$$\begin{aligned} \sum_{i=k}^{\infty} (\alpha \cdot x_i) &= \lim_{n \rightarrow \infty} \sum_{i=k}^n (\alpha \cdot x_i) \\ &\stackrel{[\text{theorem: 20.97}]}{=} \lim_{n \rightarrow \infty} \left(\alpha \cdot \sum_{i=k}^n x_i \right) \\ &\stackrel{[\text{theorem: 20.84}]}{=} \alpha \cdot \lim_{n \rightarrow \infty} \sum_{i=k}^n x_i \\ &= \alpha \cdot \sum_{i=k}^{\infty} x_i \end{aligned}$$

2. We have

$$\begin{aligned}
 \sum_{i=k}^{\infty} (x_i + y_i) &= \lim_{n \rightarrow \infty} \sum_{i=k}^n (x_i + y_i) \\
 &\stackrel{[\text{theorem: 11.17}]}{=} \lim_{n \rightarrow \infty} \left(\sum_{i=k}^n x_i + \sum_{i=k}^n y_i \right) \\
 &\stackrel{[\text{theorem: 20.84}]}{=} \lim_{n \rightarrow \infty} \sum_{i=k}^{\infty} x_i + \lim_{n \rightarrow \infty} \sum_{i=k}^n y_i \\
 &= \sum_{i=k}^{\infty} x_i + \sum_{i=k}^{\infty} y_i
 \end{aligned}$$

3. Let $n \in \{k, \dots, \infty\}$ then we have by [theorem: 20.92] that $\sum_{i=k}^n x_i \leq \sum_{i=k}^n y_i$ so that

$$\sum_{i=k}^{\infty} x_i = \lim_{n \rightarrow \infty} \sum_{i=k}^n x_i \stackrel{[\text{theorem: 20.84}]}{\leq} \lim_{n \rightarrow \infty} \sum_{i=k}^n y_i = \sum_{i=k}^{\infty} y_i \quad \square$$

Theorem 20.99. Let $k \in \mathbb{N}_0$, $\{x_i\}_{i \in \{k, \dots, \infty\}} \subseteq [0, \infty]$ then for $l \in \{k, \dots, \infty\}$ we have

$$\sum_{i=k}^{\infty} x_i = \sum_{i=k}^l x_i + \sum_{i=l+1}^{\infty} x_i$$

Proof. Let $n \in \{l+1, \dots, \infty\}$ then by [theorem: 11.23]

$$\sum_{i=k}^n x_i = \sum_{i=k}^l x_i + \sum_{i=l+1}^n x_i \quad (20.39)$$

Next we have

$$\begin{aligned}
 \sum_{i=k}^{\infty} x_i &= \lim_{n \rightarrow \infty} \sum_{i=k}^n x_i \\
 &\stackrel{[\text{theorem: 20.83}]}{=} \lim_{n \rightarrow \infty} \sum_{i=k}^{n+(l+1)} x_i \\
 &\stackrel{[\text{eq: 20.39}]}{=} \lim_{n \rightarrow \infty} \left(\sum_{i=k}^l x_i + \sum_{i=l+1}^{n+(l+1)} x_i \right) \\
 &\stackrel{[\text{theorem: 20.84 (4)}]}{=} \sum_{i=k}^l x_i + \lim_{n \rightarrow \infty} \sum_{i=l+1}^{n+(l+1)} x_i \\
 &\stackrel{[\text{theorem: 20.83}]}{=} \sum_{i=k}^l x_i + \lim_{n \rightarrow \infty} \sum_{i=l+1}^n x_i \\
 &= \sum_{i=k}^l x_i + \sum_{i=l+1}^{\infty} x_i
 \end{aligned}$$

□

Theorem 20.100. Let $k \in \mathbb{N}_0$, $\{x_i\}_{i \in \{k, \dots, \infty\}} \subseteq [0, \infty]$ then if $\sigma: \{k, \dots, \infty\} \rightarrow \{k, \dots, \infty\}$ is a permutation then

$$\sum_{i=k}^{\infty} x_i = \sum_{i=k}^{\infty} x_{\sigma(i)}$$

Proof. Let $\sigma: \{k, \dots, \infty\} \rightarrow \{k, \dots, \infty\}$ be a bijection. Let $s \in \{\sum_{i=k}^n x_{\sigma(i)} \mid n \in \{k, \dots, \infty\}\}$ then there exist a $n \in \{k, \dots, \infty\}$ such that

$$s = \sum_{i=k}^n x_{\sigma(i)}$$

Let $m_n = \max(\{\sigma(i) | i \in \{k, \dots, n\}\})$ then $\forall i \in \{k, \dots, n\}$ we have $\sigma(i) \leq m_n \Rightarrow \sigma(i) \in \{k, \dots, m_n\}$. Hence we have that

$$\sigma(\{k, \dots, n\}) = \{\sigma(i) | i \in \{k, \dots, n\}\} \subseteq \{k, \dots, m_n\} \quad (20.40)$$

As σ is injective it follows that

$\sigma|_{\{k, \dots, n\}}: \{k, \dots, n\} \rightarrow \sigma(\{k, \dots, n\})$ is a bijection

$$\begin{aligned} s &= \sum_{i=k}^n x_{\sigma(i)} \\ &\stackrel{[\text{theorem: 11.35}]}{=} \sum_{i \in \{k, \dots, n\}} x_{\sigma(i)} \\ &= \sum_{i \in \{k, \dots, m\}} x_{\sigma|_{\{k, \dots, n\}}(i)} \\ &\stackrel{[\text{theorem: 11.36}]}{=} \sum_{i \in \sigma(\{k, \dots, n\})} x_i \\ &\stackrel{[\text{eq: 20.40}] \& [\text{theorem: 20.92}]}{\leq} \sum_{i \in \{k, \dots, m_n\}} x_i \in \left\{ \sum_{i=k}^n x_i | n \in \{k, \dots, \infty\} \right\} \end{aligned}$$

So $\forall s \in \{\sum_{i=k}^n x_{\sigma(i)} | n \in \{k, \dots, \infty\}\}$ we found a $\sum_{i \in \{k, \dots, m_n\}} x_i \in \{\sum_{i=k}^n x_i | n \in \{k, \dots, \infty\}\}$ such that

$$s \leq \sum_{i \in \{k, \dots, m_n\}} x_i$$

Hence using [theorem: 3.78] it follows that

$$\sum_{i=k}^{\infty} x_{\sigma(i)} = \sup \left(\left\{ \sum_{i=k}^n x_{\sigma(i)} | n \in \{k, \dots, \infty\} \right\} \right) \leq \sup \left(\left\{ \sum_{i=k}^n x_i | n \in \{k, \dots, \infty\} \right\} \right) = \sum_{i=k}^{\infty} x_i$$

So we have proved that

$$\text{If } \sigma: \{k, \dots, \infty\} \rightarrow \{k, \dots, \infty\} \text{ is a bijection, } \{x_i\}_{i \in \{k, \dots, \infty\}} \subseteq [0, \infty] \text{ we have } \sum_{i=k}^{\infty} x_{\sigma(i)} \leq \sum_{i=k}^{\infty} x_i \quad (20.41)$$

For the opposite inequality if $\sigma: \{k, \dots, \infty\} \rightarrow \{k, \dots, \infty\}$ is a bijection then

$$\sum_{i=k}^{\infty} x_{\sigma(i)} \leq \sum_{i=k}^{\infty} x_i \quad (20.42)$$

and as $\sigma^{-1}: \{k, \dots, \infty\} \rightarrow \{k, \dots, \infty\}$ is a bijection we have also

$$\sum_{i=k}^{\infty} x_i = \sum_{i=k}^{\infty} x_{\sigma^{-1}(\sigma(i))} \leq \sum_{i=k}^{\infty} x_{\sigma(i)}$$

which combined with [eq: 20.42] gives

$$\sum_{i=k}^{\infty} x_i = \sum_{i=k}^{\infty} x_{\sigma(i)} \quad \square$$

In analogy with [definition: 11.32] the above theorem allows us to define the sum of a denumerable set of extended non negative numbers.

Definition 20.101. Let I be a denumerable set and $\{x_n\}_{n \in I}$ then $\sum_{i \in I} x_i$ is defined by

$$\sum_{i \in I} x_i = \sum_{i=0}^{\infty} x_{\beta(i)}$$

where

$\beta: \mathbb{N}_0 \rightarrow I$ is a bijection

Note 20.102. As I is denumerable there exist a bijection from $\mathbb{N}_0$ to I . Further if $\gamma: \mathbb{N}_0 \rightarrow I$ is another bijection then we have that $\beta^{-1} \circ \gamma: \mathbb{N}_0 \rightarrow \mathbb{N}_0$ is a bijection so that

$$\sum_{i=0}^{\infty} x_{\beta(i)} \stackrel{[\text{theorem: 20.100}]}{=} \sum_{i=0}^{\infty} x_{\beta((\beta^{-1} \circ \gamma)(i))} = \sum_{i=0}^{\infty} x_{\gamma(i)}$$

so that this definition is independent of the chosen bijection.

The next theorem shows how we can interchange sums.

Theorem 20.103. Let $k, l \in \mathbb{N}$ then we have:

1. If $n \in \{k, \dots, \infty\}$, $m \in \{l, \dots, \infty\}$ and $\{x_{i,j}\}_{(i,j) \in \{k, \dots, n\} \times \{l, \dots, m\}} \subseteq [0, \infty]$ then

$$\sum_{i=k}^n \left(\sum_{j=l}^m x_{i,j} \right) = \sum_{j=k}^m \left(\sum_{i=l}^n x_{i,j} \right)$$

2. Let $n \in \{l, \dots, \infty\}$ and $\{x_{i,j}\}_{(i,j) \in \{k, \dots, \infty\} \times \{l, \dots, n\}} \subseteq [0, \infty]$ then

$$\sum_{i=k}^{\infty} \left(\sum_{j=l}^n x_{i,j} \right) = \sum_{j=k}^n \left(\sum_{i=l}^{\infty} x_{i,j} \right)$$

3. Let $n \in \{l, \dots, \infty\}$ and $\{x_{i,j}\}_{(i,j) \in \{l, \dots, n\} \times \{k, \dots, \infty\}} \subseteq [0, \infty]$ then

$$\sum_{i=l}^n \left(\sum_{j=k}^{\infty} x_{i,j} \right) = \sum_{j=k}^{\infty} \left(\sum_{i=l}^n x_{i,j} \right)$$

4. Let $\{x_{i,j}\}_{(i,j) \in \{k, \dots, \infty\} \times \{l, \dots, \infty\}} \subseteq [0, \infty]$ then

$$\sum_{i=k}^{\infty} \left(\sum_{j=l}^{\infty} x_{i,j} \right) = \sum_{j=k}^{\infty} \left(\sum_{i=l}^{\infty} x_{i,j} \right)$$

Proof.

1. This was already proved in [theorem: 11.19].
2. We prove this by induction, so let

$$S = \left\{ n \in \{l, \dots, \infty\} \mid \text{If } \{x_{i,j}\}_{(i,j) \in \{k, \dots, \infty\} \times \{l, \dots, n\}} \subseteq [0, \infty] \text{ then } \sum_{i=k}^{\infty} \left(\sum_{j=l}^n x_{i,j} \right) = \sum_{j=k}^n \left(\sum_{i=l}^{\infty} x_{i,j} \right) \right\}$$

then we have:

$l \in S$. Let $\{x_{i,j}\}_{(i,j) \in \{k, \dots, \infty\} \times \{l\}} \subseteq [0, \infty]$ then we have

$$\begin{aligned} \sum_{i=k}^{\infty} \left(\sum_{j=l}^l x_{i,j} \right) &= \sum_{i=k}^{\infty} x_{i,l} \\ &= \sum_{j=l}^l \left(\sum_{i=k}^{\infty} x_{i,j} \right) \end{aligned}$$

so that $l \in S$.

$n \in S \rightarrow n+1 \in S$. Let $\{x_{i,j}\}_{(i,j) \in \{k, \dots, \infty\} \times \{l, \dots, n+1\}} \subseteq [0, \infty]$ then we have

$$\begin{aligned} \sum_{i=k}^{\infty} \left(\sum_{j=l}^{n+1} x_{i,j} \right) &= \sum_{i=k}^{\infty} \left(\sum_{j=l}^n x_{i,j} + x_{i,n+1} \right) \\ &\stackrel{[\text{theorem: 20.98}]}{=} \sum_{i=k}^{\infty} \left(\sum_{j=l}^n x_{i,j} \right) + \sum_{i=k}^{\infty} x_{i,n+1} \\ &\stackrel{=}{n \in S} \sum_{j=l}^n \left(\sum_{i=k}^{\infty} x_{i,j} \right) + \sum_{i=k}^{\infty} x_{i,n+1} \\ &= \sum_{j=l}^{n+1} \left(\sum_{i=k}^{\infty} x_{i,j} \right) \end{aligned}$$

proving that $n+1 \in S$

3. Define $\{y_{(i,j)}\}_{(i,j) \in \{k, \dots, n\} \times \{l, \dots, \infty\}}$ by $y_{(i,j)} = x_{(j,i)}$ then we have

$$\begin{aligned} \sum_{i=k}^n \left(\sum_{j=l}^{\infty} x_{i,j} \right) &= \sum_{i=k}^n \left(\sum_{j=l}^{\infty} y_{j,i} \right) \\ &\stackrel{(2)}{=} \sum_{j=l}^{\infty} \left(\sum_{i=k}^n y_{j,i} \right) \\ &= \sum_{j=l}^{\infty} \left(\sum_{i=k}^n x_{i,j} \right) \end{aligned}$$

4. Let $n \in \{k, \dots, \infty\}$ then

$$\begin{aligned} \sum_{i=k}^n \left(\sum_{j=l}^{\infty} x_{i,j} \right) &\stackrel{(3)}{=} \sum_{j=l}^{\infty} \left(\sum_{i=k}^n x_{i,j} \right) \\ &\leq \sum_{j=l}^{\infty} \sup \left(\left\{ \sum_{i=k}^n x_{i,j} \mid n \in \{k, \dots, \infty\} \right\} \right) \\ &\stackrel{[\text{definition: 20.94}]}{=} \sum_{j=l}^{\infty} \left(\sum_{i=k}^{\infty} x_{i,j} \right) \end{aligned}$$

So $\sum_{j=l}^{\infty} (\sum_{i=k}^{\infty} x_{i,j})$ is an upper bound of $\{\sum_{i=k}^n (\sum_{j=l}^{\infty} x_{i,j}) \mid n \in \{k, \dots, \infty\}\}$ from which it follows that

$$\sum_{i=k}^{\infty} \left(\sum_{j=l}^{\infty} x_{i,j} \right) = \sup \left(\sum_{i=k}^n \left(\sum_{j=l}^{\infty} x_{i,j} \right) \mid n \in \{k, \dots, \infty\} \right) \leq \sum_{j=l}^{\infty} \left(\sum_{i=k}^{\infty} x_{i,j} \right) \quad (20.43)$$

For the opposite inequality take $m \in \{l, \dots, \infty\}$ then we have

$$\begin{aligned} \sum_{j=l}^m \left(\sum_{i=k}^{\infty} x_{i,j} \right) &\stackrel{(2)}{=} \sum_{i=k}^{\infty} \left(\sum_{j=l}^m x_{i,j} \right) \\ &\leq \sum_{i=k}^{\infty} \sup \left(\left\{ \sum_{j=l}^m x_{i,j} \mid m \in \{l, \dots, \infty\} \right\} \right) \\ &\stackrel{[\text{definition: 20.94}]}{=} \sum_{i=k}^{\infty} \left(\sum_{j=l}^{\infty} x_{i,j} \right) \end{aligned}$$

So $\sum_{i=k}^{\infty} (\sum_{j=l}^{\infty} x_{i,j})$ is an upper bound of $\{\sum_{j=l}^m (\sum_{i=k}^{\infty} x_{i,j}) | m \in \{l, \dots, \infty\}\}$ proving that

$$\sum_{j=l}^{\infty} \left(\sum_{i=k}^{\infty} x_{i,j} \right) = \sup \left(\left\{ \sum_{j=l}^m \left(\sum_{i=k}^{\infty} x_{i,j} \right) | m \in \{l, \dots, \infty\} \right\} \right) \leq \sum_{i=k}^{\infty} \left(\sum_{j=l}^{\infty} x_{i,j} \right)$$

Combining this with [eq: 20.43] proves

$$\sum_{i=k}^{\infty} \left(\sum_{j=l}^{\infty} x_{i,j} \right) = \sum_{j=l}^{\infty} \left(\sum_{i=k}^{\infty} x_{i,j} \right) \quad \square$$

Every finite sum of denumerable sums can be written as a denumerable sum.

Lemma 20.104. Let $k, l, m \in \mathbb{N}_0$ and $n \in \{k, \dots, \infty\}$, $\{x_{i,j}\}_{(i,j) \in \{k, \dots, n\} \times \{l, \dots, \infty\}} \subseteq [0, \infty]$ and

$$\beta: \{m, \dots, \infty\} \rightarrow \{k, \dots, n\} \times \{l, \dots, \infty\}$$

a bijection then

$$\sum_{i=m}^{\infty} x_{\sigma(i)_1, \sigma(i)_2} = \sum_{j=l}^{\infty} \left(\sum_{i=k}^n x_{i,j} \right) \stackrel{[\text{theorem: 20.103}]}{=} \sum_{i=k}^n \left(\sum_{j=l}^{\infty} x_{i,j} \right)$$

Note 20.105. By [theorem: 6.65] there exist always a bijection between $\{m, \dots, \infty\}$ and $\{k, \dots, n\} \times \{l, \dots, \infty\}$ for a given $m \in \mathbb{N}_0$.

