{n\in\mathbb{N}}]n,\infty] \tag{20.110}$$
Let $x \in \bigcap_{n\in\mathbb{N}}]n,\infty]$. Then $x \in [1,\infty] \Rightarrow -\infty < 1 < x \leqslant \infty$ so that $x \notin -\infty$. Assume that $x \neq \infty$ then $x \in \mathbb{R}$ and by [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $x < n \Rightarrow x \notin]n,\infty]$ contradicting $x \in \bigcap_{n\in\mathbb{N}}]n,\infty]$, hence the assumption is wrong and we must have that $x = \infty \in \{\infty\}$. So $\bigcap_{n\in\mathbb{N}}]n,\infty] \subseteq \{\infty\}$ which combined with [eq: 20.110] proves that
$$\{\infty\} = \bigcap_{n\in\mathbb{N}}]n,\infty]$$
3. As $\forall n \in \mathbb{N}$ we have $-\infty \leqslant -\infty < -n$ it follows that $-\infty \in \bigcap_{n\in\mathbb{N}} [-\infty,-n[$ so that
$$\{-\infty\} \subseteq \bigcap_{n\in\mathbb{N}} [-\infty,-n[\tag{20.111}$$
Let $x \in \bigcap_{n\in\mathbb{N}} [-\infty,-n[$. Then $x \in [-\infty,-1[\Rightarrow x < -1 < \infty$ so that $x \notin \infty$. Assume that $x \neq -\infty$ then $x \in \mathbb{R}$ and by [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $-x < n \Rightarrow -n < x$ so that $x \notin [-\infty,-n[$ contradicting $x \in \bigcap_{n\in\mathbb{N}} [-\infty,-n[$, hence the assumption is wrong and we must have that $x = -\infty \in \{-\infty\}$. So $\bigcap_{n\in\mathbb{N}} [-\infty,-n[\subseteq \{-\infty\}$ which combined with [eq: 20.111] proves that
$$\{\infty\} = \bigcap_{n\in\mathbb{N}} [-\infty,-n[$$
□

Lemma 20.153. *For $\sigma[\{]a,\infty]|a \in \mathbb{R}\}]$ we have the following*

1. $\forall a \in \mathbb{R}$ *we have that* $[a,\infty] \in \sigma[\{]a,\infty]|a \in \mathbb{R}\}]$
2. $\forall a \in \mathbb{R}$ *we have that* $[-\infty,a] \in \sigma[\{]a,\infty]|a \in \mathbb{R}\}]$
3. $\forall a,b \in \mathbb{R}$ *we have that* $]a,b[\in \sigma[\{]a,\infty]|a \in \mathbb{R}\}]$
4. $\forall U \in \mathcal{T}_{||}$ *we have that* $U \in \sigma[\{]a,\infty]|a \in \mathbb{R}\}]$
5. $\{\infty\} \in \sigma[\{]a,\infty]|a \in \mathbb{R}\}]$
6. $\{-\infty\} \in \sigma[\{]a,\infty]|a \in \mathbb{R}\}]$

Proof.

1. Let $a \in \mathbb{R}$ then $\left\{\left]a - \frac{1}{n}, \infty\right]\right\}_{n\in\mathbb{N}_0} \subseteq \{]a,\infty]|a \in \mathbb{R}\} \subseteq \sigma(\{]a,\infty]|a \in \mathbb{R}\})$, hence $\bigcup_{n\in\mathbb{N}_0} \left]a - \frac{1}{n}, \infty\right] \in \sigma(\{]a,\infty]|a \in \mathbb{R}\})$. As $[a,\infty] \underset{\text{[lemma: 20.152]}}{=} \bigcup_{n\in\mathbb{N}_0} \left]a - \frac{1}{n}, \infty\right]$ we have that
$$[a,\infty] \in \sigma(\{]a,\infty]|a \in \mathbb{R}\})$$
2. Let $a \in \mathbb{R}$ then
$$\begin{aligned}
x \in \overline{\mathbb{R}} \setminus [a,\infty] \quad &\Leftrightarrow \quad x \in [-\infty,\infty] \wedge x \notin [a,\infty] \\
&\Leftrightarrow \quad (-\infty \leqslant x \wedge x \leqslant \infty) \wedge \neg(a \leqslant x \leqslant \infty) \\
&\Leftrightarrow \quad (-\infty \leqslant x \wedge x \leqslant \infty) \wedge (x < a \vee \infty < x) \\
&\underset{\infty<x \text{ is false}}{\Leftrightarrow} \quad -\infty \leqslant x \wedge x \leqslant \infty \wedge x < a \\
&\Leftrightarrow \quad -\infty \leqslant x \wedge x < a \\
&\Leftrightarrow \quad x \in [-\infty,a[
\end{aligned}$$

proving that $[-\infty, a[= \overline{\mathbb{R}} \setminus [a, \infty]$ which, as by (1) $[a, \infty] \in \sigma(\{]a, \infty] | a \in \mathbb{R}\})$ and $\sigma(\{]a, \infty] | a \in \mathbb{R}\})$ is a σ-algebra, proves

$$[-\infty, a[\in \sigma(\{]a, \infty] | a \in \mathbb{R}\})$$

3. Let $a, b \in \mathbb{R}$ with $a \leqslant b$ then

$$\begin{aligned} x \in]a, \infty] \bigcap [-\infty, b[&\Leftrightarrow x \in]a, \infty] \wedge x \in [-\infty, b[\\ &\Leftrightarrow a < x \wedge x \leqslant \infty \wedge -\infty \leqslant x \wedge x < b \\ &\Leftrightarrow a < x \wedge x < b \\ &\Leftrightarrow x \in]a, b[\end{aligned}$$

proving that $]a, b[=]a, \infty] \bigcap [-\infty, b[$. As $]a, \infty] \in \sigma(\{]a, \infty] | a \in \mathbb{R}\})$ and by (2) $[-\infty, b[\in \sigma(\{]a, \infty] | a \in \mathbb{R}\})$ we have that $]a, \infty] \bigcap [-\infty, b[\in \sigma\{]a, \infty] | a \in \mathbb{R}\}$. So

$$]a, b[\in \sigma(\{]a, \infty] | a \in \mathbb{R}\})$$

4. Let U be a open set in $\mathbb{R}$ then by [corollary: 14.105] there exist a countable set I and family $\{]a_i, b_i[\}_{i \in I}$ such that $U = \bigcup_{i \in I}]a_i, b_i[$. By (3) it follows that $\{]a_i, b_i[\}_{i \in I} \subseteq \sigma(\{]a, \infty] | a \in \mathbb{R}\})$ so that using [theorem: 20.138] $U = \bigcup_{i \in I}]a_i, b_i[\in \sigma(\{]a, \infty] | a \in \mathbb{R}\})$.
5. Using [lemma: 20.152] we have that $\{\infty\} = \bigcap_{n \in \mathbb{N}_0}]n, \infty]$ which, as $\{]n, \infty]\}_{n \in \mathbb{N}_0} \subseteq (\{]a, \infty] | a \in \mathbb{R}\})$, proves that

$$\{\infty\} \in \sigma(\{]a, \infty] | a \in \mathbb{R}\})$$

6. Using [lemma: 20.152] we have that $\{-\infty\} = \bigcap_{n \in \mathbb{N}_0} [-\infty, -n[$ which, as by (2) $\{[-\infty, -n]\}_{n \in \mathbb{N}_0} \in \sigma(\{]a, \infty] | a \in \mathbb{R}\})$, proves by [theorem: 20.135] that

$$\{-\infty\} \in \sigma(\{]a, \infty] | a \in \mathbb{R}\})$$

□

Lemma 20.154. $\mathcal{B}[\overline{\mathbb{R}}] \underset{definition}{=} \sigma[\mathcal{T}_{\overline{\mathbb{R}}}] = \sigma[\{]a, \infty] | a \in \mathbb{R}\}]$

Proof. Let $I \in \{]a, \infty] | a \in \mathbb{R}\}$ then there exist a $a \in \mathbb{R}$ such that $I =]a, \infty]$. By [definition: 20.45] it follows that $I \in \mathcal{B}_\infty \subseteq \mathcal{T}_{\overline{\mathbb{R}}}$, so that $\{]a, \infty] | a \in \mathbb{R}\} \subseteq \mathcal{T}_{\overline{\mathbb{R}}} \subseteq \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$. Hence using [theorem: 20.141]

$$\sigma[\{]a, \infty] | a \in \mathbb{R}\}] \subseteq \sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \tag{20.112}$$

For the opposite inclusion, let $U \in \mathcal{T}_{\overline{\mathbb{R}}}$ then by [theorem: 20.48] we have that $U \bigcap \mathbb{R} \in \mathcal{T}_{||}$. From $\overline{\mathbb{R}} = \mathbb{R} \bigcup \{-\infty\} \bigcup \{\infty\}$ it follows that

$$U = U \bigcap \overline{\mathbb{R}} = (U \bigcap \mathbb{R}) \bigcup (U \bigcap \{-\infty\}) \bigcup (U \bigcap \{\infty\}) \tag{20.113}$$

Now as $U \bigcap \mathbb{R} \in \mathcal{T}_{||}$ we have by [lemma: 20.153] that

$$U \bigcap \mathbb{R} \in \sigma[\{]a, \infty] | a \in \mathbb{R}\}] \tag{20.114}$$

Also $U \bigcap \{-\infty\}$ is either $\emptyset \in \sigma[\{]a, \infty] | a \in \mathbb{R}\}]$ or $\{-\infty\}$ and as by [lemma: 20.153] $\{-\infty\} \in \sigma[\{]a, \infty] | a \in \mathbb{R}\}]$ we have that

$$U \bigcap \{-\infty\} \in \sigma[\{]a, \infty] | a \in \mathbb{R}\}] \tag{20.115}$$

Finally $U \bigcap \{\infty\}$ is either $\emptyset \in \sigma[\{]a, \infty] | a \in \mathbb{R}\}]$ or $\{\infty\}$ and as by [lemma: 20.153] $\{\infty\} \in \sigma[\{]a, \infty] | a \in \mathbb{R}\}]$ it follows that

$$U \bigcap \{\infty\} \in \sigma[\{]a, \infty] | a \in \mathbb{R}\}] \tag{20.116}$$

From [eqs: 20.113, 20.114, 20.115 and 20.116] it follows that $U \in \sigma[\{]a, \infty] | a \in \mathbb{R}\}]$. Hence $\mathcal{T}_{\overline{\mathbb{R}}} \subseteq \sigma[\{]a, \infty] | a \in \mathbb{R}\}]$ [a sigma algebra on $\overline{\mathbb{R}}$] so that $\sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \subseteq \sigma[\{]a, \infty] | a \in \mathbb{R}\}]$, combining this with [eq: 20.112] gives

$$\sigma[\{]a, \infty] | a \in \mathbb{R}\}] = \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$$

□

The relation between $\mathcal{B}[\mathbb{R}]$ and $\mathcal{B}[\overline{\mathbb{R}}]$ is expressed in the following theorem.

Lemma 20.155. $\sigma[\mathcal{T}_{\overline{\mathbb{R}}}] = \{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} \underset{\mathcal{B}[\mathbb{R}] = \sigma[\mathcal{T}_{||}]}{=} \{U \in \mathcal{P}(\overline{\mathbb{R}}) | U \bigcap \mathbb{R} \in \sigma[\mathcal{T}_{||}]\}$

Proof. First we prove that

$$\left\{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\right\} \text{ is a } \sigma\text{-algebra on } \overline{\mathbb{R}} \tag{20.117}$$

Proof. As $\overline{\mathbb{R}}\bigcap\mathbb{R}=\mathbb{R}\in\mathcal{B}[\mathbb{R}]$ it follows that

$$\overline{\mathbb{R}}\in\left\{U\in\mathcal{P}[\overline{\mathbb{R}}]|U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]\right\} \tag{20.118}$$

Let $U\in\{U\in\mathcal{P}[\overline{\mathbb{R}}]|U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]\}$ then $U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]$ hence $\mathbb{R}\setminus(U\bigcap\mathbb{R})\in\mathcal{B}[\mathbb{R}]$, further

$$(\overline{\mathbb{R}}\setminus U)\bigcap\mathbb{R}\underset{\text{[theorem: 1.33]}}{=}\left(\overline{\mathbb{R}}\bigcap\mathbb{R}\right)\setminus U=\mathbb{R}\setminus U \text{ and } \mathbb{R}\setminus\left(U\bigcap\mathbb{R}\right)\underset{\text{[eq: 1.31]}}{=}(\mathbb{R}\setminus U)\bigcup(\mathbb{R}\setminus\mathbb{R})=\mathbb{R}\setminus U$$

so that $(\overline{\mathbb{R}}\setminus U)\bigcap\mathbb{R}=\mathbb{R}\setminus(U\bigcap\mathbb{R})\in\mathcal{B}[\mathbb{R}]$, proving that $(\overline{\mathbb{R}}\setminus U)\in\{U\in\mathcal{P}[\overline{\mathbb{R}}]|U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]\}$. In other words

$$\forall U\in\left\{U\in\mathcal{P}[\overline{\mathbb{R}}]|U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]\right\} \text{ we have } \overline{\mathbb{R}}\setminus U\in\left\{U\in\mathcal{P}[\overline{\mathbb{R}}]|U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]\right\} \tag{20.119}$$

Let $\{U_i\}_{i\in\mathbb{N}}\subseteq\{U\in\mathcal{P}(\overline{\mathbb{R}})|U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]\}$ then $\forall i\in\mathbb{N}$ $U_i\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]$ so that $(\bigcup_{i\in\mathbb{N}}U_i)\bigcap\mathbb{R}=\bigcup_{i\in\mathbb{N}}(U_i\bigcap\mathbb{R})\in\mathcal{B}[\mathbb{R}]$. Hence

$$\forall\{U_i\}_{i\in\mathbb{N}}\subseteq\left\{U\in\mathcal{P}(\overline{\mathbb{R}})|U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]\right\}\bigcup_{i\in\mathbb{N}}\left(U_i\bigcap\mathbb{R}\right)\in\mathcal{B}[\mathbb{R}] \tag{20.120}$$

Finally [eqs: 20.118, 20.119 and 20.120] proves [eq: 20.117]. □

Take $U\in\mathcal{T}_{\overline{\mathbb{R}}}$ then by [theorem: 20.48] we have that $U\bigcap\mathbb{R}\in\mathcal{T}_{||}\subseteq\sigma[\mathcal{T}_{||}]\underset{\text{definition}}{=}\mathcal{B}[\mathbb{R}]$ proving that $U\in\{U\in\mathcal{P}(\overline{\mathbb{R}})|U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]\}$ so that

$$\mathcal{T}_{\overline{\mathbb{R}}}\subseteq\left\{U\in\mathcal{P}(\overline{\mathbb{R}})|U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]\right\}$$

and as $\{U\in\mathcal{P}(\overline{\mathbb{R}})|U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]\}$ is a σ-algebra on $\overline{\mathbb{R}}$ [see eq: 20.117] it follows from [theorem: 20.141] that

$$\mathcal{B}[\overline{\mathbb{R}}]\underset{\text{definition}}{=}\sigma(\mathcal{T}_{\overline{\mathbb{R}}})\subseteq\left\{U\in\mathcal{P}(\overline{\mathbb{R}})|U\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]\right\} \tag{20.121}$$

For the opposite inclusion define

$$S=\left\{U\bigcap\mathbb{R}|U\in\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]\right\}\subseteq\mathcal{P}(\mathbb{R}) \tag{20.122}$$

then as $\mathcal{T}_{\overline{\mathbb{R}}}\subseteq\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ we have

$$\mathcal{T}_{||}\underset{\text{]theorem: 20.48}}{=}\left\{U\bigcap\mathbb{R}|U\in\mathcal{T}_{\overline{\mathbb{R}}}\right\}\subseteq\left\{U\bigcap\mathbb{R}|U\in\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]\right\}=S \tag{20.123}$$

Further as $\mathbb{R}\in\mathcal{T}_{||}\underset{\text{[theorem: 20.48]}}{\subseteq}\mathcal{T}_{\overline{\mathbb{R}}}\subseteq\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ we have for $U\in\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ that $U\bigcap\mathbb{R}\in\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ proving

$$S\subseteq\sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \tag{20.124}$$

Next we prove that

$$S \text{ is a } \sigma\text{-algebra on } \mathbb{R} \tag{20.125}$$

Proof. As $\mathbb{R}=\mathbb{R}\bigcap\mathbb{R}$ and $\mathbb{R}\in\mathcal{T}_{\mathbb{R}}\underset{\text{[theorem: 20.48]}}{\subseteq}\mathcal{T}_{\overline{\mathbb{R}}}\subseteq\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ it follows that

$$\mathbb{R}\in\mathcal{S} \tag{20.126}$$

If $A\in\mathcal{S}$ then there exist a $U\in\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ such that $A=U\bigcap\mathbb{R}$ so that

$$\mathbb{R}\setminus A=\mathbb{R}\setminus\left(U\bigcap\mathbb{R}\right)\underset{\text{[eq: 1.31]}}{=}(\mathbb{R}\setminus U)\bigcup(\mathbb{R}\setminus\mathbb{R})=\mathbb{R}\setminus U$$

which, as $\mathbb{R},U\in\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]\underset{\text{[eq: 20.131]}}{\Rightarrow}\mathbb{R}\setminus U\in\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$, proves that

$$\mathbb{R}\setminus A\in\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$$

Hence $(\mathbb{R}\setminus A)\bigcap\mathbb{R}=\mathbb{R}\setminus A\in\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ so that $\mathbb{R}\setminus A\in\mathcal{S}$. Summarized

$$\forall A\in\mathcal{S} \text{ we have } \mathbb{R}\setminus A\in S \tag{20.127}$$

If $\{A_i\}_{i\in\mathbb{N}}\subseteq S$ then there exists a $\{U_i\}_{i\in\mathbb{N}}\subseteq\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ such that $\forall i\in\mathbb{N}$ we have $A_i=U_i\bigcap\mathbb{R}$, then $\bigcup_{i\in\mathbb{N}}A_i=(\bigcup_{i\in\mathbb{N}}(U_i\bigcap\mathbb{R}))=(\bigcup_{i\in\mathbb{N}}U_i)\bigcap\mathbb{R}$ which, as $\bigcup_{i\in\mathbb{N}}U_i\in\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$. proves that $\bigcup_{i\in\mathbb{N}}A_i\in S$. In other words

$$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq S \text{ we have } \bigcup_{i\in\mathbb{N}}A_i\in\mathcal{S} \tag{20.128}$$

Finally [eqs: 20.126, 20.127 and 20.128] proves that S is a σ-algebra on $\mathbb{R}$ thus proving [eq: 20.125]. □

So we have proved that $\mathcal{T}_{||} \subseteq S$ [see eq: 20.123] and S is a σ-algebra on $\mathbb{R}$ from which it follows, using [theorem: 20.141], that

$$\mathcal{B}[\mathbb{R}] \underset{\text{definition}}{=} \sigma[\mathcal{T}_{\mathbb{R}}] \subseteq S \underset{\text{[eq: 20.124]}}{\subseteq} \sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \tag{20.129}$$

Let $A \in \{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\}$ then $A \subseteq \overline{\mathbb{R}}$ so that $A = A \bigcap \overline{\mathbb{R}} = A \bigcap (\mathbb{R} \bigcup \{-\infty\}, \{\infty\})$ giving

$$A = (A \bigcap \mathbb{R}) \bigcap (A \bigcap \{-\infty\}) \bigcap (A \bigcap \{\infty\}) \tag{20.130}$$

where

1. $A \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}] \underset{\text{[eq: 20.129]}}{\Rightarrow} A \bigcap \mathbb{R} \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$
2. $A \bigcap \{-\infty\}$ is either $\emptyset \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ or $\{-\infty\} \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ [as $-\infty$ is closed [theorem: 20.49] and closed sets are part of $\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ by [theorem: 20.143]].
3. $A \bigcap \{-\infty\}$ is either $\emptyset \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ or $\{\infty\} \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ [as ∞ is closed by [theorem: 20.49]and closed sets are part of $\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ by [theorem: 20.143]].

From the above we conclude that $\{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} \subseteq \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ which combined with [eq: 20.121] proves that

$$\sigma[\mathcal{T}_{\overline{\mathbb{R}}}] = \left\{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\right\}$$ □

Summarizing the above two lemmas in a theorem we get:

Theorem 20.156. *The Borel algebra on $\overline{\mathbb{R}}$ satisfies*

$$\begin{aligned} \mathcal{B}[\overline{\mathbb{R}}] &\underset{\text{defintion}}{=} \sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \\ &\underset{\text{[theorem: 20.143]}}{=} \sigma[\{C | C \text{ is closed in } \mathcal{T}_{\overline{\mathbb{R}}}\}] \\ &= \sigma[\{]a, \infty] | a \in \mathbb{R}\}] \\ &= \left\{U \subseteq \mathcal{P}[\overline{\mathbb{R}}] | U \bigcap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\right\} \end{aligned}$$

Proof. This follows from [lemma: 20.155] and [lemma: 20.155]. □

20.3.3 Borel algebra on $\mathbb{R}^n$

Definition 20.157. *Let $n \in \mathbb{N}$ then the Borel algebra on $\mathbb{R}^n$ is noted as $\mathcal{B}[\mathbb{R}^n]$ so*

$$\mathcal{B}[\mathbb{R}^n] = \sigma[\mathbb{R}^n, \mathcal{T}_{\|\|_n}]$$

where $\mathcal{T}_{\|\|_n}$ is the canonical topology on $\mathbb{R}^n$ [see example: 14.95]

First we extend the concept of generalized intervals to intervals on $\mathbb{R}^n$

Definition 20.158. *Let $n \in \mathbb{N}$ and $x, y \in \mathbb{R}^n$ then $x \leqslant_n y$ if $\forall i \in \{1, \ldots, n\}$ $x_i < y_i$*

This relation makes $\langle \mathbb{R}^n, \leqslant_n \rangle$ a partial ordered set.

Theorem 20.159. *Let $n \in \mathbb{N}$ then $\langle \mathbb{R}^n, \leqslant_n \rangle$ is a partial ordered set.*

***Note* 20.160.** *As for $(1,2)$, $(2,1)$ we that $(1,2) \nleqslant_2 (2,1)$ and $(2,1) \nleqslant_2 (1,2)$ $\leqslant_n$ is not a total or full order.*

Proof. We have

reflexivity. If $x \in \mathbb{R}^n$ then $\forall i \in \{1, \ldots, n\}$ we have $x_i = x_i \Rightarrow x_i \leqslant x_i$ proving that $x \leqslant_n x$.

anti-symmetry. If $x, y \in \mathbb{R}^n$ satisfies $x \leqslant y \wedge y \leqslant x$ then we have $\forall i \in \mathbb{N}$ we have $x_i \leqslant y_i$ and $y_i \leqslant x_i$ so that $x_i = y_i$ from which it follows that $x = y$.

transitivity. If $x \leqslant_n y$ and $y \leqslant_n z$ then we have $\forall i \in \{1, \ldots, n\}$ that $x_i \leqslant y_i \wedge y_i \leqslant z_i \Rightarrow x_i \leqslant z_i$ from which it follows that $x \leqslant_n z$. □

Using this order relation we can extend the concept of intervals to intervals in $\mathbb{R}^n$.

Definition 20.161. *Let $n \in \mathbb{N}_0$, $a, b \in \mathbb{R}^n$ such that $a \leqslant_n b$ then we have*

$$\begin{aligned}
[a,b] &= \{x \in \mathbb{R}^n | a \leqslant_n x \wedge x \leqslant_n b\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } a_i \leqslant x_i \wedge x_i \leqslant b_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } x_i \in [a_i, b_i]\} \\
&= \prod_{i \in \{1,\ldots,n\}} [a_i, b_i] \\
[a,b[&= \{x \in \mathbb{R}^n | a \leqslant_n x \wedge x <_n b\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } a_i \leqslant x_i \wedge x_i < b_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } x_i \in [a_i, b_i[\} \\
&= \prod_{i < \{1,\ldots,n\}} [a_i, b_i[\\
]a,b] &= \{x \in \mathbb{R}^n | a <_n x \wedge x \leqslant_n b\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } a_i < x_i \wedge x_i \leqslant b_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } x_i \in]a_i, b_i]\} \\
&= \prod_{i \in \{1,\ldots,n\}}]a_i, b_i] \\
]a,b[&= \{x \in \mathbb{R}^n | a <_n x \wedge x <_n b\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } a_i < x_i \wedge x_i < b_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } x_i \in]a_i, b_i[\} \\
&= \prod_{i < \{1,\ldots,n\}}]a_i, b_i[\\
]-\infty, a] &= \{x \in \mathbb{R}^n | x \leqslant_n a\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } x_i \leqslant a_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } x_i \in]-\infty, a_i]\} \\
&= \prod_{i < \{1,\ldots,n\}}]-\infty, a_i] \\
]-\infty, a[&= \{x \in \mathbb{R}^n | x < a\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } x_i < a_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } x_i \in]-\infty, a_i[\} \\
&= \prod_{i < \{1,\ldots,n\}}]-\infty, a_i[\\
[a, \infty[&= \{x \in \mathbb{R}^n | a \leqslant_n x\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } a_i \leqslant x_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } x_i \in [a_i, \infty[\} \\
&= \prod_{i < \{1,\ldots,n\}} [a_i, \infty[\\
]a, \infty[&= \{x \in \mathbb{R}^n | a <_n x\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } a_i < x_i\} \\
&= \{x \in \mathbb{R}^n | \forall i \in \{1,\ldots,n\} \text{ we have } x_i \in]a_i, \infty[\} \\
&= \prod_{i < \{1,\ldots,n\}}]a_i, \infty[
\end{aligned}$$

To simply notation we have also the following definitions:

Definition 20.162. *Let $n \in \mathbb{N}_0$ and $a, b \in \mathbb{R}$ then we define the following sets*

1. $[a,b]^n = \{x \in \mathbb{R}^n | a \leqslant x_i \leqslant b\}$
2. $[a,b[^n = \{x \in \mathbb{R}^n | a \leqslant x_i < b\}$
3. $]a,b]^n = \{x \in \mathbb{R}^n | a < x_i \leqslant b\}$
4. $]a,b[^n = \{x \in \mathbb{R}^n | a < x_i < b\}$

5. $]-\infty, a]^n = \{x \in \mathbb{R}^n | x_i \leqslant a\}$
6. $]-\infty, a[^n = \{x \in \mathbb{R}^n | x_i < a\}$
7. $[a, \infty[^n = \{x \in \mathbb{R}^n | a \leqslant x_i\}$
8. $]a, \infty[^n = \{x \in \mathbb{R}^n | a < x_i\}$

We specify now the sufficient and necessary condition for a interval in $\mathbb{R}^n$ to be empty.

Lemma 20.163.
Let $n \in \mathbb{N}$ and $a, b \in \mathbb{R}^n$ then we have

1. $[a, b[= \emptyset \Leftrightarrow \exists i \in \{1, \ldots, n\}$ *such that* $a_i \geqslant b_i$
2. $]a, b] = \emptyset \Leftrightarrow \exists i \in \{1, \ldots, n\}$ *such that* $a_i \geqslant b_i$
3. $]a, b[= \emptyset \Leftrightarrow \exists i \in \{1, \ldots, n\}$ *such that* $a_i \geqslant b_i$

Proof.

1. As $[a, b[= \prod_{i \in \{1, \ldots, n\}} [a_i, b_i[$ we have

   $\Rightarrow$. If $[a, b[= \emptyset$ then by [theorem 3.110] $\exists i \in \{1, \ldots, n\}$ such that $[a_i, b_i[= \emptyset$. If $a_i < b_i$ then by [theorem: 10.32] there exists a $x \in \mathbb{R}$ such that $a_i < x < b_i \Rightarrow x \in [a_i, b_i[$ contradicting $[a_i, b_i[= \emptyset$, so we must have $a_i \geqslant b_i$.

   $\Leftarrow$. If there exists a $i \in \{1, \ldots, n\}$ with $a_i \geqslant b_i$ then if $x \in [a_i, b_i[$ we have $a_i \leqslant x \wedge x < b_i \leqslant a_i$ leading to the contradiction $a_i < a_i$ so $[a_i, b_i[= \emptyset$. Hence using [theorem 3.110] $[a, b[= \varnothing$.

2.

   $\Rightarrow$. If $]a, b] = \emptyset$ then by [theorem 3.110] $\exists i \in \{1, \ldots, n\}$ such that $]a_i, b_i] = \emptyset$. If $a_i < b_i$ then by [theorem: 10.32] there exists a $x \in \mathbb{R}$ such that $a_i < x < b_i \Rightarrow x \in]a_i, b_i]$ contradicting $]a_i, b_i] = \emptyset$, so we must have $a_i \geqslant b_i$.

   $\Leftarrow$. If there exists a $i \in \{1, \ldots, n\}$ with $a_i \geqslant b_i$ then if $x \in]a_i, b_i]$ we have $a_i < x \wedge x \leqslant b_i \leqslant a_i$ leading to the contradiction $a_i < a_i$ so $]a_i, b_i] = \emptyset$. Hence using [theorem 3.110] $]a, b] = \varnothing$.

3.

   $\Rightarrow$. If $]a, b[= \emptyset$ then by [theorem 3.110] $\exists i \in \{1, \ldots, n\}$ such that $]a_i, b_i[= \emptyset$. If $a_i < b_i$ then by [theorem: 10.32] there exists a $x \in \mathbb{R}$ such that $a_i < x < b_i \Rightarrow x \in]a_i, b_i[$ contradicting $]a_i, b_i[= \emptyset$, so we must have $a_i \geqslant b_i$.

   $\Leftarrow$. If there exists a $i \in \{1, \ldots, n\}$ with $a_i \geqslant b_i$ then if $x \in]a_i, b_i[$ we have $a_i < x \wedge x < b_i \leqslant a_i$ leading to the contradiction $a_i < a_i$ so $]a_i, b_i[= \emptyset$. Hence using [theorem 3.110] $]a, b[= \varnothing$. □

To be able to use half open intervals in $\mathbb{R}^n$ of the form $[a, b]$ to generate the Borel algebra on $\mathbb{R}^n$ we introduce Dyadic intervals. We prove then that any open sets in $\langle \mathbb{R}^n, \mathcal{T} \rangle$ is a countable union of Diadic intervals. First we define the set of half open intervals on $\mathbb{R}^n$

Definition 20.164. *Let $n \in \mathbb{N}$ then*

$$\mathcal{R}^n = \{[a, b[| a, b \in \mathbb{R}^n \wedge a < b\}$$

***Note* 20.165.** *Note as $a < b$ we have by [lemma: 20.163] that $\forall i \in \{1, \ldots, n\}$ $a_i < b_i$ so that $[a_i, b_i[\neq \varnothing$*

The following lemma allows us to define a function that maps a element of $\mathcal{R}^n$ to its endpoints. Using this we can define then the volume of elements of $\mathcal{R}^n$.

Lemma 20.166. *Let $n \in \mathbb{N}$ and $\{x_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R}^+$ then $\prod_{i \in \{1, \ldots, n\}} x_i \in \mathbb{R}^+$*

Proof. We prove this by induction, so let

$$S = \left\{ n \in \mathbb{N} | \text{If } \{x_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R}^+ \text{ then } \prod_{i \in \{1, \ldots, n\}} x_o \right\}$$

then we have:

$1 \in \mathcal{S}$. If $\{x_i\}_{i \in \{1\}} \subseteq \mathbb{R}^+$ then $\prod_{i \in \{1\}} x_i = x_1 \in \mathbb{R}^+$ which proves that $1 \in S$.

$n \in S \Rightarrow n + 1 \in S$. Let $\{x_i\}_{i \in \{1, \ldots, n+1\}} \subseteq [0, \infty]$ then as $n \in S$ we have $\prod_{i=1}^n x_i \in \mathbb{R}^+$, as also $x_i \in \mathbb{R}^+$ it follows from [theorem: 10.14] that

$$0 \leqslant \left(\prod_{i \in \{1, \ldots, n\}} x_i \right) \cdot x_{n+1} = \prod_{i \in \{1, \ldots, n+1\}} x_i$$

so that $n+1\in\mathbb{N}$ □

Lemma 20.167. *Let $n\in\mathbb{N}$ and $I\in\mathcal{R}^n$ then there exist a **unique** a $a,b\in\mathbb{R}^n$ with $a<b$ such that $I=[a,b[$*

Proof. If $I\in\mathcal{R}^n$ then by definition of $\mathcal{R}^n$ there exist a $a,b\in\mathbb{R}^n$ with $a<b$ such that $I=[a,b[$. Assume that there exists also a $a',b'\in\mathbb{R}^n$ such that $I=[a',b'[$. Then $\prod_{i\in\{1,\ldots,n\}}[a_i,b_i[=\prod_{i\in\{1,\ldots,n\}}[a'_i,b'_i[$ and $\forall i\in\{1,\ldots,n\}$ $[a_i,b_i[\neq\varnothing$, hence using [theorem: 3.113] we have that

$$\forall i\in\{1,\ldots,n\}\text{ that }\varnothing\neq[a_i,b_i[=[a'_i,b'_i[$$

Let $i\in\{1,\ldots,n\}$ then as $\varnothing\neq[a_i,b_i[=[a'_i,b'_i[$ it follows from [theorem: 3.144] that $a_i=a'_i$ and $b_i=b'_i$ proving uniqueness.. □

Thanks to the above lemmas the following is well defined.

Definition 20.168. *Let $n\in\mathbb{N}$ then we define:*

1. $\text{begin}:\mathcal{R}^n\to\mathbb{R}$ *by* $\text{begin}(I)=a$ *where* $I=[a,b[$ *and* $a<b$
2. $\text{end}:\mathcal{R}^n\to\mathbb{R}$ *by* $\text{end}(I)=b$ *where* $I=[a,b[$ *and* $a<b$
3. $v^n:\mathcal{R}^n\to]0,\infty[=\mathbb{R}^n$ *where* $v^n(I)=\prod_{i\in\{1,\ldots,n\}}(\text{begin}(I)_i-\text{end}(I)_i)$

***Note* 20.169.** *As* $\text{begin}(I)<\text{end}(I)$ *we have* $\forall i\in\{1,\ldots,n\}$

$$\text{begin}(I)_i<\text{end}(I)_i\Rightarrow\text{end}(I)_i-\text{begin}(I)_i\in[0,\infty]\text{ so that by [lemma: 20.166]}$$

$v^n(R)\in\mathbb{R}^+$ *as is needed in (3).*

We introduce now Dyadic cubes that forms a countable subset of $\mathcal{R}^n$.

Definition 20.170. (Dyadic Cubes) *Let $n\in\mathbb{N}$, $m\in\mathbb{N}_0$ then we define $\mathcal{D}^n_m$ by*

$$\mathcal{D}^n_m=\left\{\left[\frac{z}{2^m},\frac{z+1}{2^m}\right[|z\in\mathbb{Z}^n\right\}\subseteq\mathcal{R}^n$$

Elements of $\mathcal{D}^n_m$ are called Dyadic cubes of order m. Further $\mathcal{D}^n$ defined by

$$\mathcal{D}^n=\bigcup_{m\in\mathbb{N}_0}\mathcal{D}^n_m\subseteq\mathcal{R}^n$$

is the set of all Dyadic cubes.

***Note* 20.171.** *As $\frac{z}{2^m}<\frac{z+1}{2^m}$ we have that $\frac{z}{2^m}\in\left[\frac{z}{2^m},\frac{z+1}{2^m}\right[$ so that Dyadic cubes are not empty.*

Lemma 20.172. *Let $k,l\in\mathbb{N}_0$ with $k\leqslant l$, $r,q\in\mathbb{Z}$ then for $\left[\frac{r}{2^l},\frac{r+1}{2^l}\right]$, $\left[\frac{q}{2^k},\frac{q+1}{2^k}\right[$ we have*

$$\left[\frac{r}{2^l},\frac{r+1}{2^l}\right[\bigcap\left[\frac{q}{2^k},\frac{q+1}{2^k}\right[\neq\emptyset\;\Rightarrow\;\left[\frac{r}{2^l},\frac{r+1}{2^l}\right[\subseteq\left[\frac{q}{2^k},\frac{q+1}{2^k}\right[$$
$$\left[\frac{r}{2^l},\frac{r+1}{2^l}\right[\bigcap\left[\frac{q}{2^k},\frac{q+1}{2^k}\right[=\emptyset\;\Rightarrow\;\left[\frac{r}{2^l},\frac{r+1}{2^l}\right[\not\subseteq\left[\frac{q}{2^k},\frac{q+1}{2^k}\right[$$

in other words. We have either $\left[\frac{r}{2^l},\frac{r+1}{2^l}\right[\bigcap\left[\frac{q}{2^k},\frac{q+1}{2^k}\right[=\emptyset$ or $\left[\frac{r}{2^l},\frac{r+1}{2^l}\right[\subseteq\left[\frac{q}{2^k},\frac{q+1}{2^k}\right[$ but not both.

Proof. Take $I=\left[\frac{q}{2^l},\frac{q+1}{2^l}\right[$ and $J=\left[\frac{r}{2^k},\frac{r+1}{2^k}\right[$. As $k\leqslant l$ we have $0\leqslant l-k=n$. Next

$$\begin{aligned}J&=\left[\frac{r}{2^k},\frac{r+1}{2^k}\right[\\&=\left[\frac{r}{2^k}\cdot\frac{2^{l-k}}{2^{l-k}},\frac{r+1}{2^k}\cdot\frac{2^{l-k}}{2^{l-k}}\right[\\&=\left[\frac{r\cdot2^{l-k}}{2^l},\frac{r\cdot2^{l-k}+2^{l-k}}{2^l}\right[\\&=\left[\frac{r\cdot2^n}{2^l},\frac{r\cdot2^n+2^n}{2^l}\right[\end{aligned}\tag{20.131}$$

Assume that $I\bigcap J\neq\emptyset$ so that $\exists x\in I\bigcap J$ giving

$$\frac{q}{2^l}\leqslant x<\frac{q+1}{2^l}\wedge\frac{r\cdot 2^n}{2^l}\leqslant x<\frac{r\cdot 2^n+2^n}{2^l} \tag{20.132}$$

If now $\frac{q+1}{2^l}\leqslant\frac{r\cdot 2^n}{2^l}$ then $x<\frac{q+1}{2^l}\leqslant\frac{r\cdot 2^n}{2^l}\leqslant x$ giving the contradiction $x<x$ so we must have

$$\frac{r\cdot 2^n}{2^l}<\frac{q+1}{2^l} \tag{20.133}$$

Further if $\frac{r\cdot 2^n+2^n}{2^l}\leqslant\frac{q}{2^l}$ then $x<\frac{r\cdot 2^n+2^n}{2^l}\leqslant\frac{q}{2^l}\leqslant x$ giving the contradiction $x<x$ again so we must have that

$$\frac{q}{2^l}<\frac{r\cdot 2^n+2^n}{2^l} \tag{20.134}$$

Multiplying 20.133 and 20.134 by 2^l gives $r\cdot 2^n<q+1\wedge q<r\cdot 2^n+2^n$. As $r\cdot 2^n,q+1,r\cdot 2^n+2^n\in\mathbb{Z}$ we have by [theorem: 10.28] that $r\cdot 2^n+1\leqslant q+1\wedge q+1\leqslant r\cdot 2^n+2^n\Rightarrow r\cdot 2^n\leqslant q\wedge q+1\leqslant r\cdot 2^n+2^n$. Dividing by 2^l gives:

$$\frac{r\cdot 2^n}{2^l}\leqslant\frac{q}{2^l}\wedge\frac{q+1}{2^l}\leqslant\frac{r\cdot 2^n+2^n}{2^l} \tag{20.135}$$

Next if $x\in I\bigcap J$ then $\frac{q}{2^l}\leqslant x<\frac{q+1}{2^l}\underset{20.135}{\Rightarrow}\frac{r\cdot 2^n}{2^l}\leqslant x<\frac{r\cdot 2^n+2^n}{2^l}$ proving using 20.131 that $x\in J$. Hence we have

$$\text{If } I\bigcap J\neq\emptyset \text{ then } I\subseteq J$$

Finally if $I\bigcap J=\emptyset$ then if $I\subseteq J$ we have $\emptyset=I\bigcap J=I$ a contradiction as $\frac{q}{2^l}\in I$. Hence we have either $I\bigcap J=\emptyset$ or $I\subseteq J$ but not both. □

Theorem 20.173. *Let $n\in\mathbb{N}$ then we have*

1. *$\forall m\in\mathbb{N}_0$ and $\forall R,Q\in\mathcal{D}_m^n$ with $R\neq Q$ we have $R\bigcap Q=\varnothing$*
2. *Let $k,l\in\mathbb{N}_0$ with $k\leqslant l$ then if $R\in\mathcal{D}_l^n$ and $R\in\mathcal{D}_k^n$ we have that*

$$\begin{aligned}R\bigcap Q\neq\varnothing &\Rightarrow R\subseteq Q\\ R\bigcap Q=\varnothing &\Rightarrow R\nsubseteq Q\end{aligned}$$

3. *$\forall m\in\mathbb{N}_0$ we have that $\mathbb{R}^n=\bigsqcup_{R\in\mathcal{D}_m^n}R$ [here $\bigsqcup_{R\in\mathcal{D}_m^n}R$ is a disjoint union because of (1)].*
4. *$\forall m\in\mathbb{N}_0$ and $\forall R\in\mathcal{D}_m^n$ we have that $v^n(R)=\frac{1}{2^{n\cdot m}}<1$*

Proof.

1. Let $m\in\mathbb{N}_0$ and $R,Q\in\mathcal{D}_m^n$ with $R\neq Q$. Then there exist $r,z\in\mathbb{Z}^n$ such that

$$R=\left[\frac{r}{2^m},\frac{r+1}{2^m}\right[=\prod_{i\in\{1,\ldots,n\}}\left[\frac{r_i}{2^m},\frac{r_i}{2^m}\right[\text{ and }Q=\left[\frac{z}{2^m},\frac{z+1}{2^m}\right[=\prod_{i\in\{1,\ldots,n\}}\left[\frac{z_i}{2^m},\frac{z_i+1}{2^m}\right[$$

As $R\neq Q$ there exist a $i\in\{1,\ldots,n\}$ such that $\left[\frac{r_i}{2^m},\frac{r_i+1}{2^m}\right[\neq\left[\frac{z_i}{2^m},\frac{z_i+1}{2^m}\right[$, hence we must have that $r_i\neq z_i$. We can always assume that $r_i<z_i$ [if not exchange R and Q] so that $r_i+1\leqslant z_i$ [as $r_i,z_i\in\mathbb{Z}$ we can use [theorem: 10.28]]. Assume that $x\in\left[\frac{r_i}{2^m},\frac{r_i+1}{2^m}\right[\bigcap\left[\frac{z_i}{2^m},\frac{z_i+1}{2^m}\right[$ then $\frac{r_i}{2^m}\leqslant x<\frac{r_i+1}{2^m}\leqslant\frac{z_i}{2^m}\leqslant x<\frac{z_i+1}{2^m}$ leading to the contradiction $x<x$ hence we must have that $\left[\frac{r_i}{2^m},\frac{r_i+1}{2^m}\right[\bigcap\left[\frac{z_i}{2^m},\frac{z_i+1}{2^m}\right[=\varnothing$. Using [theorem: 3.110] it follows that $\prod_{i\in\{1,\ldots,n\}}\left[\frac{r_i}{2^m},\frac{r_i}{2^m}\right[\bigcap\prod_{i\in\{1,\ldots,n\}}\left[\frac{z_i}{2^m},\frac{z_i+1}{2^m}\right[$ or

$$R\bigcap Q=\varnothing$$

2. Let $k,l\in\mathbb{N}_0$ with $k\leqslant l$ and $R\in\mathcal{D}_l^n$, $Q\in\mathcal{D}_k^n$ then there exists $r,q\in\mathbb{Z}^n$ with $R=\left[\frac{r}{2^m},\frac{r+1}{2^m}\right[$, $Q=\left[\frac{z}{2^m},\frac{z+1}{2^m}\right[$. Assume that $R\nsubseteq Q$ then we have either

   $\boldsymbol{\exists i\in\{1,\ldots,n\}\vDash\left[\frac{r_i}{2^m},\frac{r_i+1}{2^m}\right[\bigcap\left[\frac{z_i}{2^m},\frac{z_i+1}{2^m}\right[=\varnothing}$. Then using [theorem: 3.110] we have $R\bigcap Q=\varnothing$

   $\boldsymbol{\exists i\in\{1,\ldots,n\}\vDash\left[\frac{r_i}{2^m},\frac{r_i+1}{2^m}\right[\bigcap\left[\frac{z_i}{2^m},\frac{z_i+1}{2^m}\right[\neq\varnothing}$. Then using [lemma: 20.172] we have $\forall i\in\{1,\ldots,n\}$ that $\left[\frac{r_i}{2^m},\frac{r_i+1}{2^m}\right[\subseteq\left[\frac{z_i}{2^m},\frac{z_i+1}{2^m}\right[$. Applying [theorem: 3.111] proves that $R\subseteq Q$ contradicting $R\nsubseteq Q$. So this case never applies.

   So we conclude that if $R\nsubseteq\mathbb{Q}$ then $R\bigcap Q=\varnothing$ or using contraposition we have

$$\text{If } R\bigcap Q\neq\varnothing \text{ then } R\subseteq Q$$

On the other hand if $R\bigcap Q=\varnothing$ and $R\subseteq Q$ then $\varnothing\neq R=R\bigcap Q=\varnothing$ s controdiction so we have

$$\text{If } R\bigcap Q=\varnothing \text{ then } R\nsubseteq Q$$

3. Let $m\in\mathbb{N}$ and $x\in\mathbb{R}^n$ then $\forall i\in\{1,\ldots,n\}$ we have $x_i\in\mathbb{R}$. Using [theorem: 10.30] there exist a $z_i\in\mathbb{Z}$ such that $z_i\leqslant x_i\cdot 2^m<z_i+1$, hence $\frac{z_i}{2^m}\leqslant x_i<\frac{z_i+1}{2^m}$. So if we take $z=(z_1,\ldots,z_m)$ then $x\in\prod_{i\in\{1,\ldots,n\}}\left[\frac{z_i}{2^m},\frac{z_i+1}{2^m}\right[=\left[\frac{z}{2^m},\frac{z+1}{2^m}\right[\in\mathcal{D}_m^n$ proving that $\mathbb{R}^n\subseteq\bigcup_{R\in\mathcal{D}_m^n}R$. As $\forall R\in\mathcal{D}_m^n$ $R\subseteq R^n$ we have proved that
$$R^n=\bigcup_{R\in\mathcal{D}_m^n}R$$
Finally by (1) we have that $\forall R,R'\in\mathcal{D}_m^n$ with $R\neq R'$ we have $R\bigcap R'=\varnothing$ so that
$$R^n=\bigsqcup_{R\in\mathcal{D}_m^n}R$$
4. If $R\in\mathcal{R}_m^n$ then $\exists z\in\mathbb{Z}^n$ such that $R=\prod_{i\in\{1,\ldots,n\}}\left[\frac{z_i}{2^n},\frac{z_i+1}{2^n}\right[$ so that
$$v^n(R)=\prod_{i=1}^n\left(\frac{z_i+1-z_i}{2^m}\right)=\prod_{i=1}^n\frac{1}{2^m}=\frac{1}{2^{n\cdot m}}$$ □

One of the reasons that we introduce the Dyadic cubes as a subset of $\mathcal{R}^n$ is that $\mathcal{D}_m^n$ is a denumerable set in contrast with $\mathcal{R}^n$ which we need giving the definition of a σ-algebra. This is proved in the next lemma.

Lemma 20.174. *Let $n\in\mathbb{N}$ then*

1. *$\forall m\in\mathbb{N}_0$ $\mathcal{D}_m^n$ is denumerable.*
2. *$\mathcal{D}^n$ is denumerable*

Proof.

1. Let $m\in\mathbb{N}_0$ then as $\mathbb{Z}$ is denumerable [see theorem: 10.5] we have by [theorem: 6.67] that $\mathbb{Z}^n$ is also denumerable. Define now β: $\mathbb{Z}^n\to\mathcal{D}_m^n$ by $\beta(z)=\left[\frac{z}{2^m},\frac{z+1}{2^m}\right[$ then β is a bijection.

   injectivity. If $\beta(z)-\beta(w)$ then $\left[\frac{z}{2^m},\frac{z+1}{2^m}\right[=\left[\frac{w}{2^m},\frac{w+1}{2^m}\right[$. Using the fact that a Dyadic cube is not empty together with [lemma: 20.167] gives $\frac{z}{2^m}=\frac{w}{2^m}$ proving that $z=w$.

   surjectivity. This follows from the definition of $\mathcal{D}_m^n$

   So $\mathcal{D}_m^n$ is denumerable.
2. Using [theorem: 6.69] it follows that $\mathcal{D}^n=\bigcup_{m\in\mathbb{N}}\mathcal{D}_m^n$ is denumerable □

We are now finally ready to prove that every non empty open set on $\mathbb{R}^n$ can be written as a denumerable union of pairwise disjoint Dyadic cubes.

Lemma 20.175. *Let $n\in\mathbb{N}$, $\mathcal{T}_{\|\|_n}$ the canonical topology on $\mathbb{R}$ [see example: 14.95] then if $\varnothing\neq U\in\mathcal{T}_{\|\|_n}$ there exist a **pairwise disjoint family** $\{D_i\}_{i\in\mathbb{N}}\subseteq\mathcal{D}^n$ such that $U=\bigsqcup_{i\in\mathbb{N}}D_i$.*

Proof. Let $\varnothing\neq U\in\mathcal{T}_{\|\|_n}$ be a non empty open set in $\mathbb{R}^n$. Given $m\in\mathbb{N}_0$ define
$$\mathcal{S}_m=\{D\in\mathcal{D}_m^n|D\subseteq U\}\subseteq\mathcal{D}_m^n \tag{20.136}$$
and recursively
$$\mathcal{T}_m=\begin{cases}S_0 \text{ if } m=0\\ \{D\in\mathcal{S}_m|\forall i\in\{0,\ldots,m-1\} \text{ we have } \forall R\in\mathcal{T}_i \text{ that } R\bigcap D=\varnothing\} \text{ if } m\in\mathbb{N}\end{cases} \tag{20.137}$$
Using the above definitions we have the following inclusions
$$\forall m\in\mathbb{N}_0 \text{ we have } \mathcal{T}_m\subseteq\mathcal{S}_m\subseteq\mathcal{D}_m^n\subseteq\mathcal{D}^n \tag{20.138}$$
Further we define
$$\mathcal{T}=\bigcup_{m\in\mathbb{N}_0}\mathcal{T}_m \tag{20.139}$$

If $D\in\mathcal{D}$ then there exist a $i\in\mathbb{N}_0$ such that $D\in\mathcal{T}_i\subseteq\mathcal{S}_i$ proving by [eq: 20.136] that $D\subseteq U$, hence we have

$$\bigcup_{D\in\mathcal{T}} D\subseteq U \tag{20.140}$$

Proving the opposite inclusion is a little more difficult. Let $x\in U$ then there exist a $\varepsilon\in\mathbb{R}^+$ such that $x\in B_{\|\|_n}(x,\varepsilon)\subseteq U$. Using the Archimedean property of the real numbers [see theorem: 10.30] there exist $n_\varepsilon\in\mathbb{N}$ such that

$$0<\frac{1}{n_x}<\varepsilon \tag{20.141}$$

Using [theorem: 20.173 (3)] there exist a $D_x\in\mathcal{D}^n_{n_x}$ such that

$$D_x=\left[\frac{z}{2^{n_x}},\frac{z+1}{2^{n_x}}\right[=\prod_{i\in\{1,\ldots,n\}}\left[\frac{z_i}{2^{n_x}},\frac{z_i+1}{2^{n_x}}\right[\in\mathcal{D}^n_{n_x}\text{ such that }x\in D_x$$

from which it follows that

$$\forall i\in\{1,\ldots,n\}\text{ we have }\frac{z_i}{2^{n_x}}\leqslant x_i<\frac{z_i+1}{2^{n_x}} \tag{20.142}$$

Let $y\in D_x$ then $y\in\prod_{i\in\{1,\ldots,n\}}\left[\frac{z_i}{2^{n_x}},\frac{z_i+1}{2^{n_x}}\right[$ so that

$$\forall i\in\{1,\ldots,n\}\text{ we have }\frac{z_i}{2^{n_x}}\leqslant y_i<\frac{z_i+1}{2^{n_x}} \tag{20.143}$$

Hence we have

$$\begin{aligned}
y_i-x_i &\underset{\text{[eq: 20.143}}{<} \frac{z_i+1}{2^{n_x}}-x_i\\
&\underset{\text{[eq: 20.142]}}{\leqslant} \frac{z_i+1}{2^{n_x}}-\frac{z_i}{2^{n_x}}\\
&= \frac{1}{2^{n_x}}\\
&\underset{\text{[eq: 20.141}}{<} \varepsilon\\
x_i-y_i &\underset{\text{[eq: 20.142]}}{<} \frac{z_i+1}{2^{n_x}}-y_i\\
&\underset{\text{[eq: 20.143}}{\leqslant} \frac{z_i+1}{2^{n_x}}-\frac{z_i}{2^{n_x}}\\
&\underset{\text{[eq: 20.141}}{<} \varepsilon
\end{aligned}$$

which proves that $\forall i\in\{1,\ldots,n\}\ |y_i-x_i|<\varepsilon$. Hence $\|y-x\|_n=\max(\{|y_i-x_i||i\in\{1,\ldots,n\}\})<\varepsilon$ so that $y\in B_{\|\|_n}(x,\varepsilon)$. In conclusion

$$x\in D_x\subseteq B_{\|\|_n}(x,\varepsilon)\subseteq U$$

As $D_x\in\mathcal{D}^n_{n_x}$ it follows from the above and [eq: 20.136] that

$$x\in D_x\in S_{n_x} \tag{20.144}$$

Define now

$$\mathcal{K}_x=\{i\in\{0,\ldots,n_x\}|\exists D\in\mathcal{S}_i|x\in D\}\subseteq\{0,\ldots,n_x\} \tag{20.145}$$

Then by [eq: 20.144] $n_x\in\mathcal{K}_x$ so that $\mathcal{K}_x\neq\varnothing$, as further $\mathcal{K}_x$ is finite it follows that

$$m_x=\min(\mathcal{K}_x)\text{ exist} \tag{20.146}$$

For $m_x\in\mathcal{K}_x\subseteq\{0,\ldots,n_x\}$ we have now two possible cases:

- $\boldsymbol{m_x=0}$. then $\exists D\in S_0$ such that $x\in D$. As by [eqs: 20.137, 20.139] $S_0=\mathcal{T}_0$ and $\mathcal{T}_0\in\mathcal{T}$ we that $x\in D\in\mathcal{T}$. In other words $x\in\bigcup_{D\in\mathcal{T}}D$.
- $\boldsymbol{m_x\in\{1,\ldots,n_x\}}$. Then $\exists D\in\mathcal{S}_{m_x}\underset{\text{[eq: 20.136]}}{\subseteq}\mathcal{D}^n_{m_x}$ such that $x\in D$ and $\forall i\in\{0,\ldots,m_x-1\}$ we have that $\forall R\in\mathcal{S}_i$ that $x\notin R$. Let $i\in\{0,\ldots,m_x-1\}$ and assume that $\exists R\in\mathcal{S}_i\subseteq\mathcal{D}^n_i$ such that $R\bigcap D\neq\varnothing$ then by [theorem: 20.173 (2)] and the fact that $i\leqslant m_x$ it follows that $D\subseteq R$, as $x\in D$ it follows that $x\in R$ contradicing $x\notin R$ hence the assumption is wrong and we must have that $\forall R\in\mathcal{S}_i$ we have that $R\bigcap D=\varnothing$. As this is true $\forall i\in\{0,\ldots,m_x-1\}$ it follows from [definition: 20.137] that $D\in\mathcal{T}_{m_x}\underset{\text{[eq: 20.139]}}{\subseteq}\mathcal{T}$. In other words we have $x\in D\in\mathcal{T}$ which proves that $x\in\bigcup_{D\in\mathcal{T}}D$.

So in all cases we have that $x \in \bigcup_{D\in\mathcal{T}} D$ which as $x \in U$ was chosen arbitrary proves that $U \subseteq \bigcup_{D\in\mathcal{T}} D$. Combining this with [eq: 20.139] proves that

$$U = \bigcup_{D\in\mathcal{T}} D \tag{20.147}$$

Next we must prove that U is a pairwise disjoint union. Let $D, E \in \mathcal{T} = \bigcup_{m\in\mathbb{N}_0} \mathcal{T}_m$ with $D \neq E$ then there exist $k, l \in \mathbb{N}_0$ such that $D \in \mathcal{T}_k \subseteq \mathcal{D}^n_k$ and $E \in \mathcal{T}_l \subseteq \mathcal{D}^n_l$. For k, l we have the following possible cases:

$k = l$. Then using [theorem: 20.173 (1)] it follows that $D \bigcap E = \varnothing$.

$k < l$. Then using [eq: 20.137] that $D \bigcap E = \varnothing$.

$l < k$. Then using [eq: 20.137] that $D \bigcap E = \varnothing$.

combining the above with [eq: 20.147] gives then

$$\forall D, E \in \mathcal{T} \text{ with } D \neq E \text{ we have } D \bigcap E = \varnothing \tag{20.148}$$

Next we prove that $\mathcal{T}$ is denumerable, first we prove that $\mathcal{T}$ is not finite (hence by definition infinite). Assume that $\mathcal{T}$ is finite. As $U \neq \varnothing$ we must have that $\mathcal{T} \neq \varnothing$ [because $\bigcup_{D\in\varnothing} D = \varnothing$] so that $m = \min(\{(\text{begin}(D))_1 | D \in \mathcal{T}\})$ exist. Hence there exist a $R = [a, b[\in \mathcal{T}$ such that $a_1 = m$. As $a \in [a, b[= R$ and by [eq: 20.148] $R \subseteq U$ it follows that $a \in U$. Hence there exist a $\varepsilon \in \mathbb{R}^+$ such that $a \in B_{\|\|_n}(a, \varepsilon) \subseteq U$. Define e by $(e)_i = \begin{cases} 1 \text{ i=1} \\ 0 \text{ if } i \in \{2, \ldots, n\} \end{cases}$ then for $i \in \{1, \ldots, n\}$ we have

$$\left|\left(a - \left(a - \frac{\varepsilon}{2} \cdot e\right)\right)_i\right| = \left|\frac{\varepsilon}{2} \cdot e_i\right| = \left|\frac{\varepsilon}{2}\right| \cdot \left|\begin{cases} 1 \text{ if } i = 1 \\ 0 \text{ if } i \in \{2, \ldots, n\} \end{cases}\right| \leqslant \frac{\varepsilon}{2} < \varepsilon$$

so that $\left\|a - \left(a - \frac{\varepsilon}{2} \cdot e\right)\right\|_n < \varepsilon$. Hence $a - \frac{\varepsilon}{2} \cdot e \in B_{\|\|_n}(a, \varepsilon) \subseteq U$ then by [eq: 20.148] there exist a $D' \in \mathcal{T}$ such that $a - \frac{\varepsilon}{2} \cdot e \in D'$. As $D' = [\text{begin}(D'), \text{end}(D')[$ it follows that $\text{begin}(D') \leqslant a - \frac{\varepsilon}{2} \cdot e$ so that $(\text{begin}(D'))_1 \leqslant \left(a - \frac{\varepsilon}{2} \cdot e\right)_1 = a_1 - \frac{\varepsilon}{2} \cdot 1 = m - \frac{\varepsilon}{2}$. As $m = \min(\{(\text{begin}(D))_1 | D \in \mathcal{T}\})$ $m \leqslant (\text{begin}(D'))_1$ which leads to the contradiction $m \leqslant m - \frac{\varepsilon}{2} < m$, so the assumption is wrong and we must have that

$$\mathcal{T} \text{ is not finite or } \mathcal{T} \text{ is infinite} \tag{20.149}$$

As $\mathcal{D}^n$ is denumerable [see theorem: 20.174] and $\mathcal{T} \underset{\text{[eq: 20.138]}}{\subseteq} \mathcal{D}^n$ it follows from the above and [theorem: 6.60] that

$$\mathcal{T} \text{ is denumerable}$$

So there exist a bijection $\beta: \mathbb{N} \to \mathcal{T}$. define then $\{D_i\}_{i\in\mathbb{N}} \subseteq \mathcal{T} \subseteq \mathcal{D}^n$ by $D_i = \beta(i)$ then we have

$$\bigcup_{i\in\mathbb{N}} D_i \underset{\text{[theorem: 2.119]}}{=} \bigcup_{D\in\mathcal{T}} D = U$$

Further if $i, j \in \mathbb{N}$ with $i \neq j$ then as β is a bijection, hence injective, it follows that $D_i \neq D_j$, so that using [eq: 20.148] we have $D_i \bigcap D_j = \varnothing$. Hence

$$U = \bigsqcup_{i\in\mathbb{N}} D_i$$

□

Lemma 20.176. *Let $n \in \mathbb{N}$ and $R \in \mathcal{R}^n$ with $R \neq \varnothing$ then there exist a sequence $\{U_i\}_{i\in\mathbb{N}} \subseteq \mathcal{T}_{\|\|_n}$ of open sets such that $R = \bigcap_{i\in\mathbb{N}} U_i$*

Proof. As $R \in \mathcal{R}^n$ there exists a $a, b \in \mathbb{R}^n$ with $a \leqslant b$ such that $R = [a, b[= \prod_{i\in\{1,\ldots,n\}} [a_i, b_i[$. Define then $\{U_i\}_{i\in\mathbb{N}}$ by $U_i = \prod_{j\in\{1,\ldots,n\}} \left]a_j - \frac{1}{j}, b_j\right[$. As $\left]a_j - \frac{1}{i}, b_j\right[\in \mathcal{T}_{||}$ [see theorem: 14.99] and $T_{\|\|_n}$ is the product topology based on $\mathcal{T}_{||}$ [see 14.95] it follows that $\{U_i\}_{i\in\mathbb{N}} \subseteq \mathcal{T}_{\|\|_n}$. Let $i \in \mathbb{N}$ and $x \in R$ then we have $\forall j \in \{1, \ldots, n\}$ that $x_j \in [a_j, b_j[\Rightarrow a_j \leqslant x_j < b_j \Rightarrow a_j - \frac{1}{i} < a_j \leqslant x_j < b_j \Rightarrow x_j \in \left]a_j - \frac{1}{i}, b_j\right[$, proving using [theorem: 3.111] that $R \subseteq U_i$. Hence we have

$$R \subseteq \bigcap_{i\in\mathbb{N}} U_i \tag{20.150}$$

For the opposite inequality let $x \in \bigcap_{i\in\mathbb{N}} U_i$ then $\forall i \in \mathbb{N}$ we have $x \in U_i$ so that $\forall j \in \{1, \ldots, n\}$ we have $x_j \in \left]a_j - \frac{1}{i}, b_j\right[\Rightarrow a_j - \frac{1}{i} < x_j < b_j$. Assume that $\exists j \in \{1, \ldots, n\}$ such that $x_j < a_j$ then using [theorem: 10.30] there exists a $i \in \mathbb{N}$ such that $x_j < x_j + \frac{1}{i} < a_j \Rightarrow x_j < a_j - \frac{1}{i}$ contradicting the fact that $a_j - \frac{1}{i} < x_j$. Hence $\forall j \in \{1, \ldots, n\}$ we have $a_j \leqslant x_j < b_j$ proving that $x \in R$ so that $\bigcap_{i\in\mathbb{N}} U_i \subseteq R$. This together with [eq: 20.150] proves

$$R = \bigcap_{i\in\mathbb{N}} U_i$$

□

We are ready now to prove a alternative definition for the Borel algebra on $\mathbb{R}^n$.

Theorem 20.177. *Let $n \in \mathbb{N}$ then we have*

$$\sigma[\{C \subseteq \mathbb{R}^n | C \text{ is close in } \mathcal{T}_{\|\|_n}\}] = \mathcal{B}[\mathbb{R}^n] = \sigma[\mathcal{R}^n]$$

Proof. Using [theorem: 20.143] we have

$$\sigma[\{C \subseteq \mathbb{R}^n | C \text{ is close in } \mathcal{T}_{\|\|_n}\}] \underset{\text{[theorem: 20.143]}}{=} \mathcal{B}[\mathbb{R}^n, \mathcal{T}_{\|\|_n}] \underset{\text{def}}{=} \mathcal{B}[\mathbb{R}^n]$$

so we only have to prove that $\mathcal{B}[\mathbb{R}^n, \mathcal{T}_{\|\|_n}] = \sigma[\mathcal{R}^n]$. Let $U \in \mathcal{T}_{\|\|_n}$ then we have either:

- $\boldsymbol{U = \varnothing}$**.** Then $U = \varnothing \in \sigma[\mathcal{R}^n]$.
- $\boldsymbol{U \neq \varnothing}$**.** Then using [lemma: 20.175] there exist a sequence $\{D_i\}_{i \in \mathbb{N}} \subseteq \mathcal{D}^n \subseteq \mathcal{R}^n$ such that $U = \bigcup_{i \in \mathbb{N}} D_i$ which as $\sigma[\mathcal{R}^n]$ is a σ-algebra proves that $U \in \sigma[\mathcal{R}^n]$

Hence we have $\mathcal{T}_{\|\|_n} \subseteq \sigma[\mathcal{R}^n]$ which by [theorem: 20.141] gives

$$\sigma[\mathcal{T}_{\|\|_n}] \subseteq \sigma[\mathcal{R}^n] \tag{20.151}$$

For the opposite inclusion let $R \in \mathcal{R}^n$ then by [lemma: 20.176] there exist a $\{U_i\}_{i \in \mathbb{N}} \subseteq \mathcal{T}_{\|\|_n}$ such that $R = \bigcap_{i \in \mathbb{N}} U_i$. As $\sigma[\mathcal{T}_{\|\|_n}]$ is a σ-alebra we have by [theorem: 20.138] that $R \in \sigma[\mathcal{T}_{\|\|_n}]$. Hence $\mathcal{R}^n \subseteq \sigma[\mathcal{T}_{\|\|_n}]$ which by [theorem: 20.141] gives $\sigma[\mathcal{R}^n] \subseteq \sigma[\mathcal{T}_{\|\|_n}]$. Combining this with [eq: 20.151] gives

$$\sigma[\mathcal{R}^n] = \sigma[\mathcal{T}_{\|\|_n}] \underset{\text{def}}{=} \mathcal{B}[\mathbb{R}^n, \mathcal{T}_{\|\|_n}] = \mathcal{B}[\mathbb{R}^n]$$

□

20.4 Measures

20.4.1 Measure definition and properties

For a measurable space we have some simplication in the definitions of additivity, sub-additivity, countable additivity and countable sub-additivity bexause of the extra properties of a σ-algebra.

Theorem 20.178. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space [see definition: 20.134] and $\mu: \mathcal{A} \to [0, \infty[$ a function then we say that:*

1. *μ is **finite additive** $\Leftrightarrow$ for every **pairwise disjoint** families $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ where $n \in \mathbb{N}$ we have*

$$\mu\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^{n} \mu(A_i)$$

2. *μ is **finite sub-additive** $\Leftrightarrow$ for every $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$, $n \in \mathbb{N}$ we have that*

$$\mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) \leqslant \sum_{i=1}^{n} \mu(A_i)$$

3. *μ is **countable additive** $\Leftrightarrow$ for all **pairwise disjoint** $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have that*

$$\mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \mu(A_i)$$

4. *μ is **countable sub-additive** if $\Leftrightarrow$ for all $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have*

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \leqslant \sum_{i=1}^{\infty} \mu(A_i)$$

Proof.

1. This follows from the fact that $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ we have as $\mathcal{A}$ is a σ-algebra that $\bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{A}$ and the definition of additivity [see definition: 20.116].

2. This follows from the fact that $\forall\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}$ we have as $\mathcal{A}$ is a σ-algebra that $\bigcup_{i\in\{1,\ldots,n\}}A_i\in\mathcal{A}$ and the definition of sub-additivity [see definition: 20.117].
3. This follows from the fact that $\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ we have as $\mathcal{A}$ is a σ-algebra that $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}$ and the definition of countable additivity [see definition: 20.118].
4. This follows from the fact that $\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ we have as $\mathcal{A}$ is a σ-algebra that $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}$ and the definition of countable sub-additivity [see definition: 20.119]. □

Using mathematical induction it is easy to specify a neccesary and sufficient condition for finite additivity and finite sub additivity.

Lemma 20.179. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space and $\mu:\mathcal{A}\to[0,\infty]$ a function then we have*

1. *μ is finate additive $\Leftrightarrow\forall A,B\in\mathcal{A}$ with $A\bigcap B=\emptyset$ we have $\mu(A\bigcup B)=\mu(A)+\mu(B)$*
2. *μ is finite sub additive $\Leftrightarrow$ $\forall A,B\in\mathcal{A}$ we have $\mu(A\bigcup B)\leqslant\mu(A)+\mu(B)$*

Proof.

1.

$\Rightarrow$. Let $A,B\in\mathcal{A}$ with $A\bigcap B=\emptyset$ then $\{A_i\}_{i\in\{1,\ldots,2\}}$ defined by $A_i=\begin{cases}A\text{ if }i=1\\B\text{ if }i=2\end{cases}$ is pairwise disjoint and $\{A_i\}_{i\in\{1,\ldots,2\}}\subseteq\mathcal{A}$. So by assumption we have that

$$\mu(A\bigcup B)=\mu\left(\bigcup_{i\in\{1,\ldots,2\}}A_i\right)=\sum_{i=1}^{2}\mu(A_i)=\mu(A_1)+\mu(A_2)=\mu(A)+\mu(B)$$

$\Leftarrow$. Let

$$\mathcal{S}=\left\{n\in\mathbb{N}_0|\text{If }\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}\text{ is a pairwise disjoint family then we have that }\mu\left(\bigcup_{i\in\{1,\ldots,n\}}A_i\right)=\sum\mu(A_i)\right\}$$

then we have:

$1\in\mathcal{S}$. Let $\{A_i\}_{i\in\{1,\ldots,1\}}\subseteq\mathcal{A}$ then $\mu(\bigcup_{i\in\{1,\ldots,1\}}A_i)=\mu(A_1)=\sum_{i=1}^{1}\mu(A_i)$ proving that $1\in\mathcal{S}$

$n\in\mathcal{S}\Rightarrow n+1\in\mathcal{S}$. Let $\{A_i\}_{i\in\{1,\ldots,n+1\}}\subseteq\mathcal{A}$ be pairwise disjoint. Take $A=\bigcup_{i\in\{1,\ldots,n\}}A_i$ and $B=A_{n+1}$, then $A\bigcup B=\bigcup_{i\in\{1,\ldots,n+1\}}A_i$ and $A\bigcap B=(\bigcup_{i\in\{1,\ldots,n\}}A_i)\bigcap A_{n+1}=\bigcup_{i\in\{1,\ldots,n\}}(A_i\bigcap A_{i+1})=\emptyset$. Hence we have

$$\begin{aligned}\mu\left(\bigcup_{i\in\{1,\ldots,n\}}A_i\right)&=\mu(A\bigcup B)\\&=\mu(A)+\mu(B)\\&=\mu\left(\bigcup_{i\in\{1,\ldots,n\}}A_i\right)+\mu(A_{n+1})\\&\underset{n\in\mathcal{S}}{=}\left(\sum_{i=1}^{n}\mu(A_i)\right)+\mu(A_{n+1})\\&=\sum_{i=1}^{n+1}\mu(A_i)\end{aligned}$$

proving that $n+1\in\mathcal{S}$.

Using mathematical induction we have that $\mathbb{N}=\mathcal{S}$. So $\forall\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}$ pairwise disjoint we have $\mu(\bigcup_{i\in\{1,\ldots,n+1\}}A_i)=\sum_{i=1}^{n}\mu(A_i)$

2.

$\Rightarrow$. Let $A,B\in\mathcal{A}$ then $\{A_i\}_{i\in\{1,\ldots,2\}}$ defined by $A_i=\begin{cases}A\text{ if }i=1\\B\text{ if }i=2\end{cases}$ satisfies $\{A_i\}_{i\in\{1,\ldots,2\}}\subseteq\mathcal{A}$. So by assumption we have that

$$\mu(A\bigcup B)=\mu\left(\bigcup_{i\in\{1,\ldots,2\}}A_i\right)\leqslant\sum_{i=1}^{2}\mu(A_i)=\mu(A_1)+\mu(A_2)=\mu(A)+\mu(B)$$

$\Leftarrow$. Let

$$\mathcal{S}=\left\{n\in\mathbb{N}_0|\forall\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}\text{ we have }\mu\left(\bigcup_{i\in\{1,\ldots,n\}}A_i\right)\leqslant\sum_{i=1}^{n}\mu(A_i)\right\}$$

then:

$1\in\mathcal{S}$. Let $\{A_i\}_{i\in\{1,\ldots,1\}}\subseteq\mathcal{A}$ then $\mu\left(\bigcup_{i\in\{1,\ldots,1\}}A_i\right)=\mu(A_1)=\sum_{i=1}^{1}\mu(A_i)$ proving that $1\in\mathcal{S}$

$n\in\mathcal{S}\Rightarrow n+1\in\mathcal{S}$. Let $\{A_i\}_{i\in\{1,\ldots,n+1\}}\subseteq\mathcal{A}$ pairwise disjoint. Take $A=\bigcup_{i\in\{1,\ldots,n\}}A_i$ and $B=A_{n+1}$, then $A\bigcup B=\bigcup_{i\in\{1,\ldots,n+1\}}A_i$. Hence we have

$$\begin{aligned}\mu\left(\bigcup_{i\in\{1,\ldots,n\}}A_i\right) &= \mu\left(A\bigcup B\right)\\ &\leqslant \mu(A)+\mu(B)\\ &= \mu\left(\bigcup_{i\in\{1,\ldots,n\}}A_i\right)+\mu(A_{n+1})\\ &\leqslant_{n\in\mathcal{S}} \left(\sum_{i=1}^{n}\mu(A_i)\right)+\mu(A_{n+1})\\ &= \sum_{i=1}^{n+1}\mu(A_i)\end{aligned}$$

proving that $n+1\in\mathcal{S}$.

Using mathematical induction we have that $\mathbb{N}=\mathcal{S}$. So $\forall\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}$ we have $\mu\left(\bigcup_{i\in\{1,\ldots,n+1\}}A_i\right)\leqslant\sum_{i=1}^{n}\mu(A_i)$ □

Theorem 20.180. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space then if $\mu:\mathcal{A}\to[0,\infty]$ satisfies:*

1. *$\mu(\varnothing)=0$*
2. *μ is countable additive*

then μ is additive.

Proof. This was actually proved in [theorem: 20.180]. □

Definition 20.181. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space then $\mu:\mathcal{A}\to[0,\infty]$ is a measure on $\mathcal{A}$ if*

1. *$\mu(\varnothing)=0$*
2. *For every **pairwise disjoint** $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ we have*

$$\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)=\sum_{i=1}^{\infty}\mu(A_i)$$

[in other word μ is countable additve].

A trivial example of a measure is the following.

Example 20.182. Let $\langle X,\mathcal{A}\rangle$ be a measurable space then $\mu:\mathcal{A}\to[0,\infty]$ defined by $\mu(A)=0$ is a measure on $\mathcal{A}$.

Proof. We have

1. $\mu(\varnothing)=0$
2. If $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ then $\sum_{i=1}^{\infty}\mu(A_i)=\sum_{i=1}^{\infty}0\underset{\text{[example: 20.89]}}{=}0=\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)$ □

Definition 20.183. (Measure Space) *A measure space is a triple $\langle X,\mathcal{A},\mu\rangle$ where $\mathcal{A}$ is a σ-algebra on X and $\mu:\mathcal{A}\to[0,\infty]$ is a measure on $\mathcal{A}$.*

Theorem 20.184. *Let $\langle X,\mathcal{A}\rangle$ be a measureable space then we have:*

1. *If $\mu_1:\mathcal{A}\to[0,\infty]$ and $\mu_2:\mathcal{A}\to[0,\infty]$ are measures on $\mathcal{A}$ then*

$$\mu_1+\mu_2:\mathcal{A}\to[0,\infty]\text{ defined by }(\mu_1+\mu_2)(A)=\mu_1(A)+\mu_2(A)$$

is a measure on $\mathcal{A}$.

2. *If $\mu: \mathcal{A} \to [0, \infty]$ is a measure on $\mathcal{A}$ and $\alpha \in [0, \infty]$ then*

$$\alpha \cdot \mu: \mathcal{A} \to [0, \infty] \text{ defined by } (\alpha \cdot \mu)(A) = \alpha \cdot \mu(A)$$

Proof.