Proof. Let $r \in \{m, \dots, \infty\}$ and define $N_r = \max(\{\beta(i)_2 | i \in \{m, \dots, r\}\}) \in \{l, \dots, \infty\}$ then if $i \in \{m, \dots, r\}$ we have that $\beta(i)_2 \in \{k, \dots, N_r\}$ so that $\beta(i) = (\beta(i)_1, \beta(i)_2) \in \{k, \dots, n\} \times \{l, \dots, N_r\}$. Hence

$$\beta(\{m, \dots, r\}) \subseteq \{k, \dots, n\} \times \{l, \dots, N_r\}$$

Further as β is a bijection

$$\beta|_{\{m, \dots, r\}}: \{m, \dots, r\} \rightarrow \beta(\{m, \dots, r\}) \text{ is a bijection}$$

Next

$$\begin{aligned} \sum_{i=m}^r x_{\beta(i)_1, \beta(i)_2} &\stackrel{[\text{theorem: 11.35}]}{=} \sum_{i \in \{m, \dots, r\}} x_{\beta(i)_1, \beta(i)_2} \\ &= \sum_{i \in \{m, \dots, r\}} x_{\sigma|_{\{m, \dots, r\}}(i)_1, \sigma|_{\{m, \dots, r\}}(i)_2} \\ &\stackrel{[\text{theorem: 11.36}]}{=} \sum_{(i,j) \in \beta(\{m, \dots, r\})} x_{(i,j)_1, (i,j)_2} \\ &= \sum_{(i,j) \in \beta(\{m, \dots, r\})} x_{i,j} \\ &\stackrel{[\text{theorem: 20.92}]}{\leq} \sum_{(i,j) \in \{k, \dots, n\} \times \{l, \dots, N_r\}} x_{i,j} \\ &\stackrel{[\text{theorem: 11.45}]}{=} \sum_{i \in \{k, \dots, n\}} \left(\sum_{j \in \{l, \dots, N_r\}} x_{i,j} \right) \\ &\stackrel{[\text{theorem: 11.35}]}{=} \sum_{i=k}^n \left(\sum_{j=l}^{N_r} x_{i,j} \right) \\ &\stackrel{[\text{theorem: 20.98}]}{\leq} \sum_{i=k}^n \sup \left(\left\{ \sum_{j=l}^s x_{i,j} | s \in \{l, \dots, \infty\} \right\} \right) \\ &= \sum_{i=k}^n \left(\sum_{j=l}^{\infty} x_{i,j} \right) \end{aligned}$$

Hence as $r \in \{m, \dots, \infty\}$ was chosen arbitrary it follows that

$$\sum_{i=m}^{\infty} x_{\beta(i)_1, \beta(i)_2} = \sup \left(\left\{ \sum_{i=m}^r x_{\beta(i)_1, \beta(i)_2} \mid r \in \{m, \dots, \infty\} \right\} \right) \leq \sum_{i=k}^n \left(\sum_{j=l}^{\infty} x_{i,j} \right) \quad (20.44)$$

For the opposite inequality. Let $r \in \{l, \dots, \infty\}$ and take

$$M_r = \max((\beta^{-1})(\{k, \dots, n\} \times \{l, \dots, r\})) \in \{m, \dots, \infty\}$$

So $(\beta^{-1})(\{k, \dots, n\} \times \{l, \dots, r\}) \subseteq \{m, \dots, M_r\}$ hence

$$\{k, \dots, n\} \times \{l, \dots, r\} = \beta((\beta^{-1})(\{k, \dots, n\} \times \{l, \dots, r\})) \subseteq \beta(\{m, \dots, M_r\}) \quad (20.45)$$

As β is a bijection it follows that

$$\begin{aligned} \beta|_{\{m, \dots, M_r\}}: \{m, \dots, M_r\} &\rightarrow \beta(\{m, \dots, M_r\}) \\ \sum_{j=l}^r \left(\sum_{i=k}^n x_{i,j} \right) &\stackrel{[\text{theorem: 20.103}]}{=} \sum_{i=k}^n \left(\sum_{j=l}^r x_{i,j} \right) \\ &\stackrel{[\text{theorem: 11.35}]}{=} \sum_{i \in \{k, \dots, n\}} \left(\sum_{j \in \{l, \dots, r\}} x_{i,j} \right) \\ &\stackrel{[\text{theorem: 11.45}]}{=} \sum_{(i,j) \in \{k, \dots, n\} \times \{l, \dots, r\}} x_{i,j} \\ &\stackrel{[\text{theorem: 20.98}] \wedge [\text{eq: 20.45}]}{\leq} \sum_{(i,j) \in \beta(m, \dots, M_r)} x_{i,j} \\ &= \sum_{(i,j) \in \beta(m, \dots, M_r)} x_{(i,j)_1, (i,j)_2} \\ &\stackrel{[\text{theorem: 11.36}]}{=} \sum_{i \in \{m, \dots, M_r\}} x_{\beta|_{\{m, \dots, M_r\}}(i)_1, \beta|_{\{m, \dots, M_r\}}(i)_2} \\ &= \sum_{i \in \{m, \dots, M_r\}} x_{\beta(i)_1, \beta(i)_2} \\ &\stackrel{[\text{theorem: 11.35}]}{=} \sum_{i=m}^{M_r} x_{\beta(i)_1, \beta(i)_2} \\ &\leq \sup \left(\left\{ \sum_{i=m}^s x_{\beta(i)_1, \beta(i)_2} \mid s \in \{m, \dots, \infty\} \right\} \right) \\ &= \sum_{i=m}^{\infty} x_{\beta(i)_1, \beta(i)_2} \end{aligned}$$

Hence as $r \in \{l, \dots, \infty\}$ was chosen arbitrary we have that

$$\sum_{j=l}^{\infty} \left(\sum_{i=k}^n x_{i,j} \right) = \sup \left(\left\{ \sum_{j=l}^s \left(\sum_{i=k}^n x_{i,j} \right) \mid s \in \{l, \dots, \infty\} \right\} \right) \leq \sum_{i=m}^{\infty} x_{\beta(i)_1, \beta(i)_2}$$

which combined with [eq: 20.44] proves that

$$\sum_{i=m}^{\infty} x_{\beta(i)_1, \beta(i)_2} = \sum_{j=l}^{\infty} \left(\sum_{i=k}^n x_{i,j} \right)$$

□

Next we extend the above theorem for arbitrary finite sums of different size.

Theorem 20.106. *Let $k, l \in \mathbb{N}_0$ and $\{x_{(i,j)}\}_{(i,j) \in \bigcup_{i \in \{k, \dots, \infty\}} \{i\} \times \{n_i, \dots, m_i\}} \subseteq [0, \infty]$ [where $\forall i \in \{k, \dots, \infty\}$ we have $n_i \leq m_i$] then if*

$$\beta: \{l, \dots, \infty\} \rightarrow \bigcup_{i \in \{k, \dots, \infty\}} \{i\} \times \{n_i, \dots, m_i\}$$

is a bijection then we have

$$\sum_{i=l}^{\infty} x_{\beta(i)_1, \beta(i)_2} = \sum_{i=k}^{\infty} \left(\sum_{j=n_i}^{m_i} x_{(i,j)} \right)$$

Proof. Let $i \in \{k, \dots, \infty\}$ and define

$$\tau_i: \{n_i, \dots, m_i\} \rightarrow \{i\} \times \{n_i, \dots, m_i\} \text{ where } \tau_i(j) = (i, j) \text{ which is a bijection}$$

Proof.

injectivity. If $\tau_i(r) = \tau_i(s)$ then $(i, r) = (i, s)$ so that $r = s$.

surjectivity. If $(r, s) \in \{i\} \times \{n_i, \dots, m_i\}$ then $s \in \{n_i, \dots, m_i\}$ and $r = i$ so that $\tau_i(s) = (i, s) = (r, s)$ proving surjectivity. $\square$

Further

$$\begin{aligned} \sum_{(k,l) \in \tau_i(\{n_i, \dots, m_i\})} x_{k,l} &\stackrel{[\text{theorem: 11.36}]}{=} \sum_{j \in \{n_i, \dots, m_i\}} x_{\tau_i(j)_1, \tau_i(j)_2} \\ &= \sum_{j \in \{n_i, \dots, m_i\}} x_{i,j} \\ &= \sum_{j=n_i}^{m_i} x_{i,j} \end{aligned} \quad (20.46)$$

Let $m \in \{l, \dots, \infty\}$ and define $N_m = \max(\beta(i)_1 | i \in \{l, \dots, m\})$. If $i \in \{l, \dots, m\}$ then, as $\beta(i) \in \bigcup_{j \in \{k, \dots, \infty\}} \{j\} \times \{n_i, \dots, m_i\}$ there exist a $j \in \{k, \dots, \infty\}$ such that $j = \beta(i)_1 \leq N_m$ and $\beta(i)_2 \in \{n_j, \dots, m_j\}$ proving that

$$\beta(\{l, \dots, m\}) \subseteq \bigcup_{i \in \{k, \dots, N_m\}} \{i\} \times \{n_i, \dots, m_i\}$$

Further if $i, j \in \{k, \dots, N_m\}$ with $i \neq j$ then $\{i\} \times \{n_i, \dots, m_i\} \cap \{j\} \times \{n_j, \dots, m_j\} = \emptyset$ hence we have

$$\beta(\{l, \dots, m\}) \subseteq \bigsqcup_{i \in \{k, \dots, N_m\}} \{i\} \times \{n_i, \dots, m_i\} \text{ a disjoint union}$$

and as β is a bijection

$$\beta|_{\{l, \dots, m\}}: \{l, \dots, m\} \rightarrow \beta(\{l, \dots, m\}) \text{ is a bijection}$$

$$\begin{aligned} \sum_{i=l}^m x_{\beta(i)_1, \beta(i)_2} &\stackrel{[\text{theorem: 11.35}]}{=} \sum_{i \in \{l, \dots, m\}} x_{\beta(i)_1, \beta(i)_2} \\ &= \sum_{i \in \{l, \dots, m\}} x_{\beta|_{\{l, \dots, m\}}(i)_1, \beta|_{\{l, \dots, m\}}(i)_2} \\ &\stackrel{[\text{theorem: 11.36}]}{=} \sum_{(i,j) \in \beta(\{l, \dots, m\})} x_{(i,j)_1, (i,j)_2} \\ &\stackrel{[\text{theorem: 20.92}]}{\leq} \sum_{(i,j) \in \bigsqcup_{i \in \{k, \dots, N_m\}} \{i\} \times \{n_i, \dots, m_i\}} x_{(i,j)_1, (i,j)_2} \\ &= \sum_{(i,j) \in \bigsqcup_{i \in \{k, \dots, N_m\}} \{i\} \times \{n_i, \dots, m_i\}} x_{i,j} \end{aligned}$$

$$\begin{aligned}
& \stackrel{[\text{theorem: 11.44}]}{=} \sum_{r \in \{k, \dots, N_m\}} \left(\sum_{(i,j) \in \{r\} \times \{n_r, \dots, m_r\}} x_{i,j} \right) \\
& = \sum_{r \in \{k, \dots, N_m\}} \left(\sum_{j \in \{n_r, \dots, m_r\}} x_{r,j} \right) \\
& \stackrel{[\text{theorem: 11.35}]}{=} \sum_{r=k}^{N_m} \left(\sum_{j=n_r}^{m_r} x_{r,j} \right) \\
& \stackrel{[\text{theorem: 20.92}]}{\leq} \sup \left(\left\{ \sum_{r=k}^n \left(\sum_{j=n_r}^{m_r} x_{r,j} \right) \mid n \in \{k, \dots, \infty\} \right\} \right) \\
& = \sum_{r=k}^{\infty} \left(\sum_{j=n_r}^{m_r} x_{r,j} \right)
\end{aligned}$$

So $m \in \{l, \dots, \infty\}$ was chosen arbitrary we have that

$$\sum_{i=l}^{\infty} x_{\beta(i)_1, \beta(i)_2} = \sup \left(\left\{ \sum_{i=l}^m x_{\beta(i)_1, \beta(i)_2} \mid m \in \{l, \dots, \infty\} \right\} \right) \leq \sum_{r=k}^{\infty} \left(\sum_{j=n_r}^{m_r} x_{r,j} \right) \quad (20.47)$$

For the opposite inequality take $m \in \{k, \dots, \infty\}$ and take

$$M_m = \max \left(\left\{ (\beta^{-1}) \left(\bigcup_{i \in \{k, \dots, m\}} \{i\} \times \{n_i, \dots, m_i\} \right) \right\} \right)$$

then $(\beta^{-1})(\bigcup_{i \in \{k, \dots, m\}} \{i\} \times \{n_i, \dots, m_i\}) \subseteq \{l, \dots, M_m\}$ then

$$\bigcup_{i \in \{k, \dots, m\}} \{i\} \times \{n_i, \dots, m_i\} = \beta \left((\beta^{-1}) \left(\bigcup_{i \in \{k, \dots, m\}} \{i\} \times \{n_i, \dots, m_i\} \right) \right) \subseteq \beta(\{l, \dots, M_m\}) \quad (20.48)$$

Next

$$\begin{aligned}
\sum_{r=k}^m \left(\sum_{j=n_r}^{m_r} x_{r,j} \right) & \stackrel{[\text{eq: 20.46}]}{=} \sum_{r=k}^m \left(\sum_{(i,j) \in \{r\} \times \{n_r, \dots, m_r\}} x_{i,j} \right) \\
& = \sum_{r \in \{k, \dots, m\}} \left(\sum_{(i,j) \in \{r\} \times \{n_r, \dots, m_r\}} x_{i,j} \right) \\
& \stackrel{[\text{theorem: 11.44}]}{=} \sum_{(i,j) \in \bigcup_{r \in \{k, \dots, m\}} \{r\} \times \{n_r, \dots, m_r\}} x_{i,j} \\
& \stackrel{[\text{theorem: 20.92}] \wedge [\text{eq: 20.48}]}{\leq} \sum_{(i,j) \in \beta(\{l, \dots, M_m\})} x_{i,j} \\
& = \sum_{(i,j) \in \beta(\{l, \dots, M_m\})} x_{(i,j)_1, (i,j)_2} \\
& \stackrel{[\text{theorem: 11.36}]}{=} \sum_{i \in \{l, \dots, M_m\}} x_{\beta(i)_1, \beta(i)_2} \\
& = \sum_{i=l}^{M_m} x_{\beta(i)_1, \beta(i)_2} \\
& \leq \sup \left(\left\{ \sum_{i=l}^n x_{\beta(i)_1, \beta(i)_2} \mid n \in \{l, \dots, \infty\} \right\} \right) \\
& = \sum_{i=l}^{\infty} x_{\beta(i)_1, \beta(i)_2}
\end{aligned}$$

As $m \in \{k, \dots, \infty\}$ was chosen arbitrary it follows that

$$\sum_{r=k}^{\infty} \left(\sum_{j=n_r}^{m_r} x_{r,j} \right) = \sup \left(\left\{ \sum_{r=k}^n \left(\sum_{j=n_r}^{m_r} x_{r,j} \right) \mid n \in \{r, \dots, \infty\} \right\} \right) \leq \sum_{i=l}^{\infty} x_{\beta(i)_1, \beta(i)_2}$$

which combined with [eq: 20.47] proves that

$$\sum_{i=l}^{\infty} x_{\beta(i)_1, \beta(i)_2} = \sum_{r=k}^{\infty} \left(\sum_{j=n_r}^{m_r} x_{r,j} \right) \quad \square$$

Theorem 20.107. Let $k, l, n \in \mathbb{N}_0$ and $\{x_{i,j}\}_{(i,j) \in \{k, \dots, \infty\} \times \{l, \dots, \infty\}} \subseteq [0, \infty]$ and

$\beta: \{n, \dots, \infty\} \rightarrow \{k, \dots, \infty\} \times \{l, \dots, \infty\}$ a bijection

then

$$\sum_{i=0}^{\infty} x_{\beta(i)_1, \beta(i)_2} = \sum_{i=k}^{\infty} \left(\sum_{j=l}^{\infty} x_{i,j} \right)$$

Note 20.108. By [theorem: 6.65] there exist always a bijection between $\{n, \dots, \infty\}$ and $\{k, \dots, \infty\} \times \{l, \dots, \infty\}$ for a given $m \in \mathbb{N}_0$.

Proof. Let $m \in \{n, \dots, \infty\}$ and define $N_m = \max(\{\beta(i)_1 \mid i \in \{n, \dots, m\}\})$ and $M_m = \max(\{\beta(i)_2 \mid i \in \{n, \dots, m\}\})$ then we have that

$$\beta(\{n, \dots, m\}) \subseteq \{k, \dots, N_m\} \times \{l, \dots, M_m\} \quad (20.49)$$

Then we have

$$\begin{aligned} \sum_{i=n}^m x_{\beta(i)_1, \beta(i)_2} &\stackrel{[\text{theorem: 11.35}]}{=} \sum_{i \in \{n, \dots, m\}} x_{\beta(i)_1, \beta(i)_2} \\ &\stackrel{[\text{theorem: 11.36}]}{=} \sum_{(i,j) \in \beta(\{n, \dots, m\})} x_{(i,j)_1, (i,j)_2} \\ &= \sum_{(i,j) \in \beta(\{n, \dots, m\})} x_{i,j} \\ &\stackrel{[\text{theorem: 20.92}] \wedge [\text{eq: 20.49}]}{\leq} \sum_{(i,j) \in \{k, \dots, N_m\} \times \{l, \dots, M_m\}} x_{i,j} \\ &\stackrel{[\text{theorem: 11.45}]}{=} \sum_{i \in \{k, \dots, N_m\}} \left(\sum_{j \in \{l, \dots, M_m\}} x_{i,j} \right) \\ &\stackrel{[\text{theorem: 11.35}]}{=} \sum_{i=k}^{N_m} \left(\sum_{j=l}^{M_m} x_{i,j} \right) \\ &\stackrel{[\text{theorem: 20.92}]}{\leq} \sum_{i=k}^{N_m} \sup \left(\left\{ \sum_{j=l}^r x_{i,j} \mid r \in \{l, \dots, \infty\} \right\} \right) \\ &= \sum_{i=k}^{N_m} \left(\sum_{j=l}^{M_m} x_{i,j} \right) \\ &\leq \sup \left(\left\{ \sum_{i=k}^r \left(\sum_{j=l}^{M_m} x_{i,j} \right) \mid r \in \{k, \dots, \infty\} \right\} \right) \\ &= \sum_{i=k}^{\infty} \left(\sum_{j=l}^{\infty} x_{i,j} \right) \end{aligned}$$

As $m \in \{n, \dots, \infty\}$ was chosen arbitrary it follows that

$$\sum_{i=n}^{\infty} x_{\beta(i)_1, \beta(i)_2} = \sup \left(\left\{ \sum_{i=n}^m x_{\beta(i)_1, \beta(i)_2} \mid m \in \{n, \dots, \infty\} \right\} \right) \leq \sum_{i=k}^{\infty} \left(\sum_{j=l}^{\infty} x_{i,j} \right) \quad (20.50)$$

For the opposite inequality let $r \in \{k, \dots, \infty\}$, $s \in \{l, \dots, \infty\}$ and take

$$N = \max((\beta^{-1})(\{k, \dots, r\} \times \{l, \dots, s\}))$$

then $(\beta^{-1})(\{k, \dots, r\} \times \{l, \dots, s\}) \subseteq \{n, \dots, N\}$ so that

$$\{k, \dots, r\} \times \{l, \dots, s\} = \beta((\beta^{-1})(\{k, \dots, r\} \times \{l, \dots, s\})) \subseteq \beta(n, \dots, N) \quad (20.51)$$

Next

$$\begin{aligned} \sum_{i=k}^r \left(\sum_{j=l}^s x_{i,j} \right) &\stackrel{[\text{theorem: 11.35}]}{=} \sum_{i \in \{k, \dots, r\}} \left(\sum_{j \in \{l, \dots, s\}} x_{i,j} \right) \\ &\stackrel{[\text{theorem: 11.45}]}{=} \sum_{(i,j) \in \{k, \dots, r\} \times \{l, \dots, s\}} x_{i,j} \\ &\stackrel{[\text{theorem: 20.92}] \wedge [\text{eq: 20.51}]}{\leq} \sum_{(i,j) \in \beta(n, \dots, N)} x_{i,j} \\ &= \sum_{(i,j) \in \beta(n, \dots, N)} x_{(i,j)_1, (i,j)_2} \\ &\stackrel{[\text{theorem: 11.36}]}{=} \sum_{i \in \{n, \dots, N\}} x_{\beta(i)_1, \beta(i)_2} \\ &= \sum_{i=n}^N x_{\beta(i)_1, \beta(i)_2} \\ &\leq \sup \left(\left\{ \sum_{i=n}^m x_{\beta(i)_1, \beta(i)_2} \mid m \in \{n, \dots, \infty\} \right\} \right) \\ &= \sum_{i=n}^{\infty} x_{\beta(i)_1, \beta(i)_2} \end{aligned}$$

Hence as $r \in \{k, \dots, \infty\}$ was chosen arbitrary we have that

$$\sum_{i=k}^{\infty} \left(\sum_{j=l}^s x_{i,j} \right) = \sup \left(\left\{ \sum_{i=k}^m \left(\sum_{j=l}^s x_{i,j} \right) \mid m \in \{k, \dots, \infty\} \right\} \right) \leq \sum_{i=n}^{\infty} x_{\beta(i)_1, \beta(i)_2} \quad (20.52)$$

Further

$$\begin{aligned} \sum_{j=l}^s \left(\sum_{i=k}^{\infty} x_{i,j} \right) &\stackrel{[\text{theorem: 20.103}]}{=} \sum_{i=k}^{\infty} \left(\sum_{j=l}^s x_{i,j} \right) \\ &\stackrel{[\text{eq: 20.52}]}{\leq} \sum_{i=n}^{\infty} x_{\beta(i)_1, \beta(i)_2} \end{aligned}$$

So as $s \in \{l, \dots, \infty\}$ is chosen arbitrary we have that

$$\sum_{j=l}^{\infty} \left(\sum_{i=k}^{\infty} x_{i,j} \right) = \sup \left(\left\{ \sum_{j=l}^m \left(\sum_{i=k}^{\infty} x_{i,j} \right) \mid m \in \{l, \dots, \infty\} \right\} \right) \leq \sum_{i=n}^{\infty} x_{\beta(i)_1, \beta(i)_2}$$

hence

$$\sum_{i=k}^{\infty} \left(\sum_{j=l}^{\infty} x_{i,j} \right) \stackrel{[\text{theorem: 20.103}]}{=} \sum_{j=l}^{\infty} \left(\sum_{i=k}^{\infty} x_{i,j} \right) \leq \sum_{i=n}^{\infty} x_{\beta(i)_1, \beta(i)_2}$$

which combined with [eq: 20.50] proves that

$$\sum_{i=0}^{\infty} x_{\beta(i)_1, \beta(i)} = \sum_{i=k}^{\infty} \left(\sum_{j=l}^{\infty} x_{i,j} \right) \quad \square$$

If a series is finite then all the terms in the series are real numbers.

Lemma 20.109. *Let $k \in \mathbb{N}_0$, $n \in \{k, \dots, \infty\}$ and $\{x_i\}_{i \in \{k, \dots, n\}} \subseteq [0, \infty]$ then we have*

$$\sum_{i=k}^n x_i = \infty \Leftrightarrow \infty \in \{x_i | i \in \{k, \dots, n\}\}$$

Proof.

$\Rightarrow$. We use induction to prove this, so let

$$S = \left\{ n \in \{k, \dots, \infty\} \mid \text{If } \{x_i\}_{i \in \{k, \dots, n\}} \subseteq [0, \infty] \text{ satisfies } \sum_{i=k}^n x_i \text{ then } \infty \in \{x_i | i \in \{k, \dots, \infty\}\} \right\}$$

then we have:

$k \in S$. For $\{x_i\}_{i \in \{k\}} \subseteq [0, \infty]$ we have $x_k = \sum_{i=k}^k x_i = \infty$ hence $\infty \in \{x_i | i \in \{k\}\}$ proving that $k \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $\{x_i\}_{i \in \{k, \dots, n+1\}} \subseteq [0, \infty]$ be such that $\sum_{i=k}^{n+1} x_i = \infty$ then, as $\sum_{i=k}^{n+1} x_i = x_{n+1} + \sum_{i=k}^n x_i$, we have either:

$x_{n+1} = \infty$. Then $\infty \in \{x_i | i \in \{k, \dots, n+1\}\}$

$\sum_{i=k}^n x_i = \infty$. Then as $n \in S$ $\infty \in \{x_i | i \in \{k, \dots, n\}\} \subseteq \infty \in \{x_i | i \in \{k, \dots, n+1\}\}$

So in all possible cases we have $\infty \in \{x_i | i \in \{k, \dots, n+1\}\}$ which proves that $n+1 \in S$

$\Leftarrow$. We use also induction for this, so let

$$S = \left\{ n \in \{k, \dots, \infty\} \mid \text{If } \{x_i\}_{i \in \{k, \dots, n\}} \subseteq [0, \infty] \text{ satisfies } \infty \in \{x_i | i \in \{k, \dots, n\}\} \text{ then } \sum_{i=k}^n x_i = \infty \right\}$$

the we have:

$k \in S$. If $\{x_i\}_{i \in \{k\}} \subseteq [0, \infty]$ satisfies $\infty \in \{x_i | i \in \{k, \dots, k\}\} = \{x_i\}$ then $x_k = \infty$ so that $\sum_{i=k}^k x_i = x_k = \infty$. Hence $k \in S$.

$n \in S \Rightarrow n+1 \in S$. If $\{x_i\}_{i \in \{k, \dots, n+1\}} \subseteq [0, \infty]$ satisfies $\infty \in \{x_i | i \in \{k, \dots, n+1\}\}$ then there exist a $i \in \{k, \dots, n+1\}$ such that $x_i = \infty$. For i we have either:

$i = n+1$. Then $\sum_{i=k}^{n+1} x_i = x_{n+1} + \sum_{i=k}^n x_i = \infty + \sum_{i=k}^n x_i = \infty$

$i \in \{k, \dots, n\}$. Then $\sum_{i=k}^{n+1} x_i = x_{n+1} + \sum_{i=k}^n x_i \underset{n \in S}{=} x_{n+1} + \infty = \infty$

So in all cases we have $\sum_{i=k}^{n+1} x_i = \infty$ proving that $n+1 \in S$. $\square$

Theorem 20.110. *Let $k \in \mathbb{N}_0$ and for $\{x_i\}_{i \in \{k, \dots, \infty\}} \subseteq [0, \infty]$ we have $\sum_{i=k}^{\infty} x_i < \infty$ then $\forall i \in \{k, \dots, \infty\}$ we have $x_i < \infty$*

Proof. As $\sup(\{\sum_{i=k}^n x_i | n \in \{k, \dots, \infty\}\}) = \sum_{i=k}^{\infty} x_i < \infty$ it follows from [theorem: 20.15] that $\forall n \in \{k, \dots, \infty\}$ we have that $\sum_{i=k}^n x_i < \infty \underset{[\text{lemma: 20.109}]}{=} x_n = \infty$. $\square$

Chapter 21

Measures and Integration

21.1 Preliminaries

Theorem 21.1. *Let A, B, C, D be sets then*

1. $(A \cdot B) \setminus (C \cdot D) = ((A \setminus C) \cdot B) \cup (A \cdot (B \setminus D))$
2. $(A \cdot B) \setminus (C \cdot D) = (A \setminus C) \cdot (B \setminus D) \cup (A \setminus C) \cdot (B \cap D) \cup (A \cap C) \cdot (B \setminus D)$ and
 - a. $((A \setminus C) \cdot (B \setminus D)) \cap ((A \setminus C) \cdot (B \cap D)) = \emptyset$
 - b. $((A \setminus C) \cdot (B \setminus D)) \cap ((A \cap C) \cdot (B \setminus D)) = \emptyset$
 - c. $((A \setminus C) \cdot (B \cap D)) \cap ((A \cap C) \cdot (B \setminus D)) = \emptyset$

Proof.

1. We have the following equivalences

$$\begin{aligned}
 (x, y) \in (A \cdot B) \setminus (C \cdot D) &\Leftrightarrow (x, y) \in A \cdot B \wedge (x, y) \notin C \cdot D \\
 &\Leftrightarrow x \in A \wedge y \in B \wedge \neg(x \in C \wedge y \in D) \\
 &\Leftrightarrow x \in A \wedge y \in B \wedge (x \notin C \vee y \notin D) \\
 &\Leftrightarrow (x \in A \wedge y \in B \wedge x \notin C) \vee (x \in A \wedge y \in B \wedge y \notin D) \\
 &\Leftrightarrow (x \in A \setminus C \wedge y \in B) \vee (x \in A \wedge y \in B \setminus D) \\
 &\Leftrightarrow (x, y) \in (A \setminus C) \cdot B \vee (x, y) \in A \cdot (B \setminus D) \\
 &\Leftrightarrow (x, y) \in (A \setminus C) \cdot B \cup (A \cdot (B \setminus D))
 \end{aligned}$$

which proves that

$$(A \cdot B) \setminus (C \cdot D) = ((A \setminus C) \cdot B) \cup (A \cdot (B \setminus D))$$

2. Next we have

$$\begin{aligned}
 &(A \cdot B) \setminus (C \cdot D) = \\
 &((A \setminus C) \cdot B) \cup (A \cdot (B \setminus D)) \stackrel{[\text{theorem: 1.35}]}{=} \\
 &((A \setminus C) \cdot ((B \setminus D) \cup (B \cap D))) \cup (((A \setminus C) \cup (A \cap C)) \cdot (B \setminus D)) \stackrel{[\text{theorem: 6.84}]}{=} \\
 &\underbrace{(A \setminus C) \cdot (B \setminus D)} \cup (A \setminus C) \cdot (B \cap D) \cup \underbrace{(A \setminus C) \cdot (B \setminus D)} \cup (A \cap C) \cdot (B \setminus D) = \\
 &(A \setminus C) \cdot (B \setminus D) \cup (A \setminus C) \cdot (B \cap D) \cup (A \cap C) \cdot (B \setminus D)
 \end{aligned}$$

proving

$$(A \cdot B) \setminus (C \cdot D) = (A \setminus C) \cdot (B \setminus D) \cup (A \setminus C) \cdot (B \cap D) \cup (A \cap C) \cdot (B \setminus D)$$

a.

$$\begin{aligned}
 &((A \setminus C) \cdot (B \setminus D)) \cap ((A \setminus C) \cdot (B \cap D)) \stackrel{[\text{theorem: 6.84}]}{=} \\
 &(A \setminus C) \cdot ((B \setminus D) \cap (B \cap D)) = \\
 &(A \setminus C) \cdot \emptyset \stackrel{[\text{theorem: 6.84}]}{=} \\
 &\emptyset
 \end{aligned}$$

b.

$$\begin{aligned}
((A \setminus C) \cdot (B \setminus D)) \cap ((A \cap C) \cdot (B \setminus D)) & \stackrel{[\text{theorem: 6.84}]}{=} \\
((A \setminus C) \cap (A \cap C)) \cdot (B \setminus D) & = \\
\emptyset \cap (B \setminus D) & \stackrel{[\text{theorem: 6.84}]}{=} \\
\emptyset &
\end{aligned}$$

c.

$$\begin{aligned}
((A \setminus C) \cdot (B \cap D)) \cap ((A \cap C) \cdot (B \setminus D)) & \stackrel{[\text{theorem: 6.84}]}{\subseteq} \\
(A \cdot (B \cap D)) \cap (A \cdot (B \setminus D)) & \stackrel{[\text{theorem: 6.84}]}{=} \\
A \cdot ((B \cap D) \cap (B \setminus D)) & = \\
A \cdot \emptyset & \stackrel{[\text{theorem: 6.84}]}{=} \\
\emptyset &
\end{aligned}$$

□

Definition 21.2. Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$, I a set then a family of sets $\{A_i\}_{i \in I} \subseteq \mathcal{A}$ is **pairwise disjoint** if

$$\forall i, j \in I \text{ with } i \neq j \text{ we have } A_i \cap A_j = \emptyset$$

Notation 21.3. Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$, I a set and $\{A_i\}_{i \in I} \subseteq \mathcal{A}$ then if we write

$$\bigsqcup_{i \in I} A_i$$

we mean

$$\bigsqcup_{i \in I} A_i$$

and additional that $\{A_i\}_{i \in I} \subseteq \mathcal{A}$ is pairwise disjoint.

Theorem 21.4. Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$, I, J sets and $\{A_i\}_{i \in J} \subseteq \mathcal{A}$ be a pairwise disjoint family and $\sigma: I \rightarrow J$ a bijection then $\{A_{\sigma(i)}\}_{i \in I} \subseteq \mathcal{A}$ is pairwise disjoint and $\bigcup_{i \in I} A_{\sigma(i)} = \bigcup_{i \in J} A_i$. In other words using the above theorem we have

$$\bigsqcup_{i \in J} A_i = \bigsqcup_{i \in I} A_{\sigma(i)}$$

Proof. Using [theorem: 2.119] and the fact that a bijection is a surjection we have

$$\bigcup_{i \in I} A_{\sigma(i)} = \bigcup_{i \in J} A_i$$

Let $i, j \in I$ be such that $i \neq j$ then as σ is injective we have $\sigma(i) \neq \sigma(j)$ [if $\sigma(i) = \sigma(j)$ then $i = j$] so that $A_{\sigma(i)} \cap A_{\sigma(j)} = \emptyset$. Hence $\{A_{\sigma(i)}\}_{i \in \{1, \dots, n\}}$ is pairwise disjoint. □

The following set based theorems and lemmas will be usefull later

Lemma 21.5. Let N be either ∞ or $N \in \mathbb{N}$ $\{A_i\}_{i \in \{1, \dots, N\}} \subseteq \mathcal{A}$ be a sequence or finite family of sets then for

$$\{B_i\}_{i \in \{1, \dots, N\}} \text{ defined by } B_i = \begin{cases} A_i & \text{if } i = 1 \\ A_i \setminus \bigcup_{j \in \{1, \dots, j-1\}} A_j & \text{if } i \in \{2, \dots, N\} \end{cases}$$

we have

$$\begin{aligned}
\forall i \in \{1, \dots, N\} \quad B_i & \subseteq A_i \\
\bigsqcup_{i \in \{1, \dots, N\}} B_i & = \bigcup_{i \in \{1, \dots, N\}} A_i
\end{aligned}$$

and

$\forall i, j \in \{1, \dots, N\}$ with $i \neq j$ then $B_i \cap B_j \neq \emptyset$ [in other words $\{B_i\}_{i \in \{1, \dots, N\}}$ is pairwise disjoint

Proof. We have

$$\forall i \in \{1, \dots, N\} \text{ that } B_i = \begin{cases} A_1 \subseteq A_i \text{ if } i = 1 \\ A_i \setminus \bigcup_{j \in \{1, \dots, i-1\}} A_j \subseteq A_i \text{ if } i \in \{2, \dots, N\} \end{cases} \subseteq A_i$$

From the above it follows that

$$\bigcup_{i \in \{1, \dots, N\}} B_i \subseteq \bigcup_{i \in \{1, \dots, N\}} A_i \quad (21.1)$$

If $x \in \bigcup_{i \in \{1, \dots, N\}} A_i$ then there exist a $k \in \{1, \dots, N\}$ such that $x \in A_k$. Define $M = \{i \in \{1, \dots, k\} | x \in A_i\} \subseteq \{1, \dots, k\}$ then $k \in M$ and M is finite so that

$$m = \min(M) \text{ exist}$$

As $m \in M \subseteq \{1, \dots, k\}$ we have $x \in A_m$ and for m either:

$m = 1$. Then $x \in A_1 = B_1$ so that $x \in \bigcup_{i \in \{1, \dots, N\}} B_i$.

$1 < m$. Then for $\forall j \in \{1, \dots, m-1\}$ we have $x \notin A_j$ so that $x \notin \bigcup_{j \in \{1, \dots, m-1\}} A_j$ hence $x \in A_m \setminus \bigcup_{j \in \{1, \dots, m-1\}} A_j = B_m$. So $x \in \bigcup_{i \in \{1, \dots, N\}} B_i$.