1. First we have

$$(\mu_1 + \mu_2)(\emptyset) = \mu_1(\emptyset) + \mu_2(\emptyset) = 0 + 0 = 0$$

Secondly if $\{A_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{A}$ is pairwise disjoint then

$$\begin{aligned}
(\mu_1 + \mu_2)\left(\bigsqcup_{i \in \mathbb{N}_0} A_i\right) &= \mu_1\left(\bigsqcup_{i \in \mathbb{N}_0} A_i\right) + \mu_2\left(\bigsqcup_{i \in \mathbb{N}_0} A_i\right) \\
&= \sum_{i=1}^{\infty} \mu_1(A_i) + \sum_{i=1}^{\infty} \mu_2(A_i) \\
&\underset{\text{[theorem: 20.91]}}{=} \sum_{i=1}^{\infty} (\mu_1(A_i) + \mu_2(A_i)) \\
&= \sum_{i=1}^{\infty} (\mu_1 + \mu_2)(A_i)
\end{aligned}$$

proving that $\mu_1 + \mu_2$ is a measure.

2. First we have

$$(\alpha \cdot \mu)(\emptyset) = \alpha \cdot \mu(\emptyset) = \alpha \cdot 0 = 0$$

Secondly if $\{A_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{A}$ is pairwise disjoint then

$$\begin{aligned}
(\alpha \cdot \mu)\left(\bigsqcup_{i \in \mathbb{N}_0} A_i\right) &= \alpha \cdot \mu\left(\bigsqcup_{i \in \mathbb{N}_0} A_i\right) \\
&= \alpha \cdot \sum_{i=1}^{\infty} \mu(A_i) \\
&\underset{\text{[theorem: 20.91]}}{=} \sum_{i=1}^{\infty} (\alpha \cdot \mu(A_i)) \\
&= \sum_{i=1}^{\infty} (\alpha \cdot \mu)(A_i)
\end{aligned}$$

proving that $\alpha \cdot \mu$ is a measure. □

Theorem 20.185. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure and let $\mathcal{B}$ a σ-algebra on X such that $\mathcal{B} \subseteq \mathcal{A}$ then $\langle X, \mathcal{B}, \mu_{|\mathcal{B}} \rangle$ is a measure space.*

Proof. As $\mathcal{B}$ is already a σ-algebra on X we only have to proof that $\mu_{|\mathcal{B}}$ is a measure on $\mathcal{B}$.

1. As $\emptyset \in \mathcal{B} \subseteq \mathcal{A}$ we have $\mu_{|\mathcal{B}}(\emptyset) = \mu(\emptyset) = 0$
2. If $\{A_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{B} \subseteq \mathcal{A}$ is a pairwise disjoint family then

$$\mu_{|\mathcal{B}}\left(\bigsqcup_{i \in \mathbb{N}_0} A_i\right) = \mu\left(\bigsqcup_{i \in \mathbb{N}_0} A_i\right) = \sum_{i=1}^{\infty} \mu(A_i) = \sum_{i=1}^{\infty} \mu_{|\mathcal{B}}(A_i)$$

□

Theorem 20.186. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $B \in \mathcal{A}$ then $\langle B, \mathcal{A}_{|B}, \mu_{|\mathcal{A}_{|B}} \rangle$ is a measure space. Here $\mathcal{A}_{|B} = \{C \in \mathcal{A} | C \subseteq B\}$ and $\mu_{|\mathcal{A}_{|B}}$ is μ restricted to $\mathcal{A}_{|B}$.*

Proof. Using [theorem: 20.144] $\mathcal{A}_{|B}$ is a σ-algebra on X. Further $\mathcal{A}_{|B} = \{C \in \mathcal{A} | C \subseteq B\} \subseteq \mathcal{A}$ so that by the previous theorem [theorem: 20.185] $\mu_{|\mathcal{A}_{|B}}$ is a measure on $\mathcal{A}_{|B}$. □

Theorem 20.187. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then*

1. *$\forall A, B \in \mathcal{A}$ with $A \subseteq B$ we have $\mu(A) \leqslant \mu(B)$*
2. *$\forall A, B \in \mathcal{A}$ with $A \subseteq B$ and $\mu(A) < \infty$ we have $\mu(B \setminus A) = \mu(B) - \mu(A)$*

Proof.

1. If $A \subseteq B$ then $A \bigcap (B \setminus A) = \varnothing$ and $B = A \bigcup (B \setminus A)$ so that by [theorem: 20.180] we have
$$\mu(B) = \mu(A) + \mu(B \setminus A)$$
Further as $0 \leqslant \mu(B \setminus A)$ we have by [theorem: 20.32] that $\mu(A) \leqslant \mu(B)$.
2. If $A \subseteq B$ and $\mu(A) < \infty$ then as $0 \leqslant \mu(A)$ we have that $\mu(A) \in \mathbb{R}$, further by (1)
$$\mu(B) = \mu(A) + \mu(B \setminus A)$$
so that by [theorem: 20.28] $\mu(B \setminus A) = \mu(B) - \mu(A)$. □

Definition 20.188. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then μ is a **finite measure** if $\mu(X) < \infty$*

We have the following equivalent definition of a finite measure.

Theorem 20.189. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space*
$$\mu \text{ is a finite measure} \Leftrightarrow \forall A \in \mathcal{A} \text{ we have } \mu(A) < \infty$$

Proof.

$\Rightarrow$. If $A \in \mathcal{A}$ then $A \subseteq X$ so that by [theorem: 20.187] $\mu(A) \leqslant \mu(X) < \infty$.

$\Leftarrow$. If $\forall A \in \mathcal{A}$ $\mu(A) < \infty$ we have as $X \in \mathcal{A}$ that $\mu(X) < \infty$. □

Definition 20.190. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then μ is a **σ-finite measure** if there exist a $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ such that $\forall i \in \mathbb{N}$ $\mu(A_i) < \infty$ and $X = \bigcup_{i \in \mathbb{N}} A_i$.*

Next we prove that countable additivity implies sub additivity.

Theorem 20.191. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ then there exist a **pairwise disjoint family** $\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ such that*
$$\forall i \in \mathbb{N} \text{ we have } B_i \subseteq A_i$$
and
$$\bigcup_{i \in \mathbb{N}} A_i = \bigsqcup_{i \in \mathbb{N}} B_i$$

Proof. Using [lemma: 20.108] we have for $\{B_i\}_{i \in \mathbb{N}}$ defined by
$$B_i = \begin{cases} A_1 \text{ if } i = 1 \\ A_i \setminus \bigcup_{j \in \{1, \ldots, i-1\}} A_j \text{ if } i \in \{2, \ldots, \infty\} \end{cases}$$
that
$$\forall i \in \mathbb{N} \text{ we have } B_i \subseteq A_i$$
$$\bigcup_{i \in \mathbb{N}} B_i = \bigcup_{i \in \mathbb{N}} A_i$$
and
$$\forall i, j \in \mathbb{N} \text{ with } i \neq j \text{ then } B_i \bigcap B_j \neq \varnothing$$
Let $i \in \mathbb{N}$ then we have either:

$i = 1$. Then $B_i = B_1 = A_1 \in \mathcal{A}$

$1<i$. Then by [theorems: 20.135, 20.130] $B_i = A_i \setminus \bigcup_{j\in\{1,\ldots,i-1\}} A_j \in \mathcal{A}$
so that

$$\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$$

□

Theorem 20.192. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space then for every $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ we have*

$$\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right) \leqslant \sum_{i=1}^{\infty} \mu(A_i)$$

Proof. Using [theorem: 20.191] there exists a **pairwise disjoint** family $\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ such that

$$\forall i \in \mathbb{N}\ B_i \subseteq A_i \text{ and } \bigsqcup_{i\in\mathbb{N}} B_i = \bigcup_{i\in\mathbb{N}} A_i \tag{20.152}$$

So

$$\begin{aligned}
\mu\left(\bigcup_{i\in\mathbb{N}} A_i\right) &\underset{\text{[eq: 20.152]}}{=} \mu\left(\bigsqcup_{i\in\mathbb{N}} B_i\right) \\
&= \sum_{i=1}^{\infty} \mu(B_i) \\
&\underset{\text{[eq: 20.152]}\wedge\text{[theorem: 20.91]}}{\leqslant} \sum_{i=1}^{\infty} \mu(A_i)
\end{aligned}$$

□

Theorem 20.193. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space then*

1. *If $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ satisfies $\forall i \in \mathbb{N}\ A_i \leqslant A_{i+1}$ then*

$$\mu\left(\bigcup_{i\in\mathbb{N}_0} A_i\right) = \lim_{i\to\infty} \mu(A_i) = \sup\left(\{\mu(A_i) | i \in \mathbb{N}\}\right)$$

2. *$\forall \{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ satisfies $\forall i \in \mathbb{N}\ A_{i+1} \leqslant A_i$ and $\exists k \in \mathbb{N}$ such that $\mu(A_k) < \infty$ then*

$$\mu\left(\bigcap_{i\in\mathbb{N}} A_i\right) = \lim_{i\to\infty} \mu(A_i) = \inf\left(\{\mu(A_i) | i \in \mathbb{N}\}\right)$$

Proof.

1. Define

$$\{B_i\}_{i\in\mathbb{N}} \text{ by } B_i = \begin{cases} A_1 \text{ if } i = 1 \\ A_i \setminus A_{i-1} \text{ if } i \in \{2, \ldots, \infty\} \end{cases} \in \mathcal{A}$$

Let $i, j \in \mathbb{N}$ with $i \neq j$ then we may always assume that $i < j$ [otherwise exchange i and j]. Assume that $x \in B_i \bigcap B_j$ then we have for i either:

$i=1$. Then $1 = i < j \Rightarrow 1 \leqslant j-1$ so that $x \in B_i = B_1 = A_1 \subseteq A_{j-1}$. Further as $x \in B_j = A_j \setminus A_{j-1}$ we have $x \notin A_{j-1}$ contradicting that we have also $x \in A_{j-1}$.

$1<i$. Then $i < j \Rightarrow i \leqslant j-1$ so that $A_i \subseteq A_{j-1}$. As $x \in B_i = A_i \setminus A_{i-1}$ it follows that $x \in A_i \Rightarrow x \in A_{j-1}$ but as $x \in B_j = A_j \setminus A_{j-1}$ we have that $x \notin A_{j-1}$ hence we have a contradiction.

so the assumption must be wrong proving that $B_i \bigcap B_j = \varnothing$. Hence

$$\forall i, j \in \mathbb{N} \text{ we have } B_i \bigcap B_j = \varnothing \tag{20.153}$$

Next if $n \in \mathbb{N}$ then $\forall i \in \{1, \ldots, n\}$ we have that $B_i = \begin{cases} A_1 \subseteq A_i \text{ if } i = 1 \\ A_i \setminus A_{i-1} \subseteq A_i \text{ if } i \in \{2, \ldots, \infty\} \end{cases} \subseteq A_i \subseteq A_n$ so that

$$\bigcup_{i\in\{1,\ldots,n\}} B_i \subseteq A_n \tag{20.154}$$

Further if $x \in A_n$ then $n \in \{i \in \{1,\ldots,n\} | x \in A_i\} \subseteq \{1,\ldots,n\}$ so that $m = \min(\{i \in \{1,\ldots,n\} | x \in A_i\})$ exists. We have now two cases to consider for m:

$m = 1$. then $x \in A_1 = B_1 \subseteq \bigcup_{i \in \{1,\ldots,n\}} B_i$

$1 < m$. then $x \notin A_{m-1}$ and $x \in A_m$ so that $x \in A_m \setminus A_{m-1} = B_m \subseteq \bigcup_{i \in \{1,\ldots,n\}} B_i$

proving that $A_n \subseteq \bigcup_{i \in \{1,\ldots,n\}} B_i$ which by [eq: 20.154] gives $A_n = \bigcup_{i \in \{1,\ldots,n\}} B_i$. Hence

$$\forall n \in \mathbb{N} \text{ we have } A_n = \bigsqcup_{i \in \{1,\ldots,n\}} B_i \tag{20.155}$$

From the above it follows that $\forall n \in \mathbb{N}$ $A_n \subseteq \bigcup_{i \in \{1,\ldots,n\}} B_i \subseteq \bigcup_{i \in \mathbb{N}} B_i$ proving that $\bigcup_{n \in \mathbb{N}} A_n \subseteq \bigcup_{n \in \mathbb{N}} B_n$, futher $\forall i \in \mathbb{N}$ we have $B_i = \begin{cases} A_1 \subseteq A_i \text{ if } i = 1 \\ A_i \setminus A_{i-1} \subseteq A_i \text{ if } i \in \{2,\ldots,\infty\} \end{cases} \subseteq A_i$ so that $\bigcup_{i \in \mathbb{N}} B_i \subseteq \bigcup_{i \in \mathbb{N}} A_i$. Hence we have taking in account [eq: 20.153]

$$\bigcup_{i \in \mathbb{N}} A_i = \bigsqcup_{i \in \mathbb{N}} B_i \tag{20.156}$$

Next we have

$$\begin{aligned}
\mu\left(\bigcup_{i \in \mathbb{N}_0} A_i\right) &= \mu\left(\bigsqcup_{i \in \mathbb{N}_0} B_i\right) \\
&= \sum_{i=1}^{\infty} \mu(B_i) \\
&\underset{\text{def}}{=} \lim_{n \to \infty}\left(\sum_{i=1}^{n} \mu(B_i)\right) \\
&\underset{\text{[theorem: 20.180]}}{=} \lim_{n \to \infty}\left(\mu\left(\bigsqcup_{i \in \{1,\ldots,n\}} B_i\right)\right) \\
&\underset{20.155}{=} \lim_{n \to \infty} \mu(A_n)
\end{aligned}$$

So that

$$\mu\left(\bigcup_{i \in \mathbb{N}_0} A_i\right) = \lim_{n \to \infty} \mu(A_n)$$

As $\forall i \in \mathbb{N}$ we have $A_i \subseteq A_{i+1} \underset{\text{[theorem: 20.187]}}{\Rightarrow} \mu(A_i) \leqslant \mu(A_{i+1})$ so that by [theorem: 20.84]

$$\lim_{n \to \infty} \mu(A_n) = \sup(\{\mu(A_n) | n \in \mathbb{N}\})$$

2. First we consider the cases where $k = 1$. Then $\forall i \in \mathbb{N}$ we have $A_i \subseteq A_1$ so that by [theorem: 20.187] $\mu(A_i) \leqslant \mu(A_1) < \infty$ proving that

$$\forall i \in \mathbb{N} \text{ we have } \mu(A_i) < \infty \tag{20.157}$$

Define $\{B_i\}_{i \in \mathbb{N}}$ by $B_i = A \setminus A_i$. Let $i \in \mathbb{N}$ then for $x \in B_i$ we have $x \in A_1 \wedge x \notin A_i \supseteq A_{i+1}$ so that $x \in A_1 \setminus A_{i+1} = B_{i+1}$. Hence we have

$$\forall i \in \mathbb{N} \; B_i \subseteq B_{i+1} \tag{20.158}$$

So using (1) it follows that

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \lim_{i \to \infty} \mu(B_i) \tag{20.159}$$

Now

$$\begin{aligned}
A_1 \setminus \left(\bigcup_{i \in \mathbb{N}} B_i\right) &\underset{\text{[theorem: 2.132]}}{=} \bigcap_{i \in \mathbb{N}} (A_1 \setminus B_i) \\
&= \bigcap_{i \in \mathbb{N}} (A_1 \setminus (A_1 \setminus A_i)) \\
&\underset{A_i \subseteq A_1 \wedge \text{[theorem: 2.132]}}{=} \bigcap_{i \in \mathbb{N}} A_i
\end{aligned} \tag{20.160}$$

As $\forall i \in \mathbb{N}\ B_i = A_1 \setminus A_i \subseteq A_1$ it follows that

$$\mu(B_i) \underset{\text{[theorem: 20.187]}}{\leqslant} \mu(A_1) < \infty \tag{20.161}$$

and $\bigcup_{i\in\mathbb{N}} B_i \subseteq A_1$ so that

$$\mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) \underset{\text{[theorem: 20.187]}}{\leqslant} \mu(A_1) < \infty \tag{20.162}$$

Next

$$\begin{aligned}
\mu\left(\bigcap_{i\in\mathbb{N}} A_i\right) &\underset{\text{[eq: 20.160]}}{=} \mu\left(A_1 \setminus \left(\bigcup_{i\in\mathbb{N}} B_i\right)\right) \\
&\underset{\text{[eq: 20.162]}\wedge\text{[theorem: 20.187}}{=} \mu(A_1) - \mu\left(\bigcup_{i\in\mathbb{N}} B_i\right) \\
&\underset{\text{[eq: 20.159]}}{=} \mu(A_1) - \lim_{i\to\infty} \mu(B_i) \\
&= \mu(A_1) - \lim_{i\to\infty} \mu(A_1 \setminus A_i) \\
&\underset{\text{[eq: 20.161]}\wedge\text{[theorem: 20.187}}{=} \mu(A_1) - \lim_{i\to\infty} (\mu(A_1) - \mu(A_i)) \\
&\underset{\text{[theorems: 20.78, 20.71]]}}{=} \mu(A_1) - \left(\mu(A_1) - \lim_{i\to\infty} \mu(A_i)\right) \\
&= \lim_{i\to\infty} \mu(A_i)
\end{aligned}$$

hence we have that

$$\forall \{A_i\}_{i\in\mathbb{N}} \text{ with } \mu(A_1) < \infty \text{ and } \forall i \in \mathbb{N}\ A_{i+1} \subseteq A \text{ we have } \mu\left(\bigcap_{i\in\mathbb{N}} A_i\right) = \lim_{i\to\infty} \mu(A_i) \tag{20.163}$$

Next we proof the general case where $1 < k$. Define $\{C_i\}_{i\in\mathbb{N}} \subseteq \mathcal{A}$ by $C_i = A_{i+(k-1)}$ then we have as $\mu(A_k) < \infty$ that $\mu(C_1) = A_{1+(k-1)} = A_1 < \infty$. Further $\forall i \in \mathbb{N}$ we have that $C_{i+1} = A_{(i+(k-1))+1} \subseteq A_{i+(k-1)} = C_i$. So all conditions of [eq: 20.163] are satisfied and we have that

$$\mu\left(\bigcap_{i\in\mathbb{N}} C_i\right) = \lim_{i\to\infty} \mu(C_i)$$

As $\lim_{i\to\infty} \mu(C_i) = \lim_{i\to\infty} A_{i+(k-1)} \underset{\text{[theorem: 20.77]}}{=} \lim_{i\to\infty} A_i$ so that we have

$$\mu\left(\bigcap_{i\in\mathbb{N}} C_i\right) = \lim_{i\to\infty} \mu(A_i) \tag{20.164}$$

Let $x \in \bigcap_{i\in\mathbb{N}} A_i$. Then $\forall i \in \mathbb{N}$ we have, as $i + (k-1) \in \mathbb{N}$ [because $1 < k$], that $x \in A_{i+(k-1)} = C_i$ hence

$$\bigcap_{i\in\mathbb{N}} A_i \subseteq \bigcap_{i\in\mathbb{N}} C_i \tag{20.165}$$

Let $x \in \bigcap_{i\in\mathbb{N}} C_i$. Let $i \in \mathbb{N}$ then we have for i either:

$\boldsymbol{i \in \{1, \ldots, k-1\}}$. Then $x \in C_1 = A_{1+(k-1)} = A_k \underset{i \leqslant k-1 < k}{\subseteq} A_i$ so that $x \in A_i$.

$\boldsymbol{i \in \{k, \ldots, \infty\}}$. Then $i - (k-1) \in \mathbb{N}$ so that $x \in C_{i-(k-1)} = A_{(i-(k-1))+(k-1)} = A_i$ hence $x \in A_i$

as $i \in \mathbb{N}$ was choosen arbitrary it follows that $x \in \bigcap_{i\in\mathbb{N}} A_i$, Hence $\bigcap_{i\in\mathbb{N}} C_i \subseteq \bigcap_{i\in\mathbb{N}} A_i$ which combined with [eq: 20.165] proves that

$$\bigcap_{i\in\mathbb{N}} A_i = \bigcap_{i\in\mathbb{N}} C_i \tag{20.166}$$

So combining [eq: 20.164] and [eq: 20.166] it follows that

$$\mu\left(\bigcap_{i\in\mathbb{N}} A_i\right) = \lim_{i\to\infty} \mu(A_i)$$

which proves the case $1 < k$. □

The above theorem has the following inverse which provides ways to prove if a set function is actually a mesure.

Theorem 20.194. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space and $\mu: \mathcal{A} \to [0, \infty]$ a funtion that satisfies:*

1. $\mu(\varnothing) = 0$
2. *If $n \in \mathbb{N}, \{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{A}$ is a **pairwise disjoint family** then*

$$\mu\left(\bigsqcup_{i \in \{1, \ldots, n\}} A_i\right) = \sum_{i=1}^{n} \mu(A_i)$$

then we have:

1. *If $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ that satisfies $\forall i \in \mathbb{N}\ A_i \subseteq A_{i+1}$ we have that $\lim_{i \to \infty} \mu(A_i)$ exists and $\mu(\bigcup_{i \in \mathbb{N}} A_i) = \lim_{i \to \infty} \mu(A_i)$ then μ is a measure on $\mathcal{A}$.*
2. *If $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ that satisfies $\forall i \in \mathbb{N}\ A_{i+1} \subseteq A_i$ and $\bigcap_{i \in \mathbb{N}} A_i = \varnothing$ we have that $\lim_{i \to \infty} \mu(A_i)$ exists and $\mu(\bigcap_{i \in \mathbb{N}} A_i) = 0$ then μ is a measure on $\mathcal{A}$.*

Proof.

1. Let $\{A_i\}_{i \in \mathbb{N}_o} \subseteq \mathcal{A}$ be a pairwise disjoint family. Define

$$\{B_i\}_{i \in \mathbb{N}} \text{ by } B_i = \bigsqcup_{j \in \{1, \ldots, i\}} A_j \in \mathcal{A}$$

then by [lemma: 20.109] we have that

$$\bigsqcup_{i \in \mathbb{N}} A_i = \bigcup_{i \in \mathbb{N}} B_i \text{ and } \forall i \in \mathbb{N} \text{ we have } B_i \subseteq B_{i+1} \tag{20.167}$$

Then by the hypothesis

$$\lim_{i \to \infty} B_i \text{ exist and } \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \lim_{i \to \infty} \mu(B_i) \tag{20.168}$$

Next

$$\begin{aligned}
\mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &\underset{\text{[eq: 20.167]}}{=} \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \\
&\underset{\text{[eq: 20.168]}}{=} \lim_{i \to \infty} \mu(B_i) \\
&= \lim_{i \to \infty} \mu\left(\bigsqcup_{j \in \{1, \ldots, i\}} A_j\right) \\
&\underset{\text{hypothesis}}{=} \lim_{i \to \infty} \left(\sum_{j=1}^{i} \mu(A_j)\right) \\
&\underset{\text{def}}{=} \sum_{j=1}^{\infty} \mu(A_j)
\end{aligned}$$

proving countable additivity. Hence μ is a measure on $\mathcal{A}$.

2. Let $\{A_i\}_{i \in \mathbb{N}_o} \subseteq \mathcal{A}$ be a pairwise disjoint family. Define

$$\{B_i\}_{i \in \mathbb{N}} \text{ by } B_i = \bigsqcup_{j \in \{i+1, \ldots, \infty\}} A_j \underset{\text{[theorem: 20.180]}}{\in} \mathcal{A}$$

Let $i \in \mathbb{N}$ then $B_{i+1} = \bigcup_{j \in \{i+2, \ldots, \infty\}} A_j \subseteq \bigcup_{j \in \{i+1, \ldots, n\}} A_j = B_i$ so that

$$\forall i \in \mathbb{N} \text{ we have } B_{i+1} \subseteq B_i$$

Let $x \in \bigcap_{i \in \mathbb{N}} B_i$ then $x \in B_1 = \bigcup_{j \in \{2, \ldots, \infty\}} A_j$ so that $\exists k \in \{2, \ldots, \infty\}$ such that $x \in A_k$, as $x \in \bigcap_{i \in \mathbb{N}} B_i$ we must have that $x \in B_k = \bigcup_{j \in \{k+1, \ldots, \infty\}} A_j$ so that $\exists l \in \{k+1, \ldots, \infty\}$ such that $x \in A_l$. Hence it follows that $x \in A_k \bigcap A_l \underset{k \neq l}{=} \varnothing$ leading to the contradiction $x \in \varnothing$. Hence we have that

$$\bigcap_{i \in \mathbb{N}} B_i = \varnothing$$

Let $i\in\mathbb{N}$ then $\bigsqcup_{j\in\mathbb{N}}A_j=\left(\bigsqcup_{j\in\{1,\ldots,i\}}A_j\right)\bigcup\left(\bigsqcup_{j\in\{i+1,\ldots,\infty\}}A_j\right)$. Assume $x\in\left(\bigsqcup_{j\in\{1,\ldots,i\}}A_j\right)\bigcap\left(\bigsqcup_{j\in\{i+1,\ldots,\infty\}}A_j\right)$ then there exist a $k\in\{1,\ldots,i\}$ and a $l\in\{i+1,\ldots,\infty\}$ such that $x\in A_k\wedge x\in A_l\Rightarrow x\in A_k\bigcap A_l\underset{k\neq l}{=}\varnothing$ leading to the contradiction $x\in\varnothing$. Hence we must have that $\left(\bigsqcup_{j\in\{1,\ldots,i\}}A_j\right)\bigcap\left(\bigsqcup_{j\in\{i+1,\ldots,\infty\}}A_j\right)=\varnothing$. By the hypothesis we have then

$$\begin{aligned}\mu\left(\bigcup_{j\in\mathbb{N}}A_j\right) &= \mu\left(\left(\bigsqcup_{j\in\{1,\ldots,i\}}A_j\right)\bigsqcup\left(\bigsqcup_{j\in\{i+1,\ldots,\infty\}}A_j\right)\right)\\ &\underset{\mu\text{ is finite additive}}{=} \mu\left(\bigsqcup_{j\in\{1,\ldots,i\}}A_j\right)+\mu\left(\bigsqcup_{j\in\{i+1,\ldots,\infty\}}A_j\right)\\ &\underset{\mu\text{ is finite additive}}{=} \sum_{j=1}^{i}\mu(A_j)+\mu\left(\bigsqcup_{j\in\{i+1,\ldots,\infty\}}A_j\right)\\ &= \sum_{j=1}^{i}\mu(A_j)+\mu(B_i)\end{aligned}\tag{20.169}$$

By [definition: 20.87]

$$\lim_{i\to\infty}\sum_{j=1}^{i}\mu(A_j)\text{ exist and }\sum_{i=1}^{\infty}\mu(A_i)=\lim_{i\to\infty}\sum_{j=1}^{i}\mu(A_j)\tag{20.170}$$

and by the hypothesis

$$\lim_{i\to\infty}\mu(B_i)\text{ exist and }\lim_{i\to\infty}\mu(B_i)=0\tag{20.171}$$

Next we have

$$\begin{aligned}\mu\left(\bigcup_{j\in\mathbb{N}}A_j\right) &\underset{\text{[theorem: 20.71]}}{=} \lim_{i\to\infty}\left(\mu\left(\bigcup_{j\in\mathbb{N}}A_j\right)\right)\\ &\underset{\text{[eq: 20.169}}{=} \lim_{i\to\infty}\left(\sum_{j=1}^{i}\mu(A_j)+\mu(B_i)\right)\\ &\underset{\text{[theorem: 20.78]}\wedge\text{[eqs: 20.170, 20.171]}}{=} \lim_{i\to\infty}\sum_{j=1}^{i}\mu(A_j)+\lim_{i\to\infty}\mu(B_i)\\ &\underset{\text{[eqs: 20.170, 20.171]}}{=} \sum_{i=1}^{\infty}\mu(A_i)+0\\ &= \sum_{i=1}^{\infty}\mu(A_i)\end{aligned}$$

So μ is countable additive proving that μ is a measure.

□

20.4.2 Carathéodory Theorem

The Carathéodory theorem provides a general method for constructing a measure. Given a set X and a non negative set function on $\mathcal{P}(X)$ the Carathéodory theorem allows us to reduce $\mathcal{P}(X)$ to a σ-algebra on X such that the restriction of the set function to this σ-algebra is a measure on this σ-algebra. The idea is that $\mathcal{P}(X)$ is in general to big to be used as a σ-algebra on which we can define a measure. As the restriction of the set function is a measure it must satisfies some extra conditions. For example every σ-algebra contains $\varnothing$ and a measure must map $\varnothing$ to 0 so the set function on $\mathcal{P}(X)$ must also map $\varnothing$ to 0. This is the idea of a outer-measure.

Definition 20.195. (Outer Measure) *Let X be a set then $\mu^*:\mathcal{P}(X)\to[0,\infty]$ is a **outer measure** on X if*

1. $\mu^*(\varnothing)=0$
2. *For $A,B\in\mathcal{P}(X)$ with $A\subseteq B$ we have $\mu^*(A)\leqslant\mu^*(B)$ [in other words μ^* is monoton]*
3. $\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{P}(X)$ *we have* $\mu^*(\bigcup_{i\in\mathbb{N}}A_i)\leqslant\sum_{i=1}^{\infty}\mu^*(A_i)$ *[in otherwords $\mu^\star$ is countable sub-additive]*

It is easy to prove that a outer measure is finitely sub-additive.

Theorem 20.196. *Let X be a set and $\mu^*\colon \mathcal{P}(X) \to [0,\infty]$ is a outer measure on X, $n \in \mathbb{N}$ and $\{A_i\}_{i\in\{1,\dots,n\}} \in \mathcal{P}(X)$ then $\mu^*\big(\bigcup_{i\in\{1,\dots,n\}} A_i\big) \leqslant \sum_{i=1}^n \mu^\star(A_i)$*

Proof. Define $\{C_i\}_{i\in\mathbb{N}} \subseteq \mathcal{P}(X)$ by $C_i = \begin{cases} A_i \text{ if } i \in \{1,\dots,n\} \\ \varnothing \text{ if } i \in \{n+1,\dots,\infty\} \end{cases}$ then we have

$$\begin{aligned}
\mu^*\left(\bigcup_{i\in\{1,\dots,n\}} A_i\right) &= \mu^*\left(\bigcup_{i\in\{1,\dots,n\}} C_i\right) \\
&\underset{\mu^* \text{ is a outer measure}}{\leqslant} \sum_{i=1}^{\infty} \mu^*(C_i) \\
&\underset{[\text{theorem: } 20.92]}{=} \sum_{i=1}^{n} \mu^*(C_i) + \sum_{i=n+1}^{\infty} \mu^*(C_i) \\
&= \sum_{i=1}^{n} \mu^*(A_i) + \sum_{i=n+1}^{\infty} 0 \\
&\underset{[\text{theorem: } 20.89]}{=} \sum_{i=1}^{n} \mu^*(A_i)
\end{aligned}$$

□

We need now to reduce $\mathcal{P}(X)$ to a σ-algebra in such a way that the restriction of the outer-measure to this σ-algebra becomes a measure. This is the idea of μ^*-measurable sets.

Definition 20.197. (μ^*-measurable sets) *Let X be a set and $\mu^*\colon \mathcal{P}(X) \to [0,\infty]$ a outer measure on X then $A \in \mathcal{P}(X)$ is μ^*-measurable if*

$$\forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) = \mu^*\big(B \bigcap A\big) + \mu^*(B \setminus A)$$

The set of all μ^*-measurable sets in $\mathcal{P}(X)$ is noted as $\mathcal{M}[\mu^*]$, hence

$$\mathcal{M}[\mu^*] = \big\{A \in \mathcal{P}(X) | \forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) = \mu^*\big(B \bigcap A\big) + \mu^*(B \setminus A)\big\}$$

Using the properties of a outer-measure we can simplify the above definition.

Theorem 20.198. *Let X be a set and $\mu^*\colon \mathcal{P}(X) \to [0,\infty]$ and $A \in \mathcal{P}(X)$ then we have*

$$A \text{ is } \mu^*\text{-measurable} \Leftrightarrow \forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) \geqslant \mu^*\big(B \bigcap A\big) + \mu^*(B \setminus A)$$

Hence we have the following alternative definition for $\mathcal{M}[\mu^*]$

$$\mathcal{M}[\mu^*] = \big\{A \in \mathcal{P}(X) | \forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) \geqslant \mu^*\big(B \bigcap A\big) + \mu^*(B \setminus A)\big\}$$

Proof.

- **$\Rightarrow$.** This is trivial as $\mu^*(B) = \mu^*(B \bigcap A) + \mu^*(B \setminus A)$ implies $\mu^*(B) \geqslant \mu^*(B \bigcap A) + \mu^*(B \setminus A)$.
- **$\Leftarrow$.** Let $B \in \mathcal{P}(X)$ then as $B = (B \bigcap A) \bigcup (B \setminus A)$ we have by [theorem: 20.196] that $\mu^*(B) \leqslant \mu^*(B \bigcap A) + \mu^*(B \setminus A)$, combining this with the hypothesis it follows that

$$\mu^*(B) = \mu^*\big(B \bigcap A\big) + \mu^*(B \setminus A)$$

□

Theorem 20.199. *Let X be a set, $\mu^*\colon \mathcal{P}(X) \to [0,\infty]$ a outer measure and $A \in \mathcal{P}(X)$ then*

1. *If $\mu^*(A) = 0$ then $A \in \mathcal{M}[\mu^*]$.*
2. *If $\mu^*(X \setminus A) = 0$ then $A \in \mathcal{M}[\mu^*]$.*

Proof.

1. Let $B \in \mathcal{P}(X)$ then as $B \bigcap A \subseteq A$ we have $\mu^*(B \bigcap A) \leqslant \mu^*(A) = 0$ so that $\mu^*(B \bigcap A)$, further as $B \setminus A \subseteq B$ we have $\mu^*(B \setminus A) \leqslant \mu^*(B)$. Hence it follows that $\forall B \in \mathcal{P}(X)$ we have

$$\mu^*\big(B \bigcap A\big) + \mu^*(B \setminus A) \leqslant \mu^*(B)$$

proving by the previous theorem [theorem: 20.198] that $A \in \mathcal{M}[\mu^*]$.

2. Let $B \in \mathcal{P}(X)$ then as $B \setminus A \subseteq X \setminus A$ we have $\mu^*(B \setminus A) \subseteq \mu^*(X \setminus A) = 0$ so that $\mu^*(B \setminus A) = 0$, further as $B \bigcap A \subseteq B$ we have $\mu^*(B \bigcap A) \leqslant \mu^*(B)$. Hence it follows that

$$\mu^*\big(B \bigcap A\big) + \mu^*(B \setminus A) \leqslant \mu^*(B)$$

proving by the previous theorem [theorem: 20.198] that $A \in \mathcal{M}[\mu^*]$. □

We prove now that $\mathcal{M}[\mu^*]$ is a σ-algebra and the restriction of μ^* on $\mathcal{M}[\mu^*]$ is a measure on $\mathcal{M}[\mu^*]$.

Theorem 20.200. (Carathéodory Theorem) *Let X be a set and $\mu^*: \mathcal{P}(X) \to [0,\infty]$ a outer measure on X then we have:*

1. *$\mathcal{M}[\mu^*]$ is a σ-algebra on X.*
2. *$(\mu^*)_{|\mathcal{M}[\mu^*]}: \mathcal{M}[\mu^*] \to [0,\infty]$ is a measure on $\mathcal{M}[\mu^*]$.*

Proof.

1. Let $B \in \mathcal{P}(X)$ then
$$\mu^*(B) = \mu^*\big(B \bigcap X\big) + 0 = \mu^*\big(B \bigcap X\big) + \mu^\star(\varnothing) = \mu^*\big(B \bigcap X\big) + \mu^\star(B \setminus X)$$
proving that
$$X \in \mathcal{M}[\mu^*] \tag{20.172}$$
If $A \in \mathcal{M}[\mu^*]$ then for $B \in \mathcal{P}(X)$ we have
$$\begin{aligned}
\mu^*\big(B \bigcap (X \setminus A)\big) + \mu^*(B \setminus (X \setminus A)) &\underset{B \subseteq X \wedge [\text{theorem: } 1.33\ (6)]}{=} \mu^*\big(B \bigcap (X \setminus A)\big) + \mu^*\big(B \bigcap A\big) \\
&\underset{B \subseteq X \wedge [\text{theorem: } 1.33\ (8)]}{=} \mu^*(B \setminus A) + \mu^*\big(B \bigcap A\big) \\
&\underset{A \in \mathcal{M}[\mu^*]}{=} \mu^*(B)
\end{aligned}$$
so that $X \setminus A \in \mathcal{M}[\mu^*]$. Hence we have
$$\forall A \in \mathcal{M}[\mu^*] \text{ we have } X \setminus A \in \mathcal{M}[\mu^*] \tag{20.173}$$
Let $A, B \in \mathcal{M}[\mu^*]$ then for $C \in \mathcal{P}(X)$ we have
$$\begin{aligned}
\mu^*\big(C \bigcap (A \bigcup B)\big) &\underset{A \in \mathcal{M}[\mu^*]}{=} \mu^*\big((C \bigcap (A \bigcup B)) \bigcap A\big) + \mu^*\big((C \bigcap (A \bigcup B)) \setminus A\big) \\
&= \mu^*\big(C \bigcap ((A \bigcup B) \bigcap A)\big) + \mu^*\big((C \bigcap (A \bigcup B)) \setminus A\big) \\
&= \mu^*\big(C \bigcap A\big) + \mu^*\big((C \bigcap (A \bigcup B)) \setminus A\big) \\
&\underset{[\text{theorem: } 1.25\ (7)]}{=} \mu^*\big(C \bigcap A\big) + \mu^*\big(C \bigcap ((A \bigcup B) \setminus A)\big) \\
&\underset{[\text{theorem: } 1.25\ (6)]}{=} \mu^*\big(C \bigcap A\big) + \mu^*\big(C \bigcap ((A \setminus A) \bigcup (B \setminus A))\big) \\
&= \mu^*\big(C \bigcap A\big) + \mu^*\big(C \bigcap (B \setminus A)\big)
\end{aligned}$$
proving that
$$\mu^*\big(C \bigcap (A \bigcup B)\big) = \mu^*\big(C \bigcap A\big) + \mu^*\big(C \bigcap (B \setminus A)\big) \tag{20.174}$$
So we have
$$\begin{aligned}
\mu^*\big(C \bigcap (A \bigcup B)\big) + \mu^*\big(C \setminus (A \bigcup B)\big) &\underset{[\text{eq: } 20.174]}{=} \\
\mu^*\big(C \bigcap A\big) + \mu^*\big(C \bigcap (B \setminus A)\big) + \mu^*\big(C \setminus (A \bigcup B)\big) &\underset{[\text{theorem: } 1.31(1)]}{=} \\
\mu^*\big(C \bigcap A\big) + \mu^*\big(C \bigcap (B \setminus A)\big) + \mu^*((C \setminus A) \setminus B) &\underset{[\text{theorem: } 1.25(7)]}{=} \\
\mu^*\big(C \bigcap A\big) + \mu^*\big((C \setminus A) \bigcap B\big) + \mu^*((C \setminus A) \setminus B) &\underset{B \in \mathcal{M}[\mu^*]}{=} \\
\mu^*\big(C \bigcap A\big) + \mu^\star(C \setminus A) &\underset{A \in \mathcal{M}[\mu^*]}{=} \\
\mu^*(C) &
\end{aligned}$$
proving that $A \bigcup B$ is μ^*-measurable. Hence we have
$$\forall A, B \in \mathcal{M}[\mu^*] \text{ we have that } A \bigcup B \in \mathcal{M}[\mu^*] \text{ [in other words } \mathcal{M}[\mu^*] \text{ is } \cup\text{-stable]} \tag{20.175}$$
From [eqs: 20.172, 20.173 and 20.175] and [theorem: 20.131] it follows that
$$\mathcal{M}[\mu^*] \text{ is a algebra} \tag{20.176}$$
Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[\mu^*]$ **pairwise disjoint** and $B \in \mathcal{P}(X)$. We show then by mathematical induction that $\forall n \in \mathbb{N}$
$$\mu^*(B) = \sum_{i=1}^{n} \mu^*\big(B \bigcap A_i\big) + \mu^*\left(B \setminus \bigsqcup_{i \in \{1,\ldots,n\}} A_i\right) \tag{20.177}$$

Proof. Define

$$S=\left\{n\in\mathbb{N}|\mu^*(B)=\sum_{i=1}^{n}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\right\}$$

then we have:

$1\in S$. As $A_1\in\mathcal{M}[\mu^*]$ we have

$$\begin{aligned}\mu^*(B) &= \mu^*\left(B\bigcap A_1\right)+\mu^*(B\setminus A_1)\\ &= \sum_{i=1}^{1}\mu^*\left[B\bigcap A_i\right]+\mu^*\left(B\setminus\bigsqcup_{i\in\{1\}}A_i\right)\end{aligned}$$

which proves that $1\in\mathcal{S}$

$n\in S\Rightarrow n+1\in S$. If $x\in B\bigcap A_{n+1}$ then $x\in B$ and $x\in A_{n+1}$ then $\forall i\in\{1,\dots,n\}$ we have by pairwise disjointedness $x\notin A_i$ so that $x\notin\bigsqcup_{i\in\{1,\dots,n\}}A_i$ or $x\in\left(B\setminus\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\bigcap A_{n+1}$. Hence $B\bigcap A_{n+1}\subseteq\left(B\setminus\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\bigcap A_{n+1}\subseteq B\bigcap A_{n+1}$. Summarized

$$\left(B\setminus\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\bigcap A_{n+1}=B\bigcap A_{n+1}\tag{20.178}$$

As $A_{n+1}\in\mathcal{M}[\mu^*]$ we have

$$\begin{aligned}\mu^*\left(B\setminus\bigsqcup_{i\in\{1,\dots,n\}}A_i\right) &=\\ \mu^*\left(\left(B\setminus\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\bigcap A_{n+1}\right)+\mu^*\left(\left(B\setminus\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\setminus A_{n+1}\right) &\underset{\text{[eq: 20.178]}}{=}\\ \mu^*\left(B\bigcap A_{n+1}\right)+\mu^*\left(\left(B\setminus\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\setminus A_{n+1}\right) &\underset{\text{[theorem: 1.31]}}{=}\\ \mu^*\left(B\bigcap A_{n+1}\right)+\mu^*\left(B\setminus\left(\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\bigcup A_{n+1}\right)\right) &=\\ \mu^*\left(B\bigcap A_{n+1}\right)+\mu^*\left(B\setminus\left(\bigsqcup_{i\in\{1,\dots,n+1\}}A_i\right)\right)\end{aligned}$$

proving that

$$\mu^*\left(B\setminus\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)=\mu^*\left(B\bigcap A_{n+1}\right)+\mu^*\left(B\setminus\left(\bigsqcup_{i\in\{1,\dots,n+1\}}A_i\right)\right)\tag{20.179}$$

Finally

$$\begin{aligned}\mu^*(B) &\underset{n\in S}{=} \sum_{i=1}^{n}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\\ &\underset{\text{[eq: 20.179]}}{=} \sum_{i=1}^{n}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\bigcap A_{n+1}\right)+\mu^*\left(B\setminus\left(\bigsqcup_{i\in\{1,\dots,n+1\}}A_i\right)\right)\\ &= \sum_{i\asymp 1}^{n+1}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\left(\bigsqcup_{i\in\{1,\dots,n+1\}}A_i\right)\right)\end{aligned}$$

which proves that $n+1\in\mathcal{S}$.

Mathematical induction proves then [eq: 20.177]. □

Let $n\in\mathbb{N}$ then we have $\bigsqcup_{i\in\{1,\dots,n\}}A_i\subseteq\bigsqcup_{i\in\mathbb{N}}A_i$ so that $B\setminus\bigcup_{i\in\mathbb{N}}A_i\subseteq B\setminus\bigcup_{i\in\{1,\dots,n\}}A_i$ hence $\mu^*(B\setminus\bigcup_{i\in\mathbb{N}}A_i)\leqslant\mu^*\left(B\setminus\bigcup_{i\in\{1,\dots,n\}}A_i\right)$. So

$$\begin{aligned}\sum_{i=1}^{n}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\bigcup_{i\in\mathbb{N}}A_i\right) &\leqslant \sum_{i=1}^{n}\mu^*\left(B\bigcap A_i\right)+\mu^*\left(B\setminus\bigcup_{i\in\{1,\dots,n\}}A_i\right)\\ &\underset{\text{[eq: 20.177]}}{=} \mu^*(B)\end{aligned}\tag{20.180}$$

Next

$$\begin{aligned}
\sum_{i=1}^{\infty}\mu^*(B\bigcap A_i)+\mu^*\left(B\setminus\bigsqcup_{i\in\mathbb{N}}A_i\right) &= \\
\lim_{n\to\infty}\left(\sum_{i=1}^{n}\mu^*(B\bigcap A_i)\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\mathbb{N}}A_i\right) &\underset{\text{[theorem: 20.78]}}{=} \\
\lim_{n\to\infty}\left(\sum_{i=1}^{n}\mu^*(B\bigcap A_i)+\mu^*\left(B\setminus\bigsqcup_{i\in\mathbb{N}}A_i\right)\right) &\underset{\text{[theorem: 20.78]}\wedge\text{[eq: 20.180]}}{\leqslant} \\
\lim_{n\to\infty}\mu^*(B) &\underset{\text{[theorem: 20.71]}}{=} \\
\mu^*(B)
\end{aligned}$$

proving that $\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{M}[\mu^*]$ and $B\in\mathcal{P}(X)$

$$\sum_{i=1}^{\infty}\mu^*(B\bigcap A_i)+\mu^*\left(B\setminus\bigsqcup_{i\in\mathbb{N}}A_i\right)\leqslant\mu^*(B) \tag{20.181}$$

Hence we have for $\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{M}[\mu^*]$ and $B\in\mathcal{P}(X)$ that

$$\begin{aligned}
\mu^*\left(B\bigcap\left(\bigsqcup_{i\in\mathbb{N}}A_i\right)\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\mathbb{N}}A_i\right) &= \\
\mu^*\left(\bigcup_{i\in\mathbb{N}}(B\bigcap A_i)\right)+\mu^*\left(B\setminus\bigsqcup_{i\in\mathbb{N}}A_i\right) &\underset{\mu^*\text{ is a outer measure}}{\leqslant} \\
\sum_{i=1}^{\infty}\mu^*(B\bigcap A_i)+\mu^*\left(B\setminus\bigsqcup_{i\in\mathbb{N}}A_i\right) &\underset{\text{[eq: 20.181]}}{\leqslant} \mu^*(B)
\end{aligned}$$

So by [theorem: 20.198] it follows that $\bigsqcup_{i\in\mathbb{N}}A_i$ is $\mu^\star$-measureable. Hence we have proved that

$$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{M}[\mu^*]\text{ pairwise disjoint we have }\bigsqcup_{i\in\mathbb{N}}A_i\in\mathcal{M}[\mu^*] \tag{20.182}$$

As $\mathcal{M}[\mu^*]$ is a algebra [see eq: 20.176] we can use the alternative definition for a σ-algbra [see theorem: 20.135] and the above to prove that

$$\mathcal{M}[\mu^*]\text{ is a }\sigma\text{-algebra}$$

2. Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{M}[\mu^*]$ a pairwise disjoint family then for $B=\bigsqcup_{j\in\mathbb{N}}A_i\in\mathcal{P}(X)$ we have

$$\begin{aligned}
\sum_{i=1}^{\infty}(\mu^*)_{|\mathcal{M}[\mu^*]}(A_i) &= \sum_{i=1}^{\infty}\mu^*(A_i) \\
&= \sum_{i=1}^{\infty}\mu^*\left(\left(\bigcup_{j\in\mathbb{N}}A_j\right)\bigcap A_i\right)+0 \\
&= \sum_{i=1}^{\infty}\mu^*\left(\left(\bigcup_{j\in\mathbb{N}}A_j\right)\bigcap A_i\right)+\mu^*\left(\left(\bigcup_{j\in\mathbb{N}}A_j\right)\setminus\left(\bigcup_{j\in\mathbb{N}}A_j\right)\right) \\
&= \sum_{i=1}^{\infty}\mu^*(B\bigcap A_i)+\mu^*\left(B\setminus\left(\bigcup_{j\in\mathbb{N}}A_j\right)\right) \\
&\underset{\text{[eq: 20.181]}}{\leqslant} \mu^*(B) \\
&= \mu^*\left(\bigsqcup_{i\in\mathbb{N}}A_i\right) \\
&= (\mu^*)_{|\mathcal{M}[\mu^*]}\left(\bigsqcup_{i\in\mathbb{N}}A_i\right)
\end{aligned}$$

As further by the sub-additivity of μ^* we have

$$(\mu^*)_{|\mathcal{M}[\mu^*]}\left(\bigsqcup_{i\in\mathbb{N}} A_i\right)=\mu^*\left(\bigcup_{i\in\mathbb{N}} A_i\right)\leqslant\sum_{i=1}^{\infty}\mu^*(A_i)=\sum_{i=1}^{\infty}(\mu^*)_{|\mathcal{M}[\mu^*]}(A_i)$$

it follows that

$$(\mu^*)_{|\mathcal{M}[\mu^*]}\left(\bigsqcup_{i\in\mathbb{N}} A_i\right)=\sum_{i=1}^{\infty}(\mu^*)_{|\mathcal{M}[\mu^*]}(A_i)$$

which together with $(\mu^*)_{|\mathcal{M}[\mu^*]}(\varnothing)=\mu^\star(\varnothing)=0$ proves

$$(\mu^*)_{|\mathcal{M}[\mu^*]} \text{ is a measure on } \mathcal{M}[\mu^*]$$

□

20.4.3 Uniqueness of measure extensions

Let X be a set, $\mathcal{G}\subseteq\mathcal{P}(X)$ and $\sigma[\mathcal{G}]$ is the σ-algebra generated by $\mathcal{G}$ [see theorem: 20.141] then if we have a set function on $\mathcal{G}$ that we extend to a measure on $\sigma[\mathcal{G}]$ we can ask ourselves if the extension is unique. The answer is true if $\mathcal{G}$ and the set function satisfies certain conditions. To prove this we introduce the concept of a Dynkin system.

20.4.3.1 Dynkin systems

Definition 20.201. (Dynkin System) *Let X be a set then $\mathfrak{D}\subseteq\mathcal{P}(X)$ is a **Dynkin system** on X if*

1. $X\in\mathfrak{D}$
2. *If $D\in\mathfrak{D}$ then $X\setminus D\in\mathfrak{D}$*
3. *If $\{D_i\}_{i\in\mathbb{N}}\subseteq\mathfrak{D}$ is a **pairwise disjoint family** then $\bigsqcup_{i\in\mathbb{N}}D_i\in\mathfrak{D}$*

***Note* 20.202.** *Using [definition: 20.132] every σ-algebra is automatical a Dynkin system however the opposite is in general not true.*

Some of the properties of a Dynkin system are similar to the properties of a σ-algebra.

Theorem 20.203. *Let X be a set and $\mathfrak{D}$ is a Dynkin system on X then we have:*

1. $\varnothing\in\mathfrak{D}$
2. *Let $n\in\mathbb{N}$ and $\{D_i\}_{i\in\{1,\dots,n\}}\subseteq\mathfrak{D}$ pairwise disjoint then $\bigsqcup_{i\in\{1,\dots,n\}}D_i\in\mathfrak{D}$*

Proof.

1. As $X\in\mathfrak{D}$ we have that $\varnothing=X\setminus X\in\mathfrak{D}$
2. Define $\{E_i\}_{i\in\mathbb{N}}\subseteq\mathfrak{D}$ by $E_i=\begin{cases}\varnothing \text{ if } i\in\{n+1,\dots,\infty\}\\ D_i \text{ if } i\in\{1,\dots,n\}\end{cases}$. Let $i,j\in\mathbb{N}$ with $i\neq j$ then we have either

   $\boldsymbol{i\leqslant n\wedge j\leqslant n}$. Then $E_i\bigcap E_j=D_i\bigcap D_j=\varnothing$

   $\boldsymbol{n<i\wedge j\leqslant n}$. Then $E_i\bigcap E_j=\varnothing\bigcap D_j=\varnothing$

   $\boldsymbol{i\leqslant n\wedge n<j}$. Then $E_i\bigcap E_j=D_i\bigcap D_j=\varnothing$

   $\boldsymbol{n<i\wedge n<j}$. Then $E_i\bigcap E_j=\varnothing\bigcap\varnothing=\varnothing$

   which proves that $\{E_i\}_{i\in\mathbb{N}}$ is pairwise disjoint. So

   $$\bigsqcup_{i\in\mathbb{N}}E_i\in\mathfrak{D}$$

   If $x\in\bigcup_{i\in\{1,\dots,n\}}D_i$ then $\exists i\in\{1,\dots,n\}$ such that $x\in D_i=E_i$ so that $x\in\bigcup_{i\in\mathbb{N}}E_i$. If $x\in\bigcup_{i\in\mathbb{N}}E_i$ then there exist a $i\in\mathbb{N}$ such that $x\in E_i$, as $\forall i\in\{n+1,\dots,\infty\}$ $E_i=\varnothing$ we must have that $i\in\{1,\dots,n\}$ so that $E_i=D_i$ proving that $x\in\bigcup_{i\in\{1,\dots,n\}}D_i$. Hence we have

   $$\bigsqcup_{i\in\{1,\dots,n\}}D_i=\bigsqcup_{i\in\mathbb{N}}E_i\in\mathfrak{D}$$

□

Example 20.204. Let X be a set then $\mathcal{P}(X)$ is a Dynkin system on X

Proof. As $\mathcal{P}(X)$ is a σ-algebra on X [see example: 20.137] and every σ-algebra is a Dynkin system it follows that $\mathcal{P}(X)$ is a Dynkin system on X. □

Given a set of subsets of X we can, just like with σ-algebras, find the smallest Dynkin system that contains the set of subsets.

Lemma 20.205. *Let X be a set and $\mathcal{X}$ a non empty set of Dynkin systems on X then $\bigcap_{\mathfrak{D}\in\mathcal{X}}\mathfrak{D}$ is a Dynkin system on X.*

Proof. As $\mathcal{X}\neq\varnothing$ there exist a $\mathfrak{D}\in\mathcal{X}$ with $\mathfrak{D}\subseteq\mathcal{P}(X)$ so that we have by [theorem: 1.63] that $\bigcap_{\mathcal{D}\in\mathcal{X}}\mathcal{D}\subseteq\mathfrak{D}\subseteq\mathcal{P}(X)$ proving that

$$\bigcap_{\mathcal{D}\in\mathcal{X}}\mathcal{D}\subseteq\mathcal{P}(X)$$

As $\forall\mathcal{D}\in\mathfrak{D}$ $\mathcal{D}$ is a Dynkin system on X we have $X\in\mathcal{A}$ hence

$$X\in\bigcap_{\mathcal{D}\in\mathcal{X}}\mathcal{D}$$

Let $A\in\bigcap_{\mathcal{D}\in\mathcal{X}}\mathcal{D}$ then for $\mathcal{D}\in\mathcal{X}$ we have $A\in\mathcal{D}$ so that $X\setminus A\in\mathcal{D}$ which as $\mathcal{D}\in\mathcal{X}$ was chosen arbitrary proves that $X\setminus A\in\bigcap_{\mathcal{D}\in\mathcal{X}}\mathcal{D}$. Hence as $A\in\bigcap_{\mathcal{D}\in\mathcal{X}}\mathcal{D}$ was chosen arbitrary we have that

$$\forall A\in\bigcap_{\mathcal{D}\in\mathcal{X}}\mathcal{D}\text{ we have }X\setminus A\in\bigcap_{\mathcal{D}\in\mathcal{X}}\mathcal{D}$$

If $\{D_i\}_{i\in\mathbb{N}}\subseteq\bigcap_{\mathcal{D}\in\mathcal{X}}\mathcal{D}$ is pairwise disjoint then for $\mathcal{D}\in\mathcal{X}$ we have $\{D_i\}_{i\in\mathbb{N}}\subseteq\mathcal{D}$ so that $\bigsqcup_{i\in\mathbb{N}}D_i\in\mathcal{D}$ which as $\mathcal{D}\in\mathcal{X}$ was chosen arbitrary proves that $\bigcup_{i\in\mathbb{N}}D_i\in\bigcap_{\mathcal{D}\in\mathcal{X}}\mathcal{D}$. Hence as $\{D_i\}_{i\in\mathbb{N}}\subseteq\bigcap_{\mathcal{D}\in\mathcal{X}}\mathcal{D}$ was chosen arbitrary we have that

$$\text{For every pairwise disjoint family }\{D_i\}_{i\in\mathbb{N}}\subseteq\bigcap_{\mathcal{D}\in\mathcal{X}}\mathcal{D}\text{ we have }\bigcup_{i\in\mathbb{N}}D_i\in\bigcap_{\mathcal{D}\in\mathcal{X}}\mathcal{D}$$ □

Theorem 20.206. *Let X be a set $\mathcal{D}\subseteq\mathcal{P}(X)$ then there exist a **unique** Dynkin system $\delta[\mathcal{A}]$ on X such that:*

1. $\mathcal{D}\subseteq\delta[\mathcal{D}]$
2. *If $\mathfrak{D}'$ is another Dynkin system with $\mathcal{D}\subseteq\mathfrak{D}'$ then $\delta[\mathcal{D}]\subseteq\mathfrak{D}'$*
3. $\delta[\mathcal{D}]\subseteq\sigma[\mathcal{D}]$

This unique smallest Dynkin system that contains $\mathcal{D}$ is called the Dynkin system generated by $\mathcal{D}$

Proof.

1. Define $\mathcal{X}=\{\mathfrak{D}\subseteq\mathcal{P}(X)|\mathfrak{D}$ is a Dynkin system on X and $\mathcal{D}\subseteq\mathfrak{D}\}$ then as $\mathcal{P}(X)$ is a Dynkin system [see example: 20.204] and $\mathcal{D}\subseteq\mathcal{P}(X)$ it follows that $\mathcal{X}\neq\varnothing$. Hence by [lemma: 20.205] it follows that, if we take $\delta[\mathcal{D}]=\bigcap_{\mathfrak{D}\in\mathcal{X}}\mathfrak{D}$, that
$$\delta[\mathcal{D}]\text{ is a Dynkin system on }X$$
If $D\in\mathcal{D}$ then, as $\forall\mathfrak{D}\in\mathcal{X}$ we have by defintion of $\mathcal{X}$ that $\mathcal{D}\subseteq\mathfrak{D}$, it follows that $D\in\mathfrak{D}$, hence $D\in\bigcap_{\mathfrak{D}\in\mathcal{X}}\mathfrak{D}$. So that
$$\mathcal{D}\subseteq\bigcap_{\mathfrak{D}\in\mathcal{X}}\mathfrak{D}=\delta[\mathcal{D}]$$
2. Assume that $\mathfrak{D}'$ is another Dynkin system on X such that $\mathcal{D}\subseteq\mathfrak{D}'$ then $\mathfrak{D}'\in\mathcal{X}$ so that by [theorem: 1.63]
$$\delta[\mathcal{D}]=\bigcap_{\mathfrak{D}\in\mathcal{X}}\mathfrak{D}\subseteq\mathfrak{D}'$$
3. As $\mathcal{D}\subseteq\sigma[\mathcal{D}]$, $\sigma[\mathcal{D}]$ is a σ-algebra hence a Dynkin system on X it follows from (2) that
$$\delta[\mathcal{D}]\subseteq\sigma[\mathcal{D}]$$ □

We show now the sufficient and necessary condition for a Dynkin system to be a σ-algebra.

Theorem 20.207. *Let X be a set and $\mathfrak{D}$ a Dynkin system on X then we have*

$$\mathfrak{D}\text{ is a }\sigma\text{-algebra}\Leftrightarrow\forall A,B\in\mathfrak{D}\text{ we have }A\bigcap B\in\mathfrak{D}\text{ [in other words }\mathfrak{D}\text{ is }\cap\text{-stable]}$$

Proof.

$\Rightarrow$. Let $A,B\in\mathfrak{D}$ then, as $\mathfrak{D}$ is a σ-algebra, it follows from [theorems: 20.135, 20.131] that $A\bigcap B\in\mathcal{A}$.

$\Leftarrow$. As $\mathfrak{D}$ is a Dynkin system and $\cap$-stable we have already that

$$X\in\mathfrak{D},\ \forall D\in\mathfrak{D}\text{ we have }X\setminus D\in\mathfrak{D}\text{ and }\forall A,B\in\mathfrak{D}\text{ we have }A\bigcap B\in\mathfrak{D}\tag{20.183}$$

Let $\{D_i\}_{i\in\mathbb{N}}\subseteq\mathfrak{D}$. Define

$$\{E_i\}_{i\in\mathbb{N}} \text{ by } E_i=\begin{cases} D_1 \text{ if } i=1 \\ D_i\bigcap\left(\bigcap_{j\in\{1,\ldots,i-1\}}(X\setminus D_j)\right) \text{ if } i\in\{2,\ldots\infty\}\end{cases} \underset{\text{[eq: 20.183]}\wedge\text{[theorem: 20.111]}}{\in} \mathfrak{D}$$

Then $\forall i\in\mathbb{N}$ we have

$$E_i=\begin{cases} D_1\subseteq D_i \text{ if } i=1 \\ D_i\bigcap\left(\bigcap_{j\in\{1,\ldots,i-1\}}(X\setminus D_j)\right)\subseteq D_i \text{ if } i\in\{2,\ldots,\infty\}\end{cases} \subseteq D_i \tag{20.184}$$

so that

$$\bigcup_{i\in\mathbb{N}} E_i\subseteq\bigcup_{i\in\mathbb{N}} D_i \tag{20.185}$$

If $x\in\bigcup_{i\in\mathbb{N}} D_i$ then there exist a $k\in\mathbb{N}$ such that $x\in D_k$. Define

$$S=\{i\in\{1,\ldots,k\}|x\in D_i\}\subseteq\{1,\ldots,k\}$$

then $k\in S\Rightarrow S\neq\varnothing$ and S is finite so that $m=\min(S)$ exists. For m we have either:

$m=1$. Then $x\in D_1=E_1\subseteq\bigcup_{i\in\mathbb{N}} E_i$

$1<m$. Then $x\in D_m$ and $\forall i\in\{1,\ldots,m-1\}$ $x\notin D_i\Rightarrow x\in X\setminus D_i$ so that

$$x\in D_m\bigcap\left(\bigcap_{i\in\{1,\ldots,m-1\}}(X\setminus D_i)\right)=E_m\subseteq\bigcup_{i\in\mathbb{N}} E_i$$

Hence $\bigcup_{i\in\mathbb{N}} D_i\subseteq\bigcup_{i\in\mathbb{N}} E_i$ and we have by [eq: 20.185] that

$$\bigcup_{i\in\mathbb{N}} E_i=\bigcup_{i\in\mathbb{N}} D_i \tag{20.186}$$

Let $i,j\in\mathbb{N}$ with $i\neq j$ then we may always assume that $i<j$ [otherwise exchange i and j]. Assume that $x\in E_i\bigcap E_j$ then $x\in E_i\underset{\text{[eq: 20.184]}}{\subseteq} D_i$ and $x\in E_j=D_j\bigcap\left(\bigcap_{k\in\{1,\ldots,j-1\}}(X\setminus D_k)\right)\subseteq(X\setminus D_i)\Rightarrow x\notin D_i$ so that we reach the contradiction $x\in D_i$ and $x\notin D_i$. Hence we have

$$\forall i,j\in\mathbb{N} \text{ with } i\neq j \text{ we have } E_i\bigcap E_j=\varnothing$$

So by the definition of a Dynkin system it follows that

$$\bigcup_{i\in\mathbb{N}} D_i\underset{\text{[eq: 20.186]}}{=}\bigcup_{i\in\mathbb{N}} E_i\in\mathfrak{D}$$

Finally by the above, [eq: 20.183] and [definition: 20.132] it follows that $\mathfrak{D}$ is a σ-algebra on X. □

Theorem 20.208. *If $\mathcal{D}\subseteq\mathcal{P}(\mathcal{A})$ is such that $\forall A,B\in\mathfrak{D}$ $A\bigcap B\in\mathcal{D}$ [in other words $\mathfrak{D}$ is $\cap$-stable] then $\delta(\mathcal{D})=\sigma(\mathcal{D})$*

Proof. Using [theorem: 20.206] it follows that

$$\delta[\mathcal{D}]\subseteq\sigma[\mathcal{D}] \tag{20.187}$$

For the opposite inclusion. Defiine for every $D\in\delta[\mathcal{D}]$

$$\mathfrak{D}_D=\left\{E\subseteq X|E\bigcap D\in\delta[\mathcal{D}]\right\} \tag{20.188}$$

As $X\subseteq X$ and $X\bigcap D=D\in\delta[\mathcal{D}]$ it follows that

$$X\in\mathfrak{D}_D \tag{20.189}$$

Let $E\in\mathfrak{D}_D$ then $X\setminus E\subseteq X$ and

$$\begin{aligned} X\setminus\left(\left(E\bigcap D\right)\bigcup(X\setminus D)\right) &\underset{\text{[theorem: 1.31]}}{=} \left(X\setminus\left(E\bigcap D\right)\right)\bigcap\left(X\setminus(X\setminus D)\right) \\ &\underset{\text{[theorem: 1.33]}\wedge D\subseteq X}{=} \left(X\setminus\left(E\bigcap D\right)\right)\bigcap D \\ &\underset{\text{[theorem: 1.31]}}{=} \left((X\setminus E)\bigcup(X\setminus D)\right)\bigcap D \\ &\underset{\text{[theorem: 1.30]}}{=} \left((X\setminus E)\bigcap D\right)\bigcup\left((X\setminus D)\bigcap D\right) \\ &= \left((X\setminus E)\bigcap D\right)\bigcup\varnothing \\ &= (X\setminus E)\bigcap D \end{aligned}$$

Further $(E\bigcap D)\bigcap(X\setminus D)=\varnothing$ so that

$$(X\setminus E)\bigcap D=X\setminus\big((E\bigcap D)\bigsqcup(X\setminus D)\big) \tag{20.190}$$

As $E\in\mathfrak{D}_D$ we have by [eq: 20.188] that $E\bigcap D\in\delta[\mathcal{D}]$, further as $\delta[\mathcal{D}]$ is a Dynkin system and $D\in\delta[\mathcal{D}]$ it follows that $X\setminus D\in\delta[\mathcal{D}]$ so that $(E\bigcap D)\bigsqcup(X\setminus D)\in\delta[\mathcal{D}]$ and finally that

$$X\setminus\big((E\bigcap D)\bigsqcup(X\setminus D)\big)\in\delta[\mathcal{D}]$$

Hence by [eq: 20.190] it follows that

$$\forall E\in\mathfrak{D}_D \text{ that } X\setminus E\in\mathfrak{D}_D \tag{20.191}$$

Let $\{D_i\}_{i\in\mathbb{N}}\subseteq\mathfrak{D}_D$ be pairwise disjoint then $\forall i,j\in\mathbb{N}$ with $i\neq j$ we have $(D_i\bigcap D)\bigcap(D_j\bigcap D)\subseteq D_i\bigcap D_j=\varnothing$, further $\forall i\in\mathbb{N}$ we have by the definition of $\mathfrak{D}_D$ that $D_i\bigcap D\in\delta[\mathcal{D}]$. Hence $\{D_i\bigcap D\}_{i\in\mathbb{N}}\subseteq\delta[\mathcal{D}]$ is pairwise disjoint, so that, as $\delta[\mathcal{D}]$ is a Dynkin system, we have

$$\left(\bigsqcup_{i\in\mathbb{N}}D_i\right)\bigcap D=\bigsqcup_{i\in\mathbb{N}}\big(D_i\bigcap D\big)\in\delta[\mathcal{D}]$$

proving that

$$\bigsqcup_{i\in\mathbb{N}}D_i\in\mathfrak{D}_D \tag{20.192}$$

From [eqs: 20.189. 20.191 and 20.192] it follows that $\mathfrak{D}_D$ is a Dynkin system on X, hence

$$\forall D\in\delta[\mathcal{D}] \text{ we have that } \mathfrak{D}_D \text{ is a Dynkin system} \tag{20.193}$$

Let $G\in\mathcal{D}\subseteq\delta[\mathcal{D}]$ then by the hypothesis we have $\forall D\in\mathcal{D}$ that $G\bigcap D\in\mathcal{D}\Rightarrow D\in\mathfrak{D}_G$, hence $\mathcal{D}\subseteq\mathfrak{D}_G$. As $\mathfrak{D}_G$ is a Dynkin system and $\delta[\mathcal{D}]$ is the smallest Dynkin system containing $\mathcal{D}$ it follows that $\delta[\mathcal{D}]\subseteq\mathfrak{D}_G$. Hence we have proved that

$$\forall G\in\mathcal{D} \text{ we have } \delta[\mathcal{D}]\subseteq\mathfrak{D}_G \tag{20.194}$$

Let $G\in\mathcal{D}$ and $D\in\delta[\mathcal{D}]\underset{\text{[eq: 20.194]}}{\subseteq}\mathfrak{D}_G$ then by the definition of $\mathfrak{D}_G$ we have $G\bigcap D\in\delta[\mathcal{D}]$ so that $G\in\mathfrak{D}_D$. In other words $\forall D\in\delta[\mathcal{D}]$ we have $\forall G\in\mathcal{D}$ that $G\in\mathfrak{D}_D$ proving that

$$\forall D\in\delta[\mathcal{D}] \text{ we have } \mathcal{D}\subseteq\mathfrak{D}_D$$

As $\delta[\mathcal{D}]$ is the smallest Dynkin system containg $\mathcal{D}$ and $\mathfrak{D}_D$ is a Dynkin system [see eq: 20.193] it follows from the above that

$$\forall D\in\delta[\mathcal{D}] \text{ that } \delta[\mathcal{D}]\subseteq\mathfrak{D}_D$$

Let $A,B\in\delta[\mathcal{D}]$ then by the above $\delta[\mathcal{D}]\subseteq\mathfrak{D}_B$ and as $A\in\delta(\mathcal{D})$ we have $A\in\mathfrak{D}_B\underset{\text{[eq: 20.188]}}{\Rightarrow}A\bigcap B\in\delta[\mathcal{D}]$. So we have that

$$\forall A,B\in\delta[\mathcal{D}] \text{ we have } A\bigcap B\in\delta[\mathcal{D}] \text{ where } \delta[\mathcal{D}] \text{ is a Dynkin system}$$

Hence by [theorem: 20.207] it follows finally that

$$\delta[\mathcal{D}] \text{ is a } \sigma\text{-algebra}$$

□

20.4.3.2 Uniqueness theorem

We are now ready to prove that every set function on $\mathcal{G}\subseteq\mathcal{P}(X)$ has a unique extension to a measure on $\sigma[\mathcal{G}]$ if certain conditions are met.

Theorem 20.209. *Let X be a set, $\mathcal{G}\subseteq\mathcal{P}(X)$ such that:*

1. *$\forall A,B\in\mathcal{G}$ we have $A\bigcap B\in\mathcal{G}$ [in other words $\mathcal{G}$ is $\cap$-stable]*
2. *$\exists\{G_i\}_{i\in\mathbb{N}}\subseteq\mathcal{G}$ such that $\forall i\in\mathbb{N}$ we have $G_i\subseteq G_{i+1}$, $\mu(G_i)<\infty$ and $\bigcup_{i\in\mathbb{N}}G_i=X$*

Then if $\mu:\sigma[\mathcal{G}]\to[0,\infty]$ and $\nu:\sigma[\mathcal{G}]\to[0,\infty]$ are two measures defined on $\sigma[\mathcal{G}]$ [the σ-algebra generated from $\mathcal{G}$] such that $\forall A\in\mathcal{G}$ we have $\mu(A)=\nu(A)$ then

$$\mu=\nu$$

Proof. Given $n\in\mathbb{N}$ define

$$\mathfrak{D}_n=\big\{A\in\sigma[\mathcal{G}]|\mu\big(G_n\bigcap A\big)=\nu\big(G_n\bigcap A\big)\big\}\subseteq\sigma[\mathcal{G}] \tag{20.195}$$

We prove then that $\mathfrak{D}_n$ is a Dynkin system for every $n \in \mathbb{N}$. Take $G \in \mathcal{G}$ then $G, G_n \in \mathcal{G}$ so that by (1) $G_n \bigcap G \in \mathcal{G}$, as μ, ν are the same on $\mathcal{G}$ we have $\mu(G_n \bigcap G) = \nu(G_n \bigcap G)$. Hence we have

$$\mathcal{G} \subseteq \mathfrak{D}_n \tag{20.196}$$

As $X \in \sigma[\mathcal{G}]$ and $\mu(G_n \bigcap X) = \mu(G_n) \underset{G_n \in \mathcal{G}}{=} \nu(G_n) = \nu(G_n \bigcap X)$ it follows that

$$X \in \mathfrak{D}_n \tag{20.197}$$

Let $A \in \mathfrak{D}_n$ then we have $G_n \setminus (G_n \bigcap A) \underset{\text{[theorem: 1.31]}}{=} (G_n \setminus G_n) \bigcup (G_n \setminus A) = \varnothing \bigcup (G_n \setminus A) = G_n \setminus A$ so that

$$G_n \setminus \left(G_n \bigcap A\right) = G_n \setminus A \tag{20.198}$$

Further $\mu(G_n \bigcap A) \underset{\text{[theorem: 20.187]}}{\leqslant} \mu(G_n) \underset{(2)}{<} \infty$ and $\nu(G_n \bigcap A) \underset{\text{[theorem: 20.187]}}{\leqslant} \nu(G_n) \underset{(n)}{<} \infty$ so that by [theorem: 20.187]

$$\mu\left(G_n \setminus \left(G_n \bigcap A\right)\right) = \mu(G_n) - \mu\left(G_n \bigcap A\right) \wedge \nu\left(G_n \setminus \left(G_n \bigcap A\right)\right) = \nu(G_n) - \nu\left(G_n \bigcap A\right) \tag{20.199}$$

hence

$$\begin{aligned}
\mu\left(G_n \bigcap (X \setminus A)\right) &\underset{\text{[theorem: 1.33(8)]}}{=} \mu(G_n \setminus A) \\
&\underset{\text{[eq: 20.198]}}{=} \mu\left(G_n \setminus \left(G_n \bigcap A\right)\right) \\
&\underset{\text{[eq: 20.199]}}{=} \mu(G_n) - \mu\left(G_n \bigcap A\right) \\
&\underset{A \in \mathfrak{D}_n}{=} \mu(G_n) - \nu\left(G_n \bigcap A\right) \\
&\underset{G_n \in \mathcal{G}}{=} \nu(G_n) - \nu\left(G_n \bigcap A\right) \\
&\underset{\text{[eq: 20.199]}}{=} \nu\left(G_n \setminus \left(G_n \bigcap A\right)\right) \\
&\underset{\text{[eq: 20.198]}}{=} \nu(G_n \setminus A) \\
&\underset{\text{[theorem: 1.33]}}{=} \nu\left(G_n \bigcap (X \setminus A)\right)
\end{aligned}$$

proving that $(X \setminus A) \in \mathfrak{D}_n$, further as $A \in \mathfrak{D}_n \subseteq \sigma[\mathcal{G}]$ we have $X \setminus A \in \sigma[\mathcal{G}]$. Hence

$$\forall A \in \mathfrak{D}_n \text{ we have } X \setminus A \in \mathfrak{D}_n \tag{20.200}$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}_n$ be a pairwise disjoint family. Then $\forall i \in \mathbb{N}$ with $i \neq j$ we have $(G_n \bigcap A_i) \bigcap (G_n \bigcap A_j) \subseteq A_i \bigcap A_j = \varnothing$ so that $\{G_n \bigcap A_i\}_{i \in \mathbb{N}}$ is pairwise disjoint. Hence

$$\mu\left(\bigsqcup_{i \in \mathbb{N}} \left(G_n \bigcap A_i\right)\right) = \sum_{i \in \mathbb{N}} \mu\left(G_n \bigcap A_i\right) \underset{A_i \in \mathfrak{D}_n}{=} \sum_{i \in \mathbb{N}} \nu\left(G_n \bigcap A_i\right) = \nu\left(\bigsqcup_{i \in \mathbb{N}} \left(G_n \bigcap A_i\right)\right)$$

which, as $G_n \bigcap \left(\bigsqcup_{i \in \mathbb{N}} A_i\right) = \bigsqcup_{i \in \mathbb{N}} (G_n \bigcap A_i)$ and $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}_n \subseteq \sigma[\mathcal{G}]$, proves that

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}_n \text{ we have } \bigsqcup_{i \in \mathbb{N}} A \in \mathfrak{D}_n \tag{20.201}$$

By [eqs: 20.197, 20.200 and 20.201] we have

$$\mathfrak{D}_n \text{ is a Dynkin system} \tag{20.202}$$

As $\forall A, B \in \mathcal{G}$ we have by (1) that $A \bigcap B \in \mathcal{G}$ we have by [theorem: 20.208] that

$$\delta[\mathcal{G}] = \sigma[\mathcal{G}] \tag{20.203}$$

As by [eq: 20.196] $\mathcal{G} \subseteq \mathfrak{D}_n$ and $\mathfrak{D}_n$ is a Dynkin system it follows that

$$\sigma[\mathcal{G}] \underset{\text{[eq: 20.203]}}{=} \delta[\mathcal{G}] \subseteq \mathfrak{D}_n \underset{\text{[eq: 20.195]}}{\subseteq} \sigma[\mathcal{G}]$$

Hence we have $\forall n \in \mathbb{N}$ that $\sigma[\mathcal{G}] = \mathfrak{D}_n$ so that using the definition of $\mathcal{D}_n$ [see eq: 20.195]

$$\forall n \in \mathbb{N} \text{ we have } \forall A \in \sigma[\mathcal{G}] \text{ that } \mu\left(G_n \bigcap A\right) = \nu\left(G_n \bigcap A\right) \tag{20.204}$$

Let $A \in \sigma[\mathcal{G}]$ then $\forall i \in \mathbb{N}$ we have $G_i \bigcap A \subseteq G_{i+1} \bigcap A \in \sigma[\mathcal{G}]$ and

$$A = A \bigcap X = A \bigcap \left(\bigcup_{i \in \mathbb{N}} G_i \right) = \bigcup_{i \in \mathbb{N}} \left(G_i \bigcap A \right) \tag{20.205}$$

so that by [theorem: 20.193] we have that

$$\lim_{i \to \infty} \mu\left(G_i \bigcap A \right) \text{ exists and } \lim_{i \to \infty} \mu\left(G_i \bigcap A \right) = \mu\left(\bigcup_{i \in \mathbb{N}} \left(G_i \bigcap A \right) \right) \underset{\text{[eq: 20.205]}}{=} \mu(A) \tag{20.206}$$

and

$$\lim_{i \to \infty} \nu\left(G_i \bigcap A \right) \text{ exists and } \lim_{i \to \infty} \nu\left(G_i \bigcap A \right) = \mu\left(\bigcup_{i \in \mathbb{N}} \left(G_i \bigcap A \right) \right) \underset{\text{[eq: 20.205]}}{=} \nu(A) \tag{20.207}$$

Hence we have for $A \in \sigma[\mathcal{G}]$ that

$$\mu(A) \underset{\text{[eq: 20.206]}}{=} \lim_{i \to \infty} \mu\left(G_i \bigcap A \right) \underset{\text{[eq: 20.204]}}{=} \lim_{i \to \infty} \nu\left(G_i \bigcap A \right) \underset{\text{[eq: 20.207]}}{=} \nu(A)$$

proving that

$$\mu = \nu$$

□

20.4.4 Constructing measures and σ-algebras

20.4.4.1 Constructing outer measures

Let X be a set then given $\mathcal{G} \subseteq \mathcal{P}(X)$ we want to extend a function $\mu: \mathcal{G} \to [0, \infty]$ to a measure on a σ-algebra containing $\mathcal{G}$. To use the Carathéodory theorem for this task we have to construct a outer measure out of μ. This is the subject of this section. First we need some definitions that specifies the minimum requirements for this task.

Definition 20.210. (Proto-Ring) *Let X be a set then $\mathcal{S} \subseteq \mathcal{P}(X)$ is a **proto-ring** on X if*

$$\varnothing \subseteq \mathcal{S}$$

Definition 20.211. (Proto-Measure) *Let X be a set then and $\mathcal{S}$ a proto-ring on X then a function $\mu: \mathcal{S} \to [0, \infty]$ is a **proto-measure** on $\mathcal{S}$ if*

$$\mu(\varnothing) = 0$$

Next we shown how to construct a outer-measure from a proto-measure.

Theorem 20.212. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a proto-ring and $\mu: \mathcal{S} \to [0, \infty]$ a proto-measure on $\mathcal{S}$ then*

1. $$\mu^*: \mathcal{P}(X) \to [0, \infty] \text{ defined by } \mu^*(A) = \begin{cases} \inf\left(\{ \sum_{i=1}^{\infty} \mu(A_i) | \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[A] \} \right) & \text{if } \mathcal{S}[A] \neq \varnothing \\ \infty & \text{if } \mathcal{S}[A] = \varnothing \end{cases}$$

   where

   $$\mathcal{S}[A] = \left\{ \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S} | A \subseteq \bigcup_{i \in \mathbb{N}} A_i \right\}$$

   is a outer measure.

2. *If additional we have that*

   a. $\forall A, B \in S$ *that* $A \bigcap B \in \mathcal{S}$

   b. $\forall A, B \in \mathcal{S}$ *with* $A \subseteq B$ *we have* $\mu(A) \leqslant \mu(B)$

   c. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}$ *with* $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{S}$ *we have* $\mu(\bigcup_{i \in \mathbb{N}} A_i) \leqslant \sum_{i=1}^{\infty} \mu(A_i)$

   then

   $$\forall A \in \mathcal{S} \text{ we have } \mu^*(A) = \mu(A)$$

***Note* 20.213.** *The outer measure defined in (1) is not neccesary a extension of μ, for that we need the extra conditions 2.a, 2.b, 2.c.*

Proof.

1. Define $\{N_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}$ by $N_i=\varnothing\in\mathcal{S}$ then $\varnothing\subseteq\bigcup_{i\in\mathbb{N}}N_i$ so that $\{N_i\}_{i\in\mathbb{N}}\in\mathcal{S}[\varnothing]$, hence $\mathcal{S}[\varnothing]\neq\emptyset$. So $0=\sum_{I=1}^{\infty}\mu(\varnothing)=\sum_{i=1}^{\infty}\mu(N_i)\in\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\}$, hence
$$0\leqslant\inf\left(\left\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\right\}\right)\leqslant 0$$
proving that $\mu^*(\varnothing)=\inf(\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\})=0$. Hence we have
$$\mu^*(\varnothing)=0 \tag{20.208}$$
Let $A,B\in\mathcal{P}(X)$ with $A\subseteq B$. Then for $S[B]$ we have either:

   $S[B]=\varnothing$. Then $\mu^*[A]\leqslant\infty=\mu^*[B]$

   $\mathcal{S}[B]\neq\varnothing$. If $\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[B]$ then $\{A_i\}_{i\in\mathbb{N}}\subseteq S$ and $B\subseteq\bigcup_{i\in\mathbb{N}}A_i$ hence, as $A\subseteq B$ we have $A\subseteq\bigcup_{i\in\mathbb{N}}A_i$ so that $\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]$. Hence
$$\varnothing\neq\mathcal{S}[B]\subseteq S[A]$$
From the above it follows that
$$\left\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[B]\right\}\subseteq\left\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\right\},$$
so that by [theorem: 3.77]
$$\begin{aligned}\mu^*[A] &= \inf\left(\left\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\right\}\right)\\ &\leqslant \inf\left(\left\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[B]\right\}\right)\\ &= \mu^*[B]\end{aligned}$$

To summarize
$$\forall A,B\in\mathcal{P}(X)\text{ with }A\subseteq B\text{ we have }\mu^*(A)\leqslant\mu^*(B) \tag{20.209}$$
Let $\{T_i\}_{i\in\mathbb{N}}\subseteq\mathcal{P}(X)$ then we have two cases to consider:

   $\exists i\in\mathbb{N}$ such that $\mu^*(T_i)=\infty$. Then $\mu^*(\bigcup_{i\in\mathbb{N}}T_i)\leqslant\infty=\sum_{i=1}^{\infty}\mu^*(A_i)$

   $\forall i\in\mathbb{N}$ we have $\mu^*(T_i)<\infty$. Then we must have $\forall i\in\mathbb{N}$ that $\mathcal{S}[T_i]\neq\infty$ so that
$$\mu^*(T_i)=\inf\left(\left\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[T_i]\right\}\right)$$
Take $\varepsilon\in\mathbb{R}^+$. Given $n\in\mathbb{N}$ we have, as $\mu^*(T_n)<\infty$, that $\mu^*(T_n)<\mu^*(T_n)+\frac{\varepsilon}{2^n}$, so as $\mu^*(T_n)=\inf(\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[T_n]\})$, there exist a $\{I_{n,i}\}_{i\in\mathbb{N}}\in\mathcal{S}[T_n]$ with $T_n\subseteq\bigcup_{i\in\mathbb{N}}I_{n,i}$ such that $\mu^*(T_n)\leqslant\sum_{i=1}^{\infty}\mu(I_{n,i})<\mu^*(T_n)+\frac{\varepsilon}{2^n}$. Hence we have
$$\mu^*(T_n)\leqslant\sum_{i=1}^{\infty}\mu(I_{n,i})<\mu^*(T_n)+\frac{\varepsilon}{2^n}\text{ and }T_n\subseteq\bigcup_{i\in\mathbb{N}}I_{n,i} \tag{20.210}$$
As $\mathbb{N}\times\mathbb{N}$ is denumerable [see theorem: 6.63] there exist a bijection $\beta:\mathbb{N}\to\mathbb{N}\times\mathbb{N}$. Let $x\in\bigcup_{i\in\mathbb{N}}T_i$ then $\exists k\in\mathbb{N}$ such that $x\in T_k\underset{\text{[eq: 20.210]}}{\subseteq}\bigcup_{i\in\mathbb{N}}I_{k,i}$, hence $\exists l\in\mathbb{N}$ such that $x\in I_{k,l}$. As $(k,l)\in\mathbb{N}\times\mathbb{N}$ there exist a $i\in\mathbb{N}$ such that $\beta(i)=(k,l)$ so that $x\in I_{\beta(i)_1,\beta(i)_2}\subseteq\bigcup_{i\in\mathbb{N}}I_{\beta(i)_1,\beta(i)_2}$. To summarize we have proved that
$$\bigcup_{i\in\mathbb{N}}T_i\subseteq\bigcup_{i\in\mathbb{N}}I_{\beta(i)_1,\beta(i)_2}\text{ so that }\{I_{\beta(i)_1,\beta(i)_2}\}_{i\in\mathbb{N}}\in\mathcal{S}\left[\bigcup_{i\in\mathbb{N}}T_i\right] \tag{20.211}$$

Hence $\mathcal{S}[\bigcup_{i\in\mathbb{N}} T_i] \neq \varnothing$ so that

$$\begin{aligned}
\mu^*\left(\bigcup_{i\in\mathbb{N}} T_i\right) &= \inf\left(\left\{\sum_{i=1}^{\infty} \mu(A_i) | \{A_i\}_{i\in\mathbb{N}} \in \mathcal{S}\left[\bigcup_{i\in\mathbb{N}} T_i\right]\right\}\right) \\
&\underset{\text{[eq: 20.211]}}{\leqslant} \sum_{i=1}^{\infty} \mu(I_{\beta(i)_1,\beta(i)_2}) \\
&\underset{\text{[lemma: 20.100]}}{=} \sum_{i=1}^{\infty}\left(\sum_{j=1}^{\infty} \mu(I_{i,j})\right) \\
&\underset{\text{[eq: 20.210]}}{\leqslant} \sum_{i=1}^{\infty}\left(\mu^*(T_i) + \frac{\varepsilon}{2^i}\right) \\
&\underset{\text{[theorem: 20.91]}}{=} \sum_{i=1}^{\infty} \mu^*(T_i) + \sum_{i=1}^{\infty} \frac{\varepsilon}{2^i} \\
&\underset{\text{[theorem: 20.91]}}{=} \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon \cdot \sum_{i=1}^{\infty} \frac{1}{2^i} \\
&= \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon \cdot \lim_{n\to\infty} \sum_{i=1}^{n} \frac{1}{2^i} \\
&\underset{\text{[theorem: 20.68]}\wedge\text{[examle: 14.353]}}{=} \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon \cdot \frac{\frac{1}{2}}{1-\frac{1}{2}} \\
&= \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon
\end{aligned}$$

Hence we have

$$\forall \varepsilon \in \mathbb{R}^+ \text{ that } \mu^*\left(\bigcup_{i\in\mathbb{N}} T_i\right) \leqslant \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon$$

which, as $\varepsilon \in \mathbb{R}^+$ is choosen arbitrary, proves by [theorem: 20.40] that

$$\mu^*\left(\bigcup_{i\in\mathbb{N}} T_i\right) < \sum_{i=1}^{\infty} \mu^*(T_i).$$

To summarize we have in all cases that

$$\forall \{T_i\}_{i\in\mathbb{N}} \subseteq \mathcal{P}(X) \text{ we have } \mu^*\left(\bigcup_{i\in\mathbb{N}} T_i\right) \leqslant \sum_{i=1}^{\infty} \mu^*(T_i) \tag{20.212}$$

Taking in account the definition of a outer measure and [eqs: 20.208, 20.209 and 20.212] it follows that

$$\mu^* \text{ is a outer measure on } X$$

2. If $A \in \mathcal{S}$ then for $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{S}$ defined by $A_i = \begin{cases} A \text{ if } i=1 \\ \varnothing \text{ if } i \in \{2,\ldots,\infty\} \end{cases} \in \mathcal{S}$ we have $A = \bigcup_{i\in\mathbb{N}} A_i$ so that $A \in S[A] \Rightarrow \mathcal{S}[A] \neq \varnothing$ and

$$\sum_{i=1}^{\infty} \mu(A_i) \underset{\text{[theorem: 20.92]}}{=} \sum_{i=1}^{1} \mu(A_i) + \sum_{i=2}^{\infty} \mu(A_i) = \mu(A_1) + \sum_{i=2}^{\infty} 0 = \mu(A)$$

so that $\mu(A) \in \{\sum_{i=1}^{\infty} \mu(A_i) | \{A_i\}_{i\in\mathbb{N}} \in S[A]\}$. Hence

$$\mu^*(A) = \inf\left(\left\{\sum_{i=1}^{\infty} \mu(A_i) | \{A_i\}_{i\in\mathbb{N}} \in S[A]\right\}\right) \leqslant \mu(A)$$

proving that

$$\forall A \in \mathcal{S} \text{ we have } \mu^*(A) \leqslant \mu(A) \tag{20.213}$$

For the opposite inequality, let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}[A]$ then $A\subseteq\bigcup_{i\in\mathbb{N}}A_i$ so that $\bigcup_{i\in\mathbb{N}}(A\bigcap A_i)=A\in\mathcal{S}$. By (2.a) we have $\{A\bigcap A_i\}_{i\in\mathbb{N}}\subseteq S$ and further

$$\mu(A)=\mu\left(\bigcup_{i\in\mathbb{N}}(A\bigcap A_i)\right)\underset{(2.c)}{\leqslant}\sum_{i=1}^{\infty}\mu(A\bigcap A_i)\underset{(2.b)}{\leqslant}\sum_{i=1}^{\infty}\mu(A_i)$$

Hence $\mu(A)$ is a lower bound of $\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in S[A]\}$, therefore $\mu(A)\leqslant\mu^*(A)$. Combining this with [eq: 20.213] gives finally

$$\mu(A)=\mu^*(A)$$

□

As is mentioned in [note: 20.213] if we want that the above theorem extend a proto-measure to a outer measure we need extra conditions on the proto-ring and the proto-measure. This motivates the definition of a semi-ring and a pre-measure below.

Definition 20.214. (Semi-Ring) *Let X be a set then $S\subseteq\mathcal{P}(X)$ is a **semi-ring** on X if*

1. $\varnothing\in\mathcal{S}$
2. $\forall A,B\in\mathcal{S}$ *we have* $A\bigcap B\in\mathcal{S}$ *[in other words $\mathcal{S}$ is $\bigcap$-stable]*
3. $\forall A,B\in\mathcal{S}$ *there exist a finite pairwise disjoint family* $\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ *such that*

$$A\setminus B=\bigsqcup_{i\in\{1,\ldots,n\}}A_i$$

***Note* 20.215.** *As by (2) $\mathcal{S}$ is $\cap$-stable it follows from [lemma: 20.111] that $\forall\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ we have that $\bigcap_{i\in\{1,\ldots,n\}}A_i\in\mathcal{S}$.*

***Note* 20.216.** *As $\varnothing\in\mathcal{S}$ it follows from the definition of a proto-ring [see definition: 20.210] that every semi-ring is a proto-ring.*

Definition 20.217. (Pre-Measure) *Let X be a set, $\mathcal{S}$ a semi-ring on X then a set function $\mu:\mathcal{S}\to[0,\infty]$ is a pre-measure if*

1. $\mu(\varnothing)=0$
2. *For every pairwise disjoint family* $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}$ *such that* $\bigsqcup_{i\in\mathbb{N}}A_i\in\mathcal{S}$ *we have that*

$$\mu\left(\bigsqcup_{i\in\mathbb{N}}A_i\right)=\sum_{i=1}^{\infty}\mu(A_i)$$

In other words $\mu:\mathcal{S}\to[0,\infty]$ is countable addive on $\mathcal{A}$]

***Note* 20.218.** *As $\mu(\varnothing)=0$ it follows from the definition of a proto-measure [see definition: 20.211] that that a pre-measure on a semi-ring is a proto-measure on a proto-ring.*

The above definitions do not exactly cover the extra conditions 1.a, 2.b and 2.c in [theorem: 20.212]. The next theorems will ensure that this will be satisfied by semi-rings and pre-measures.

Lemma 20.219. *Let X be a set, $\mathcal{S}$ a semi-ring on X, $n\in\mathbb{N}$, $\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{S}$ and $A\in\mathcal{S}$ then there exist a pairwise disjoint family $\{B_i\}_{i\in\{1,\ldots,m\}}\subseteq\mathcal{S}$, $m\in\mathbb{N}$ such that*

$$A\setminus\bigcup_{i\in\{1,\ldots,n\}}A_i=\bigsqcup_{i\in\{1,\ldots,m\}}B_i$$

Proof. We use induction to prove this. Let $A\in\mathcal{S}$ and define

$$S_A=\left\{n\in\mathbb{N}|\text{If}\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{S}_i\text{ then there exist a pairwise disjoint }\{B_i\}_{i\in\{1,\ldots,m\}}\subseteq\mathcal{S},m\in\mathbb{N}\text{ such that }A\setminus\bigcup_{i\in\{1,\ldots,n\}}A_i=\bigsqcup_{i\in\{1,\ldots,m\}}B_i\right)$$

then we have:

$1\in\mathcal{S}_A$. If $\{A_i\}_{i\in\{1\}}\subseteq\mathcal{S}$ then $A\setminus\bigcup_{i\in\{1\}}A_i=A\setminus A_1$. As $\mathcal{S}$ is a semi-ring it follows that there exist a pairwise disjoint family $\{B_i\}_{i\in\{1,\ldots,m\}}\subseteq\mathcal{S}$, $m\in\mathbb{N}$ such that $A\setminus\bigcup_{i\in\{1\}}A_i=A\setminus A_1=\bigsqcup_{i\in\{1,\ldots,m\}}B_i$ which proves that $1\in\mathcal{S}$.

$n\in\mathcal{S}_A\Rightarrow n+1\in\mathcal{S}_A$. Let $\{A_i\}_{i\in\{1,\ldots,n+1\}}\subseteq\mathcal{S}$ then as $n\in S$ there exist a $\{B_i\}_{i\in\{1,\ldots,m\}}\subseteq\mathcal{S}$ pairwise disjoint such that

$$A\setminus\bigcup_{i\in\{1,\ldots,n\}}A_i=\bigsqcup_{i\in\{1,\ldots,m\}}B_i \tag{20.214}$$

Further we have

$$\begin{aligned} A\setminus\bigcup_{i\in\{1,\ldots,n+1\}}A_i &= A\setminus\left(\left(\bigcup_{i\in\{1,\ldots,n\}}A_i\right)\bigcup A_{n+1}\right)\\ &\underset{\text{[theorem: 1.31]}}{=}\left(A\setminus\left(\bigcup_{i\in\{1,\ldots,n\}}A_i\right)\right)\setminus A_{n+1}\\ &\underset{\text{[eq: 20.214]}}{=}\left(\bigsqcup_{i\in\{1,\ldots,m\}}B_i\right)\setminus A_{n+1}\\ &\underset{\text{[theorem: 2.133]}}{=}\bigsqcup_{i\in\{1,\ldots,m\}}(B_i\setminus A_{n+1}) \end{aligned}\tag{20.215}$$

If $i,j\in\{1,\ldots,m\}$ with $i\neq j$ then we have $(B_i\setminus A_{n+1})\bigcap(B_j\setminus A_{n+1})\subseteq B_i\bigcap B_j=\varnothing$ proving that

$$\{B_i\setminus A_{n+1}\}_{i\in\{1,\ldots,m\}}\text{ is pairwise disjoint}\tag{20.216}$$

Let $i\in\{1,\ldots,m\}$ then as $\mathcal{S}$ is a semi-ring and $B_i,A_{n+1}\in\mathcal{S}$ there exist a pairwise disjoint $\{C_{i,j}\}_{j\in\{1,\ldots,n_i\}}\subseteq\mathcal{S}$ such that

$$B_i\setminus A_{n+1}=\bigsqcup_{j\in\{1,\ldots,n_i\}}C_{i,j}\tag{20.217}$$

Hence using [lemma: 20.113]

$$\bigsqcup_{i\in\{1,\ldots,m\}}(B_i\setminus A_{n+1}) = \bigsqcup_{\sigma\in\bigcup_{i\in\{1,\ldots,m\}}\{i\}\times\{1,\ldots,n_i\}}C_{\sigma_1,\sigma_2}\tag{20.218}$$

and

$$\{C_{\sigma_1,\sigma_2}\}_{\sigma\in\bigcup_{i\in\{1,\ldots,m\}}\{i\}\times\{1,\ldots,n_i\}}\subseteq\mathcal{S}\text{ is pairwise disjoint}\tag{20.219}$$

As $\bigcup_{i\in\{1,\ldots,m\}}\{i\}\times\{1,\ldots,n_i\}$ is finite [see theorems: 6.41, 6.36] there exist a bijection such that $\beta:\{1,\ldots,N\}\to\bigcup_{i\in\{1,\ldots,m\}}\{i\}\times\{1,\ldots,n_i\}$. Let $i,j\in\{1,\ldots,N\}$ with $i\neq j$ then, as β is injective, we have $\beta(i)\neq\beta(j)$. For $\beta(i)_1$, $\beta(j)_1$ we have either:

$\boldsymbol{\beta(i)_1=\beta(j)_1}$. Then we must have that $\beta(i)_2\neq\beta(j)_2$ so that

$$C_{\beta(i)_1,\beta(i)_2}\bigcap C_{\beta(j)_1,\beta(j)_2}=C_{\beta(i)_1,\beta(i)_2}\bigcap C_{\beta(i)_1,\beta(j)_2}=\varnothing$$

$\boldsymbol{\beta(i)_1\neq\beta(j)_1}$. Then we have

$$\begin{aligned} C_{\beta(i)_1,\beta(i)_2}\bigcap C_{\beta(j)_1,\beta(j)_2} &\subseteq\left(\bigcup_{k\in\{1,\ldots,n_{\beta(i)_1}\}}C_{\beta(i)_1,k}\right)\bigcap\left(\bigcup_{k\in\{1,\ldots,n_{\beta(j)_1}\}}C_{\beta(j)_1,k}\right)\\ &= B_{\beta(i)_1}\bigcap B_{\beta(j)_1}\\ &=\varnothing \end{aligned}$$

which proves that

$$\{C_{\beta(i)_1,\beta(i)_2}\}_{i\in\{1,\ldots,N\}}\subseteq\mathcal{S}\text{ is pairwise disjoint}\tag{20.220}$$

Further

$$\begin{aligned} A\setminus\bigcup_{i\in\{1,\ldots,n+1\}}A_i &\underset{\text{[eq: 20.215]}}{=}\bigsqcup_{i\in\{1,\ldots,m\}}(B_i\setminus A_{n+1})\\ &\underset{\text{[eq: 20.217]}}{=}\bigsqcup_{\sigma\in\bigcup_{i\in\{1,\ldots,m\}}\{i\}\times\{1,\ldots,n_i\}}C_{\sigma_1,\sigma_2}\\ &\underset{\text{[theorem: 2.119]}}{=}\bigsqcup_{i\in\{1,\ldots,N\}}C_{\beta(i)_1,\beta(i)_2} \end{aligned}$$

which proves that $n+1\in\mathcal{S}$. □

Theorem 20.220. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu:\mathcal{S}\to[0,\infty]$ a pre-measure then $\forall\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq S$ pairwise disjoint, $n\in\mathbb{N}$ with $\bigcup_{i\in\{1,\ldots,n\}}A_i\in\mathcal{S}$ we have*

$$\mu\left(\bigcup_{i\in\{1,\ldots,n\}}A_i\right)=\sum_{i=1}^{n}A_i$$

In other words a pre-measure is additive.

Proof. As for a pre-measure we have $\mu(\varnothing)=0$ and $\mu:\mathcal{S}\to[0,\infty]$ is countable additive it follows from [theorem: 20.180] that $\mu:\mathcal{S}\to[0,\infty]$ is additive. In other words $\forall\{A_i\}_{i\in\{1,\dots,n\}}\subseteq S$ pairwise disjoint, $n\in\mathbb{N}$ with $\bigcup_{i\in\{1,\dots,n\}}A_i\in\mathcal{S}$ we have

$$\mu\left(\bigcup_{i\in\{1,\dots,n\}}A_i\right)=\sum_{i=1}^{n}A_i$$

□

Theorem 20.221. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu:\mathcal{S}\to[0,\infty]$ a additive set function [see definition: 20.116] then we have:*

1. *$\forall A\in\mathcal{S}$ and $\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ **pairwise disjoint** such that $\bigcup_{i\in\{1,\dots,n\}}A_i\subseteq A$ we have*
$$\sum_{i=1}^{n}\mu(A_i)\leqslant\mu(A)$$
2. *$\forall A,B\in\mathcal{S}$ with $A\subseteq B$ we have $\mu(A)\leqslant\mu(B)$*

Proof.

1. As $A\in\mathcal{S}$ and $\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ then by [lemma: 20.219] there exist a pairwise disjoint $\{B_i\}_{i\in\{1,\dots,m\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ such that
$$A\setminus\bigcup_{i\in\{1,\dots,m\}}A_i=\bigsqcup_{i\in!,\dots,m}B_i \tag{20.221}$$
Define
$$\{D_i\}_{i\in\{1,\dots,n+m\}}\subseteq\mathcal{S}\text{ by }D_i=\begin{cases}A_i\text{ if }i\in\{1,\dots,n\}\\B_{i-n}\text{ if }i\in\{n+1,\dots,n+m\}\end{cases}\subseteq\mathcal{S}$$
Let $i,j\in\{1,\dots,n+m\}$ with $i\neq j$ then we can always assume that $i<j$ [otherwise exchange i and j]. For i we have either:
   - $\boldsymbol{i\in\{1,\dots,n\}}$**.** Then for j we have either:
     - $\boldsymbol{j\in\{1,\dots,n\}}$**.** Then $D_i\bigcap D_j=A_i\bigcap A_j\underset{\{A_i\}_{i\in\{1,\dots,n\}}\text{ is pairwise disjoint}}{=}\varnothing$
     - $\boldsymbol{j\in\{n+1,\dots,n+m\}}$**.** Then
$$D_i\bigcap D_j=A_i\bigcap B_{j-n}\subseteq A_i\bigcap\left(A\setminus\bigcup_{i\in\{1,\dots,n\}}A_i\right)=\varnothing$$
   - $\boldsymbol{i\in\{n+1,\dots,n+m\}}$**.** Then as $i<j$ we have $j\in\{n+1,\dots,n+m\}$ so that
$$D_i\bigcap D_j=B_{i-n}\bigcap B_{j-n}\underset{i-n\neq j-n}{=}\varnothing$$
hence
$$\{D_i\}_{i\in\{1,\dots,n+m\}}\subseteq\mathcal{S}\text{ is pairwise disjoint} \tag{20.222}$$
Further as $\bigsqcup_{i\in\{1,\dots,n\}}A_i\subseteq A$ we have
$$\begin{aligned}A&\underset{\text{[theorem: 1.35]}}{=}\left(A\setminus\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\bigcup\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\\&=\left(\bigsqcup_{i\in\{1,\dots,m\}}B_i\right)\bigsqcup\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\\&=\left(\bigsqcup_{i\in\{1,\dots,m\}}D_{i+n}\right)\bigsqcup\left(\bigsqcup_{i\in\{1,\dots,n\}}D_i\right)\\&\underset{\text{[theorem: 2.119]}}{=}\left(\bigsqcup_{i\in\{n+1,\dots,n+m\}}D_i\right)\bigsqcup\left(\bigsqcup_{i\in\{1,\dots,n\}}D_i\right)\\&\underset{\text{[theorem: 2.128]}}{=}\bigsqcup_{i\in\{1,\dots,n+m\}}D_i\end{aligned} \tag{20.223}$$

So as $\bigsqcup_{i\in\{1,\dots,n+m\}} D_i = A \in \mathcal{S}$ we have

$$\begin{aligned}
\mu(A) &\underset{\text{[eq: 20.223]}}{=} \mu\left(\bigsqcup_{i\in\{1,\dots,n+m\}} D_i\right) \\
&\underset{\mu \text{ is additive}}{=} \sum_{i=1}^{n+m} \mu(D_i) \\
&= \sum_{i=1}^{n} \mu(D_i) + \sum_{i=n+1}^{n+m} \mu(D_i) \\
&= \sum_{i=1}^{n} \mu(A_i) + \sum_{i=n+1}^{n+m} \mu(D_i)
\end{aligned}$$

so that by [theorem: 20.32] we have

$$\sum_{i=1}^{n} \mu(A_i) \leqslant \mu(A)$$

2. Let $A, B \in \mathcal{S}$ with $A \subseteq B$. Take then $\{A_i\}_{i\in\{1\}} \subseteq \mathcal{S}$ by $A_i = A$ then we have $\bigsqcup_{i\in\{1\}} A_i = A \subseteq B$, hence by (1) it follows that $\mu(A) = \sum_{i=1}^{1} \mu(A_i) \leqslant \mu(B)$ □

Corollary 20.222. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu: \mathcal{S} \to [0,\infty]$ a pre-measure on $\mathcal{S}$ [see definition: 20.217] then we have:*

1. *$\forall A \in \mathcal{S}$ and $\{A_i\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ pairwise disjoint such that $\bigcup_{i\in\{1,\dots,n\}} A_i \subseteq A$ we have*
$$\sum_{i=1}^{n} \mu(A_i) \leqslant \mu(A)$$
2. *$\forall A, B \in \mathcal{S}$ with $A \subseteq B$ we have $\mu(A) \leqslant \mu(B)$*

Proof. As a pre-measure is additive [see theorem: 20.220] this follows from the previous theorem [theorem: 20.221]. □

Theorem 20.223. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu: \mathcal{S} \to [0,\infty]$ a pre-measure then*

$$\forall \{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{S} \text{ with } \bigcup_{i\in\mathbb{N}} A_i \in \mathcal{S} \text{ we have } \mu\left(\bigcup_{i\in\mathbb{N}} A_i\right) \leqslant \sum_{i=0}^{\infty} \mu(A_i)$$

In other words μ is countable sub-addtive.

Proof. Let $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{S}$ be a sequence such that $\bigcup_{i\in\mathbb{N}} A_i \in \mathcal{S}$. Define

$$\{B_i\}_{i\in\mathbb{N}} \text{ by } B_i = \begin{cases} A_1 \text{ if } i = 1 \\ A_i \setminus \bigcup_{j\in\{1,\dots,i-1\}} A_j \text{ if } i \in \{2,\dots,\infty\} \end{cases}$$

then by [lemma: 20.108]

$$\{B_i\}_{i\in\mathbb{N}} \text{ is pairwise disjoint and } \bigcup_{i\in\mathbb{N}} A_i = \bigsqcup_{i\in\mathbb{N}} B_i \text{ and } \forall i \in \mathbb{N}\ B_i \subseteq A_i \tag{20.224}$$

Note that the sets B_i are not elements of $\mathcal{S}$, however we will show that each B_i is a finite pairwise disjoint union of sets in $\mathcal{S}$ so that we can write $\bigcup_{i\in\mathbb{N}} A_i$ as countable pairwise disjoint union of elements of $\mathcal{S}$, allowing use to apply countable additivity. Let $i \in \mathbb{N}$ then we have either:

- **$i = 1$.** Define $n_1 = 1$ and $\{C_{1,j}\}_{j\in\{1,\dots,n_1\}} \subseteq \mathcal{S}$ by $C_{1,1} = A_1 \in \mathcal{S}$ then $\{C_{1,j}\}_{j\in\{1,\dots,n_1\}} \subseteq S$ is pairwise disjoint and $B_1 = A_1 = \bigsqcup_{i\in\{1,\dots,n_1\}} C_{1,j}$
- **$i \in \{2,\dots,\infty\}$.** By [lemma: 20.219] there exist a pairwise disjoint family $\{C_{i,j}\}_{j\in\{1,\dots,n_i\}} \subseteq \mathcal{S}$ such that $B_i = A_i \setminus \bigcup_{j\in\{1,\dots,i-1\}} A_j = \bigsqcup_{j\in\{1,\dots,n_i\}} C_{i,j}$.

Hence we have

$$\forall i \in \mathbb{N}\ \exists \{C_{i,j}\}_{j\in\{1,\dots,n_i\}} \subseteq \mathcal{S} \text{ pairwise disjoint such that } B_i = \bigsqcup_{j\in\{1,\dots,n_i\}} C_{i,j} \tag{20.225}$$

By [corollary: 6.75] it follows that $\bigcup_{i\in\mathbb{N}} \{i\} \times \{1,\dots,n_i\}$ is denumerable, hence there exist a bijection

$$\beta: \mathbb{N} \to \bigcup_{i\in\mathbb{N}} \{i\} \times \{1,\dots,n_i\}$$

Using the above and [eq: 20.225] allows us to use [corollary: 20.114] giving

$$\{C_{\beta(i)_1\beta(i)_2}\}_{i\in\mathbb{N}}\subseteq\mathcal{S}\text{ is pairwise disjoint and }\bigcup_{i\in\mathbb{N}}A_i\underset{\text{[eq: 20.224]}}{=}\bigsqcup_{i\in\mathbb{N}}B_i=\bigsqcup_{i\in\mathbb{N}}C_{\beta(i)_1,\beta(i)_2}\tag{20.226}$$

So we have as $\bigsqcup_{i\in\mathbb{N}}C_{\beta(i)_1,\beta(i)_2}=\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{S}$ that

$$\begin{aligned}\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)&\underset{\text{[eq: 20.226]}}{=}\mu\left(\bigsqcup_{i\in\mathbb{N}}C_{\beta(i)_1,\beta(i)_2}\right)\\&\underset{\mu\text{ is a pre-measure}}{=}\sum_{i=1}^{\infty}\mu(C_{\beta(i)_1,\beta(i)_2})\\&\underset{\text{[theorem: 20.99]}}{=}\sum_{i=1}^{\infty}\left(\sum_{j=1}^{n_i}\mu(C_{i,j})\right)\end{aligned}\tag{20.227}$$

As $\forall i\in\mathbb{N}\ \bigcup_{j\in\{1,\ldots,n_i\}}C_{i,j}\underset{\text{[eq: 20.225]}}{=}B_i\subseteq A_i$ it follows from [corollary: 20.222(1)] and [eq: 20.226] that $\sum_{j=1}^{n_i}\mu(C_{i,j})\leqslant\mu(A_i)$, which combined with [eq: 20.227] and [theorem: 20.91] gives

$$\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)\leqslant\sum_{i=1}^{\infty}A_j$$

□

We can now combine the above theorems to prove a version of [theorem: 20.212] for semi-rings and pre-measures.

Theorem 20.224. *Let X be a set, $\mathcal{S}\subseteq\mathcal{P}(X)$ a semi-ring and $\mu:\mathcal{S}\to[0,\infty]$ a pre-measure on $\mathcal{S}$ then*

$$\mu^*:\mathcal{P}(X)\to[0,\infty]\text{ defined by }\mu^*(A)=\begin{cases}\inf\left(\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\}\right)\text{ if }\mathcal{S}[A]\neq\varnothing\\\infty\text{ if }\mathcal{S}[A]=\varnothing\end{cases}$$

where

$$\mathcal{S}[A]=\left\{\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}|A\subseteq\bigcup_{i\in\mathbb{N}}A_i\right\}$$

is a outer measure and

$$\forall A\in\mathcal{S}\text{ we have }\mu^*(A)=\mu(A)$$

so that

$$\mu^*\text{ is a extension of }\mu$$

Proof. As μ is a pre-measure [see definition: 20.217] we have that $\mu(\varnothing)=0$ hence

$$\mu\text{ is a proto-measure on }\mathcal{S}$$

Using [theorems: 20.222, 20.223] it follows that

$$\forall A,B\in\mathcal{S}\text{ with }A\subseteq B\text{ we have }\mu(A)\leqslant\mu(B)$$

$$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq S\text{ such that }\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{S}\text{ we have }\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)\leqslant\sum_{i=1}^{\infty}\mu(A_i)$$

and as $\mathcal{S}$ is a semi-ring we have

$$\forall A,B\in\mathcal{S}\text{ we have }A\bigcap B\in\mathcal{S}$$

So all conditions for [theorem: 20.212] are satisfies so that

$$\mu^*\text{ is a outer measure on }S\text{ and }\forall A\in\mathcal{S}\text{ we have }\mu^*(A)=\mu(A)$$

□

In the above proof we use the fact that a pre-measure is countable sub-additive [see theorem 20.223] but never the countable additivity that is part of the definition of a pre-measure. So why do we define a pre-measure to be countable additive and not just countable sub-additive? The answer lies in proving the existance of a **unique extension** of a pre-measure on a semi-ring $\mathcal{S}$ to a measure on $\sigma[\mathcal{S}]$. To extend the pre-measure μ on $\mathcal{S}$ we first use the previous theorem [theorem: 20.212] to create a outer-measure μ^* that extend μ [here the need for countable sub-additivity], next use the Carathéodory theorem [theorem: 20.200] to find a measure on $\mathcal{M}[\mu^*]$. However to make sure that the constructed measure is also a measure on $\sigma[\mathcal{S}]$ we still have to prove that $\sigma[\mathcal{S}]\subseteq\mathcal{M}[\mu^*]$ and this is where we need additivity of μ. The countable additivity of a pre-measure ensures additional the additivity and countable sub-additivity of the pre-measure. Another way to look at this is the following, if μ on S is extended to a countable additive measure on $\sigma[\mathcal{S}]$ then we must have, as $\mathcal{S}\subseteq\sigma[\mathcal{S}]$, that μ is also countable additive.

Theorem 20.225. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu:\mathcal{S}\to[0,\infty]$ a pre-measure on $\mathcal{S}$ and define*

$$\mu^*:\mathcal{P}(X)\to[0,\infty]\text{ defined by }\mu^*(A)=\begin{cases}\infty\ \textit{if}\ \mathcal{S}[A]=\varnothing\\ \inf\left(\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\}\right)\end{cases}$$

where

$$\mathcal{S}[A]=\left\{\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}|A\subseteq\bigcup_{i\in\mathbb{N}}A_i\right\}$$

and

$$\mathcal{M}[\mu^*]=\left\{A\in\mathcal{P}(X)|\forall B\in\mathcal{P}(X)\ \textit{we have}\ \mu^*(B)=\mu^\star\left(B\bigcap A\right)+\mu^*(B\setminus A)\right\}$$

then

$$\mu^*\ \textit{is a outer measure}$$

$$\mathcal{M}[\mu^*]\ \textit{is a}\ \sigma\textit{-algebra on}\ X$$

and

$$(\mu^*)_{|\mathcal{S}}=\mu\ \textit{[in other words}\ \mu^*\ \textit{extends}\ \mu$$

and

$$(\mu^*)_{|\mathcal{M}[\mu^*]}:\mathcal{M}[\mu^*]\to[0,\infty]\ \textit{is a measure on}\ \mathcal{M}[\mu^*]$$

and

$$\mathcal{S}\subseteq\mathcal{M}[\mu^*]$$

so that by [theorem: 20.141]

$$\sigma[\mathcal{S}]\subseteq\mathcal{M}[\mu^*]$$

and by [theorem: 20.185]

$$(\mu^*)_{|\sigma[\mathcal{S}]}:\sigma[\mathcal{S}]\to[0,\infty]\ \textit{is a measure on}\ \sigma[\mathcal{S}]$$

Hence

$$\langle X,\mathcal{M}[\mu^*],(\mu^*)_{\mathcal{M}[\mu^*]}\rangle\ \textit{and}\ \langle X,\sigma[\mathcal{S}],(\mu^*)_{|\sigma[\mathcal{S}]}\rangle\ \textit{are measure spaces}$$

where

$$\forall A\in\mathcal{S}\ \textit{we have}\ \mu(A)=\mu^*(A)=(\mu^*)_{|\mathcal{M}[\mu^*]}(A)=(\mu^*)_{|\sigma[\mathcal{S}]}$$

If additional there exist a $\{G_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}$ such that $\forall i\in\mathbb{N}\ G_i\subseteq G_{i+1}\wedge\mu(G_i)<\infty$ and $X=\bigcup_{i\in\mathbb{N}}G_i$ then if $\nu:\sigma[\mathcal{S}]\to[0,\infty]$ is a another measure on $\sigma[\mathcal{S}]$ such that $\nu_{|\mathcal{S}}=(\mu^*)_{|\mathcal{S}}$ then

$$\nu=(\mu^*)_{|\sigma[\mathcal{S}]}$$

In other words the extension of μ to a measure $(\mu^*)_{|\sigma[\mathcal{S}]}$ on $\sigma[\mathcal{S}]$ is unique.

***Note* 20.226.** *We need additivity on μ to prove that $\mathcal{S}\subseteq\mathcal{M}[\mu^*]$ which is essential for the last part of the theorem.*

Proof. Using [theorem: 20.224] we have

$$\mu^*:\mathcal{P}(X)\to[0,\infty]\text{ defined by }\mu^*(A)=\begin{cases}\inf\left(\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\}\right)\text{ if }\mathcal{S}[A]\neq\varnothing\\ \infty\text{ if }\mathcal{S}[A]=\varnothing\end{cases}\tag{20.228}$$

where

$$\mathcal{S}[A]=\left\{\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}|A\subseteq\bigcup_{i\in\mathbb{N}}A_i\right\}\tag{20.229}$$

is a outer measure and

$$\forall A\in\mathcal{S}\text{ we have }\mu^*(A)=\mu(A)\text{ hence }(\mu^*)_{|\mathcal{S}}=\mu\tag{20.230}$$

As μ^* is a outer measure we can use the Carathéodory [theorem: 20.200] so that

$$\mathcal{M}[\mu^*]=\left\{A\in\mathcal{P}(X)|\forall B\in\mathcal{P}(X)\text{ we have }\mu^*(B)=\mu^\star\left(B\bigcap A\right)+\mu^*(B\setminus A)\right\}$$

is a σ-algebra on X and

$$(\mu^*)_{|\mathcal{M}[\mu^*]}:\mathcal{M}[\mu^*]\to[0,\infty]\text{ is a measure on the }\sigma\text{-algebra }\mathcal{M}[\mu^*]\tag{20.231}$$

so that

$$\langle X, \mathcal{M}[\mu^*], (\mu^*)_{|\mathcal{M}[\mu^*]}\rangle \text{ a measure space} \tag{20.232}$$

Next we have to prove that $\mathcal{S} \subseteq \mathcal{M}[\mu^*]$. Let $R, T \in \mathcal{S}$ then as $\mathcal{S}$ is a semi-ring there exist a $m \in \mathbb{N}$, $\{S_i\}_{i\in\{1,\ldots,m\}} \subseteq \mathcal{S}$ pairwise disjoint such that

$$T \setminus R = \bigsqcup_{i\in\{1,\ldots,m\}} S_i \text{ and } R \bigcap T \in \mathcal{S} \tag{20.233}$$

Define now

$$\{D_i\}_{i\in\{1,\ldots,m+1\}} \subseteq \mathcal{S} \text{ by } D_i = \begin{cases} S_i \text{ if } i \in \{1,\ldots,m\} \\ R \bigcap T \text{ if } i = m+1 \end{cases} \in \mathcal{S}$$

Let $i, j \in \{1,\ldots,m+1\}$ with $i \neq j$ then we may always assume that $i < j$ [otherwise exchange i and j], so that we have the following possibilities for j:

$j = m+1$. Then, as $i < j$, $i \in \{1,\ldots,m\}$ so that

$$\begin{aligned} D_i \bigcap D_j &= S_i \bigcap (R \bigcap T) \\ &\subseteq \left(\bigsqcup_{i\in\{1,\ldots,m\}} S_i\right) \bigcap (R \bigcap T) \\ &\underset{\text{[eq: 20.233]}}{=} (T \setminus R) \bigcap (R \bigcap T) \\ &\subseteq (T \setminus R) \bigcap R \\ &= \varnothing \end{aligned}$$

henve we have $D_i \bigcap D_j = \varnothing$.

$j \in \{1,\ldots,m\}$. Then, as $i < j$, $i \in \{1,\ldots,m\}$ so that $D_i \bigcap D_j = S_i \bigcap S = \varnothing$

which proves that

$$\{D_i\}_{i\in\{1,\ldots,m+1\}} \subseteq \mathcal{S} \text{ is pairwise disjoint}$$

Further

$$\begin{aligned} T &= (T \setminus R) \bigcup (T \bigcap R) \\ &= \left(\bigcup_{i\in\{1,\ldots,m\}} S_i\right) \bigcup (T \bigcap R) \\ &= \left(\bigcup_{i\in\{1,\ldots,m\}} D_i\right) \bigcup D_{m+1} \\ &= \bigsqcup_{i\in\{1,\ldots,m+1\}} D_i \end{aligned}$$

Hence

$$\bigsqcup_{i\in\{1,\ldots,m+1\}} D_i = T \in \mathcal{S} \tag{20.234}$$

As by [theorem: 20.220] μ is additive on S we have

$$\begin{aligned} \mu(T) &\underset{\text{[eq: 20.234]}}{=} \mu\left(\bigsqcup_{i\in\{1,\ldots,m+1\}} D_i\right) \\ &\underset{\mu \text{ is additive}}{=} \sum_{i=1}^{m+1} \mu(D_i) \\ &= \mu(D_{m+1}) + \sum_{i=1}^{m} \mu(D_i) \\ &= \mu(R \bigcap T) + \sum_{i=1}^{m} \mu(S_i) \end{aligned}$$

hence

$$\mu(T)=\mu\big(R\bigcap T\big)+\sum_{i=1}^{m}\mu(S_i) \tag{20.235}$$

Further as a outer measure is sub-additive [see definition: 20.195 and theorem: 20.122] we have

$$\begin{aligned}\mu^*\big(R\bigcap T\big)+\mu^*(T\setminus R) &\underset{\text{[eq: 20.233]}}{=} \mu^*\big(R\bigcap T\big)+\mu^*\left(\bigsqcup_{i\in\{1,\dots,m\}} S_i\right)\\ &\underset{\text{sub-additivity of }\mu^*}{\leqslant} \mu^*\big(R\bigcap T\big)+\sum_{i=1}^{m}\mu^*(S_i)\\ &\underset{\text{[eq: 20.230]}}{=} \mu\big(R\bigcap T\big)+\sum_{i=1}^{m}\mu(S_i)\\ &\underset{\text{[eq: 20.235]}}{=} \mu(T)\end{aligned}$$

To summarize we have proved the following:

$$\forall R,S\in\mathcal{S} \text{ we have that } \mu^*\big(R\bigcap T\big)+\mu^*(T\setminus R)\leqslant\mu(T) \tag{20.236}$$

Let $A\in\mathcal{S}$ and take $B\in\mathcal{P}(X)$. For B we have either:

$\mathcal{S}[B]=\varnothing$. Then $\mu^\star(B\setminus A)+\mu^*(B\bigcap A)\leqslant\infty=\mu^*(B)$

$\mathcal{S}[B]\neq 0$. Let $\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[B]$ then we have

$$\begin{aligned}\sum_{i=1}^{\infty}\mu^*\big(A_i\bigcap A\big)+\sum_{i=1}^{\infty}\mu^*(A_i\setminus A) &\underset{\text{[theorem: 20.91]}}{=}\\ \sum_{i=1}^{\infty}\big(\mu^*\big(A_i\bigcap A\big)+\mu^*(A_i\setminus A)\big) &\underset{\text{[theorem: 20.91] and [eq: 20.236]}}{\leqslant} \sum_{i=1}^{\infty}\mu(A_i)\end{aligned} \tag{20.237}$$

As $\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[B]$ we have $B\subseteq\bigcup_{i\in\mathbb{N}}A_i$ so that

$$B\setminus A\subseteq\left(\bigcup_{i\in\mathbb{N}}A_i\right)\setminus A=\bigcup_{i\in\mathbb{N}}(A_i\setminus A) \text{ and } B\bigcap A\subseteq\left(\bigcup_{i\in\mathbb{N}}A_i\right)\bigcap A=\bigcup_{i\in\mathbb{N}}\big(A_i\bigcap A\big)$$

As μ^* is a outer measure hence monotone by definition [see definition: 20.195(2)] it follows from the above that

$$\mu^*(B\setminus A)\leqslant\mu^*\left(\bigcup_{i\in\mathbb{N}}(A_i\setminus A)\right) \text{ and } \mu^*\big(B\bigcap A\big)\leqslant\mu^*\left(\bigcup_{i\in\mathbb{N}}\big(A_i\bigcap A\big)\right) \tag{20.238}$$

Further using the sub-additivity of a outer measure [see definition: 20.195(3)] we have

$$\mu^*\left(\bigcup_{i\in\mathbb{N}}(A_i\setminus A)\right)\leqslant\sum_{i=1}^{\infty}\mu^*(A_i\setminus A) \text{ and } \mu^*\left(\bigcup_{i\in\mathbb{N}}\big(A_i\bigcap A\big)\right)\leqslant\sum_{i=1}^{\infty}\mu^*\big(A_i\bigcap A\big)$$

which combined with [eq: 20.238] gives

$$\mu^*(B\setminus A)\leqslant\sum_{i=1}^{\infty}\mu^*(A_i\setminus A) \text{ and } \mu^*\big(B\bigcap A\big)\leqslant\sum_{i=1}^{\infty}\mu^*\big(A_i\bigcap A\big)$$

so that

$$\begin{aligned}\mu^*(B\setminus A)+\mu^*\big(B\bigcap A\big) &\leqslant \sum_{i=1}^{\infty}\mu^*(A_i\setminus A)+\sum_{i=1}^{\infty}\mu^*\big(A_i\bigcap A\big)\\ &\underset{\text{[eq: 20.237]}}{\leqslant} \sum_{i=1}^{\infty}\mu(A_i)\end{aligned}$$

So $\mu^*(B\setminus A)+\mu^*(B\bigcap A)$ is a lower bound for $\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[B]\}$ so that

$$\mu^*(B\setminus A)+\mu^*\big(B\bigcap A\big)\leqslant\inf\left(\left\{\sum_{i=1}^{\infty}\mu(A_i)|\{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[B]\right\}\right)\underset{\text{[eq: 20.228]}}{=}\mu^*(B)$$

So in all cases we have that $\mu^*(B\setminus A)+\mu^*(B\bigcap A)\leqslant\mu^*(B)$ which by [theorem: 20.198] means that $A\in\mathcal{M}[\mu^*]$. As $A\in\mathcal{S}$ was chosen arbitrary we conclude that

$$\mathcal{S}\subseteq\mathcal{M}[\mu^*] \tag{20.239}$$

As $\mathcal{M}[\mu^*]$ is a σ-algebra it follows from [theorem: 20.141] that

$$\mathcal{S}\subseteq\sigma[\mathcal{S}]\subseteq\mathcal{M}[\mu^*] \tag{20.240}$$

From the above, [eq: 20.231] and [theorem: 20.185] it follows that

$$(\mu^*)_{|\sigma[\mathcal{S}]}\underset{\text{[theorem: 2.86 (3)]}}{=}((\mu^*)_{|\mathcal{M}[\mu^*]})_{|\sigma(\mathcal{S})}\text{ is a measure on }\sigma[\mathcal{S}]$$

making

$$\langle X,\sigma[\mathcal{S}],(\mu^*)_{|\sigma[\mathcal{S}]}\rangle\text{ a measure space}$$

Finally assume additional that there exist a $\{G_i\}_{i\in\mathbb{N}}\subseteq\mathcal{S}$ such that $\forall i\in\mathbb{N}\ G_i\subseteq G_{i+1}\wedge\mu(G_i)<\infty$. Let $\nu:\sigma[\mathcal{S}]\to[0,\infty]$ be a measure such that $\forall A\in\mathcal{S}$ we have $\mu(A)=\nu(A)$ then as $(\mu^*)_{|\sigma[\mathcal{S}]}(A)=\mu^*(A)\underset{\text{[eq: 20.230]}}{=}\mu(A)$ it follows that $\forall A\in\mathcal{S}\ (\mu^*)_{|\sigma[\mathcal{S}]}(A)=\nu(A)$. Hence by [theorem: 20.209] it follows that

$$(\mu^*)_{|\sigma[\mathcal{S}]}=\nu$$

proving uniqueness. □

20.4.4.2 Contents and pre-measures

So given a pre-measure μ on a semi-ring $\mathcal{S}$ we can extend μ to a measure on $\sigma[\mathcal{S}]$ and from there to a measure on $\mathcal{M}[\mathcal{S}]$. In the next section we show a way of proving that a additive set-function on a ring [see definition: 20.123] can be extended [if certain conditions are satisfied] to a pre-measure. First we show that every ring is actually a semi-ring.

Theorem 20.227. *Let X be a set, $\mathcal{R}\subseteq\mathcal{P}(X)$ a ring [see definition: 20.123] then $\mathcal{R}$ is a semi-ring [see definition: 20.214].*

Proof. As $\mathcal{R}$ is a ring we have by [theorem: 20.126] that

$$\varnothing\in\mathcal{R}\text{ and }\forall A,B\in\mathcal{R}\text{ we have }A\bigcap B\in\mathcal{R}$$

Further if $A,B\in\mathcal{R}$ then by the definition of a ring [see definition: 20.123] $A\setminus B\in\mathcal{R}$. So if we define $\{A_i\}_{i\in\{1\}}\subseteq\mathcal{R}$ by $A_1=A\setminus B$ we have that $A\setminus B=\bigsqcup_{i\in\{1\}}A_i$. Hence we have proved that

$$\forall A,B\in\mathcal{R}\ \ \exists\{A_i\}_{i\in\{1,\dots,m\}}\subseteq\mathcal{R}\text{ pairwise disjointsuch that }A\setminus B=\bigsqcup_{i\in\{1,\dots,m\}}A_i$$ □

Next we define what a **content** is.

Definition 20.228. *Let X be a set, $\mathcal{S}\subseteq\mathcal{P}(X)$ a semi-ring then $\mu:\mathcal{S}\to[0,\infty]$ is a **content** on $\mathcal{S}$ if*

1. $\mu(\varnothing)=0$
2. $\forall\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ *pairwise disjoint such that* $\bigsqcup_{i\in\{1,\dots,n\}}A_i\in\mathcal{S}$ *we have* $\mu\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)=\sum_{i=1}^n\mu(A_i)$.

*A content is **finite** if $\forall A\in\mathcal{S}\ \mu(A)<\infty$.*

***Note* 20.229.** *If $\mathcal{S}$ is a ring then (2) can be replaced by*

$$\forall\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S},\ n\in\mathbb{N}\text{ we have }\mu\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)=\sum_{i=1}^n\mu(A_i)$$

because [theorem: 20.126] ensures that $\bigsqcup_{i\in\{1,\dots,n\}}A_i\in\mathcal{S}$.

Lemma 20.230. *Let X be a set $\mathcal{S}\subseteq\mathcal{P}(X)$ a semi-ring then a pre-measure $\mu:\mathcal{S}\to[0,\infty]$ is a content*

Proof. From the definition of a pre-measure [see definition: 20.217] it follows that

$$\mu(\varnothing)=0$$

Further $\forall\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{S}, n\in\mathbb{N}$ pairwise disjoint such that $\bigsqcup_{i\in\{1,\ldots,n\}}A_i\in\mathcal{S}$ we have by [theorem: 20.220] that

$$\mu\left(\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)=\sum_{i=1}^{n}\mu(A_i)$$

□

We have a simpler equivalent definition of a content on a ring.

Theorem 20.231. *Let X be a set, $\mathcal{R}$ a ring on X and $\mu:\mathcal{R}\to[0,\infty]$ a function such that $\mu(\varnothing)=0$ [in other words μ is a proto-measure] then*

$$\mu \text{ is a content} \Leftrightarrow \forall A,B\in\mathcal{R} \text{ with } A\bigcap B=\varnothing \text{ we have } \mu\big(A\bigsqcup B\big)=\mu(A)+\mu(B)$$

Proof.

⇒. Let $A,B\in\mathcal{R}$ with $A\bigcap B=\varnothing$ and define $\{A_i\}_{i\in\{1,2\}}\subseteq\mathcal{R}$ by $A_1=A$ and $A_2=B$, then $\{A_i\}_{i\in\{1,2\}}$ is pairwise disjoint and $\mu(A\bigsqcup B)=\mu\big(\bigcup_{i\in\{1,2\}}A_i\big)=\sum_{i=1}^{2}\mu(A_i)=\mu(A)+\mu(B)$.

⇐. We prove this by induction so let

$$\mathcal{S}=\{n\in\mathbb{N}|\text{if } \{A_i\}_{i\in\{1,\ldots,n\}} \text{ is a pairwise disjoint family of sets in } \mathcal{R}\}$$

then we have

$1\in\mathcal{S}$. If $\{A_i\}_{i\in\{1,\ldots,1\}}$ is a pairwise disjoint family of sets in $\mathcal{R}$ then

$$\mu\left(\bigsqcup_{i\in\{1,\ldots,1\}}A_i\right)=\mu(A_1)=\sum_{i=1}^{1}\mu(A_i)$$

proving that $1\in\mathcal{S}$.

$n\in\mathcal{S}\Rightarrow n+1\in\mathcal{S}$. If $\{A_i\}_{i\in\{1,\ldots,n+1\}}$ is a pairwise disjoint family of sets in $\mathcal{R}$ then we have $\bigsqcup_{i\in\{1,\ldots,n+1\}}A_i=\big(\bigsqcup_{i\in\{1,\ldots,n\}}A_i\big)\bigsqcup A_{n+1}$ so that

$$\begin{aligned}
\mu\left(\bigsqcup_{i\in\{1,\ldots,n+1\}}A_i\right) &= \mu\left(\bigsqcup_{i\in\{1,\ldots,n+1\}}A_i\right)\\
&= \mu\left(\left(\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)\bigsqcup A_{n+1}\right)\\
&= \mu\left(\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)+\mu(A_{n+1})\\
&\underset{n\in\mathcal{S}}{=} \left(\sum_{i=1}^{n}\mu(A_i)\right)+\mu(A_{n+1})\\
&= \sum_{i=1}^{n+1}\mu(A_i)
\end{aligned}$$

proving that $n+1\in\mathcal{S}$. □

A content has the following properties:

Theorem 20.232. *Let X be a set, $\mathcal{R}$ a ring on X and $\mu:\mathcal{R}\to[0,\infty]$ a content on $\mathcal{R}$ then we have:*

1. *$\forall A,B\in\mathcal{R}$ we have $\mu(A\bigcup B)+\mu(A\bigcap B)=\mu(A)+\mu(B)$*
2. *$\forall A,B\in\mathcal{R}$ with $A\subseteq B$ we have $\mu(A)\leqslant\mu(B)$ [μ is monotone].*
3. *$\forall A,B\in\mathcal{R}$ with $A\subseteq B$ and $\mu(A)<\infty$ we have $\mu(B\setminus A)=\mu(B)-\mu(A)$.*
4. *$\forall\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{R}$, $n\in\mathbb{N}$ we have $\mu\big(\bigcup_{i\in\{1,\ldots,n\}}A_i\big)\leqslant\sum_{i=1}^{n}\mu(A_i)$ [sub-additivity]*
5. *$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ pairwise disjoint such that $\bigsqcup_{i\in\mathbb{N}}A_i\in\mathcal{R}$ we have $\sum_{i=1}^{\infty}\mu(A_i)\leqslant\mu(\bigsqcup_{i\in\mathbb{N}}A_i)$.*

Proof. First as $\mathcal{R}$ is a ring we have that $\forall A, B \in \mathcal{R}\ B \setminus A \in \mathcal{R}$, further

1. As $A \bigcup (B \setminus A) \underset{\text{[theorem: 1.35]}}{=} A \bigcup B$ with $A \bigcap (B \setminus A) \underset{\text{[theorem: 1.35]}}{=} \varnothing$ and μ is a content we have
$$\mu\left(A \bigcup B\right) = \mu(A) + \mu(B \setminus A) \tag{20.241}$$
Further $B \underset{\text{[theorem: 1.35]}}{=} (A \bigcap B) \bigcup (B \setminus A)$ with $(A \bigcap B) \bigcap (B \setminus A) \underset{\text{[theorem: 1.35]}}{=} \varnothing$ so that
$$\mu(B) = \mu\left(A \bigcap B\right) + \mu(B \setminus A) \tag{20.242}$$
For $\mu(B \setminus A)$ we have either:
   $\mu(B \setminus A) < \infty$. As μ is non negative we can sum [eq: 20.241] and [eq: 20.242] giving
$$\mu\left(A \bigcup B\right) + \mu\left(A \bigcap B\right) + \mu(B \setminus A) = \mu(B) + \mu(A) + \mu(B \setminus A)$$
   and we can use [theorem: 20.28] to get
$$\mu\left(A \bigcup B\right) + \mu\left(A \bigcap B\right) = \mu(B) + \mu(A)$$
   $\mu(B \setminus A) = \infty$. Then
$$\mu\left(A \bigcup B\right) \underset{\text{[eq: 20.241]}}{=} \mu(A) + \mu(B \setminus A) = \mu(A) + \infty = \infty$$
   and
$$\mu(B) \underset{\text{[eq: 20.242]}}{=} \mu\left(A \bigcap B\right) + \mu(B \setminus A) = \mu\left(A \bigcap B\right) + \infty = \infty$$
   so that
$$\mu\left(A \bigcup B\right) + \mu\left(A \bigcap B\right) = \infty + \mu\left(A \bigcap B\right) = \infty = \mu(A) + \infty = \mu(A) + \mu(B)$$
So in all cases we have
$$\mu\left(A \bigcup B\right) + \mu\left(A \bigcap B\right) = \mu(B) + \mu(A)$$
2. If $A, B \in \mathcal{R}$ with $A \subseteq B$ then $A \bigcup B = B$ so that
$$\mu(B) = \mu\left(A \bigcup B\right) \underset{\text{[eq: 20.241]}}{=} \mu(A) + \mu(B \setminus A) \tag{20.243}$$
then by [theorem: 20.32] it follows that
$$\mu(A) \leqslant \mu(B)$$
3. As $A \subseteq B$ we have by [eq: 20.243] that $\mu(B) = \mu(A) + \mu(B \setminus A)$ so as $\mu(A) < \infty$ we can safely add $-\mu(A)$ to both sides giving
$$\mu(B) - \mu(A) = \mu(A) + \mu(B \setminus A) - \mu(A) = \mu(B \setminus A)$$
4. Let $\{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{R}$ and define
$$\{B_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{R} \text{ by } B_i = \begin{cases} A_1 \text{ if } i = 1 \\ A_i \setminus \bigcup_{j \in \{1, \ldots, i-1\}} A_j \end{cases} \underset{\mathcal{R} \text{ is a ring and [theorem: 20.126]}}{\in} \mathcal{R}$$
so that
$$\{B_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{R} \text{ and } \forall i \in \{1, \ldots, n\}\ B_i \subseteq A_i \underset{(2)}{\Rightarrow} \mu(B_i) \leqslant \mu(A_i) \tag{20.244}$$
Using [lemma: 20.108] we have that
$$\{B_i\}_{i \in \{1, \ldots, n\}} \text{ is pairwise disjoint and } \bigcup_{i \in \{1, \ldots, n\}} A_i = \bigsqcup_{i \in \{1, \ldots, n\}} B_i \tag{20.245}$$
Hence
$$\begin{aligned} \mu\left(\bigcup_{i \in \{1, \ldots, n\}} A_i\right) &\underset{\text{[eq: 20.245]}}{=} \mu\left(\bigsqcup_{i \in \{1, \ldots, n\}} B_i\right) \\ &\underset{\text{[definition: 20.228]}}{=} \sum_{i=1}^{n} \mu(B_i) \\ &\underset{\text{[eq: 20.244]}}{\leqslant} \sum_{i=1}^{n} \mu(A_i) \end{aligned}$$

5. Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ be a pairwise disjoint sequence of sets in $\mathcal{R}$ such that $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{R}$. Let $n\in\mathbb{N}$ then we have $\bigsqcup_{i\in\{1,\dots,n\}}A_i\subseteq\bigsqcup_{i\in\mathbb{N}}A_i$ so that
$$\sum_{i=1}^{n}\mu(A_i)\underset{\text{[definition: 20.228]}}{=}\mu\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\underset{(2)}{\leqslant}\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)\tag{20.246}$$
Hence $\mu(\bigcup_{i\in\mathbb{N}}A_i)$ is a upper bound of $\{\sum_{i=1}^{n}\mu(A_i)|n\in\mathbb{N}\}$ so that
$$\sup\left(\left\{\sum_{i=1}^{n}\mu(A_i)|n\in\mathbb{N}\right\}\right)\leqslant\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)$$
Hence
$$\sum_{i=1}^{\infty}\mu(A_i)\underset{\text{[definition: 20.87]}}{=}\sup\left(\left\{\sum_{i=1}^{n}\mu(A_i)|n\in\mathbb{N}\right\}\right)\leqslant\mu\left(\bigcup_{i\in\mathbb{N}}A_i\right)$$
□

Similar to [theorems: 20.193, 20.194] we have the following neccesary and sufficient conditions for a content to be a pre-measure.

Theorem 20.233. *Let X be a set, $\mathcal{R}\subseteq X$ a ring on X and $\mu:\mathcal{R}\to[0,\infty]$ a content then for the following statements:*

1. *μ is a pre-measure*
2. *$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ such that $\forall i\in\mathbb{N}\ A_i\subseteq A_{i+1}$ and $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{R}$ we have $\mu(\bigcup_{i\in\mathbb{N}}A_i)=\lim_{i\to\infty}\mu(A_i)$.*
3. *$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ such that $\forall i\in\mathbb{N}\ A_{i+1}\subseteq A_i$ and $\mu(A_i)<\infty$ and $\bigcap_{i\in\mathbb{N}}A_i\in\mathcal{R}$ we have $\mu(\bigcap_{i\in\mathbb{N}}A_i)=\lim_{i\to\infty}\mu(A_i)$.*
4. *$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ such that $\forall i\in\mathbb{N}\ A_{i+1}\subseteq A_i$ and $\mu(A_i)<\infty$ and $\bigcap_{i\in\mathbb{N}}A_i=\varnothing$ we have $\lim_{i\to\infty}\mu(A_i)=0$.*

we have $(1)\Leftrightarrow(2)\Rightarrow(3)\Leftrightarrow(4)$, Further if μ is finite then $(1)\Leftrightarrow(2)\Leftrightarrow(3)\Leftrightarrow(4)$

Proof. First as $\mathcal{R}$ is a ring we have by [theorem: 20.126] that
$$\forall\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{R}\ \bigcup_{i\in\{1,\dots,n\}}A_i\in\mathcal{R}\text{ and }\bigcap_{i\in\{1,\dots,n\}}A_i\in\mathcal{R}\tag{20.247}$$

(1) ⇒ (2). Let$\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ be such that $\forall i\in\mathbb{N}\ A_i\subseteq A_{i+1}$ and $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{R}$. Define
$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}\text{ by }B_i=\begin{cases}A_1\text{ if }i=1\\A_i\setminus A_{i-1}\text{ if }i\in\{2,\dots,\infty\}\end{cases}\underset{\mathcal{R}\text{ is a ring}}{\in}\mathcal{R}$$
Then by the above definition we have
$$\forall i\in\mathbb{N}\ B_i\subseteq A_i\tag{20.248}$$
Let $i,j\in\mathbb{N}$ with $i\neq j$. We may always assume that $i<j$ [otherwise exchange i and j], then for i we have either

$i=1$. Then $1<j$ so that $B_1=A_1$ and $B_j=A_j\setminus A_{j-1}$. As $1<j\Rightarrow 1\leqslant j-1$ we have $A_1\subseteq A_{j-1}$ so that by [theorem: 1.33] $B_j=A_j\setminus A_{j-1}\subseteq A_j\setminus A_1=A_j\setminus B_1$. Hence
$$B_i\bigcap B_j=B_1\bigcap(A_j\setminus B_1)=\varnothing$$

$i\in\{2,\dots,\infty\}$. Then $i,j\in\{2,\dots,\infty\}$ so that $B_i=A_i\setminus A_{i-1}\wedge B_j=A_j\setminus A_{j-1}$. As $i<j\Rightarrow i\leqslant j-1$ we have $B_i\subseteq A_i\subseteq A_{j-1}$ so that by [theorem: 1.33] $B_j=A_j\setminus A_{j-1}\subseteq A_j\setminus B_i$. Hence
$$B_j\bigcap B_i\subseteq(A_j\setminus B_i)\bigcap B_i=\varnothing$$
Hence it follows that
$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}\text{ is pairwise disjoint}\tag{20.249}$$
Let $n\in\mathbb{N}$. As $\forall i\in\{1,\dots,n\}$ we have $B_i\underset{\text{[eq: 20.248]}}{\subseteq}A_i\subseteq A_n$ so that
$$\bigsqcup_{i\in\{1,\dots,n\}}B_i\subseteq A_n\tag{20.250}$$

If $x \in A_n$ then $n \in \{i \in \{1, \ldots, n\} | x \in A_i\}$ a finite set so that $j = \min(\{i \in \{1, \ldots, n\} | x \in A_i\})$ exists. For j we have either:

$j = 1$. Then $x \in A_1 = B_1$ so that $x \in \bigsqcup_{i \in \{1, \ldots, n\}} B_i$

$1 < j$. Then $x \in A_j$ and $x \notin A_{j-1}$ so that $x \in A_j \setminus A_{j-1} = B_j \subseteq \bigsqcup_{i \in \{1, \ldots, n\}} B_i$

hence $A_n \subseteq \bigsqcup_{i \in \{1, \ldots, n\}} B$ which combined with [eq: 20.250] we have

$$\forall n \in \mathbb{N} \text{ we have } A_n = \bigsqcup_{i \in \{1, \ldots, n\}} B_i \tag{20.251}$$

Let $x \in \bigcup_{n \in \mathbb{N}} A_n$ then $\exists n \in \mathbb{N}$ so that $x \in A_n$ and by [eq: 20.251] $\exists m \in \{1, \ldots, n\} \subseteq \mathbb{N}$ such that $x \in B_m$, hence $\bigcup_{n \in \mathbb{N}} A_n \subseteq \bigcup_{i \in \mathbb{N}} B_i$. As also $B_n \underset{\text{[eq: 20.248]}}{\subseteq} A_n \subseteq \bigcup_{n \in \mathbb{N}} A_n$ it follows that

$$\bigsqcup_{i \in \mathbb{N}} B_i = \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{S} \tag{20.252}$$

As μ is a pre-measure hence countable additive we have that

$$\begin{aligned}
\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) &= \mu\left(\bigsqcup_{i \in \mathbb{N}} B_i\right) \\
&= \sum_{i=1}^{\infty} \mu(B_i) \\
&\underset{\text{[definition: 20.87]}}{=} \lim_{i \to \infty} \sum_{j=1}^{i} \mu(B_i) \\
&\underset{\text{[theorem: 20.220]}}{=} \lim_{i \to \infty} \mu\left(\bigcup_{j=1}^{i} B_j\right) \\
&\underset{\text{[eq: 20.251]}}{=} \lim_{i \to \infty} \mu(A_i)
\end{aligned}$$

Hence we have

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \lim_{i \to \infty} \mu(A_i)$$

(2) $\Rightarrow$ (1). As for a content $\mu(\varnothing) = 0$ we only have to prove countable additivity. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ be a pairwise disjoint sequence of sets in $\mathcal{R}$ such that $\bigcup_{i \in \mathbb{N}} A_i$. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R} \text{ by } B_i = \bigsqcup_{j \in \{1, \ldots, i\}} A_j$$

Then we have

$$\forall i \in \mathbb{N}\ B_i = \bigsqcup_{j \in \{1, \ldots, i\}} A_i \subseteq \left(\bigsqcup_{j \in \{1, \ldots, i\}} A_i\right) \bigcup A_{i+1} = \bigsqcup_{j \in \{1, \ldots, i+1\}} A_i = B_{i+1} \tag{20.253}$$

If $x \in \bigsqcup_{i \in \mathbb{N}} A_i$ then $\exists i \in \mathbb{N}$ such that $x \in A_i \subseteq \bigsqcup_{j \in \{1, \ldots, i\}} A_i = B_i \subseteq \bigcup_{i \in \mathbb{N}} B_i$, hence $\bigcup_{i \in \mathbb{N}} A_i \subseteq \bigcup_{i \in \mathbb{N}} B_i$, as also $B_i = \bigcup_{j \in \{1, \ldots, i\}} A_j \subseteq \bigcup_{j \in \mathbb{N}} B_j$ it follows that $\bigcup_{i \in \mathbb{N}} B_i \subseteq \bigcup_{j \in \mathbb{N}} B_j$. Hence

$$\bigcup_{i \in \mathbb{N}} B_i = \bigsqcup_{i \in \mathbb{N}} A_i \in \mathcal{R} \tag{20.254}$$

Using (1) together with [eqs: 20.253, 20.254] it follows that

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \lim_{i \to \infty} \mu(B_i) = \lim_{i \to \infty} \mu\left(\bigsqcup_{j \in \{1, \ldots, i\}} A_j\right) \tag{20.255}$$

A μ is a content hence additive we have $\forall i \in \mathbb{N}$ that $\mu\left(\bigsqcup_{j \in \{1, \ldots, i\}} A_j\right) = \sum_{j=1}^{i} \mu(A_j)$ so that by the above

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \lim_{i \to \infty} \sum_{j=1}^{i} \mu(A_j) \underset{\text{[theorem: 20.87]}}{=} \sum_{i=1}^{\infty} \mu(A_i)$$

Finally using [eq: 20.254] it follows that

$$\mu\left(\bigsqcup_{i\in\mathbb{N}} A_i\right)=\sum_{i=1}^{\infty}\mu(A_i)$$

proving countable additivity.