As $x \in \bigcup_{i \in \{1, \dots, N\}} A_i$ was chosen arbitrary it follows that $\bigcup_{i \in \{1, \dots, N\}} A_i \subseteq \bigcup_{i \in \{1, \dots, N\}} B_i$ which combined with [eq: 21.1] proves that

$$\bigcup_{i \in \{1, \dots, N\}} B_i = \bigcup_{i \in \{1, \dots, N\}} A_i$$

Let $i, j \in \{1, \dots, N\}$ with $i \neq j$ then we may assume that $i < j$ [otherwise exchange i and j]. Assume that $x \in B_i \cap B_j$ then for i we have either:

$i = 1$. Then $x \in B_1 = A_1$ and $x \in B_j = A_j \setminus \bigcup_{k \in \{1, \dots, j-1\}} A_k$. So $\forall k \in \{1, \dots, j-1\}$ we have that $x \notin A_k$, hence, as $1 = i < j \Rightarrow 1 \in \{1, \dots, j-1\}$, it follows that $x \notin A_1$ contradicting $x \in B_1 = A_1$.

$1 < j$. Then $x \in B_j = A_j \setminus \bigcup_{k \in \{1, \dots, j-1\}} A_k \Rightarrow \forall k \in \{1, \dots, j-1\}$ we have $x \notin A_k$. As $i < j \Rightarrow i \in \{1, \dots, j-1\}$ it follows that $x \notin A_i$ contradicting $x \in A_i \setminus \bigcup_{k \in \{1, \dots, i-1\}} A_k \subseteq A_i$.

As in all cases we have a contradiction the assumption is wrong and we must have that

$$B_i \cap B_j = \emptyset \quad \square$$

Lemma 21.6. Let $\{A_i\}_{i \in \mathbb{N}}$ be a sequence of sets then if we define $\{B_i\}_{i \in \mathbb{N}}$ by $B_i = \bigcup_{j \in \{1, \dots, i\}} A_j$ we have

$$\bigcup_{i \in \mathbb{N}} A_i = \bigcup_{i \in \mathbb{N}} B_i \text{ and } \forall i \in \mathbb{N} \text{ we have } B_i \subseteq B_{i+1}$$

Proof. First if $i \in \mathbb{N}$ and $x \in B_i$ then there exists a $j \in \{1, \dots, i\}$ such that

$$x \in A_j \subseteq \bigcup_{j \in \{1, \dots, i+1\}} A_j = B_{i+1}$$

proving that

$$\forall i \in \mathbb{N} \text{ we have } B_i \subseteq B_{i+1} \quad (21.2)$$

Second if $x \in \bigcup_{i \in \mathbb{N}_0} A_i$ then $\exists i \in \mathbb{N}$ such that $x \in A_i$. So as $i \in \{1, \dots, i\}$ we have that $x \in \bigcup_{j \in \{1, \dots, i\}} A_j = B_i$ which proves that $x \in \bigcup_{i \in \mathbb{N}} B_i$, or

$$\bigcup_{i \in \mathbb{N}} A_i \subseteq \bigcup_{i \in \mathbb{N}} B_i \quad (21.3)$$

Third if $x \in \bigcup_{i \in \mathbb{N}} B_i$ then $\exists i \in \mathbb{N}$ such that $x \in B_i = \bigcup_{j \in \{1, \dots, i\}} A_j$, so there exists a $j \in \{1, \dots, i\} \subseteq \mathbb{N}$ with $x \in A_j$, proving that $x \in \bigcup_{i \in \mathbb{N}} A_i$. Hence $\bigcup_{i \in \mathbb{N}} B_i \subseteq \bigcup_{i \in \mathbb{N}} A_i$ which combined with [eq: 21.3] gives

$$\bigcup_{i \in \mathbb{N}} A_i = \bigcup_{i \in \mathbb{N}} B_i \quad (21.4)$$

The theorem is then proved by [eqs: 21.2, 21.3 and 21.4]. $\square$

Definition 21.7. Let X be a set and $\mathcal{A} \subseteq \mathcal{P}(X)$ then

1. $\mathcal{A}$ is $\cup$ -stable if $\forall A, B \in \mathcal{A}$ we have $A \cup B \in \mathcal{A}$
2. $\mathcal{A}$ is $\cap$ -stable if $\forall A, B \in \mathcal{A}$ we have $A \cap B \in \mathcal{A}$

Theorem 21.8. Let X be a set and $\mathcal{A} \subseteq \mathcal{P}(X)$ then we have:

1. $\mathcal{A}$ is $\cup$ -stable $\Leftrightarrow \forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$, $n \in \mathbb{N}$ we have $\bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{A}$
2. $\mathcal{A}$ is $\cap$ -stable $\Leftrightarrow \forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$, $n \in \mathbb{N}$ we have $\bigcap_{i \in \{1, \dots, n\}} A_i \in \mathcal{A}$

Proof. This is easily proved by induction

1.

$\Rightarrow$. We prove this by induction so let

$$S = \left\{ n \in \mathbb{N} \mid \text{If } \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \text{ then } \bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{A} \right\}$$

then we have:

$1 \in S$. If $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{A}$ then $\bigcup_{i \in \{1\}} A_i = A_1 \in \mathcal{A}$ so that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $\{A_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{A}$ then $A_{n+1} \in \mathcal{A}$ and, as $n \in S$, $\bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{A}$. Hence $\bigcup_{i \in \{1, \dots, n+1\}} A_i = A_{n+1} \cup \left(\bigcup_{i \in \{1, \dots, n\}} A_i \right) \in \mathcal{A}$ which proves that $n+1 \in S$

$\Leftarrow$. Let $A, B \in \mathcal{A}$ and define $\{A_i\}_{i \in \{1, 2\}} \subseteq \mathcal{A}$ by $A_1 = A$ and $A_2 = B$ then $A \cup B = A_1 \cup A_2 = \bigcup_{i \in \{1, 2\}} A_i \in \mathcal{A}$.

2.

$\Rightarrow$. We prove this by induction so let

$$S = \left\{ n \in \mathbb{N} \mid \text{If } \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \text{ then } \bigcap_{i \in \{1, \dots, n\}} A_i \in \mathcal{A} \right\}$$

then we have:

$1 \in S$. If $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{A}$ then $\bigcap_{i \in \{1\}} A_i = A_1 \in \mathcal{A}$ so that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $\{A_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{A}$ then $A_{n+1} \in \mathcal{A}$ and, as $n \in S$, $\bigcap_{i \in \{1, \dots, n\}} A_i \in \mathcal{A}$. Hence $\bigcap_{i \in \{1, \dots, n+1\}} A_i = A_{n+1} \cap \left(\bigcap_{i \in \{1, \dots, n\}} A_i \right) \in \mathcal{A}$ which proves that $n+1 \in S$

$\Leftarrow$. Let $A, B \in \mathcal{A}$ and define $\{A_i\}_{i \in \{1, 2\}} \subseteq \mathcal{A}$ by $A_1 = A$ and $A_2 = B$ then $A \cap B = A_1 \cap A_2 = \bigcap_{i \in \{1, 2\}} A_i \in \mathcal{A}$. $\square$

Lemma 21.9. Let $n \in \mathbb{N}$, $\{A_i\}_{i \in \{1, \dots, n\}}$ a finite family of sets such that $\forall i \in \{1, \dots, n\}$ there exist a family $\{B_{i,j}\}_{j \in I_i}$ such that $A_i = \bigcup_{j \in I_i} B_{i,j}$ then we have:

1. $\bigcap_{i \in \{1, \dots, n\}} A_i = \bigcup_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i} \left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right)$

2. If $\forall i \in \{1, \dots, n\}$ $\{B_{i,j}\}_{j \in I_i}$ is pairwise disjoint then we have that $\{\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k}\}_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i}$ is pairwise disjoint. In other words

$$\bigcap_{i \in \{1, \dots, n\}} A_i = \bigcup_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i} \left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right)$$

Proof.

1. We use induction to prove this, so define

$$S = \left\{ n \in \mathbb{N} \mid \text{If } \{A_i\}_{i \in \{1, \dots, n\}} \text{ is such that } \forall i \in \{1, \dots, n\} \exists \{B_{i,j}\}_{j \in I_i} \text{ with } A_i = \bigcup_{j \in I_i} B_{i,j} \right.$$

$$\left. \text{then } \bigcap_{i \in \{1, \dots, n\}} A_i = \bigcup_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i} \left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right) \right\}$$

then we have:

- $1 \in S$. If $\{A_i\}_{i \in \{1, 1\}}$ satisfies that there exist a $\{B_{1,j}\}_{j \in I_1}$ such that $A_1 = \bigcup_{j \in I_1} B_{1,j}$ then

$$\begin{aligned} \bigcap_{i \in \{1\}} A_i &= A_1 \\ &= \bigcup_{j \in I_1} B_{1,j} \\ &= \bigcup_{j \in I_1} \left(\bigcap_{k \in \{1\}} B_{k,j} \right) \\ &= \bigcup_{(j) \in \prod_{i \in \{1\}} I_i} \left(\bigcap_{k \in \{1\}} B_{k,j} \right) \\ &= \bigcup_{\sigma \in \prod_{i \in \{1\}} I_i} \left(\bigcap_{k \in \{1\}} B_{k, \sigma_k} \right) \end{aligned}$$

proving that $1 \in S$.

- $n \in S \Rightarrow n+1 \in S$. Let $\{A_i\}_{i \in \{1, \dots, n+1\}}$ is such that $\forall i \in \{1, \dots, n+1\} \exists \{B_{i,j}\}_{j \in I_i}$ with $A_i = \bigcup_{j \in I_i} B_{i,j}$. Then as $n \in S$ we have that

$$\bigcap_{i \in \{1, \dots, n\}} A_i = \bigcup_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i} \left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right) \quad (21.5)$$

Hence

$$\begin{aligned} &\bigcap_{i \in \{1, \dots, n+1\}} A_i = \\ &\left(\bigcap_{i \in \{1, \dots, n\}} A_i \right) \cap A_{n+1} \stackrel{n \in S}{=} \\ &\left(\bigcup_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i} \left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right) \right) \cap A_{n+1} \stackrel{[\text{theorem: 2.130}]}{=} \\ &\bigcup_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i} \left(\left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right) \cap A_{n+1} \right) = \\ &\bigcup_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i} \left(\left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right) \cap \left(\bigcup_{j \in I_{n+1}} B_{n+1,j} \right) \right) \stackrel{[\text{theorem: 2.130}]}{=} \\ &\bigcup_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i} \left(\left(\bigcup_{j \in I_{n+1}} \left(B_{n+1,j} \cap \left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right) \right) \right) \right) = \end{aligned}$$

So that

$$\bigcap_{i \in \{1, \dots, n+1\}} A_i = \bigcup_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i} \left(\left(\bigcup_{j \in I_{n+1}} \left(B_{n+1, j} \cap \left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right) \right) \right) \right) \quad (21.6)$$

If $x \in \bigcup_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i} \left(\left(\bigcup_{j \in I_{n+1}} \left(B_{n+1, j} \cap \left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right) \right) \right) \right)$ then there exist a $\sigma = (\sigma_1, \dots, \sigma_n)$ such that $x \in \left(\bigcup_{j \in I_{n+1}} \left(B_{n+1, j} \cap \left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right) \right) \right)$, hence there exist a $j \in I_{n+1}$ such that

$$x \in B_{n+1, j} \cap \left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right)$$

Define

$$\tau \in \bigcup_{i \in \{1, \dots, n+1\}} I_i \text{ by } \tau_i = \begin{cases} \sigma_i & \text{if } i \in \{1, \dots, n\} \\ j & \text{if } i = n+1 \end{cases}$$

then $x \in B_{n+1, \tau_{n+1}} \cap \left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \tau_k} \right) = \bigcap_{k \in \{1, \dots, n+1\}} B_{k, \tau_k}$. Hence

$$x \in \bigcup_{\tau \in \prod_{i \in \{1, \dots, n+1\}} I_i} \left(\bigcap_{k \in \{1, \dots, n+1\}} B_{k, \tau_k} \right)$$

whic proves that

$$\bigcup_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i} \left(\left(\bigcup_{j \in I_{n+1}} \left(B_{n+1, j} \cap \left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right) \right) \right) \right) \subseteq \bigcup_{\sigma \in \prod_{i \in \{1, \dots, n+1\}} I_i} \left(\bigcap_{k \in \{1, \dots, n+1\}} B_{k, \sigma_k} \right) \quad (21.7)$$

If $x \in \bigcup_{\sigma \in \prod_{i \in \{1, \dots, n+1\}} I_i} \left(\bigcap_{k \in \{1, \dots, n+1\}} B_{k, \sigma_k} \right)$ then there exist a $\sigma \in \prod_{i \in \{1, \dots, n+1\}} I_i$ such that $x \in \bigcap_{k \in \{1, \dots, n+1\}} B_{k, \sigma_k}$. Define $\eta \in \prod_{i \in \{1, \dots, n\}} I_i$ by $\eta_l = \sigma_l$ and $j = \sigma_{n+1} \in I_{n+1}$ then

$$x \in B_{n+1, j} \cap \left(\bigcap_{k \in \{1, \dots, n+1\}} B_{k, \eta_k} \right) \subseteq \bigcup_{j \in I_{n+1}} \left(B_{n+1, j} \cap \left(\bigcap_{k \in \{1, \dots, n+1\}} B_{k, \eta_k} \right) \right)$$

so that $x \in \bigcup_{j \in I_{n+1}} \left(B_{n+1, j} \cap \left(\bigcap_{k \in \{1, \dots, n+1\}} B_{k, \eta_k} \right) \right)$ or as $\eta \in \prod_{i \in \{1, \dots, n\}} I_i$ we have that $x \in \bigcup_{\eta \in \prod_{i \in \{1, \dots, n\}} I_i} \left(\bigcup_{j \in I_{n+1}} \left(B_{n+1, j} \cap \left(\bigcap_{k \in \{1, \dots, n+1\}} B_{k, \eta_k} \right) \right) \right)$. Hence

$$\bigcup_{\sigma \in \prod_{i \in \{1, \dots, n+1\}} I_i} \left(\bigcap_{k \in \{1, \dots, n+1\}} B_{k, \sigma_k} \right) \subseteq \bigcup_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i} \left(\left(\bigcup_{j \in I_{n+1}} \left(B_{n+1, j} \cap \left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right) \right) \right) \right)$$

which combined with [eq: 21.7] proves that

$$\bigcup_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i} \left(\left(\bigcup_{j \in I_{n+1}} \left(B_{n+1, j} \cap \left(\bigcap_{k \in \{1, \dots, n\}} B_{k, \sigma_k} \right) \right) \right) \right) = \bigcup_{\sigma \in \prod_{i \in \{1, \dots, n+1\}} I_i} \left(\bigcap_{k \in \{1, \dots, n+1\}} B_{k, \sigma_k} \right)$$

Combining the above with [eq: 21.6] proves that

$$\bigcap_{i \in \{1, \dots, n+1\}} A_i = \bigcup_{\sigma \in \prod_{i \in \{1, \dots, n+1\}} I_i} \left(\bigcap_{k \in \{1, \dots, n+1\}} B_{k, \sigma_k} \right)$$

Hence we have that $n+1 \in \mathcal{S}$

2. Assume that $\sigma, \tau \in \prod_{i \in \{1, \dots, n\}} I_i$ with $\sigma \neq \tau$ then there exist $i \in \{1, \dots, n\}$ such that $\sigma_i \neq \tau_i$. As $\{B_{i,j}\}_{j \in \{1, \dots, I_i\}}$ is pairwise disjoint we have that $B_{i,\sigma_i} \cap B_{i,\tau_i} = \emptyset$. Hence

$$\left(\bigcap_{k \in \{1, \dots, n\}} B_{k,\sigma_k} \right) \cap \left(\bigcap_{k \in \{1, \dots, n\}} B_{k,\tau_k} \right) \subseteq B_{i,\sigma_i} \cap B_{i,\tau_i} = \emptyset$$

proving that $\{\bigcap_{k \in \{1, \dots, n\}} B_{k,\sigma_k}\}_{\sigma \in \prod_{i \in \{1, \dots, n\}} I_i}$ is pairwise disjoint. $\square$

Theorem 21.10. Let $\{A_i\}_{i \in I}$ be a family of sets such that $\forall i \in I$ there exist a $\{B_{i,j}\}_{j \in I_i}$ such that $A_i = \bigcup_{j \in I_i} B_{i,j}$ then

1. $\bigcup_{i \in I} A_i = \bigcup_{i \in I} \left(\bigcup_{j \in I_i} B_{i,j} \right) = \bigcup_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} B_{\sigma_1, \sigma_2}$
2. If additional $\{A_i\}_{i \in I}$ is pairwise disjoint and $\forall i \in I$ $\{B_{i,j}\}_{j \in I_i}$ is pairwise disjoint then

$$\{B_{\sigma_1, \sigma_2}\}_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} \text{ is pairwise disjoint}$$

so that we have

$$\bigsqcup_{i \in I} A_i = \bigsqcup_{i \in I} \left(\bigsqcup_{j \in I_i} B_{i,j} \right) = \bigsqcup_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} B_{\sigma_1, \sigma_2}$$

Proof.

1. Let $x \in \bigcup_{i \in I} A_i$ then there exist a $i \in I$ such that $x \in A_i$, hence, as $A_i = \bigcup_{j \in I_i} B_{i,j}$ there exist a $j \in I_i$ such that $x \in B_{i,j}$. As $\sigma = (i, j) \in \{i\} \times I_i \subseteq \bigcup_{i \in I} \{i\} \times I_i$ it follows $x \in B_{\sigma_1, \sigma_2}$, hence we have that $\bigcup_{i \in I} A_i \subseteq \bigcup_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} B_{\sigma_1, \sigma_2}$. Further as for $\sigma \in \bigcup_{i \in I} \{i\} \times I_i$ we have that $B_{\sigma_1, \sigma_2} \subseteq \bigcup_{j \in I_{\sigma_1}} B_{\sigma_1, j} = A_{\sigma_1} \subseteq \bigcup_{i \in I} A_i$ it follows that $\bigcup_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} B_{\sigma_1, \sigma_2} \subseteq \bigcup_{i \in I} A_i$. So it follows that

$$\bigcup_{i \in I} A_i = \bigcup_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} B_{\sigma_1, \sigma_2}$$

2. Let $\sigma, \tau \in \bigcup_{i \in I} \{i\} \times I_i$ with $\sigma \neq \tau$ then we have either:

$\sigma_1 = \tau_1$. Then we must have that $\sigma_2 \neq \tau_2$ so that $B_{\sigma_1, \sigma_2} \cap B_{\tau_1, \tau_2} = B_{\sigma_1, \sigma_2} \cap B_{\sigma_1, \tau_2} = \emptyset$ [because $\{B_{\sigma_1, j}\}_{j \in I_{\sigma_1}}$ is pairwise disjoint].