(2) ⇒ (3). Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ such that $\forall i\in\mathbb{N}\ \mu(A_i)<\infty$, $A_{i+1}\subseteq A_i$ and $\bigcap_{i\in\mathbb{N}}A_i\in\mathcal{R}$. Define

$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}\text{ by }B_i=A_1\setminus A_i\underset{\mathcal{R}\text{ is a ring}}{\in}\mathcal{R}$$

Then we have

$$\forall i\in\mathbb{N}\ B_i=A_1\setminus A_i\underset{\text{[theorem: 1.33]}}{\subseteq}A_1\setminus A_{i+1}=B_i \tag{20.256}$$

and

$$A_1\setminus\left(\bigcap_{i\in\mathbb{N}}A_i\right)\underset{\text{[theorem: 2.132]}}{=}\bigcup_{i\in\mathbb{N}}(A_1\setminus A_i)=\bigcup_{i\in\mathbb{N}}B_i \tag{20.257}$$

As $\mathcal{R}$ is a ring and $A_1,\bigcap_{i\in\mathbb{N}}A_i\in\mathcal{R}$ we have that $\bigcup_{i\in\mathbb{N}}B_i=A_1\setminus(\bigcap_{i\in\mathbb{N}}A_i)\in\mathcal{R}$. Hence we can apply (2)

$$\mu\left(A_1\setminus\bigcap_{i\in\mathbb{N}}A_i\right)=\mu\left(\bigcup_{i\in\mathbb{N}}B_i\right)\underset{(2)}{=}\lim_{i\to\infty}\mu(B_i)=\lim_{i\to\infty}\mu(A_1\setminus A_i) \tag{20.258}$$

Let $i\in\mathbb{N}$ then $\bigcap_{i\in\mathbb{N}}A_i\subseteq A_i$ so that by [theorem: 20.232 (2)] $\mu(\bigcap_{i\in\mathbb{N}}A_i)\leqslant\mu(A_i)<\infty$, further we have $A_1\setminus A_i\subseteq A_1\Rightarrow\mu(A_1\setminus A_i)\leqslant\mu(A_1)<\infty$. Hence using [theorem: 20.232(3)] we have

$$\forall i\in\mathbb{N}\text{ that }\mu(B_i)=\mu(A_1\setminus A_i)=\mu(A_1)-\mu(A_i) \tag{20.259}$$

and

$$\mu\left(\bigcup_{i\in\mathbb{N}}B_i\right)\underset{\text{[eq: 20.257]}}{=}\mu\left(A_1\setminus\bigcap_{i\in\mathbb{N}}A_i\right)=\mu(A_1)-\mu\left(\bigcap_{i\in\mathbb{N}}A_i\right) \tag{20.260}$$

So

$$\begin{aligned}\mu(A_1)-\mu\left(\bigcap_{i\in\mathbb{N}}A_i\right)&\underset{\text{[eqs: 20.258, 20.260]}}{=}\lim_{i\to\infty}\mu(A_1\setminus A_i)\\&\underset{\text{[eq; 20.259]}}{=}\lim_{i\to\infty}(\mu(A_1)-\mu(A_i))\\&\underset{\text{[theorem: 20.78]}}{=}\mu(A_1)-\lim_{i\to\infty}\mu(A_i)\end{aligned}$$

As $\mu(A_1)<\infty\Rightarrow\mu(A_1)\in\mathbb{R}$ we can safely subtract $\mu(A)$ from both sides from the above equation to get $-\mu\left(\bigcap_{i\in\mathbb{N}}A_i=-\lim_{i\to\infty}\mu(A_i)\right.$ from which it follows that

$$\mu\left(\bigcap_{i\in\mathbb{N}}A_i\right)=\lim_{i\to\infty}\mu(A_i)$$

(3) ⇒ (4). Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ be such that $\forall i\in\mathbb{N}\ A_{i+1}\subseteq A_i$ and $\mu(A_i)<\infty$ and $\bigcap_{i\in\mathbb{N}}A_i=\varnothing\in\mathcal{S}$ then by (3) we have

$$0=\mu(\varnothing)=\mu\left(\bigcap_{i\in\mathbb{N}}A_i\right)=\lim_{i\to\infty}\mu(A_i)$$

(4) ⇒ (3). Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}$ be such that $\forall i\in\mathbb{N}\ A_{i+1}\subseteq A_i$ and $\mu(A_i)<\infty$ and $\bigcap_{i\in\mathbb{N}}A_i\in\mathcal{R}$. Take $A=\bigcap_{i\in\mathbb{N}}A_i\in\mathcal{R}$ and define

$$\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{R}\text{ by }B_i=A_i\setminus A\underset{\mathcal{R}\text{ is a ring}}{\in}\mathcal{R}$$

then we have

$$\forall i\in\mathbb{N}\text{ that }B_{i+1}=A_{i+1}\setminus A\subseteq A_i\setminus A=B_i$$

Further we have

$$\varnothing=A\setminus A=\left(\bigcap_{i\in\mathbb{N}}A_i\right)\setminus A\underset{\text{[theorem: 2.133]}}{=}\bigcap_{i\in\mathbb{N}}(A_i\setminus A)=\bigcap_{i\in\mathbb{N}}B_i$$

Hence using (4) we have

$$0 = \lim_{i\to\infty} \mu(B_i) = \lim_{i\to\infty} (A_i \setminus A) \tag{20.261}$$

As $A = \bigcap_{i\in\mathbb{N}} A_i \subseteq A_i$ it follows from [theorem: 20.232(2)] that $\mu(A) \leqslant \mu(A_i) < \infty$, hence we have by [theorem: 20.232(3)] that

$$\forall i \in \mathbb{N} \text{ we have } \mu(A_i \setminus A) = \mu(A_i) - \mu(A) \tag{20.262}$$

Hence we have

$$\begin{aligned} 0 &\underset{\text{[eq: 20.261]}}{=} \lim_{i\to\infty} \mu(A_i \setminus A) \\ &\underset{\text{[eq: 20.262]}}{=} \lim_{i\to\infty} (\mu(A_i) - \mu(A)) \\ &\underset{\text{[theorem: 20.78]}}{=} \lim_{i\to\infty} \mu(A_i) - \mu(A) \end{aligned}$$

As $\mu(A) < \infty \Rightarrow \mu(A) \in \mathbb{R}$ we have

$$\mu\left(\bigcap_{i\in\mathbb{N}} A_i\right) = \mu(A) = \lim_{i\to\infty} \mu(A_i)$$

Now for the last part we have to prove that if μ is finite then $(4) \Rightarrow (2)$ [because then from $(1) \Leftrightarrow (2) \Rightarrow (3) \Leftrightarrow (4)$ it follows that $(1) \Leftrightarrow (2) \Leftrightarrow (3) \Leftrightarrow 4$].

(4) ⇒ (2). Let $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{R}$ is such that $\forall i \in \mathbb{N}$ we have $A_i \subseteq A_{i+1}$ and $\bigcup_{i\in\mathbb{N}} A_i \in \mathcal{R}$. Take $A = \bigcup_{i\in\mathbb{N}} A_i$ and define

$$\{B_i\}_{i\in\mathbb{N}} \subseteq \mathcal{R} \text{ by } B_i = A \setminus A_i \underset{\mathcal{R} \text{ is a ring}}{\in} \mathcal{R}$$

Then we have

$$\forall i \in \mathbb{N} \text{ that } B_{i+1} = A \setminus A_{i+1} \underset{\text{[theorem: 1.33]}}{\subseteq} A \setminus A_i = B_i \text{ and } \mu(B_i) \underset{\mu \text{ is finite}}{<} \infty$$

Further we have

$$\varnothing = A \setminus A = A \setminus \left(\bigcup_{i\in\mathbb{N}} A_i\right) \underset{\text{[theorem: 2.133]}}{=} \bigcap_{i\in\mathbb{N}} (A \setminus A_i) = \bigcap_{i\in\mathbb{N}} B_i$$

So using (4) we have that

$$\lim_{i\to\infty} \mu(A \setminus A_i) = \lim_{i\to\infty} \mu(B_i) = 0 \tag{20.263}$$

Let $i \in \mathbb{N}$ then, as $A_i \subseteq \bigcup_{i\in\mathbb{N}} A_i = A$ and $\mu(A_i) \underset{\mu \text{ is finite}}{<} \infty$, it follows from [theorem: 20.232(3)] that $\mu(A \setminus A_i) = \mu(A) - \mu(A_i)$. Hence we have

$$\begin{aligned} 0 &\underset{\text{[eq: 20.263]}}{=} \lim_{i\to\infty} \mu(A \setminus A_i) \\ &= \lim_{i\to\infty} (\mu(A) - \mu(A_i)) \\ &\underset{\text{[theorem: 20.78]}}{=} \mu(A) - \lim_{i\to\infty} \mu(A_i) \end{aligned}$$

As μ is finite it follows from the above that

$$\mu\left(\bigsqcup_{i\in\mathbb{N}} A_i\right) = \mu(A) = \lim_{i\to\infty} \mu(A_i)$$

□

The above equivalences allows us to determine if a content on a ring is a pre-measure. However this is not always simple. If we assume a ring on a topological space then proving becomes easier if we make use of the properties of the topological space. For this we introduce approximation by compact classes. First recap the definition of a compact class [see definition: 14.242].

Definition 20.234. *Let X be a set then $\mathcal{C} \subseteq \mathcal{P}(X)$ is a **compact class** if $\forall \{K_i\}_{i\in\mathbb{N}} \subseteq \mathcal{C}$ with $\bigcap_{i\in\mathbb{N}} K_i = \varnothing$ there exist a $N \in \mathbb{N}$ such that $\bigcap_{i\in\{1,\ldots,N\}} K_i = \varnothing$.*

We have then the following theorem that can be used to determine if a content is a pre-measure.

Theorem 20.235. *Let X be a set, $\mathcal{R}$ a ring on X and $\mu: X \to [0,\infty]$ a **finite** content. If there exist a compact class $\mathcal{C} \subseteq \mathcal{P}(X)$ such that $\forall A \in \mathcal{R}$ and $\forall \varepsilon \in \mathbb{R}^+$ we have that $\exists K_\varepsilon \in \mathcal{C}$ and $\exists A_\varepsilon \in \mathcal{R}$ such that*

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A \text{ and } \mu(A \setminus A_\varepsilon) < \varepsilon$$

then μ is a pre-measure. In other words if we can 'approximate' $\mathcal{R}$ by a complex class $\mathcal{C}$ then μ is a pre-measure.

Proof. Let $\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{R}$ be such that

$$\forall i \in \mathbb{N} \text{ we have } A_{i+1} \subseteq A_i \text{ and } \bigcap_{i\in\mathbb{N}} A_i = \varnothing \tag{20.264}$$

As μ is finite we have also

$$\forall i \in \mathbb{N} \text{ we have } \mu(A_i) < \infty \tag{20.265}$$

So if we prove that $\lim_{i\to\infty} \mu(A_i) = 0$ then it follows from [theorem: 20.233] that μ is a pre-measure. Let $\varepsilon \in \mathbb{R}^+$ and $n \in \mathbb{N}$ then by the assumption there exist a $K_{n,\varepsilon} \in \mathcal{C}$ and a $R_{n,\varepsilon} \in \mathcal{R}$ such that $R_{n,\varepsilon} \subseteq K_{n,\varepsilon} \subseteq A_n$ and $\mu(A \setminus R_{n,\varepsilon}) < \frac{\varepsilon}{2^n}$. Hence there exist a $\{K_{n,\varepsilon}\}_{n\in\mathbb{N}} \subseteq \mathcal{C}$ and $\{R_{n,e}\}_{n\in\mathbb{N}} \subseteq \mathcal{R}$ such that

$$\forall n \in \mathbb{N} \text{ we have } R_{n,\varepsilon} \subseteq K_{n,\varepsilon} \subseteq A_n \text{ and } \mu(A \setminus R_{n,\varepsilon}) < \frac{\varepsilon}{2^n} \tag{20.266}$$

Then we have

$$\bigcap_{n\in\mathbb{N}} K_{n,\varepsilon} \subseteq \bigcap_{n\in\mathbb{N}} A_n \underset{\text{[eq: 20.264]}}{=} \varnothing$$

so that by the definition of a compact class there exist a $N_\varepsilon \in \mathbb{N}$ such that $\bigcap_{n\in\{1,\dots,N_\varepsilon\}} K_{n,\varepsilon} = \varnothing$. As $\bigcap_{n\in\{1,\dots,N_\varepsilon\}} R_{n,\varepsilon} \underset{\text{[eq: 20.266]}}{\subseteq} \bigcap_{n\in\{1,\dots,N_\varepsilon\}} K_{n,\varepsilon}$ it follows that

$$\bigcap_{n\in\{1,\dots,N_\varepsilon\}} R_{n,\varepsilon} = \bigcap_{n\in\{1,\dots,N_\varepsilon\}} K_{n,\varepsilon} = \varnothing \tag{20.267}$$

Let $n \in \{1,\dots,N_\varepsilon\}$ then $A_{N_\varepsilon} \underset{\text{[eq: 20.264]}}{\subseteq} A_n$ so that $A_{N_\varepsilon} \subseteq \bigcap_{n\in\{1,\dots,N_\varepsilon\}} A_n \subseteq A_{N_\varepsilon}$ proving that

$$A_{N_\varepsilon} = \bigcap_{n\in\{1,\dots,N_\varepsilon\}} A_n \tag{20.268}$$

Let $x \in \bigcap_{n\in\{1,\dots,N_\varepsilon\}} A_n$. Assume that $x \notin \bigcup_{n\in\{1,\dots,N_\varepsilon\}} (A_n \setminus R_{n,\varepsilon})$ then $\forall n \in \{1,\dots,N_\varepsilon\}$ we have $x \notin A_n \setminus R_{n,\varepsilon}$, as $x \in \bigcap_{n\in\{1,\dots,N_\varepsilon\}} A_n \subseteq A_n$, it follows that $x \in R_{n,\varepsilon}$. So $x \in \bigcap_{n\in\{1,\dots,N_\varepsilon\}} R_{n,\varepsilon}$ contradicting [eq: 20.267]. Hence the assumption is wrong and we must have that $x \in \bigcup_{n\in\{1,\dots,N_\varepsilon\}} (A_n \setminus R_{n,\varepsilon})$ proving

$$A_{N_\varepsilon} \underset{\text{[eq: 20.268]}}{=} \bigcap_{n\in\{1,\dots,N_\varepsilon\}} A_n \subseteq \bigcup_{n\in\{1,\dots,N_\varepsilon\}} (A_n \setminus R_{n,\varepsilon}) \underset{\mathcal{R} \text{ is a ring}}{\in} \mathcal{R} \tag{20.269}$$

Hence using the above we have

$$\begin{aligned}
\mu(A_{N_\varepsilon}) &\underset{\text{[theorem: 20.232(2)]}\wedge\text{[eq:20.269]}}{\leqslant} \mu\left(\bigcup_{n\in\{1,\dots,N_\varepsilon\}} (A_n \setminus R_{n,\varepsilon})\right) \\
&\underset{\text{[definition: 20.228]}\wedge\text{[eq:20.269]}}{=} \sum_{i=1}^{N_\varepsilon} \mu(A_n \setminus R_{n,\varepsilon}) \\
&\underset{\text{[eq: 20.266]}}{\leqslant} \sum_{i=1}^{N_\varepsilon} \frac{\varepsilon}{2^n} \\
&= \varepsilon \cdot \sum_{i=1}^{N} \left(\frac{1}{2}\right)^n \\
&\underset{\text{[lemma: 14.352]}}{=} \varepsilon \cdot \left(\frac{1}{2}\right) \cdot \frac{1-\left(\frac{1}{2}\right)^n}{1-\frac{1}{2}} \\
&= \varepsilon \cdot \left(1 - \frac{1}{2^n}\right) \\
&< \varepsilon
\end{aligned}$$

So we have proved that

$$\forall \varepsilon \in \mathbb{R}^+ \text{ there exist a } N_\varepsilon \in \mathbb{N} \text{ such that } \forall n \in \{N_\varepsilon, \ldots, \infty\} \text{ we have } |\mu(A_n) - 0| = \mu(A_n) \leqslant \mu(A_{N_\varepsilon}) < \varepsilon$$

which proves that $\lim_{n\to\infty}{}_{\mathbb{R}}\mu(A_n) = 0$. Using the fact that μ is finite and [theorem: 20.74] it follows that

$$\lim_{n\to\infty} \mu(A_i) = 0$$

So using [theorem: 20.233] it follows that μ is a pre-measure. □

The above theorem is especially usefull if we have a ring on a topological Hausdorff space because every set of compact sets is a compact class [see theorem: 14.243]. This is expressed in the following theorem.

Theorem 20.236. *Let $\langle X, \mathcal{T}\rangle$ be a Hausdorff topological space,, $\mathcal{R}$ a ring on X and $\mu: X \to [0, \infty]$ a **finite** content. If $\forall A \in \mathcal{R}$ and $\forall \varepsilon \in \mathbb{R}^+$ we have that $\exists K_\varepsilon$ compact and $\exists A_\varepsilon \in \mathcal{R}$ such that*

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A \text{ and } \mu(A \setminus A_\varepsilon) < \varepsilon$$

then μ is a pre-measure.

Proof. If $\mathcal{C} = \{A \in \mathcal{P}(X) | A \text{ is compact}\}$ is the set of compact subsets of X then by [theorem: 14.243] $\mathcal{C}$ is a compact class. The proof follows then from [theorem: 20.235]. □

Proving that $\mathcal{R} \subseteq \mathcal{P}(X)$ is a ring is not always possible, especially proving that $\forall A, B \in \mathcal{R}$ we have that $A \setminus B \in \mathcal{R}$. For example the difference of two half-open intervals in $\mathcal{I}_{[[}$ is not always a half-open interval, hence $\mathcal{R}_{[[}$ is not a ring, however it will be proved later that $\mathcal{I}_{[[}$ is a semi-ring on $\mathbb{R}$. Luckely it turns out that a semi-ring with a content on it can easely be extended to a ring with a content on it. First we show how we can extend a semi-ring to a smallest ring containing the semi-ring.

Definition 20.237. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring on X then $\mathcal{R}[\mathcal{S}]$ is defined by*

$$\mathcal{R}[\mathcal{S}] = \left\{ \bigsqcup_{i\in\{1,\ldots,n\}} A_i | n \in \mathbb{N} \wedge \{A_i\}_{i\in\{1,\ldots,n\}} \subseteq S \text{ is pairwise disjoint} \right\}$$

***Note* 20.238.** *As for $A, B \in \mathcal{S}$ we have by definition of a semi-ring that $\exists \{C_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ pairwise disjoint such that $A \setminus B = \bigsqcup_{i\in\{1,\ldots,n\}} C_i$ it follows that*

$$\forall A, B \in \mathcal{S} \text{ we have } A \setminus B \in \mathcal{S}$$

To prove that $\mathcal{R}[\mathcal{S}]$ we have to prove that $\varnothing \in \mathcal{R}[\mathcal{S}]$ and $\forall A, B \in \mathcal{R}[\mathcal{S}]$ that $A \bigcup B \in \mathcal{R}[\mathcal{S}] \wedge A \setminus B \in \mathcal{R}[\mathcal{S}]$. We start with proving that $\forall A, B \in \mathcal{R}[\mathcal{S}]$ $A \bigcup B \in \mathcal{R}[\mathcal{S}]$ using the following two lemma's.

Lemma 20.239. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring on X, $A \in \mathcal{S}$ and $B \in \mathcal{R}[\mathcal{S}]$ then*

$$A \bigcup B \in \mathcal{R}[\mathcal{S}]$$

Proof. As $B \in \mathcal{R}[\mathcal{S}]$ there exist a pairwise disjoint $\{B_i\}_{i\in\{1,\ldots,,n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that

$$B = \bigsqcup_{i\in\{1,\ldots,n\}} B_i$$

Define

$$\{C_i\}_{i\in\{1,\ldots,n+1\}} \text{ by } C_i = \begin{cases} B_i \setminus A \text{ if } i \in \{1, \ldots, n\} \\ A \text{ if } i = n+1 \end{cases}$$

Then if $x \in A \bigcup B$ we have either:

***x* ∈ *A*.** Then $x \in C_{n+1} \subseteq \bigcup_{i\in\{1,\ldots,n+1\}} C_i$

***x* ∉ *A*.** Then we must have that $x \in B$ so that there exist a $i \in \{1, \ldots, n\}$ such that

$$x \in B_i \underset{x\in A}{\Rightarrow} x \in B_i \setminus A \in C_i \subseteq \bigcup_{i\in\{1,\ldots,n+1\}} C_i$$

proving that

$$A\bigcup B\subseteq\bigcup_{i\in\{1,\dots,n+1\}}C_i \tag{20.270}$$

Let $x\in\bigcup_{i\in\{1,\dots,n+1\}}C_i$ then there exist a $i\in\{1,\dots,n+1\}$ such that $x\in C_i$. For i we have either

$i\in\{1,\dots,n\}$. Then $x\in C_i=B_i\setminus A\subseteq B_i\subseteq\bigcup_{i\in\{1,\dots,n\}}B_i=B\subseteq A\bigcup B$

$i=n+1$. Then $x\in C_{n+1}=A\bigcup B$

hence $\bigcup_{i\in\{1,\dots,n+1\}}C_i\subseteq A\bigcup B$. Combining this with [eq: 20.270] results in

$$A\bigcup B=\bigcup_{i\in\{1,\dots,n+1\}}C_i \tag{20.271}$$

Let $i,j\in\{1,\dots,n+1\}$ with $i\neq j$ then for i we have either:

$i\in\{1,\dots,n\}$. Then for j we have either:

$j\in\{1,\dots,n\}$. Then $C_i\bigcap C_j=(B_i\setminus A)\bigcap(B_j\setminus A)\subseteq B_i\bigcap B_j=\varnothing$

$j=n+1$. Then $C_i\bigcap C_j=(B_i\setminus A)\bigcap A=\varnothing$

$i=n+1$. Then as $i\neq j$ we have that $j\in\{1,\dots,n\}$ so that $C_i\bigcap C_j=A\bigcap(B_j\setminus A)=\varnothing$

hence

$$\{C_i\}_{i\in\{1,\dots,n+1\}}\text{ is pairwise disjoint so that }A\bigcup B=\bigsqcup_{i\in\{1,\dots,n+1\}}C_i \tag{20.272}$$

Let $i\in\{1,\dots,n+1\}$ then we have either:

$i\in\{1,\dots,n\}$. As $A,B_i\in\mathcal{S}$ and S is a semi-ring there exist a pairwise disjoint $\{D_{i,j}\}_{j\in\{1,\dots,n_i\}}\subseteq\mathcal{S}$ such that $C_i=B_i\setminus A=\bigsqcup_{i\in\{1,\dots,n_i\}}D_{i,j}$.

$i=n+1$. Take $n_1=1$ and $\{D_{1,j}\}_{j\in\{1\}}\subseteq\mathcal{S}$ by $D_{1,1}=A$ so that $C_{n+1}=\bigsqcup_{i\in\{1,\dots,n_i\}}D_{1,j}$

Summarized we have that

$$\forall i\in\{1,\dots,n+1\}\ \exists\{D_{i,j}\}_{j\in\{1,\dots,n\}}\subseteq\mathcal{S}\text{ with }C_i=\bigsqcup_{i\in\{1,\dots,n_i\}}D_{i,j} \tag{20.273}$$

As $\bigcup_{i\in\{1,\dots,n+1\}}\{i\}\times\{1,\dots,n_i\}$ is finite by [theorems: 6.41, 6.36] there exists a bijection

$$\beta:\{1,\dots,N\}\to\bigcup_{i\in\{1,\dots,n+1\}}\{i\}\times\{1,\dots,n_i\} \tag{20.274}$$

Using [eqs: 20.272, 20.273 and 20.274] allows us to apply [theorem: 20.114] that

$$\{D_{\beta(i)_1\beta(i)2}\}_{i\in\{1,\dots,N\}}\subseteq\mathcal{S}\text{ is pairwise disjoint and }\bigsqcup_{i\in\{1,\dots,n+1\}}C_i=\bigsqcup_{i\in\{1,\dots,N\}}D_{\beta(i)_1,\beta(i)_2}$$

Hence using [eq: 20.272] it follows that $A\bigcup B=\bigsqcup_{i\in\{1,\dots,N\}}D_{\beta(i)_1,\beta(i)_2}$ which proves that

$$A\bigcup B\in\mathcal{S}[\mathcal{R}]$$

□

We use the above lemma in a proof by induction to prove that that $\mathcal{R}[\mathcal{S}]$ is $\cup$-stable.

Lemma 20.240. *Let X be a set, $\mathcal{S}\subseteq\mathcal{P}(X)$ a semi-ring on X and $A,B\in\mathcal{R}[\mathcal{S}]$ then $A\bigcup B\in\mathcal{R}[\mathcal{S}]$*

Proof. Let $B\in\mathcal{R}[\mathcal{S}]$ and define

$$\mathcal{S}_B=\left\{n\in\mathbb{N}|\text{If }\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}\text{ pairwise disjoint then }\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\bigcup B\in\mathcal{R}[\mathcal{S}]\right\}$$

then we have:

$1\in\mathcal{S}_B$. If $\{A_i\}_{i\in\{1\}}\subseteq\mathcal{S}$ is pairwise disjoint then, as $A_1\in\mathcal{S}$, we have by [lemma: 20.239] that $\left(\bigsqcup_{i\in\{1\}}A_i\right)\bigcup B=A_1\bigcup B\in\mathcal{R}[\mathcal{S}]$ which proves that $1\in\mathcal{S}_B$.

$\boldsymbol{n \in \mathcal{S}_B \Rightarrow n+1 \in \mathcal{S}_B}$. Let $\{A_i\}_{i\in\{1,\ldots,n+1\}} \subseteq \mathcal{S}$ be a pairwise disjoint family of sets in $\mathcal{S}$. As $\{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{S}$ is pairwise disjoint and $n \in \mathcal{R}[\mathcal{S}]$ we have that

$$\left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right) \bigcup B \in \mathcal{R}[\mathcal{S}]$$

Hence, as $A_{n+1} \in \mathcal{S}$, we have by the previous lemma [lemma: 20.239] that

$$A_{n+1} \bigcup \left(\left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right) \bigcup B\right) \in \mathcal{R}[\mathcal{S}]$$

which as $A_{n+1} \bigcup \left(\left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right) \bigcup B\right) = \left(\bigsqcup_{i\in\{1,\ldots,n+1\}} A_i\right) \bigcup B$ proves that

$$\left(\bigsqcup_{i\in\{1,\ldots,n+1\}} A_i\right) \bigcup B$$

so that $n+1 \in \mathcal{S}$.

Mathematical induction proves then that $\mathcal{S}_B = \mathbb{N}$. Finally if $A \in \mathcal{R}[\mathcal{S}]$ then there exist a $\{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{S}$ such that $A = \bigsqcup_{i\in\{1,\ldots,n\}} A_i$, hence, as $n \in \mathbb{N} = \mathcal{S}_B$, it follows that $A \bigcup B = \left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right) \bigcup B \in \mathcal{R}[\mathcal{S}]$. □

Next we have to prove that $\forall A, B \in \mathcal{R}[\mathcal{S}]$.

Lemma 20.241. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring on X, $A \in \mathcal{R}[\mathcal{S}]$ and $B \in \mathcal{S}$ then $A \setminus B \in \mathcal{R}[\mathcal{S}]$.*

Proof. We use mathematical induction in the proof. Define

$$S_B = \left\{ n \in \mathbb{N} | \text{If } \{A_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{S} \text{ pairwise disjoint then } \left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right) \setminus B \in \mathcal{R}[\mathcal{S}] \right\}$$

then we have:

$\boldsymbol{1 \in S_B}$. Let $\{A_i\}_{i\in\{1\}} \subseteq \mathcal{S}$ pairwise disjoint then $\left(\bigsqcup_{i\in\{1\}} A_i\right) \setminus B = A_1 \setminus B \in \mathcal{R}[S]$ [using the note in the definition of $\mathcal{R}[\mathcal{S}]$ see [definition: 20.237]], hence $1 \in S_B$.

$\boldsymbol{n \in S_B \Rightarrow n+1 \in S_B}$. Let $\{A_i\}_{i\in\{1,\ldots,n+1\}} \subseteq \mathcal{S}$ pairwise disjoint. Then we have

$$\begin{aligned} \left(\bigsqcup_{i\in\{1,\ldots,n+1\}} A_i\right) \setminus B &= \left(\left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right) \bigsqcup A_{n+1}\right) \setminus B \\ &= \left(\left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right) \setminus B\right) \bigsqcup (A_{n+1} \setminus B) \end{aligned} \tag{20.275}$$

As $n \in S_B$ we have that $\left(\bigcup_{i\in\{1,\ldots,n\}} A_i\right) \setminus B \in \mathcal{R}[\mathcal{S}]$ so that there exists a pairwise disjoint $\{C_i\}_{i\in\{1,\ldots,k\}} \subseteq \mathcal{S}$, $k \in \mathbb{N}$ such that

$$\left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right) \setminus B = \bigsqcup_{j\in\{1,\ldots,k\}} C_j \tag{20.276}$$

Further as A_{n+1}, $B \in S$ and S is a semi-ring there exist a pairwise disjoint $\{D_i\}_{i\in\{1,\ldots,l\}} \subseteq \mathcal{S}$, $l \in \mathbb{N}$ such that

$$A_{n+1} \setminus B = \bigsqcup_{i\in\{1,\ldots,l\}} D_i \tag{20.277}$$

Define

$$\{E_i\}_{i\in\{1,\ldots,k+l\}} \subseteq \mathcal{S} \text{ by } E_i = \begin{cases} C_i \in \mathcal{S} \text{ if } i \in \{1,\ldots,k\} \\ D_{i-k} \in \mathcal{S} \text{ if } i \in \{k+1,\ldots,k+l\} \end{cases} \tag{20.278}$$

Let $i \in \{1,\ldots,k+l\}$ then we have either

$\boldsymbol{i \in \{1,\ldots,k\}}$. Then

$$E_i = C_i \underset{\text{[eq: 20.276}}{\subseteq} \left(\bigsqcup_{i\in\{1,\ldots,n\}} A_i\right) \setminus B \underset{\text{[eq: 20.275]}}{\subseteq} \left(\bigsqcup_{i\in\{1,\ldots,n+1\}} A_i\right) \setminus B$$

$\boldsymbol{i \in \{k+1,\ldots,k+l\}}$. Then

$$E_i = D_{i-k} \underset{\text{[eq: 20.277]}}{\subseteq} A_{n+1} \setminus B \underset{\text{[eq: 20.275]}}{\subseteq} \left(\bigsqcup_{i \in \{1,\ldots,n+1\}} A_i \right) \setminus B$$

which proves that

$$\bigcup_{i \in \{1,\ldots,k+l\}} E_i \subseteq \left(\bigsqcup_{i \in \{1,\ldots,n+1\}} A_i \right) \setminus B \tag{20.279}$$

If $x \in \left(\bigsqcup_{i \in \{1,\ldots,n+1\}} A_i\right) \setminus B = \left(\left(\bigsqcup_{i \in \{1,\ldots,n\}} A_i\right) \setminus B\right) \bigsqcup (A_{n+1} \setminus B)$ then we have either:

$\boldsymbol{x \in \left(\bigsqcup_{i \in \{1,\ldots,n\}} A_i\right) \setminus B}$. Then by [eq: 20.277] there exist a $i \in \{1,\ldots,k\}$ such that $x \in C_i \underset{\text{[eq: 20.278]}}{=} E_i \subseteq \bigcup_{i \in \{1,\ldots,k+l\}} E_i$

$\boldsymbol{x \in A_{n+1} \setminus B}$. Then by [eq: 20.277] there exist a $i \in \{1,\ldots,l\}$ such that

$$x \in D_i = D_{(i+k)-k} = E_{i+k} \subseteq \bigcup_{i \in \{1,\ldots,k+l\}} E_i$$

which proves that $\left(\bigsqcup_{i \in \{1,\ldots,n+1\}} A_i\right) \setminus B \subseteq \bigcup_{i \in \{1,\ldots,k+l\}} E_i$. Combininig this with [eq: 20.279] proves that

$$\left(\bigsqcup_{i \in \{1,\ldots,n+1\}} A_i \right) \setminus B = \bigcup_{i \in \{1,\ldots,k+l\}} E_i \tag{20.280}$$

Let $i, j \in \{1,\ldots,k+l\}$ with $i \neq j$ then without losing generality we may assume that $i < j$ [otherwise exchange i and j]. For i we have either:

$\boldsymbol{i \in \{1,\ldots,k\}}$. Then for j we have either:

$\boldsymbol{j \in \{1,\ldots,k\}}$. Then $E_i \bigcap E_j = C_i \bigcap C_j = \varnothing$

$\boldsymbol{j \in \{k+1,\ldots,k+l\}}$. Then

$$\begin{aligned} E_i \bigcap E_j &= C_i \bigcap D_{j-k} \\ &\underset{\text{[eq: 20.276]}}{\subseteq} \left(\bigsqcup_{i \in \{1,\ldots,n\}} A_i \right) \bigcap D_{j-k} \\ &\underset{\text{[eq: 20.277]}}{\subseteq} \left(\bigsqcup_{i \in \{1,\ldots,n\}} A_i \right) \bigcap A_{n+1} \\ &= \bigsqcup_{i \in \{1,\ldots,n\}} \left(A_i \bigcap A_{n+1} \right) \\ &\underset{i \neq n+1}{=} \varnothing \end{aligned}$$

$\boldsymbol{i \in \{k+1,\ldots,k+l\}}$. As $i < j$ we have $j \in \{k+1,\ldots,k+l\}$ so that

$$E_i \bigcap E_j = D_{i-k} \bigcap D_{j-k} = \varnothing$$

which proves that

$$\{E_i\}_{i \in \{1,\ldots,k+l\}} \subseteq \mathcal{S} \text{ is pairwise disjoint and } \left(\bigsqcup_{i \in \{1,\ldots,n+1\}} A_i \right) \setminus B \underset{\text{[eq: 20.280]}}{=} \bigsqcup_{i \in \{1,\ldots,k+l\}} E_i$$

So using the definition of $\mathcal{R}[\mathcal{S}]$ it follows that $\left(\bigsqcup_{i \in \{1,\ldots,n+1\}} A_i\right) \setminus B \in \mathcal{R}[\mathcal{S}]$ which proves that $n+1 \in \mathcal{S}_B$

By mathematical induction it follows that

$$S_B = \mathbb{N}$$

Finally let $A \in \mathcal{R}[\mathcal{S}]$ then there exist a pairwise disjoint $\{A_i\}_{i \in \{1,\ldots,n\}} \subseteq \mathcal{S}$ such that $A = \bigsqcup_{i \in \{1,\ldots,n\}} A_i$. As $n \in \mathbb{N} = S_B$ we have that $A \setminus B = \left(\bigsqcup_{i \in \{1,\ldots,n\}} A_i\right) \setminus B \in \mathcal{R}[\mathcal{S}]$. □

Next we use mathematical induction to prove that $\forall A, B \in \mathcal{R}[S]$ we have $A \setminus B \in \mathcal{R}[\mathcal{S}]$.

Lemma 20.242. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring on X then $\forall A, B \in \mathcal{R}[\mathcal{S}]$ we have that $A \setminus B \in \mathcal{R}[\mathcal{S}]$.*

Proof. Let $A \in \mathcal{R}[\mathcal{S}]$ and define

$$S_A = \left\{ n \in \mathbb{N} | \text{If } \{B_i\}_{i \in \{1,\dots,n\}} \subseteq \mathcal{S} \text{ is pairwise disjoint then } A \setminus \bigsqcup_{i \in \{1,\dots,n\}} B_i \in \mathcal{R}[\mathcal{S}] \right\}$$

then we have:

$1 \in S_A$. Let $\{B_i\}_{i \in \{1\}} \subseteq \mathcal{S}$ be pairwise disjoint then by the previous lemma [lemma: 20.241] we have that $A \setminus \bigsqcup_{i \in \{1\}} B_i = A \setminus B_1 \in \mathcal{R}[\mathcal{S}]$ which proves that $1 \in \mathcal{S}_A$.

$n \in S_A \Rightarrow n+1 \in S_A$. Let $\{B_i\}_{i \in \{1,\dots,n+1\}} \subseteq \mathcal{S}$ be pairwise disjoint. Then

$$\begin{aligned} A \setminus \bigsqcup_{i \in \{1,\dots,n+1\}} B_i &= A \setminus \left(\left(\bigsqcup_{i \in \{1,\dots,n\}} B_i \right) \bigsqcup B_{n+1} \right) \\ &\underset{\text{[theorem: 1.31]}}{=} \left(A \setminus \bigsqcup_{i \in \{1,\dots,n\}} B_i \right) \setminus B_{n+1} \end{aligned}$$

As $n \in S_A$ we have that $A \setminus \bigsqcup_{i \in \{1,\dots,n\}} B_i \in \mathcal{R}[\mathcal{S}]$ so that by [lemma: 20.241] $\left(A \setminus \bigsqcup_{i \in \{1,\dots,n\}} B_i\right) \setminus B_{n+1} \in \mathcal{R}[\mathcal{S}]$. Hence $A \setminus \bigsqcup_{i \in \{1,\dots,n+1\}} B_i \in \mathcal{R}[\mathcal{S}]$ which proves that $n+1 \in \mathcal{S}_A$.

Mathematical induction proves that

$$\mathcal{S}_A = \mathbb{N}$$

Finally if $B \in \mathcal{R}[\mathcal{S}]$ then by definition of $\mathcal{R}[\mathcal{S}]$ there exist a pairwise disjoint $\{B_i\}_{i \in \{1,\dots,n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that $B = \bigsqcup_{i \in \{1,\dots,n\}} B_i$. As $n \in \mathbb{N} = \mathcal{S}_A$ $A \setminus B = A \setminus \bigsqcup_{i \in \{1,\dots,n\}} B_i \in \mathcal{R}[\mathcal{S}]$. □

We are now ready to prove that $\mathcal{R}[\mathcal{S}]$ is a ring

Theorem 20.243. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring on X then $\mathcal{R}[\mathcal{S}]$ is a ring on X such that:*

1. *$\mathcal{S} \subseteq \mathcal{R}[S]$*
2. *If $\mathcal{T}$ is another ring on X with $\mathcal{S} \subseteq \mathcal{T}$ then $\mathcal{R}[\mathcal{S}]$*

In other words the set of all disjoint finite unions of sets in $\mathcal{S}$ is the smallest ring covering $\mathcal{S}$

Proof. Let Let $A \in \mathcal{S}$ and define $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}$ by $A_1 = A$ then $\{A_i\}_{i \in \{1\}}$ is pairwise disjoint and $A = \bigsqcup_{i \in \{1\}} A_i$, hence $A \in \mathcal{R}[\mathcal{S}]$ proving that

$$\mathcal{S} \subseteq \mathcal{R}[\mathcal{S}] \tag{20.281}$$

As $\mathcal{S}$ is a semi-ring we have $\varnothing \in \mathcal{S}$ so by the above we have

$$\varnothing \in \mathcal{R}[\mathcal{S}] \tag{20.282}$$

Let $A, B \in \mathcal{R}[\mathcal{S}]$ then by [lemma: 20.240] and [lemma:20.242] we have that

$$A \bigcup B \in \mathcal{R}[\mathcal{S}] \text{ and } A \setminus B \in \mathcal{R}[\mathcal{S}] \tag{20.283}$$

So by [eqs: 20.281, 20.282 and 20.283] it follows that

$$\mathcal{R}[\mathcal{S}] \text{ is a ring on } X$$

It remains to prove that $\mathcal{R}[\mathcal{S}]$ is the smallest ring containing $\mathcal{S}$. So let $\mathcal{T}$ be another ring such that $\mathcal{S} \subseteq \mathcal{T}$. If $A \in \mathcal{R}[\mathcal{S}]$ then then there exist a pairwise disjoint finite family $\{A_i\}_{i \in \{1,\dots,k\}} \subseteq \mathcal{S} \subseteq \mathcal{T}$ such that $A = \bigsqcup_{i \in \{1,\dots,k\}} A_i$. As $\mathcal{T}$ is a ring it follows from [theorem: 20.126] that $A = \bigsqcup_{i \in \{1,\dots,k\}} A_i \in \mathcal{T}$ which proves that

$$\mathcal{R}[\mathcal{S}] \subseteq \mathcal{T}$$

□

Next we want to extend a content on a semi-ring $\mathcal{S}$ to a content on the ring $\mathcal{R}[\mathcal{S}]$.

Theorem 20.244. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu: \mathcal{S} \to [0,\infty]$ a content on $\mathcal{S}$ then*

1. *There exist a content $\nu: \mathcal{R}[\mathcal{S}] \to [0,\infty]$ such that $\nu_{|\mathcal{S}} = \mu$ [in other words ν is a extension of μ]*
2. *If $\omega: \mathcal{R}[\mathcal{S}] \to [0,\infty]$ is another content such that $\omega_{|\mathcal{S}} = \mu$ then $\omega = \nu$ [in other words the extension is unique].*

3. *If μ is finite then ν is finite.*

Proof.

1. First we proof existence. Let $A\in\mathcal{R}[\mathcal{S}]$ then there exist a pairwise disjoint finite family $\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ such that $A=\sqcup_{i\in\{1,\ldots,n\}}A_i$. As ν will be a content on $\mathcal{R}[\mathcal{S}]$ we must have that $\nu(A)=\sum_{i=1}^n\nu(A_i)\underset{A_i\in\Sigma}{=}\sum_{i=1}^n\mu(A_i)$. So it make sense to define

$$\nu:\mathcal{R}[\mathcal{S}]\to[0,\infty]\text{ by }\nu(A)=\sum_{i=1}^n\mu(A_i)$$
$$\text{where }\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{S},n\in\mathbb{N}\text{ is pairwise disjoint and }A=\bigsqcup_{i\in\{1,\ldots,n\}}A_i$$

Of course this only works if $\nu(A)$ is independent of the chosen family $\{A_i\}_{i\in\{1,\ldots,n\}}$. So assume that for $A\in\mathcal{R}[\mathcal{S}]$ we have two pairwise disjoint families $\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ and $\{B_i\}_{i\in\{1,\ldots,m\}}\subseteq\mathcal{S}$, $m\in\mathbb{N}$ such that

$$A=\bigsqcup_{i\in\{1,\ldots,n\}}A_i=\bigsqcup_{i\in\{1,\ldots,m\}}B_i$$

Then we have

$$\begin{aligned}
\sum_{i=1}^n\mu(A_i)&\underset{A_i\bigcap A=A_i}{=}\sum_{i=1}^n\mu\big(A_i\bigcap A\big)\\
&=\sum_{i=1}^n\mu\left(A_i\bigcap\left(\bigsqcup_{j\in\{1,\ldots,m\}}B_j\right)\right)\\
&\underset{\text{[theorem: 2.130]}}{=}\sum_{i=1}^n\mu\left(\bigsqcup_{j\in\{1,\ldots,m\}}\mu\big(A_i\bigcap B_j\big)\right)\\
&\underset{A_i\bigcap B_j\in\mathcal{S}}{=}\sum_{i=1}^n\left(\sum_{j=1}^m\mu\big(A_i\bigcap B_j\big)\right)\\
&\underset{\text{[theorem: 20.96]}}{=}\sum_{j=1}^m\left(\sum_{i=1}^n\mu\big(A_i\bigcap B_j\big)\right)\\
&\underset{A_i\bigcap B_j\in\mathcal{S}}{=}\sum_{j=1}^m\mu\left(\bigsqcup_{i\in\{1,\ldots,n\}}\big(A_i\bigcap B_j\big)\right)\\
&\underset{\text{[theorem: 2.130]}}{=}\sum_{j=1}^m\mu\left(\left(\bigsqcup_{i\in\{1,\ldots,n\}}A_i\right)\bigcap B_j\right)\\
&=\sum_{j=1}^m\mu\big(A\bigcap B_j\big)\\
&=\sum_{j=1}^m\mu(B_j)
\end{aligned}$$

proving that $\nu:\mathcal{R}[\mathcal{S}]\to[0,\infty]$ is well defined. Next we prove that ν is a extension of $\mathcal{S}$. Let $A\in\mathcal{S}$ then if we define $\{A_i\}_{i\in\{1\}}\subseteq\mathcal{S}$ by $A_1=A$ then $\{A_i\}_{i\in\{1\}}$ is clearly disjoint and $\bigsqcup_{i\in\{1\}}A_i=A_1=A$ so that $\nu(A)=\sum_{i=1}^1\mu(A_i)=\mu(A_1)=\mu(A)$ proving that

$$\nu_{|\mathcal{S}}=\mu \tag{20.284}$$

Next we use [theorem: 20.231] to prove that ν is a content on $\mathcal{R}[\mathcal{S}]$. As $\varnothing\in\mathcal{S}$ we have by [eq: 20.284] that

$$\nu(\varnothing)\underset{\varnothing\in\mathcal{S}}{=}\mu(\varnothing)=0 \tag{20.285}$$

Let $A,B\in\mathcal{R}[\mathcal{S}]$ such that $A\bigcap B=\varnothing$ then there exist pairwise disjoint families $\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ and $\{B_i\}_{i\in\{1,\ldots,m\}}\subseteq\mathcal{S}$, $m\in\mathbb{N}$ such that $A=\bigsqcup_{i\in\{1,\ldots,n\}}A_i$, $B=\bigsqcup_{i\in\{1,\ldots,m\}}$. Define

$$\{C_i\}_{i\in\{1,\ldots,n+m\}}\subseteq\mathcal{S}\text{ by }C_i=\begin{cases}A_i\text{ if }i\in\{1,\ldots,n\}\\B_{i-n}\text{ if }i\in\{n+1,\ldots,n+m\}\end{cases}$$

Let $i,j\in\{1,\dots,n+m\}$ with $i\neq j$ then we may assume that $i<j$ [otherwise exchange i and j], for i we have either:

$\boldsymbol{i\in\{1,\dots,n\}}$**.** Then for j we have either:

$\boldsymbol{j\in\{1,\dots,n\}}$**.** Then $C_i\bigcap C_j=A_i\bigcap A_j\underset{i\neq j}{=}\varnothing$.

$\boldsymbol{j\in\{n+1,\dots,n+m\}}$**.** Then $C_i\bigcap C_j=A_{i-n}\bigcap B_{j-n}\subseteq A\bigcap B=\varnothing$.

$\boldsymbol{i\in\{n+1,\dots,n+m\}}$**.** Then $j\in\{n+1,\dots,n+m\}$ $C_i\bigcap C_j=A_{i-n}\bigcap B_{j-n}\underset{i-n\neq j-n}{=}\varnothing$

proving that

$$\{C_i\}_{i\in\{1,\dots,n+m\}}\subseteq\mathcal{S}\text{ is pairwise disjoint}\tag{20.286}$$

Let $x\in A\bigcup B$ then either $x\in A=\bigcup_{i\in\{1,\dots,n\}}A_i\Rightarrow\exists i\in\{1,\dots,n\}$ with $x\in A_i=C_i$ or $x\in B=\bigcup_{i\in\{1,\dots,m\}}B_i\Rightarrow\exists i\in\{1,\dots,m\}$ with $x\in B_i=C_{i+n}$, hence $x\in\bigcup_{i\in\{1,\dots,n+m\}}C_i$, proving that

$$A\bigsqcup B\subseteq\bigcup_{i\in\{1,\dots,n+m\}}C_i.\tag{20.287}$$

For $i\in\{1,\dots,n+m\}$ we have either $i\in\{1,\dots,n\}$ then $C_i=A_i\subseteq A\bigcup B$ or $i\in\{n+1,\dots,n+m\}$ then $C_i=B_{i-n}\subseteq A\bigcup B$, hence in all cases we have $C_i\subseteq A\bigcup B$. This proves that $\bigcup_{i\in\{1,\dots,n+m\}}C_i\subseteq A\bigcup B$ which combines with [eq: 20.287] gives

$$A\bigsqcup B=\bigsqcup_{i\in\{1,\dots,n+m\}}C_i\tag{20.288}$$

Hence we have

$$\begin{aligned}\nu(A\bigcup B)&=\nu\left(\bigsqcup_{i\in\{1,\dots,n+m\}}C_i\right)\\&\underset{\text{def}}{=}\sum_{i=1}^{n+m}\mu(C_i)\\&\underset{\text{[theorem: 11.23]}}{=}\sum_{i=1}^{n}\mu(C_i)+\sum_{i=n+1}^{n+m}\mu(C_i)\\&=\sum_{i=1}^{n}\mu(A_i)+\sum_{i=n+1}^{n+m}\mu(B_{i-n})\\&\underset{\text{[theorem: 11.12]}}{=}\sum_{i=1}^{n}\mu(A_i)+\sum_{i=1}^{m}\mu(B_i)\\&=\nu(A)+\nu(B)\end{aligned}$$

proving that

$$\forall A,B\in\mathcal{R}[\mathcal{S}]\text{ with }A\bigcap B=\varnothing\text{ we have }\nu\big(A\bigsqcup B\big)=\nu(A)+\nu(B)\tag{20.289}$$

Using [eqs: 20.285, 20.289] we can apply]theorem: 20.231] to prove that

$$\nu\colon\mathcal{R}[\mathcal{S}]\to[0,\infty]\text{ is a content on }\mathcal{R}[\mathcal{S}]$$

2. Let $\omega\colon\mathcal{R}[\mathcal{S}]\to[0,\infty]$ be another content on $\mathcal{R}[S]$ such that $\omega_{|\mathcal{S}}=\mu$. Let $A\in\mathcal{R}[\mathcal{S}]$ then there exist a pairwise disjoint family $\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{S}$, $n\in\mathbb{N}$ such that $A=\bigsqcup_{i\in\{1,\dots,n\}}A_i$. Hence

$$\begin{aligned}\omega(A)&=\omega\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\\&\underset{\omega\text{ is a content}}{=}\sum_{i=1}^{n}\omega(A_i)\\&\underset{\omega_{|\mathcal{S}}=\mu}{=}\sum_{i=1}^{n}\mu(A_i)\\&\underset{\text{def of }\nu}{=}\nu(A)\end{aligned}$$

so that

$$\omega = \nu$$

3. If $A \in \mathcal{R}[\mathcal{S}]$ then there exist a finite pairwise disjoint family $\{A_i\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that $A = \bigsqcup_{i\in\{1,\dots,n\}} A_i$. Then $\nu(A) = \sum_{i=1}^{n} \mu(A) < \infty$ [because μ is assumed to be finite]. □

We can now rephrase [theorem: 20.235] to work with semi-rings instead of rings.

Theorem 20.245. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu: X \to [0,\infty]$ a **finite** content. If there exist a compact class $\mathcal{C} \subseteq \mathcal{P}(X)$ such that*

1. *$\forall \{K_i\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{C}$, $n \in \mathbb{N}$ we have that $\bigcup_{i\in\{1,\dots,n\}} K_i \in \mathcal{C}$*
2. *$\forall A \in \mathcal{S}$ and $\forall \varepsilon \in \mathbb{R}^+$ we have that $\exists K_\varepsilon \in \mathcal{C}$ and $\exists A_\varepsilon \in \mathcal{S}$ such that*

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A \text{ and } \mu(A) - \mu(A_\varepsilon) < \varepsilon$$

then

$$\mu \text{ is a pre-measure}$$

Proof. Using [theorem: 20.244] there exist a **finite** content $\overline{\mu}: \mathcal{R}[S] \to [0,\infty]$ on the ring $\mathcal{R}[\mathcal{S}]$ such that

$$(\overline{\mu})_{|\mathcal{S}_{[[}} = \mu \tag{20.290}$$

Let $A \in \mathcal{R}[\mathcal{S}]$ then by definition there exist a pairwise disjoint $\{A_i\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that $A = \bigsqcup_{i\in\{1,\dots,n\}} A_i$. Let $\varepsilon \in \mathbb{R}^+$ then by the hypothesis there exists $\{A_{i,\varepsilon}\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{S}$ and $\{K_{i,\varepsilon}\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{C}$ such that

$$\forall i \in \{1,\dots,n\} \text{ we have } A_{i,\varepsilon} \subseteq K_{i,\varepsilon} \subseteq A_i \text{ and } \mu(A_i) - \mu(A_{i,\varepsilon}) < \frac{\varepsilon}{2^n} \tag{20.291}$$

Define

$$K_\varepsilon = \bigcup_{i\in\{1,\dots,n\}} K_{i,\varepsilon} \in \mathcal{C} \text{ [hypothesis]} \tag{20.292}$$

and

$$A_\varepsilon = \bigcup_{i\in\{1,\dots,n\}} A_{i,\varepsilon} \in \mathcal{R}[\mathcal{S}] \text{ [because } \mathcal{S} \subseteq \mathcal{R}[\mathcal{S}] \text{ and } \mathcal{R}[\mathcal{S}] \text{ is a ring hence } \cup\text{-stable]} \tag{20.293}$$

then we have

$$A_\varepsilon = \bigcup_{i\in\{1,\dots,n\}} A_{i,\varepsilon} \underset{\text{[eq: 20.291]}}{\subseteq} \bigcup_{i\in\{1,\dots,n\}} K_{i,\varepsilon} = K_\varepsilon$$

and

$$K_\varepsilon = \bigcup_{i\in\{1,\dots,n\}} K_{i,\varepsilon} \underset{\text{[eq: 20.291]}}{\subseteq} \bigcup_{i\in\{1,\dots,n\}} A_i = A$$

so that we have

$$A_\varepsilon \in \mathcal{R}[\mathcal{S}],\ K_\varepsilon \in \mathcal{C} \text{ and } A_\varepsilon \subseteq K_\varepsilon \subseteq A \tag{20.294}$$

Next

$$\begin{aligned}
A \setminus A_\varepsilon &= \left(\bigcup_{i\in\{1,\dots,n\}} A_i\right) \setminus \left(\bigcup_{j\in\{1,\dots,n\}} A_{j,\varepsilon}\right) \\
&\underset{\text{[theorem: 2.133]}}{=} \bigcup_{i\in\{1,\dots,n\}} \left(A_i \setminus \left(\bigcup_{j\in\{1,\dots,n\}} A_{j,\varepsilon}\right)\right) \\
&\underset{\text{[theorem: 2.132]}}{=} \bigcup_{i\in\{1,\dots,n\}} \left(\bigcap_{j\in\{1,\dots,n\}} (A_i \setminus A_{j,\varepsilon})\right) \\
&\subseteq \bigcup_{i\in\{1,\dots,n\}} (A_i \setminus A_{i,\varepsilon})
\end{aligned}$$

Further if $i, j \in \{1,\dots,n\}$ with $i \neq j$ then $(A_i \setminus A_{i,\varepsilon}) \bigcap (A_j \setminus A_{j,\varepsilon}) \subseteq A_i \bigcap A_j = \varnothing$. To summarize we have that

$$A \setminus A_\varepsilon \subseteq \bigsqcup_{i\in\{1,\dots,n\}} (A_i \setminus A_{i,\varepsilon}) \text{ and } \{A_i \setminus A_{i,\varepsilon}\}_{i\in\{1,\dots,n\}} \text{ is pairwise disjoint} \tag{20.295}$$

As $\overline{\mu}$ is a **finite** content on the ring $\mathcal{R}[\mathcal{S}]$ and $\forall i \in \{1, \ldots, n\}$ $A_i \setminus A_{i,\varepsilon} \in \mathcal{R}[\mathcal{S}]$ [because $\mathcal{R}[\mathcal{S}]$ is a ring and $A, A_\varepsilon, A_i, A_{i,\varepsilon} \in \mathcal{R}[\mathcal{S}]$] we have

$$\begin{aligned}
\overline{\mu}(A \setminus A_\varepsilon) &\underset{\text{[theorem:20.232(2)]}}{\leqslant} \overline{\mu}\left(\bigsqcup_{i \in \{1, \ldots, n\}} (A_i \setminus A_{i,\varepsilon})\right) \\
&= \sum_{i=1}^{n} \overline{\mu}(A_i \setminus A_{i,\varepsilon}) \\
&\underset{\text{[theorem: 20.232(3)]}}{=} \sum_{i=1}^{n} (\overline{\mu}(A_i) - \overline{\mu}(A_{i,\varepsilon})) \\
&\underset{\overline{\mu} \text{ extends } \mu}{=} \sum_{i=1}^{n} (\mu(A_i) - \mu(A_{i,\varepsilon})) \\
&\underset{\text{[eq: 20.291]}}{\leqslant} \sum_{i=1}^{m} \frac{\varepsilon}{2^i} \\
&= \varepsilon \cdot \sum_{i=1}^{n} \left(\frac{1}{2}\right)^i \\
&\underset{\text{[lemma: 14.352]}}{=} \varepsilon \cdot \left(\frac{1}{2}\right) \cdot \frac{1 - \left(\frac{1}{2}\right)^n}{1 - \frac{1}{2}} \\
&= \varepsilon \cdot \left(1 - \left(\frac{1}{2}\right)^n\right) \\
&< \varepsilon
\end{aligned}$$

Hence

$$\overline{\mu}(A \setminus A_\varepsilon) < \varepsilon \tag{20.296}$$

Using [eq: 20.294] and [eq: 20.296] allows us to apply [theorem: 20.235] proving that

$$\overline{\mu} \text{ is a pre-measure on } \mathcal{R}[\mathcal{S}]$$

As μ is a content

$$\mu(\varnothing) = 0 \tag{20.297}$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}$ be pairwise disjoint such that $\bigsqcup_{i \in \mathbb{N}} A_i \in \mathcal{S}$ then we have

$$\begin{aligned}
\mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &\underset{\text{[eq: 20.290]}}{=} \overline{\mu}\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) \\
&\underset{\overline{\mu} \text{ is a pre-measure}}{=} \sum_{i=1}^{\infty} \overline{\mu}(A_i) \\
&\underset{\text{[eq: 20.290]}}{=} \sum_{i=1}^{\infty} \mu(A_i)
\end{aligned}$$

which together with [eq: 20.299] proves that μ is a pre-measure. □

If we deal with topological spaces then we have a even simpler test to see if the extension of a content on a semi-ring $\mathcal{S}$ to the ring $\mathcal{R}[\mathcal{S}]$.

Theorem 20.246. *Let $\langle X, \mathcal{T} \rangle$ be a topological space, $\mathcal{S}$ a semi-ring on X and $\mu: X \to [0, \infty]$ a **finite** content. If $\forall A \in \mathcal{S}$ and $\forall \varepsilon \in \mathbb{R}^+$ there exists a compact K_ε and a $A_\varepsilon \in \mathcal{S}$ such that*

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A \text{ and } \mu(A) - \mu(A_\varepsilon) < \varepsilon$$

then

$$\mu: \mathcal{R}[\mathcal{S}] \to [0, \infty] \text{ is a pre-measure}$$

Proof. First using [theorem: 14.243] it follows that

$$\mathcal{C} = \{A \in \mathcal{P}(X) | A \text{ is compact}\} \text{ is a compact class} \tag{20.298}$$

Further:

1. $\forall\{K_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{C}$, $n\in\mathbb{N}$ we have by [theorem: 14.228] that $\bigcup_{i\in\{1,\dots,n\}}K_i$ is compact hence $\bigcup_{i\in\{1,\dots,n\}}K_i\in\mathcal{C}$.
2. $\forall A\in\mathcal{S}$ and $\forall\varepsilon\in\mathbb{R}^+$ we have by the hypothesis that $\exists K_\varepsilon\in\mathcal{C}$ and $\exists A_\varepsilon\in\mathcal{S}$ such that
$$A_\varepsilon\subseteq K_\varepsilon\subseteq A \text{ and } \mu(A)-\mu(A_\varepsilon)<\varepsilon$$

So using the previous theorem [theorem: 20.245] we have that μ is a pre-measure. □

20.4.4.3 Using the Carathéodory theorem on $\mathbb{R}$

We use now the theory developped in the previous sections to construct a σ-algebra and a measure on $\mathbb{R}$. The procedure that we will follow is the following:

1. Prove that $\mathcal{I}_{[[}=\{[a,b[|a,b\in\mathbb{R}\wedge[a,b]\neq\varnothing\}\bigcup\{\varnothing\}$ [see theorem: 20.150] is semi-ring.
2. Prove that $\text{len}:\mathcal{I}_{[[}\bigcup\{\varnothing\}\to[0,\infty]$ defines by $\text{len}(I)=\begin{cases} b-a \text{ if } I=[a,b[\in\mathcal{I}_{[[} \\ 0 \text{ if } I=\varnothing\end{cases}$ [the function that calculates the lenght of a half-open interval] is a finite content on the semi-ring $\mathcal{I}_{[[}$.
3. Use [theorem: 20.245] to extend the function len to a pre-measure on the ring $\mathcal{R}[\mathcal{S}]$
4. Use [theorem: 20.225] a derivate of the Carathéodore Theorem to extend the pre-measure to a measure [the Lebesgue measure] on a σ-algebra [the Lebesgue algebra on $\mathbb{R}$] that contains $\sigma[\mathcal{I}_{[[}]=\mathcal{B}[\mathbb{R}]$ and whose restriction on $\mathcal{B}[\mathbb{R}]$ is also a measure.

Definition 20.247. *The set $\mathcal{S}_{[[}\subseteq\mathcal{P}(\mathbb{R})$ is defined by*
$$\mathcal{S}_{[[}=\{[a,b[|a,b\in\mathbb{R}\}$$

Theorem 20.248. *$S_{[[}=\mathcal{I}_{[[}\bigcup\{\varnothing\}$ and $\{\varnothing\}\bigcap\mathcal{I}_{[[}=\varnothing$ in other words*
$$\mathcal{S}_{[[}=\mathcal{I}_{[[}\bigsqcup\{\varnothing\}$$
where $\mathcal{I}_{[[}\underset{[\text{definition: 20.146}]}{=}\{[a,b[|a,b\in\mathbb{R}\wedge[a,b[\neq\varnothing\}$

Proof. If $I\in\mathcal{S}_{[[}$ then there exists $a,b\in\mathbb{R}$ such that $I=[a,b[$. For a,b we have either

a < b. Then $[a,b[\neq\varnothing$ so that $I\in\mathcal{I}_{[[}\subseteq\mathcal{I}_{[[}\bigcup\{\varnothing\}$

b ⩽ a. Then $[a,b[=\varnothing$ so that $I\in\{\varnothing\}=\mathcal{I}_{[[}\bigcup\{\varnothing\}$

hence we have that
$$\mathcal{S}_{[[}\subseteq\mathcal{I}_{[[}\bigcup\{\varnothing\} \tag{20.299}$$
If $I\in\mathcal{I}_{[[}\bigcup\{\varnothing\}$ then either we have:

$\boldsymbol{I\in\mathcal{I}_{[[}}$**.** Then $\exists a,b\in\mathbb{R}$ such that $I=[a,b[$ so that $I\in\mathcal{S}_{[[}$.

$\boldsymbol{I\in\{\varnothing\}}$**.** Then $I=\varnothing=[0,0[$ so that $I\in\mathcal{S}_{[[}$

which proves that $\mathcal{I}_{[[}\bigcup\{\varnothing\}\subseteq\mathcal{S}$. Combining this with [eq: 20.299] gives
$$S_{[[}=\mathcal{I}_{[[}\bigcup\{\varnothing\}$$
Further if $I\in\mathcal{I}_{[[}\bigcap\{\varnothing\}$ then $I=\varnothing$ and there exists a $a,b\in\mathbb{R}$ such that $I=[a,b[\neq\varnothing$ which is a contradiction. Hence
$$\mathcal{I}_{[[}\bigcap\{\varnothing\}=\varnothing$$
□

Theorem 20.249. $\mathcal{S}_{[[}=\mathcal{I}_{[[}\bigsqcup\{\varnothing\}$ where $\mathcal{I}_{[[}=\{[a,b[|a,b\in\mathbb{R}$ *such that* $[a,b[\neq\varnothing\}$ *is a semi-ring.*

Proof.

1. $\varnothing\in\mathcal{I}_{[[}\bigcup\{\varnothing\}=\mathcal{S}_{[[}$
2. If $[a,b[$, $[c,d[\in\mathcal{S}_{[[}$ then we have either:

   $\boldsymbol{[a,b[=\varnothing\wedge[c,d[=\varnothing}$**.** Then $[a,b[\bigcap[c,d[=\varnothing\bigcap\varnothing=\varnothing\in\mathcal{S}_{[[}$.

$\boldsymbol{[a,b[\in\mathcal{I}_{[[}\wedge[c,d[=\varnothing}$. Then $[a,b[\bigcap[c,d[=[a,b[\bigcap\varnothing=\varnothing\in\mathcal{S}_{[[}$.

$\boldsymbol{[a,b[=\varnothing\wedge[c,d[\in\mathcal{I}_{[[}}$. Then $[a,b[\bigcap[c,d[=\varnothing\bigcap[c,d[=\varnothing\in\mathcal{S}_{[[}$.

$\boldsymbol{[a,b[\in\mathcal{I}_{[[}\wedge[c,d[\in\mathcal{I}_{[[}}$. Then for $[a,b[\bigcap[c,d[$ we have either

$\boldsymbol{[a,b[\bigcap[c,d[=\varnothing}$. Then $[a,b[\bigcap[c,d[=\varnothing\in\mathcal{S}_{[[}$

$\boldsymbol{[a,b[\bigcap[c,d[\neq\varnothing}$. Then for a we have either:

$\boldsymbol{a\leqslant c}$. For b we have either:

$\boldsymbol{b\leqslant d}$. Let $y\in[c,b[$ then $a\leqslant c\leqslant y<b\leqslant d$ so that $y\in[a,b[\wedge y\in[c,d[$ hence $y\in[a,b[\bigcap[c,d[$, proving that

$$[c,b[\subseteq[a,b[\bigcap[c,d[$$

Let $y\in[a,b[\bigcap[c,d[$ then $y\in[a,b[\wedge y\in[c,d[$ so that

$$a\leqslant y<b\wedge c\leqslant y<d\Rightarrow c\leqslant y<b$$

proving that $y\in[c,b[$ so that $[a,b[\bigcap[c,d[\subseteq[c,b[$. Hence

$$\varnothing\neq[a,b[\bigcap[c,d[=[c,b[\in\mathcal{I}_{[[}\subseteq\mathcal{S}_{[[}$$

$\boldsymbol{d<b}$. Let $y\in[c,d[$ then $a\leqslant c\leqslant y<d<b$ so that $y\in[a,b[$ hence $[c,d[\subset[a,b[$ so that

$$\varnothing\neq[c,d[=[a,b[\bigcap[c,d[$$

$\boldsymbol{c<a}$. For b we have either:

$\boldsymbol{b\leqslant d}$. Let $y\in[a,b[$ then $c<a\leqslant y<b\leqslant d$ so that $y\in[c,d[$ hence $[a,b[\subseteq[c,d[$ so that

$$\varnothing\neq[a,b[\subseteq[a,b[\bigcap[c,d[$$

$\boldsymbol{d<b}$. Let $y\in[a,d[$ then $c<a\leqslant y<d<b$ so that $y\in[a,b[\wedge[c,d[$ hence $y\in[a,b[\bigcap[c,d[$, proving that

$$\varnothing\neq[a,d[\subseteq[a,b[\bigcap[c,d[$$

Let $y\in[a,b[\bigcap[c,d[$ then $y\in[a,b[\wedge y\in[c,d[$ so that

$$a\leqslant y<b\wedge c\leqslant y<d\Rightarrow a\leqslant y<d$$

proving that $y\in[a,d[$ or $[a,b[\bigcap[c,d[\subseteq[a,d[$. Hence

$$\varnothing\neq[a,b[\bigcap[c,d[=[a,d[\in\mathcal{I}_{[[}\subseteq\mathcal{S}_{[[}$$

so in all cases we have that

$$[a,b[\bigcap[c,d[\in\mathcal{S}_{[[}$$

3. Let $[a,b[,[c,d[\in\mathcal{S}_{[[}$ then we have either:

$\boldsymbol{[a,b[=\varnothing\wedge[c,d[=\varnothing}$. Then $[a,b[\setminus[c,d[=\varnothing\setminus\varnothing=\varnothing=\bigsqcup_{i\in\{1\}}A_i$ where $\{A_i\}_{i\in\{1\}}\subseteq\mathcal{S}_{[[}$ is defined by $A_i=\varnothing$.

$\boldsymbol{[a,b[\in\mathcal{I}_{[[}\wedge[c,d[=\varnothing}$. Then $[a,b[\setminus[c,d[=[a,b[\setminus\varnothing=[a,b[=\bigsqcup_{i\in\{1\}}A_i$ where $\{A_i\}_{i\in\{1\}}\subseteq\mathcal{S}_{[[}$ is defined by $A_i=[a,b[$.

$\boldsymbol{[a,b[=\varnothing\wedge[c,d[\in\mathcal{I}_{[[}}$. Then $[a,b[\setminus[c,d[=\varnothing\setminus[c,d[=\varnothing=\bigsqcup_{i\in\{1\}}A_i$ where $\{A_i\}_{i\in\{1\}}\subseteq\mathcal{S}_{[[}$ is defined by $A_i=\varnothing$.

$\boldsymbol{[a,b[\in\mathcal{I}_{[[}\wedge[c,d[\in\mathcal{I}_{[[}}$. Then for $[a,b[\bigcap[c,d[$ we have either:

$\boldsymbol{[a,b[\bigcap[c,d[=\varnothing}$. Then $[a,b[\setminus[c,d[=[a,b[=\bigsqcup_{i\in\{1\}}A_i$ where $\{A_i\}_{i\in\{1\}}\subseteq\mathcal{S}_{[[}$ is defined by $A_i=[a,b[$.

$\boldsymbol{[a,b[\bigcap[c,d[\neq\varnothing}$. As $[a,b[\neq\varnothing\neq[c,d[$ we have

$$a<b\wedge c<d \tag{20.300}$$

further there exist a x such that

$$a \leqslant x < b \wedge c \leqslant x < d \Rightarrow a < d \wedge c < b \tag{20.301}$$

***a* ⩽ *c*.** Then for b we have either:

***b* ⩽ *d*.** Let $y \in [a, c[$ then $a \leqslant y < c \underset{\text{[eq: 20.301]}}{<} b$ so that $y \in [a, b[$. Assume that $y \in [c, d[$ then $c \leqslant y$ contradicting $y < c$ hence $y \notin [c, d[$ so that $y \in [a, b[\setminus [c, d[$. Hence

$$[a, c[\subseteq [a, b[\setminus [c, d[\tag{20.302}$$

On the other hand if $y \in [a, b[\setminus [c, d[$ we have $a \leqslant y < b \leqslant d$ and $\neg(c \leqslant y < d) \Rightarrow y < c \vee d \leqslant y$. Assume that $d \leqslant y$ then as also $y < b \leqslant d \Rightarrow y < d$ we would have a contradiction so that we must have $y < c$. Hence we have $a \leqslant y < c$ which proves that $[a, b[\setminus [c, d[\subseteq [a, c[$ so that, using [eq: 20.302] we have

$$[a, b[\setminus [c, d[= [a, c[\in \mathcal{S}_{[[} = \mathcal{I}_{[[} \bigcup \{\varnothing\}$$

So if we define $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}_{[[}$ by $A_1 = [a, c[$ we have

$$[a, b[\setminus [c, d[= \bigsqcup_{i \in \{1\}} A_i$$

***d* < *b*.** Let $y \in [a, c[\bigcap [d, b[$ then $a \leqslant y < c \wedge d \leqslant y < b$, as by [eq: 20.300] $c < d$ we reach the contradictib $y < y$ so that

$$[a, c[\bigcap [d, b[= \varnothing \tag{20.303}$$

Let $y \in [a, c[\bigcup [d, b[$ then we have either:

***y* ∈ [*a*, *c*[.** Then $a \leqslant y < c \underset{\text{[eq: 20.301]}}{<} b$ so that $y \in [a, b]$. Assume that $y \in [c, d[$ then $c \leqslant y < d$ contradicting $y < c$ hence we have $y \notin [c, d[$ so

$$y \in [a, b[\setminus [c, d]$$

***y* ∈ [*d*, *b*[.** Then $a \underset{\text{[eq: 20.301]}}{<} d \leqslant y < b$ so that $y \in [a, b[$. Assume that $y \in [c, d[$ then $c \leqslant y < d$ contradicting $d \leqslant y$ hence we must have $y \notin [c, d[$ or

$$y \in [a, b[\setminus [c, d[$$

as in all cases we have $y \in [a, b[\setminus [c, d[$ it follows that

$$[a, c[\bigcup [d, b[\subseteq [a, b[\setminus [c, d[\tag{20.304}$$

On the other hand if $y \in [a, b[\setminus [c, d[$ then

$$\begin{aligned} a \leqslant y < b \wedge \neg(c \leqslant y \wedge y < d) &= \\ a \leqslant y < b \wedge (y < c \vee d \leqslant y) &= \\ (a \leqslant y < b \wedge y < c) \vee (a \leqslant y < b \wedge d \leqslant y) & \end{aligned}$$

so that $y \in [a, c[\vee y \in [d, b[\Rightarrow y \in [a, c[\bigcup [d, b[$ which proves that $[a, b[\setminus [c, d[\subseteq [a, c[\bigcup [d, b[$. Combining this with [eq: 20.304]

$$[a, b[\setminus [c, d[= [a, c[\bigcup [d, b[$$

Hence if we define $\{A_i\}_{i \in \{1,2\}} \subseteq \mathcal{I}_{[[} \bigcup \{\varnothing\}$ by $A_1 = [a, c[$, $A_2 = [d, b[$ then $\{A_i\}_{i \in \{1,2\}}$ is pairwise disjoint and

$$[a, b[\setminus [c, d[= \bigsqcup_{i \in \{1,2\}} A_i$$

***c* < *a*.** Then for b we have either:

***b* ⩽ *d*.** If $y \in [a, b[$ then $c < a \leqslant y < b \leqslant d$ so that $y \in [c, d[$, hence $[a, b[\subseteq [c, d[$ so that $[a, b[\setminus [c, d[= \varnothing$. Hence if we define $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}_{[[}$ by $A_1 = \varnothing$ it follows that

$$[a, b[\setminus [c, d[= \bigsqcup_{i \in \{1\}} A_i$$

d < b. Let $y \in [d,b[$ then $a \underset{\text{[eq: 20.301]}}{<} d \leqslant y < b$ so that $y \in [a,b[$. Assume that $y \in [c,d[$ then $c \leqslant y < d$ contradicting $d \leqslant y$. Hence $y \in [a,b[\setminus [c,d[$ proving that

$$[d,b[\subseteq [a,b[\setminus [c,d] \tag{20.305}$$

If $y \in [a,b[\setminus [c,d]$ then

$$\begin{aligned}
a \leqslant y < b \wedge \neg(c \leqslant y < d) &= \\
a \leqslant y < b \wedge (y < c \vee d \leqslant y) &= \\
(a \leqslant y < b \wedge y < c) \vee (a \leqslant y < b \wedge d \leqslant y) &\underset{c<a}{=} \\
(c < a \leqslant y < b \wedge y < c) \vee (c < a \leqslant y < b \wedge d \leqslant y) &\underset{c \not< c}{=} \\
c < a \leqslant y < b \wedge d \leqslant y &
\end{aligned}$$

so that $y \in [d,b[$. Hence $[a,b[\setminus [c,d[\subseteq [d,b[$ which combined with [eq: 20.305] gives

$$[a,b[\setminus [c,d[= [d,b[$$

Define $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}_{[[}$ by $A_1 = [d,b[$ then

$$[a,b[\setminus [c,d[= \bigsqcup_{i \in \{1\}} A_i$$

So in all cases we found a pairwise disjoint family $\{A_i\}_{i \in \{1,\ldots,m\}} \subseteq \mathcal{S}_{[[}$ such that

$$[a,b[\setminus [c,d[= \bigsqcup_{i \in \{1,\ldots,m\}} A_i$$

□

Theorem 20.250. *For $\mathcal{S}_{[[} = \mathcal{I}_{[[} \bigsqcup \{\varnothing\}$ where $\mathcal{I}_{[[} = \{[a,b[| a,b \in \mathbb{R}$ such that $[a,b[\neq \varnothing\}$ then*

$$\sigma[\mathcal{S}_{[[}] = \sigma[\mathcal{I}_{[[}]$$

so that using [theorem: 20.150]

$$\begin{aligned}
\sigma[\{C \subseteq \mathbb{R} | C \text{ is closed in } \mathcal{T}_{||}\}] &\underset{\text{[theorem: 20.143]}}{=} \mathcal{B}[\mathbb{R}] \\
&= \sigma[\mathcal{T}_{||}] \\
&= \sigma[\mathcal{I}_{]]}] \\
&= \sigma[\mathcal{I}_{]]}] \\
&= \sigma[\mathcal{I}_{[]}] \\
&= \sigma[\mathcal{I}_{[[}] \\
&= \sigma[\mathcal{S}_{[[}] \\
&= \sigma[\{[a,\infty[| a \in \mathbb{R}\}] \\
&= \sigma[\{]a,\infty[| a \in \mathbb{R}\}] \\
&= \sigma[\{]-\infty,a] | a \in \mathbb{R}\}] \\
&= \sigma[\{]-\infty,a[| a \in \mathbb{R}\}]
\end{aligned}$$

Proof. As $\mathcal{I}_{[[} \subseteq \mathcal{S}_{[[} \subseteq \sigma[\mathcal{S}_{[[}]$ it follows from [theorem: 20.141] and the fact that $\sigma[\mathcal{S}_{[[}]$ is a σ-algebra that

$$\sigma[\mathcal{I}_{[[}] \subseteq \sigma[\mathcal{S}_{[[}] \tag{20.306}$$

Let $A \in \mathcal{S}_{[[}$ then either $A \in \mathcal{I}_{[[} \subseteq \sigma[\mathcal{I}_{[[}]$ or $A = \varnothing \in \sigma[\mathcal{I}_{[[}]$ which proves that $\mathcal{S}_{[[} \subseteq \sigma[\mathcal{I}_{[[}]$. Hence using [theorem: 20.141] and the fact that $\sigma[\mathcal{I}_{[[}]$ is a σ-algebra it follows that $\sigma[\mathcal{S}_{[[}] \subseteq \sigma[\mathcal{I}_{[[}]$. Combining this with [eq: 20.306] proves that

$$\sigma[\mathcal{S}_{[[}] = \sigma[\mathcal{I}_{[[}]$$

□

Definition 20.251. *We define*

$$\text{begin}: \mathcal{I}_{[[} \to \mathbb{R} \text{ by } \text{begin}(I) = a \text{ where } I = [a, b[$$

$$\text{end}: \mathcal{I}_{[[} \to \mathbb{R} \text{ by } \text{end}(I) = b \text{ where } I = [a, b[$$

***Note* 20.252.** *If $\varnothing \neq I = [a, b[= [c, d[$ then by [theorem: 3.144(7)] we have $a = c \wedge b = d$ so these functions are well defined.*

***Note* 20.253.** *As $I \neq \varnothing$ we have always that* $\text{begin}(I) < \text{end}(I)$

We define

$$\text{begin}: \mathcal{I}_{[[} \to \mathbb{R} \text{ by } \text{begin}(I) = a \text{ where } I = [a, b[$$

$$\text{end}: \mathcal{I}_{[[} \to \mathbb{R} \text{ by } \text{end}(I) = b \text{ where } I = [a, b[$$

Note 20.254. If $\varnothing \neq I = [a, b[= [c, d[$ then by [theorem: 3.144(7)] we have $a = c \wedge b = d$ these functions are well defined.

Note 20.255. As $I \neq \varnothing$ we have that $\text{begin}(I) < \text{end}(I)$

Using the above two functions we can now define the length function.

Definition 20.256. *We define*

$$\text{len}: \mathcal{S}_{[[} \to [0, \infty] \text{ by } \text{len}(I) = \begin{cases} 0 \text{ if } I = \varnothing \\ \text{end}(I) - \text{begin}(I) \text{ if } I \in \mathcal{I}_{[[} \end{cases}$$

In other words the function len *calculates the length of a interval.*

To simplify the proof that len is a content we need to order the half open intervals based on their boundary points. We define now a total order on $\mathcal{I}_{[[}$ the set of half-open intervals.

Theorem 20.257. *The relation $\preccurlyeq \subseteq \mathcal{I}_{[[} \times \mathcal{I}_{[[}$ defined by*

$$[a, b[\preccurlyeq [c, d[\text{ if } a < c \vee (a = c \wedge b \leqslant d)$$

is a total order on $\mathcal{I}_{[[}$ making $\langle \mathcal{I}_{[[}, \preccurlyeq \rangle$ a totally ordered set.

Proof. We have

reflexivity. Let $[a, b[\in \mathcal{I}_{[[}$ then as $a = a$ and $b = b \Rightarrow b \leqslant b$ it follows that $[a, b[\preccurlyeq [a, b[$ proving reflectivity.

anti-symmetry. Let $[a, b[, [c, d[\in \mathcal{I}_{[[}$ be such that $[a, b[\preccurlyeq [c, d[$ and $[c, d[\preccurlyeq [a, b[$. As $[a, b[\preccurlyeq [c, d[$ we have either:

- ***a* < *c*.** Then as $[c, d[\preccurlyeq [a, b[$ we have either $c = a$ or $c < a$ which both give a contradiction, so this cases never occurs.
- ***a* = *c*.** Then from $[a, b[\preccurlyeq [c, d[$ it follows that $b \leqslant d$ and from $[c, d[\preccurlyeq [a, b[$ it follows that $d \leqslant b$. Hence we have $a = c \wedge b = d$ so that $[a, b[= [c, d[$

transitivity. Assume that $[a, b[\preccurlyeq [c, d[$ and $[c, d[\preccurlyeq [e, f[$. As $[a, b[\preccurlyeq [c, d[$ we have either:

- ***a* < *c*.** Then as $[c, d[\preccurlyeq [e, f[$ we have either:
  - ***c* < *e*.** Then $a < e$ so that $[a, b[\preccurlyeq [e, f[$
  - ***c* = *e*.** Then $a < e$ so that $[a, b[\preccurlyeq [e, f[$
- ***a* = *c*.** Then as $[a, b[\preccurlyeq [c, d[$ we must have that

$$b \leqslant d$$

  As $[c, d[\preccurlyeq [e, f[$ we have either:
  - ***c* < *e*.** Then $a < e$ so that $[a, b[\preccurlyeq [e, f[$.
  - ***c* = *e*.** Then as $[c, d[\preccurlyeq [e, f[$ we have that $d \leqslant f$ which combined with $a = c = e$ proves that $[a, b[\preccurlyeq [e, f[$.

So in all cases we have $[a, b[\preccurlyeq [e, f[$ proving transitivity.

totally. If $[a,b[,[c,d[$ then, as $a,b,c,d\in\mathbb{R}$ and $\langle\mathbb{R},\leqslant\rangle$ is totally ordered, we have for a,c either:

- $\boldsymbol{a<c}$. Then $[a,b[\preccurlyeq[c,d[$
- $\boldsymbol{a=c}$. Then as $\langle\mathbb{R},\leqslant\rangle$ is totally ordered we have for b,d either:
  - $\boldsymbol{b<d}$. Then $[a,b[\preccurlyeq[c,d]$
  - $\boldsymbol{d\leqslant b}$. Then $[c,d[\preccurlyeq[a,b[$
- $\boldsymbol{c<a}$. Then $[c,d[\preccurlyeq[a,b[$ □

So we can sort half open intervals which will be used in the next lemma.

Theorem 20.258. *Let $n\in\mathbb{N}$, $\{[a_i,b_i[\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{I}_{[[}$ pairwise disjoint such that*

$$\bigcup_{i\in\{1,\dots,n\}}[a_i,b_i[\in\mathcal{I}_{[[}$$

then there exist a bijection $\sigma:\{1,\dots,n\}\to\{1,\dots,n\}$ such that

$$\forall i\in\{1,\dots,n-1\}\text{ we have }b_{\sigma(i)}=a_{\sigma(i+1)}$$

and

$$\bigcup_{i\in\{1,\dots,n\}}[a_i,b_i[=[a_{\sigma(1)},b_{\sigma(n)}]$$

Proof. For $n\in\mathbb{N}$ we have either:

- $\boldsymbol{n=1}$. Take $\sigma=\mathrm{Id}_{\{1\}}:\{1\}\to\{1\}$ then σ is a bijection, further as $\{1,\dots,n-1\}=\varnothing$ we have vacuously that $\forall i\in\{1,\dots,n-1\}$ $b_{\sigma(i)}=a_{\sigma(i+1)}$, finally $\bigcup_{i\in\{1\}}[a_i,b_i[=[a_1,b_1[=[a_{\sigma(1)},b_{\sigma(1)}[$.
- $\boldsymbol{n\in\{2,\dots,\infty\}}$. As $\langle\mathcal{I}_{[[},\preccurlyeq\rangle$ is totally ordered there exist by [corollary: 6.55] a bijection $\sigma:\{1,\dots,n\}\to\{1,\dots,n\}$ such that

$$\forall i,j\in\{1,\dots,n\}\text{ with }i\leqslant j\text{ we have }[a_{\sigma(i)},b_{\sigma(i)}[\preccurlyeq[a_{\sigma(j)},\beta_{\sigma(j)}[\tag{20.307}$$

Let $i,j\in\{1,\dots,n\}$ with $i\leqslant j$ then as $[a_{\sigma(i)},b_{\sigma(i)}[\preccurlyeq[a_{\sigma(j)},\beta_{\sigma(j)}[$ we have either $a_{\sigma(i)}<a_{\sigma(j)}\Rightarrow a_{\sigma(i)}\leqslant a_{\sigma(j)}$ or $a_{\sigma(i)}=a_{\sigma(i+1)}\Rightarrow a_{\sigma(i)}\leqslant a_{\sigma(j)}$ so that

$$\forall i,j\in\{1,\dots,n\}\text{ with }i\leqslant j\text{ we have }a_{\sigma(i)}\leqslant a_{\sigma(j)} \tag{20.308}$$

Futher by [theorem: 20.107] we have that

$$\{[a_{\sigma(i)},b_{\sigma(i)}[\}_{i\in\{1,\dots,n\}}\text{ is pairwise disjoint} \tag{20.309}$$

Assume that there exist a $k\in\{1,\dots,n-1\}$ such that $a_{\sigma(k+1)}<b_{\sigma(k)}$. Then by [eq: 20.308] $a_{\sigma(k)}\leqslant a_{\sigma(k+1)}<b_{\sigma(k)}$ from which it follows that $a_{\sigma(k+1)}\in[a_{\sigma(k)},b_{\sigma(k)}[\bigcap[a_{\sigma(k+1)},b_{\sigma(k+1)}[$ contradicting $[a_{\sigma(k)},b_{\sigma(k)}[\bigcap[a_{\sigma(k+1)},b_{\sigma(k+1)}[\underset{\text{[eq: 20.309]}}{=}\varnothing$. Hence the assumtion is wrong and we conclude that

$$\forall i\in\{1,\dots,n-1\}\text{ we have }b_{\sigma(i)}\leqslant a_{\sigma(i+1)} \tag{20.310}$$

As $\bigcup_{i\in\{1,\dots,n\}}[a_i,b_i[\in\mathcal{I}_{[[}$ there exist a $c,d\in\mathbb{R}$ with $c<d$ such that

$$\bigcup_{i\in\{1,\dots,n\}}[a_{\sigma(i)},b_{\sigma(i)}[\underset{\text{[theorem: 2.119]}}{=}\bigcup_{i\in\{1,\dots,n\}}[a_i,b_i[=[c,d[\tag{20.311}$$

If $i=\{1,\dots,n-1\}$ then by [eq: 20.310] we have $b_{\sigma(i)}\leqslant a_{\sigma(i+1)}$ and as $i\leqslant n-1<n\Rightarrow i+1\leqslant n$ it follows from [eq: 20.308] that $a_{\sigma(i+1)}\leqslant a_{\sigma(n)}<b_{\sigma(n)}$ so that $b_{\sigma(i)}<b_{\sigma(n)}$, hence

$$\forall i\in\{1,\dots,n\}\text{ we have }b_{\sigma(i)}\leqslant b_{\sigma(n)} \tag{20.312}$$

Let $i\in\{1,\dots,n\}$ then for $x\in[a_{\sigma(i)},b_{\sigma(i)}[$ we have $a_{\sigma(1)}\underset{\text{[eq: 20.308]}}{\leqslant}a_{\sigma(i)}<x<b_{\sigma(i)}\underset{\text{[eq: 20.312]}}{\leqslant}b_{\sigma(n)}$ so that $x\in[a_{\sigma(1)},b_{\sigma(n)}[$ hence $[a_{\sigma(i)},b_{\sigma(i)}[\subseteq[a_{\sigma(n)},b_{\sigma(n)}[$. So

$$[c,d[\underset{\text{[eq: 20.311]}}{=}\bigcup_{i\in\{1,\dots,n\}}[a_{\sigma(i)},b_{\sigma(i)}[\subseteq[a_{\sigma(1)}b_{\sigma(n)}[\tag{20.313}$$

As $[c,d[\subseteq[a_{\sigma(1)}b_{\sigma(n)}[$ it follows from [theorem: 3.144(9)] that

$$a_{\sigma(1)}\leqslant c\wedge d\leqslant b_{\sigma(n)} \tag{20.314}$$

As $a_{\sigma(1)}\in[a_{\sigma(1)},b_{\sigma(1)}[\subseteq\bigcup_{i\in\{1,\dots,n\}}[a_{\sigma(i)},b_{\sigma(i)}[\underset{\text{[eq: 20.311]}}{=}[c,d]$ it follows that $c\leqslant a_{\sigma(1)}$ which combined with [eq: 20.314] proves that

$$a_{\sigma(1)}=c \tag{20.315}$$

As $a_{\sigma(n)}\in[a_{\sigma(n)},b_{\sigma(n)}[\subseteq\bigcup_{i\in\{1,\dots,n\}}[a_{\sigma(i)},b_{\sigma(i)}[\underset{\text{[eq: 20.311]}}{=}[c,d[$ we have $c\leqslant a_{\sigma(n)}<d$. Assume that $d<b_{\sigma(n)}$ then $a_{\sigma(n)}<d<b_{\sigma(n)}$, proving that $d\in[a_{\sigma(n)},b_{\sigma(n)}[\subseteq[c,d[$ leading to the contradiction $d<d$. Hence we must have $b_{\sigma(n)}\leqslant d$ which combined with [eq: 20.314] proves

$$b_{\sigma(n)}=d \tag{20.316}$$

Summarizing [eqs: 20.311, 20.315 and 20.316] we have

$$\bigsqcup_{i\in\{1,\dots,n\}}[a_i,b_i[=\bigsqcup_{i\in\{1,\dots,n\}}[a_{\sigma(i)},b_{\sigma(i)}[=[a_{\sigma(1)},b_{\sigma(n)}[\tag{20.317}$$

Assume now that there exist a $k\in\{1,\dots,n-1\}$ such that $b_{\sigma(k)}\neq a_{\sigma(k+1)}$. If $a_{\sigma(k+1)}<b_{\sigma(k)}$ then by [eq: 20.310] $b_{\sigma(k)}\leqslant a_{\sigma(k+1)}$ and we reach the contradiction $a_{\sigma(k+1)}<a_{\sigma(k+1)}$ so we must have that $b_{\sigma(k)}<a_{\sigma(k+1)}$. Hence there exist a $x\in\mathbb{R}$ such that

$$b_{\sigma(k)}<x<a_{\sigma(k+1)} \text{ so that } x\notin[a_{\sigma(k)},b_{\sigma(k)}[\text{ and } x\notin[a_{\sigma(k+1)},b_{\sigma(k+1)}[\tag{20.318}$$

If $i\in\{1,\dots,k-1\}$ then $b_{\sigma(i)}\underset{\text{[eq: 20.310]}}{\leqslant}a_{\sigma(i+1)}\underset{\text{[eq: 20.308]}}{\leqslant}a_{\sigma(k)}<b_{\sigma(k)}<x$ so that $x\notin[a_{\sigma(i)},b_{\sigma(i)}[$. Further if $i\in\{k+1,\dots,n\}$ then $x<a_{\sigma(k+1)}\leqslant a_{\sigma(i)}$ so that $x\notin[a_{\sigma(i)},b_{\sigma(i)}[$. From this we conclude that $\forall i\in\{1,\dots,n\}$ $x\notin[a_{\sigma(i)},b_{\sigma(i)}[$ or

$$x\notin\bigcup_{i\in\{1,\dots,n\}}[a_{\sigma(i)},b_{\sigma(i)}[=[a_{\sigma(1)},b_{\sigma(n)}[\tag{20.319}$$

As $a_{\sigma(1)}\underset{\text{[eq: 20.308]}}{\leqslant}a_{\sigma(k)}<b_{\sigma(k)}<x$ and $x<a_{\sigma(k+1)}\underset{\text{[eq: 20.308]}}{\leqslant}a_{\sigma(n)}<b_{\sigma(n)}$ so that $x\in[a_{\sigma(1)},b_{\sigma(n)}[$ which contradicts [eq: 20.319]. Hence the assumption is false and we must have

$$\forall i\in\{1,\dots,n-1\} \text{ that } b_{\sigma(i)}=a_{\sigma(i)}$$

□

We are now ready to prove that len is a content on the semi-ring $\mathcal{S}_{[[}$.

Lemma 20.259. *The length function* $\text{len}:\mathcal{S}_{[[}\to[0,\infty]$ *defined by* $\text{len}(I)=\begin{cases}0 & \text{if } I=\varnothing\\ \text{end}(I)-\text{begin}(I) & \text{if } I\in\mathcal{I}_{[[}\end{cases}$ *[see definition: 20.256] is a finite content on the semi-ring* $\mathcal{S}_{[[}$.

Proof. First by definition we have

$$\text{len}(\varnothing)=0 \tag{20.320}$$

Second $\forall I\in\mathcal{S}_{[[}$ we have $\text{len}(I)=\begin{cases}0<\infty \text{ if } I=\varnothing\\ \text{end}(I)-\text{begin}(I)<\infty \text{ if } I\in\mathcal{I}_{[[}\end{cases}$ which proves that

$$\text{len is a finite} \tag{20.321}$$

Next we prove that len is additive on $\mathcal{I}_{[[}$. Let $\{I_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{I}_{[[}$, $n\in\mathbb{N}$ pairwise disjoint such that $\bigsqcup_{i\in\{1,\dots,n\}}I_i\in\mathcal{I}_{[[}$ then we have for $n\in\mathbb{N}$ either:

- $\boldsymbol{n=1}$. Then $\text{len}\big(\bigsqcup_{i\in\{1,\dots,n\}}I_i\big)=\text{len}\big(\bigsqcup_{i\in\{1\}}I_i\big)=\text{len}(I_1)=\sum_{i=1}^{1}\text{len}(I_i)=\sum_{i=1}^{n}\text{len}(I_i)$
- $\boldsymbol{1<n}$. Then $\forall i\in\{1,\dots,n\}$ there exists a_i, $b_i\in\mathbb{R}$ with $a_i<b_i$ such that $I_i=[a_i,b_i[$. Using [theorem: 20.258] there exist a bijection σ: $\{1,\dots,n\}\to\{1,\dots,n\}$ such that

$$\bigsqcup_{i\in\{1,\dots,n\}}I_i=\bigsqcup_{i\in\{1,\dots,n\}}[a_i,b_i[=\bigsqcup_{i\in\{1,\dots,n\}}[a_{\sigma(i)},b_{\sigma(i)}[=[a_{\sigma(1)},b_{\sigma(n)}[\tag{20.322}$$

such that

$$\forall i\in\{1,\dots,n-1\}\ b_{\sigma(i)}=a_{\sigma(i+1)} \tag{20.323}$$

Then

$$\begin{aligned}
\sum_{i=1}^{n} \operatorname{len}(I_i) &\underset{\text{[theorem: 11.31]}}{=} \sum_{i=1}^{n} \operatorname{len}(I_{\sigma(i)}) \\
&= \sum_{i=1}^{n} \operatorname{len}([a_{\sigma(i)}, b_{\sigma(i)}[) \\
&= \sum_{i=1}^{n} (b_{\sigma(i)} - a_{\sigma(i)}) \\
&\underset{1<n}{=} (b_{\sigma(n)} - a_{\sigma(n)}) + \sum_{i=1}^{n-1} (b_{\sigma(i)} - a_{\sigma(i)}) \\
&\underset{\text{[eq: 20.323]}}{=} (b_{\sigma(n)} - a_{\sigma(n)}) + \sum_{i=1}^{n-1} (a_{\sigma(i+1)} - a_{\sigma(i)}) \\
&\underset{\text{[theorem: 11.10]}}{=} b_{\sigma(n)} - a_{\sigma(n)} + a_{\sigma(n)} - a_{\sigma(1)} \\
&= b_{\sigma(n)} - a_{\sigma(1)} \\
&= \operatorname{len}([a_{\sigma(1)}, b_{\sigma(n)}[) \\
&\underset{\text{[eq: 20.322]}}{=} \operatorname{len}\left(\bigsqcup_{i \in \{1,\dots,n\}} I_i \right)
\end{aligned}$$

To summarize

$$\forall \{I_i\}_{i \in \{1,\dots,n\}} \subseteq \mathcal{I}_{[[} \text{ pairwise disjoint with } \bigsqcup_{i \in \{1,\dots,n\}} I_i \in \mathcal{I}_{[[} \ \operatorname{len}\left(\bigsqcup_{i \in \{1,\dots,n\}} I_i \right) = \sum_{i=1}^{n} \operatorname{len}(I_i) \tag{20.324}$$

Next we extend the above to $\mathcal{S}_{[[}$. Let $\{I_i\}_{i \in \{1,\dots,n\}} \subseteq \mathcal{S}_{[[}$, $n \in \mathbb{N}$ such that $\bigsqcup_{i \in \{1,\dots,n\}} I_i \in \mathcal{S}_{[[}$. Define $N = \{i \in \{1,\dots,n\} | I_i \neq \varnothing\}$ then for N we have either:

$\boldsymbol{N = \varnothing}$**.** Then

$$\operatorname{len}\left(\bigsqcup_{i \in \{1,\dots,n\}} I_i \right) = \operatorname{len}(\varnothing) = 0 = \sum_{i=1}^{n} 0 = \sum_{i=1}^{n} \operatorname{len}(I_i)$$

$\boldsymbol{N \neq \varnothing}$**.** Then as $\varnothing \neq N$ is finite there exist a $m \in \{1,\dots,n\}$ and a bijection $\beta \colon \{1,\dots,m\} \to N$. Further we have

$$\begin{aligned}
\operatorname{len}\left(\bigsqcup_{i \in \{1,\dots,n\}} I_i \right) &\underset{\text{[theorem: 2.134]}}{=} \operatorname{len}\left(\bigsqcup_{i \in N} I_i \right) \\
&\underset{\text{[theorem: 2.119]}}{=} \operatorname{len}\left(\bigsqcup_{i \in \{1,\dots,m\}} I_{\sigma(i)} \right) \\
&\underset{\text{[eq: 20.324]}}{=} \sum_{i=1}^{m} \operatorname{len}(I_{\sigma(i)}) \\
&= \sum_{i \in \{1,\dots,m\}} \operatorname{len}(I_{\sigma(i)}) \\
&\underset{\text{[theorem: 11.36]}}{=} \sum_{i \in N} \operatorname{len}(I_i) \\
&= \sum_{i \in N} \operatorname{len}(I_i) + \sum_{i \in \{1,\dots,n\} \setminus N} 0 \\
&= \sum_{i \in N} \operatorname{len}(I_i) + \sum_{i \in \{1,\dots,n\} \setminus N} \operatorname{len}(I_i) \\
&= \sum_{i \in \{1,\dots,n\}} \operatorname{len}(I_i) \\
&= \sum_{i=1}^{n} \operatorname{len}(I_i)
\end{aligned}$$

So in all cases we have that

$$\text{Let } \{I_i\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{S}_{[[}, n\in\mathbb{N} \text{ pairwise disjoint with } \bigsqcup_{i\in\{1,\dots,n\}} I_i \in \mathcal{S}_{[[} \text{ then } \operatorname{len}\left(\bigsqcup_{i\in\{1,\dots,n\}} I_i\right) = \sum_{i=1}^{n} \operatorname{len}(I_i) \tag{20.325}$$

So using [eqs: 20.320, 20.321 and 20.325] it follows that len is a finite content on the semi-ring $\mathcal{S}_{[[}$. □

Next we prove that len is a pre-measure on $\mathcal{S}_{[[}$.

Lemma 20.260. *The function* $\operatorname{len}: \mathcal{S}_{[[} \to [0,\infty]$ *[see definition: 20.256] is a pre-measure on the semi-ring* $\mathcal{S}_{[[}$

Proof. Consider the topological space $\langle \mathbb{R}, \mathcal{T}_{||}\rangle$. Let $A\in S_{[[}$ and $\varepsilon\in\mathbb{R}^+$ then for A we have either:

- $\boldsymbol{A=\varnothing}$**.** Take then $A_\varepsilon=\varnothing\in\mathcal{S}_{[[}$ and $K_\varepsilon=\varnothing$. Then K_ε is compact by [example: 14.226], $A_\varepsilon\subseteq K_\varepsilon\subseteq A$ and $\operatorname{len}(A)-\operatorname{len}(A_\varepsilon)=0-0=0<\varepsilon$.
- $\boldsymbol{A\neq\varnothing}$**.** Then there exists $a,b\in\mathbb{R}$ with $a<b$ such that $A=[a,b[$. Define then $A_\varepsilon=\left[a,b-\frac{\varepsilon}{2}\right[$ and $K_\varepsilon=\left[a,b-\frac{\varepsilon}{2}\right]$. Then by the Heine Borel theorem]theorem: 14.235] K_ε is compact. Further $A_\varepsilon\subseteq K_\varepsilon\subseteq A$ and $\operatorname{len}(A)-\operatorname{len}(A_\varepsilon)=\operatorname{len}([a,b[)-\operatorname{len}\left(\left[a,b-\frac{\varepsilon}{2}\right[\right)=b-a-\left(b-\frac{\varepsilon}{2}-a\right)=\frac{\varepsilon}{2}<\varepsilon$

Hence using [theorem: 20.246] it follows that

$$\overline{\operatorname{len}} \text{ is a pre-measure on } \mathcal{R}[\mathcal{S}]$$ □

Next we use a derivate of the Carathéodry theorem [theorem: 20.225] to extend len to the Lebesgue measure on Lebesgue measurable sets in $\mathbb{R}$.

Theorem 20.261. *If we define*

$$\lambda^*: \mathcal{P}[\mathbb{R}] \to [0,\infty] \text{ by } \lambda^*(A) = \begin{cases} \infty \text{ if } \mathcal{S}[A]=\varnothing \\ \inf\left(\{\sum_{i=1}^{\infty}\mu(A_i) | \{A_i\}_{i\in\mathbb{N}}\in\mathcal{S}[A]\}\right)\end{cases}$$

where

$$\mathcal{S}[A] = \left\{\{A_i\}_{i\in\mathbb{N}} \subseteq \mathcal{S}_{[[} | A\subseteq \bigcup_{i\in\mathbb{N}} A_i\right\}$$

then

$$\lambda^* \text{ is a outer measure}$$

$$\mathcal{L}[\mathbb{R}] = \left\{A\in\mathcal{P}(\mathbb{R}) | \forall B\in\mathcal{P}(\mathbb{R}) \text{ we have } \lambda^*(B)=\lambda^*\left(B\bigcap A\right)+\lambda^*(B\setminus A)\right\}$$

is a σ*-algebra on* $\mathbb{R}$ *such that*

$$\sigma[\mathcal{S}_{[[}] \subseteq \mathcal{L}[\mathbb{R}]$$

and

$$\overline{\lambda} = (\lambda^*)_{|\mathcal{L}(\mathbb{R})}: \mathcal{L}[\mathbb{R}] \to [0,\infty] \text{ is a measure on } \mathcal{L}[\mathbb{R}]$$

and

$$\lambda = (\lambda^*)_{|\sigma[\mathcal{S}_{[[}]}: \sigma[\mathcal{S}_{[[}] \to [0,\infty] \text{ is a measure on } \sigma[\mathcal{S}_{[[}]$$

and

$$(\lambda^*)_{|\mathcal{S}_{[[}} = \operatorname{len}$$

Further if $\mu: \sigma[\mathcal{S}_{[[}] \to [0,\infty]$ *is another measure such that* $\mu_{|S_{[[}} = \operatorname{len}$ *then*

$$\mu = \lambda$$

We have then

$$\langle \mathbb{R}, \mathcal{L}[\mathbb{R}], \overline{\lambda}\rangle \text{ is a measure space called the Lebesgue measure space}$$

where

$$\mathcal{L}[\mathbb{R}] \text{ is called the set of Lebesgue measurable sets}$$

and

$$\overline{\lambda} \text{ the Lebesgue measure}$$

***Note* 20.262.** *As by [theorem: 20.250] $\mathcal{B}[\mathbb{R}]=\sigma[\mathcal{S}_{[[}]$ we have also that*

$$\mathcal{B}[\mathbb{R}]\subseteq\mathcal{L}[\mathbb{R}]$$

and

$$\lambda:\mathcal{B}[\mathbb{R}]\to[0,\infty] \text{ is a measure on } \mathcal{B}[\mathbb{R}]$$

So

$$\langle\mathbb{R},\mathcal{B}[\mathbb{R}],\lambda\rangle \text{ is a measure space called the Borel measures space}$$

where

$$\mathcal{B}[\mathbb{R}] \text{ is called the set of Borel sets on } \mathbb{R}$$

and

$$\lambda \text{ is called the Borel measure}$$

Proof. Using [lemma: 20.260] we have that

$$\text{len is a pre-measure on the semi-ring } \mathcal{S}_{[[}$$

Define $\{[-i,i[\}_{i\in\mathbb{N}}\subseteq\mathcal{S}_{[[}$ then we have

$$\forall i\in\mathbb{N} \text{ that } [-i,i[\subseteq[-(i+1),i+1[\text{ and } \operatorname{len}([-i,i[)=2\cdot i<\infty$$

If $x\in\mathbb{R}$ then by [theorem: 10.30] there exist $n,m\in\mathbb{N}$ such that $-n<x<m$. Let $i=\max(n,m)$ then $-i\leqslant-n<x<m<i$ so that $x\in[-i,i[$ from which it follows that $\mathbb{R}\subseteq\bigcup_{i\in\mathbb{N}}[-i,i[$. As $\forall i\in\mathbb{N}$ $[-i,i[\subseteq\mathbb{R}$ we have $\bigcup_{i\in\mathbb{N}}[-i,i[\subseteq\mathbb{R}$. Hence we have

$$\mathbb{R}=\bigcup_{i\in\mathbb{N}}[-i,i[$$

The proof follows then from applying [theorem: 20.225]. □

20.4.4.4 Product of semi-rings

If we want to use the Carathéodory theorem to create a measure on $\mathcal{B}[\mathbb{R}^n]$ we have to start with a semi-ring, as $\mathcal{B}[\mathbb{R}^n]=\sigma[\mathcal{R}^n]$ it seems sensible to prove that $\mathcal{R}^n\bigcup\{\varnothing\}$ is a semi-ring on $\mathbb{R}^n$. First note that $R\in\mathcal{R}^n\bigcup\{\varnothing\}$ can be written as $R=\prod_{i\in\{1,\ldots,n\}}I_i$ where $I_i\in\mathcal{T}_{[[}$ which suggest the following definition that extends this note to the more general cases of a product of a finite number of semi-rings.

Definition 20.263. *Let $n\in\{2,\ldots,\infty\}$, $\{\langle X_i,\mathcal{S}_i\rangle\}_{i\in\{1,\ldots,n\}}$ a finite family such that $\forall i\in\{1,\ldots,n\}$ $\mathcal{S}_i\subseteq\mathcal{P}(X_i)$ then $\bigodot_{i\in\{1,\ldots,n\}}\mathcal{S}_i$ is defined by*

$$\bigodot_{i\in\{1,\ldots,n\}}\mathcal{S}_i=\left\{\prod_{i\in\{1,\ldots,n\}}A_i|\forall i\in\{1,\ldots,n\}\ A_i\in\mathcal{S}_i\right\}$$

***Note* 20.264.** *In the particular cases where $n=2$ we note $\bigodot_{i\in\{1,2\}}S_i$ as $\mathcal{S}_1\odot\mathcal{S}_2$. In other words*

$$S_1\odot\mathcal{S}_2=\{A\cdot B|A\in\mathcal{S}_1\wedge B\in\mathcal{S}_2\}$$

Next we will prove using mathematical induction that $\bigodot_{i\in\{1,\ldots,n\}}\mathcal{S}_i$ is a semi-ring on $\prod_{i\in\{1,\ldots,\}}X_i$. The next lemma will be used in the base case and the induction step.

Lemma 20.265. *Let X_1,X_2 be two sets and $\mathcal{S}_1\subseteq\mathcal{P}(X_1)$, $\mathcal{S}_2\subseteq\mathcal{P}(X_2)$ be semi-rings on X_1 and X_2 respectively then $\mathcal{S}_1\odot S_2$ is a semi-ring on $X_1\cdot X_2$.*

Proof. As $\mathcal{S}_1$, $\mathcal{S}_2$ are semi-rings we have that $\varnothing\in S_1\wedge\varnothing\in S_2$ so that

$$\varnothing=\varnothing\cdot\varnothing\in\mathcal{S}_1\odot\mathcal{S}_2 \tag{20.326}$$

Let $R,S\in\mathcal{S}_1\odot\mathcal{S}_2$ then there exists $A,C\in\mathcal{S}_1$ and $B,D\in\mathcal{S}_2$ such that

$$R=A\cdot B \text{ and } S=C\cdot D$$

Then we have

$$\begin{aligned} R\bigcap S &= (A\cdot B)\bigcap(C\cdot D) \\ &\underset{\text{[theorem: 6.84]}}{=} \left(A\bigcap C\right)\cdot\left(B\bigcap D\right) \end{aligned}$$

given that $\mathcal{S}_1,\mathcal{S}_2$ are semi-rings it follows that $A\bigcap C\in\mathcal{S}_1\wedge B\bigcap D\in\mathcal{S}_2$ so that

$$R\bigcap S\in\mathcal{S}_1\odot\mathcal{S}_2 \tag{20.327}$$

Using [theorem: 20.104] we have that

$$\begin{aligned} R\setminus S &= (A\cdot B)\setminus(C\cdot D) \\ &= (A\setminus C)\cdot(B\setminus D)\bigcup(A\setminus C)\cdot\left(B\bigcap D\right)\bigcup\left(A\bigcap C\right)\cdot(B\setminus D) \end{aligned}$$

where

1. $((A\setminus C)\cdot(B\setminus D))\bigcap((A\setminus C)\cdot(B\bigcap D))=\varnothing$
2. $((A\setminus C)\cdot(B\setminus D))\bigcap((A\bigcap C)\cdot(B\setminus D))=\varnothing$
3. $((A\setminus C)\cdot(B\bigcap D))\bigcap((A\bigcap C)\cdot(B\setminus D))=\varnothing$

So if we define $\{R_i\}_{i\in\{1,2,3\}}$ by

$$\begin{aligned} R_1 &= (A\setminus C)\cdot(B\setminus D) \\ R_2 &= (A\setminus C)\cdot\left(B\bigcap D\right) \\ R_3 &= \left(A\bigcap C\right)\cdot(B\setminus D) \end{aligned}$$

then we have

$$\{R_i\}_{i\in\{1,2,3\}}\text{ is a pairwise disjoint and }R\setminus S=\bigsqcup_{i\in\{1,2.3\}}R_i \tag{20.328}$$

Now for $i\in\{1,2,3\}$ we have either:

$i=1$. As $A,C\in\mathcal{S}_1$ a semi ring there exist a pairwise disjoint $\{A_i\}_{i\in\{1,\dots,m_1\}}\subseteq\mathcal{S}_1$ such that

$$A\setminus C=\bigsqcup_{i\in\{1,\dots,m_1\}}A_i \tag{20.329}$$

likewise as $B,D\in\mathcal{S}_1$ there exist a pairwise disjoint $\{B_i\}_{i\in\{1,\dots,m_2\}}\subseteq\mathcal{S}_2$ such that

$$B\setminus D=\bigsqcup_{i\in\{1,\dots,m_2\}}B_i \tag{20.330}$$

so that we have

$$\begin{aligned} R_1 &= (A\setminus C)\cdot(B\setminus D) \\ &= \left(\bigsqcup_{i\in\{1,\dots,m_1\}}A_i\right)\cdot\left(\bigsqcup_{j\in\{1,\dots,m_2\}}B_j\right) \\ &\underset{\text{[theorem: 6.85]}}{=} \bigcup_{i\in\{1,\dots,m_1\}\times\{1,\dots,m_2\}}(A_i\cdot B_j) \end{aligned}$$

By [theorem: 6.41] $\{1,\dots,m_1\}\times\{1,\dots,m_2\}$ is finite so there exist a bijection

$$\sigma:\{1,\dots,N_1\}\to\{1,\dots,m_1\}\times\{1,\dots,m_2\}$$

then we have

$$R_1=\bigcup_{(i,j)\in\{1,\dots,m_1\}\times\{1,\dots,m_2\}}(A_i\cdot B_j)\underset{\text{[theorem: 2.119]}}{=}\bigcup_{i\in\{1,\dots,N_1\}}(A_{\sigma(i)_1}\cdot B_{\sigma(i)_2})$$

Define

$$\{R_{1,i}\}_{i\in\{1,\dots,N_1\}}\text{ by }R_{1,i}=A_{\sigma(i)_1}\cdot B_{\sigma(i)_2}$$

then we have $\forall i\in\{1,\dots,N_1\}$ that, as $A_{\sigma(i)_1}\in\mathcal{S}_1$, $B_{\sigma(i)_2}\in\mathcal{S}_2$ so that $R_{1,i}=A_{\sigma(i)_1}\cdot B_{\sigma(i)_2}\in S_1\odot\mathcal{S}_2$. Hence we have

$$\{R_{1,i}\}_{i\in\{1,\dots,N_1\}}\subseteq\mathcal{S}_1\odot\mathcal{S}_2\text{ and }R_1=\bigcup_{i\in\{1,\dots,N_1\}}R_{1,i}$$

Further if $i,j\in\{1,\ldots,N_1\}$ with $i\neq j$ we have, as σ is a bijection, that $\sigma(i)\neq\sigma(j)$, for $\sigma(i)_1$, $\sigma(j)_1$ we have either

$\boldsymbol{\sigma(i)_1=\sigma(j)_1}$**.** Then $\sigma(i)_2\neq\sigma(j)_2$ so that

$$\begin{aligned}R_{1,i}\bigcap R_{1,j} &= (A_{\sigma(i)_1}\cdot B_{\sigma(i)_2})\bigcap(A_{\sigma(j)_1}\cdot B_{\sigma(j)_2})\\ &= \left(A_{\sigma(i)_1}\bigcap A_{\sigma(j)_1}\right)\cdot\left(B_{\sigma(i)_2}\bigcap B_{\sigma(j)_2}\right)\\ &= \left(A_{\sigma(i)_1}\bigcap A_{\sigma(j)_1}\right)\cdot\varnothing\\ &= \varnothing\end{aligned}$$

$\boldsymbol{\sigma(i)_1\neq\sigma(j)_1}$**.** Then

$$\begin{aligned}R_{1,i}\bigcap R_{1,j} &= (A_{\sigma(i)_1}\cdot B_{\sigma(i)_2})\bigcap(A_{\sigma(j)_1}\cdot B_{\sigma(j)_2})\\ &= \left(A_{\sigma(i)_1}\bigcap A_{\sigma(j)_1}\right)\cdot\left(B_{\sigma(i)_2}\bigcap B_{\sigma(j)_2}\right)\\ &= \varnothing\cdot\left(B_{\sigma(i)_2}\bigcap B_{\sigma(j)_2}\right)\\ &= \varnothing\end{aligned}$$

which proves that

$$\{R_{1,i}\}_{i\in\{1,\ldots,N_1\}}\subseteq\mathcal{S}_1\odot\mathcal{S}_2 \text{ is pairwise disjoint and } R_1=\bigsqcup_{i\in\{1,\ldots,N_1\}}R_{1,i}$$

$\boldsymbol{i=2}$**.** Then

$$\begin{aligned}R_2 &= (A\setminus C)\cdot\left(B\bigcap D\right)\\ &\underset{\text{[eq: 20.329]}}{=} \left(\bigsqcup_{i\in\{1,\ldots,m_1\}}A_i\right)\cdot\left(B\bigcap D\right)\\ &\underset{\text{[theorem: 6.85]}}{=} \bigcup_{i\in\{1,\ldots,m_1\}}\left(A_i\cdot\left(B\bigcap D\right)\right)\\ &= \bigcup_{i\in\{1,\ldots,N_2\}}R_{2,i}\end{aligned}$$

where

$$N_2=m_1 \text{ and } \{R_{2,i}\}_{i\in\{1,\ldots,N_2\}} \text{ is defined by } R_{2,i}=A_i\cdot\left(B\bigcap D\right)$$

Let $i\in\{1,\ldots,N_2\}$ then, as $A_i\in\mathcal{S}_1$, $B,D\in\mathcal{S}_2\Rightarrow B\bigcap D\in\mathcal{S}_2$, $R_{2,i}=A_i\cdot(B\bigcap D)\in\mathcal{S}_1\odot\mathcal{S}_2$ so that

$$\{R_{2,i}\}_{i\in\{1,\ldots,N_2\}}\subseteq S_1\odot S_2$$

Further if $i,j\in\{1,\ldots,N_2\}$ with $i\neq j$ then we have

$$R_{2,i}\bigcap R_{2,j}=\left(A_i\cdot\left(B\bigcap D\right)\right)\bigcap\left(A_j\cdot\left(B\bigcap D\right)\right)=\left(A_i\bigcap A_j\right)\cdot\left(B\bigcap D\right)=\varnothing\cdot\left(B\bigcap D\right)=\varnothing$$

So we have proved that

$$\{R_{2,i}\}_{i\in\{1,\ldots,N_2\}}\subseteq\mathcal{S}_1\odot\mathcal{S}_2 \text{ is pairwise disjoint and } R_2=\bigsqcup_{i\in\{1,\ldots,N_2\}}R_{2,i}$$

$\boldsymbol{i=3}$**.** Then

$$\begin{aligned}R_3 &= \left(A\bigcap C\right)\cdot(B\setminus D)\\ &\underset{\text{[eq: 20.330]}}{=} \left(A\bigcap C\right)\cdot\left(\bigsqcup_{i\in\{1,\ldots,m_2\}}B_i\right)\\ &\underset{\text{[theorem: 6.85]}}{=} \bigcup_{i\in\{1,\ldots,m_2\}}\left(\left(A\bigcap C\right)\cdot B_i\right)\\ &= \bigcup_{i\in\{1,\ldots,N_3\}}D_{3,i}\end{aligned}$$

where

$$N_3=m_2 \text{ and } \{R_{3,i}\}_{i\in\{1,\ldots,N_3\}} \text{ is defined by } R_{3,i}=\left(A\bigcap C\right)\cdot B_i$$

Let $i \in \{1,\dots,N_3\}$ then, as $B_i \in \mathcal{S}_2$, $A,C \in \mathcal{S}_1 \Rightarrow A \bigcap C \in \mathcal{S}_1$, $R_{3,i} = ((A \bigcap C) \cdot B_i) \in \mathcal{S}_1 \odot \mathcal{S}_2$ so that

$$\{R_{3,i}\}_{i \in \{1,\dots,N_2\}} \subseteq S_1 \odot S_2$$

Further if $i,j \in \{1,\dots,N_2\}$ with $i \neq j$ then we have

$$R_{3,i} \bigcap R_{3,j} = \big((A \bigcap C) \cdot B_i\big) \bigcap \big((A \bigcap C) \cdot B_j\big) = \big(A \bigcap C\big) \cdot \big(B_i \bigcap B_j\big) = \big(A \bigcap C\big) \cdot \varnothing = \varnothing$$

So we have proved that

$$\{R_{3,i}\}_{i \in \{1,\dots,N_3\}} \subseteq \mathcal{S}_1 \odot \mathcal{S}_2 \text{ is pairwise disjoint and } R_3 = \bigsqcup_{i \in \{1,\dots,N_3\}} R_{3,i}$$

To summarize the above, we have a pairwise disjoint $\{R_i\}_{i \in \{1,2,3\}}$ such that

$$R \setminus S \underset{[\text{eq: } 20.328[}{=} \bigsqcup_{i \in \{1,2,3\}} R_i$$

and $\forall i \in \{1,2,3\}$ there exist a pairwised disjoint $\{R_{i,j}\}_{j \in \{1,\dots,N_i\}} \subseteq \mathcal{S}_1 \odot S_2$ such

$$R_i = \bigsqcup_{j \in \{1,\dots,N_i\}} R_{i,j}$$

Further as $\bigcup_{i \in \{1,2,3\}} \{i\} \cdot \{1,\dots,N_i\}$ is finite by [theorems: 6.41, 6.36] there exist a bijection

$$\sigma: \{1,\dots,N\} \to \bigcup_{i \in \{1,2,3\}} \{i\} \cdot \{1,\dots,N_i\}$$

Hence we can apply]corollary: 20.114] to get that

$$\{R_{\sigma(i)_1,\sigma(i)_2}\}_{i \in \{1,\dots,N\}} \subseteq \mathcal{S}_1 \odot \mathcal{S}_2 \text{ is pairwise disjoint and } R \setminus S = \bigsqcup_{i \in \{1,\dots,N\}} R_{\sigma(i)_1,\sigma(i)_2} \tag{20.331}$$

Finally from [eqs: 20.326, 20.327 and the above eq: 20.331] it follows that

$$\mathcal{S}_1 \odot \mathcal{S}_2 \text{ is a semi-ring on } X_1 \cdot X_2$$

□

If we want to use the above lemma in the proof by mathematical induction that $\bigodot_{i \in \{1,\dots,n\}} \mathcal{S}_i$ is a semi-ring we have a small problem: $\prod_{i \in \{1,\dots,n+1\}} X_i$ is not equal to $\big(\prod_{i \in \{1,\dots,n\}} X_i\big) \cdot X_{n+1}$. Luckely we can prove that $\big(\prod_{i \in \{1,\dots,n\}} X_i\big) \cdot X_{n+1}$ is bijective to $\prod_{i \in \{1,\dots,n+1\}} X_i$. So it makes sense to see how a bijection can be used to generate a semi-ring on the image of the bijection based on a semi-ring on the domain of the bijection.

Theorem 20.266. *Let X,Y be sets, $\beta: X \to Y$ a bijection and $\mathcal{S} \subseteq X$ a semi-ring on X then $\{\beta(A) | A \in \mathcal{S}\}$ is a semi-ring on Y.*

Proof. As $\beta(\varnothing) = \varnothing$ it follows that

$$\varnothing \in \{\beta(A) | A \in \mathcal{S}\} \tag{20.332}$$

Let $R,S \in \{\beta(A) | A \in \mathcal{S}\}$ there exist $A,B \in \mathcal{S}$ such that $R = \beta(A)$, $S = \beta(B)$. Using [theorem: 2.95(4)] and the fact that β is a bijection hence injective we have that

$$R \bigcap S = \beta(A) \bigcap \beta(B) \underset{[\text{theorem: } 2.95(4)]}{=} \beta\big(A \bigcap B\big)$$

As $\mathcal{S}$ is a semi-ring $A \bigcap B \in \mathcal{S}$ so that $\beta(A \bigcap B) \in \{\beta(A) | A \in \mathcal{S}\}$ which combined with the above proves that

$$\forall R,S \in \{\beta(A) | A \in \mathcal{S}\} \text{ we have } R \bigcap S \in \{\beta(A) | A \in \mathcal{S}\} \tag{20.333}$$

Using [theorem: 2.94(5)] and the fact that β is injective it follows that

$$R \setminus S = \beta(A) \setminus \beta(B) \underset{[\text{theorem: } 2.94(5)]}{=} \beta(A \setminus B) \tag{20.334}$$

As $A,B \in \mathcal{S}$ and $\mathcal{S}$ is a semi-ring there exist a pairwise disjoint $\{A_i\}_{i \in \{1,\dots,n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that

$$A \setminus B = \bigsqcup_{i \in \{1,\dots,n\}} A_i \tag{20.335}$$

Let $i,j\in\{1,\dots,n\}$ with $i\neq j$ then $\beta(A_i)\bigcap\beta(A_j)\underset{\text{[theorem: 2.95(4)]}}{=}\beta(A_i\bigcap A_j)=\beta(\varnothing)=\varnothing$ so that

$$\beta(A_i)_{i\in\{1,\dots,n\}}\subseteq\{\beta(A)|A\in\mathcal{S}\}\text{ is pairwise disjoint}\tag{20.336}$$

Further

$$\bigsqcup_{i\in\{1,\dots,n\}}\beta(A_i)\underset{\text{[theorem: 2.136]}}{=}\beta\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\underset{\text{[eq: 20.335]}}{=}\beta(A\setminus B)\underset{\text{[eq: 20.334]}}{=}R\setminus S\tag{20.337}$$

Define $\{R_i\}_{i\in\{1,\dots,n\}}\subseteq\{\beta(A)|A\in\mathcal{S}\}$ by $R_i=\beta(A_i)$ then [eqs: 20.336, 20.337] can be summarized as

$$\forall R,S\in\{\beta(A)|A\in\mathcal{S}\}\ \exists\{R_i\}_{i\in\{1,\dots,n\}}\subseteq\{\beta(A)|A\in\mathcal{S}\}\text{ such that }R\setminus S=\bigsqcup_{i\in\{1,\dots,n\}}R_i\tag{20.338}$$

By [eqs: 20.332, 20.333 and 20.338] it follows that

$$\{\beta(A)|A\in\mathcal{S}\}\text{ is a semi-ring on }Y$$

□

Next we construct a bijection between $\left(\prod_{i\in\{1,\dots,n\}}X_i\right)\cdot X_{n+1}$ and $\prod_{i\in\{1,\dots,n+1\}}X_i$.

Lemma 20.267. *Let $n\in\mathbb{N}$, $\{\langle X_i,\mathcal{S}_i\rangle\}_{i\in\{1,\dots,n+1\}}$ a finite family such that $\forall i\in\{1,\dots,n\}$ $\mathcal{S}_i\subseteq\mathcal{P}(X_i)$ then*

1. $$\beta:\left(\prod_{i\in\{1,\dots,n\}}X_i\right)\cdot X_{n+1}\to\prod_{i\in\{1,\dots,n+1\}}X_i\text{ defined by }\beta(x,y)_i=\begin{cases}x_i\text{ if }i\in\{1,\dots,n\}\\ y\text{ if }i=n+1\end{cases}$$
   is a bijection
2. $\bigodot_{i\in\{1,\dots,n+1\}}\mathcal{S}_i=\left\{\beta(B)|B\in\left(\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i\right)\odot S_{n+1}\right\}$

***Note* 20.268.** *Be carefull in the notation used in (2) $\beta(B)$ is the image of the set B in the domain $\left(\prod_{i\in\{1,\dots,n\}}X_i\right)\cdot X_{n+1}$ of the bijection β. So $\bigodot_{i\in\{1,\dots,n+1\}}\mathcal{S}_i$ is not equal to $\beta\left(\left(\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i\right)\odot S_{n+1}\right)$ which is by the way not well defined.*

Proof.

1. We have:

   injectivity. Assume that $\beta(x,y)=\beta(u,v)$ then $\forall i\in\{1,\dots,n\}$ we have
   $$x_i=\beta(x,y)_i=\beta(u,v)_i=u_i$$
   so that $x=u$ and $y=\beta(x,y)_{n+1}=\beta(u,v)_{n+1}=v$. So $(x,y)=(u,v)$ which proves injectivity.

   surjectivity. Let $u\in\prod_{i\in[1,\dots,n+1]}X_i$ and define $x\in\prod_{i\in\{1,\dots,n\}}X_i$ by $x_i=u_i$ and $y\in X_{n+1}$ by $y=u_{n+1}$ then $\forall i\in\{1,\dots,n+1\}$ we have
   $$\beta(x,y)_i=\begin{cases}x_i=u_i\text{ if }i\in\{1,\dots,n\}\\ u_{n+1}\text{ if }i=n+1\end{cases}=u_i$$
   proving that $\beta(x,y)=u$

2. Let $\{A_i\}_{i\in\{1,\dots,n+1\}}$ be a family of sets such that $\forall i\in\{1,\dots,n+1\}$ $A_i\in S_i\subseteq\mathcal{P}(X_i)$. Let $u\in\beta\left(\left(\prod_{i\in\{1,\dots,n\}}A_i\right)\cdot A_{n+1}\right)$ then $u=\beta(x,y)$ where $x\in\prod_{i\in\{1,\dots,n\}}A_i\Rightarrow\forall i\in\{1,\dots,n\}$ $x_i\in A_i$ and $y\in A_{n+1}$. So
   $$\forall i\in\{1,\dots,n+1\}\ \beta(x,y)_i=\begin{cases}x_i\in A_i\text{ if }i\in\{1,\dots,n\}\\ y\in A_i\text{ if }i=n+1\end{cases}\in A$$
   so that $u\in\prod_{i\in\{1,\dots,n+1\}}A_i$, Hence
   $$\beta\left(\left(\prod_{i\in\{1,\dots,n\}}A_i\right)\cdot A_{n+1}\right)\subseteq\prod_{i\in\{1,\dots,n+1\}}A_i\tag{20.339}$$
   If $u\in\prod_{i\in\{1,\dots,n+1\}}A_i$ then $\forall i\in\{1,\dots,n+1\}$ we have $u_i\in A_i$. Define $x\in\prod_{i\in\{1,\dots,n\}}X_i$ by $x_i=u_i\in A_i$ and $y=u_{n+1}\in A_{n_1}$ then $(x,y)\in\left(\prod_{i\in\{1,\dots,n\}}A_i\right)\cdot A_{n+1}$. further
   $$\beta(x,y)=\begin{cases}x_i=u_i\text{ if }i\in\{1,\dots,n\}\\ y=u_{n+1}\text{ if }i=n+1\end{cases}=u_i$$

proving that $u=\beta(x,y)\in\beta\left(\left(\prod_{i\in\{1,\dots,n\}}A_i\right)\cdot A_{n+1}\right)$. Hence

$$\prod_{i\in\{1,\dots,n+1\}}A_i\subseteq\beta\left(\left(\prod_{i\in\{1,\dots,n\}}A_i\right)\cdot A_{n+1}\right)$$

which combined with [eq: 20.339] proves that

$$\prod_{i\in\{1,\dots,n+1\}}A_i=\beta\left(\left(\prod_{i\in\{1,\dots,n\}}A_i\right)\cdot A_{n+1}\right)\tag{20.340}$$

Let now $A\in\bigodot_{i\in\{1,\dots,n+1\}}S_i$ then $A=\prod_{i\in\{1,\dots,n+1\}}A$ where $\forall i\in\{1,\dots,n+1\}\ A_i\in\mathcal{S}_i$. Then $\prod_{i\in\{1,\dots,n\}}A_i\in\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i$ and $A_{n+1}\in S_{n+1}$ so that

$$\left(\prod_{i\in\{1,\dots,n\}}A_i\right)\cdot A_{n+1}\in\left(\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i\right)\odot\mathcal{S}_{n+1}$$

Hence as

$$A=\prod_{i\in\{1,\dots,n+1\}}A_i\underset{\text{[eq: 20.340]}}{=}\beta\left(\left(\left(\prod_{i\in\{1,\dots,n\}}A_i\right)\cdot A_{n+1}\right)\right)$$

it follows that $A\in\left\{\beta(B)|B\in\left(\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i\right)\odot S_{n+1}\right\}$ which proves that

$$\bigodot_{i\in\{1,\dots,n+1\}}S_i\subseteq\left\{\beta(B)|B\in\left(\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i\right)\odot S_{n+1}\right\}\tag{20.341}$$

On the other hand if $B\in\left\{\beta(B)|B\in\left(\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i\right)\odot S_{n+1}\right\}$ then there exists a $A\in\left(\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i\right)\odot S_{n+1}$ such that $B=\beta(A)$. As $A\in\left(\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i\right)\odot S$ there exist a $\{A_i\}_{i\in\{1,\dots,n\}}$ with $\forall i\in\{1,\dots,n\}\ A_i\in\mathcal{S}_i$ and a $A_{n+1}\in\mathcal{S}_{n+1}$ such that

$$B=\beta(A)=\beta\left(\left(\prod_{i\in\{1,\dots,n\}}A_i\right)\cdot A_{n+1}\right)$$

Using [eq: 20.340] on the above proves that that

$$B=\prod_{i\in\{1,\dots,n+1\}}A_i\in\bigodot_{i\in\{1,\dots,n+1\}}\mathcal{S}_i$$

hence $\left\{\beta(B)|B\in\left(\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i\right)\odot S_{n+1}\right\}\subseteq\bigodot_{i\in\{1,\dots,n+1\}}\mathcal{S}_i$ which combined with [eq: 20.341] proves that

$$\bigodot_{i\in\{1,\dots,n+1\}}S_i=\left\{\beta(B)|B\in\left(\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i\right)\odot S_{n+1}\right\}$$

□

We are now ready to use mathematical induction to prove that $\bigodot_{i\in\{1,\dots,n\}}S_i$ is a semi-ring on $\prod_{i\in\{1,\dots,n\}}X_i$.

Theorem 20.269. *Let $n\in\mathbb{N}$, $\{\langle X_i,\mathcal{S}_i\rangle\}_{i\in\{1,\dots,n\}}$ a finite family such that $\forall i\in\{1,\dots,n\}\ \mathcal{S}_i$ is a semi-ring on X_i then for $\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i$ defined by*

$$\bigodot_{i\in\{1,\dots,n\}}\mathcal{S}_i=\left\{\prod_{i\in\{1,\dots,n\}}A_i|\forall i\in\{1,\dots,n\}\ A_i\in\mathcal{S}_i\right\}$$

we have that

$$\bigodot_{i\in\{1,\dots,n\}}S_i\text{ is a semi-ring on }\prod_{i\in\{1,\dots,n\}}X_i$$

Proof. We prove this by mathematical induction, so define

$$\mathcal{S}=\left\{n\in\mathbb{N}|\text{If }\{\langle X_i,\mathcal{S}_i\rangle\}_{i\in\{1,\dots,n\}}\text{ is a family such that }\forall i\in\{1,\dots,n\}\ \mathcal{S}_i\text{ is a semi-ring on }X_i\text{ then }\bigodot_{i\in\{1,\dots,n\}}S_i\text{ is a semi-ring on }\prod_{i\in\{1,\dots,n\}}X_i\right\}$$

then we have:

$1 \in \mathcal{S}$. Let $\{\langle X_i, \mathcal{S}_i\rangle\}_{i\in\{1\}}$ be such that $\mathcal{S}_1$ is a semi-ring on X_1. Define

$$\beta: X_1 \to \prod_{i\in\{1\}} X_i \text{ where } \beta(x) \text{ is defined by } \beta(x)_1 = x \text{ [in other words } \beta(x) = (x)$$

then we have:

injectivity. If $\beta(x) = \beta(y)$ then $x = \beta(x)_1 = \beta(y)_1 = y$.

surjectivity. If $y \in \prod_{i\in\{1\}} X_i$ then for $x = y_1$ we have $\forall i \in \{1\}$ that $\beta(x)_1 = x = y_1$ so that $\beta(x) = y$.

so that

$$\beta \text{ is a bijection}$$

Let $A \in \bigodot_{i\in\{1\}} S_i = \left\{\prod_{i\in\{1\}} A_i | \forall i \in \{1\}\ A_i \in S_i\right\}$ then $A = \prod_{i\in\{1\}} A_i$ where $A_1 \in \mathcal{S}_1$. If $x \in A = \prod_{i\in\{1\}} A_i$ then $x_1 \in A_i$ so that $x = \beta(x_1) \in \beta(A_1)$ and if $x \in \beta(A_1)$ then there exist a $a \in A_1$ such that $x = \beta(a) = (a)$ hence $x_1 = \beta(a)_1 = a \in A_i$ so that $x \in \prod_{i\in\{1\}} A_i = A$, proving that $A = \beta(A_1) \in \{\beta(B) | B \in \mathcal{S}_1\}$. Hence we have

$$\bigodot_{i\in\{1\}} S_i \subseteq \{\beta(B) | B \in \mathcal{S}_1\} \tag{20.342}$$

For the opposite inclusion, let $A \in \{\beta(B) | B \in \mathcal{S}_1\}$ then there exist a $A_1 \in S_1$ such that $A = \beta(A_1)$. If $x \in A = \beta(A_1)$ then there exist a $a \in A_1$ such that $x = \beta(a)$ so that $x_1 = \beta(a)_1 = a \in A_1$ hence $x \in \prod_{i\in\{1\}} A_i$ and if $x \in \prod_{i\in\{1\}} A_i$ then $x_1 \in A_1$ so that $x = \beta(x_1) \in \beta(A_i)$, proving that $A = \prod_{i\in\{1\}} A_i \in \bigodot_{i\in\{1\}} S_i$. Hence we have that $\{\beta(B) | B \in \mathcal{S}_1\} \subseteq \bigodot_{i\in\{1\}} S_i$ which combined with [eq: 20.342] proves that

$$\bigodot_{i\in\{1\}} S_i = \{\beta(B) | B \in \mathcal{S}_1\}$$

Finally as $\mathcal{S}_1$ is a semi-ring it follows from [lemma: 20.266] that $\bigodot_{i\in\{1\}} \mathcal{S}_i$ is a semi-ring which proves that $1 \in S$.

$2 \in \mathcal{S}$. If $\{\langle X_i, \mathcal{S}_i\rangle\}_{i\in\{1,2\}}$ is such that $\mathcal{S}_1$ is a semi-ring on X_1 and $\mathcal{S}_2$ is a semi-ring on X_2 then by [theorem: 20.263] $\bigodot_{i\in\{1,2\}} \mathcal{S}_i = \mathcal{S}_1 \odot \mathcal{S}_2$ is a semi-ring on $X_1 \cdot X_2 = \prod_{i\in\{1,2\}} X_i$. Hence $2 \in \mathcal{S}$.

$n \in \mathcal{S} \Rightarrow n+1 \in \mathcal{S}$. Let $\{\langle X_i, \mathcal{S}_i\rangle\}_{i\in\{1,\dots,n+1\}}$ be a finite family such that $\forall i \in \{1,\dots,n+1\}$ we have that $\mathcal{S}_i$ is a semi-ring on X_i. As $n \in \mathcal{S}$ it follows that $\bigodot_{i\in\{1,\dots,n\}} \mathcal{S}_i$ is a semi-ring on $\prod_{i\in\{1,\dots,n\}} X_i$. As also $\mathcal{S}_{n+1}$ is a semi-ring on X_{n+1} it follows from [theorem: 20.263] that

$$\left(\bigodot_{i\in\{1,\dots,n\}} \mathcal{S}_i\right) \odot S_{n+1} \text{ is a semi-ring on } \left(\prod_{i\in\{1,\dots,n\}} X_i\right) \cdot X_{n+1}$$

Using the previous lemma [lemma: 20.267] there exist a bijection

$$\beta: \left(\prod_{i\in\{1,\dots,n\}} X_i\right) \cdot X_{n+1} \to \prod_{i\in\{1,\dots,n+1\}} X_i$$

such that

$$\bigodot_{i\in\{1,\dots,n+1\}} \mathcal{S}_i = \left\{\beta(B) | B \in \left(\bigodot_{i\in\{1,\dots,n\}} \mathcal{S}_i\right) \odot S_{n+1}\right\}$$

By [theorem: 20.266] it follows then that $\left\{\beta(B) | B \in \left(\bigodot_{i\in\{1,\dots,n\}} \mathcal{S}_i\right) \odot S_{n+1}\right\}$ is a semi-ring on $\prod_{i\in\{1,\dots,n+1\}} X_i$. Hence $\bigodot_{i\in\{1,\dots,n+1\}} \mathcal{S}_i$ is a semi-ring on $\prod_{i\in\{1,\dots,n+1\}} X_i$ proving that $n+1 \in \mathcal{S}$

□

Corollary 20.270. *Let $n \in \mathbb{N}$, X a set and $\mathcal{S}$ a semi-ring on X then*

$$\mathcal{S}^n = \left\{\prod_{i\in\{1,\dots,n\}} A_i | \forall i \in \{1,\dots,n\}\ A_i \in \mathcal{S}\right\} = \left\{\prod_{i\in\{1,\dots,m\}} A_i | \{A_i\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{S}\right\}$$

is a semi-ring on X^n

Proof. Define $\{\langle X_i,\mathcal{S}_i\rangle\}_{i\in\{1,\ldots,n\}}$ by $X_i=X$ and $\mathcal{S}_i=\mathcal{S}$. Then by the previous theorem [theorem: 20.269] we have that $\bigodot_{i\in\{1,\ldots,n\}}\mathcal{S}_i$ is a semi-ring on $\prod_{i\in\{1,\ldots,n\}}X_i$. Now by definition we have that

$$X^n \underset{\text{definition}}{=} \prod_{i\in\{1,\ldots,n\}} X_i$$

and

$$\begin{aligned}\bigodot_{i\in\{1,\ldots,n\}}\mathcal{S}_i &= \left\{\prod_{i\in\{1,\ldots,n\}} A_i|\forall i\in\{1,\ldots,n\}\ A_i\in\mathcal{S}_i\right\}\\ &\underset{\mathcal{S}_i=\mathcal{S}}{=} \left\{\prod_{i\in\{1,\ldots,n\}} A_i|\forall i\in\{1,\ldots,n\}\ A_i\in\mathcal{S}\right\}\\ &= \mathcal{S}^n\end{aligned}$$

so that $\mathcal{S}^n$ is a semi-ring on X^n. □

20.4.4.5 Semi-ring on $\mathbb{R}^n$

We are now ready to prove that $\mathcal{R}^n\bigcup\{\varnothing\}$ is a semi-ring.

Theorem 20.271. *Let $n\in\mathbb{N}$ then we have*

$$\mathcal{R}^n=\left\{\prod_{i\in\{1,\ldots,n\}} I_i|\forall i\in\{1,\ldots,n\}\ I_i\in\mathcal{I}_{[[}\right\}\underset{\text{def}}{=}\left\{\prod_{i\in\{1,\ldots,n\}} I_i|\{I_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{I}_{[[}\right\}$$

$$\mathcal{R}^n\bigcap\{\varnothing\}=\varnothing$$

$$\mathcal{R}^n\bigcup\{\varnothing\}=\left\{\prod_{i\in\{1,\ldots,n\}} I_i|\forall i\in\{1,\ldots,n\}\ I_i\in\mathcal{S}_{[[}\right\}\underset{\text{def}}{=}\left\{\prod_{i\in\{1,\ldots,n\}} I_i|\{I_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{S}_{[[}\right\}$$

Proof. If $R\in\mathcal{R}^n$ then by [definition: 20.164] there exists $a,b\in\mathbb{R}^n$ with $a<b\Rightarrow a_i<b_i$ such that

$$R=[a,b[\underset{\text{[definition: 20.161]}}{=}\prod_{i\in\{1,\ldots,n\}}[a_i,b_i[$$

As $\forall i\in\{1,\ldots,n\}\ a_i<b_i$ hence $[a_i,b_i[\in\mathcal{I}_{[[}$ it follows that $R\in\left\{\prod_{i\in\{1,\ldots,n\}}I_i|\forall i\in\{1,\ldots,n\}\ I_i\in\mathcal{I}_{[[}\right\}$ proving that

$$\mathcal{R}^n\subseteq\left\{\prod_{i\in\{1,\ldots,n\}} I_i|\forall i\in\{1,\ldots,n\}\ I_i\in\mathcal{I}_{[[}\right\}\tag{20.343}$$

Further if $R\in\left\{\prod_{i\in\{1,\ldots,n\}}I_i|\forall i\in\{1,\ldots,n\}\ I_i\in\mathcal{I}_{[[}\right\}$ then there exists a $\{I_i\}_{i\in\{1,\ldots,n\}}$ with $\forall i\in\{1,\ldots,n\}\ I_i\in\mathcal{I}_{[[}$ such that $R=\prod_{i\in\{1,\ldots,n\}}I_i$.. Hence $\forall i\in\{1,\ldots,n\}$ there exists $a_i,b_i\in\mathbb{R}$ with $a_i<b_i$ such that $I_i=[a_i,b_i[$. Define $a=(a_1,\ldots,a_n)\in\mathbb{R}^n$, $(b_1,\ldots,b_n)\in\mathbb{R}^n$ then $a<b$ and $[a,b[\underset{\text{[definition: 20.161]}}{=}\prod_{i\in\{1,\ldots,n\}}[a_i,b_i[=\prod_{i\in\{1,\ldots,n\}}I_i=R$ from which it follows that $R\in\mathcal{R}^n$. So $\left\{\prod_{i\in\{1,\ldots,n\}}I_i|\forall i\in\{1,\ldots,n\}\ I_i\in\mathcal{I}_{[[}\right\}\subseteq\mathcal{R}^n$, combining this with [eq: 20.343] gives

$$\mathcal{R}^n=\left\{\prod_{i\in\{1,\ldots,n\}} I_i|\forall i\in\{1,\ldots,n\}\ I_i\in\mathcal{I}_{[[}\right\}\tag{20.344}$$

Let $R\in\mathcal{R}^n$ then there exists $\{I_i\}_{i\in\{1,\ldots,n\}}$ with $I_i\in\mathcal{I}_{[[}$ [so that $I_i\neq\varnothing$] such that $R=\prod_{i\in\{1,\ldots,n\}}I_i$. Applying [theorem: 3.109] it follows that $R\neq\varnothing$ so that

$$\mathcal{R}^n\bigcap\{\varnothing\}=\varnothing\tag{20.345}$$

If $R\in\mathcal{R}^n\bigcup\{\varnothing\}$ then we have either:

- $\boldsymbol{R\in\mathcal{R}^n}$**.** Then by [eq: 20.344] $R=\prod_{i\in\{1,\ldots,n\}}I_i$ where $\forall i\in\{1,\ldots,n\}\ I_i\in\mathcal{I}_{[[}\subseteq\mathcal{S}_{[[}$ so that $R\in\left\{\prod_{i\in\{1,\ldots,n\}}I_i|\forall i\in\{1,\ldots,n\}\ I_i\in\mathcal{S}_{[[}\right\}$.
- $\boldsymbol{R=\varnothing}$**.** Define $\{I_i\}_{i\in\{1,\ldots,n\}}$ by $I_i=\varnothing\in\mathcal{S}_{[[}$ then $\varnothing\underset{\text{[theorem: 2.138]}}{=}\prod_{i\in\{1,\ldots,n\}}I_i$ so that $R\in\left\{\prod_{i\in\{1,\ldots,n\}}I_i|\forall i\in\{1,\ldots,n\}\ I_i\in\mathcal{S}_{[[}\right\}$.

hence we have that

$$\mathcal{R}^n \bigcup \{\varnothing\} \subseteq \left\{ \prod_{i \in \{1,\ldots,n\}} I_i | \forall i \in \{1,\ldots,n\}\ I_i \in \mathcal{S}_{[[} \right\} \tag{20.346}$$

Let $R \in \left\{ \prod_{i \in \{1,\ldots,n\}} I_i | \forall i \in \{1,\ldots,n\}\ I_i \in \mathcal{S}_{[[} \right\}$ then $R = \prod_{i \in \{1,\ldots,n\}} I_i$ where $\forall i \in \{1,\ldots,n\}\ I_i \in \mathcal{S}_{[[}$. Then we have either:

$\forall i \in \{1,\ldots,n\}\ I_i \neq \varnothing$. Then by [theorem: 20.248] it follows that $\forall i \in I\ I_i \in \mathcal{I}_{[[}$ so that $I_i = [a_i, b_i[\neq \varnothing \Rightarrow a_i < b_i$, hence for $a = (a_1,\ldots,a_n), b = (b_1,\ldots,b_n) \in \mathbb{R}$ we have $a < b$ so that

$$R = \prod_{i \in \{1,\ldots,n\}} [a, b[\in \mathcal{R}^n \subseteq \mathcal{R}^n \bigcup \{\varnothing\}$$

$\exists i \in \{1,\ldots,n\}$ such that $I_i = \varnothing$. Then

$$R = \prod_{i \in \{1,\ldots,n\}} A_i \underset{\text{[theorem: 2.138]}}{=} \varnothing \in \mathcal{R}^n \bigcap \{\varnothing\}$$

proving that $\left\{ \prod_{i \in \{1,\ldots,n\}} I_i | \forall i \in \{1,\ldots,n\}\ I_i \in \mathcal{S}_{[[} \right\} \subseteq \mathcal{R}^n \bigcap \{\varnothing\}$. Combining this with [eq: 20.346] proves finally that

$$\mathcal{R}^n \bigcup \{\varnothing\} = \left\{ \prod_{i \in \{1,\ldots,n\}} I_i | \forall i \in \{1,\ldots,n\}\ I_i \in \mathcal{S}_{[[} \right\}$$ □

A direct consequence of the above theorem is the following

Theorem 20.272. *Let $n \in \mathbb{N}$ then $\mathcal{R}^n \bigsqcup \{\varnothing\}$ is a semi-ring on $\mathbb{R}^n$*

Proof. First we have

$$\mathcal{R}^n \bigsqcup \{\varnothing\} \underset{\text{[theorem: 20.271]}}{=} \mathcal{R}^n \bigcup \{\varnothing\} = \left\{ \prod_{i \in \{1,\ldots,n\}} I_i | \forall i \in \{1,\ldots,n\}\ I_i \in \mathcal{S}_{[[} \right\} = (\mathcal{S}_{[[})^n$$

so that by [theorem: 20.270]

$$\mathcal{R}^n \bigsqcup \{\varnothing\} \text{ is a semi-ring}$$ □

Theorem 20.273. *Let $n \in \mathbb{N}$ then we have that*

$$\sigma[\{C \subseteq \mathbb{R}^n | C \text{ is closed in } \mathcal{T}_{\|\|^n}\}] = \beta[\mathbb{R}^n] = \sigma[\mathcal{R}^n] = \sigma\left[\mathcal{R}^n \bigcup \{\varnothing\}\right]$$

Proof. By [theorem: 20.177] we only have to prove that $\sigma[\mathcal{R}^n] = \sigma[\mathcal{R}^n \bigsqcup \{\varnothing\}]$. As $\mathcal{R}^n \subseteq \mathcal{R}^n \bigcup \{\varnothing\} \subseteq \sigma[\mathcal{R}^n \bigcup \{\varnothing\}]$ and $\sigma[\mathcal{R}^n \bigcup \{\varnothing\}]$ is a σ-algebra it follows from [theorem: 20.141] that

$$\sigma[\mathcal{R}^n] \subseteq \sigma\left[\mathcal{R}^n \bigsqcup \{\varnothing\}\right] \tag{20.347}$$

Let $A \in \mathcal{R}^n \bigsqcup \{\varnothing\}$ then either $A \in \mathcal{R}^n \subseteq \sigma[\mathcal{R}_n]$ or $A = \varnothing \in \sigma[\mathcal{R}_n]$ so that $\mathcal{R}^n \bigsqcup \{\varnothing\} \subseteq \sigma[\mathcal{R}^n]$, as $\sigma[\mathcal{R}^n]$ is a σ-algebra it follows from [theorem: 20.141] that $\sigma[\mathcal{R}^n \bigsqcup \{\varnothing\}] \subseteq \sigma[\mathcal{R}^n]$. Combining this with [eq: 20.347] proves

$$\sigma[\mathcal{R}^n] = \sigma\left[\mathcal{R}^n \bigsqcup \{\varnothing\}\right]$$ □

20.4.4.6 Content on the semi-ring $\mathcal{R}^n \bigcup \{\varnothing\}$

Definition 20.274. (Content of a rectangle) *Let $n \in \mathbb{N}$ then we define*

$$\text{vol}^n : \mathcal{R}^n \bigsqcup \{\varnothing\} \to [0, \infty] \text{ by } \text{vol}^n(R) = \begin{cases} 0 & \text{if } R = \varnothing \\ v^n(R) & \text{if } R \neq \varnothing \end{cases}$$

where $v^n(R) : \mathcal{R}^n \to [0, \infty]$ is defined by $v^n(R) = \prod_{i=1}^n (\text{begin}(R)_i - \text{end}(R)_i) \in \mathbb{R}^+$ [see definition: 20.168].

***Note* 20.275.** *Using the definition it follows that $\text{vol}^n(R)$ is finite and*

$$\forall R \in \mathcal{R}^n \bigcup \{\varnothing\} \text{ we have } \text{vol}^n(R) = 0 \Leftrightarrow R \in \mathcal{R}^n$$

Next it remains to prove that vol^n is actual a content on $\mathcal{R}^n \bigcup \{\varnothing\}$, the most difficult part is proving additivity of vol^n. To illustrate how to prove this consider the following 2-dimesional case [see figure:] where

$$R = \bigsqcup_{i \in \{1,\ldots,4\}} R_i$$

then we have to prove that

$$\mathrm{vol}^2(R) = \sum_{i=1}^{4} \mathrm{vol}^2(R_i)$$

Figure 20.1.

To do this we divide R_1, R_2, R_3, R_4 and R_5 in sub-cubes by partitioning their sides in sub intervals.

Figure 20.2.

so that

$$\begin{aligned} R_1 &= R_{1,1} + R_{1,2} + R_{1,3} + R_{1,4} \\ R_2 &= R_{2,1} + R_{2,2} \\ R_3 &= R_{3,1} \\ R_4 &= R_{4,1} \\ R_5 &= R_{5,1} \end{aligned}$$

then we prove that

$$\mathrm{vol}^2(R) = \mathrm{vol}^2(R_{1,1}) + \mathrm{vol}^2(R_{1,2}) + \mathrm{vol}^2(R_{1,3}) + \mathrm{vol}^2(R_{1,4}) + \mathrm{vol}^2(R_{2,1}) + \mathrm{vol}^2(R_{2,2}) + \mathrm{vol}^2(R_{3,1}) + \mathrm{vol}^2(R_{3,1}) + \mathrm{vol}^2(R_{4,1}) + \mathrm{vol}^2(R_{5,1})$$

and apply associativity to get

$$\begin{aligned}\mathrm{vol}^2(R) &= (\mathrm{vol}^2(R_{1,1})+\mathrm{vol}^2(R_{1,2})+\mathrm{vol}^2(R_{1,3})+\mathrm{vol}^2(R_{1,4}))+(\mathrm{vol}^2(R_{2,1})+\mathrm{vol}^2(R_{2,2}))+(\mathrm{vol}^2(R_{3,1}))+(\mathrm{vol}^2(R_{3,1}))+(\mathrm{vol}^2(R_{4,1}))+\\ &\quad (\mathrm{vol}^2(R_{5,1}))\\ &= \mathrm{vol}^2(R_1)+\mathrm{vol}^2(R_2)+\mathrm{vol}^2(R_3)+\mathrm{vol}^2(R_4)+\mathrm{vol}^2(R_5)\end{aligned}$$

which proves additivity. First we show that every increasing finite family of real numbers can be used to construct a pairwise disjoint union of half open intervals that is itself a half open interval. This will be used later to turn a union of half open intervals that is itself a half open interval in a disjoint union of half open intervals.