$\sigma_1 \neq \tau_1$. Then $B_{\sigma_1, \sigma_2} \cap B_{\tau_1, \tau_2} \subseteq \left(\bigcup_{j \in I_{\sigma_1}} B_{\sigma_1, j} \right) \cap \left(\bigcup_{j \in I_{\tau_1}} B_{\tau_1, j} \right) = A_{\sigma_1} \cap A_{\tau_1} = \emptyset$ [because $\{A_i\}_{i \in I}$ is pairwise disjoint].

Hence $\{B_{\sigma_1, \sigma_2}\}_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i}$ is pairwise disjoint. $\square$

Corollary 21.11. Let $\{A_i\}_{i \in I}$ be a family of sets such that $\forall i \in I$ there exist a $\{B_{i,j}\}_{j \in I_i}$ such that $A_i = \bigcup_{j \in I_i} B_{i,j}$ and $\beta: J \rightarrow \bigcup_{i \in I} \{i\} \times I_i$ a bijection then

1. $\bigcup_{i \in I} A_i = \bigcup_{i \in I} \left(\bigcup_{j \in I_i} B_{i,j} \right) = \bigcup_{j \in J} B_{\beta(j)_1, \beta(j)_2}$
2. If additional $\{A_i\}_{i \in I}$ is pairwise disjoint and $\forall i \in I$ $\{B_{i,j}\}_{j \in I_i}$ is pairwise disjoint then

$$\{B_{\beta(j)_1, \beta(j)_2}\}_{j \in J} \text{ is pairwise disjoint}$$

so that

$$\bigsqcup_{i \in I} A_i = \bigsqcup_{i \in I} \left(\bigsqcup_{j \in I_i} B_{i,j} \right) = \bigsqcup_{j \in J} B_{\beta(j)_1, \beta(j)_2}$$

Proof.

1. Using [theorem: 21.10] we have that

$$\bigcup_{i \in I} A_i = \bigcup_{i \in I} \left(\bigcup_{j \in I_i} B_{i,j} \right) = \bigcup_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} B_{\sigma_1, \sigma_2} \quad (21.8)$$

Let $x \in \bigcup_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} B_{\sigma_1, \sigma_2}$ then there exist a $\sigma \in \bigcup_{i \in I} \{i\} \times I_i$ such that $x \in B_{\sigma_1, \sigma_2}$. As β is a bijection hence surjective there exist a $j \in J$ such that $\beta(j) = \sigma$ so that $x \in B_{\beta(j)_1, \beta(j)_2}$, hence $x \in \bigcup_{j \in J} B_{\beta(j)_1, \beta(j)_2}$. So

$$\bigcup_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} B_{\sigma_1, \sigma_2} \subseteq \bigcup_{j \in J} B_{\beta(j)_1, \beta(j)_2} \quad (21.9)$$

If $x \in \bigcup_{j \in J} B_{\beta(j)_1, \beta(j)_2}$ then $\exists j \in J$ such that $x \in B_{\beta(j)_1, \beta(j)_2}$ which as $\beta(j) \in \bigcup_{i \in I} \{i\} \times I_i$ proves that $x \in \bigcup_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} B_{\sigma_1, \sigma_2}$. Hence $\bigcup_{j \in J} B_{\beta(j)_1, \beta(j)_2} \subseteq \bigcup_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} B_{\sigma_1, \sigma_2}$ which combined with [eq: 21.9] results in

$$\bigcup_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} B_{\sigma_1, \sigma_2} = \bigcup_{j \in J} B_{\beta(j)_1, \beta(j)_2} \quad (21.10)$$

Substituting the above in [eq: 21.8] proves finally that

$$\bigcup_{i \in I} A_i = \bigcup_{i \in I} \left(\bigcup_{j \in J} B_{i,j} \right) = \bigcup_{j \in J} B_{\beta(j)_1, \beta(j)_2}$$

2. Assume that additional $\{A_i\}_{i \in I}$ is pairwise disjoint and $\forall i \in I \{B_{i,j}\}_{j \in I_i}$ is pairwise disjoint then by [theorem: 21.10]

$$\{B_{\sigma_1, \sigma_2}\}_{\sigma \in \bigcup_{i \in I} \{i\} \times I_i} \text{ pairwise disjoint} \quad (21.11)$$

Let $i, j \in J$ with $i \neq j$ then as β is injective we have $\beta(i) \neq \beta(j)$ hence we have by the above $B_{\beta(i)_1, \beta(i)_2} = \emptyset$ proving that

$$\{B_{\beta(i)_1, \beta(i)_2}\}_{i \in J} \text{ is pairwise disjoint} \quad \square$$

Theorem 21.12. Let X be a set, $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{P}(X)$ and $\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{P}(X)$ such that

$$X = \bigcup_{i \in \mathbb{N}} A_i = \bigcup_{i \in \mathbb{N}} B_i$$

then there exists a bijection $\beta: \mathbb{N} \rightarrow \mathbb{N} \times \mathbb{N}$ such that

$$X = \bigcup_{i \in \mathbb{N}} (A_{\beta(i)_1} \cap B_{\beta(i)_2})$$

Proof. As $\mathbb{N}$ is denumerable we have by [theorem: 6.63] that there exists a bijection $\beta: \mathbb{N} \rightarrow \mathbb{N} \times \mathbb{N}$. Let $i \in \mathbb{N}$ then $A_i = A_i \cap X = A_i \cap \left(\bigcup_{j \in \mathbb{N}} B_j \right) = \bigcup_{j \in \mathbb{N}} (A_i \cap B_j)$ so that

$$X = \bigcup_{i \in \mathbb{N}} A_i = \bigcup_{i \in \mathbb{N}} \left(\bigcup_{j \in \mathbb{N}} (A_i \cap B_j) \right)$$

Let $x \in \bigcup_{i \in \mathbb{N}} (A_{\beta(i)_1} \cap B_{\beta(i)_2})$ then there exists a $i \in \mathbb{N}$ such that $x \in A_{\beta(i)_1} \cap B_{\beta(i)_2} \subseteq X$ proving that

$$\bigcup_{i \in \mathbb{N}_0} (A_{\beta(i)_1} \cap B_{\beta(i)_2}) \subseteq X \quad (21.12)$$

If $x \in X$ then $\exists i \in \mathbb{N}$ so that $x \in \bigcup_{j \in \mathbb{N}} (A_i \cap B_j)$, hence there exists a $j \in \mathbb{N}$ such that $x \in A_i \cap B_j$. As β is a bijection there exists a $k \in \mathbb{N}$ such that $\beta(k) = (i, j)$, hence

$$x \in A_{\beta(k)_1} \cap B_{\beta(k)_2} \subseteq \bigcup_{i \in \mathbb{N}} (A_{\beta(i)_1} \cap B_{\beta(i)_2})$$

proving that

$$X \subseteq \bigcup_{i \in \mathbb{N}} (A_{\beta(i)_1} \cap B_{\beta(i)_2}) \quad (21.13)$$

Finally from 21.12 and 21.13 it follows that

$$X = \bigcup_{i \in \mathbb{N}} (A_{\beta(i)_1} \cap B_{\beta(i)_2}) \quad \square$$

Definition 21.13. (Monotone set function) Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ then a set function $\mu: \mathcal{A} \rightarrow [0, \infty]$ is **monotone** if $\forall A, B \in \mathcal{A}$ then $\mu(A) \leq \mu(B)$.

Definition 21.14. (Additive set function) Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ then a set function $\mu: \mathcal{A} \rightarrow [0, \infty]$ is **finite additive on $\mathcal{A}$** if $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$, $n \in \mathbb{N}$ pairwise disjoint with $\bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{A}$ we have

$$\mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^n \mu(A_i)$$

Definition 21.15. (Sub-additive set function) Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ then a set function $\mu: \mathcal{A} \rightarrow [0, \infty]$ is **sub-additive** if $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ with $\bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{A}$ we have

$$\mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) \leq \sum_{i=1}^n \mu(A_i)$$

Definition 21.16. (Countable additive set function) Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ then a set function $\mu: \mathcal{A} \rightarrow [0, \infty]$ is **countable additive on $\mathcal{A}$** if $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$, $n \in \mathbb{N}$ pairwise disjoint with $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$ we have

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \mu(A_i)$$

Definition 21.17. (Countable sub-additive set function) Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ then a set function $\mu: \mathcal{A} \rightarrow [0, \infty]$ is **countable sub-additive** if $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$ we have

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \leq \sum_{i=1}^{\infty} \mu(A_i)$$

Countable sets are either finite or denumerable, $n \in \mathbb{N}$ so you can ask yourself why we talk about countable additivity instead of denumerable additivity [because $\mathbb{N}$ is denumerable]. However the next theorem shows that countable additivity implies finite additivity justifying the use of the term countable additivity.

Theorem 21.18. Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ such that $\emptyset \in \mathcal{A}$ and $\mu: \mathcal{A} \rightarrow [0, \infty]$ a countable additive set function on $\mathcal{A}$ satisfying $\mu(\emptyset) = 0$ is finite additive on $\mathcal{A}$.

Note 21.19. The requirement that $\emptyset \in \mathcal{A}$ and $\mu(\emptyset) = 0$ is essential for the proof to work.

Proof. Let $n \in \mathbb{N}$, $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ be a pairwise disjoint finite family such that $\bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{A}$. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \begin{cases} A_i & \text{if } i \in \{1, \dots, n\} \\ \emptyset & \text{if } i \in \{n+1, \dots, \infty\} \end{cases} \quad \emptyset, A_i \in \mathcal{A}$$

Let $x \in \bigcup_{i \in \mathbb{N}} B_i$ then there exist a $i \in \mathbb{N}$ such that $x \in B_i$. Assume that $i \in \{n+1, \dots, \infty\}$ then $x \in B_i = \emptyset$ a contradiction so we must have that $i \in \{1, \dots, n\}$. Hence $x \in B_i = A_i$ proving that $x \in \bigcup_{i \in \{1, \dots, n\}} A_i$, so

$$\bigcup_{i \in \mathbb{N}} B_i \subseteq \bigcup_{i \in \{1, \dots, n\}} A_i \quad (21.14)$$

Further if $x \in \bigcup_{i \in \{1, \dots, n\}} A_i$ then there exist a $i \in \{1, \dots, n\}$ such that $x \in A_i = B_i$ so that $x \in \bigcup_{i \in \mathbb{N}} B_i$ proving that $\bigcup_{i \in \{1, \dots, n\}} A_i \subseteq \bigcup_{i \in \{1, \dots, n\}} B_i$. Combining this with [eq: 21.14] proves that

$$\bigcup_{i \in \mathbb{N}} B_i = \bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{A} \quad (21.15)$$

Let $i, j \in \mathbb{N}$ with $i \neq j$ then we have the following possible cases:

$i \in \{1, \dots, n\} \wedge j \in \{1, \dots, n\}$. Then $B_i \cap B_j = A_i \cap A_j \stackrel{=}{=} \emptyset$

$i \in \{n+1, \dots, \infty\} \wedge j \in \{1, \dots, n\}$. Then $B_i \cap B_j = \emptyset \cap A_j = \emptyset$

$i \in \{1, \dots, n\} \wedge j \in \{n+1, \dots, \infty\}$. Then $B_i \cap B_j = A_i \cap \emptyset = \emptyset$

$i \in \{n+1, \dots, \infty\} \wedge j \in \{n+1, \dots, \infty\}$. Then $B_i \cap B_j = \emptyset \cap \emptyset = \emptyset$

Hence we conclude that

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ is pairwise disjoint} \quad (21.16)$$

As by [eq: 21.15] $\bigcup_{i \in \mathbb{N}} B_i \in \mathcal{A}$ we have by the above and the countable additivity of μ that

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \sum_{i=1}^{\infty} \mu(B_i) \quad (21.17)$$

Next we have

$$\begin{aligned} \mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) &\stackrel{[\text{eq: 21.15}]}{=} \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \\ &\stackrel{[\text{eq: 21.17}]}{=} \sum_{i=1}^{\infty} \mu(B_i) \\ &\stackrel{[\text{theorem: 20.99}]}{=} \sum_{i=1}^n \mu(B_i) + \sum_{i=n+1}^{\infty} \mu(B_i) \\ &= \sum_{i=1}^n \mu(A_i) + \sum_{i=n+1}^{\infty} \mu(\emptyset) \\ &\stackrel{[\text{theorem: 20.96}]}{=} \sum_{i=1}^n \mu(A_i) \end{aligned}$$

Hence $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$, $n \in \mathbb{N}$ pairwise disjoint we have $\mu(\bigcup_{i \in \{1, \dots, n\}} A_i) = \sum_{i=1}^n \mu(A_i)$ proving that μ is finite additive on $\mathcal{A}$. $\square$

Theorem 21.20. Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ such that $\emptyset \in \mathcal{A}$ and $\mu: \mathcal{A} \rightarrow [0, \infty]$ a countable sub-additive function then μ is sub-additivity.

Proof. Let $n \in \mathbb{N}$, $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ be a finite family such that $\bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{A}$. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \begin{cases} A_i & \text{if } i \in \{1, \dots, n\} \\ \emptyset & \text{if } i \in \{n+1, \dots, \infty\} \end{cases} \in \mathcal{A}$$

Let $x \in \bigcup_{i \in \mathbb{N}} B_i$ then there exist a $i \in \mathbb{N}$ such that $x \in B_i$. Assume that $i \in \{n+1, \dots, \infty\}$ then $x \in B_i = \emptyset$ a contradiction so we must have that $i \in \{1, \dots, n\}$. Hence $x \in B_i = A_i$ proving that $x \in \bigcup_{i \in \{1, \dots, n\}} A_i$, so

$$\bigcup_{i \in \mathbb{N}} B_i \subseteq \bigcup_{i \in \{1, \dots, n\}} A_i \quad (21.18)$$

Further if $x \in \bigcup_{i \in \{1, \dots, n\}} A_i$ then there exist a $i \in \{1, \dots, n\}$ such that $x \in A_i = B_i$ so that $x \in \bigcup_{i \in \mathbb{N}} B_i$ proving that $\bigcup_{i \in \{1, \dots, n\}} A_i \subseteq \bigcup_{i \in \{1, \dots, n\}} B_i$. Combining this with [eq: 21.18] proves that

$$\bigcup_{i \in \mathbb{N}} B_i = \bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{A} \quad (21.19)$$

As $\bigcup_{i \in \mathbb{N}} B_i \in \mathcal{A}$ and μ is countable additive it follows that

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \leq \sum_{i=1}^{\infty} \mu(B_i) \quad (21.20)$$

$$\begin{aligned} \mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) &\stackrel{[\text{eq: 21.19}]}{=} \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \\ &\stackrel{[\text{eq: 21.20}]}{\leq} \sum_{i=1}^{\infty} \mu(B_i) \\ &\stackrel{[\text{theorem: 20.99}]}{=} \sum_{i=1}^n \mu(B_i) + \sum_{i=n+1}^{\infty} \mu(B_i) \\ &= \sum_{i=1}^n \mu(A_i) + \sum_{i=n+1}^{\infty} \mu(\emptyset) \\ &\stackrel{\mu(\emptyset)=0 \wedge [\text{theorem: 20.96}]}{=} \sum_{i=1}^n \mu(A_i) \end{aligned}$$

□

21.2 Rings, algebras and σ -algebras

Definition 21.21. (Ring) Let X be a set then $\mathcal{R} \subseteq \mathcal{P}(X)$ [the set of subsets of X] is a **ring** on X if $\mathcal{R}$ satisfies:

1. $\mathcal{R} \neq \emptyset$
2. If $A, B \in \mathcal{R}$ then $A \cup B \in \mathcal{R}$ [in other words $\mathcal{R}$ is $\cup$ -stable]
3. If $A, B \in \mathcal{R}$ then $A \setminus B \in \mathcal{R}$

Rather trivial examples of rings are the following:

Example 21.22. Let X be a set then $\{\emptyset\}$ is a ring on X

Proof.

1. As $\emptyset \in \{\emptyset\}$ we have that $\{\emptyset\} \neq \emptyset$
2. If $A, B \in \{\emptyset\}$ then $A = B = \emptyset$ so that $A \cup B = \emptyset \in \{\emptyset\}$
3. If $A, B \in \{\emptyset\}$ then $A = B = \emptyset$ so that $A \setminus B = \emptyset \setminus \emptyset = \emptyset \in \{\emptyset\}$

□

Example 21.23. Let X be a set then $\mathcal{P}(X)$ is a ring on X

Proof. As $X \subseteq X$ $X \in \mathcal{P}(X)$ so that

$$\mathcal{P}(X) \neq \emptyset$$

If $A, B \in \mathcal{P}(X)$ then $A, B \subseteq X$ so that $A \cup B \subseteq X$ and $A \setminus B \subseteq X$ so that

$$A \cup B \in \mathcal{P}(X) \text{ and } A \setminus B \in \mathcal{P}(X)$$

□

Theorem 21.24. Let X be a set and $\mathcal{R}$ a ring on X then we have

1. $\emptyset \in \mathcal{R}$
2. If $n \in \mathbb{N}$ and $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{R}$ a finite family of sets in $\mathcal{R}$ then $\bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{R}$
3. If $A, B \in \mathcal{R}$ then $A \cap B \in \mathcal{R}$ [in other words $\mathcal{R}$ is $\cap$ -stable]

4. If $n \in \mathbb{N}$ and $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{R}$ a finite family of sets in $\mathcal{R}$ then $\bigcap_{i \in \{1, \dots, n\}} A_i \in \mathcal{R}$

Proof.

1. As $\mathcal{R} \neq \emptyset$ there exist a $A \in \mathcal{R}$ so that $\emptyset = A \setminus A \in \mathcal{R}$
2. This follows from [theorem: 21.8].
3. If $A, B \in \mathcal{R}$ then $A \setminus B \in \mathcal{R}$ so that $A \setminus (A \setminus B) \in \mathcal{R}$ which as $A \setminus (A \setminus B) \stackrel{[theorem: 1.33]}{=} A \cap B$ proves that $A \cap B \in \mathcal{R}$.
4. This follows from [theorem: 21.8]. □

A algebra on X is a ring such that X is a element of the ring.