Lemma 20.276. *Let $n,m\in\mathbb{N}$ with $n\leqslant m$, $\{a_i\}_{i\in\{n,\ldots,m\}}\subseteq\mathbb{R}$ such that $\forall i\in\{n,\ldots,m-1\}$ we have $a_i\leqslant a_{i+1}$ then*

$$\{[a_i,a_{i+1}[\}_{i\in\{n,\ldots,m-1\}} \text{ is pairwise disjoint}$$

and

$$\bigsqcup_{i\in\{n,\ldots,m-1\}}[a_i,a_{i+1}[=[a_n,a_m[$$

Proof. Let $i,j\in\{n,\ldots,m-1\}$ with $i\neq j$ then we may assume that $i<j$ [otherwise exchange i and j]. Assume that $x\in[a_i,a_{i+1}[\bigcap[a_j,a_{j+1}[$ then $a_i\leqslant x<a_{i+1}\underset{i<j\Rightarrow i+1\leqslant j}{\leqslant}a_j\leqslant x<a_{j+1}$ leading to the contradiction $x<x$, hence the assumption is wrong proving that $[a_i,a_{i+1}[\bigcap[a_j,a_{j+1}[=\varnothing$. So

$$\{[a_i,a_{i+1}[\}_{i\in\{n,\ldots,m-1\}} \text{ is pairwise disjoint}$$

Let $x\in[a_n,a_m[$ then $a_n\leqslant x<a_m$ so that $n\in\{i\in\{n,\ldots,m\}|a_i\leqslant x\}$ a finite set. Hence $M=\max(\{i\in\{n,\ldots,m\}|a_i\leqslant x\})$ exist. As $x<a_m\Rightarrow a_m\nleqslant x$ we have $M\neq m$ so that $M\in\{n,\ldots,m-1\}\Rightarrow M+1\in\{n,\ldots,m\}$. As $M=\max(\{i\in\{n,\ldots,m\}|a_i\leqslant x\})$ it follows that $a_M\leqslant x<a_{M+1}$ so that $x\in[a_M,a_{M+1}[\subseteq\bigsqcup_{i\in\{n,\ldots,m-1\}}[a_i,a_{i+1}[$. Hence we have proved that

$$[a_n,a_m[\subseteq\bigsqcup_{i\in\{n,\ldots,m-1\}}[a_i,a_{i+1}[\tag{20.348}$$

Let $x\in\bigsqcup_{i\in\{n,\ldots,m-1\}}[a_i,a_{i+1}[$ then there exist a $i\in\{n,\ldots,m-1\}$ such that $a_i\leqslant x<a_{i+1}$. As $n\leqslant i$ and $i\leqslant m-1<m$ we have by the hypothesis that $a_n\leqslant a_i\wedge a_{i+1}\leqslant a_m$ so that $a_n\leqslant x<a_m$ or $x\in[a_n,a_m[$. Hence $\bigsqcup_{i\in\{n,\ldots,m-1\}}[a_i,a_{i+1}[\subseteq[a_n,a_m[$ which combined with [eq: 20.348] gives

$$\bigsqcup_{i\in\{n,\ldots,m-1\}}[a_i,a_{i+1}[=[a_n,a_m[$$ □

Next we show that a half open interval that is a union of half open subintevals is the disjoint union of sub intervals that are based on the boundary points of the half open subintervalas. For example:

$$\begin{aligned}[-4,2[&= [-3,2[\bigcup[-1,1[\bigcup[-4,0[\bigcup[0,2[\\ &= [-4,-3[\bigsqcup[-3,-1[\bigsqcup[-1,0[\bigsqcup[0,1[\bigsqcup[1,2[\end{aligned}$$

to do thist we sort the boundary points $\{-3,2,-1,1,-4,0,2\}$ giving the sorted set

$$\{-4,-3,-1,0,1,2\}$$

and use the the previous lemma to create the final list of intervals

$$[-4,-3[,[-3,-1[,[-1,0[,[0,1[,[1,2[$$

Lemma 20.277. *Let $n\in\mathbb{N}$ and $\{[a_i,b_i[\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{I}_{[[}$ such that $\bigcup_{i\in\{1,\ldots,n\}}[a_i,b_i[=[a,b[$ then if we take*

$$A=\{\alpha_i|i\in\{1,\ldots,n\}\}\bigcup\{b_i|i\in\{1,\ldots,n\}\}$$

there exists a $m\in\mathbb{N}\setminus\{1\}$ and a bijection $\beta:\{1,\ldots,m\}\to A$ such that:

1. *$\beta(1)=a\wedge\beta(m)=b$*
2. *$\forall i,j\in\{1,\ldots,m\}$ with $i<j$ we have $\beta(i)<\beta(j)$*

3. $\forall x, y \in A$ *with* $x < y$ *we have* $\beta^{-1}(x) < \beta^{-1}(y)$
4. $\forall i \in \{1, \ldots, n\}$ *we have* $\beta^{-1}(a_i) < \beta^{-1}(b_i)$
5. $\forall i \in \{1, \ldots, n\}$ $\{[\beta(j), \beta(j+1)[\}_{j \in \{\beta^{-1}(a_i), \ldots, \beta^{-1}(b_i)-1\}}$ *is pairwise disjoint and* $[a_i, b_i[= \bigsqcup_{j \in \{\beta^{-1}(a_i), \ldots, \beta^{-1}(b_i)-1\}} [\beta(j), \beta(j+1)[$
6. $\{[\beta(i), \beta(i+1)[\}_{i \in \{1, \ldots, m-1\}}$ *is pairwise disjoint and* $\bigsqcup_{i \in \{1, \ldots, m-1\}} [\beta(i), \beta(i+1)[= [a, b[$

Proof. Define $A = \{a_i | i \in \{1, \ldots, n\}\} \bigcup \{b_i | i \in \{1, \ldots, n\}\}$. As $[a_1, b_1[\neq \varnothing$ we have that $[a, b[= \bigcup_{i \in \{1, \ldots, n\}} [a_i, b_i[\neq \varnothing$ so that

$$a < b \tag{20.349}$$

Assume that $a \notin A$. As $a \in [a, b[= \bigcup_{i \in \{1, \ldots, n\}} [a_i, b_i[$ there exist a $i \in \{1, \ldots, n\}$ such that $a \in [a_i, b_i[\Rightarrow a_i \leqslant a < b_i \underset{a \notin A \Rightarrow a \neq a_i}{\Rightarrow} a_i < a < b_i$. Using the density of the real numbers [theorem: 10.32] there exist a $t \in \mathbb{R}$ such that $a_i < t < a < b_i \Rightarrow t \notin [a, b[\wedge t \in [a_i, b_i[\subseteq [a, b[$ a contradiction. So the assumption is wrong and we have

$$a \in A \tag{20.350}$$

Assume that $b \notin A$. Given $i \in \{1, \ldots, n\}$ we have $[a_i, b_i[\subseteq \bigcup_{i \in \{1, \ldots, n\}} [a_i, b_i[\subseteq [a, b[$ so that by [theorem: 3.144] $b_i \leqslant b \underset{b \notin A \Rightarrow b \neq b_i}{\Rightarrow} b_i < b$. As also $a < b$ it follows that $\max(\{a\} \bigcup \{b_i | i \in \{1, \ldots, n\}\}) < b$. Hence using the density of the real numbers [theorem: 10.32] there exists a $t \in \mathbb{R}$ with $\max(\{a\} \bigcup \{b_i | i \in \{1, \ldots, n\}\}) < t < b$. Hence $\forall i \in \{1, \ldots, n\}$ $t \notin [a_i, b_i[\wedge a < t < b$. So $t \notin \bigcup_{i \in \{1, \ldots, n\}} [a_i, b_i[= [a, b[\wedge t \in [a, b[$ again a contradiction. Hence the assumption is wrong and we have

$$b \in A \tag{20.351}$$

As $\forall i \in \{1, \ldots, n\}$ we have $[a_i, b_i[\subseteq \bigcup_{i \in \{1, \ldots, n\}} [a_i, b_i[= [a, b[$ it follows from theorem: 3.144] that $a \leqslant a_i < b_i \leqslant b$ proving that

$$a = \min(A) \wedge b = \max(A)$$

Using [theorems: 6.34, 6.45] it follows that A is finite and as $a, b \in A$ $\operatorname{card}(A) \in \mathbb{N}$, hence using [theorem: 10.96] it follows that there exist a bijection

$$\beta: \{1, \ldots, m\} \to A \text{ where } m = \operatorname{card}(A) \text{ such that } \forall i \in \{1, \ldots, m-1\} \ \beta(i) < \beta(i+1) \tag{20.352}$$

As $\forall i \in \{1, \ldots, m\}$ we have $\beta(1) \leqslant \beta(i)$ and $\beta(i) \leqslant \beta(m)$ it follows that $\beta(1) = \min(A) = a \wedge \beta(m) = \max(A) = b$, hence

$$a = \beta(1) \wedge b = \beta(m) \tag{20.353}$$

Let $x, y \in A$ such that $x < y$. If $\beta^{-1}(y) \leqslant \beta^{-1}(x)$ it follows that $y = \beta(\beta^{-1}(y)) \leqslant \beta(\beta^{-1}(x)) = x$ contradicting $x \leqslant y$. Hence we have

$$\forall x, y \in A \text{ with } x < y \text{ we have } \beta^{-1}(x) < \beta^{-1}(y) \tag{20.354}$$

Let $i \in \{1, \ldots, n\}$ then $a_i, b_i \in A$ and $a_i < b_i$ [as $[a_i, b_i[\in \mathcal{I}_{[[}$] so that by the above $\beta^{-1}(a_i) < \beta^{-1}(b_i)$. In other words

$$\forall i \in \{1, \ldots, n\} \text{ we have } \beta^{-1}(a_i) < \beta^{-1}(b_i) \tag{20.355}$$

Let $i \in \{1, \ldots, n\}$ then for $j \in \{\beta^{-1}(a_i), \ldots, \beta^{-1}(b_i) - 1\}$ we have $\beta(j) < \beta(j)$ so that by [lemma: 20.276] we have

$$\{[\beta(j), \beta(j+1)[\}_{j \in \{\beta^{-1}(a_i), \ldots, \beta^{-1}(b_i)-1\}} \text{ is pairwise disjoint} \tag{20.356}$$

and

$$\bigsqcup_{j \in \{\beta^{-1}(a_i), \ldots, \beta^{-1}(b_i)-1\}} [\beta(j), \beta(j+1)[= [\beta(\beta^{-1}(a_i)), \beta(\beta^{-1}(b_i))[= [a_i, b_i[\tag{20.357}$$

Using [lemma: 20.276] on [eq: 20.352] gives

$$\{[\beta(i), \beta(i-1)[\}_{i \in \{1, \ldots, m-1\}} \text{ is pairwise disjoint} \tag{20.358}$$

and

$$\bigsqcup_{i \in \{1, \ldots, m-1\}} [\beta(i), \beta(i+1)[= [\beta(1), \beta(n)[\underset{\text{[eq: 20.353]}}{=} [a, b[\tag{20.359}$$

So (1) is proved by [eq: 20.353], (2) is proved by [eq: 20.352], (3) is proved by [eq: 20.354], (4) is proved by [eq: 20.355], (5) by [eqs: 20.356, 20.357] and finally (6) by [eqs: 20.358, 20.359]. □

Next we show how the volume of a half open rectangle partioned by its sides can be calculated. Giving the follow example of a partioned rectangle R

Figure 20.3.

we have then

$$\begin{aligned}
\prod_{i\in\{1,\ldots,n\}} [a_i,b_i[&= [a_1,b_1[\cdot[a_2,b_2[\\
&= [a_{1,1},\ a_{1,2}[\ \cdot\ [a_{2,1},\ a_{2,2}[\bigsqcup [a_{1,1},\ a_{1,2}[\ \cdot\ [a_{2,2},\ a_{2,3}[\bigsqcup [a_{1,1},\ a_{1,2}[\ \cdot\ [a_{2,3},\ a_{2,4}[\bigsqcup \\
&\quad [a_{1,2},a_{1,3}[\cdot[a_{2,1},a_{2,2}[\bigsqcup [a_{1,2},a_{1,3}[\cdot[a_{2,2},a_{2,3}[\bigsqcup [a_{1,2},a_{1,3}[\cdot[a_{2,3},a_{2,4}[\\
&= \bigsqcup_{\rho\in\{(1,1),(1,2),(1,3),(2,1),(2,2),(2,3)\}} [a_{1,\rho_1},a_{1,\rho_1+1}[\cdot[a_{2,\rho_2},a_{2,\rho_2+1}[\\
&= \bigsqcup_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}} \left(\prod_{i\in\{1,\ldots,n\}} [a_{i,\rho_i},a_{i,\rho_i+1}[\right)
\end{aligned}$$

and

$$\begin{aligned}
\prod_{i\in\{1,\ldots,n\}} (b_i-a_i) &= (b_1-a_1)\cdot(b_2-a_2) \\
&= (a_{1,2}-a_{1,1})\cdot(a_{2,2}-a_{2,1})+(a_{1,2}-a_{1,1})\cdot(a_{2,3}-a_{2,2})+(a_{1,2}-a_{1,1})\cdot(a_{2,4}-a_{2,3})+(a_{1,3}-a_{1,2})\cdot(a_{2,2}-a_{2,1})+ \\
&\quad (a_{1,3}-a_{1,2})\cdot(a_{2,3}-a_{2,2})+(a_{1,3}-a_{1,2})\cdot(a_{2,4}-a_{2,3}) \\
&= \bigsqcup_{\rho\in\{(1,1),(1,2),(1,3),(2,1),(2,2),(2,3)\}} (a_{1,\rho_1+1}-a_{1,\rho_1})\cdot(a_{2,\rho_2+1}-a_{2,\rho_2}) \\
&= \bigsqcup_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}} \left(\prod_{i\in\{1,\ldots,n\}} (a_{i,\rho_i+1}-a_{i,\rho_i})\right)
\end{aligned}$$

Lemma 20.278. *Let $n\in\mathbb{N}$, $\{[a_i,b_i[\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{I}_{[[}$ such that $\forall i\in\{1,\ldots,n\}$ there exists $n_i,m_i\in\mathbb{N}$ with $n_i\leqslant m_i$ and a $\{a_{i,j}\}_{j\in\{n_i,\ldots,m_i\}}\subseteq\mathbb{R}$ such that $\forall j\in\{n_i,\ldots,m_i-1\}$ $a_{i,j}\leqslant a_{i,j+1}$ and $a_{i,n_i}=a_i\wedge a_{i,m_i}=b_i$ then*

$$\left\{\prod_{i\in\{1,\ldots,n\}} [a_{i,\rho_i},a_{i,\rho_i+1}[\right\}_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}} \quad \textit{is pairwise disjoint}$$

$$\prod_{i\in\{1,\ldots,n\}} [a_i,b_i[= \bigsqcup_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}} \left(\prod_{i\in\{1,\ldots,n\}} [a_{i,\rho_i},a_{i,\rho_i+1}[\right)$$

$$\prod_{i=1}^{n} (b_i-a_i) = \sum_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}} \left(\prod_{i\in\{1,\ldots,n\}} (a_{i,\rho_i+1}-a_{i,\rho_i})\right)$$

Proof. Assume that $\exists i \in \{1,\ldots,n\}$ such that $n_i = m_i$ then $a_i = a_{i,n_i} = a_{o,m_i} = b_i$ contradicting $a_i < b_i$ [because $[a_i, b_i[\neq \varnothing$], hence a assumption is false and we have

$$\forall i \in \{1,\ldots,n\} \text{ we have } n_i < m_i \text{ or } n_i \leqslant m_i - 1 \tag{20.360}$$

Let $i \in \{1,\ldots,n\}$ then, as $\forall j \in \{n_i,\ldots,m_i-1\}$ $a_{i,j} \leqslant a_{i,j+1}$ it follows form [lemma: 20.276] that

$$\{[a_{i,j}, a_{i,j+1}[\}_{j\in\{n_i\ldots,m_i-1\}} \text{ is pairwise disjoint} \tag{20.361}$$

and

$$[a_i, b_i[= [a_{i,n_i}, a_{i,m_i}[= \bigsqcup_{j\in\{n_i,\ldots,m_i-1\}} [a_{i,j}, a_{i,j+1}[\tag{20.362}$$

Let $x \in \prod_{i\in\{1,\ldots,n\}} [a_i, b_i[$ then $\forall i \in \{1,\ldots,n\}$ we have $x_i \in [a_i, b_i[$, hence by the above there exist a $\rho_i \in \{n_i,\ldots,m_i-1\}$ such that $x_i \in [a_{i,\rho_i}, a_{i,\rho_i+1}[$. So for $\rho = (\rho_1,\ldots,\rho_n) \in \prod_{i\in\{1,\ldots,n\}} \{n_i,\ldots,m_i-1\}$ it follows that $\forall i \in \{1,\ldots,n\}$ $x_i \in [a_{i,\rho_i}, a_{i,\rho_i+1}[$ proving that $x \in \prod_{i\in\{1,\ldots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[$. Hence we have

$$\prod_{i\in\{1,\ldots,n\}} [a_i, b_i[\subseteq \bigcup_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}} \left(\prod_{i\in\{1,\ldots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \tag{20.363}$$

If $x \in \bigcup_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}} \left(\prod_{i\in\{1,\ldots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right)$ then there exist a $\rho \in \prod_{i\in\{1,\ldots,n\}} \{n_i,\ldots,m_i-1\}$ such that $x \in \prod_{i\in\{1,\ldots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[$. Hence $\forall i \in \{1,\ldots,n\}$ we have $x_i \in [a_{i,\rho_i}, a_{i,\rho_i+1}[\underset{\text{[eq: 20.362]}}{\subseteq} [a_i, b_i[$ proving that $x \in \prod_{i\in\{1,\ldots,n\}} [a_i, b_i[$. So it follows that $\bigcup_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}} \left(\prod_{i\in\{1,\ldots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \subseteq \prod_{i\in\{1,\ldots,n\}} [a_i, b_i[$ which combined with [eq: 20.363] proves that

$$\prod_{i\in\{1,\ldots,n\}} [a_i, b_i[= \bigcup_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}} \left(\prod_{i\in\{1,\ldots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \tag{20.364}$$

Let $\rho, \sigma \in \prod_{i\in\{1,\ldots,n\}} \{n_i,\ldots,m_i-1\}$ with $\rho = \sigma$ then there exist a $k \in \{1,\ldots,n\}$ such that $\rho(l) \neq \sigma(k)$. Assume that that there exist a $x \in \left(\prod_{i\in\{1,\ldots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \bigcap \left(\prod_{i\in\{1,\ldots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right)$ then $x_k \in [a_{k,\rho_k}, a_{k,\rho_k+1}[\bigcap [a_{k,\sigma_k}, a_{k,\sigma_k+1}[\underset{\rho_k\neq\sigma_k}{=} \varnothing$ which is a contradiction, hence the assumption is wrong and we must have that $\left(\prod_{i\in\{1,\ldots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \bigcap \left(\prod_{i\in\{1,\ldots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) = \varnothing$. So we have

$$\left\{\prod_{i\in\{1,\ldots,n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right\}_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i-1\}} \text{ is pairwise disjoint} \tag{20.365}$$

Further we have

$$\begin{aligned}
\prod_{i=1}^{n} (b_i - a_i) &\underset{\text{[definition: 20.256]}}{=} \prod_{i=1}^{n} \operatorname{len}([a_i, b_i[) \\
&\underset{\text{[eq: 20.361, 20.362]}}{=} \prod_{i=1}^{n} \operatorname{len}\left(\bigsqcup_{j\in\{n_i,\ldots,m_i\}} [a_{i,j}, a_{i,j+1}[\right) \\
&\underset{\text{[lemma: 20.259]}}{=} \prod_{i=1}^{n} \left(\sum_{j\in\{n_i,\ldots,m_i\}} \operatorname{len}([a_{i,j}, a_{i,j+1}])\right) \\
&\underset{\text{[theorem: 11.49]}}{=} \sum_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i\}} \left(\prod_{i\in\{1,\ldots,n\}} \operatorname{len}([a_{i,\rho_i}, a_{i,\rho_i+1}[)\right) \\
&= \sum_{\rho\in\prod_{i\in\{1,\ldots,n\}}\{n_i,\ldots,m_i\}} \left(\prod_{i\in\{1,\ldots,n\}} (a_{i,\rho_i+1} - a_{i,\rho_i})\right)
\end{aligned}$$

which proves the last part of the theorem. □

The following lemma shows that if the union of half open rectangles is a half open rectangle then each side of the of the open rectangle is a union of the corresponding sides of the subrectangles. For example in the following 2-dimesional we have that

$$\begin{aligned}
[a_1, b_1[&= [a_{1,1}, b_{1,1}[\bigcup [a_{2,1}, b_{2,1}[\bigcup [a_{3,1}, b_{3,1}[\bigcup [a_{4,1}, b_{5,1}[\bigcup [a_{5,1}, b_{5,1}[\\
&= \bigcup_{i\in\{1,\dots,5\}} [a_{i,1}, b_{i,1}[\\
[a_2, b_2[&= [a_{1,2}, b_{1,2}[\bigcup [a_{2,2}, b_{2,2}[\bigcup [a_{3,2}, b_{3,2}[\bigcup [a_{4,2]}, b_{4,2}[\bigcup [a_{5,2}, b_{5,2}[\\
&= \bigcup_{i\in\{1,\dots,b\}} [a_{i,2}, b_{i,2}[
\end{aligned}$$

Figure 20.4.

Lemma 20.279. *Let $n, m \in \mathbb{N}$ and let $\left\{\prod_{j\in\{1,\dots,n\}} [a_{i,j}, b_{i,j}[\right\}_{i\in\{1,\dots,m\}} \subseteq \mathcal{R}^n$ such that*

$$\bigcup_{i\in\{1,\dots,m\}} \left(\prod_{j\in\{1,\dots n\}} [a_{i,j}, b_{i,j}[\right) = \prod_{j\in\{1,\dots,n\}} [a_j, b_j[\in \mathcal{R}^n$$

then $\forall j \in \{1,\dots,n\}$ we have

$$[a_j, b_j[= \bigcup_{i\in\{1,\dots,m\}} [a_{i,j}, b_{i,j}[$$

Proof. Take $j \in \{1,...,n\}$. If $t \in \bigcup_{i\in\{1,\dots,m\}} [a_{i,j}, b_{i,j}[$ then there exist a $i \in \{1,...,m\}$ such that $t \in [a_{i,j}, b_{i,j}[$. As $\prod_{j\in\{1,\dots n\}} [a_{i,j}, b_{i,j}[\in \mathcal{R}^n$ $\prod_{j\in\{1,\dots n\}} [a_{i,j}, b_{i,j}[\neq \varnothing$ it follows from [theorems: 3.109, 3.108] that the projection function $\pi_j \colon \prod_{j\in\{1,\dots n\}} [a_{i,j}, b_{i,j}[\to [a_{i,j}, b_{i,j}[$ is a surjection hence there exists a $x \in \prod_{j\in\{1,\dots n\}} [a_{i,j}, b_{i,j}[$ such that $x_j = \pi_j(x) = t$. As

$$\prod_{j\in\{1,\dots n\}} [a_{i,j}, b_{i,j}[\subseteq \bigsqcup_{i\in\{1,\dots,m\}} \left(\prod_{j\in\{1,\dots n\}} [a_{i,j}, b_{i,j}[\right) = \prod_{j\in\{1,\dots,n\}} [a_j, b_j[$$

we have that $x \in \prod_{j\in\{1,\dots,n\}} [a_j, b_j[$ so that $t = \pi_j(x) \in [a_j, b_j[$. Hence we have

$$\bigcup_{i\in\{1,\dots,m\}} [a_{i,j}, b_{i,j}[\subseteq [a_j, b_j[\tag{20.366}$$

Let $t \in [a_j, b_j[$. As $\prod_{j\in\{1,\dots,n\}} [a_j, b_j[\in \mathcal{R}^n$ $\prod_{j\in\{1,\dots,n\}} [a_j, b_j[\neq \varnothing$ so that by [theorems: 3.109, 3.108] the projection function $\pi_j\colon \prod_{j\in\{1,\dots,n\}} [a_j, b_j[\to [a_j, b_j[$ is a surjection, hence there exist a $x \in \prod_{j\in\{1,\dots,n\}} [a_j, b_j[= \bigsqcup_{i\in\{1,\dots,m\}} \left(\prod_{j\in\{1,\dots n\}} [a_{i,j}, b_{i,j}[\right)$ such that $t = \pi_j(x)$. Then there exists a $i \in \{1,\dots,m\}$ such that $x \in \prod_{j\in\{1,\dots n\}} [a_{m,j}, b_{m,j}[$. So it follows that $t = \pi_j(x) \in [a_{m,j}, b_{m,j}[\subseteq \bigcup_{i\in\{1,\dots,m\}} [a_{i,j}, b_{i,j}[$ which proves that $[a_j, b_j[\subseteq \bigcup_{i\in\{1,\dots,m\}} [a_{i,j}, b_{i,j}[$. Combining this with [eq: 20.366] proves that

$$[a_j, b_j[= \bigcup_{i\in\{1,\dots,m\}} [a_{i,j}, b_{i,j}[\qquad \square$$

We show now that the volume of the pairwise distinct union of half open non empty rectangles is equal to the sum of the volumes of thise reactangles if this distinct union is also a half open rectangle.

Lemma 20.280. *Let $n,\ m \in \mathbb{N}$, $\left\{\prod_{j\in\{1,\dots,n\}} [a_{i,j}, b_{i,j}[\right\}_{i\in\{1,\dots,m\}} \subseteq \mathcal{R}^n$ pairwise disjoint such that $\bigsqcup_{i\in\{1,\dots,m\}} \left(\prod_{j\in\{1,\dots n\}} [a_{i,j}, b_{i,j}[\right) = \prod_{i\in\{1,\dots,n\}} [a_i, b_i[\in \mathcal{R}^n$ then we have*

$$\prod_{i\in\{1,\dots,n\}} (b_i - a_i) = \sum_{i=1}^{m} \left(\prod_{j=1}^{n} (b_{i,j} - a_{i,j})\right)$$

Proof. First using the previous lemma [lemma: 20.279] we have that

$$\forall j \in \{1,\dots,n\}\ [a_j, b_j[= \bigcup_{i\in\{1,\dots,m\}} [a_{i,j}, b_{i,j}[\tag{20.367}$$

Let $j \in \{1,\dots,n\}$. Using [lemma: 20.277] there exists a $n_j \in \mathbb{N}$ and a bijection

$$\beta_j\colon \{1,\dots,n_j\} \to \{a_{i,j} | i \in \{1,\dots,n_j\}\} \bigcup \{b_{i,j} | i \in \{1,\dots,n_j\}\} \tag{20.368}$$

such that

$$\beta_j(1) = a_j \wedge \beta_j(n_j) = b_j \tag{20.369}$$

$$\forall k, l \in \{1,\dots,n_j\} \text{ with } k < l \text{ we have } \beta_j(k) < \beta_j(l) \tag{20.370}$$

$$\forall x, y \in \{a_{i,j} | i \in \{1,\dots,n_j\}\} \bigcup \{b_{i,j} | i \in \{1,\dots,n_j\}\} \text{ with } x < y \text{ we have } (\beta_j)^{-1}(x) < (\beta_j)^{-1}(y) \tag{20.371}$$

$$\forall i \in \{1,\dots,m\} \text{ we have } (\beta_j)^{-1}(a_{i,j}) < (\beta_j)^{-1}(b_{i,j}) \tag{20.372}$$

$$\forall i \in \{1,\dots,m\}\ \ [a_{i,j}, b_{i,j}[= \bigsqcup_{l\in\{(\beta_j)^{-1}(a_{i,j}),\dots,(\beta_j)^{-1}(b_{i,j})-1\}} [\beta_j(l), \beta_j(l+1)[\tag{20.373}$$

$$[a_j, b_j[= \bigsqcup_{i\in\{1,\dots,n_j\}} [\beta_i(i), \beta_j(i+1)[\tag{20.374}$$

Because of [eqs: 20.369 and 20.370] we can apply the previous lemma [lemma: 20.278] giving

$$\prod_{j\in\{1,\dots,n\}} [a_j, b_j[= \bigsqcup_{\rho\in\prod_{i\in\{1,\dots,n\}}\{1,\dots,n_j-1\}} \left(\prod_{j\in\{1,\dots,n\}} [\beta_j(\rho_j) - \beta_j(\rho_j+1)[\right) \tag{20.375}$$

$$\prod_{j=1}^{n} (b_j - a_j) = \sum_{\rho\in\prod_{i\in\{1,\dots,n\}}\{1,\dots,n_j-1\}} \left(\prod_{j\in\{1,\dots,n\}} (\beta_j(\rho_j+1) - \beta_j(\rho_j))\right) \tag{20.376}$$

Let $i \in \{1,\dots,m-1\}$. As $a_{i,j} = \beta_j((\beta_j)^{-1}(a_{i,j}))$ and $b_{i,j} = \beta_j((\beta_j)^{-1}(b_{i,j}))$ and $\forall i \in \{(\beta_j)^{-1}(a_{i,j}),\dots,(\beta_j)^{-1}(b_{i,j})-1\}$ we have by [eq: 20.370] that $\beta_j(i) < \beta_j(i+1)$ we can use [[lemma: 20.278] again to get

$$\prod_{j\in\{1,\dots,n\}} [a_{i,j}, b_{i,j}[\;=\; \bigsqcup_{\rho\in\prod_{i\in\{1,\dots,n\}}\{(\beta_j)^{-1}(a_{i,j}),\dots,(\beta_j)^{-1}(b_{i,j})-1\}} \left(\prod_{j=1}^{n} [\beta_j(\rho_j), \beta_j(\rho_j)+1[\right) \tag{20.377}$$

$$\prod_{j\in\{1,\dots,n\}} (b_{i,j} - a_{i,j}) \;=\; \sum_{\rho\in\prod_{i\in\{1,\dots,n\}}\{(\beta_j)^{-1}(a_{i,j}),\dots,(\beta_j)^{-1}(b_{i,j})-1\}} \left(\prod_{j=1}^{n} (\beta_j(\rho_j+1) - \beta_j(j))\right) \tag{20.378}$$

To relate [eq: 20.375] to [eq: 20.378] we prove now the following:

$$\bigsqcup_{i\in\{1,\dots,m\}} \left(\prod_{j\in\{1,\dots,n\}} \{(\beta_j)^{-1}(a_{i,j}),\dots,(\beta_j)^{-1}(b_{i,j})-1\}\right) = \prod_{j\in\{1,\dots,n\}} \{1,\dots,n_j-1\} \tag{20.379}$$

Proof. Let $i \in \{1,\dots,m\}$ and $j \in \{1,\dots,n\}$. From [eq: 20.368] it follows that $(\beta_j)^{-1}(a_{i,j}), (\beta_j)^{-1}(b_{i,j}) \in \{1,\dots,m_j\}$, further by [eq: 20.372] we have $(\beta_j)^{-1}(a_{i,j}) \leqslant (\beta_j)^{-1}(b_{i,j})-1$ so that $\{(\beta_j)^{-1}(a_{i,j}),\dots,(\beta_j)^{-1}(b_{i,j})-1\} \subseteq \{1,\dots,m_j-1\}$. Applying [theorem: 2.141] gives us then $\prod_{j\in\{1,\dots,n\}} \{(\beta_j)^{-1}(a_{i,j}),\dots,(\beta_j)^{-1}(b_{i,j})-1\} \subseteq \prod_{j\in\{1,\dots,m\}} \{1,\dots,n_j-1\}$ hence we have

$$\bigcup_{i\in\{1,\dots,m\}} \left(\prod_{j\in\{1,\dots,n\}} \{(\beta_j)^{-1}(a_{i,j}),\dots,(\beta_j)^{-1}(b_{i,j})-1\}\right) \subseteq \prod_{j\in\{1,\dots,n\}} \{1,\dots,n_j-1\} \tag{20.380}$$

For the opposite inclusion let $\rho \in \prod_{j\in\{1,\dots,n\}} \{1,\dots,n_j-1\}$. For $j \in \{1,\dots,n\}$ $\rho_j \in \{1,\dots,n_j-1\}$ we have by [eq: 20.370] that $\beta_j(\rho_j) < \beta_j(\rho_j+1)$ so that $\beta_j(\rho_j) \in [\beta_j(\rho_j), \beta_j(\rho_j)[$. Hence

$$\begin{aligned}
(\beta_1(\rho_1),\dots,\beta_n(\rho_n)) &\in \prod_{j\in\{1,\dots,n\}} [\beta_j(\rho_j), \beta_j(\rho_j)[\\
&\subseteq \bigsqcup_{\rho\in\prod_{i\in\{1,\dots,n\}}\{1,\dots,n_j-1\}} \left(\prod_{j\in\{1,\dots,n\}} [\beta_j(\rho_j), \beta_j(\rho_j+1)[\right) \\
&\underset{\text{[eq: 20.375]}}{=} \prod_{j\in\{1,\dots,n\}} [a_j, b_j[\\
&\underset{\text{hypothesis}}{=} \bigsqcup_{i\in\{1,\dots,m\}} \left(\prod_{j\in\{1,\dots n\}} [a_{i,j}, b_{i,j}[\right)
\end{aligned}$$

Hence

$$\exists k \in \{1,\dots,m\} \text{ such that } (\beta_1(\rho_1),\dots,\beta_n(\rho_n)) \in \prod_{j\in\{1,\dots n\}} [a_{k,j}, b_{k,j}[\tag{20.381}$$

Assume now that $\exists j \in \{1,\dots,n\}$ such that $b_{k,j} < \beta_j(\rho_j+1)$ then $\beta_j(\rho_j) \underset{\text{[eq: 20.381]}}{<} b_{k,j} < \beta_j(\rho_j+1)$ so that by [eq: 20.371] $(\beta_j)^{-1}(\beta_j(\rho_j)) < (\beta_j)^{-1}(b_{k,j}) < (\beta_j)^{-1}(\rho_j+1)$, hence $\rho_j < (\beta_j)^{-1}(b_{k,j}) < \rho_j+1$ from which it follows that $0 < (\beta_j)^{-1}(b_{k,j})-1 < 1$ which, as $(\beta_j)^{-1}(b_{k,j})$ is a whole number [because $(\beta_j)^{-1}(b_{k,j}) \in \{1,\dots,n_j\}$], is impossible. Hence the assumption is wrong and we must have that

$$\forall j \in \{1,\dots,n\} \;\; \beta_j(\rho_j+1) \leqslant b_{k,j} \tag{20.382}$$

So given $j \in \{1,\dots,n\}$ we hav $a_{k,j} \underset{\text{[eq: 20.381]}}{\leqslant} \beta_j(\rho_j) \underset{\text{[eq: 20.370]}}{<} \beta_j(\rho_j+1) \underset{\text{[eq: 20.382}}{\leqslant} b_{k,j}$. applying then [eq: 20.371] proves that $(\beta_j)^{-1}(a_{k,j}) \leqslant \rho_j < \rho_j+1 \leqslant (\beta_j)^{-1}(b_{k,j})$, hence $(\beta_j)^{-1}(a_{k,j}) \leqslant \rho_j \leqslant (\beta_j)^{-1}(b_{k,j})-1$ proving that $\rho_j \in \{(\beta_j)^{-1}(a_{k,j}), (\beta_j)^{-1}(b_{k,j})-1\}$ from which it follows that $\rho \in \prod_{j\in\{1,\dots,n\}} \{(\beta_j)^{-1}(a_{k,j}), (\beta_j)^{-1}(b_{k,j})-1\}$. This prove that

$$\prod_{j\in\{1,\dots,n\}} \{1,\dots,n_j-1\} \subseteq \bigcup_{i\in\{1,\dots,m\}} \left(\prod_{j\in\{1,\dots,n\}} \{(\beta_j)^{-1}(a_{i,j}),\dots,(\beta_j)^{-1}(b_{i,j})-1\}\right)$$

which combined with [eq: 20.380] results in

$$\prod_{j\in\{1,\dots,n\}}\{1,\dots,n_j-1\}=\bigcup_{i\in\{1,\dots,m\}}\left(\prod_{j\in\{1,\dots,n\}}\{(\beta_j)^{-1}(a_{i,j}),\dots,(\beta_j)^{-1}(b_{i,j})-1\}\right) \tag{20.383}$$

To finish the prove for [eq: 20.379] we must prove that it is a pairwise disjoint union. So let $k,l\in\{1,\dots,m\}$ with $k\neq l$ and assume that

$$\exists r\in\prod_{j\in\{1,\dots,n\}}\{(\beta_j)^{-1}(a_{k,j}),\dots,(\beta_j)^{-1}(b_{k,j})-1\}\bigcap\prod_{j\in\{1,\dots,n\}}\{(\beta_j)^{-1}(a_{l,j}),\dots,(\beta_j)^{-1}(b_{l,j})-1\}$$

then $\forall j\in\{1,\dots,n\}$

$$(\beta_j)^{-1}(a_{k,j})\leqslant r\leqslant(\beta_j)^{-1}(b_{k,j})-1\wedge(\beta_j)^{-1}(a_{l,j})\leqslant r\leqslant(\beta_j)^{-1}(b_{l,j})-1$$

or

$$(\beta_j)^{-1}(a_{k,j})\leqslant r<(\beta_j)^{-1}(b_{k,j})\wedge(\beta_j)^{-1}(a_{l,j})\leqslant r<(\beta_j)^{-1}(b_{l,j})$$

applying then [eq: 20.370] gives

$$a_{k,j}\leqslant\beta_j(r)<b_{k,j}\wedge a_{l,j}\leqslant\beta_j(r)<b_{l,j}\text{ or }\beta_j(r)\in[a_{k,j},b_{k,j}[\wedge\beta_j(r)\in[a_{l,j},b_{l,j}[$$

proving that $(\beta_1(r),\dots,\beta_n(r))\in\left(\prod_{i\in\{1,\dots,n\}}[a_{k,i},b_{k,i}[\right)\bigcap\left(\prod_{i\in\{1,\dots,n\}}[a_{l,i},b_{l,i}[\right)$ which as by the hypothesis $(\beta_1(r),\dots,\beta_n(r))\in\left(\prod_{i\in\{1,\dots,n\}}[a_{k,i},b_{k,i}[\right)\bigcap\left(\prod_{i\in\{1,\dots,n\}}[a_{l,i},b_{l,i}[\right)=\varnothing$ is a contradiction hence we must have that

$$\prod_{j\in\{1,\dots,n\}}\{(\beta_j)^{-1}(a_{k,j}),\dots,(\beta_j)^{-1}(b_{k,j})-1\}\bigcap\prod_{j\in\{1,\dots,n\}}\{(\beta_j)^{-1}(a_{l,j}),\dots,(\beta_j)^{-1}(b_{l,j})-1\}$$

the above together with [eq: 20.383] proves finally [eq: 20.379]. □

Finally we are able to finish the prove of the lemma.

$$\begin{aligned}
&\prod_{i=1}^{n}(b_i-a_i) && \underset{\text{[eq: 20.376]}}{=}\\
&\sum_{\rho\in\prod_{i\in\{1,\dots,n\}}\{1,\dots,n_j-1\}}\left(\prod_{j\in\{1,\dots,n\}}(\beta_j(\rho_j+1)-\beta_j(\rho_j))\right) && \underset{\substack{\text{[eq: 20.379]}\\ \text{[theorem: 11.44]}}}{=}\\
&\sum_{i\in\{1,\dots,m\}}\left(\sum_{\rho\in\prod_{j\in\{1,\dots,n\}}\{(\beta_j)^{-1}(a_{i,j}),\dots,(\beta_j)^{-1}(b_{i,j})-1\}}(\beta_j(\rho_j+1)-\beta_j(\rho_j))\right) && \underset{\text{[eq: 20.378]}}{=}\\
&\sum_{i\in\{1,\dots,m\}}\left(\prod_{j\in\{1,\dots,n\}}(b_{i,j}-a_{i,j})\right)
\end{aligned}$$

□

Now we are finally ready to prove that $\mathrm{vol}^n:\mathcal{R}^n\bigcup\{\varnothing\}\to[0,\infty]$ is a finite content.

Theorem 20.281. *Let $n\in\mathbb{N}$ then $\mathrm{vol}^n:\mathcal{R}^n\bigcup\{\varnothing\}\to[0,\infty]$ [see definition: 20.274] is a finite content on the semi-ring $\mathcal{R}^n\bigcup\{\varnothing\}$ on $\mathbb{R}^n$ [see theorem: 20.272]*

Proof. First from the definition of vol^n [see definition: 20.274] it follows that

$$\mathrm{vol}^n\text{ is finite} \tag{20.384}$$

and

$$\mathrm{vol}^n(\varnothing)=\varnothing \tag{20.385}$$

Let $m\in\mathbb{N}$ and $\{R_i\}_{i\in\{1,\dots,m\}}\subseteq\mathcal{R}^n\bigcup\{\varnothing\}$ be pairwise disjoint such that $\bigsqcup_{i\in\{1,\dots,m\}}R_i\in\mathcal{R}^n\bigcup\{\varnothing\}$ then we have two possibilities for $\bigsqcup_{i\in\{1,\dots,m\}}R_i$

$\boldsymbol{\bigsqcup_{i\in\{1,\dots,m\}}R_i=\varnothing}$**.** Then we must have $\forall i\in\{1,\dots,m\}$ that $R_i=\varnothing$ so that

$$\mathrm{vol}^n\left(\bigsqcup_{i\in\{1,\dots,m\}}R_i\right)=\mathrm{vol}^n(\varnothing)=0=\sum_{i=1}^{n}0=\sum_{i=1}^{n}\mathrm{vol}^n(\varnothing)=\sum_{i=1}^{n}\mathrm{vol}^n(R_i)$$

$\bigsqcup_{i\in\{1,\ldots,m\}} \boldsymbol{R_i} \neq \varnothing$**.** Then for $R = \bigsqcup_{i\in\{1,\ldots,m\}} R_i$ there exist a $\{[a_i, b_i[\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{I}_{[[}$ such that

$$R = \prod_{i\in\{1,\ldots,n\}} [a_i, b_i[\in \mathcal{R}^n \tag{20.386}$$

Then there exist a $i \in \{1,\ldots,m\}$ such that $R_i \neq \varnothing$ so that $I = \{i \in \{1,\ldots,m\} | R_i \neq \varnothing\} \neq \varnothing$ hence there exist a $k \in \mathbb{N}$ and a bijection

$$\beta : \{1,\ldots,k\} \to I$$

Then $\forall i \in \{1,\ldots,k\}$ $R_{\beta(i)} \neq \varnothing$ and $\forall i, j \in \{1,\ldots,k\}$ with $i \neq j$ we have, as β is injective, that $\beta(i) \neq \beta(j)$ so that $R_{\beta(i)} \bigcap R_{\beta(j)} = \varnothing$. So that

$$\{R_{\beta(i)}\}_{i\in\{1,\ldots,k\}} \subseteq \mathcal{R}^n \text{ is pairwise disjoint} \tag{20.387}$$

Let $R = \bigsqcup_{i\in\{1,\ldots,m\}} R_i$ then we have

$$R = \bigsqcup_{i\in\{1,\ldots,m\}} R_i \underset{\text{[theorem: 2.134]}}{=} \bigsqcup_{i\in I} R_i \underset{\text{[theorem: 2.119]}}{=} \bigsqcup_{i\in\{1,\ldots k\}} R_{\beta(i)} \tag{20.388}$$

Further as $\{R_{\beta(i)}\}_{i\in\{1,\ldots,k\}} \subseteq \mathcal{R}^n$ we have $\forall i \in \{1,\ldots,k\}$ that

$$R_{\beta(i)} = \Pi_{j\in\{1,\ldots,n\}} [a_{i,j}, b_{i,j}[\subseteq \mathcal{R}n. \tag{20.389}$$

So that

$$\prod_{i\in\{1,\ldots,n\}} [a_i, b_i[\underset{\text{[eq: 20.386]}}{=} \bigsqcup_{i\in\{1,\ldots,k\}} \left(\prod_{j\in\{1,\ldots,n\}} [a_{i,j}, b_{i,j}[\right) \tag{20.390}$$

Then we have

$$\begin{aligned}
\mathrm{vol}^n(R) &= \prod_{i=1}^{n} (\mathrm{begin}(R)_i = \mathrm{end}(R)_i) \\
&= \prod_{i=1}^{n} (b_i - a_i) \\
&\underset{\substack{\text{[eq: 20.390]}\\ \text{[lemma: 20.280]}}}{=} \sum_{i=1}^{k} \left(\prod_{j=1}^{n} (b_{i,j} - a_{i,j}) \right) \\
&\underset{\text{[eq: 20.389]}}{=} \sum_{i=1}^{k} \left(\prod_{j=1}^{n} (\mathrm{begin}(R_{\beta(i)})_j - \mathrm{end}(R_{\beta(j)})_j) \right) \\
&= \sum_{i=1}^{k} \mathrm{vol}^n(R_{\beta(i)}) \\
&= \sum_{i\in\{1.,\ldots,k\}} \mathrm{vol}^n(R_{\beta(i)}) \\
&\underset{\text{[theorem: 11.36]}}{=} \sum_{i\in I} \mathrm{vol}^n(R_i) \\
&= \sum_{i\in I} \mathrm{vol}^n(R_i) + 0 \\
&\underset{i\notin I = R_i = \varnothing}{=} \sum_{i\in I} \mathrm{vol}^n(R_i) + \sum_{i\in\{1,\ldots,m\}\setminus I} \mathrm{vol}^n(R_i) \\
&= \sum_{i\in\{1,\ldots,m\}} \mathrm{vol}^n(R_i) \\
&= \sum_{i=1}^{m} \mathrm{vol}^n(R_i)
\end{aligned}$$

Hence

$$\mathrm{vol}^n\left(\bigsqcup_{i\in\{1,\ldots,m\}} R_i \right) = \sum_{i=1}^{n} \mathrm{vol}^n(R_i)$$

which finished the proof of the theorem. □

Next we use [theorem: 20.246] to prove that vol^n is actually a pre-measure on the semi-ring $\mathcal{R}^n\bigcup\{\varnothing\}$. To do this we need the following lemma that will allows us to 'aproximate' a half open rectangle by a compact set.

Lemma 20.282. *Let $n\in\mathbb{N}$, $\varepsilon\in\mathbb{R}^+$ and $\{x_i\}_{i\in\{1,\dots,n\}}\subseteq\mathbb{R}^+$ then $\exists\{\varepsilon_i\}_{i\in\{1,\dots,n\}}\subseteq\mathbb{R}^+$ with $0<\varepsilon_i<x_i$ such that $\prod_{i=1}^n x_i<(\prod_{i=1}^n(x_i-\varepsilon_i))+\varepsilon$*

Proof. We use induction on n. Let $\varepsilon\in\mathbb{R}^n$ and define

$$S_\varepsilon=\left\{n\in\mathbb{N}|\text{If }\{x_i\}_{i\in\{1,\dots,n\}}\subseteq\mathbb{R}^+\text{ then }\exists\{\varepsilon_i\}_{i\in\{1,\dots,n\}}\subseteq\mathbb{R}^+\text{ with }\forall i\in\{1,\dots,n\}\ 0<\varepsilon_i<x_i\text{ such that }\prod_{i=1}^n x_i<\left(\prod_{i=1}^n(x_i-\varepsilon_i)\right)+\varepsilon\right\}$$

then we have:

- $\boldsymbol{1\in S_\varepsilon}$. If $\{x_i\}_{i\in\{1,\dots,1\}}\subseteq\mathbb{R}^+$ then $x_1\in\mathbb{R}^+$, define $\varepsilon_1=\min\left(\frac{x_1}{2},\frac{\varepsilon}{2}\right)\in\mathbb{R}^+$ then $0<\varepsilon_1\leqslant\frac{x_1}{2}<x_1$ and $\prod_{i=1}^1 x_i-\prod_{i=1}^1(x_i-\varepsilon_i)=x_1-(x_1-\varepsilon_1)=\varepsilon_1\leqslant\frac{\varepsilon}{2}<\varepsilon$ so that $\prod_{i=1}^1 x_i<(\prod_{i=1}^1(x_i-\varepsilon_i))+\varepsilon$ proving that $1\in\mathcal{S}$.
- $\boldsymbol{n\in S_\varepsilon\Rightarrow n+1\in S_\varepsilon}$. Assume that $\{x_i\}_{i\in\{1,\dots,n+1\}}\subseteq\mathbb{R}^+$ then as $n\in\mathcal{S}$ there exists $\{\varepsilon_i\}_{i\in\{1,\dots,n\}}\subseteq\mathbb{R}^+$ with $0<\varepsilon_i<x_i$ and $\prod_{i=1}^n x_i<(\prod_{i=1}^n(x_i-\varepsilon_i))+\frac{\varepsilon}{2\cdot x_{n+1}}$ so that as $0<x_{n+1}$ we have

$$x_{n+1}\cdot\prod_{i=1}^n x_i-x_{n+1}\cdot\prod_{i=1}^n(x_i-\varepsilon_i)<\frac{\varepsilon}{2}\tag{20.391}$$

Take now $\varepsilon_{n+1}=\min\left(\frac{\varepsilon}{4\cdot\prod_{i=1}^n x_i},\frac{x_{n+1}}{2}\right)$ then $0<\varepsilon_{n+1}\leqslant\frac{x_{n+1}}{2}<x_{n+1}$ and $\varepsilon_{n+1}\cdot(\prod_{i=1}^n x_i)\leqslant\frac{\varepsilon}{4}<\frac{\varepsilon}{2}$. Now

$$\begin{aligned}\prod_{i=1}^{n+1}x_i-\prod_{i=1}^{n+1}(x_i-\varepsilon_i)&=x_{n+1}\cdot\prod_{i=1}^n x_i-(x_{n+1}-\varepsilon_{n+1})\cdot\prod_{i=1}^n(x_i-\varepsilon_i)\\&=x_{n+1}\cdot\left(\prod_{i=1}^n x_i-\prod_{i=1}^n(x_i-\varepsilon_i)\right)+\varepsilon_{n+1}\cdot\prod_{i=1}^n(x_i-\varepsilon_i)\\&\leqslant x_{n+1}\cdot\left(\prod_{i=1}^n x_i-\prod_{i=1}^n(x_i-\varepsilon_i)\right)+\frac{\varepsilon}{4}\\&\underset{\text{[eq: 20.391]}}{<}\frac{\varepsilon}{2}+\frac{\varepsilon}{4}\\&<\varepsilon\end{aligned}$$

proving that $n+1\in S_\varepsilon$. □

Now we can prove that the volume function is a pre-measure.

Theorem 20.283. *Let $n\in\mathbb{N}$ then the function $\mathrm{vol}^n:\mathcal{R}^n\bigcup\{\varnothing\}\to[0,\infty]$ is a finite pre-measure on the semi-ring $\mathcal{R}^n\bigcup\{\varnothing\}$.*

Proof. Consider the topological space $\langle\mathbb{R}^n,\|\|_n\rangle$ based on the canonical topology $\|\|_n$ [see theorem: 14.95]. Let $A\in\mathcal{R}^n\bigcup\{\varnothing\}$ then for A we have either:

- $\boldsymbol{A=\varnothing}$. Take then $A_\varepsilon=\varnothing$ and $K_\varepsilon=\varnothing$. Then K_ε is compact by [example: 14.226], $A_\varepsilon\subseteq K_\varepsilon\subseteq A$ and $\mathrm{vol}^n(A)-\mathrm{vol}^n(A_\varepsilon)=0-0=0<\varepsilon$.
- $\boldsymbol{A\neq\varnothing}$. Then there exiss $a,b\in\mathbb{R}^n$ with $a<b$ such that $A=[a,b[=\prod_{i\in\{1,\dots,n\}}[a_i,b_i[$. As $\forall i\in\{1,\dots,n\}\ a_i<b_i\Rightarrow b_i-a_i\in\mathbb{R}^+$ we can use [lemma: 20.282] there exists a $\{\varepsilon_i\}_{i\in\{1,\dots,n\}}\subseteq\mathbb{R}^+$ such that

$$\forall i\in\{1,\dots,n\}\ 0<\varepsilon_i<b_i-a_i\text{ and }\prod_{i=1}^n(b_i-a_i)<\left(\prod_{i=1}^n((b_i-a_i)-\varepsilon_i)\right)+\varepsilon\tag{20.392}$$

From the above it follows that $\forall i\in\{1,\dots,n\}\ a_i<b_i-\varepsilon_i$ so that

$$A_\varepsilon=\prod_{i\in\{1,\dots,n\}}[a_i,b_i-\varepsilon_i[\in\mathcal{R}^n\subseteq\mathcal{R}^n\bigcup\{\varnothing\}$$

Further by [theorem: 14.275]

$$K_\varepsilon=\prod_{i\in\{1,\dots,n\}}[a,b_i-\varepsilon_i]\text{ is compact}$$

As $\forall i \in \{1, \ldots, n\}$ $[a_i, b_i - \varepsilon_i[\subseteq [a_i, b_i - \varepsilon_i] \subseteq [a_i, b_i]$ it follows from [theorem: 2.141] that

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A$$

Further

$$\mathrm{vol}^n(A) - \mathrm{vol}^n(A_\varepsilon) = \prod_{i=1}^{n} (b_i - a_i) - \prod_{i=1}^{n} ((b_i - a_i) - \varepsilon_i) \underset{\text{[eq: 20.392]}}{<} \varepsilon$$

So in all cases we found a $A_\varepsilon \in \mathcal{R}^n \bigcup \{\varnothing\}$ and a compact set K_ε such that $A_\varepsilon \subseteq K_\varepsilon \subseteq A$ and $\mathrm{vol}^n(A) - \mathrm{vol}^n(A_\varepsilon) < \varepsilon$. Finally using [theorem: 20.246] it follows that

$$\mathrm{vol}^n : \mathcal{R}^n \bigcup \{\varnothing\} \to [0, \infty] \text{ is a pre-measure on } \mathcal{R}^n \bigcup \{\varnothing\}$$

which is finite by [theorem: 20.281]. □

Next we use a derivate of the Carathéodry theorem [theorem: 20.225] to extend vol^n to the Lebesgue measure on Lebesgue measurable sets in $\mathbb{R}^n$.

Theorem 20.284. *If we define*

$$(\lambda^n)^* : \mathcal{P}[\mathbb{R}^n] \to [0, \infty] \text{ by } (\lambda^n)^*(A) = \begin{cases} \infty \text{ if } \mathcal{S}[A] = \varnothing \\ \inf(\{\sum_{i=1}^{\infty} \mu(A_i) | \{A_i\}_{i \in \{1, \ldots, n\}} \in \mathcal{S}[A]) \end{cases}$$

where

$$\mathcal{S}[A] = \left\{ \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}^n \bigsqcup \{\varnothing\} | A \subseteq \bigcup_{i \in \mathbb{N}} A_i \right\}$$

then

$$(\lambda^n)^* \text{ is a outer measure}$$

$$\mathcal{L}[\mathbb{R}^n] = \left\{ A \in \mathcal{P}[\mathbb{R}^n] | \forall B \in \mathcal{P}(\mathbb{R}^n) \text{ we have } (\lambda^n)^*(B) = (\lambda^n)^*\left(B \bigcap A\right) + (\lambda^n)^*(B \setminus A) \right\}$$

is a σ-algebra on $\mathbb{R}^n$ such that

$$\sigma\left[\mathcal{R}^n \bigcup \{\varnothing\}\right] \subseteq \mathcal{L}[\mathbb{R}^n]$$

and

$$\overline{\lambda^n} = ((\lambda^n)^\star)_{|\mathcal{L}(\mathbb{R}^n)} : \mathcal{L}[\mathbb{R}^n] \to [0, \infty] \text{ is a measure on } \mathcal{L}[\mathbb{R}^n]$$

and

$$\lambda^n = ((\lambda^n)^\star)_{|\sigma[\mathcal{R}^n \bigsqcup \{\varnothing\}]} : \sigma\left[\mathcal{R}^n \bigsqcup \{\varnothing\}\right] \to [0, \infty] \text{ is a measure on } \sigma\left[\mathcal{R}^n \bigsqcup \{\varnothing\}\right]$$

and

$$((\lambda^n)^\star)_{|\mathcal{R}^n \bigsqcup \{\varnothing\}} = \mathrm{vol}^n$$

Further if $\mu : \sigma[\mathcal{R}^n \bigsqcup \{\varnothing\}] \to [0, \infty]$ is another measure such that $\mu_{|\mathcal{R}^n \bigsqcup \{\varnothing\}} = \mathrm{vol}^n$ then

$$\mu = \lambda^n$$

We have then

$$\langle \mathbb{R}^n, \mathcal{L}[\mathbb{R}^n], \overline{\lambda^n} \rangle \text{ is a measure space called the Lebesgue mesaure space on } \mathbb{R}^n$$

where

$$\mathcal{L}[\mathbb{R}^n] \text{ is called the set of Lebesgue measurable sets in } \mathbb{R}^n$$

and

$$\overline{\lambda^n} \text{ is called the Lebesgue mearuse on } \mathbb{R}^n$$

***Note* 20.285.** *As by [theorem: 20.273] $\mathcal{B}[\mathbb{R}^n] = \sigma[\mathcal{R}^n \bigsqcup \{\varnothing\}]$ we have also*

$$\mathcal{B}[\mathbb{R}^n] \subseteq \mathcal{L}[\mathbb{R}^n]$$

and

$$\lambda^n : \mathcal{B}[\mathbb{R}^n] \to [0, \infty] \text{ is a measure on } \mathcal{B}[\mathbb{R}^n]$$

so that

$$\langle \mathbb{R}^n, \mathcal{B}[\mathbb{R}^n], \lambda^n \rangle \text{ is a measure space called the Borel measure space on } \mathbb{R}^n$$

and

$$\lambda^n \text{ is called the Borel measure on } \mathbb{R}^n$$

Proof. Using [theorem: 20.283] we have that

$$\text{vol}^n : \mathcal{R}^n \bigsqcup \{\varnothing\} \to [0, \infty] \text{ is a pre-measure on } \mathbb{R}^n \tag{20.393}$$

Define now $\{G_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}^n$ by $G_i = \prod_{j \in \{1, \ldots, n\}} [-i, i[$. Then as $\forall i \in \mathbb{N}$ $[-i, i[\subseteq [-(i+1), i+1[$ it follows from [theorem: 2.141] that $G_i \subseteq G_{i+1}$, hence we have

$$\forall i \in \mathbb{N} \text{ we have } G_i \subseteq G_{i+1} \text{ and as vol}^n \text{ is finite that vol}^n(G_i) < \infty \tag{20.394}$$

Let $x \in \mathbb{R}^n$ then $\forall i \in \{1, \ldots, n\}$ we have by [theorem: 10.30] that there exists $n_i, m_i \in \mathbb{N}$ such that $-n_i < x_i < m_i$. Take $k = \max(\{n_i | i \in \mathbb{N}\} \bigcup \{m_i | i \in \mathbb{N}\}) \in \mathbb{N}$ then $\forall i \in \mathbb{N}$ we have $-k < n_i < x_i < m_i < k$ so that $x \in G_k \subseteq \bigcup_{i \in \mathbb{N}} G_i \subseteq \mathbb{R}^n$. Hence we have

$$\mathbb{R}^n = \bigcup_{i \in \mathbb{N}} G_i \tag{20.395}$$

The proof follows then from [eqs: 20.393, 20.394, 20.395] and [theorem: 20.225]. □

20.4.5 Completeness of measures

Definition 20.286. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $B \in \mathcal{P}(X)$ is **μ-negligible** [sometimes also called μ-null] if there exist a $A \in \mathcal{S}$ with $\mu(A) = 0$ such that $B \subseteq A$. The set of all μ-negligible sets is noted as $\mathcal{N}_\mu$ hence*

$$\mathcal{N}_\mu = \{A \in \mathcal{P}(X) | \exists B \in \mathcal{A} \text{ with } \mu(B) = \varnothing \text{ such that } A \subseteq B\}$$

We have the following properties for μ-negligible sets.

Theorem 20.287. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measurable space then we have*

1. $\varnothing \in \mathcal{N}_\mu$
2. *If $A \in \mathcal{N}_\mu$ then for every $B \subseteq A$ we have $B \in \mathcal{N}_\mu$*
3. *If $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{N}_\mu$ then we have $\bigcup_{i \in \mathbb{N}} A_i \subseteq \mathcal{N}_\mu$ and $\bigcap_{i \in \mathbb{N}} A_i \subseteq \mathcal{N}_\mu$*

Proof.

1. This is trivial as $\varnothing \subseteq \varnothing \in \mathcal{A}$ and $\mu(\varnothing) = 0$.
2. Let $A \in \mathcal{N}_\mu$ and $B \subseteq A$. As $A \in \mathcal{N}_\mu$ there exists a $C \in \mathcal{A}$ with $\mu(C) = 0$ such that $A \subseteq C$ which as $B \subseteq A$ proves that $B \subseteq C$ so that $B \in \mathcal{N}_\mu$.
3. Assume that $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{N}_\mu$ then there exists a $\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ such that $\forall i \in \mathbb{N}$ $\mu(B_i) = 0$ and $A_i \subseteq B_i$. Hence $\bigcup_{i \in \mathbb{N}} A_i \subseteq \bigcup_{i \in \mathbb{N}} B_i$ and using [theorem: 20.192] we have that
$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \leqslant \sum_{i=1}^{\infty} \mu(B_i) = \sum_{i=1}^{\infty} 0 = 0$$
which proves that
$$\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{N}_\mu$$
Finally as $\bigcap_{i \in \mathbb{N}} A_i \subseteq A_1 \in \mathcal{N}_\mu$ it follows from (2) that $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{N}_\mu$. □

Definition 20.288. (Complete Measures) *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then μ is **complete** if $\forall A \in \mathcal{A}$ with $\mu(A) = 0$ we have $\forall B \in \mathcal{P}(X)$ with $B \subseteq A$ that $B \in \mathcal{A}$. Every measure space with a complete measure is called a **complete measure space**.*

Theorem 20.289. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then*

$$\mu \text{ is complete} \Leftrightarrow \mathcal{N}_\mu \subseteq \mathcal{A}$$

Proof.

- **⇒.** If $A \in \mathcal{N}_\mu$ then there exists a $B \in \mathcal{A}$ with $\mu(B) = 0$ such that $A \subseteq B$. As μ is complete, $B \in \mathcal{A}$, $\mu(B) = 0$ and $A \subseteq B$ it follows that $A \in \mathcal{A}$. Hence $\mathcal{N}_A \subseteq \mathcal{A}$
- **⇐.** Let $A \in \mathcal{A}$ with $\mu(A) = 0$ then for $B \in \mathcal{P}(X)$ with $B \subseteq A$ we have by definition of $\mathcal{N}_\mu$ that $B \in \mathcal{N}_\mu$ hence, as $\mathcal{N}_\mu \subseteq \mathcal{A}$, it follows that $B \in \mathcal{A}$ which proves that μ is complete. □

We prove now that every measure space constructed via the Carathéodory is a complete measure space.

Theorem 20.290. *Let X be a set and $\mu^*: \mathcal{P}(X) \to [0, \infty]$ is a **outer measure** then the measure space*

$$\langle X, \mathcal{M}[\mu^*], (\mu^*)_{|\mathcal{M}[\mu^*]} \rangle \text{ [see theorem: 20.200]}$$

where

$$\mathcal{M}[\mu^*] \underset{\text{[definition: 20.197]}}{=} \left\{ A \in \mathcal{P}(X) | \forall B \in P(X) \text{ we have } \mu^*(B) = \mu^*\left(B \bigcap A\right) + \mu^*(B \setminus A) \right\}$$

is a complete measure space.

Proof. If $A \in \mathcal{N}_{(\mu^*)_{|\mathcal{M}[\mu^*]}}$ then there exists a $B \in \mathcal{M}[\mu^*]$ with $\mu^*(B) = (\mu^*)_{|\mathcal{M}[\mu^*]}(B) = 0$ such that $A \subseteq B$. Hence by the definition of a outer measure [see definition: 20.195] we have that $\mu^*(A) \leqslant \mu^*(B) = 0$ which proves that $\mu^*(A) = 0$. Applying then [theorem: 20.199] proves that $A \in \mathcal{M}[\mu^*]$. Hence $\mathcal{N}_{(\mu^*)_{|\mathcal{M}[\mu^*]}} \subseteq \mathcal{M}[\mu^*]$ which by the previous theorem [theorem: 20.289] proves that $\langle X, \mathcal{M}[\mu^*], (\mu^*)_{|\mathcal{M}[\mu^*]} \rangle$ is a complete measure space. □

Corollary 20.291. *We have that*

1. $\left\langle \mathbb{R}, \mathcal{L}[\mathbb{R}], \overline{\lambda} \right\rangle$ *is a complete measure space.*
2. *Let $n \in \mathbb{N}$ then $\langle \mathbb{R}, \mathcal{L}[\mathbb{R}^n], \overline{\lambda^n} \rangle$ is a complete measure space*

Proof.

1. This follows from the previous theorem [theorem: 20.261] and the definition of $\langle \mathbb{R}, \mathcal{L}[\mathbb{R}], \overline{\lambda} \rangle$ [see theorem: 20.261].
2. This follows from the previous theorem [theorem: 20.261] and the definition of $\langle \mathbb{R}^n, \mathcal{L}[\mathbb{R}^n], \overline{\lambda^n} \rangle$ [see theorem: 20.284]. □

Sometimes we have to deal with arbitrary subsets of sets with measure zero, it is then desirable to that there exists a extension of measure space to a bigger measure space in which these sets are elements of the bigger σ-algebra. To do this we introduce the concept of the **completion** of a measure space.

Definition 20.292. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then the **completion** of $\mathcal{A}$ noted as $\mathcal{A}_\mu$ is defined by*

$$\mathcal{A}_\mu = \{ A \in \mathcal{P}(X) | \exists E, F \in \mathcal{A} \text{ such that } E \subseteq A \subseteq F \text{ and } \mu(F \setminus E) = 0 \}$$

elements of $\mathcal{A}_\mu$ are called μ-measurable sets.

***Note* 20.293.** *As by [theorem: 20.135] a σ-algebra is a algebra if follows from [theorem: 20.130] that $\forall E, F \in \mathcal{A}$ $\mu \setminus F \in \mathcal{A}$ so the above is well defined.*

Next we define a set function of $\overline{\mu}: \mathcal{A}_\mu \to [0, \infty]$, first we need a little lemma needed for the existence of such a function.

Lemma 20.294. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space $A \in \mathcal{P}(X)$ and $E, F \in \mathcal{A}$ such that $E \subseteq A \subseteq F$ and $\mu(F \setminus E) = 0$ then*

$$\{ \mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A \} \neq \varnothing \text{ [so that } \sup(\{ \mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A \}) \text{ exists]}$$

and

$$\mu(F) = \mu(E) = \sup(\{ \mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A \})$$

Proof. As $E \in \mathcal{A} \in \mathcal{A}$ and $E \subseteq A$ it follows that $\mu(E) \in \{ \mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A \}$ hence

$$\{ \mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A \} \neq \varnothing \tag{20.396}$$

and

$$\mu(E) \leqslant \sup(\{ \mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A \}) \tag{20.397}$$

As $E \subseteq A \subseteq F$ we have $E \subseteq F$ so that by [theorem: 1.35] $F = (F \setminus E) \bigsqcup E$ hence $\mu(F) = \mu(F \setminus E) + \mu(E) = 0 + \mu(E) = \mu(E)$ proving that

$$\mu(E) = \mu(F) \tag{20.398}$$

If $B \in \mathcal{A}$ with $B \subseteq A$ then $B \subseteq F$ so that by [theorem: 20.187] $\mu(B) \leqslant \mu(F) = \mu(E)$ hence

$$\sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\}) \leqslant \mu(E)$$

which combining with [eq: 20.397] proves that

$$\sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\})$$

□

Theorem 20.295. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then if we define*

$$\overline{\mu} : \mathcal{A}_\mu \to [0, \infty] \text{ by } \overline{\mu}(A) = \sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\})$$

then we have

$$\forall A \in \mathcal{A}_\mu \text{ we have if } E, F \in \mathcal{A} \text{ satsifies } E \subseteq A \subseteq F \text{ and } \mu(F \setminus E) = 0 \text{ then } \mu(E) = \mu(F) = \overline{\mu}(A)$$

and

$$\langle X, \mathcal{A}_\mu, \overline{\mu} \rangle \text{ is a measure space}$$

and

$$\mathcal{A} \subseteq \mathcal{A}_\mu$$

and

$$\mu = (\overline{\mu})_{|\mathcal{A}}$$

In other words the measure space $\langle X, \mathcal{A}_\mu, \overline{\mu} \rangle$ is a extension of the measure space $\langle X, \mathcal{A}, \mu \rangle$. $\langle X, \mathcal{A}_\mu, \overline{\mu} \rangle$ is called the ***completion of the measure space*** *$\langle X, \mathcal{A}, \mu \rangle$*

***Note* 20.296.** *$\overline{\mu}$ is welll defined because if $A \in \mathcal{A}_\mu$ then there exists $E, F \in \mathcal{A}$ with $E \subseteq A \subseteq F$ and $\mu(F \setminus E) = 0$ so that by [lemma: 20.294] $\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\} \neq \varnothing$.*

Proof. Let $A \in \mathcal{A}_\mu$ then if $E, F \in \mathcal{A}$ is such that $E \subseteq A \subseteq F$ and $\mu(F \setminus E) = 0$ it follows from [lemma: 20.294] that

$$\mu(E) = \mu(F) = \sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\}) = \overline{\mu}(A) \tag{20.399}$$

Next we prove that $\mathcal{A}_\mu$ contains $\mathcal{A}$ and is a σ-algebra. Let $A \in \mathcal{A}$ and take $E = \varnothing \in \mathcal{A}$,, $F = A \in \mathcal{A}$ then $E = \varnothing \subseteq A \subseteq A = F$ and $\mu(F \setminus E) = \mu(\varnothing) = 0$ so that $A \in \mathcal{A}_\mu$. Hence we have

$$\mathcal{A} \subseteq \mathcal{A}_\mu \tag{20.400}$$

As $\mathcal{A}$ is a σ-algebra $\varnothing \in \mathcal{A}$ hence using the above it follows that

$$\varnothing \in \mathcal{A}_\mu \tag{20.401}$$

Let $A \in \mathcal{A}_\mu$ then there exists $E, F \in \mathcal{A}$ such that $E \subseteq A \subseteq F$ and $\mu(F \setminus E) = 0$. As $\mathcal{A}$ is a σ-algebra we have that

$$X \setminus E, X \setminus F \in \mathcal{A} \tag{20.402}$$

further applying [theorem: 1.33] gives

$$X \setminus F \subseteq X \setminus A \subseteq X \setminus E \tag{20.403}$$

Next

$$\begin{aligned}
x \in (X \setminus E) \setminus (X \setminus F) \quad &\Leftrightarrow \quad x \in X \setminus E \wedge x \notin X \setminus F \\
&\Leftrightarrow \quad (x \in X \wedge x \notin E) \wedge \neg(x \in X \wedge x \notin F) \\
&\Leftrightarrow \quad (x \in X \wedge x \notin E) \wedge (x \notin X \vee x \in F) \\
&\Leftrightarrow \quad (x \in X \wedge x \notin E \wedge x \notin X) \vee (x \in X \wedge x \notin E \wedge x \in F) \\
&\Leftrightarrow \quad x \in X \wedge x \notin E \wedge x \in F \\
&\underset{F \subseteq X}{\Leftrightarrow} \quad x \notin E \wedge x \in F \\
&\Leftrightarrow \quad F \setminus E
\end{aligned}$$

so that $(X \setminus E) \setminus (X \setminus F) = F \setminus E$ hence

$$\mu((X \setminus E) \setminus (X \setminus F)) = \mu(F \setminus E) = 0 \tag{20.404}$$

From [eqs: 20.402, 20.403 and 20.404] it follows that $X\setminus A\in\mathcal{A}_\mu$ so that

$$\forall A\in\mathcal{A}_\mu \text{ we have } X\setminus A\in\mathcal{A}_\mu \tag{20.405}$$

Let $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}_\mu$ then there exists $\{E_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$, $\{F_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}$ such that $\forall i\in\mathbb{N}$ $E_i\subseteq A_i\subseteq F_i$ and $\mu(F_i\setminus E_i)=0$. Then we have

$$\bigcup_{i\in\mathbb{N}}E_i\subseteq\bigcup_{i\in\mathbb{N}}A_i\subseteq\bigcup_{i\in\mathbb{N}}F_i \text{ and, as } \mathcal{A} \text{ is a } \sigma\text{-algebra, } \bigcup_{i\in\mathbb{N}}E_i,\bigcup_{i\in\mathbb{N}}F_i\in\mathcal{A} \tag{20.406}$$

If $x\in(\bigcup_{i\in\mathbb{N}}F_i)\setminus(\bigcup_{i\in\mathbb{N}}E_i)$ then $x\in\bigcup_{i\in\mathbb{N}}F_i$ and $x\notin\bigcup_{i\in\mathbb{N}}E_i$, hence there exist a $i\in\mathbb{N}$ such that $x\in F_i$ and $\forall j\in\mathbb{N}$ $x\notin E_j$ in particular $x\notin E_i$, so $x\in F_i\setminus E_i$. So $(\bigcup_{i\in\mathbb{N}}F_i)\setminus(\bigcup_{i\in\mathbb{N}}E_i)\subseteq\bigcup_{i\in\mathbb{N}}(F_i\setminus E_i)$ where as $\mathcal{A}$ is a σ-algebra $F_i\setminus E_i\in\mathcal{A}$, hence

$$\mu\left(\left(\bigcup_{i\in\mathbb{N}}F_i\right)\setminus\left(\bigcup_{i\in\mathbb{N}}E_i\right)\right)\leqslant\mu\left(\bigcup_{i\in\mathbb{N}}(F_i\setminus E_i)\right)\underset{\text{[theorem: 20.192]}}{\leqslant}\sum_{i=1}^{\infty}\mu(F_i\setminus E_i)=0 \tag{20.407}$$

From [eq: 20.406] and [eq: 20.407] it follows that $\bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}_\mu$ hence

$$\forall\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}_\mu \text{ we have } \bigcup_{i\in\mathbb{N}}A_i\in\mathcal{A}_\mu \tag{20.408}$$

From [eqs: 20.401, 20.405 and 20.408] it follows that

$$\mathcal{A}_\mu \text{ is a } \sigma\text{-algebra} \tag{20.409}$$

Now as $\varnothing\in\mathcal{A}$, $\varnothing\subseteq\varnothing\subseteq\varnothing$ and $\mu(\varnothing\setminus\varnothing)=0$ it follows from [eq: 20.399] that

$$\overline{\mu}(\varnothing)=\mu(\varnothing)=0 \tag{20.410}$$

If additional $\{A_i\}_{i\in\mathbb{N}}\subseteq\mathcal{A}_\mu$ is pairwise disjoint then $\forall i\in\mathbb{N}$ $E_i\subseteq A_i\subseteq F_i$ and $\mu(F_i\setminus E_i)=0$. Let $i,j\in\mathbb{N}$ with $i\neq j$ then $E_i\bigcap E_j\subseteq A_i\bigcap A_j=\varnothing$ which proves that $\{E_i\}_{i\in\mathbb{N}}$ is pairwise disjoint. So

$$\begin{aligned}\overline{\mu}\left(\bigsqcup_{i\in\mathbb{N}}A_i\right)&\underset{\text{[eq: 20.406, 20.407, 20.399]}}{=}\mu\left(\bigsqcup_{i\in\mathbb{N}}E_i\right)\\&\underset{\mu\text{ is a measure}}{=}\sum_{i=1}^{\infty}\mu(E_i)\\&\underset{\text{[eq: 20.399]}}{=}\sum_{i=1}^{\infty}\overline{\mu}(A_i)\end{aligned}$$

The above together with [eq: 20.410] proves that

$$\overline{\mu} \text{ is a measure so that } \langle X,\mathcal{A}_\mu,\overline{\mu}\rangle \text{ is a measure space} \tag{20.411}$$

Let $A\in\mathcal{A}$ then as $A\subseteq A\subseteq A$ and $\mu(A\setminus A)=\mu(\varnothing)=0$ we have by [eq: 20.399] that $\overline{\mu}(A)=\mu(A)$, hence

$$(\overline{\mu})_{|A}=\mu \tag{20.412}$$

Let $A\in\mathcal{N}_{\overline{\mu}}$ then there exist a $B\in\mathcal{A}_\mu$ with $\overline{\mu}(B)=0$ such that $A\subseteq B$. As $B\in\mathcal{A}_\mu$ there exists $E,F\in\mathcal{A}$ with $E\subseteq B\subseteq F$ and $\mu(F\setminus E)=0$, hence by [eq: 20.399] $\mu(F)=\overline{\mu}(B)=0$. Next as $\varnothing\subseteq A\subseteq B\subseteq F$ and $\mu(F\setminus\varnothing)=\mu(F)=0$ it follows that $A\in\mathcal{A}_\mu$. This proves that $\mathcal{N}_{\overline{\mu}}\subseteq\mathcal{A}_\mu$ so that by [theorem: 20.289]

$$\langle X,\mathcal{A}_\mu,\overline{\mu}\rangle \text{ is complete}$$

□

20.5 Measurable Functions

20.5.1 Measurable function definition

We define now the functions that can be integrated.

Definition 20.297. (Measurable Function) *Let $\langle X,\mathcal{A}\rangle$, $\langle Y,\mathcal{B}\rangle$ be two measurable spaces and $A\in\mathcal{A}$ then a function*

$$f:A\to Y$$

is $\boldsymbol{\mathcal{A},\mathcal{B}}$***-measurable*** *if* $\forall B\in\mathcal{B}$ *we have that* $f^{-1}(B)\in\mathcal{A}$. *The set of* $\mathcal{A},\mathcal{B}$*-measurable function graphs is noted as* $\mathfrak{M}[A,\mathcal{A},Y,\mathcal{B}]$ *hence*

$$\mathfrak{M}[A,\mathcal{A},Y,\mathcal{B}]=\{f\in Y^A|f\colon A\to Y \text{ is } \mathcal{A},\mathcal{B}\text{-measurable}\}$$

***Note* 20.298.** *A set can have many* σ*-algebras defined on it, so the same function can at the same time be measurable and not measurable, depending on the* σ*-algebras used.*

Example 20.299. Let $\langle X,\mathcal{A}\rangle$, $\langle Y,\mathcal{B}\rangle$ be measurable spaces, $A\in\mathcal{A}$, $y\in Y$ and $C_y\colon A\to Y$ defined by $C_y(x)=y$ [the constant function then C_y is $\mathcal{A},\mathcal{B}$-measurable.

Proof. Let $B\in\mathcal{B}$ then we have two cases to check

- $\boldsymbol{y\in B}$**.** Then for $x\in A$ we have $C_y(x)=y\in B$ so that $C_y^{-1}(B)=A\in\mathcal{A}$
- $\boldsymbol{y\notin B}$**.** Assume that $x\in C_y^{-1}(B)$ then $C_y(x)=y\in B$ contradicting $y\notin B$, hence $C_y^{-1}(B)=\varnothing\in\mathcal{A}$

so in all cases $C_y^{-1}(B)\in\mathcal{A}$ which proves that C_y is $\mathcal{A},\mathcal{B}$-measurable. □

We have the following more specialized cases of measurable functions

Definition 20.300. *Let* $\langle X,\mathcal{T}_X\rangle$, $\langle Y,\mathcal{T}_Y\rangle$ *be two topological spaces,* $A\in\mathcal{B}[X,\mathcal{T}_X]$ *then a* $\mathcal{B}[X,\mathcal{T}_X],\mathcal{B}[Y,\mathcal{T}_Y]$*-measurable* $f\colon X\to Y$ *function is called a* ***Borel measurable*** *function.*

Example 20.301. Let $A\in\mathcal{B}[\mathbb{R}]$ then a $\mathcal{B}[\mathbb{R}],\mathcal{B}[\overline{\mathbb{R}}]$-measurable function $f\colon A\to\overline{\mathbb{R}}$ is a Borel measurable function.

Example 20.302. Let $A\in\mathcal{B}[\mathbb{R}^n]$ then a $\mathcal{B}[\mathbb{R}^n],\mathcal{B}[\overline{\mathbb{R}}]$-measurable funciton $f\colon A\to\overline{\mathbb{R}}$ is a Borel measurable function.

For integration we are only interested in functions to $\overline{\mathbb{R}}$ so we use some simplified notations for these functions.

Definition 20.303. *Let* $\langle X,\mathcal{A}\rangle$ *be a measurable space,* $A\in\mathcal{A}$ *then a*

$$\mathcal{A},\mathcal{B}[\overline{\mathbb{R}}]\text{-measurable function } f\colon A\to\overline{\mathbb{R}}$$

is called a $\boldsymbol{\mathcal{A}}$***-measurable*** *function. The set of* $\mathcal{A}$*-measurable function graphs is noted as* $\mathcal{M}_A[X,\mathcal{A}]$ *hence*

$$\mathcal{M}_A\langle X,\mathcal{A}\rangle=\{f\in\overline{\mathbb{R}}^A|f\colon A\to\overline{\mathbb{R}} \text{ is } \mathcal{A},\mathcal{B}[\overline{\mathbb{R}}]\text{-measurable}\}$$

If $A=X$ *then we use the notation* $\mathcal{M}\langle X,\mathcal{A}\rangle$ *hence*

$$\mathcal{M}\langle X,\mathcal{A}\rangle=\{f\in\overline{\mathbb{R}}^X|f\colon X\to\overline{\mathbb{R}} \text{ is } \mathcal{A},\mathcal{B}[\overline{\mathbb{R}}]\text{-measurable}\}$$

The following theorem shows the relation between $\mathcal{A},\mathcal{B}[\mathbb{R}]$-measurable and $\mathcal{A},\mathcal{B}[\overline{\mathbb{R}}]$-measurable functions.

Theorem 20.304. *Let* $\langle X,\mathcal{A}\rangle$ *be a measurable space,* $A\in\mathcal{A}$ *then we have:*

1. *If* $f\colon A\to\mathbb{R}$ *is* $\mathcal{A},\mathcal{B}[\mathbb{R}]$*-measurable then* $f\colon A\to\overline{\mathbb{R}}$ *is* $\mathcal{A},\mathcal{B}[\overline{\mathbb{R}}]$*-measurable [in other words* f *is* $\mathcal{A}$*-measurable or* $f\in\mathcal{M}_A\langle X,\mathcal{A}\rangle$*.*
2. *If* $f\colon A\to\overline{\mathbb{R}}$ *is* $\mathcal{A},\mathcal{B}[\overline{\mathbb{R}}]$*-measurable and* $f(A)\subseteq\mathbb{R}$ *then* $f\colon A\to\mathbb{R}$ *is* $\mathcal{A},\mathcal{B}[\mathbb{R}]$*-measurable. In other words if* $f\in\mathcal{M}_A\langle X,\mathcal{A}\rangle$ *is such that* $f(A)\subseteq\mathbb{R}$ *then* $f\colon A\to\mathbb{R}$ *is* $\mathcal{A},\mathcal{B}[\mathbb{R}]$*-measurable.*

Proof.

1. Let $B\in\mathcal{B}[\overline{\mathbb{R}}]$ then by [theorem: 20.156] $B\bigcap\mathbb{R}\in\mathcal{B}[\mathbb{R}]$, hence, as f is $\mathcal{A},\mathcal{B}[\mathbb{R}]$-measurable, $f^{-1}(B\bigcap\mathbb{R})\in\mathcal{A}$. Further
$$f^{-1}\big(B\bigcap\mathbb{R}\big)\underset{\text{[theorem: 2.95]}}{=}f^{-1}(B)\bigcap f^{-1}(\mathbb{R})=f^{-1}(B)\bigcap A=f^{-1}(B)$$
so that $f^{-1}(B)\in\mathcal{A}$, which proves that $f\colon A\to\overline{\mathbb{R}}$ is $\mathcal{A},\mathcal{B}[\overline{\mathbb{R}}]$-measurable.
2. As $f(A)\subseteq\mathbb{R}$ it follows that $f\colon A\to\mathbb{R}$ is a well defined function. Let $B\in\mathcal{B}[\mathbb{R}]$ then as $B\bigcap\mathbb{R}=\mathbb{R}$ we have by [theorem: 20.156] that $B\in\mathcal{B}[\overline{\mathbb{R}}]$, hence, as $f\colon A\to\overline{\mathbb{R}}$ is $\mathcal{A},\mathcal{B}[\overline{\mathbb{R}}]$-measurable, $f^{-1}(B)\in\mathcal{A}$ which proves that $f\colon A\to\mathbb{R}$ is $\mathcal{A},\mathcal{B}[\mathbb{R}]$-measurable. □

For the cases $X=\mathbb{R}$ and $X=\mathbb{R}^n$ we have also some extra notations.

Definition 20.305. *Let $A \in \mathcal{B}[\mathbb{R}]$ then a $\mathcal{B}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$-measurable function $f: A \to \overline{\mathbb{R}}$ is by definition a Borel measurable function and the set of $\mathcal{B}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$-measurable function graphs is noted as $\mathcal{M}_A$ or $\mathcal{M}$ if $A = \mathbb{R}$, hence*

$$\mathcal{M}_A = \{ f \in \overline{\mathbb{R}}^A | f: A \to \overline{\mathbb{R}} \text{ is } \mathcal{B}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]\text{-measurable} \}$$

$$\mathcal{M} = \{ f \in \overline{\mathbb{R}}^{\mathbb{R}} | f: A \to \overline{\mathbb{R}} \text{ is } \mathcal{B}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]\text{-measurable} \}$$

Definition 20.306. *Let $A \in \mathcal{B}[\mathbb{R}^n]$ then a $\mathcal{B}[\mathbb{R}^n], \mathcal{B}[\overline{\mathbb{R}}]$-measurable function $f: A \to \overline{\mathbb{R}}$ is by definition a Borel measurable function and the set of $\mathcal{B}[\mathbb{R}^n], \mathcal{B}[\overline{\mathbb{R}}]$-measurable function graphs is noted as $\mathcal{M}_A^n$ or $\mathcal{M}^n$ if $A = \mathbb{R}^n$, hence*

$$\mathcal{M}_A^n = \{ f \in \overline{\mathbb{R}}^A | f: A \to \overline{\mathbb{R}} \text{ is } \mathcal{B}[\mathbb{R}^n], \mathcal{B}[\overline{\mathbb{R}}]\text{-measurable} \}$$

$$\mathcal{M}^n = \{ f \in \overline{\mathbb{R}}^{\mathbb{R}^n} | f: \mathbb{R}^n \to \overline{\mathbb{R}} \text{ is } \mathcal{B}[\mathbb{R}^n], \mathcal{B}[\overline{\mathbb{R}}]\text{-measurable} \}$$

Next we define Lebesgue measurable functions.

Definition 20.307. *Let $A \in \mathcal{L}[\mathbb{R}]$ then a $\mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$-measurable function $f: A \to \overline{\mathbb{R}}$ is called a Lebesgue measurable function and the set of $\mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$-measurable function is noted as $\mathcal{L}_A$ or $\mathcal{L}$ if $A = \mathbb{R}$ hence*

$$\mathcal{L}_A = \{ f \in \overline{\mathbb{R}}^A | f: A \to \overline{\mathbb{R}} \text{ is } \mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{R}]\text{-measurable} \}$$

$$\mathcal{L} = \{ f \in \overline{\mathbb{R}}^{\mathbb{R}} | f: \mathbb{R} \to \overline{\mathbb{R}} \text{ is } \mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{R}]\text{-measurable} \}$$

Definition 20.308. *Let $n \in \mathbb{N}$, $A \in \mathcal{L}[\mathbb{R}^n]$ then a $\mathcal{L}[\mathbb{R}^n], \mathcal{B}[\overline{\mathbb{R}}]$-measurable function $f: A \to \overline{\mathbb{R}}$ is called a Lebesgue measurable function and the set of $\mathcal{L}[\mathbb{R}^n], \mathcal{B}[\overline{\mathbb{R}}]$-measurable function is noted as $\mathcal{L}_A^n$ or $\mathcal{L}^n$ if $A = \mathbb{R}^n$ hence*

$$\mathcal{L}_A^n = \{ f \in \overline{\mathbb{R}}^A | f: A \to \overline{\mathbb{R}} \text{ is } \mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{R}]\text{-measurable} \}$$

$$\mathcal{L}^n = \{ f \in \overline{\mathbb{R}}^{\mathbb{R}^n} | f: \mathbb{R} \to \overline{\mathbb{R}} \text{ is } \mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{R}]\text{-measurable} \}$$

Note that Borel measurability implies Lebesgue measurability.

Theorem 20.309. *We have*

1. *If $A \in \mathcal{B}[\mathbb{R}]$ then a Borel measurable function $f: A \to \overline{\mathbb{R}}$ is Lebesgue measurable, in other words*

$$\mathcal{M}_A \subseteq \mathcal{L}_A$$

2. *Let $n \in \mathbb{N}$ and $A \in \mathcal{B}[\mathbb{R}^A]$ then a Borel measurable function $f: A \to \overline{\mathbb{R}}$ is Lebesgue measurable, in other words*

$$\mathcal{M}_A^n \subseteq \mathcal{L}_A^n$$

Proof.

1. Using [theorem: 20.261] $\mathcal{B}[\mathbb{R}] \subseteq \mathcal{L}[\mathbb{R}]$ hence $A \in \mathcal{L}[\mathbb{R}]$. As $f \in \mathcal{M}_A$ is $\mathcal{B}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$-measurable we have for $B \in \mathcal{B}[\overline{\mathbb{R}}]$ that $f^{-1}(B) \in \mathcal{B}[\mathbb{R}]$, hence $f^{-1}(B) \in \mathcal{L}[\mathbb{R}]$ so that $f: A \to \overline{\mathbb{R}}$ is $\mathcal{L}[\mathbb{R}], \mathcal{B}[\mathbb{R}]$-measurable, which proves that $f \in \mathcal{L}_A$. Hence

$$\mathcal{M}_A \subseteq \mathcal{L}_A$$

2. Using [theorem: 20.284] $\mathcal{B}[\mathbb{R}^n] \subseteq \mathcal{L}[\mathbb{R}^n]$ hence $A \in \mathcal{L}[\mathbb{R}^n]$. As $f \in \mathcal{M}_A^n$ is $\mathcal{B}[\mathbb{R}^n], \mathcal{B}[\overline{\mathbb{R}}]$-measurable we have for $B \in \mathcal{B}[\overline{\mathbb{R}}]$ that $f^{-1}(B) \in \mathcal{B}[\mathbb{R}^n]$, hence $f^{-1}(B) \in \mathcal{L}[\mathbb{R}^n]$ so that $f: A \to \overline{\mathbb{R}}$ is $\mathcal{L}[\mathbb{R}^n], \mathcal{B}[\mathbb{R}]$-measurable which proves that $f \in \mathfrak{L}^n[\mathbb{R}]$. Hence

$$\mathcal{M}_A^n \subseteq \mathcal{L}_A^n$$

□

In the case of generated σ-algebras there is a easier way to check if a function is measurable.

Theorem 20.310. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $A \in \mathcal{A}$, Y a set and $\mathcal{B} \subseteq \mathcal{P}(Y)$ so that $\langle Y, \sigma[\mathcal{B}] \rangle$ is a measurable space and $f: A \to Y$ a function then*

$$f \text{ is } \mathcal{A}, \sigma[\mathcal{B}]\text{-measurable} \Leftrightarrow \forall B \in \mathcal{B} \text{ we have } f^{-1}(B) \in \mathcal{A}$$

Proof.

⇒. If f is $\mathcal{A}, \sigma[\mathcal{B}]$-measurable then if $B \in \mathcal{B}$ we have, as $\mathcal{B} \subseteq \sigma[\mathcal{B}]$, that $B \in \sigma[\mathcal{B}]$, hence $f^{-1}(B) \in \mathcal{A}$.

⇐. Define $\mathcal{H}=\{B\in\mathcal{P}(Y)|f^{-1}(B)\in\mathcal{A}\}$ and prove that $\mathcal{H}$ is a σ-algebra containing $\mathcal{B}$. If $B\in\mathcal{B}$ then by the hypothesis $f^{-1}(B)\in\mathcal{A}$ so that $\mathcal{B}\in\mathcal{H}$, hence

$$\mathcal{B}\subseteq\mathcal{H} \tag{20.413}$$

As $f^{-1}(Y)=A\in\mathcal{A}$ we have also

$$Y\in\mathcal{H} \tag{20.414}$$

Let $B\in\mathcal{H}$ then $f^{-1}(B)\in\mathcal{A}$ so that using [theorems: 20.131, 20.135] we have also that $A\setminus f^{-1}(B)\in\mathcal{A}$. As $f^{-1}(Y\setminus B)\underset{\text{[theorem: 2.94(4]}}{=}A\setminus f^{-1}(B)$ it follows that $f^{-1}(Y\setminus B)\in\mathcal{A}$ from which it follows that $Y\setminus B\in\mathcal{H}$. Hence

$$\forall B\in\mathcal{H}\text{ we have that }Y\setminus B\in\mathcal{H} \tag{20.415}$$

Let $\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{H}$ then $\forall i\in\mathbb{N}\ f^{-1}(B_i)\in\mathcal{A}$. As $f^{-1}(\bigcup_{i\in\mathbb{N}}B_i)\underset{\text{[theorem: 2.136]}}{=}\bigcup_{i\in\mathbb{N}}f^{-1}(B_i)$ and $\mathcal{A}$ is a σ-algebra it follows that $f^{-1}(\bigcup_{i\in\mathbb{N}}B_i)\in\mathcal{A}$ so that $\bigcup_{i\in\mathbb{N}}B_i\in\mathcal{H}$. Hence

$$\forall\{B_i\}_{i\in\mathbb{N}}\subseteq\mathcal{H}\text{ we have that }\bigcup_{i\in\mathbb{N}}B_i\in\mathcal{H} \tag{20.416}$$

From [eqs: 20.413, 20.414, 20.415 and 20.416] it follows that $\mathcal{H}$ is a σ-algebra containing $\mathcal{B}$ hence, using [theorem: 20.141], it follows that $\sigma[\mathcal{B}]\subseteq\mathcal{H}$. So $\forall B\in\sigma[\mathcal{B}]$ we have $B\in\mathcal{H}$ meaning that $f^{-1}(B)\in\mathcal{A}$ which proves that f is $\mathcal{A},\sigma[\mathcal{B}]$-measurable. □

Most books on mesure theory give a alternative definition for $\mathcal{A}$-measurable functions based on the following definitions.

Definition 20.311. *Let X be a set then we define*

1. *If $f:X\to\overline{\mathbb{R}}$,$g:X\to\overline{\mathbb{R}}$ then given $x\in\overline{\mathbb{R}}$ we define*

$$\begin{aligned}
\{f<x\}&\underset{\text{def}}{=}f^{-1}([-\infty,x[)=\{t\in X|f(t)<x\}\\
\{f\leqslant x\}&\underset{\text{def}}{=}f^{-1}([-\infty,x])=\{t\in X|f(t)\leqslant x\}\\
\{f>x\}&\underset{\text{def}}{=}f^{-1}(]x,\infty])=\{t\in X|x<f(t)\}\\
\{f\geqslant x\}&\underset{\text{def}}{=}f^{-1}([x,\infty])=\{t\in X|x\leqslant f(t)\}\\
\{f=x\}&\underset{\text{def}}{=}f^{-1}(\{x\})=\{t\in X|x=f(t)\}\\
\{f\leqslant g\}&\underset{\text{def}}{=}\{x\in X|f(x)\leqslant g(x)\}\\
\{f<g\}&\underset{\text{def}}{=}\{x\in X|f(x)<g(x)\}\\
\{f=g\}&\underset{\text{def}}{=}\{x\in X|f(x)=g(x)\}
\end{aligned}$$

2. *If $f:X\to\mathbb{R}$, $g:X\to\mathbb{R}$ then given $x\in\mathbb{R}$ we define*

$$\begin{aligned}
\{f<x\}&\underset{\text{def}}{=}f^{-1}(]-\infty,x[)=\{t\in X|f(t)<x\}\\
\{f\leqslant x\}&\underset{\text{def}}{=}f^{-1}(]-\infty,x])=\{t\in X|f(t)\leqslant x\}\\
\{f>x\}&\underset{\text{def}}{=}f^{-1}(]x,\infty[)=\{t\in X|x<f(t)\}\\
\{f\geqslant x\}&\underset{\text{def}}{=}f^{-1}([x,\infty[)=\{t\in X|x\leqslant f(t)\}\\
\{f=x\}&\underset{\text{def}}{=}f^{-1}(\{x\})=\{t\in X|x=f(t)\}\\
\{f\leqslant g\}&\underset{\text{def}}{=}\{x\in X|f(x)\leqslant g(x)\}\\
\{f<g\}&\underset{\text{def}}{=}\{x\in X|f(x)<g(x)\}\\
\{f=g\}&\underset{\text{def}}{=}\{x\in X|f(x)=g(x)\}
\end{aligned}$$

Lemma 20.312. *Let X be a set, $f:X\to\overline{\mathbb{R}}$ and $x\in\mathbb{R}$ then*

1. $\{f\geqslant x\}=\bigcap_{n\in\mathbb{N}}\{f>x-\frac{1}{n}\}$
2. $X\setminus\{f\geqslant x\}=\{f<x\}$
3. $\{f\leqslant x\}=\bigcap_{n\in\mathbb{N}}\{f<x+\frac{1}{n}\}$
4. $X\setminus\{f\leqslant x\}=\{f>x\}$

Proof.

1. Let $n \in \mathbb{N}$ then if $t \in \{f \geqslant x\}$ we have that $x \leqslant f(t) \underset{x \in \mathbb{R}}{\Rightarrow} x - \frac{1}{n} < f(t) \Rightarrow t \in \left\{x - \frac{1}{n} < f\right\}$ proving

$$\{f \geqslant x\} \subseteq \bigcap_{n \in \mathbb{N}} \left\{f > x - \frac{1}{n}\right\} \tag{20.417}$$

If $t \in \bigcap_{n \in \mathbb{N}} \left\{f > x - \frac{1}{n}\right\}$ then $\forall n \in \mathbb{N}$ we have $x - \frac{1}{n} < f(t)$. Assume that $f(t) < x$ then by [theorem: 10.30] there exists a $n \in \mathbb{N}$ such that $f(t) + \frac{1}{n} < x \underset{x \in \mathbb{R}}{\Rightarrow} f(t) < x - \frac{1}{n}$ a contradiction, so we must have $x \leqslant f(t)$ or $t \in \{f \geqslant x\}$. So $\bigcap_{n \in \mathbb{N}} \left\{f > x - \frac{1}{n}\right\} \subseteq \{f \geqslant x\}$. Combining this with [eq: 20.417] proves

$$\{f \geqslant x\} = \bigcap_{n \in \mathbb{N}} \left\{f > x - \frac{1}{n}\right\}$$

2.

$$\begin{aligned} X \setminus \{f \geqslant x\} &= X \setminus f^{-1}([x, \infty]) \\ &= f^{-1}(\overline{\mathbb{R}}) \setminus f^{-1}(]x, \infty]) \\ &\underset{\text{[theorem: 2.94]}}{=} f^{-1}(\overline{\mathbb{R}} \setminus [x, \infty]) \\ &= f^{-1}([-\infty, x[) \\ &= \{f < x\} \end{aligned}$$

3. Let $n \in \mathbb{N}$ then if $t \in \{f \leqslant x\}$ we have that $f(t) \leqslant x \underset{x \in \mathbb{R}}{\Rightarrow} f(t) < x + \frac{1}{n}$ or $t \in \left\{f < x + \frac{1}{n}\right\}$. So

$$\{f \leqslant x\} \subseteq \bigcap_{n \in \mathbb{N}} \left\{f < x + \frac{1}{n}\right\} \tag{20.418}$$

Let $t \in \bigcap_{n \in \mathbb{N}} \left\{f < x + \frac{1}{n}\right\}$ then $\forall n \in \mathbb{N}$ we have $f(t) < x + \frac{1}{n}$. Assume that $f(t) > x$ then by [theorem: 10.30] there exists a $n \in \mathbb{N}$ such that $x + \frac{1}{n} < f(t)$ a contradiction hence $f(t) \leqslant x$ or $t \in \{f \leqslant x\}$. Combining this with [eq: 20.418] proves that

$$\{f \leqslant x\} = \bigcap_{n \in \mathbb{N}} \left\{f < x + \frac{1}{n}\right\}$$

4.

$$\begin{aligned} X \setminus \{f \leqslant x\} &= X \setminus f^{-1}([-\infty, x]) \\ &= f^{-1}(\overline{\mathbb{R}}) \setminus f^{-1}([-\infty, x]) \\ &\underset{\text{[theorem: 2.94]}}{=} f^{-1}(\overline{\mathbb{R}} \setminus [-\infty, x]) \\ &= f^{-1}(]x, \infty]) \\ &= \{x < f\} \end{aligned}$$

□

We are now ready to state the following equivalences for $\mathcal{A}$-measurability [which is used in many books about measure theory].

Theorem 20.313. *Let $\langle X, \mathcal{A} \rangle$ be a measurable set, $A \in \mathcal{A}$ and $f: A \to \overline{\mathbb{R}}$ then we have the following equivalences:*

1. *f is $\mathcal{A}$-measurable*
2. *$\forall x \in \mathbb{R}$ we have $\{f > x\} \in \mathcal{A}$*
3. *$\forall x \in \mathbb{R}$ we have $\{f \geqslant x\} \in \mathcal{A}$*
4. *$\forall x \in \mathbb{R}$ we have $\{f < x\} \in \mathcal{A}$*
5. *$\forall x \in \mathbb{R}$ we have $\{f \leqslant x\} \in \mathcal{A}$*

Proof.

1 ⇒ 2. Take $x \in \mathbb{R}$ then $]x, \infty] \in \sigma[\{]a, \infty] | a \in \mathbb{R}\}] \underset{\text{[theorem: 20.156]}}{=} \mathcal{B}[\overline{\mathbb{R}}]$ and we have, as f is $\mathcal{A}$-measurable, that $\{f > x\} = f^{-1}(]x, \infty]) \in \mathcal{A}$

2 ⇒ 1. Let $B \in \{]a, \infty] | a \in \mathbb{R}\}$ then $B =]x, \infty]$ where $x \in \mathbb{R}$. hence

$$f^{-1}(B) = f^{-1}(]x, \infty]) = \{f > x\} \in \mathcal{A}.$$

So using [theorem: 20.310] together with $\sigma[\{]a,\infty]|a\in\mathbb{R}\}]\underset{\text{[theorem: 20.156]}}{=}\mathcal{B}[\overline{\mathbb{R}}]$ it follows that f is $\mathcal{A},\mathcal{B}[\overline{\mathbb{R}}]$-measurable or in other words $\mathcal{A}$-measurable.

2 ⇒ 3. Let $x\in\mathbb{R}$ then using (2) we have $\forall n\in\mathbb{N}$ that $\left\{f>x-\frac{1}{n}\right\}\in\mathcal{A}$, hence by [theorem: 20.135] it follows that $\bigcap_{n\in\mathbb{N}}\left\{f>x-\frac{1}{n}\right\}\in\mathcal{A}$. Using [lemma: 20.312] $\{f\geqslant x\}=\bigcap_{n\in\mathbb{N}}\left\{f>x-\frac{1}{n}\right\}$ proving that $\{f\geqslant x\}\in\mathcal{A}$.

3 ⇒ 4. Let $x\in\mathbb{R}$ then $\{f<x\}\underset{\text{[lemma: 20.312]}}{=}A\setminus\{f\geqslant x\}\in\mathcal{A}$ [as $A,\{f\geqslant x\}\in\mathcal{A}$, together with [theorems: 20.130, 20.135]].

4 ⇒ 5. Let $x\in\mathbb{R}$ then by (4) we have that $\forall n\in\mathbb{N}$ that $\left\{f<x+\frac{1}{n}\right\}\in\mathcal{A}$, hence by [theorem: 20.135] it follows that $\bigcap_{n\in\mathbb{N}}\left\{f<x+\frac{1}{n}\right\}\in\mathcal{A}$. Using [lemma: 20.312] $\{f\leqslant x\}=\bigcap_{n\in\mathbb{N}_0}\left\{f<x+\frac{1}{n}\right\}$ proving that $\{f\leqslant x\}\in\mathcal{A}$

5 ⇒ 2. Let $x\in\mathbb{R}$ then $\{f>x\}\underset{\text{[lemma: 20.312]}}{=}A\setminus\{f\leqslant x\}\in\mathcal{A}$ [as $A\in\mathcal{A}$ together with [theorems: 20.130, 20.135]]. □

20.5.2 Measurable function properties

Theorem 20.314. *Let $\langle X,\mathcal{A}\rangle$, $\langle Y,\mathcal{B}\rangle$ be measurable spaces, $A,B\in\mathcal{A}$ with $B\subseteq A$ and $f\colon A\to Y$ a $\mathcal{A},\mathcal{B}$-measurable function then $f_{|B}\colon B\to Y$ is $\mathcal{A},\mathcal{B}$-measurable.*

Proof. Let $C\in\mathcal{B}$ then $(f_{|B})^{-1}(C)\underset{\text{[theorem: 2.86]}}{=}B\bigcap f^{-1}(C)\in\mathcal{A}$ [as $B,f^{-1}(C)\in\mathcal{A}$]. □

We show now how we can extend a measurable function to a measurable function.

Theorem 20.315. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space and $A\in\mathcal{A}$, $f\colon A\to\overline{\mathbb{R}}$ a function and*

$$f_{A\uparrow X}\colon X\to\overline{\mathbb{R}}\text{ defined by }f_{|A\uparrow X}(x)=\begin{cases}f(x) & \text{if } x\in A\\ 0 & \text{if } x\in X\setminus A\end{cases}$$

then we have

$$f_{A\uparrow X}\colon X\to\overline{\mathbb{R}}\text{ is }\mathcal{A}\text{-measurable}\Leftrightarrow f\colon A\to\overline{\mathbb{R}}\text{ is }\mathcal{A}\text{-measurable}$$

Proof.

⇒. As $\forall x\in A$ $f_{|A\uparrow X}(x)=f(x)$ it follows that $(f_{A\uparrow X})_{|A}=f$, further by the hypothesis $f_{|A\uparrow X}$ is $\mathcal{A}$-measurable. Applying then [theorem: 20.314] it follows that f is $\mathcal{A}$-measurable.

⇐. Let $B\in\mathcal{B}[\overline{\mathbb{R}}]$ then we have two possibilities:

$0\in B$. Let $t\in(f_{A\uparrow X})^{-1}(B)$ then $t\in X\wedge f_{A\uparrow X}(t)\in B$, as $t\in X$ we have either:

$t\in A$. then $f(t)=f_{A\uparrow X}(t)\in B$ so that $t\in f^{-1}(B)\subseteq f^{-1}(B)\bigcup(X\setminus A)$

$t\in X\setminus A$. then $t\in f^{-1}(B)\bigcup(X\setminus A)$

which proves that

$$(f_{A\uparrow X})^{-1}(B)\subseteq f^{-1}(B)\bigcup(X\setminus A)\tag{20.419}$$

Let $t\in f^{-1}(B)\bigcup(X\setminus A)$ then we have either:

$t\in A$. Then $t\in f^{-1}(B)$ so that $f_{A\uparrow X}(t)=f(t)\in B$ hence $t\in(f_{A\uparrow X})^{-1}(B)$

$t\in X\setminus A$. Then $f_{A\uparrow X}(t)=0\in B$ so that $t\in(f_{A\uparrow X})^{-1}(B)$

hence $f^{-1}(B)\bigcup(X\setminus A)\subseteq(f_{A\uparrow X})^{-1}(B)$ which combined with [eq: 20.419] proves

$$(f_{A\uparrow X})^{-1}(B)\subseteq f^{-1}(B)\bigcup(X\setminus A)$$

As f is $\mathcal{A}$-measurable $f^{-1}(B)\in\mathcal{A}$ and as $A\in\mathcal{A}$ $X\setminus A\in\mathcal{A}$ hence $f^{-1}(B)\bigcup(X\setminus A)\in\mathcal{A}$ which proves that

$$(f_{A\uparrow X})^{-1}(B)\in\mathcal{A}$$

$0\notin B$. Let $t\in(f_{A\uparrow X})^{-1}(B)$ then $f_{A\uparrow X}(t)\in B$. Assume that $t\in X\setminus A$ then $f_{A\uparrow X}(t)=0\notin B$ contradicting $f_{A\uparrow X}(t)\in B$, hence we must have that $t\in A$. So $f(t)=f_{A\uparrow X}(t)\in B$ from which it follows that $t\in f^{-1}(B)$. Hence

$$(f_{A\uparrow X})^{-1}(B)\subseteq f^{-1}(B)\tag{20.420}$$

If $t \in f^{-1}(B)$ then $t \in A$ and $f(t) \in B$, hence $f_{A\uparrow X}(t) = f(t) \in B$ so that $t \in (f_{A\uparrow X})^{-1}(B)$. Hence $f^{-1}(B) \subseteq (f_{A\uparrow X})^{-1}(B)$ which combined with [eq: 20.420] proves that

$$(f_{A\uparrow X})^{-1}(B) = f^{-1}(B)$$

As f is $\mathcal{A}$-measurable $f^{-1}(B)$ it follows that

$$(f_{A\uparrow X})^{-1}(B) \in \mathcal{A}$$

As in all cases $(f_{A\uparrow X})^{-1}(B) \in \mathcal{A}$ it follows that $f_{A\uparrow X}: X \to \overline{\mathbb{R}}$ is $\mathcal{A}$-measurable.

□

Theorem 20.316. *Let $\langle X, \mathcal{T}_X \rangle$, $\langle Y, \mathcal{T}_Y \rangle$ be topological spaces and $f: X \to Y$ a continuous function then f is $\mathcal{B}[X, \mathcal{T}_X], \mathcal{B}[Y, \mathcal{T}_Y]$-measurable. In other words continuous functions are Borel measurable.*

Proof. If $U \in \mathcal{T}_Y$ then as f is continuous we have $f^{-1}(U) \in \mathcal{T}_X \subseteq \mathcal{B}[X, \mathcal{T}_X]$ so that by [theorem: 20.310] we have that f is $\mathcal{B}[X, \mathcal{T}_X]$, $\mathcal{B}[Y, \mathcal{T}_Y]$-measurable. □

Theorem 20.317. *Let $\langle X, \mathcal{A} \rangle$, $\langle Y, \mathcal{B} \rangle, \langle Z, \mathcal{C} \rangle$ be measurable spaces, $A \in \mathcal{A}$, $f: A \to Y$ a $\mathcal{A}, \mathcal{B}$-measurable function, $B \in \mathcal{B}$ such that $f(A) \subseteq \mathcal{B}$ and $g: B \to Z$ a $\mathcal{B}, \mathcal{C}$-measurable function then*

$$g \circ f: A \to Z$$

is a $\mathcal{A}, \mathcal{C}$ measurable function.

Proof. Take $B \in \mathcal{C}$ then, as g is $\mathcal{B}, \mathcal{C}$-measurable, $g^{-1}(B) \in \mathcal{B}$. As f is $\mathcal{A}, \mathcal{B}$-measurable it follows that $f^{-1}(g^{-1}(B)) \in \mathcal{A}$. So, as $(g \circ f)^{-1}(B) \underset{\text{[theorem: 2.23]}}{=} f^{-1}(g^{-1}(B))$ it follows that $(g \circ f)^{-1}(B) \in \mathcal{A}$. Hence $g \circ f$ is $\mathcal{A}, \mathcal{C}$-measurable. □

Note that although the composition of measurable functions is measurable this is not the case for Lebesgue measurable functions. For example if $f: \mathbb{R} \to \overline{\mathbb{R}}$ and $g: \mathbb{R} \to \overline{\mathbb{R}}$ are Lebesgue measurable functions such that $f(\mathbb{R}) \subseteq \mathbb{R}$ then by [theorem: 20.304] $f: \mathbb{R} \to \mathbb{R}$ is $\mathcal{L}[\mathbb{R}]$, $\mathcal{B}[\overline{\mathbb{R}}]$-measurable and g is $\mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$–measurable but not $\mathcal{B}[\mathbb{R}], \mathcal{B}[\mathbb{R}]$-measurable, so we can not apply the previous theorem. If however g is $\mathcal{B}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$-measurable then $g \circ f$ is by the previous theorem $\mathcal{L}[\mathbb{R}], \mathcal{B}[\mathbb{R}]$-measurable hence Lebesgue measurable.

Theorem 20.318. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and let $f: X \to \overline{\mathbb{R}}$ and $g: X \to \overline{\mathbb{R}}$ be $\mathcal{A}$-measurable functions then we have:*

1. $\{f < g\} \in \mathcal{A}$
2. $\{f \leqslant g\} \in \mathcal{A}$
3. $\{f = g\} \in \mathcal{A}$
4. $\{f \neq g\} \in \mathcal{A}$
5. *If $x \in \overline{\mathbb{R}}$ then $\{f = x\} \in \mathcal{A}$*

Proof.

1. Let $t \in \{f < g\}$ then $f(t) < g(t)$. Using the density of the rational numbers in the extended real numbers [see theorem: 20.12] there exist a $q \in \mathbb{Q}$ such that $f(t) < q < g(t)$, so that $t \in \{f < q\}$ and $t \in \{g > q\}$, proving $t \in \{f < q\} \bigcap \{g > q\}$ Hence we have

$$\{f < g\} \subseteq \bigcup_{q \in \mathbb{Q}} \left(\{f < q\} \bigcap \{g > q\}\right) \tag{20.421}$$

If $t \in \bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g > q\})$ then there exist a $q \in Q$ such that $t \in \{f < q\} \bigcap \{g > q\}$, hence $f(t) < q \wedge g(t) < q \Rightarrow f(t) < g(t)$ proving that $t \in \{f < g\}$. Hence $\bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g > q\}) \subseteq \{f < g\}$ which combined with [eq: 20.421] proves that

$$\{f < g\} = \bigcup_{q \in \mathbb{Q}} \left(\{f < q\} \bigcap \{g > q\}\right)$$

Using [theorem: 20.313] we have that $\forall q \in Q \ \{f < q\}, \{g > q\} \in \mathcal{A} \Rightarrow \{f < q\} \bigcap \{g > q\} \in \mathcal{A}$. As $\mathbb{Q}$ is denumerable [see theorem: 10.5] it follows from [theorem: 20.138] that $\bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g > q\}) \in \mathcal{A}$ so that

$$\{f < g\} \in \mathcal{A}$$

2. We have

$$\begin{aligned} t \in (X \setminus \{g < f\}) &\Leftrightarrow t \in X \wedge \neg(g(t) < f(t)) \\ &\Leftrightarrow t \in X \wedge f(t) \leqslant g(t) \\ &\Leftrightarrow t \in \{f \leqslant g\} \end{aligned}$$

proving that $X \setminus \{g < f\} = \{f \leqslant g\}$. Using (1) we have $\{g < f\} \in \mathcal{A}$ hence $X \setminus \{g < f\} \in \mathcal{A}$ which proves that

$$\{f \leqslant g\} \in \mathcal{A}$$

3. We have

$$\begin{aligned} t \in (\{f \leqslant g\} \setminus \{f < g\}) &\Leftrightarrow t \in \{f \leqslant g\} \wedge t \notin \{f < g\} \\ &\Leftrightarrow t \in X \wedge f(t) \leqslant g(t) \wedge \neg(f(t) < g(t)) \\ &\Leftrightarrow t \in X \wedge f(t) \leqslant g(t) \wedge g(t) \leqslant f(t) \\ &\Leftrightarrow t \in X \wedge f(t) = g(t) \\ &\Leftrightarrow t \in \{f = g\} \end{aligned}$$

proving that $\{f = g\} = \{f \leqslant g\} \setminus \{f > g\} \in \mathcal{A}$ [using (1), (2) and [theorems: 20.131, 20.135]

4. We have

$$\begin{aligned} t \in X \setminus \{f = g\} &\Leftrightarrow t \in X \wedge \neg(f(t) = g(t)) \\ &\Leftrightarrow t \in X \wedge f(t) \neq g(t) \\ &\Leftrightarrow t \in \{f \neq g\} \end{aligned}$$

proving that $\{f \neq g\} = X \setminus \{f = g\} \in \mathcal{A}$ [using (3)]

5. Let $x \in \overline{\mathbb{R}}$ then as $\{x\}$ is closed [see theorem: 20.49], we have by 20.143] that $\{x\} \in \mathcal{B}[\overline{\mathbb{R}}]$ which as f is $\mathcal{A}$-measurable proves that $\{f = x\} = f^{-1}(\{x\}) \in \mathcal{A}$. □

Theorem 20.319. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $A \in \mathcal{A}$, $f: A \to \overline{\mathbb{R}}$ and $g: A \to \overline{\mathbb{R}}$ $\mathcal{A}$-measurable functions such that $f(A) \subseteq [0, \infty] \wedge g(A) \subseteq [0, \infty]$ then the function*

$$f + g: A \to \overline{\mathbb{R}} \text{ where } (f + g)(x) = f(x) + g(x)$$

is $\mathcal{A}$-measurable.

***Note* 20.320.** *The condition $f(A), g(A) \subseteq [0, \infty]$ is neccesary to ensure that $\forall a \in A$ $f(a) + f(a)$ is well defined.*

Proof. Let $x \in \mathbb{R}$. If $t \in \{f + g < x\}$ then $f(t) + g(t) < x$. As $0 \leqslant f(t) + g(t) < x \in \mathbb{R}$ $f(t), g(t) \in \mathbb{R}$ so that $f(t) < x - g(t)$. Using the density of $\mathbb{Q}$ in $\mathbb{R}$ [see theorem: 10.32] there exists a $q \in \mathbb{Q}$ such that $f(t) < q < x - g(t)$ hence

$$f(t) < q \wedge g(t) < x - q \Rightarrow t \in \{f < q\} \bigcap \{g < x - q\} \subseteq \bigcup_{q \in \mathbb{Q}} \left(\{f < q\} \bigcap \{g < x - q\}\right)$$

which proves that

$$\{f + g < x\} \subseteq \bigcup_{q \in \mathbb{Q}} \left(\{f < q\} \bigcap \{g < x - q\}\right) \tag{20.422}$$

If $t \in \bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g < x - q\})$ then there exists a $q \in \mathbb{Q}$ such that $t \in \{f < q\} \bigcap \{g < x - q\}$ hence $f(t) < q \wedge g(t) < x - q \Rightarrow f(t) + g(t) < x - q + q = x$ or $t \in \{f + g < x\}$. So $\bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g < x - q\}) \subseteq \{f + g < x\}$ which combined with [eq: 20.422] results in

$$\{f + g < x\} = \bigcup_{q \in \mathbb{Q}} \left(\{f < q\} \bigcap \{g < x - q\}\right)$$

Let $q \in \mathbb{Q}$ then as f, g is $\mathcal{A}$-measurable $\{f < q\}, \{g < x - q\} \in \mathcal{A} \Rightarrow \{f < q\} \bigcap \{g < x - q\} \in \mathcal{A}$, using [theorem: 20.138] and the fact that $\mathbb{Q}$ is countable [see theorem: 10.5] it follows that $\bigcup_{q \in \mathbb{Q}} (\{f < q\} \bigcap \{g < x - q\}) \in \mathcal{A}$ hence we have

$$\{f + g < x\} \in \mathcal{A}$$

As $x \in \mathbb{R}$ was choosen arbitrary it follows from the above that $f + g$ is $\mathcal{A}$-measurable. □

For the case where $f(A), g(A) \subseteq \mathbb{R}$ we can extend the above theorem.

Theorem 20.321. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $A\in\mathcal{A}$, $f:A\to\overline{\mathbb{R}}$ and $g:A\to\overline{\mathbb{R}}$ $\mathcal{A}$-measurable functions such that $f(A)\subseteq\mathbb{R}\wedge g(A)\subseteq\mathbb{R}$ then the function*

$$f+g:A\to\overline{\mathbb{R}} \text{ where } (f+g)(x)=f(x)+g(x)$$

is $\mathcal{A}$-measurable.

***Note* 20.322.** *The condition $f(A),g(A)\subseteq\mathbb{R}$ is neccesary to ensure that $\forall a\in A\ f(a)+f(a)$ is well defined.*

Proof. Let $x\in\mathbb{R}$. If $t\in\{f+g<x\}$ then $f(t)+g(t)<x$. As $f(t),g(t)\in\mathbb{R}$ we have $f(t)<x-g(t)$. Using the density of $\mathbb{Q}$ in $\mathbb{R}$ [see theorem: 10.32] there exists a $q\in\mathbb{Q}$ such that $f(t)<q<x-g(t)$ hence

$$f(t)<q\wedge g(t)<x-q\Rightarrow t\in\{f<q\}\bigcap\{g<x-q\}\subseteq\bigcup_{q\in\mathbb{Q}}\left(\{f<q\}\bigcap\{g<x-q\}\right)$$

which proves that

$$\{f+g<x\}\subseteq\bigcup_{q\in\mathbb{Q}}\left(\{f<q\}\bigcap\{g<x-q\}\right) \tag{20.423}$$

If $t\in\bigcup_{q\in\mathbb{Q}}(\{f<q\}\bigcap\{g<x-q\})$ then there exists a $q\in\mathbb{Q}$ such that $t\in\{f<q\}\bigcap\{g<x-q\}$ hence $f(t)<q\wedge g(t)<x-q\Rightarrow f(t)+g(t)<x-q+q=x$ or $t\in\{f+g<x\}$. So $\bigcup_{q\in\mathbb{Q}}(\{f<q\}\bigcap\{g<x-q\})\subseteq\{f+g<x\}$ which combined with [eq: 20.423] results in

$$\{f+g<x\}=\bigcup_{q\in\mathbb{Q}}\left(\{f<q\}\bigcap\{g<x-q\}\right)$$

Let $q\in\mathbb{Q}$ then as f,g is $\mathcal{A}$-measurable $\{f<q\},\{g<x-q\}\in\mathcal{A}\Rightarrow\{f<q\}\bigcap\{g<x-q\}\in\mathcal{A}$, using [theorem: 20.138] and the fact that $\mathbb{Q}$ is countable [see theorem: 10.5] it follows that $\bigcup_{q\in\mathbb{Q}}(\{f<q\}\bigcap\{g<x-q\})\in\mathcal{A}$ hence we have

$$\{f+g<x\}\in\mathcal{A}$$

As $x\in\mathbb{R}$ was choosen arbitrary it follows from the above that $f+g$ is $\mathcal{A}$-measurable. □

Next we extend the above two theorems to finite sums of $\mathcal{A}$-measurable functions

Definition 20.323. *Let X be a set, $n\in\mathbb{N}$ and $\{f_i\}_{i\in\{1,\dots,n\}}\subseteq\overline{\mathbb{R}}^X$ then we define*

$$\sum_{i=1}^{n}f_i:X\to\overline{\mathbb{R}} \text{ by } \left(\sum_{1=1}^{n}f_i\right)(x)=\sum_{i=1}^{n}f_i(x)$$

Corollary 20.324. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $A\in\mathcal{A}$, $n\in\mathbb{N}$ and $\{f_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{M}_A\langle X,\mathcal{A}\rangle$ such that $\forall i\in\mathbb{N}\ f_i(A)\subseteq[0,\infty]$ then $\sum_{i=1}^{n}f_i\in\mathcal{M}_A\langle X,\mathcal{A}\rangle$*

Proof. We use induction to prove this, so define

$$S=\left\{n\in\mathbb{N}|\text{If } \{f_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{M}_A\langle X,\mathcal{A}\rangle \text{ satisfies } \forall i\in\{1,\dots,n\}\ f_i(A)\subseteq[0,\infty] \text{ then } \sum_{i=1}^{n}f_i\in\mathcal{M}_A\langle X,\mathcal{A}\rangle\right\}$$

then we have:

- $\mathbf{1\in S}$. If $\{f_i\}_{i\in\{1\}}\subseteq\mathcal{M}_A\langle X,\mathcal{A}\rangle$ then $\forall x\in A\ (\sum_{i=1}^{1}f_i)(x)=\sum_{i=1}^{1}f_i(x)=f_1(x)$ which proves that $\sum_{i=1}^{1}f=f_1\in\mathcal{M}_A\langle X,\mathcal{A}\rangle$, hence $1\in S$.
- $\boldsymbol{n\in S\Rightarrow n+1\in\mathcal{S}}$. Let $\{f_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{M}_A\langle X,\mathcal{A}\rangle$ with $\forall i\in\{1,...,n\}\ f_i(A)\subseteq[0,\infty]$ then $\forall x\in A$ we have $(\sum_{i=1}^{n+1}f_i)(x)=\sum_{i=1}^{n+1}f_i(x)=f_{n+1}(x)+\sum_{i=1}^{n}f_i(x)=(f_{n+1}+\sum_{i=1}^{n}f_i)(x)$ so that

$$\sum_{i=1}^{n+1}f_i=f_{n+1}+\sum_{i=1}^{n}f_i \tag{20.424}$$

  As $n\in S$ we have $\sum_{i=1}^{n}f_i\in\mathcal{M}_A\langle X,\mathcal{A}\rangle$. As further $\forall x\in A\ (\sum_{i=1}^{n}f_i)(x)=\sum_{i=1}^{n}f_i(x)\in[0,\infty]$ so that $(\sum_{i=1}^{n}f_i)(A)\subseteq[0,\infty]$ we can apply [theorem: 20.319] to get

$$f_{n+1}+\sum_{i=1}^{n}f_i\in\mathcal{M}_A\langle X,\mathcal{A}\rangle$$

  which combined with [eq: 20.424] proves that $\sum_{i=1}^{n+1}f_i\in\mathcal{M}_A\langle X,\mathcal{A}\rangle$ so that $n+1\in S$. □

Theorem 20.325. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $A\in\mathcal{A}$, $n\in\mathbb{N}$ and $\{f_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{M}_A\langle X,\mathcal{A}\rangle$ such that $\forall i\in\{1,\dots,n\}\ f_i(A)\subseteq\mathbb{R}$ then $\sum_{i=1}^{n}f_i\in\mathcal{M}_A\langle X,\mathcal{A}\rangle$*

Proof. We use induction to prove this, so define

$$S=\left\{n\in\mathbb{N}|\text{If }\{f_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{M}_A\langle X,\mathcal{A}\rangle\text{ satisfies }\forall i\in\{1,\ldots,n\}\ f_i(A)\subseteq[0,\infty]\text{ then }\sum_{i=1}^{n}f_i\in\mathcal{M}_A\langle X,\mathcal{A}\rangle\right\}$$

then we have:

$1\in S$. If $\{f_i\}_{i\in\{1\}}\subseteq\mathcal{M}_A\langle X,\mathcal{A}\rangle$ then $\forall x\in A\ (\sum_{i=1}^{1}f_i)(x)=\sum_{i=1}^{1}f_i(x)=f_1(x)$ which proves that $\sum_{i=1}^{1}f=f_1\in\mathcal{M}_A\langle X,\mathcal{A}\rangle$, hence $1\in S$.

$n\in S\Rightarrow n+1\in S$. Let $\{f_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{M}_A\langle X,\mathcal{A}\rangle$ with $\forall i\in\{1,\ldots,n\}\ f_i(A)\subseteq\mathbb{R}$ then $\forall x\in A$ we have $(\sum_{i=1}^{n+1}f_i)(x)=\sum_{i=1}^{n+1}f_i(x)=f_{n+1}(x)+\sum_{i=1}^{n}f_i(x)=(f_{n+1}+\sum_{i=1}^{n}f_i)(x)$ so that

$$\sum_{i=1}^{n+1}f_i=f_{n+1}+\sum_{i=1}^{n}f_i \tag{20.425}$$

As $n\in S$ we have $\sum_{i=1}^{n}f_i\in\mathcal{M}_A\langle X,\mathcal{A}\rangle$. As further $\forall x\in A\ (\sum_{i=1}^{n}f_i)(x)=\sum_{i=1}^{n}f_i(x)\in\mathbb{R}$ so that $(\sum_{i=1}^{n}f_i)(A)\subseteq\mathbb{R}$ we can apply [theorem: 20.319] to get

$$f_{n+1}+\sum_{i=1}^{n}f_i\in\mathcal{M}_A\langle X,\mathcal{A}\rangle$$

which combined with [eq: 20.425] proves that $\sum_{i=1}^{n+1}f_i\in\mathcal{M}_A\langle X,\mathcal{A}\rangle$ so that $n+1\in S$. □

Having covered the case of sums of measurable functions we consider now the multiplication of a function by a scalar.

Theorem 20.326. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $A\in\mathcal{A}$, $\alpha\in\mathbb{R}$ and $f:A\to\overline{\mathbb{R}}$ a $\mathcal{A}$-measurable function then $a\cdot f:A\to\overline{\mathbb{R}}$ defined by $(\alpha\cdot f)(x)=\alpha\cdot f(x)$ is a $\mathcal{A}$-measurable function.*

Proof. For $\alpha\in\mathbb{R}$ we have 3 cases to consider.

$\alpha=0$. Then $\forall x\in A\ (\alpha\cdot f)(x)=0\cdot f(x)=0$ so that $\alpha\cdot f=C_0$, hence using theorem [theorem: 20.299] it follows that $\alpha\cdot f$ is $\mathcal{A}$-measurable.

$0<\alpha$. Let $x\in\mathbb{R}$ then

$$\begin{aligned}t\in\{\alpha\cdot f<x\}\ &\Leftrightarrow\ \alpha\cdot f(t)<x\\ &\Leftrightarrow\ f(t)<\frac{x}{\alpha}\\ &\Leftrightarrow\ t\in\left\{f<\frac{x}{\alpha}\right\}\end{aligned}$$

proving that $\{\alpha\cdot f<x\}=\left\{f<\frac{x}{\alpha}\right\}\in\mathcal{A}$ [as f is $\mathcal{A}$-measurable and [theorem: 20.313]]. Using [theorem: 20.313] we have then that $\alpha\cdot f$ is $\mathcal{A}$-measurable.

$\alpha<0$. Let $x\in\mathbb{R}$ then

$$\begin{aligned}t\in\{\alpha\cdot f<x\}\ &\Leftrightarrow\ \alpha\cdot f(t)<x\\ &\Leftrightarrow\ f(t)>\frac{x}{\alpha}\\ &\Leftrightarrow\ t\in\left\{f>\frac{x}{\alpha}\right\}\end{aligned}$$

proving that $\{\alpha\cdot f<x\}=\left\{f>\frac{x}{\alpha}\right\}\in\mathcal{A}$ [as f is $\mathcal{A}$-measurable and [theorem: 20.313]. Using [theorem: 20.313] we have then that $\alpha\cdot f$ is $\mathcal{A}$-measurable. □

Theorem 20.327. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $A\in\mathcal{A}$ then we have*

1. *If $f:A\to\overline{\mathbb{R}}$ and $g:A\to\overline{\mathbb{R}}$ be $\mathcal{A}$-measurable functions with $f(A),g(A)\subseteq\mathbb{R}$ then*

$$f-g:A\to\overline{\mathbb{R}}\text{ defined by }(f-g)(x)=f(x)-g(x)$$

is $\mathcal{A}$-measurable

2. *If $f:A\to\overline{\mathbb{R}}$ a $\mathcal{A}$-measurable functions with $f(A)\subseteq\mathbb{R}$ then*

$$f^2:A\to\overline{\mathbb{R}}\text{ defined by }f^2(x)=(f(x))^2$$

is $\mathcal{A}$-measurable.

3. *If $f:A\to\overline{\mathbb{R}}$ and $g:A\to\overline{\mathbb{R}}$ be $\mathcal{A}$-measurable functions with $f(A),g(A)\subseteq\mathbb{R}$ then*

$$f\cdot g:A\to\overline{\mathbb{R}}\text{ defined by }(f\cdot g)(x)=f(x)\cdot g(x)$$

is $\mathcal{A}$-measurable.

4. *If $f: A \to \overline{\mathbb{R}}$ and $g: A \to \overline{\mathbb{R}}$ be $\mathcal{A}$-measurable functions with $f(A), g(A) \subseteq \mathbb{R}$ then we have that*

$$D = \{x \in A | g(x) \neq 0\} \in \mathcal{A}$$

and

$$\frac{f}{g}: D \to \overline{\mathbb{R}} \text{ defined by } \frac{f}{g}(x) = \frac{f(x)}{g(x)}$$

is $\mathcal{A}$-measurable.

Proof.

1. As $\forall x \in A$

$$(f + (-1) \cdot g)(x) = f(x) + ((-1) \cdot g)(x) = f(x) + (-1) \cdot g(x) = f(x) - g(x) = (f - g)(x)$$

we have that $f + (-1) \cdot g = f - g$. Using [theorem: 20.326] $(-1) \cdot g$ is $\mathcal{A}$-measurable so that by [theorem: 20.321] $f - g = g + (-1) \cdot g$ is $\mathcal{A}$-measurable.

2. Let $x \in \mathbb{R}$ then we have either:

   $\boldsymbol{x \leqslant 0}$**.** If $t \in \{f^2 < x\}$ we have $0 < (f(t))^2 = f^2(t) < x \leqslant 0$ leading to the contradiction $0 < 0$. Hence $\{f^2 < x\} = \varnothing \in \mathcal{A}$.

   $\boldsymbol{0 < x}$**.** Then Then

$$\begin{aligned} t \in \{f^2 < x\} & \Leftrightarrow & f^2(t) < x \\ & \underset{\text{[theorem: 10.71]}}{\Leftrightarrow} & -\sqrt{x} < f(t) < \sqrt{x} \\ & \Leftrightarrow & t \in \{f > -\sqrt{x}\} \wedge t \in \{f < \sqrt{x}\} \\ & \Leftrightarrow & t \in \{f > -\sqrt{x}\} \bigcap \{f < \sqrt{x}\} \end{aligned}$$

   proving that $\{f^2 < x\} = \{f > -\sqrt{x}\} \bigcap \{f < \sqrt{x}\}$. As f is $\mathcal{A}$-measurable it follows from [theorem: 20.313] that $\{f > -\sqrt{x}\}$, $\{f < \sqrt{x}\} \in \mathcal{A} \Rightarrow \{f > -\sqrt{x}\} \bigcap \{f < \sqrt{x}\}$, Hence $\{f^2 < x\} \in \mathcal{A}$.

   As in all cases $\{f^2 < x\} \in \mathcal{A}$ we have by [theorem: 20.313] that f^2 is $\mathcal{A}$-measurable.

3. As f, g are $\mathcal{A}$-measurable we have by [theorem: 20.321] that $f + g$ is $\mathcal{A}$-measurable, Applying (2) we have that f^2, g^2 and $(f + g)^2$ are $\mathcal{A}$-measurable. Using (1) twice we have that $((f + g)^2 - f^2) - g^2$ is $\mathcal{A}$ measurable, by [theorem: 20.326] we have then that

$$\frac{1}{2} \cdot (((f + g)^2 - f^2) - g^2) \text{ is } \mathcal{A}\text{-measurable} \tag{20.426}$$

   Finally if $x \in A$ then

$$\begin{aligned} \left(\frac{1}{2} \cdot ((f + g)^2 - f^2 - g^2)\right)(x) &= \frac{1}{2} \cdot (((f(x) + g(x))^2 - f^2(x)) - g^2(x)) \\ &= \frac{1}{2} \cdot (f^2(x) + g^2(x) + 2 \cdot f(x) \cdot g(x) - f^2(x) - g^2(x)) \\ &= f(x) \cdot g(x) \\ &= (f \cdot g)(x) \end{aligned}$$

   which proves that that $f \cdot g = \frac{1}{2} \cdot (((f + g)^2 - f^2) - g^2)$ and by [eq: 20.426] that

$$f \cdot g \text{ is } \mathcal{A}\text{-measurable}$$

4. Let $D = \{x \in A | g(x) \neq 0\}$ then

$$\begin{aligned} t \in D &\Leftrightarrow t \in \{x \in A | g(x) \neq 0\} \\ &\Leftrightarrow t \in A \wedge (g(t) < 0 \vee 0 < g(t)) \\ &\Leftrightarrow (t \in A \wedge g(t) < 0) \vee (t \in \mathcal{A} \wedge 0 < g(t)) \\ &\Leftrightarrow t \in \{g < 0\} \vee t \in \{g > 0\} \\ &\Leftrightarrow t \in \{g < 0\} \bigcup \{g > 0\} \end{aligned}$$

   so that $D = \{g < 0\} \bigcup \{g > 0\}$. As g is $\mathcal{A}$-measurable we have by [theorem: 20.313] that $\{g < 0\}, \{g > 0\} \in \mathcal{A}$ proving that

$$D = \{x \in A | g(x) \neq 0\} = \{g < 0\} \bigcup \{g > 0\} \in \mathcal{A} \tag{20.427}$$

   Let $x \in \mathbb{R}$. If

$$t \in \left(\{t \in A | g(t) > 0\} \bigcap \{t \in A | f(t) < x \cdot g(t)\}\right) \bigcup \left(\{t \in A | g(t) < 0\} \bigcap \{t \in A | f(t) > x \cdot g(t)\}\right)$$

then we have either:

$\{t \in A | g(t) > 0\} \bigcap \{t \in A | f(t) < x \cdot g(t)\}$. then $t \in A \wedge g(t) > 0 \wedge f(t) < x \cdot g(t)$, so that $t \in A \wedge \frac{f(t)}{g(t)} < x$, proving as $g(t) \neq 0$, that $t \in \left\{t \in D | \frac{f(t)}{g(t)} < x\right\}$.

$\{t \in A | g(t) < 0\} \bigcap \{t \in A | f(t) > x \cdot g(t)\}$. then $t \in A \wedge g(t) < 0 \wedge f(t) > x \cdot g(t)$ so that $t \in A \wedge \frac{f(t)}{g(t)} < x$ proving as $g(t) \neq 0$, that $t \in \left\{t \in D | \frac{f(t)}{g(t)} < x\right\}$.

So we have

$$\left(\{t \in A | g(t) > 0\} \bigcap \{t \in A | f(t) < x \cdot g(t)\}\right) \bigcup \left(\{t \in A | g(t) < 0\} \bigcap \{t \in A | f(t) > x \cdot g(t)\}\right) \subseteq \left\{t \in D | \frac{f(t)}{g(t)} < x\right\} \tag{20.428}$$

For the opposite inclusion, let $t \in \left\{t \in D | \frac{f(t)}{g(t)} < x\right\}$ then $g(t) \neq 0$ and $\frac{f(t)}{g(t)} < x$ so we must consider the following cases for $g(t) \neq 0$:

$g(t) > 0$. then $f(t) < x \cdot g(t)$ or $t \in \{t \in A | g(t) > 0\} \bigcap \{t \in A | f(t) < x \cdot g(t)\}$

$g(t) < 0$. then $f(t) > x \cdot g(t)$ or $t \in \{t \in A | g(t) < 0\} \bigcap \{t \in A | f(t) > x \cdot g(t)\}$

proving that

$$\left\{t \in D | \frac{f(t)}{g(t)} < x\right\} \subseteq \left(\{t \in A | g(t) > 0\} \bigcap \{t \in A | f(t) < x \cdot g(t)\}\right) \bigcup \left(\{t \in A | g(t) < 0\} \bigcap \{t \in A | f(t) > x \cdot g(t)\}\right).$$

So combining this with 20.428 proves that

$$\left(\{t \in A | g(t) > 0\} \bigcap \{t \in A | f(t) < x \cdot g(t)\}\right) \bigcup \left(\{t \in A | g(t) < 0\} \bigcap \{t \in A | f(t) > x \cdot g(t)\}\right) = \left\{t \in D | \frac{f(t)}{g(t)} < x\right\} \tag{20.429}$$

Now as g is $\mathcal{A}$-measurable it follows from 20.313] that $\{g > 0\} = \{t \in A | g(t) > 0\} \in \mathcal{A}$, $\{g < 0\} = \{t \in A | g(t) < 0\} \in \mathcal{A}$. As f, g are $\mathcal{A}$-measurable and $x \cdot g$ is $\mathcal{A}$-measurable [using theorem: 20.326] it follows from 20.318] that $\{f > x \cdot g\} = \{t \in A | f(t) > x \cdot g(t)\}$, $\{f < x \cdot g\} = \{t \in A | f(t) < x \cdot g(t)\} \in \mathcal{A}$ which proves that $\left\{t \in D | \frac{f(t)}{g(t)} < x\right\} \in \mathcal{A}$. Using [theorem: 20.313] we get finally that

$$\frac{f}{g} : D \to \mathbb{R} \text{ is } \mathcal{A}\text{-measurable}$$

□

Theorem 20.328. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space, $A \in \mathcal{A}$, $f : A \to \overline{\mathbb{R}}$ a $\mathcal{A}$-measurable function and $g : A \to \overline{\mathbb{R}}$ a $\mathcal{A}$-measurable function then*

1. *$f \vee g : A \to [0, \infty]$ defined by $(f \vee g)(x) = \max(f(x), g(x))$ is a $\mathcal{A}$-measurable function.*
2. *$f \wedge g : A \to [0, \infty]$ defined by $(f \wedge g)(x) = \min(f(x), g(x))$ is a $\mathcal{A}$-measurable function.*

Proof.

1. Let $x \in \mathbb{R}$ then

$$\begin{aligned} t \in \{(f \vee g) < x\} &\Leftrightarrow (f \vee g)(t) < x \\ &\Leftrightarrow \max(f(t), g(t)) < x \\ &\Leftrightarrow f(t) < x \wedge g(t) < x \\ &\Leftrightarrow t \in \{f < x\} \wedge t \in \{g < x\} \\ &\Leftrightarrow t \in \{f < x\} \bigcap \{g < x\} \end{aligned}$$

which proves that

$$\{(f \vee g) < x\} = \{f < x\} \bigcap \{g < x\}$$

Using [theorem: 20.313] and the fact that f, g are $\mathcal{A}$-measurable it follows that $\{f < x\}, \{g < x\} \in \mathcal{A}$ from which it follows, using the above, that $\{(f \vee g) < x\} \in \mathcal{A}$. Applying [theorem: 20.313] again proves that $f \vee g$ is $\mathcal{A}$-measurable.

2. Let $x \in \mathbb{R}$ then

$$\begin{aligned} t \in \{(f \wedge g) > x\} &\Leftrightarrow (f \wedge g)(t) > x \\ &\Leftrightarrow \min(f(t), g(t)) > x \\ &\Leftrightarrow f(t) > x \wedge g(t) > x \\ &\Leftrightarrow t \in \{f > x\} \vee t \in \{g > x\} \\ &\Leftrightarrow t \in \{f > x\} \bigcap \{g > x\} \end{aligned}$$

which proves that

$$\{(f \vee g) > x\} = \{f > x\} \bigcap \{g > x\}$$

Using [theorem: 20.313] and the fact that f, g are $\mathcal{A}$-measurable it follows that $\{f > x\}, \{g > x\} \in \mathcal{A}$ from which it follows, using the above, that $\{(f \vee g) > x\} \in \mathcal{A}$. Applying [theorem: 20.313] again proves that $f > g$ is $\mathcal{A}$-measurable. □

Using mathematical induction we can extend the above to a finite family of $\mathcal{A}$-measurable functions.

Corollary 20.329. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space, $A \in \mathcal{A}$, $n \in \mathbb{N}$ and $\{f_i\}_{i \in \{1,\dots,n\}} \subseteq \mathcal{M}_A\langle X, \mathcal{A}\rangle$ then*

1. *$\bigvee_{i=1}^n f_i : A \to \overline{\mathbb{R}}$ defined by $(\bigvee_{i=1}^n f_i)(x) = \max(\{f_i(x) | i \in \{1,\dots,n\}\})$ is $\mathcal{A}$-measurble. In other words $\bigvee_{i=1}^n f_i \in \mathcal{M}_A\langle X, \mathcal{A}\rangle$*
2. *$\bigwedge_{i=1}^n f_i : A \to \overline{\mathbb{R}}$ defined by $(\bigwedge_{i=1}^n f_i)(x) = \min(\{f_i(x) | i \in \{1,\dots,n\}\})$ is $\mathcal{A}$-measurable. In other words $\bigwedge_{i=1}^n f_i \in \overline{\mathcal{M}_A\langle X, \mathcal{A}\rangle}$.*

Proof. We use recursion to prove this.

1. Let

$$S = \left\{ n \in \mathbb{N} | \text{If } \{f_i\}_{i \in \{1,\dots,n\}} \subseteq \overline{\mathcal{M}_A\langle X, \mathcal{A}\rangle} \text{ then } \bigvee_{i=1}^n f_i \in \mathcal{M}_A\langle X, \mathcal{A}\rangle \right\}$$

then we have:

$1 \in S$. If $\{f_i\}_{i \in \{1\}} \subseteq \overline{\mathcal{M}_A\langle X, \mathcal{A}\rangle}$ then $(\bigvee_{i=1}^1 f)(x) = \max(\{f_1(x)\}) = f_1(x)$ so that $\bigvee_{i=1}^1 f_i = f_1 \in \mathcal{M}_A\langle X, \mathcal{A}\rangle$, hence $1 \in S$

$n \in S \Rightarrow n+1 \in S$. Let $\{f_i\}_{i \in \{1,\dots,n+1\}} \subseteq \mathcal{M}_A\langle X, \mathcal{A}\rangle$ then $\forall x \in A$ we have

$$\begin{aligned}
\left(\bigvee_{i=1}^{n+1} f_i\right)(x) &= \max(\{f_i(x) | i \in \{1,\dots,n+1\}\}) \\
&\underset{\text{[corollary: 3.67]}}{=} \max(\max(\{f_i(x) | i \in \{1,\dots,n+1\}\}), f_{n+1}(x)) \\
&= \max\left(\left(\bigvee_{i=1}^{n} f_i\right)(x), f_{n+1}(x)\right) \\
&= \left(\left(\bigvee_{i=1}^{n} f_i\right) \vee f_{n+1}\right)(x)
\end{aligned}$$

so that

$$\bigvee_{i=1}^{n+1} f_i = \left(\bigvee_{i=1}^{n} f_i\right) \vee f_{n+1}$$

As $n \in S$ we have that $\bigvee_{i=1}^n f_i \in \overline{\mathcal{M}_A\langle X, \mathcal{A}\rangle}$, hence, using [theorem: 20.328] it follows that $(\bigvee_{i=1}^{n+1} f_i) \in \mathcal{M}_A\langle X, \mathcal{A}\rangle$, proving $n+1 \in \mathcal{S}$.

2. Let

$$S = \left\{ n \in \mathbb{N} | \text{If } \{f_i\}_{i \in \{1,\dots,n\}} \subseteq \mathcal{M}_A\langle X, \mathcal{A}\rangle \text{ then } \bigwedge_{i=1}^n f_i \in \overline{\mathcal{M}_A\langle X, \mathcal{A}\rangle} \right\}$$

then we have:

$1 \in S$. If $\{f_i\}_{i \in \{1\}} \subseteq \mathcal{M}_A\langle X, \mathcal{A}\rangle$ then $(\bigwedge_{i=1}^1 f)(x) = \min(\{f_1(x)\}) = f_1(x)$ so that $\bigwedge_{i=1}^1 f_i = f_1 \in \mathcal{M}_A\langle X, \mathcal{A}\rangle$, hence $1 \in S$

$n \in S \Rightarrow n+1 \in S$. Let $\{f_i\}_{i \in \{1,\dots,n+1\}} \subseteq \mathcal{M}_A\langle X, \mathcal{A}\rangle$ then $\forall x \in A$ we have

$$\begin{aligned}
\left(\bigwedge_{i=1}^{n+1} f_i\right)(x) &= \min(\{f_i(x) | i \in \{1,\dots,n+1\}\}) \\
&\underset{\text{[corollary: 3.67]}}{=} \min(\min(\{f_i(x) | i \in \{1,\dots,n+1\}\}), f_{n+1}(x)) \\
&= \min\left(\left(\bigwedge_{i=1}^{n} f_i\right)(x), f_{n+1}(x)\right) \\
&= \left(\left(\bigwedge_{i=1}^{n} f_i\right) \wedge f_{n+1}\right)(x)
\end{aligned}$$

so that

$$\bigwedge_{i=1}^{n+1} f_i = \left(\bigwedge_{i=1}^{n} f_i\right) \vee f_{n+1}$$

As $n \in S$ we have that $\bigwedge_{i=1}^{n} f_i \in \mathcal{M}_A\langle X, \mathcal{A}\rangle$, hence, using [theorem: 20.328] it follows that $(\bigwedge_{i=1}^{n+1} f_i) \in \mathcal{M}_A\langle X, \mathcal{A}\rangle$, proving $n+1 \in \mathcal{S}$. □

We now look at the measurability of the sup, inf, $\lim\limits_{n\to\infty}\sup$ and $\lim\limits_{n\to\infty}\inf$ and limit of a sequence of measurable functions.

Theorem 20.330. *Let $\langle X, \mathcal{A}\rangle$ be a measurable space, $k \in \mathbb{N}$, $A \in \mathcal{A}$ and $\{f_i\}_{i\in\{k,\ldots,\infty\}} \subseteq \mathcal{M}_A\langle X, \mathcal{A}\rangle$ a sequence of $\mathcal{A}$-measurable functions then we have:*

1. *The function*

$$\sup_{n\in\{k,\ldots,\infty\}} f_n : A \to \overline{\mathbb{R}} \text{ defined by } \left(\sup_{n\in\{k,\ldots,\infty\}} f_n\right)(x) = \sup\left(\{f_n(x) | n \in \{k,\ldots,\infty\}\}\right)$$

is $\mathcal{A}$-measurable. In other words $\sup\limits_{n\to\infty} f_n \in \mathcal{M}_A\langle X, \mathcal{A}\rangle$.

2. *The function*

$$\inf_{n\in\{k,\ldots,\infty\}} f_n : A \to \overline{\mathbb{R}} \text{ defined by } \left(\inf_{n\in\{k,\ldots,\infty\}} f_n\right)(x) = \inf\left(\{f_n(x) | n \in \{k,\ldots,\infty\}\}\right)$$

is $\mathcal{A}$-measurable. In other words $\inf\limits_{n\in\{k,\ldots,\infty\}} f_n \in \mathcal{M}_A\langle X, \mathcal{A}\rangle$.

3. *The function*

$$\liminf_{n\to\infty} f_n : A \to \overline{\mathbb{R}} \text{ defined by } \left(\liminf_{n\to\infty} f_n\right)(x) = \liminf_{n\to\infty} f_n(x)$$

is $\mathcal{A}$-measurable. In other words $\liminf\limits_{n\to\infty} f_n \in \mathcal{M}_A\langle X, \mathcal{A}\rangle$.

4. *The function*

$$\limsup_{n\to\infty} f_n : A \to \overline{\mathbb{R}} \text{ defined by } \left(\limsup_{n\to\infty} f_n\right)(x) = \limsup_{n\to\infty} f_n(x)$$

is $\mathcal{A}$-measurable. In other words $\limsup\limits_{n\to\infty} f_n \in \mathcal{M}_A\langle X, \mathcal{A}\rangle$.

5. *Let $D = \left\{x \in A | \left(\limsup\limits_{n\to\infty} f_n\right)(x) = \left(\liminf\limits_{n\to\infty} f_n\right)(x)\right\}$ [this is the set where by [definition: 20.69] $\operatorname{limit}\limits_{n\to\infty} f_n(x)$ exist so $D = \left\{x \in A | \lim\limits_{n\to\infty} f_n(x) \text{ exist}\right\}$] then*

$$D \in \mathcal{A}$$

and the function

$$\lim_{n\to\infty} f_n : D \to \overline{\mathbb{R}} \text{ defined by } \left(\lim_{n\to\infty} f_n\right)(x) = \lim_{n\to\infty} f_n(x)$$

is $\mathcal{A}$-measurable. In other words $\lim\limits_{n\to\infty} f_n \in \mathcal{M}_D[X, \mathcal{A}]$.

Proof.

1. Let $x \in \mathbb{R}$. If $t \in \left\{\left(\sup\limits_{k\in\{n,\ldots,\infty\}} f_n\right) \leqslant x\right\}$ then $\sup\left(\{f_n(t) | n \in \{k,\ldots,\infty\}\}\right) \leqslant x$. So $\forall n \in \{k,\ldots,\infty\}$ we have $f_n(t) \leqslant x \Rightarrow t \in \{f_n \leqslant x\}$. Hence

$$\left\{\left(\sup_{k\in\{n,\ldots,\infty\}} f_n\right) \leqslant x\right\} \subseteq \bigcap_{n\in\{k,\ldots,\infty\}} \{f_n \leqslant x\} \tag{20.430}$$

If $t \in \bigcap_{n\in\{k,\ldots,\infty\}} \{f_n \leqslant x\}$ then we have $\forall n \in \{k,\ldots,\infty\}$ that $t \in \{f_n \leqslant x\} \Rightarrow f_n(t) \leqslant x$. Assume that $x < \sup\left(\{f_n(t) | n \in \{k,\ldots,\infty\}\}\right)$ then there exists a $n \in \{k,\ldots,\infty\}$ such that $x < f_n(t) \leqslant x$ leading to the contradiction $x < x$. Hence $\sup(\{f_n(t) | n \in \{k,\ldots,\infty\}\}) \leqslant x$ or $t \in \left\{\left(\sup\limits_{n\in\{k,\ldots,\infty\}} f_n\right) \leqslant x\right\}$ proving that $\bigcap_{n\in\{k,\ldots,\infty\}} \{f_n \leqslant x\} \subseteq \left\{\left(\sup\limits_{n\in\{k,\ldots,\infty\}} f_n\right) \leqslant x\right\}$. Combining this with [eq: 20.430] gives

$$\left\{\left(\sup_{n\in\{k,\ldots,\infty\}} f_n\right) \leqslant x\right\} = \bigcap_{n\in\{k,\ldots,\infty\}} \{f_n \leqslant x\} \tag{20.431}$$

As $\forall n \in \{k,\ldots,n\}$ f_n is $\mathcal{A}$-measurable it follows from [theorem: 20.313] that $\{f_n \leqslant x\} \in \mathcal{A}$. Using [theorem: 20.135] we have that $\bigcap_{n\in\{k,\ldots,\infty\}} \{f_n \leqslant x\} \in \mathcal{A}$ or, using [eq: 20.431], that $\left\{\left(\sup_{n\in\{k,\ldots,\infty\}} f_n\right) \leqslant x\right\} \in \mathcal{A}$. Applying then [theorem: 20.313] proves that

$$\sup_{n\in\{k,\ldots,\infty\}} f_n \text{ is } \mathcal{A}\text{-measurable}$$

2. Let $x \in \mathbb{R}$. If $t \in \left\{\left(\inf_{n\in\{k,\ldots,\infty\}} f_n\right) < x\right\}$ then $\inf(\{f_n(t)|n \in \{k,\ldots,n\}\}) < x$. So $\exists n \in \{k,\ldots,\infty\}$ such that $f_n(t) < x \Rightarrow t \in \{f_n < x\}$. Hence

$$\left\{\left(\inf_{n\in\{k,\ldots,\infty\}} f_n\right) < x\right\} \subseteq \bigcup_{n\in\{k,\ldots,\infty\}} \{f_n < x\} \tag{20.432}$$

If $t \in \bigcup_{n\in\{k,\ldots,\infty\}} \{f_n < x\}$ then $\exists n \in \{k,\ldots,\infty\}$ such that $t \in \{f_n < x\} \Rightarrow f_n(t) < x$, hence $\inf(\{f_n(t)|n \in \{k,\ldots,n\}\}) \leqslant f_n(t) < x$, proving that $t \in \left\{\left(\inf_{n\in\{k,\ldots,\infty\}} f_n\right) < x\right\}$. So $\bigcup_{n\in\{k,\ldots,\infty\}} \{f_n < x\} \subseteq \left\{\left(\inf_{n\in\{k,\ldots,\infty\}} f_n\right) < x\right\}$ which by [eq: 20.432] gives

$$\left\{\left(\inf_{n\in\{k,\ldots,\infty\}} f_n\right) < x\right\} = \bigcup_{n\in\{k,\ldots,\infty\}} \{f_n < x\} \tag{20.433}$$

As $\forall n \in \{k,\ldots,n\}$ f_n is $\mathcal{A}$-measurable it follows from [theorem: 20.313] that $\{f_n < x\} \in \mathcal{A}$, applying then [definition: 20.132] proves that $\bigcup_{n\in\{k,\ldots,\infty\}} \{f_n < x\} \in \mathcal{A}$ or using [eq: 20.433] that $\left\{\left(\inf_{n\in\{k,\ldots,\infty\}} f_n\right) < x\right\} \in \mathcal{A}$. Using then [theorem: 20.313] it follows that

$$\inf_{n\in\{k,\ldots,\infty\}} f_n \text{ is } \mathcal{A}\text{-measurable}$$

3. Let $x \in A$ then

$$\begin{aligned}
\left(\liminf_{n\to\infty} f_n\right)(x) &= \liminf_{n\to\infty} f_n(x) \\
&\underset{\text{[definition: 20.55]}}{=} \sup\left(\{\inf(\{f_i|i \in \{l,\ldots,\infty\}\})|l \in \{k,\ldots,\infty\}\}\right) \\
&= \sup\left(\left\{\left(\inf_{i\in\{l,\ldots,\infty\}} f_i\right)(x)|l \in \{k,\ldots,\infty\}\right\}\right) \\
&= \sup_{l\in\{k,\ldots,\infty\}}\left(\left(\inf_{i\in\{l,\ldots,\infty\}} f_i\right)(x)\right) \\
&= \left(\sup_{l\in\{k,\ldots,\infty\}}\left(\inf_{i\in\{l,\ldots,\infty\}} f_i\right)\right)(x)
\end{aligned}$$

which proves that

$$\liminf_{n\to\infty} f_n = \sup_{l\in\{k,\ldots,\infty\}}\left(\inf_{i\in\{l,\ldots,\infty\}} f_i\right) \tag{20.434}$$

Now $\forall l \in \{k,\ldots,\infty\}$ we have by (2) that $\inf_{i\in\{l,\ldots,\infty\}} f_i$ is $\mathcal{A}$-measurable. So applying (1) it follows that $\sup_{l\in\{k,\ldots,\infty\}}\left(\inf_{i\in\{l,\ldots,\infty\}} f_i\right)$ is $\mathcal{A}$-measurable. Hence using [eq: 20.434] it follows that $\liminf_{n\to\infty} f_n$ is $\mathcal{A}$-measurable.