Definition 21.25. (Algebra) Let X be a set then $\mathcal{A} \subseteq \mathcal{P}(X)$ is a **algebra** on X if $\mathcal{A}$ satisfies

1. $\mathcal{A}$ is a ring on X
2. $X \in \mathcal{A}$

Example 21.26. Let $X \neq \emptyset$ be a non empty set then $\{\emptyset\}$ is a ring [see example: 21.22] but not a algebra because $X \notin \{\emptyset\}$, however $\{X, \emptyset\}$ is a algebra on X .

Proof.

1. As $X, \emptyset \in \{X, \emptyset\}$ $\{X, \emptyset\} \neq \emptyset$
2. If $A, B \in \{X, \emptyset\}$ then we have either:
 - $A = X \wedge B = X$. Then $A \cup B = X \in \{X, \emptyset\}$ and $A \setminus B = X \setminus X = \emptyset \in \{X, \emptyset\}$
 - $A = \emptyset \wedge B = X$. Then $A \cup B = X \in \{X, \emptyset\}$ and $A \setminus B = \emptyset \setminus X = \emptyset \in \{X, \emptyset\}$
 - $A = X \wedge B = \emptyset$. Then $A \cup B = X \in \{X, \emptyset\}$ and $A \setminus B = X \setminus \emptyset = X \in \{X, \emptyset\}$
 - $A = \emptyset \wedge B = \emptyset$. Then $A \cup B = \emptyset \in \{X, \emptyset\}$ and $A \setminus B = \emptyset \setminus \emptyset = \emptyset \in \{X, \emptyset\}$ □

Example 21.27. Let X be a set then $\mathcal{P}(X)$ is a ring on X

Proof. Using [example: 21.23] it follows that $\mathcal{A}$ is a ring. Further as $X \subset X$ it follows that $X \in \mathcal{P}(X)$. □

The following summarizes some trivial properties of a algebra.

Theorem 21.28. Let X be a set and $\mathcal{A}$ a algebra on X then we have:

1. $\emptyset \in \mathcal{A}$
2. $X \in \mathcal{A}$
3. $\forall A, B \in \mathcal{A}$ we have that $A \cup B \in \mathcal{A}$, $A \cap B \in \mathcal{A}$ and $A \setminus B \in \mathcal{A}$
4. If $n \in \mathbb{N}$ and $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ a finite family of sets in $\mathcal{A}$ then $\bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{A}$
5. If $n \in \mathbb{N}$ and $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ a finite family of sets in $\mathcal{A}$ then $\bigcap_{i \in \{1, \dots, n\}} A_i \in \mathcal{A}$
6. $\forall A \in \mathcal{A}$ we have that $X \setminus A \in \mathcal{A}$

Proof.

1. As $\mathcal{A}$ is a ring this follows from [theorem: 21.24].
2. This is stated in the definition of a algebra.
3. As $\mathcal{A}$ is a ring this follows from [theorem: 21.24] and the definition of a ring.
4. As $\mathcal{A}$ is a ring this follows from [theorem: 21.24].
5. As $\mathcal{A}$ is a ring this follows from [theorem: 21.24].

6. As $X \in \mathcal{A}$ and $A \in \mathcal{A}$ we have by (3) that $X \setminus A \in \mathcal{A}$. □

In most books we have the following equivalent definitions of a algebra

Theorem 21.29. *Let X be a set and $\mathcal{A} \subseteq \mathcal{P}(X)$ then the following are equivalent:*

1. $\mathcal{A}$ is a algebra on X
2. $\mathcal{A}$ satisfies:
 - a. $X \in \mathcal{A}$
 - b. $\forall A \in \mathcal{A}$ we have $X \setminus A \in \mathcal{A}$
 - c. $\forall A, B \in \mathcal{A}$ we have $A \cap B \in \mathcal{A}$ [in other words $\mathcal{A}$ is $\cap$ -stable]
3. $\mathcal{A}$ satisfies:
 - a. $X \in \mathcal{A}$
 - b. $\forall A \in \mathcal{A}$ we have $X \setminus A \in \mathcal{A}$
 - c. $\forall A, B \in \mathcal{A}$ we have $A \cup B \in \mathcal{A}$ [in other words $\mathcal{A}$ is $\cup$ -stable]
4. $\mathcal{A}$ satisfies:
 - a. $X \in \mathcal{A}$
 - b. $\forall A, B \in \mathcal{A}$ we have $A \setminus B \in \mathcal{A}$

Proof.

1 $\Rightarrow$ 2. If $\mathcal{A}$ is a algebra then by definition $\mathcal{A}$ is a ring and $X \in \mathcal{A}$ so that

1. $X \in \mathcal{A}$
2. $\forall A \in \mathcal{A}$ we have, as $X \in \mathcal{A}$, that $X \setminus A \in \mathcal{A}$ [by the definition of a ring].
3. $\forall A, B \in \mathcal{A}$ we have by the definition of a ring that $A \setminus B \in \mathcal{A}$.

2 $\Rightarrow$ 3. We have:

1. $X \in \mathcal{A}$ by the hypothesis.
2. $X \setminus A$ by the hypothesis.
3. Let $A, B \in \mathcal{A}$ then we have that $X \setminus A \in \mathcal{A}$ and $X \setminus B \in \mathcal{A}$ so that $(X \setminus A) \cap (X \setminus B) \in \mathcal{A}$, hence

$$X \setminus ((X \setminus A) \cap (X \setminus B)) \in \mathcal{A}$$

Further we have

$$\begin{aligned} X \setminus ((X \setminus A) \cap (X \setminus B)) &\stackrel{[\text{theorem: 1.31}]}{=} (X \setminus (X \setminus A)) \cup (X \setminus (X \setminus B)) \\ &\stackrel{A, B \subseteq X \wedge [\text{theorem: 1.33}]}{=} A \cup B \end{aligned}$$

so that $A \cup B \in \mathcal{A}$.

3 $\Rightarrow$ 4. We have

1. $X \in \mathcal{A}$ by the hypothesis
2. Let $A, B \in \mathcal{A}$ then $X \setminus A \in \mathcal{A}$ so that $(X \setminus A) \cup B \in \mathcal{A}$ hence

$$X \setminus ((X \setminus A) \cup B) \in \mathcal{A}$$

Further we have

$$\begin{aligned} X \setminus ((X \setminus A) \cup B) &\stackrel{[\text{theorem: 1.31}]}{=} (X \setminus (X \setminus A)) \cap (X \setminus B) \\ &\stackrel{A \subseteq X \wedge [\text{theorem: 1.33}]}{=} A \cap (X \setminus B) \\ &\stackrel{A, B \subseteq X \wedge [\text{theorem: 1.33}]}{=} A \setminus B \end{aligned}$$

so that $A \setminus B \in \mathcal{A}$

4 $\Rightarrow$ 1. Then we have

1. $X \in \mathcal{A}$ by the hypothesis.
2. If $A, B \in \mathcal{A}$ then by the hypothesis $A \setminus B \in \mathcal{A}$ so that $A \setminus (A \setminus B) \in \mathcal{A}$, as by [theorem: 1.33] $A \setminus (A \setminus B) = A \cap B$ it follows that $A \cap B \in \mathcal{A}$ hence we have proved that

$$\forall A, B \in \mathcal{A} \text{ we have } A \cap B \in \mathcal{A}$$

Further if $A, B \in \mathcal{A}$ then as $X \in \mathcal{A}$ we have that $(X \setminus A), (X \setminus B) \in \mathcal{A}$ so that $(X \setminus A) \cap (X \setminus B) \in \mathcal{A}$, hence we have that

$$X \setminus ((X \setminus A) \cap (X \setminus B)) \in \mathcal{A}$$

Now

$$\begin{aligned} X \setminus ((X \setminus A) \cap (X \setminus B)) &\stackrel{[\text{theorem: 1.31}]}{=} (X \setminus (X \setminus A)) \cup (X \setminus (X \setminus B)) \\ &\stackrel{A, B \subseteq X \wedge [\text{theorem: 1.33}]}{=} A \cup B \end{aligned}$$

proving that

$$\forall A, B \in \mathcal{A} \text{ we have } A \cup B \in \mathcal{A}$$

So as $X \in \mathcal{A} \Rightarrow \mathcal{A} \neq \emptyset$ and $\forall A, B \in \mathcal{A}$ we have $A \cup B \in \mathcal{A}$ and $A \setminus B \in \mathcal{A}$ it follows that $\mathcal{A}$ is a algebra. $\square$

We also want to deal with countable unions of sets and for this we define a sigma algebra.

Definition 21.30. Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ then $\mathcal{A}$ is a sigma algebra [noted as σ -algebra] on X if

1. $X \in \mathcal{A}$
2. $\forall A \in \mathcal{A}$ we have $X \setminus A \in \mathcal{A}$
3. If $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ is a countable family of sets in $\mathcal{A}$ then $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$

Note 21.31. If $A, B \in \mathcal{A}$ then if we define $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ by $A_i = \begin{cases} A & \text{if } i=1 \\ B & \text{if } i \in \{2, \dots, \infty\} \end{cases}$ then

$$A \cup B = A_1 \cup \left(\bigcup_{i \in \{2, \dots, \infty\}} A_i \right) = \bigcup_{i \in \mathbb{N}} A_i$$

so that every σ -algebra on X is a algebra. So we have

$$\sigma\text{-algebra} \xrightarrow[\text{is a}]{\Rightarrow} \text{algebra} \xrightarrow[\text{is a}]{\Rightarrow} \text{ring}$$

Definition 21.32. (Measurable Space) Let X be a non empty set and $\mathcal{A}$ a σ -algebra on X then the couple $\langle X, \mathcal{A} \rangle$ is called a **measurable space**.

We have the following equivalent definitions of a σ -algebra

Theorem 21.33. Let X be a set, $\mathcal{A} \subseteq \mathcal{P}(X)$ then we have the following equivalences:

1. $\mathcal{A}$ is a σ -algebra on X
2. $\mathcal{A}$ is a algebra and $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ **pairwise disjoint** we have $\bigsqcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$
3. $\mathcal{A}$ is a algebra and $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$
4. $\mathcal{A}$ satisfies:
 - a. $\emptyset \in \mathcal{A}$

- b. $\forall A \in \mathcal{A}$ we have $X \setminus A \in \mathcal{A}$
- c. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$

5. $\mathcal{A}$ satisfies:

- a. $\emptyset \in \mathcal{A}$
- b. $\forall A \in \mathcal{A}$ we have $X \setminus A \in \mathcal{A}$
- c. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{A}$

6. $\mathcal{A}$ satisfies:

- a. $X \in \mathcal{A}$
- b. $\forall A \in \mathcal{A}$ we have $X \setminus A \in \mathcal{A}$
- c. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{A}$

Proof.

1 $\Rightarrow$ 2. As $\mathcal{A}$ is a sigma-algebra it follows that

$\mathcal{A}$ is a algebra

Further if $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ is pairwise disjoint then by the definition of a σ -algebra it follows that

$$\bigsqcup_{i \in \mathbb{N}} A_i \stackrel{\text{def}}{=} \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

2 $\Rightarrow$ 3. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ and define

$$\{B_i\}_{i \in \mathbb{N}} \text{ by } B_i = \begin{cases} A_1 & \text{if } i = 1 \\ A_i \setminus \bigcup_{j \in \{1, \dots, i-1\}} A_j & \text{if } i \in \{2, \dots, \infty\} \end{cases}$$

As $\mathcal{A}$ is a algebra we have by [theorem: 21.28] it follows that $\forall i \in \mathbb{N}$ we have $B_i \in \mathcal{A}$ so that

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$$

Further by [lemma: 21.5] $\{B_i\}_{i \in \mathbb{N}}$ is pairwise disjoint so that by (2)

$$\bigsqcup_{i \in \mathbb{N}} B_i \in \mathcal{A}$$

As further $\bigcup_{i \in \mathbb{N}} A_i \stackrel{[\text{lemma: 21.5}]}{=} \bigsqcup_{i \in \mathbb{N}} B_i$ it follows that

$$\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

3 $\Rightarrow$ 4. As $\mathcal{A}$ is a algebra we have by [theorem: 21.28] that

$$\emptyset \in \mathcal{A}$$

$$\forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A}$$

Finally by the definition of a σ -algebra we have

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ we have } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

4 $\Rightarrow$ 5. We have by (3) that

$$\emptyset \in \mathcal{A} \text{ and } \forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A}$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$. If $i \in \mathbb{N}$ then as $A_i \in \mathcal{A}$ it follows that $X \setminus A_i \in \mathcal{A}$ we have by (3) that $\bigcup_{i \in \mathbb{N}} (X \setminus A_i) \in \mathcal{A}$ so that

$$X \setminus \left(\bigcup_{i \in \mathbb{N}} (X \setminus A_i) \right) \in \mathcal{A}$$

As

$$\begin{aligned} X \setminus \left(\bigcup_{i \in \mathbb{N}} (X \setminus A_i) \right) &\stackrel{[\text{theorem: 2.132}]}{=} \bigcap_{i \in \mathbb{N}} (X \setminus (X \setminus A_i)) \\ &\stackrel{A_i \subseteq X \wedge [\text{theorem: 1.33}]}{=} \bigcap_{i \in \mathbb{N}} A_i \end{aligned}$$

it follows that

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ we have } \bigcap_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

5 $\Rightarrow$ 6. By (4) we have that $\emptyset \in \mathcal{A}$ so that by (4) again we have

$$X = X \setminus \emptyset \in \mathcal{A}$$

further by (4) we have

$$\forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A} \text{ and } \forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ we have } \bigcap_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

6 $\Rightarrow$ 1. By (1) we have

$$X \in \mathcal{A} \text{ and } \forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A}$$

Further if $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ then $\forall i \in \mathbb{N}$ we have $A_i \in \mathcal{A}$ so that $X \setminus A_i \in \mathcal{A}$. Hence we have

$$X \setminus \left(\bigcap_{i \in \mathbb{N}} (X \setminus A_i) \right) \in \mathcal{A}$$

Now

$$\begin{aligned} X \setminus \left(\bigcap_{i \in \mathbb{N}} (X \setminus A_i) \right) &\stackrel{[\text{theorem: 2.132}]}{=} \bigcup_{i \in \mathbb{N}} (X \setminus (X \setminus A_i)) \\ &\stackrel{A_i \subseteq X \wedge [\text{theorem: 1.33}]}{=} \bigcup_{i \in \mathbb{N}} A_i \end{aligned}$$

so that

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ we have } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

This proves that $\mathcal{A}$ is a σ -algebra. □

Example 21.34. Let $X \neq \emptyset$ be a set then $\{\emptyset\}$ is not a σ -algebra on X [see example: 21.22] but $\{\emptyset, X\}$ is a σ -algebra on X .

Proof. Using [example: 21.22] it follows that $\{\emptyset, X\}$ is a algebra on X so that

$$X \in \mathcal{A} \text{ and } \forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A}$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \{\emptyset, X\}$ then we have two cases to consider:

$\forall i \in \mathbb{N}$ we have $A_i \neq \emptyset$. Then $\forall i \in \mathbb{N}$ $A_i = X$ so that $\bigcap_{i \in \mathbb{N}} A_i = X \in \mathcal{A}$

$\exists i \in \mathbb{N}$ with $A_i = \emptyset$. Then $\bigcap_{i \in \mathbb{N}} A_i = \emptyset \in \mathcal{A}$

so that $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{A}$. Applying then [theorem: 21.33] proves that $\{\emptyset, X\}$ is a σ -algebra on X . □

Example 21.35. Let X be a set then $\mathcal{P}(X)$ is a σ -algebra on X

Proof. Using [example: 21.27] $\mathcal{P}(X)$ is a algebra on X . Further for $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{P}(X)$ we have $\forall i \in \mathbb{N}$ that $A_i \subseteq X$ so that $\bigcup_{i \in \mathbb{N}} A_i \subseteq X$ proving that $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{P}(X)$. Applying then [theorem: 21.33] proves that $\mathcal{P}(X)$ is a σ -algebra on X . □

Theorem 21.36. Let X be a set, $\mathcal{A}$ a σ -algebra on X , I a countable set, $\{A_i\}_{i \in I} \subseteq \mathcal{A}$ a countable family of element of $\mathcal{A}$ then we have

1. $\bigcup_{i \in I} A_i \in \mathcal{A}$
2. $\bigcap_{i \in I} A_i \in \mathcal{A}$

Proof.

1. For I we have either

I is finite. Then there exist a bijection $\beta: \{1, \dots, n\} \rightarrow I$ where $n \in \mathbb{N}_0$. Let $x \in \bigcup_{i \in I} A_i$ then there exist a $i \in I$ such that $x \in A_i$. As β is a bijection hence surjective there exist a $j \in \{1, \dots, n\}$ such that $i = \beta(j)$ so that $x \in A_{\beta(j)} \subseteq \bigcup_{j \in \{1, \dots, n\}} A_{\beta(j)}$. Hence we have that

$$\bigcup_{i \in I} A_i \subseteq \bigcup_{j \in \{1, \dots, n\}} A_{\beta(j)} \quad (21.21)$$

Likewise if $x \in \bigcup_{j \in \{1, \dots, n\}} A_{\beta(j)}$ then there exist a $j \in \{1, \dots, n\}$ such that $x \in A_{\beta(j)}$ which as $\beta(j) \in I$ proves that $x \in \bigcup_{i \in I} A_i$, hence $\bigcup_{j \in \{1, \dots, n\}} A_{\beta(j)} \subseteq \bigcup_{i \in I} A_i$. Combining this with [eq: 21.21] proves that

$$\bigcup_{i \in I} A_i = \bigcup_{j \in \{1, \dots, n\}} A_{\beta(j)}$$

As $\forall j \in \{1, \dots, n\} A_{\beta(j)} \in \mathcal{A}$ [because $\beta(j) \in I$] it follows, as a σ -algebra is a ring, from [theorem: 21.24] that $\bigcup_{j \in \{1, \dots, n\}} A_{\beta(j)} \in \mathcal{A}$. Hence

$$\bigcup_{i \in I} A_i \in \mathcal{A}$$

I is denumerable. Then there exist a bijection $\beta: \mathbb{N} \rightarrow I$. Let $x \in \bigcup_{i \in I} A_i$ then there exist a $i \in I$ such that $x \in A_i$. As β is a bijection hence surjective there exist a $j \in \mathbb{N}$ such that $i = \beta(j)$ so that $x \in A_{\beta(j)} \subseteq \bigcup_{j \in \mathbb{N}} A_{\beta(j)}$. Hence we have that

$$\bigcup_{i \in I} A_i \subseteq \bigcup_{j \in \mathbb{N}} A_{\beta(j)} \quad (21.22)$$

Likewise if $x \in \bigcup_{j \in \mathbb{N}} A_{\beta(j)}$ then there exist a $j \in \mathbb{N}$ such that $x \in A_{\beta(j)}$ which as $\beta(j) \in I$ proves that $x \in \bigcup_{i \in I} A_i$, hence $\bigcup_{j \in \mathbb{N}} A_{\beta(j)} \subseteq \bigcup_{i \in I} A_i$. Combining this with [eq: 21.22] proves that

$$\bigcup_{i \in I} A_i = \bigcup_{j \in \mathbb{N}} A_{\beta(j)}$$

As $\forall j \in \mathbb{N} A_{\beta(j)} \in \mathcal{A}$ [because $\beta(j) \in I$] it follows, as a σ -algebra is a ring, from [theorem: 21.24] that $\bigcup_{j \in \mathbb{N}} A_{\beta(j)} \in \mathcal{A}$. Hence

$$\bigcup_{i \in I} A_i \in \mathcal{A}$$

2. Let $i \in I$ then $A_i \in \mathcal{A}$ hence $X \setminus A_i \in \mathcal{A}$ so that by (1) $\bigcup_{i \in I} (X \setminus A_i) \in \mathcal{A}$ from which it follows that

$$X \setminus \left(\bigcup_{i \in I} (X \setminus A_i) \right) \in \mathcal{A}$$

As we have

$$\begin{aligned} X \setminus \left(\bigcup_{i \in I} (X \setminus A_i) \right) &\stackrel{[\text{theorem: 2.132}]}{=} \bigcap_{i \in I} (X \setminus (X \setminus A_i)) \\ &\stackrel{A_i \subseteq X \wedge [\text{theorem: 1.33}]}{=} \bigcap_{i \in I} A_i \end{aligned}$$

it follows that

$$\bigcap_{i \in I} A_i \in \mathcal{A} \quad \square$$

If we have already proved that a subset of $\mathcal{P}(X)$ is a algebra on X then the following theorem will be useful to prove that this subset is actually a σ -algebra.

Theorem 21.37. *Let X be a set and let $\mathcal{A}$ be a algebra on X then we have:*

1. *If $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N} A_i \subseteq A_{i+1}$ we have $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$ then $\mathcal{A}$ is a σ -algebra on X .*
2. *If $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N} A_{i+1} \subseteq A_i$ we have $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{A}$ then $\mathcal{A}$ is a σ -algebra on X .*

Proof.

1. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$. Define $\{B_i\}_{i \in \mathbb{N}}$ by $B_i = \bigcup_{j \in \{1, \dots, i\}} A_j$ then as $\mathcal{A}$ is a algebra we have by [theorem: 21.28] that $\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$. Further for $i \in \mathbb{N}$ we have

$$B_i = \bigcup_{j \in \{1, \dots, i\}} B_j \subseteq \bigcup_{j \in \{1, \dots, i+1\}} B_j = B_{i+1}$$

hence by the hypothesis we have

$$\bigcup_{i \in \mathbb{N}} B_i \in \mathcal{A} \quad (21.23)$$

As $\forall i \in \mathbb{N}$ we have $A_i \subseteq \bigcup_{j \in \{1, \dots, i\}} A_j = B_i$ it follows that

$$\bigcup_{i \in \mathbb{N}} A_i \subseteq \bigcup_{i \in \mathbb{N}} B_i \quad (21.24)$$

Further if $x \in \bigcup_{i \in \mathbb{N}} B_i$ then there exist a $i \in \mathbb{N}$ such that $x \in B_i = \bigcup_{j \in \{1, \dots, i\}} A_j$, hence there exist a $j \in \{1, \dots, i\}$ such that $x \in A_j \subseteq \bigcup_{i \in \mathbb{N}} A_i$. This proves that $\bigcup_{i \in \mathbb{N}} B_i \subseteq \bigcup_{i \in \mathbb{N}} A_i$ which combined with [eq: 21.24] gives us $\bigcup_{i \in \mathbb{N}} A_i = \bigcup_{i \in \mathbb{N}} B_i$, hence using [eq: 21.23] we have that

$$\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

Applying then [theorem: 21.33] it follows that $\mathcal{A}$ is a σ -algebra.

2. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be such that $\forall i \in \mathbb{N}$ we have $A_i \subseteq A_{i+1}$. Let $i \in \mathbb{N}$ then as $\mathcal{A}$ is a algebra $X \setminus A_i \in \mathcal{A}$, further if $x \in X \setminus A_{i+1}$ then $x \in X$ and $x \notin A_i$ [as $A_i \subseteq A_{i+1}$] so that $x \in X \setminus A_i$. Hence $\{X \setminus A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ and $\forall i \in \mathbb{N}$ we have $X \setminus A_{i+1} \subseteq X \setminus A_i$ so by the hypothesis we have that $\bigcap_{i \in \mathbb{N}} (X \setminus A_i) \in \mathcal{A}$. As $\mathcal{A}$ is a algebra we have then that

$$X \setminus \left(\bigcap_{i \in \mathbb{N}} (X \setminus A_i) \right) \in \mathcal{A}$$

Further $X \setminus \left(\bigcap_{i \in \mathbb{N}} (X \setminus A_i) \right) \stackrel{[\text{theorem: 2.132}]}{=} \bigcup_{i \in \mathbb{N}} (X \setminus (X \setminus A_i)) \stackrel{A_i \subseteq X \wedge [\text{theorem: 1.33}]}{=} \bigcup_{i \in \mathbb{N}} A_i$ so that $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$. Hence we have proved that $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N} A_i \subseteq A_{i+1}$ $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$ so that by (1) $\mathcal{A}$ is a σ -algebra. $\square$

We show now how we can generate a σ algebra based on a arbitrary subset of $\mathcal{P}(X)$. First we prove that for a non empty collection of σ -algebra's the intersection of this collection is again a σ -algebra.

Lemma 21.38. *Let X be a set and $\mathfrak{A}$ a non empty set of σ -algebra's on X then $\bigcap_{\mathcal{A} \in \mathfrak{A}} \mathcal{A}$ is a σ -algebra on X .*

Proof. As $\mathfrak{A} \neq \emptyset$ there exist a $\mathcal{S} \in \mathfrak{A}$ with $\mathcal{S} \subseteq \mathcal{P}(X)$ so that we have by [theorem: 1.63] that $\bigcap_{\mathcal{A} \in \mathfrak{A}} \mathcal{A} \subseteq \mathcal{S} \subseteq \mathcal{P}(X)$ proving that

$$\bigcap_{\mathcal{A} \in \mathfrak{A}} \mathcal{A} \subseteq \mathcal{P}(X)$$

As $\forall \mathcal{A} \in \mathfrak{A}$ $\mathcal{A}$ is a σ -algebra on X we have by [theorem: 21.33] that $X \in \mathcal{A}$ hence

$$X \in \bigcap_{\mathcal{A} \in \mathfrak{A}} \mathcal{A}$$

Let $A \in \bigcap_{\mathcal{A} \in \mathfrak{A}} \mathcal{A}$ then for $\mathcal{A} \in \mathfrak{A}$ we have $A \in \mathcal{A}$ so that $X \setminus A \in \mathcal{A}$ which as $\mathcal{A} \in \mathfrak{A}$ was chosen arbitrary proves that $X \setminus A \in \bigcap_{\mathcal{A} \in \mathfrak{A}} \mathcal{A}$. Hence as $A \in \bigcap_{\mathcal{A} \in \mathfrak{A}} \mathcal{A}$ was chosen arbitrary we have that

$$\forall A \in \bigcap_{\mathcal{A} \in \mathfrak{A}} \mathcal{A} \text{ we have } X \setminus A \in \bigcap_{\mathcal{A} \in \mathfrak{A}} \mathcal{A}$$

If $\{A_i\}_{i \in \mathbb{N}} \subseteq \bigcap_{\mathcal{A} \in \mathfrak{A}} \mathcal{A}$ then for $\mathcal{A} \in \mathfrak{A}$ we have $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ so that $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$ which as $\mathcal{A} \in \mathfrak{A}$ was chosen arbitrary proves that $\bigcup_{i \in \mathbb{N}} A_i \in \bigcap_{\mathcal{A} \in \mathfrak{A}} \mathcal{A}$. Hence as $\{A_i\}_{i \in \mathbb{N}} \subseteq \bigcap_{\mathcal{A} \in \mathfrak{A}} \mathcal{A}$ was chosen arbitrary we have that

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \bigcap_{\mathcal{A} \in \mathfrak{A}} \mathcal{A} \text{ we have } \bigcup_{i \in \mathbb{N}} A_i \in \bigcap_{\mathcal{A} \in \mathfrak{A}} \mathcal{A}$$

□

We use now the above theorem to show how we can generate a σ -algebra out of a non empty subset of $\mathcal{P}(X)$.

Theorem 21.39. *Let X be a set $\mathcal{A} \subseteq \mathcal{P}(X)$ then there exist a **unique** algebra $\sigma[\mathcal{A}]$ on X such that:*

1. $\mathcal{A} \subseteq \sigma[\mathcal{A}]$
2. If $\mathcal{B}$ is another σ -algebra with $\mathcal{A} \subseteq \mathcal{B}$ then $\sigma[\mathcal{A}] \subseteq \mathcal{B}$

This unique smallest σ -algebra that contains $\mathcal{A}$ is called the σ -algebra generated by $\mathcal{A}$

Proof. Define $\mathfrak{A} = \{\mathcal{T} \mid \mathcal{T} \text{ is a } \sigma\text{-algebra on } X \text{ with } \mathcal{A} \subseteq \mathcal{T}\}$. As $\mathcal{A} \subseteq \mathcal{P}(X)$ and $\mathcal{P}(X)$ is a σ -algebra on X [see example: 21.35] it follows that $\mathcal{P}(X) \in \mathfrak{A}$ hence $\mathfrak{A}$ is not empty. Using then previous lemma [lemma: 21.38] it follows that

$$\bigcap_{\mathcal{T} \in \mathfrak{A}} \mathcal{T} \text{ is a } \sigma\text{-algebra on } X$$

As $\forall \mathcal{T} \in \mathfrak{A}$ $\mathcal{A} \subseteq \mathcal{T}$ it follows from [theorem: 1.63] that

$$\mathcal{A} \subseteq \bigcap_{\mathcal{T} \in \mathfrak{A}} \mathcal{T}$$

Finally assume that $\mathcal{B}$ is another σ -algebra on X such that $\mathcal{A} \subseteq \mathcal{B}$ then $\mathcal{B} \in \mathfrak{A}$ so that by [theorem: 1.63]

$$\bigcap_{\mathcal{T} \in \mathfrak{A}} \mathcal{T} \subseteq \mathcal{B}$$

Taking $\sigma[\mathcal{A}] = \bigcap_{\mathcal{T} \in \mathfrak{A}} \mathcal{T}$ then proves the theorem. □

Corollary 21.40. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space then $\sigma[\mathcal{A}] = \mathcal{A}$*

Proof. As $\mathcal{A}$ is a σ -algebra and $\mathcal{A} \subseteq \mathcal{A}$ it follows from [theorem: 21.39] that $\mathcal{A} \subseteq \sigma[\mathcal{A}] \subseteq \mathcal{A}$ which proves that $\sigma[\mathcal{A}] = \mathcal{A}$. □

We introduce now the concept of a measurable supspace.

Theorem 21.41. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $B \subseteq X$ then $\mathcal{A}|_B$ defined by*

$$\mathcal{A}|_B = \{B \cap A \mid A \in \mathcal{A}\}$$

*is a σ -algebra on B called the **trace of $\mathcal{A}$ in B** . If additional $B \in \mathcal{A}$ then we have that*

$$\mathcal{A}|_B \subseteq \mathcal{A}$$

and

$$\mathcal{A}|_B = \{A \in \mathcal{A} | A \subseteq B\}$$

Note 21.42. If $B = X$ then we have $\mathcal{A}|_X = \{X \cap A | A \in \mathcal{A}\} = \{A | A \in \mathcal{A}\} = \mathcal{A}$ so that we have $\langle X, \mathcal{A}|_X \rangle = \langle X, \mathcal{A} \rangle$.

Proof. As $X \in \mathcal{A}$ and $B = B \cap X$ it follows that

$$B \in \mathcal{A}|_B$$

Let $C \in \mathcal{A}|_B$ then there exist a $C' \in \mathcal{A}$ such that $C = B \cap C'$. As $\mathcal{A}$ is a σ -algebra we have that $X \setminus C' \in \mathcal{A}$, as further

$$\begin{aligned} B \setminus C &= B \setminus (B \cap C') \\ &\stackrel{[\text{theorem: 1.31}]}{=} (B \setminus B) \cup (B \setminus C') \\ &= B \setminus C' \\ &\stackrel{B \subseteq X}{=} (B \cap X) \setminus C' \\ &\stackrel{[\text{theorem: 1.25}]}{=} B \cap (X \setminus C') \end{aligned}$$

which proves that $B \setminus C \in \mathcal{A}|_B$. Hence we have that

$$\forall C \in \mathcal{A}|_B \text{ we have that } B \setminus C \in \mathcal{A}|_B$$

Let $\{C_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}|_B$ then there exist a $\{C'_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ such that $\forall i \in \mathbb{N} \ C_i = B \cap C'_i$. As $\mathcal{A}$ is a σ -algebra we have that $\bigcup_{i \in \mathbb{N}} C'_i \in \mathcal{A}$. Now $\bigcup_{i \in \mathbb{N}} C_i = \bigcup_{i \in \mathbb{N}} (B \cap C'_i) \stackrel{[\text{theorem: 2.130}]}{=} B \cap (\bigcup_{i \in \mathbb{N}} C'_i)$ so that $\bigcup_{i \in \mathbb{N}} C_i \in \mathcal{A}|_B$. Hence we have that

$$\forall \{C_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}|_B \text{ we have } \bigcup_{i \in \mathbb{N}} C_i \in \mathcal{A}|_B$$

So all the conditions for a σ -algebra are satisfied which allows us to conclude that

$$\mathcal{A}|_B \text{ is a } \sigma\text{-algebra}$$

Assume now that additional $B \in \mathcal{A}$. If $C \in \mathcal{A}|_B$ then there exist a $C' \in \mathcal{A}$ such that $C = B \cap C'$, further by [theorems: 21.33, 21.28] $B \cap C' \in \mathcal{A}$ so that $C \in \mathcal{A}$. Hence we have that

$$\mathcal{A}|_B \subseteq \mathcal{A}$$

If $C \in \mathcal{A}|_B$ then by the above $C \in \mathcal{A}$ and $C = B \cap C' \subseteq B$ so that $C \in \{A \in \mathcal{A} | A \subseteq B\}$. Further if $C \in \{A \in \mathcal{A} | A \subseteq B\}$ then $C \in \mathcal{A}$ and $C \stackrel{C \subseteq B}{=} B \cap C$ so that $C \in \mathcal{A}|_B$. Hence we have

$$\mathcal{A}|_B = \{A \in \mathcal{A} | A \subseteq B\} \quad \square$$

21.2.1 Borel Algebra

A special case of a σ -algebra in the context of topological spaces is the Borel algebra.

Definition 21.43. Let $\langle X, \mathcal{T} \rangle$ be a topological space then the Borel algebra on X noted as $\mathcal{B}[X, \mathcal{T}]$ is defined to be $\mathcal{B}[X, \mathcal{T}] = \sigma[\mathcal{T}]$. In other words the Borel algebra on a topological space is the σ -algebra generated by $\mathcal{T}$.

Theorem 21.44. Let $\langle X, \mathcal{T} \rangle$ be a topological space then $\mathcal{B}[X, \mathcal{T}] = \sigma[\{C \subseteq X | C \text{ is closed}\}]$.