4. Let $x \in A$ then

$$\begin{aligned}
\left(\limsup_{n\to\infty} f_n\right)(x) &= \limsup_{n\to\infty} f_n(x) \\
&\underset{\text{[definition: 20.55]}}{=} \inf\left(\{\sup(\{f_i|i \in \{l,\ldots,\infty\}\})|l \in \{k,\ldots,\infty\}\}\right) \\
&= \inf\left(\left\{\left(\sup_{i\in\{l,\ldots,\infty\}} f_i\right)(x)|l \in \{k,\ldots,\infty\}\right\}\right) \\
&= \inf_{l\in\{k,\ldots,\infty\}}\left(\left(\sup_{i\in\{l,\ldots,\infty\}} f_i\right)(x)\right) \\
&= \left(\inf_{l\in\{k,\ldots,\infty\}}\left(\sup_{i\in\{l,\ldots,\infty\}} f_i\right)\right)(x)
\end{aligned}$$

which proves that

$$\limsup_{n\to\infty} f_n = \inf_{l\in\{k,\ldots,\infty\}}\left(\sup_{i\in\{l,\ldots,\infty\}} f_i\right) \tag{20.435}$$

Now $\forall l \in \{k, \ldots, \infty\}$ we have by (1) that $\sup_{i \in \{l, \ldots, \infty\}} f_i$ is $\mathcal{A}$-measurable. So applying (2) it follows that $\inf_{l \in \{k, \ldots, \infty\}} \left(\sup_{i \in \{l, \ldots, \infty\}} f_i \right)$ is $\mathcal{A}$-measurable. Hence using [eq: 20.434] it follows that $\limsup_{n \to \infty} f_n$ is $\mathcal{A}$-measurable.

5. From (3),(4) it follows that $\liminf_{n \to \infty} f_n$ and $\limsup_{n \to \infty} f_n$ are $\mathcal{A}$-measurable, combining this fact with [theorem: 20.318], proves that $\left\{ \limsup_{n \to \infty} f_n = \limsup_{n \to \infty} f_n \right\} \in \mathcal{A}$. As $D = \left\{ x \in A \middle| \left(\limsup_{n \to \infty} f_n \right)(x) = \left(\limsup_{n \to \infty} f_n \right)(x) \right\} = \left\{ \limsup_{n \to \infty} f_n = \limsup_{n \to \infty} f_n \right\}$ it follows that

$$D \in \mathcal{A} \tag{20.436}$$

If $x \in D$ then by definition $\limsup_{n \to \infty} f_n(x) = \limsup_{n \to \infty} f_n(x)$ so that by [definition: 20.69] $\lim_{n \to \infty} f_n(x)$ exist and $\lim_{n \to \infty} f_n(x) = \limsup_{n \to \infty} f_n(x) = \limsup_{n \to \infty} f_n(x)$. This allows us to define the function

$$\lim_{n \to \infty} f_n : D \to [0, \infty] \text{ defined by } \left(\lim_{n \to \infty} f_n \right)(x) = \lim_{n \to \infty} f_n(x) = \limsup_{n \to \infty} f_n(x) = \limsup_{n \to \infty} f_n(x) \tag{20.437}$$

Let $x \in \overline{\mathbb{R}}$ then

$$\begin{aligned} t \in D \bigcap \left\{ \left(\limsup_{n \to \infty} f_n \right) \leqslant x \right\} \quad & \Leftrightarrow \quad t \in D \wedge \left(\limsup_{n \to \infty} f_n \right)(t) \leqslant x \\ & \underset{\text{[eq: 20.437]}}{\Leftrightarrow} \quad t \in D \wedge \left(\lim_{n \to \infty} f_n \right)(t) \leqslant x \\ & \Leftrightarrow \quad t \in \left\{ \left(\lim_{n \to \infty} f_n \right) \leqslant x \right\} \end{aligned}$$

which proves that $\left\{ \left(\lim_{n \to \infty} f_n \right) \leqslant x \right\} = D \bigcap \left\{ \left(\limsup_{n \to \infty} f_n \right) \leqslant x \right\} \in \mathcal{A}$ [as $D \in \mathcal{A}$ and $\left\{ \left(\limsup_{n \to \infty} f_n \right) \leqslant x \right\} \in \mathcal{A}$]. Finally using [theorem: 20.313] it follows that

$$\lim_{n \to \infty} f_n : D \to \overline{\mathbb{R}} \text{ is } \mathcal{A}\text{-measurable}$$

□

Theorem 20.331. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\{f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{M}_A[X, \mathcal{A}]$ a sequence of $\mathcal{A}$-measurable functions then*

$$f_\infty : X \to \overline{\mathbb{R}} \text{ definied by } f_\infty(x) = \begin{cases} \lim_{n \to \infty} f_n(x) & \text{if } x \in D \\ 0 & \text{if } x \in X \setminus D \end{cases}$$

where

$$D = \left\{ x \in X \middle| \lim_{n \to \infty} f_n(x) \text{ exist} \right\} = \left\{ x \in X \middle| \left(\limsup_{n \to \infty} f_n \right)(x) = \left(\liminf_{n \to \infty} f_n \right)(x) \right\}$$

is

$$\mathcal{A}\text{-measurable}$$

Proof. Using the previous theorem [theorem: 20.330] it follows that

$$D \in \mathcal{A} \text{ and } \lim_{n \to \infty} f_n : D \to \overline{\mathbb{R}} \text{ defined by } \left(\lim_{n \to \infty} f_n \right)(x) = \lim_{n \to \infty} f_n(x) \text{ is } \mathcal{A}\text{-measurable}$$

From [theorem: 20.315] it follows that the function

$$f_\infty : X \to \overline{\mathbb{R}} \text{ definied by } f_\infty(x) = \begin{cases} \left(\lim_{n \to \infty} f_n \right)(x) = \lim_{n \to \infty} f_n(x) & \text{if } x \in D \\ 0 \text{ if } x \in X \setminus D \end{cases}$$

is $\mathcal{A}$-measurable. □

A very usefull $\mathcal{A}$-measurable function is the Charasteristic function.

Definition 20.332. *Let X be a set, $A \in \mathcal{P}(X)$ then the Charasteristic function $\mathcal{X}_A$ is defined by*

$$\mathcal{X}_A : X \to \overline{\mathbb{R}} \text{ where } \mathcal{X}_A(x) = \begin{cases} 1 & \text{if } x \in A \\ 0 & \text{if } x \in X \setminus A \end{cases}$$

Theorem 20.333. *Let $\langle X, \mathcal{A} \rangle$ be a measurable function and $A \in \mathcal{A}$ then $\mathcal{X}_A : A \to \overline{\mathbb{R}}$ is $\mathcal{A}$-measurable.*

Proof. Let $x \in X$ then we have two possibilities:

$1 \leqslant x$. If $t \in \{\mathcal{X}_A > x\}$ then $1 \leqslant x < \mathcal{X}_A(t) = \begin{cases} 1 \text{ if } t \in A \\ 0 \text{ if } t \in X \setminus A \end{cases} \leqslant 1$ leading to the contradiction $1 < 1$ hence we have $\{\mathcal{X}_A > x\} = \varnothing \in \mathcal{A}$

$0 \leqslant x < 1$. Let $t \in \{\mathcal{X}_A > x\}$ then $0 \leqslant x < \mathcal{X}_A(t)$. If $t \notin A$ then $0 \leqslant x < \mathcal{X}_A(t) = 0$ leding to the contradiction $0 < 0$ hence we must have that $t \in A$ which proves that

$$\{\mathcal{X}_A > x\} \subseteq A$$

If $t \in A$ then $\mathcal{X}_A(t) = 1 > x$ so that $t \in \{\mathcal{X}_A > x\}$ which proves that $A \subseteq \{\mathcal{X}_A > x\}$. Combining this with the above gives $\{\mathcal{X}_A > x\} = A \in \mathcal{A}$.

$x < 0$. If $t \in X$ then we have $\mathcal{X}_A(t) = \begin{cases} 1 \text{ if } t \in A \\ 0 \text{ if } t \in X \setminus A \end{cases} \geqslant 0 > x$ so that $X \subseteq \{\mathcal{X}_A > x\} \subseteq X$, hence $\{\mathcal{X}_A > x\} = X \in \mathcal{A}$.

As in all cases $\{\mathcal{X}_A > x\} \in \mathcal{A}$ it follows from [theorem: 20.313] that $\mathcal{X}_A$ is $\mathcal{A}$-measurable. □

20.5.3 Almost everywhere properties

Using the concept of μ-negligible sets [see definition: 20.286] we can introduce the term almost every where. A statement about elements in a set is said to be almost everywhere true if it is true for every element in the set except for a μ-negligible subset. The idea is that we can ignore the μ-negligible part because because it will not influence the final result.

Definition 20.334. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $P(x)$ a predicat then $P(x)$ is **μ-a.e. true** if $\{x \in X | \neg P(x)\} \in \mathcal{N}_\mu$. In other words using the definition of $\mathcal{N}_\mu$ [see definition: 20.286]*

$$P(x) \text{ is } \mu\text{-a.e. true or } P(x) \text{ holds } \mu\text{-a.e.}$$

if there exists a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$\{x \in X | \neg P(x)\} \subseteq N$$

Using the above we have the following examples.

Definition 20.335. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then we define:*

1. *If $f: X \to \overline{\mathbb{R}}$ and $g: X \to \overline{\mathbb{R}}$ are functions then $f = g$ μ-a.e. if there exist a $N \in \mathcal{A}$ with $\mu(A) = 0$ such that $\{x \in X | f(x) \neq g(x)\} \subseteq N$.*
2. *If $f: X \to \overline{\mathbb{R}}$ and $g: X \to \overline{\mathbb{R}}$ are functions then $f \leqslant g$ μ-a.e. if there exist a $N \in \mathcal{A}$ with $\mu(A) = 0$ such that $\{x \in X | g(x) < f(x)\} \subseteq N$.*
3. *If $f: X \to \overline{\mathbb{R}}$ and $g: X \to \overline{\mathbb{R}}$ are functions then $f < g$ μ-a.e. if there exist a $N \in \mathcal{A}$ with $\mu(A) = 0$ such that $\{x \in X | g(x) \leqslant f(x)\} \subseteq N$.*
4. *If $f: X \to \overline{\mathbb{R}}$ then $f = 0$ μ-a.e. if there exist a $N \in \mathcal{A}$ with $\mu(A) = 0$ such that $\{x \in X | f(x) \neq 0\}$*
5. *Let $\{f_n\}_{n \in \mathbb{N}} \subseteq \overline{\mathbb{R}}^X$ be a sequence of functions and $f: X \to \overline{\mathbb{R}}$ then $\lim_{n \to \infty} f_n = f$ μ-a.e. if there exist a $N \in \mathcal{A}$ with $\mu(A) = 0$ such that*

$$X \setminus \left\{ x \in X | \lim_{n \to \infty} f_n(x) \text{ exist and } \lim_{n \to \infty} f_n(x) f(x) \right\} \subseteq N$$

One way that almost every where equality is used is masking undesirable points from the domain of a function using a charasteristic function.

Theorem 20.336. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $A \in \mathcal{N}_\mu$ [in other words there exist a $N \in \mathcal{S}$ with $\mu(N) = 0$ such that $A \subseteq N$] and $f: X \to \overline{\mathbb{R}}$ then for $\mathcal{X}_{X \setminus A} \cdot f: X \to \overline{\mathbb{R}}$ we have that*

$$\mathcal{X}_{X \setminus A} \cdot f = f \ \mu\text{-a.e.}$$

Proof. Let $x \in \{x \in X | (\mathcal{X}_{X \setminus A} \cdot f)(x) \neq f(x)\}$ then $x \in X$ and $\mathcal{X}_{X \setminus A}(x) \cdot f(x) \neq f(x)$. Assume that $x \notin A$ then $x \in X \setminus A$ so that $f(x) \neq \mathcal{X}_{X \setminus A}(x) \cdot f(x) = 1 \cdot f(x) = f(x)$ which is a contradiction. Hence the assumption is false and we must have that $x \in A$, which proves that

$$\{x \in X | (\mathcal{X}_{X \setminus A} \cdot f)(x) \neq f(x)\} \subseteq A \subseteq N$$

So by definition

$$\mathcal{X}_{X \setminus A} \cdot f = f \ \mu\text{-a.e.}$$

□

Theorem 20.337. *Let $\langle X, \mathcal{A}, \mu\rangle$ be a measure space together with functions*

$$\begin{aligned} f&: X \to \overline{\mathbb{R}} \\ g&: X \to \overline{\mathbb{R}} \\ h&: X \to \overline{\mathbb{R}} \\ k&: X \to \overline{\mathbb{R}} \end{aligned}$$

then we have:

1. *If $f = g$ μ-a.e. and $g = h$ μ-a.e. then $f = h$ μ-a.e.*
2. *If $f \leqslant g$ μ-a.e. and $g \leqslant h$ μ-a.e. then $f \leqslant h$ μ-a.e.*
3. *If $f \leqslant g$ μ-a.e. and $g \leqslant f$ μ-a.e. then $f = g$ μ-a.e.*
4. *If $\alpha \in \mathbb{R}\setminus\{0\}$ then if $f = g$ μ-a.e. then $\alpha \cdot f = \alpha \cdot g$ μ-a.e.*
5. *If $\forall x \in X$ $(f(x), g(x)), (h(x), k(x)) \in \overline{\mathbb{R}}\setminus\{(\infty, -\infty), \{-\infty, \infty\}\}$ [in other words $\forall x \in X$ $f(x) + g(x)$ and $h(x) + k(x)$ is well defined], $f = h$ μ-a.e. and $g = k$ μ-a.e. then $f + g = h + k$ μ-a.e.*

Proof.

1. As $f = g$ μ-a.e. and $g = h$ μ-a.e. there exist $N_1, N_2 \in \mathcal{A}$ with $\mu(N_1) = 0 = \mu(N_2)$ such that $\{x \in X \,|\, f(x) \neq g(x)\} \subseteq N_1$ and $\{x \in X \,|\, g(x) \neq h(x)\} \subseteq N_2$. Let $x \in \{x \in X \,|\, f(x) \neq h(x)\}$ then $f(x) \neq g(x) \vee g(x) \neq h(x)$ [for if $f(x) = g(x) \wedge g(x) = h(x)$ then $f(x) = h(x)$] so that $x \in \{x \in X \,|\, f(x) \neq g(x)\} \bigcup \{x \in X \,|\, g(x) \neq h(x)\}$ proving
$$\{x \in X \,|\, f(x) \neq h(x)\} \subseteq \{x \in X \,|\, f(x) \neq g(x)\} \bigcup \{x \in X \,|\, g(x) \neq h(x)\} \subseteq N_1 \bigcup N_2 \in \mathcal{A}$$
which, as $\mu(N_1 \bigcup N_2) \leqslant \mu(N_1) + \mu(N_2) = 0$, proves that
$$f = h \ \mu\text{-a.e.}$$
2. As $f \leqslant g$ μ-a.e. and $g \leqslant h$ μ-a.e. there exist $N_1, N_2 \in \mathcal{A}$ with $\mu(N_1) = 0 = \mu(N_2)$ such that $\{x \in X \,|\, g(x) < f(x)\} \subseteq N_1$ and $\{x \in X \,|\, h(x) < g(x)\} \subseteq N_2$. Let $x \in \{x \in X \,|\, h(x) < f(x)\}$ then we have $g(x) < f(x) \vee h(x) < g(x)$ [for if $f(x) \leqslant g(x) \wedge g(x) \leqslant h(x)$ we have $f(x) \leqslant h(x)$ contradicting $h(x) < f(x)$] so that $x \in \{x \in X \,|\, g(x) < f(x)\} \bigcup \{x \in X \,|\, h(x) < g(x)\}$ proving
$$\{x \in X \,|\, h(x) < f(x)\} \subseteq \{x \in X \,|\, g(x) < f(x)\} \bigcup \{x \in X \,|\, h(x) < g(x)\} \subseteq N_1 \bigcup N_2 \in \mathcal{A}$$
which as $\mu(N_1 \bigcup N_2) \leqslant \mu(N_1) + \mu(N_2) = 0$, proves that
$$f \leqslant h \ \mu\text{-a.e.}$$
3. As $f \leqslant g$ μ-a.e. and $g \leqslant f$ μ-a.e. there exist $N_1, N_2 \in \mathcal{A}$ with $\mu(N_1) = 0 = \mu(N_2)$ such that $\{x \in X \,|\, g(x) < f(x)\} \subseteq N_1$ and $\{x \in X \,|\, f(x) < g(x)\} \subseteq N_2$. Let $x \in \{x \in X \,|\, f(x) \neq g(x)\}$ then $f(x) \neq g(x)$ hence $f(x) < g(x) \vee g(x) < f(x)$ so that $x \in \{x \in X \,|\, g(x) < f(x)\} \bigcup \{x \in X \,|\, f(x) < g(x)\}$ proving that
$$\{x \in X \,|\, f(x) \neq g(x)\} \subseteq \{x \in X \,|\, g(x) < f(x)\} \bigcup \{x \in X \,|\, f(x) < g(x)\} \subseteq N_1 \bigcup N_2 \in \mathcal{A}$$
which as $\mu(N_1 \bigcup N_2) \leqslant \mu(N_1) + \mu(N_2) = 0$, proves that
$$f = g \ \mu\text{-a.e.}$$
4. As $f = g$ μ-a.e. there exists a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X \,|\, f(x) \neq g(x)\} \subseteq N$. Let now $x \in \{x \in X \,|\, \alpha \cdot f(x) \neq \alpha \cdot g(x)\}$ then $\alpha \cdot f(x) \neq \alpha \cdot g(x) \underset{\alpha \neq 0}{\Rightarrow} f(x) \neq g(x)$ proving that $\{x \in X \,|\, \alpha \cdot f(x) \neq \alpha \cdot g(x)\} \subseteq \{x \in X \,|\, f(x) \neq g(x)\} \subseteq N$. So
$$\alpha \cdot f \neq \alpha \cdot g \ \mu\text{-a.e.}$$
5. As $f = h$ μ-a.e. and $g = k$ μ-a.e. there exists $N_1, N_2 \in \mathcal{A}$ with $\mu(N_1) = 0 = \mu(N_2)$ such that $\{x \in X \,|\, f(x) \neq h(x)\} \subseteq N_1$ and $\{x \in X \,|\, g(x) \neq k(x)\} \subseteq N_2$. Let $x \in \{x \in X \,|\, f(x) + g(x) \neq h(x) + k(x)\}$ then $f(x) \neq h(x) \vee g(x) \neq k(x)$ [for if $f(x) = h(x) \wedge g(x) = k(x) \Rightarrow f(x) + g(x) = h(x) + k(x)$] so that $x \in \{x \in X \,|\, f(x) \neq h(x)\} \bigcup \{x \in X \,|\, g(x) \neq k(x)\}$. Hence
$$\{x \in X \,|\, f(x) + g(x) \neq h(x) + k(x)\} \subseteq N_1 \bigcup N_2 \in \mathcal{A}$$
As $\mu(N_1 \bigcup N_2) \leqslant \mu(N_1) + \mu(N_2) = 0$ it follows that $f + g = h + k$ μ-a.e. □

Theorem 20.338. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space and $f:X\to\overline{\mathbb{R}}$ $g:X\to\overline{\mathbb{R}}$ with $f(X),g(X)\subseteq\mathbb{R}$ then*

$$f=g\ \mu\text{-a.e.}\Leftrightarrow f-g=0\ \mu\text{-a.e.}$$

Proof. Note that

$$\begin{aligned}x\in\{x\in X\,|\,f(x)\neq g(x)\}\ &\Leftrightarrow\ x\in X\wedge f(x)\neq g(x)\\ &\Leftrightarrow\ x\in X\wedge(f-g)(x)\neq 0\\ &\Leftrightarrow\ x\in\{x\in X\,|\,(f-g)(x)\neq 0\}\end{aligned}$$

proving that $\{x\in X\,|\,f(x)\neq g(x)\}=\{x\in X\,|\,(f-g)(x)\neq 0\}$, from which we have trivially that

$$f=g\ \mu\text{-a.e.}\Leftrightarrow f-g=0\ \mu\text{-a.e.}$$

□

The following theorem shows that for a complete measure a function that is a.e. equal to a measurable function is also mesurable.

Theorem 20.339. *Let $\langle X,\mathcal{A},\mu\rangle$ be a* ***complete*** *measure space [see theorem: 20.288], $f:X\to\overline{\mathbb{R}}$ a $\mathcal{A}$-measurable function and $g:X\to\overline{\mathbb{R}}$ satisfies $f=g$ μ-a.e. then g is $\mathcal{A}$-measurable.*

Proof. As $f=g$ μ-a.e. there exists a $N\in\mathcal{A}$ with $\mu(N)=0$ and $\{x\in X\,|\,f(x)\neq g(x)\}\subseteq N$. So

$$x\in X\setminus N\Rightarrow f(x)=g(x)\tag{20.438}$$

. Let $t\in\mathbb{R}$ then

$$\begin{aligned}x\in\{g\leqslant t\}\quad &\Leftrightarrow\quad x\in X\wedge g(x)\leqslant t\\ &\Leftrightarrow\quad (x\in X\setminus N\vee x\in N)\wedge g(x)\leqslant t\\ &\Leftrightarrow\quad (x\in X\setminus N\wedge g(x)\leqslant t)\vee(x\in N\wedge g(x)\leqslant t)\\ &\overset{\text{[eq: 20.438]}}{\Leftrightarrow}\quad (x\in X\setminus N\wedge f(x)\leqslant t)\vee(x\in N\wedge g(x)\leqslant t)\\ &\Leftrightarrow\quad x\in\left((X\setminus N)\bigcap\{f\leqslant t\}\right)\vee x\in\left(N\bigcap\{g\leqslant t\}\right)\\ &\Leftrightarrow\quad x\in\left(X\setminus N\bigcap\{f\leqslant t\}\right)\bigcup\left(N\bigcap\{g\leqslant t\}\right)\end{aligned}$$

which proves that

$$\{g\leqslant t\}=\left(X\setminus N\bigcap\{f\leqslant t\}\right)\bigcup\left(N\bigcap\{g\leqslant t\}\right)\tag{20.439}$$

Given that f is $\mathcal{A}$-measurable we have by [theorem: 20.313] that $\{f\leqslant t\}\in\mathcal{A}$, further as $N\in\mathcal{A}$ we have also $X\setminus N\in\mathcal{A}$. Finally as $N\bigcap\{g\leqslant t\}\subseteq N$ and $\mu(N)=0$ it follows from the fact μ is complete that $N\bigcap\{g\leqslant t\}\in\mathcal{A}$. So $(X\setminus N\bigcap\{f\leqslant t\})\bigcup(N\bigcap\{g\leqslant t\})\in\mathcal{A}$ which by [eq: 20.439] proves that $\{g\leqslant t\}\in\mathcal{A}$. Applying then [theorem: 20.313] results in

$$g\text{ is }\mathcal{A}\text{-measurable}$$

□

Theorem 20.340. *Let $\langle X,\mathcal{A},\mu\rangle$ be a* ***complete measure space*** *and $\{f_n\}_{n\in\mathbb{N}}\subseteq\mathcal{M}_A[X,\mathcal{A}]$ a sequence of $\mathcal{A}$-measurable functions and $f:X\to\overline{\mathbb{R}}$ a function such that $\lim\limits_{n\to\infty}f_n=f$ μ-a.e. then f is $\mathcal{A}$-measurable.*

Proof. Let $D=\left\{x\in X\,|\,\lim\limits_{n\to\infty}f_n(x)\text{ exist}\right\}$ then we have by [theorem: 20.331] that

$$f_\infty:X\to\overline{\mathbb{R}}\text{ where }f_\infty(x)=\begin{cases}\lim\limits_{n\to\infty}f_n(x)\text{ if }x\in D\\ 0\text{ if }x\in X\setminus D\end{cases}\text{ is }\mathcal{A}\text{-measurable}$$

As $\lim\limits_{n\to\infty}f_n=f$ μ-a.e. there exist a $N\in\mathcal{A}$ with $\mu(N)=0$ such that

$$X\setminus\left\{x\in X\,|\,\left\{\lim_{n\to\infty}f_n(x)\text{ exist and }\lim_{n\to\infty}f_n(x)=f(x)\right\}\right\}\subseteq N$$

If $x\in\left\{x\in X\,|\,\left\{\lim\limits_{n\to\infty}f_n(x)\text{ exist and }\lim\limits_{n\to\infty}f_n(x)=f(x)\right\}\right\}$ then $\lim\limits_{n\to\infty}f_n(x)$ exists and $\lim\limits_{n\to\infty}f_n(x)=f(x)$ so that $x\in D$ and $f(x)=\lim\limits_{n\to\infty}f_n(x)=f_\infty(x)$ which proves that $x\in\{x\in X\,|\,f(x)=f_\infty(x)\}$. Hence

$$\left\{x\in X\,|\,\left\{\lim_{n\to\infty}f_n(x)\text{ exist and }\lim_{n\to\infty}f_n(x)=f(x)\right\}\right\}\subseteq\{x\in X\,|\,f(x)=f_\infty(x)\}$$

so that

$$X\setminus\{x\in X\,|\,f(x)=f_\infty(x)\}\subseteq X\setminus\left\{x\in X\,|\,\left\{\lim_{n\to\infty}f_n(x)\text{ exist and }\lim_{n\to\infty}f_n(x)=f(x)\right\}\right\}\subseteq N$$

from which it follows that $f = f_\infty$ μ-a.e.. Using then the previous theorem [theorem: 20.339] we must conclude that

$$f \text{ is } \mathcal{A}\text{-measurable.}$$ □

20.6 The measure integral

We will build up the definition of the measure integral in fases:

1. We define a integral over measurable functions whose image is finite the so called **simple functions**.
2. Extend this integral to non negative measurable functions.
3. Extend the integral of non negative measurable function to general measurable functions.
4. Finally extend the integral to complex valued functions.

20.6.1 Integral of simple functions

Definition 20.341. *Let X be a set then a function $f: X \to \overline{\mathbb{R}}$ is a **simple function** if $f(X)$ is a **finite set** and $\boldsymbol{f(X) \subseteq \mathbb{R}}$. The set of all simple function graphs is noted as $\mathcal{S}[X]$ so*

$$\mathcal{S}[X] = \{f \in \overline{\mathbb{R}}^X \,|\, f(X) \subseteq \mathbb{R} \text{ and } f(X) \text{ is a finite set}\}$$

We have the following alternative definition of a simple function.

Theorem 20.342. *Let X be a set then for a function $f: X \to \overline{\mathbb{R}}$ with $f(X) \subseteq \mathbb{R}$ we have the following equivalences:*

1. *f is a simple function [in other words $f \in \mathcal{S}[X]$*
2. *There exist a $n \in \mathbb{N}$ and a bijection $\beta: \{1, \ldots, n\} \to f(X)$ such that for $\{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{P}(X)$ defined by $A_i = f^{-1}(\{\beta(i)\})$ we have:*
   a. *$\{A_i\}_{i \in \{1, \ldots, n\}}$ is pairwise disjoint*
   b. *$X = \bigsqcup_{i \in \{1, \ldots, n\}} A_i$*
   c. *$f = \sum_{i=1}^n \beta(i) \cdot \mathcal{X}_{A_i}$*
3. *There exist a $n \in \mathbb{N}$ and a pairwise disjoint $\{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{P}(X)$ and $\{f_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R}$ such that*

$$f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{A_i}$$

Proof.

1 ⇒ 2. As f is a simple function $f(X)$ is finite, hence there exists a $n \in \mathbb{N}$ and a bijection

$$\beta: \{1, \ldots, n\} \to f(X)$$

Define $\{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{P}(X)$ by $A_i = f^{-1}(\{b(i)\})$. Let $i, j \in \{1, \ldots, n\}$ with $i \neq j$ then

$$\begin{aligned} A_j \bigcap A_j &= f^{-1}(\{\beta(i)\}) \bigcap f^{-1}(\{\beta(j)\}) \\ &\underset{\text{[theorem: 2.95]}}{=} f^{-1}\big(\{\beta(i)\} \bigcap \{\beta(j)\}\big) \\ &\underset{\beta(i) \neq \beta(j) \Rightarrow \{\beta(i)\} \bigcap \{\beta(j)\} = \varnothing}{=} f^{-1}(\varnothing) \\ &= \varnothing \end{aligned}$$

which proves that

$$\{A_i\}_{i \in \{1, \ldots, n\}} \text{ is pairwise disjoint} \tag{20.440}$$

Let $x \in X$ then $f(x) \in f(X)$ so, using the surjectivity of β, there exist a $i \in \{1, \ldots, n\}$ such that $f(x) = \beta(i)$. Hence $x \in f^{-1}(\{\beta(i)\}) = A_i \subseteq \bigsqcup_{i \in \{1, \ldots, n\}} A_i$ which proves that $X \subseteq \bigsqcup_{i \in \{1, \ldots, n\}} A_i \subseteq X$ or that

$$X = \bigsqcup_{i \in \{1, \ldots, n\}} A_i \tag{20.441}$$

Let $x \in X$ then by [eqs: 20.440, 20.441] there exists a $i \in \{1, \ldots, n\}$ such that $x \in A_i$ and $\forall j \in \{1, \ldots, n\}$ $x \notin A_j$. Hence

$$\begin{aligned}
\left(\sum_{k=1}^{n} f(\beta(k)) \cdot \mathcal{X}_{A_k}\right)(x) &= \sum_{k \in \{1, \ldots, n\}} f(\beta(k)) \cdot \mathcal{X}_{A_k}(x) \\
&= \sum_{k \in \{i\}} f(\beta(k)) \cdot \mathcal{X}_{A_k}(x) + \sum_{k \in \{1, \ldots, n\} \setminus \{i\}} f(\beta(k)) \cdot \mathcal{X}_{A_k}(x) \\
&= f(\beta(i)) \cdot \mathcal{X}_{A_i}(x) + \sum_{k \in \{1, \ldots, n\} \setminus \{i\}} f(\beta(k)) \cdot 0 \\
&= f(\beta(i)) \\
&= f(x)
\end{aligned}$$

proving that

$$f = \sum_{k=1}^{n} f(\beta(k)) \cdot \mathcal{X}_{A_k} \tag{20.442}$$

2 ⇒ 3. By (2) there exists a $n \in \mathbb{N}$, a bijection $\beta: \{1, \ldots, n\} \to f(X) \subseteq \mathbb{R}$ such that for $\{A_i\}_{i \in \{1, \ldots, n\}}$ defined by $A_i = \beta^{-1}(\{\beta(i)\})$ we have

$$\{A_i\}_{i \in \{1, \ldots, n\}} \text{ is pairwise disjoint, } X = \bigsqcup_{i \in \{1, \ldots, n\}} A_i \text{ and } f = \sum_{i=1}^{n} f(\beta(i)) \cdot \mathcal{X}_{A_i}$$

Define $\{f_i\}_{i \in \{1, \ldots, n\}} \subseteq f(X) \subseteq \mathbb{R}$ by $f_i = f(\beta(i)) \in \mathbb{R}$ then we have by the above also

$$f = \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{A_i}$$

which finish the proof of (3).

3 ⇒ 1. By (3) there exists a $n \in \mathbb{N}$, $\{A_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathcal{P}(X)$, $\{f_i\}_{i \in \{1, \ldots, n\}} \subseteq \mathbb{R}$ such that

$$\{A_i\}_{i \in \{1, \ldots, n\}} \text{ is pairwise disjoint and } f = \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{A_i}$$

Let $y \in f(X)$ then there exists a $x \in X$ such that $y = f(x)$. Using the above there exist a $i \in \{1, \ldots, n\}$ such that $x \in A_i$ and $\forall j \in \{1, \ldots, n\} \setminus \{i\}$ $x \notin A_j$ hence

$$\begin{aligned}
y &= f(x) \\
&= \left(\sum_{k=1}^{n} f_k \cdot \mathcal{X}_{A_k}\right)(x) \\
&= \sum_{k \in \{1, \ldots, n\}} f_k \cdot \mathcal{X}_{A_k}(x) \\
&= \sum_{k \in \{i\}} f_k \cdot \mathcal{X}_{A_k}(x) + \sum_{k \in \{1, \ldots, n\} \setminus \{i\}} f_k \cdot \mathcal{X}_{A_k}(x) \\
&= f_i \cdot \mathcal{X}_{A_i}(x) + \sum_{k \in \{1, \ldots, n\} \setminus \{i\}} f_k \cdot 0 \\
&= f_i \\
&\in \{f_i | i \in \{1, \ldots, n\}\}
\end{aligned}$$

from which it follows that $f(X) \subseteq \{f_i | i \in \{1, \ldots, n\}\}$ a finite set. As the subset of a finite set is finite [see theorem: 6.43] it follows that $f(X)$ is a finite set, hence f is a simple function by definition. □

We have the following important result for functions of the form $f = \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{A_i}$.

Theorem 20.343. *Let X be a set, $n \in \mathbb{N}$, I finite, $\{A_i\}_{i \in I} \subseteq \mathcal{P}(X)$ pairwise disjoint, $\{f_i\}_{i \in I} \subseteq \mathbb{R}$ then for*

$$f = \sum_{i \in I} f_i \cdot \mathcal{X}_{A_i}: X \to \overline{\mathbb{R}}$$

we have that:

1. *$\forall i \in I$ we have $\forall x \in A_i$ that $f(x) = f_i$*
2. *$\forall x \in X \setminus (\bigsqcup_{i \in I} A_i)$ we have $f(x) = 0$*

Proof.

1. Let $i \in I$ then for $x \in A_i$ we have, as $\{A_i\}_{i \in I}$ is pairwise disjoint, that $\forall j \in I \setminus \{i\}$ $x \notin A_j$. So
$$\begin{aligned} f(x) &= \sum_{k \in I} f_k \cdot \mathcal{X}_{A_k}(x) \\ &= \sum_{k \in \{i\}} f_k \cdot \mathcal{X}_{A_k}(x) + \sum_{k \in I \setminus \{i\}} f_k \cdot \mathcal{X}_{A_k}(x) \\ &= f_i \cdot \mathcal{X}_{A_i}(x) + \sum_{k \in I \setminus \{i\}} f_k \cdot 0 \\ &= f_i \end{aligned}$$
2. If $x \in X \setminus (\bigsqcup_{i \in I} A_i)$ then $\forall i \in I$ we have $x \notin A_i$ so that
$$f(x) = \sum_{i \in I} f_i \cdot \mathcal{X}_{A_i}(x) = \sum_{i \in I} f_i \cdot 0 = 0$$

□

A example of a simple function $f: \mathbb{R} \to \overline{\mathbb{R}}$ of the form
$$f = f_1 \cdot \mathcal{X}_{A_1} + f_2 \cdot \mathcal{X}_{A_2} + f_3 \cdot \mathcal{X}_{A_3} + f_4 \cdot \mathcal{X}_{A_4} \text{ where } f(X) = \{f_1, f_2, f_3, f_4\}$$
is shown in the following figure:

Figure 20.5.

The area below the above function and the X-axis is intuitively equal to the sum
$$f_1 \cdot \text{size}(A_1) + f_2 \cdot \text{size}(A_2) + f_3 \cdot \text{size}(A_3) + f_4 \cdot \text{size}(A_4)$$
so the integral of f which calculates this size should be of the form
$$\int f = f_1 \cdot \text{size}(A_1) + f_2 \cdot \text{size}(A_2) + f_3 \cdot \text{size}(A_3) + f_4 \cdot \text{size}(A_4)$$
hence we need a way to calculate the sizes of A_1, A_2, A_3 and A_4, in other words A_1, A_2, A_3 and A_4 must be measurable so that we can use the measure function to calculate the sizes. The integral becomes then
$$\int f = f_1 \cdot \mu(A_1) + f_2 \cdot \mu(A_2) + f_3 \cdot \mu(A_3) + f_4 \cdot \mu(A_4)$$
For this to work we must have $A_1, A_2, A_3, A_4 \in \mathcal{A}$ and as $\mu(A_i)$ can be ∞ f_1, f_2, f_3, f_4 must be non negative. This motivates the following defintion.

Definition 20.344. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space then the set of $\mathcal{A}$-measurable real valued simple functions is noted as $\mathcal{S}[X, \mathcal{A}]$, if the functions are non negative the set is called $\mathcal{S}^+[X, \mathcal{A}]$. Hence*
$$\mathcal{S}[X, \mathcal{A}] = \{f \in \mathcal{S}[X] | f: X \to \overline{\mathbb{R}} \text{ is } \mathcal{A}\text{-measurable}\}$$

and

$$\mathcal{S}^+[X,\mathcal{A}]=\{f\in\mathcal{S}[X,\mathcal{A}]|f(X)\subseteq[0,\infty[\}$$

A trivial example of a non negative measurable simple function is the constant function.

Example 20.345. Let $\langle X,A\rangle$ be a measurable space, $a\in[0,\infty[$ then $C_a\in\mathcal{S}^+[X,\mathcal{A}]$ where

$$C_a\colon X\to\overline{\mathbb{R}} \text{ is defined by } C_a(x)=a$$

Proof. As $C_a(X)=\{a\}$ we have that $C_a\in\mathcal{S}[X]$ and $C_a(X)\subseteq[0,\infty[$. Let $B\in\mathcal{B}[\overline{\mathbb{R}}]$ then for a we have either:

***a* ∈ *B*.** Then $(C_a)^{-1}(B)=\{x\in X|a=C_a(x)\in B\}=X\in\mathcal{A}$

***a* ∉ *B*.** Then $(C_a)^{-1}(B)=\{x\in X|a=C_a(x)\in B\}=\varnothing\in\mathcal{A}$

so that C_a is $\mathcal{A}$-measurable. Hence it follows that $C_a\in\mathcal{S}^+[X,\mathcal{A}]$. □

We have a simpler alternative definition for $\mathcal{S}[X,\mathcal{A}]$

Theorem 20.346. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space then we have the following equivalences:*

1. *$f\in\mathcal{S}^+[X,\mathcal{A}]$ [in other words $f\in\mathcal{S}[X]$, $f(X)\subseteq[0,\infty[$ and f is $\mathcal{A}$-measurable.*
2. *$f\in\mathcal{S}[X]$, $f(X)\subseteq[0,\infty[$ and $\forall y\in f(X)$ $f^{-1}(\{y\})\in\mathcal{A}$*
3. *There exists a $n\in\mathbb{N}$, a pairwise disjoint family $\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{A}$ of measurable sets and a family $\{f_i\}_{i\in\{1,\dots,n\}}\subseteq[0,\infty[$ of real non negative numbers so that*

$$f=\sum_{i=1}^{n}f_i\cdot\mathcal{X}_{A_i}$$

Proof.

1 ⇒ 2. Let $y\in f(X)$ then as $f\in\mathcal{S}[X]\Rightarrow f(X)\subseteq\mathbb{R}$ it follows that $y\in\mathbb{R}$. Applying then [theorem: 20.318] it follows that $f^{-1}(\{y\})\underset{\text{[definition: 20.311]}}{=}\{f=y\}\in\mathcal{A}$.

2 ⇒ 3. As $f\in S[X]$ we can use [theorem: 20.342] to get a $n\in\mathbb{N}$ and a bijection $\beta\colon\{1,\dots,n\}\to f(X)$ such that for $\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{P}(X)$ defined by $A_i=f^{-1}(\beta(i))$ we have that

$$f=\sum_{i=1}^{n}\beta(i)\cdot\mathcal{X}_{A_i} \text{ and } \{A_i\}_{i\in\{1,\dots,n\}} \text{ is pairwise disjoint}$$

Using (2) we have $\forall i\in\{1,\dots,n\}$ $A_i=f^{-1}(\beta(i))\in\mathcal{A}$ so that

$$\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{A}$$

Finally, define $\{f_i\}_{i\in\{1,\dots,n\}}$ by $f_i=\beta(i)\in f(X)\subseteq[0,\infty[$ then

$$\{f_i\}_{i\in\{1,\dots,n\}}\subseteq[0,\infty[\text{ and } f=\sum_{i=1}^{n}f_i\cdot\mathcal{X}_{A_i}$$

3 ⇒ 1. As $\{A_i\}_{i\in\{1,\dots,n\}}\subseteq\mathcal{A}$ we have that $A_{n+1}\underset{\text{def}}{=}X\setminus\left(\bigsqcup_{i\in\{1,\dots,n\}}A_i\right)\in\mathcal{A}$, take $f_{n+1}=0$ then

$$\{f_i\}_{i\in\{1,\dots,n+1\}}\subseteq[0,\infty[,\ \{A_i\}_{i\in\{1,\dots,n+1\}}\subseteq\mathcal{A} \text{ is pairwise, } \bigsqcup_{i\in\{1,\dots,n+1\}}A_i=X \tag{20.443}$$

and $\forall x\in X$ we have $\sum_{i=1}^{n+1}f_i\cdot\mathcal{X}_{A_i}(x)=f_{n+1}\cdot\mathcal{X}_{A_{n+1}}+\sum_{i=1}^{n}f_i\cdot\mathcal{X}_{A_i}(x)=0+f(x)=f(x)$ so that

$$f=\sum_{i=1}^{n+1}f_i\cdot\mathcal{X}_{A_i} \tag{20.444}$$

Let $x\in X$ then there exist a $i\in\{1,\dots,n+1\}$ such that $x\in A_i$ hence $f(x)\underset{\text{[theorem: 20.343]}}{=}f_i\in[0,\infty[$ which proves that

$$f(X)\subseteq[0,\infty[$$

So by [theorem: 20.342] we have

$$f \in \mathcal{S}[X]$$

Define $\{I_i\}_{i\in\{1,\dots,n+1\}} \subseteq \mathcal{P}(\{1,\dots,n+1\})$ by

$$I_i = \{j \in \{1,\dots,n+1\} | f(A_j) = \{f_i\}\} \subseteq \{1,\dots,n+1\}$$

then we prove that

$$\forall i \in \{1,\dots,n+1\} \text{ we have } f^{-1}(\{f_i\}) = \bigsqcup_{j\in I_i} A_j \underset{\text{[theorem: 20.138]}}{\in} \mathcal{A} \tag{20.445}$$

Proof. Given $i \in \{1,\dots,n+1\}$. Let $x \in f^{-1}(\{f_i\})$ then $f(x) = f_i$. As $x \in X = \bigsqcup_{k\in\{1,\dots,n\}} A_i$ there exist a $k \in \{1,\dots,n\}$ such that $x \in A_k$. Using [theorem: 20.343] it follows that $f(A_k) = \{f_k\}$ which, as $x \in A_k \wedge f(x) = f_i$, proves that $f_i = f_k$, hence $f(A_k) = \{f_i\}$ or $k \in I_i$. In other words $x \in A_k \subseteq \bigcup_{j\in I_i} A_j$, so that

$$f^{-1}(\{f_i\}) \subseteq \bigcup_{j\in I_i} A_j \tag{20.446}$$

Let $x \in \bigcup_{j\in I_i} A_j$ then there exist a $k \in I_i$ such that $x \in A_k$, as $k \in I_i$ $f(A_k) = \{f_i\}$, so that $f(x) = f_i$ or $x \in f^{-1}(\{f_i\})$. Hence $\bigcup_{j\in I_i} A_j \subseteq f^{-1}(\{f_i\})$ which combined with [eq: 20.446] proves $f^{-1}(\{f_i\}) = \bigcup_{j\in I_i} A_j$ and thus [eq: 20.445]. □

Let $x \in X = \bigsqcup_{i\in\{1,\dots,n+1\}} A_i$ then there exist a $i \in \{1,\dots,n+1\}$ such that $x \in A_i$. Using [theorem: 20.343] again it follows that $f(x) \in f_i$ so that $x \in f^{-1}(\{f_i\}) \subseteq \bigcup_{i\in\{1,\dots,n+1\}} f^{-1}(\{f_i\})$. Hence as triviallye $\bigcup_{i\in\{1,\dots,n+1\}} f^{-1}(\{f_i\}) \subseteq X$ we have

$$X = \bigcup_{i\in\{1,\dots,n+1\}} f^{-1}(\{f_i\}) \tag{20.447}$$

We are now ready to prove that f is $\mathcal{A}$-measurable. Let $B \in \mathcal{B}[\overline{\mathbb{R}}]$ then as $f^{-1}(B) \subseteq X$ we have

$$\begin{aligned} f^{-1}(B) &= f^{-1}(B) \bigcap X \\ &\underset{\text{[eq: 20.447]}}{=} f^{-1}(B) \bigcap \left(\bigcup_{i\in\{1,\dots,n+1\}} f^{-1}(\{f_i\}) \right) \\ &= \bigcup_{i\in\{1,\dots,n+1\}} \left(f^{-1}(B) \bigcap f^{-1}(\{f_i\}) \right) \\ &\underset{\text{[theorem: 2.95]}}{=} \bigcup_{i\in\{1,\dots,n+1\}} f^{-1}\left(B \bigcap \{f_i\}\right) \end{aligned} \tag{20.448}$$

Let $i \in \{1,\dots,n+1\}$ then for f_i we have either :

- $\boldsymbol{f_i \in B}$. Then $B \bigcap \{f_i\} = \{f_i\}$ so that $f^{-1}(B) = f^{-1}(\{f_i\}) \in \mathcal{A}$ [see eq: 20.445]
- $\boldsymbol{f_i \notin B}$. Then $f^{-1}(B \bigcap \{f_i\}) = f^{-1}(\varnothing) = \varnothing \in \mathcal{A}$

Hence $\forall i \in \{1,\dots,n+1\}$ $f^{-1}(B \bigcap \{f_i\}) \in \mathcal{A}$ so that $\bigcup_{i\in\{1,\dots,n+1\}} f^{-1}(B \bigcap \{f_i\}) \in \mathcal{A}$ which by [eq: 20.448] that $f^{-1}(B) \in \mathcal{A}$. As $B \in \mathcal{B}[\overline{\mathbb{R}}]$ was choosen arbitrary it follows by definition that

$$f \text{ is } \mathcal{A}\text{-measurable}$$

□

Given a non negative measurable simple function $f = \sum_{i=1}^n \alpha_i \cdot \mathcal{X}_{A_i}$ we want to define the integral of f as $\int f = \sum_{i=1}^n f_i \cdot \mu(A_i)$. However the same function f can have another representation $f = \sum_{i=1}^m \beta_i \cdot \mathcal{X}_{B_i}$, so we must show that the integral is independent of the choosen representation.

Theorem 20.347. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{S}^+[X, \mathcal{A}]$ then if $n, m \in \mathbb{N}$, $\{A_i\}_{i\in\{1,\dots,n\}} \subseteq \mathcal{A}$, $\{B_i\}_{i\in\{1,\dots,m\}} \subseteq \mathcal{A}$, $\{a_i\}_{i\in\{1,\dots,n\}} \subseteq [0,\infty[$ and $\{b_i\}_{i\in\{1,\dots,m\}} \subseteq [0,\infty[$ satisfies*

$$\sum_{i=1}^n a_i \cdot \mathcal{X}_{A_i} = f = \sum_{i=1}^m b_i \cdot \mathcal{X}_{B_i}$$

then we have

$$\sum_{i=1}^n a_i \cdot \mu(A_i) = \sum_{i=1}^m b_i \cdot \mu(B_i)$$

***Note* 20.348.** *The condition that $f \in S^+[X, \mathcal{A}]$ is needed because this ensures that $\{a_i\}_{i\in\{1,\ldots,n\}}, \{b_i\}_{i\in\{1,\ldots,m\}}$ are non negative so that $\sum_{i=1}^n a_i \cdot \mu(A_i)$ and $\sum_{i=1}^m b_i \cdot \mu(B_i)$ are well defined [as $\mu(A_i), \mu(B_i)$ can be ∞].*

Proof. First we remove all the terms where $a_i \cdot \mu(A_i) = 0$ and $b_i \cdot \mu(B_i) = 0$, this will not change the sum. Defiine $I = \{i \in \{1, \ldots, n\} | A_i \neq \varnothing \wedge a_i \neq \varnothing\}$ and $J = \{i \in \{1, \ldots, m\} | B_i \neq 0 \wedge b_i \neq \varnothing\}$. Then $\forall i \in \{1, \ldots, n\} \setminus I$ we have $a_i \cdot \mu(A_i) \underset{a_i=0 \vee A_i \neq \varnothing}{=} 0$ and $\forall i \in \{1, \ldots, m\} \setminus J \underset{b_i=0 \vee B_i=\varnothing}{=} 0$ so that

$$\begin{aligned}
\left(\sum_{i=1}^n a_i \cdot \mathcal{X}_{A_i}\right)(x) &= \sum_{i=1}^n a_i \cdot \mathcal{X}_{A_i}(x) \\
&= \sum_{i\in I} a_i \cdot \mathcal{X}_{A_i}(x) + \sum_{i\in\{1,\ldots,n\}\setminus I} a_i \cdot \mathcal{X}_{A_i}(x) \\
&= \sum_{i\in I} a_i \cdot \mathcal{X}_{A_i}(x) + 0 \\
&= \sum_{i\in I} a_i \cdot \mathcal{X}_{A_i}(x)
\end{aligned}$$

and

$$\begin{aligned}
\left(\sum_{i=1}^m b_i \cdot \mathcal{X}_{B_i}\right)(x) &= \sum_{i=1}^m b_i \cdot \mathcal{X}_{B_i}(x) \\
&= \sum_{i\in J} b_i \cdot \mathcal{X}_{B_i}(x) + \sum_{i\in\{1,\ldots,m\}\setminus J} b_i \cdot \mathcal{X}_{B_i}(x) \\
&= \sum_{i\in J} b_i \cdot \mathcal{X}_{B_i}(x) + 0 \\
&= \sum_{i\in J} b_i \cdot \mathcal{X}_{B_i}(x)
\end{aligned}$$

proving that

$$\sum_{i\in I} a_i \cdot \mathcal{X}_{A_i} = f = \sum_{i\in J} b_i \cdot \mathcal{X}_{B_i} \tag{20.449}$$

As $\{A_i\}_{i\in\{1,\ldots,n\}}$ and $\{B_i\}_{i\in\{1,\ldots,m\}}$ are pairwise disjoint we have

$$\{A_i\}_{i\in I} \subseteq \mathcal{A} \text{ and } \{B_i\}_{i\in J} \subseteq \mathcal{A} \text{ are pairwise disjoint} \tag{20.450}$$

Further if $x \in \bigsqcup_{i\in I} A_i$ then there exist a $i \in I$ such that $x \in A_i$ so that by [theorem: 20.343] $f(x) = a_i \neq 0$. Assume that $x \notin \bigsqcup_{i\in J} B_i$ then $f(x) = \sum_{i\in J} b_i \cdot \mathcal{X}_{B_i}(x) = \sum_{i\in J} b_i \cdot 0 = 0$ contradicting $f(x) \neq 0$. Hence the assumption is wrong and we must have that $x \in \bigsqcup_{i\in J} B_i$. So

$$\bigsqcup_{i\in I} A_i \subseteq \bigsqcup_{i\in J} B_i \tag{20.451}$$

Likewise if $x \in \bigsqcup_{i\in J} B_i$ then there exist a $i \in J$ such that $x \in B_i$ so that by [theorem: 20.343] $f(x) = b_i \neq 0$. Assume that $x \notin \bigsqcup_{i\in I} A_i$ then $f(x) = \sum_{i\in I} a_i \cdot \mathcal{X}_{A_i}(x) = \sum_{i\in I} a_i \cdot 0 = 0$ contradicting $f(x) \neq 0$. Hence the assumption is wrong and we must have that $x \in \bigsqcup_{i\in I} A_i$. So $\bigsqcup_{i\in J} B_i \subseteq \bigsqcup_{i\in J} A_i$, combining this with [eq: 20.451] gives

$$\bigsqcup_{i\in I} A_i = \bigsqcup_{i\in J} B_i \tag{20.452}$$

Let $i \in \{1, \ldots, n\}$ then, as $\{B_j\}_{j\in J}$ are pairwise disjoint, $\{A_i \bigcap B_j\}_{j\in J}$ are pairwise disjoint and

$$A_i = A_i \bigcap \left(\bigsqcup_{j\in I} A_j\right) \underset{\text{[eq: 20.452]}}{=} A_i \bigcap \left(\bigsqcup_{j\in J} B_j\right) = \bigsqcup_{j\in J} \left(A_i \bigcap B_j\right) \tag{20.453}$$

Let $i \in \{1, \ldots, m\}$ then, as $\{A_j\}_{j\in I}$ are pairwise disjoint $\{A_j \bigcap B_i\}_{j\in J}$ are pairwise disjoint and

$$B_i = B_i \bigcap \left(\bigsqcup_{j\in I} B_j\right) \underset{\text{[eq: 20.452]}}{=} B_i \bigcap \left(\bigsqcup_{j\in I} A_j\right) = \bigsqcup_{j\in I} \left(A_j \bigcap B_i\right) \tag{20.454}$$

Define $K=\{(i,j)\in\{1,\ldots,n\}\times\{1,\ldots,m\}|A_i\bigcap B_j\neq\varnothing\}$ then if $(i,j)\in K$ we have $A_i\bigcap B_j\neq\varnothing$ so there exist a $x\in A_i\bigcap B_j$ and

$$a_i \underset{x\in A_i\wedge[\text{theorem: }20.343]}{=} f(x) \underset{x\in B_i\wedge[\text{theorem: }20.343]}{=} b_j$$

In other words

$$\forall(i,j)\in K \text{ we have } a_i=b_j \tag{20.455}$$

Now

$$\begin{aligned}
\sum_{i=1}^{n} a_i\cdot\mu(A_i) &= \sum_{i\in I} a_i\cdot\mu(A_i)+\sum_{i\in\{1,\ldots,n\}\setminus I}\alpha_i\cdot\mu(A_i)\\
&= \sum_{i\in I} a_i\cdot\mu(A_i)\\
&\underset{[\text{eq: }20.453]}{=} \sum_{i\in I} a_i\cdot\mu\left(\bigsqcup_{j\in J}\left(A_i\bigcap B_j\right)\right)\\
&= \sum_{i\in I}\left(a_i\cdot\sum_{j\in J}\mu\left(A_i\bigcap B_j\right)\right)\\
&= \sum_{i\in I}\left(\sum_{j\in J} a_i\cdot\mu\left(A_i\bigcap B_j\right)\right)\\
&\underset{[\text{theorem: }11.45]}{=} \sum_{(i,j)\in I\times J} a_i\cdot\mu\left(A_i\bigcap B_j\right)\\
&= \sum_{(i,j)\in K} a_i\cdot\mu\left(A_i\bigcap B_j\right)+\sum_{(i,j)\in \mathrm{K}\setminus(I\times J)} a_i\cdot\mu\left(A_i\bigcap B_j\right)\\
&= \sum_{(i,j)\in K} a_i\cdot\mu\left(A_i\bigcap B_j\right)+\sum_{(i,j)\in \mathrm{K}\setminus(I\times J)} a_i\cdot 0\\
&= \sum_{(i,j)\in K} a_i\cdot\mu\left(A_i\bigcap B_j\right)\\
&\underset{[\text{eq: }20.455]}{=} \sum_{(i,j)\in K} b_j\cdot\mu\left(A_i\bigcap B_j\right)\\
&= \sum_{(i,j)\in K} b_j\cdot\mu\left(A_i\bigcap B_j\right)+\sum_{(i,j)\in \mathrm{K}\setminus(I\times J)} b_j\cdot 0\\
&= \sum_{(i,j)\in K} b_j\cdot\mu\left(A_i\bigcap B_j\right)+\sum_{(i,j)\in \mathrm{K}\setminus(I\times J)} b_j\cdot\mu\left(A_i\bigcap B_j\right)\\
&= \sum_{(i,j)\in I\times J} b_j\cdot\mu\left(A_i\bigcap B_j\right)\\
&\underset{[\text{theorem: }11.45]}{=} \sum_{j\in J}\left(\sum_{i\in I}\left(b_j\cdot\mu\left(A_i\bigcap B_j\right)\right)\right)\\
&= \sum_{j\in J}\left(b_j\cdot\sum_{i\in I}\mu\left(A_i\bigcap B_j\right)\right)\\
&= \sum_{j\in J} b_j\cdot\mu\left(\bigsqcup_{i\in I}\left(A_i\bigcap B_j\right)\right)\\
&\underset{[\text{eq: }20.454]}{=} \sum_{j\in J} b_j\cdot\mu(B_j)\\
&= \sum_{j\in J} b_j\cdot\mu(B_j)+\sum_{j\in\{1,\ldots,m\}\setminus J} b_j\cdot\mu(B_j)\\
&= \sum_{j=1}^{m} b_j\cdot\mu(B_j)
\end{aligned}$$

□

Thanks to the two previous theorems [theorems: 20.346, 20.347] the following definition is well defined [existence and uniqueness].

Definition 20.349. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space then we define*

$$\int^S : \mathcal{S}^+[X,\mathcal{A}] \to [0,\infty] \text{ by } \left(\int^S\right)(f) \underset{\text{notation}}{=} \int^S f d\mu \underset{\text{def}}{=} \sum_{i=1}^n a_i \cdot \mu(A_i)$$

where $n\in\mathbb{N}$, $\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}$ is pairwise disjoint, $\{a_i\}_{i\in\{1,\ldots,n\}}\subseteq[0,\infty[$ satisfies

$$f=\sum_{i=1}^n a_i\cdot\mathcal{X}_{A_i}$$

***Note* 20.350.** *For the moment we use the special symbol $\int^s f d\mu$ to differentiate the integral of a simple function from the more general integral $\int f d\mu$ that will be based on the integral of simple functions.*

The following lemma will be usefull if we have to compare or add simple functions.

Lemma 20.351. *Let $\langle X,\mathcal{A}\rangle$ be a measurable space, $f,g\in\mathcal{S}^+[X,\mathcal{A}]$ then there exist a $n\in\mathbb{N}$, a pairwise disjoint family $\{C_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}$ of sets in $\mathcal{A}$, a family $\{f_i\}_{i\in\{1,\ldots,n\}}\subseteq[0,\infty[$ and a family $\{g_i\}_{i\in\{1,\ldots,n\}}$ such that*

$$X=\bigsqcup_{i\in\{1,\ldots,n\}} C_i$$

$$f=\sum_{i=1}^n f_i\cdot\mathcal{X}_{C_i} \text{ and } g=\sum_{i=1}^n g_i\cdot\mathcal{X}_{C_i}$$

Proof. As $f,g\in S^+[X,\mathcal{A}]$ we have by [theorem: 20.346] that there exists $n',m'\in\mathbb{N}$, $\{A'_i\}_{i\in\{1,\ldots,n'\}}\subseteq\mathcal{A}$ pairwise disjoint, $\{B'_i\}_{i\in\{1,\ldots,m'\}}\subseteq\mathcal{A}$ pairwise disjoint, $\{a'_i\}_{i\in\{1,\ldots,n'\}}\subseteq[0,\infty[$ and $\{b'_i\}_{i\in\{1,\ldots,m'\}}$ so that

$$f=\sum_{i=1}^n a'_i\cdot\mathcal{X}_{A'_i} \text{ and } g=\sum_{i=1}^m b'_i\cdot\mathcal{X}_{B'_i} \tag{20.456}$$

Define now

$$\{A_i\}_{i\in\{1,\ldots,n'+1\}}\subseteq\mathcal{A} \text{ by } A_i = \begin{cases} X\setminus\bigcup_{i\in\{1,\ldots,n'\}}A'_i \text{ if } i=n'+1\\ A'_i \text{ if } i\in\{1,\ldots,n'\}\end{cases}$$

$$\{B_i\}_{i\in\{1,\ldots,m'+1\}}\subseteq\mathcal{A} \text{ by } B_i = \begin{cases} X\setminus\bigcup_{i\in\{1,\ldots,m'\}}B'_i \text{ if } i=m'+1\\ B'_i \text{ if } i\in\{1,\ldots,m'\}\end{cases}$$

$$\{a_i\}_{i\in\{1,\ldots,n'+1\}} \text{ by } a_i = \begin{cases} 0 \text{ if } i=n'+1\\ a'_i \text{ if } i\in\{1,\ldots,n'\}\end{cases}$$

$$\{b_i\}_{i\in\{1,\ldots,m'+1\}} \text{ by } b_i = \begin{cases} 0 \text{ if } i=m'+1\\ b'_i \text{ if } i\in\{1,\ldots,m'\}\end{cases}$$

then clearly $\{A_i\}_{i\in\{1,\ldots,n'+1}$, $\{B_i\}_{i\in\{1\ldots,m'+1\}}$ are pairwise disjoint and

$$X=\bigsqcup_{i\in\{1,\ldots,n'+1\}} A_i=\bigsqcup_{i\in\{1,\ldots,m'+1\}} B_i \tag{20.457}$$

Hence

$$\forall i\in\{1,\ldots,n'+1\}\ A_i=A_i\bigcap X=A_i\bigcap\left(\bigsqcup_{j\in\{1,\ldots,m'+1\}} B_j\right)=\bigsqcup_{j\in\{1,\ldots,m'+1\}}(A_i\bigcap B_j) \tag{20.458}$$

and

$$\forall i\in\{1,\ldots,m'+1\}\ B_i=B_i\bigcap X=B_i\bigcap\left(\bigsqcup_{j\in\{1,\ldots,n'+1\}} A_j\right)=\bigsqcup_{j\in\{1,\ldots,n'+1\}}(A_j\bigcap B_i) \tag{20.459}$$

so that

$$X=\bigsqcup_{i=1}^{n'+1}\left(\bigsqcup_{j=1}^{m'+1}(A_i\bigcap B_j)\right)=\bigsqcup_{i=1}^{m'+1}\left(\bigsqcup_{j=1}^{n'+1}(A_j\bigcap B_i)\right) \tag{20.460}$$

Using [theorem: 6.41] $\{1,\ldots,n'+1\}\times\{1,\ldots,m'+1\}$ is finite and there exists a bijection

$$\beta:\{1,\ldots,n\}\to\{1,\ldots,n'+1\}\times\{1,\ldots,m'+1\}\text{ where }n=(n'+1)\cdot(m'+1)$$

Define now

$$\begin{aligned}\{C_i\}_{i\in\{1,\ldots,n\}}\subseteq A\quad&\text{by}\quad C_i=A_{\beta(i)_1}\bigcap B_{\beta(i)_2}\\ \{f_i\}_{i\in\{1,\ldots,n\}}\quad&\text{by}\quad f_i=a_{\beta(i)_1}\\ \{g_i\}_{i\in\{1,\ldots,n\}}\quad&\text{by}\quad g_i=b_{\beta(i)_2}\end{aligned}$$

Let $x\in X$ then by [eq: 20.460] there exists a $i\in\{1,\ldots,n'+1\}$ such that $x\in\bigsqcup_{j\in\{1,\ldots,m'+1\}}(A_i\bigcap B_j)$, hence there exist a $j\in\{1,\ldots,m'+1\}$ such that $x\in A_i\bigcap B_j$. As β is a bijection there exist a $k\in\{1,\ldots,n\}$ such that $\beta(k)=(i,j)$ hence $x\in A_{\beta(k)_1}\bigcap B_{\beta(k)_2}=C_k\subseteq\bigcup_{k\in\{1,\ldots,n\}}C_k$. Hence $X\subseteq\bigcup_{k\in\{1,\ldots,n\}}C_k$ and as trivially $\bigcup_{k\in\{1,\ldots,n\}}C_k\subseteq X$ it follows that

$$X=\bigcup_{i\in\{1,\ldots,n\}}C_i \tag{20.461}$$

Next we prove that $\{C_i\}_{i\in\{1,\ldots,n\}}$ is pairwise disjoint. So let $i,j\in\{1,\ldots,n\}$ with $i\neq j$ then as β is a bijection we have that $\beta(i)\neq\beta(j)$, for $\beta(i)_1$, $\beta(j)_1$ we have then either:

$\beta(i)_1=\beta(j)_1$. Then we must have that $\beta(i)_2\neq\beta(j)_2$ so that

$$C_i\bigcap C_j=\left(A_{\beta(i)_1}\bigcap B_{\beta(i)_2}\right)\bigcap\left(A_{\beta(j)_1}\bigcap B_{\beta(j)_2}\right)\subseteq B_{\beta(i)_2}\bigcap B_{\beta(j)_2}=\varnothing$$

$\beta(i)_1\neq\beta(j)_1$. Then we have that

$$C_i\bigcap C_j=\left(A_{\beta(i)_1}\bigcap B_{\beta(i)_2}\right)\bigcap\left(A_{\beta(j)_1}\bigcap B_{\beta(j)_2}\right)\subseteq A_{\beta(i)_1}\bigcap B_{\beta(j)_1}=\varnothing$$

which proves that

$$\{C_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}\text{ is pairwise disjoint and }X=\bigsqcup_{i\in\{1,\ldots,n\}}C_i \tag{20.462}$$

Let $x\in X$ then by [eq: 20.462] there exist a $i\in\{1,\ldots,n\}$ such that $x\in C_i=A_{\beta(i)_1}\bigcap B_{\beta(i)_2}$ hence $x\in A_{\beta(i)_1}$. For $\beta(i)_1$ we have the following possibilities:

$\beta(i)_1=n'+1$. Then $x\in A_{n'+1}=X\setminus\left(\bigsqcup_{i\in\{1,\ldots,n'\}}A_i\right)$ so that by [theorem: 20.343] and [eq: 20.456] $f(x)=0$. Further using [theorem: 20.343] and [eq: 20.462] it follows also that

$$\left(\sum_{i=1}^{n}f_i\cdot\mathcal{X}_{C_i}\right)(x)=f_i=a_{\beta(i)_1}=a_{n'+1}=0=f(x)$$

which proves that $f(x)=(\sum_{i=1}^{n}f_i\cdot\mathcal{X}_{C_i})(x)$.

$\beta(i)_1\in\{1,\ldots,n'\}$. Then $x\in A_{\beta(i)_1}=A'_{\beta(i)_1}$ so that by [theorem: 20.343] and [eq: 20.456] $f(x)=a'_{\beta(i)_1}$. Further using [theorem: 20.343] and [eq: 20.462] we have that

$$\left(\sum_{i=1}^{n}f_i\cdot\mathcal{X}_{C_i}\right)(x)=f_i=a_{\beta(i)_1}=a'_{\beta(i)}=f(x)$$

so that in this cases we have also that $f(x)=(\sum_{i=1}^{n}f_i\cdot\mathcal{X}_{C_i})(x)$.

To summarize we have proved that

$$f=\sum_{i=1}^{n}f_i\cdot\mathcal{X}_{C_i}$$

We use now the same technic for g. Let $x\in X$ then by [eq: 20.462] there exist a $i\in\{1,\ldots,n\}$ such that $x\in C_i=A_{\beta(i)_1}\bigcap B_{\beta(i)_2}$ hence $x\in B_{\beta(i)_2}$. For $\beta(i)_2$ we have the following possibilities:

$\beta(i)_2=m'+1$. Then $x\in B_{n'+1}=X\setminus\left(\bigsqcup_{i\in\{1,\ldots,n'\}}B_i\right)$ so that by [theorem: 20.343] and [eq: 20.456] $g(x)=0$. Further using [theorem: 20.343] and [eq: 20.462] it follows also that

$$\left(\sum_{i=1}^{n}g_i\cdot\mathcal{X}_{C_i}\right)(x)=g_i=b_{\beta(i)_2}=b_{m'+1}=0=g(x)$$

which proves that $g(x)=(\sum_{i=1}^{n} g_i\cdot\mathcal{X}_{C_i})(x)$.

$\beta(i)_2\in\{1,\ldots,m'\}$. Then $x\in B_{\beta(i)_2}=B'_{\beta(i)_2}$ so that by [theorem: 20.343] and [eq: 20.456] $g(x)=b'_{\beta(i)_2}$. Further using [theorem: 20.343] and [eq: 20.462] we have that

$$\left(\sum_{i=1}^{n} g_i\cdot\mathcal{X}_{C_i}\right)(x)=g_i=b_{\beta(i)_2}=b'_{\beta(i)}=g(x)$$

so that in this cases we have also that $g(x)=(\sum_{i=1}^{n} g_i\cdot\mathcal{X}_{C_i})(x)$.

To summarize we have proved that

$$g=\sum_{i=1}^{n} g_i\cdot\mathcal{X}_{C_i}$$

□

We prove now that the integral of non negative measurable simple functions has the usual properties of integration.

Theorem 20.352. *Let $\langle X,\mathcal{A},\mu\rangle$ be a measure space then we have*

1. *If $\alpha\in[0,\infty[$ and $f\in\mathcal{S}^+[X,\mathcal{A}]$ then $\alpha\cdot f\in\mathcal{S}^+[X,\mathcal{A}]$ and $\int^S(\alpha\cdot f)\,d\mu=\alpha\cdot\int^S f d\mu$.*
2. *If $f,g\in\boldsymbol{S}^+[X,\mathcal{A}]$ then*
   a. *$f+g\in\mathcal{S}^+[X,\mathcal{A}]$ and $\int^S(f+g)\,d\mu=\int^S f d\mu+\int^S g d\mu$.*
   b. *If $\forall x\in X\ f(x)\leqslant g(x)$ then $\int^S f d\mu\leqslant\int^S g d\mu$*
   c. *$f\wedge g\in\mathcal{S}^+[X,\mathcal{A}]$, $\int^S(f\wedge g)\,d\mu\leqslant\int^S f d\mu$ and $\int^S(f\wedge g)\,d\mu\leqslant\int^S g d\mu$*
3. *If $f\in\mathcal{S}^+[X,\mathcal{A}]$ satisfies $f=0$ μ-a.e. then $\int^S f d\mu=0$*

Proof.

1. As $f\in\mathcal{S}^+[X,\mathcal{A}]$ there exists by [theorem: 20.346] a pairwise disjoint $\{A_i\}_{i\in\{1,\ldots,n\}}\subseteq\mathcal{A}$ and a $\{f_i\}_{i\in\{1,\ldots,n\}}\subseteq[0,\infty[$ such that $f=\sum_{i=1}^{n} f_i\cdot\mathcal{X}_{A_i}$. Further we have by definition that

$$\int^S f d\mu=\sum_{i=1}^{n} f_i\cdot\mu(A_i)$$

Then $\{\alpha\cdot a_i\}_{i\in\{1,\ldots,n\}}\subseteq[0,\infty[$ and $\forall x\in X$ we have

$$\begin{aligned}(\alpha\cdot f)(x) &= \alpha\cdot f(x)\\ &= \alpha\cdot\sum_{i=1}^{n} a_i\cdot\mathcal{X}_{A_i}(x)\\ &= \sum_{i=1}^{n}(\alpha\cdot a_i)\cdot\mathcal{X}_{A_i}(x)\\ &= \left(\sum_{i=1}^{n}(\alpha\cdot a_i)\cdot\mathcal{X}_{A_i}\right)(x)\end{aligned}$$

proving that

$$\alpha\cdot f=\sum_{i=1}^{n}(\alpha\cdot a_i)\cdot\mathcal{X}_{A_i}$$

Using [theorem: 20.346] it follows that

$$\alpha\cdot f\in\mathcal{S}^+[X,\mathcal{A}]$$

Further we have

$$\begin{aligned}\int^S\alpha\cdot f d\mu &= \sum_{i=1}^{n}(\alpha\cdot f_i)\cdot\mu(A_i)\\ &= \alpha\cdot\sum_{i=1}^{n} f_i\cdot\mu(A_i)\\ &= \alpha\cdot\int^S f d\mu\end{aligned}$$

2. As $f, g \in \mathcal{S}^+[X, \mathcal{A}]$ there exists by [lemma: 20.351] $\{C_i\}_{i\in\{1,\ldots,n\}} \subseteq \mathcal{A}$ pairwise disjoint, $\{f_i\}_{i\in\{1,\ldots,n\}} \subseteq [0,\infty[$ and $\{g_i\}_{i\in\{1,\ldots,n\}} \subseteq [0,\infty[$ such that

$$X = \bigsqcup_{i\in\{1,\ldots,n\}} A_i,\ f = \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{C_i} \text{ and } g = \sum_{i=1}^{n} g_i \cdot \mathcal{X}_{C_i} \tag{20.463}$$

By the definition of $\int^S$ we have also

$$\int^S f d\mu = \sum_{i=1}^{n} f_i \cdot \mu(C_i) \text{ and } \int^S g d\mu = \sum_{i=1}^{n} g_i \cdot \mu(C_i) \tag{20.464}$$

Next we have:

a. Now $\{f_i + g_i\}_{i\in\{1,\ldots,n\}} \subseteq [0,\infty[$ and

$$\begin{aligned}
(f+g)(x) &= f(x) + g(x) \\
&= \sum_{i=1}^{n} f_i \cdot \mathcal{X}_{C_i}(x) + \sum_{i=1}^{n} g_i \cdot \mathcal{X}_{C_i}(x) \\
&= \sum_{i=1}^{n} (f_i \cdot \mathcal{X}_{C_i}(x) + g_i \cdot \mathcal{X}_{C_i}(x)) \\
&= \sum_{i=1}^{n} (f_i + g_i) \cdot \mathcal{X}_{C_i}(x) \\
&= \left(\sum_{i=1}^{n} (f_i + g_i)\right)(x)
\end{aligned}$$

whic proves that

$$f + g = \sum_{i=1}^{n} (f_i + g_i)$$

So using [theorem: 20.346] it follows that

$$f + g \in \mathcal{S}^+[X, \mathcal{A}]$$

and using the definition of the integral

$$\begin{aligned}
\int^S (f+g)\, d\mu &= \sum_{i=1}^{n} (f_i + g_i) \cdot \mu(C_i) \\
&= \sum_{i=1}^{n} f_i \cdot \mu(C_i) + \sum_{i=1}^{n} g_i \cdot \mu(C_i) \\
&\underset{\text{[eq: 20.464]}}{=} \int^S f d\mu + \int^S g d\mu
\end{aligned}$$

Chapter 21
Differential Manifolds

21.1 Topological Manifold

Chapter 22
TODO

22.1 Sets.tm

1. Spell check started/Finished
2. Definition of totally (fully ordered) set is changed from preorder + total ordering to partial order + tota; order. Check must be done to ensure that this does not introduce inconsequences.

22.2 NaturalNumbers.tm

1. Spell check started/Finished

22.3 Numbers.tm

1. Spell check started/Finished

22.4 LinearAlgebra.tm

1. Spell check started/Finished

22.5 DirectSum.tm

1. Spell check started/Finished

22.6 TensorProduct.tm

1. Spell check started/Finished

22.7 Topology.tm

1. Spell check started/Finished

22.8 IntegrationBanach.tm

1. Spell check started/Finished

22.9 Differentiation.tm

1. Spell check started/Finished
2. Change definition of C^k to C^k at a point Started/Finished
3. Add n-times derivatives on [a,b] and taylor expansion

22.10 FundamentalTheorem.OfAlgebra.tm

1. Spell check started/Finished
2. Check for errors started/Finished

22.11 InnerProductSpaces.tm

1. Spell check started/Finished

22.12 Exponential.tm

1. Spell check started/Finished
2. Check for errors Started

22.13 Measure.tm

1. Rewrite started/

22.14 Manifold.tm