Proof. If $C \in \{C \subseteq X | C \text{ is closed}\}$ then C is closed, hence there exist a open $U \in \mathcal{T}$ such that $C = X \setminus U$. As $U \in \mathcal{T} \in \sigma[\mathcal{T}]$ it follows that $C = X \setminus U \in \sigma[\mathcal{T}]$. So $\{C \subseteq X | C \text{ is closed}\} \subseteq \sigma[\mathcal{T}]$ a σ -algebra, hence using [theorem: 21.39] we have

$$\sigma[\{C \subseteq X | C \text{ is closed}\}] \subseteq \sigma[\mathcal{T}]$$

If $U \in \mathcal{T}$ then $X \setminus U$ is closed hence $X \setminus U \in \{C \subseteq X \mid C \text{ is closed}\} \in \sigma[\{C \subseteq X \mid C \text{ is closed}\}]$, hence $U = X \setminus (X \setminus U) \in \sigma[\{C \subseteq X \mid C \text{ is closed}\}]$ proving that $\mathcal{T} \subseteq \sigma[\{C \subseteq X \mid C \text{ is closed}\}]$. So using [theorem: 21.39] we have

$$\sigma[\mathcal{T}] \subseteq \sigma[\{C \subseteq X \mid C \text{ is closed}\}]$$

This proves that

$$\mathcal{B}[X, \mathcal{T}] = \sigma[\mathcal{T}] = \sigma[\{C \subseteq X \mid C \text{ is closed}\}] \quad \square$$

Theorem 21.45. *Let $\langle X, \mathcal{T}_X \rangle$ and $\langle Y, \mathcal{T}_Y \rangle$ be topological spaces and $f: X \rightarrow Y$ a continuous function then $\forall A \in \mathcal{B}[Y, \mathcal{T}_Y]$ we have that $f^{-1}(A) \in \mathcal{B}[X, \mathcal{T}_X]$.*

Proof. Let $\mathcal{A} = \{A \in \mathcal{P}(Y) \mid f^{-1}(A) \in \mathcal{B}[X, \mathcal{T}_X]\}$ then we prove that $\mathcal{A}$ is a σ -algebra containing $\mathcal{T}_Y$. First, as $f^{-1}(Y) = X \in \mathcal{B}[X, \mathcal{T}_X]$, it follows that

$$Y \in \mathcal{A}$$

If $A \in \mathcal{A}$ then $A \subseteq Y$ and $f^{-1}(A) \in \mathcal{B}[X, \mathcal{T}_X]$, as further $f^{-1}(Y \setminus A) \stackrel{[\text{theorem: 2.94}]}{=} Y \setminus f^{-1}(A) \in \mathcal{B}[X, \mathcal{T}_X]$ it follows that $Y \setminus A \in \mathcal{B}[X, \mathcal{T}_X]$. Hence we have that

$$\forall A \in \mathcal{A} \text{ we have } Y \setminus A \in \mathcal{A}$$

If $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ then $\forall i \in \mathbb{N}$ we have $f^{-1}(A_i) \in \mathcal{B}[X, \mathcal{T}_X]$, further $f^{-1}(\bigcup_{i \in \mathbb{N}} A_i) \stackrel{[\text{theorem: 2.136}]}{=} \bigcup_{i \in \mathbb{N}} f^{-1}(A_i) \in \mathcal{B}[X, \mathcal{T}_X]$ which proves that

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ we have } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$$

From the above it follows then that

$$\mathcal{A} \text{ is a } \sigma\text{-algebra}$$

If $U \in \mathcal{T}_Y$ then as f is continuous it follows that $f^{-1}(U) \in \mathcal{T}_X \subseteq \sigma(\mathcal{T}_X) = \mathcal{B}[X, \mathcal{T}_X]$ from which it follows that $U \in \mathcal{A}$ hence we have that

$$\mathcal{T}_Y \subseteq \mathcal{A}$$

Finally using [theorem: 21.39] it follows that $\mathcal{B}[Y, \mathcal{T}_Y] = \sigma[\mathcal{T}_Y] \subseteq \mathcal{A}$ from which it follows that $\forall A \in \mathcal{B}[Y, \mathcal{T}_Y]$ we have that $f^{-1}(A) \in \mathcal{B}[X, \mathcal{T}_X]$. $\square$

Corollary 21.46. *Let $\langle X, \|\cdot\| \rangle$ be a normed space with the norm topology $\mathcal{T}_{\|\cdot\|}$ then*

1. $\forall x \in X$ and $\forall A \in \mathcal{B}[X, \mathcal{T}_{\|\cdot\|}]$ we have

$$x + A \in \mathcal{B}[X, \mathcal{T}_{\|\cdot\|}]$$

$$\text{where } x + A = \{x + a \mid a \in A\} = \{a + x \mid a \in A\} = x + A.$$

2. $\forall \alpha \in \mathbb{K}$ and $\forall A \in \mathcal{B}[X, \mathcal{T}_{\|\cdot\|}]$ we have

$$\alpha \cdot A \in \mathcal{B}[X, \mathcal{T}_{\|\cdot\|}]$$

$$\text{where } \alpha \cdot A = \{\alpha \cdot a \mid a \in A\}$$

Proof.

1. Take $x \in X$ then by [theorem: 14.162] $\delta_{-x}: X \rightarrow X$ defined by $\delta_{-x}(y) = -x + y$ is a continuous function. Hence by [theorem: 21.45] we have that

$$\forall A \in \mathcal{B}[X, \mathcal{T}_{\|\cdot\|}] \text{ that } \delta_{-x}^{-1}(A) \in \mathcal{B}[X, \mathcal{T}_{\|\cdot\|}] \quad (21.25)$$

Further

$$\begin{aligned} y \in \delta_{-x}^{-1}(A) &\Leftrightarrow \delta_{-x}(y) \in A \\ &\Leftrightarrow -x + y \in A \\ &\Leftrightarrow y = x + (-x + y) \text{ where } (-x + y) \in A \\ &\Leftrightarrow y = x + a \text{ where } a \in A \\ &\Leftrightarrow y \in x + A \end{aligned}$$

which proves that $\delta_{-x}^{-1}(A) = x + A$. Combining this with [eq: 21.25] proves that

$$\forall x \in X \text{ and } \forall A \in \mathcal{B}[X, \mathcal{T}_{||}] \text{ we have } x + A \in \mathcal{B}[X, \mathcal{T}_{||}]$$

2. Take $\alpha \in \mathbb{K}$ and $A \in \mathcal{B}[X, \mathcal{T}_{||}]$ then we have two cases for α to consider:

$\alpha = 0$. For A we have either:

$$A = \emptyset. \text{ Then } \alpha \cdot A = \emptyset \in \mathcal{B}[X, \mathcal{T}_{||}]$$

$A \neq \emptyset$. Then $\alpha \cdot A = \{0\}$ which is closed [see theorems: 14.205, 14.207] so that by [theorem: 21.44] $\alpha \cdot A \in \mathcal{B}[X, \mathcal{T}_{||}]$.

$\alpha \neq 0$. Using [theorem: 14.145] the function $\mu_{1 \setminus \alpha}: X \rightarrow X$ by $\mu_{1 \setminus \alpha}(x) = \frac{1}{\alpha} \cdot x$ is a continuous function. Hence by [theorem: 21.45] we have that

$$\mu_{1 \setminus \alpha}^{-1}(A) \in \mathcal{B}[X, \mathcal{T}_{||}] \quad (21.26)$$

Further

$$\begin{aligned} y \in \mu_{1 \setminus \alpha}^{-1}(A) &\Leftrightarrow \mu_{1 \setminus \alpha}(y) \in A \\ &\Leftrightarrow \frac{1}{\alpha} \cdot y \in A \\ &\Leftrightarrow y = \alpha \cdot \left(\frac{1}{\alpha} \cdot y \right) \text{ where } \frac{1}{\alpha} \cdot y \in A \\ &\Leftrightarrow y = \alpha \cdot a \text{ where } a \in A \\ &\Leftrightarrow y \in \alpha \cdot A \end{aligned}$$

which proves that $\mu_{1 \setminus \alpha}^{-1}(A) = \frac{1}{\alpha} \cdot A$. Combining this with [eq: 21.26] proves that

$$\alpha \cdot A \in \mathcal{B}[X, \mathcal{T}_{||}]$$

In other words we have

$$\forall \alpha \in \mathbb{K} \text{ and } \forall A \in \mathcal{B}[X, \mathcal{T}_{||}] \text{ that } \alpha \cdot A \in \mathcal{B}[X, \mathcal{T}_{||}] \quad \square$$

21.2.1.1 Borel algebra on $\mathbb{R}$

Definition 21.47. Let $\langle \mathbb{R}, \mathcal{T}_{||} \rangle$ be the set of real numbers with the canonical topology $\mathcal{T}_{||}$ based on the absolute value norm [see theorem: 14.99] then $\mathcal{B}[\mathbb{R}]$ is the Borel algebra based on $\mathcal{T}_{||}$. In other words

$$\mathcal{B}[\mathbb{R}] = \mathcal{B}[\mathbb{R}, \mathcal{T}_{||}] = \sigma[\mathcal{T}_{||}]$$

We will now find equivalent definitions for $\mathcal{B}[\mathbb{R}]$ that will be usefull if we define a measure. First we introduce the concept of bounded intervals on $\mathbb{R}$.

Definition 21.48. We define the following set of bounded intervals:

1. $\mathcal{I}_{[]} = \{[a, b] | a, b \in \mathbb{R} \wedge [a, b] \neq \emptyset\}$ [the set of non empty closed bounded intervals]
2. $\mathcal{I}_{[)} = \{[a, b[| a, b \in \mathbb{R} \wedge [a, b[\neq \emptyset\}$ [the set of non empty right open bounded intervals]
3. $\mathcal{I}_{])} = \{]a, b[| a, b \in \mathbb{R} \wedge]a, b[\neq \emptyset\}$ [the set of non empty left open bounded intervals]
4. $\mathcal{I}_{|]} = \{]a, b] | a, b \in \mathbb{R} \wedge]a, b] \neq \emptyset\}$ [the set of non empty open bounded intervals]
5. $\mathcal{I} = \mathcal{I}_{[]} \cup \mathcal{I}_{[)} \cup \mathcal{I}_{])} \cup \mathcal{I}_{|]}$

Note 21.49. If $b = a$ then $]a, b[= [a, b[=]a, b] =]a, b] = \emptyset$ and if $b < a$ then $[a, b] = [a, b[=]a, b] =]a, b[= \emptyset$ then we have valid bounded intervals but they are not elements of $\mathcal{I}_{[]}$, $\mathcal{I}_{[)}$, $\mathcal{I}_{])}$ and $\mathcal{I}_{|]}$. One reason to exclude these intervals is that the boundary points of these intervals are not well defined [for example $[1, 0[= [2, 0[= [0, 0[$ which is needed for defining the length of the interval based on the boundary points.

For case to case analysis the following lemma will be usefull.

Lemma 21.50. *We have that $\mathcal{I}_{\emptyset}$, $\mathcal{I}_{[}$, $\mathcal{I}_{]}$ and $\mathcal{I}_{|}$ are pairwise disjoint. In other words we have*

$$\begin{aligned}\mathcal{I}_{\emptyset} \cap \mathcal{I}_{[} &= \emptyset \\ \mathcal{I}_{\emptyset} \cap \mathcal{I}_{]} &= \emptyset \\ \mathcal{I}_{\emptyset} \cap \mathcal{I}_{|} &= \emptyset \\ \mathcal{I}_{[} \cap \mathcal{I}_{\emptyset} &= \emptyset \\ \mathcal{I}_{[} \cap \mathcal{I}_{]} &= \emptyset \\ \mathcal{I}_{[} \cap \mathcal{I}_{|} &= \emptyset \\ \mathcal{I}_{]} \cap \mathcal{I}_{\emptyset} &= \emptyset \\ \mathcal{I}_{]} \cap \mathcal{I}_{[} &= \emptyset \\ \mathcal{I}_{]} \cap \mathcal{I}_{|} &= \emptyset \\ \mathcal{I}_{|} \cap \mathcal{I}_{\emptyset} &= \emptyset \\ \mathcal{I}_{|} \cap \mathcal{I}_{[} &= \emptyset \\ \mathcal{I}_{|} \cap \mathcal{I}_{]} &= \emptyset\end{aligned}$$

so that

$$\mathcal{I} = \mathcal{I}_{\emptyset} \sqcup \mathcal{I}_{[} \sqcup \mathcal{I}_{]} \sqcup \mathcal{I}_{|}$$

Proof. We have to check the following cases:

$\mathcal{I}_{\emptyset} \cap \mathcal{I}_{[}$. If $I \in \mathcal{I}_{\emptyset} \cap \mathcal{I}_{[}$ then $\emptyset \neq I = [a, b] = [c, d[$. As $[a, b] \neq \emptyset$ it follows from [theorem: 3.139] that $a \leq b$ so that $b \in [a, b] = [c, d[$ hence $c \leq b < d$. Using [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $c \leq b < x < d$ proving that $x \in [c, d[= [a, b]$ so that $b < x \leq b$ leading to the contradiction $b < b$. Hence we have

$$\mathcal{I}_{\emptyset} \cap \mathcal{I}_{[} = \emptyset \quad (21.27)$$

$\mathcal{I}_{\emptyset} \cap \mathcal{I}_{]}$. If $I \in \mathcal{I}_{\emptyset} \cap \mathcal{I}_{]}$ then $\emptyset = [a, b] =]c, d]$. As $[a, b] \neq \emptyset$ it follows from [theorem: 3.139] that $a \leq b$ so that $a \in [a, b] =]c, d]$ hence $c < a \leq d$. Using [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $c < x < a \leq d$ proving that $x \in]c, d] = [a, b]$ so that $a \leq x < a$ leading to the contradiction $a < a$. Hence we have

$$\mathcal{I}_{\emptyset} \cap \mathcal{I}_{]} = \emptyset \quad (21.28)$$

$\mathcal{I}_{\emptyset} \cap \mathcal{I}_{|}$. If $I \in \mathcal{I}_{\emptyset} \cap \mathcal{I}_{|}$ then $\emptyset \neq I = [a, b] =]c, d[$. As $[a, b] \neq \emptyset$ it follows from [theorem: 3.139] that $a \leq b$ so that $b \in [a, b] =]c, d[$ hence $c < b < d$. Using [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $c < b < x < d$ proving that $x \in]c, d[= [a, b]$ so that $b < x \leq b$ leading to the contradiction $b < b$. Hence we have

$$\mathcal{I}_{\emptyset} \cap \mathcal{I}_{|} = \emptyset \quad (21.29)$$

$\mathcal{I}_{[} \cap \mathcal{I}_{]}$. Then we have

$$\mathcal{I}_{[} \cap \mathcal{I}_{]} = \mathcal{I}_{\emptyset} \cap \mathcal{I}_{[} \stackrel{\text{eq; 21.27}}{=} \emptyset$$

$\mathcal{I}_{[} \cap \mathcal{I}_{|}$. If $I \in \mathcal{I}_{[} \cap \mathcal{I}_{|}$ then $\emptyset \neq I = [a, b[=]c, d]$. As $[a, b] \neq \emptyset$ it follows from [theorem: 3.139] that $a < b$ so that $a \in [a, b[=]c, d]$ hence $c < a \leq d$. Using [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $c < x < a \leq d$ proving that $x \in]c, d] = [a, b[$ so that $a \leq x < a$ leading to the contradiction $a < a$. Hence we have

$$\mathcal{I}_{[} \cap \mathcal{I}_{|} = \emptyset \quad (21.30)$$

$\mathcal{I}_{[} \cap \mathcal{I}_{|}$. If $I \in \mathcal{I}_{[} \cap \mathcal{I}_{|}$ then $\emptyset \neq I = [a, b[=]c, d]$. As $[a, b] \neq \emptyset$ it follows from [theorem: 3.139] that $a < b$ so that $a \in [a, b[=]c, d]$ hence $c < a < d$. Using [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $c < x < a < d$ proving that $x \in]c, d] = [a, b[$ so that $a \leq x < a$ leading to the contradiction $a < a$. Hence we have

$$\mathcal{I}_{[} \cap \mathcal{I}_{|} = \emptyset \quad (21.31)$$

$\mathcal{I}_{]]} \cap \mathcal{I}_{[]}$. Then we have

$$\mathcal{I}_{]]} \cap \mathcal{I}_{[]} = \mathcal{I}_{[]} \cap \mathcal{I}_{]]} \underset{[\text{eq: 21.28}]}{=} \emptyset$$

$\mathcal{I}_{]]} \cap \mathcal{I}_{[}$. If $I \in \mathcal{I}_{]]} \cap \mathcal{I}_{[}$ then $I =]a, b] = [c, d[$. As $]a, b] \neq \emptyset$ we have by [theorem: 3.139] that $a < b$ so that $b \in]a, b] = [c, d[$ hence $c \leq b < d$. Using [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $c \leq b < x < d$ proving that $x \in [c, d[=]a, b]$ so that $b < x \leq b$ leading to the contradiction $b < b$. Hence we have

$$\mathcal{I}_{]]} \cap \mathcal{I}_{[} = \emptyset \quad (21.32)$$

$\mathcal{I}_{]]} \cap \mathcal{I}_{]}$. If $I \in \mathcal{I}_{]]} \cap \mathcal{I}_{]}$ then $I =]a, b] =]c, d[$. As $]a, b] \neq \emptyset$ we have by [theorem: 3.139] that $a < b$ so that $b \in]a, b] =]c, d[$ hence $c < b < d$. Using [theorem: 10.32] there exist a $x \in \mathbb{R}$ such that $c < b < x < d$ proving that $x \in]c, d[=]a, b]$ so that $b < x \leq b$ leading to the contradiction $b < b$. Hence we have

$$\mathcal{I}_{]]} \cap \mathcal{I}_{]} = \emptyset \quad (21.33)$$

$\mathcal{I}_{]}\cap \mathcal{I}_{[]}$. Then we have

$$\mathcal{I}_{]}\cap \mathcal{I}_{[]} = \mathcal{I}_{[]} \cap \mathcal{I}_{]}\underset{[\text{eq: 21.29}]}{=} \emptyset$$

$\mathcal{I}_{]}\cap \mathcal{I}_{[}$. Then we have

$$\mathcal{I}_{]}\cap \mathcal{I}_{[} = \mathcal{I}_{[}\cap \mathcal{I}_{]}\underset{[\text{eq: 21.31}]}{=} \emptyset$$

$\mathcal{I}_{]}\cap \mathcal{I}_{]}$. Then we have

$$\mathcal{I}_{]}\cap \mathcal{I}_{]} = \mathcal{I}_{]}\cap \mathcal{I}_{]}\underset{[\text{eq: 21.33}]}{=} \emptyset \quad \square$$

The following allows us to switch between the different types of non empty bounded intervals.

Lemma 21.51. *Let $a, b \in \mathbb{R}$ then we have*

1. $]a, b] = \bigcap_{n \in \mathbb{N}}]a, b + \frac{1}{n}[$
2. $[a, b[= \bigcap_{n \in \mathbb{N}}]a - \frac{1}{n}, b[$
3. $[a, b] = \bigcap_{n \in \mathbb{N}}]a - \frac{1}{n}, b]$
4. $[a, b] = \bigcap_{n \in \mathbb{N}} [a, b + \frac{1}{n}[$
5. $[a, b] = \bigcap_{n \in \mathbb{N}}]a - \frac{1}{n}, b + \frac{1}{n}[$
6. $] -\infty, a] = \bigcap_{n \in \mathbb{N}}] -\infty, a + \frac{1}{n}[$
7. $[a, \infty[= \bigcap_{n \in \mathbb{N}}]a - \frac{1}{n}, \infty[$
8. $]a, b] = \bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, b]$
9. $[a, b[= \bigcup_{n \in \mathbb{N}} [a, b - \frac{1}{n}]$
10. $]a, b[= \bigcup_{n \in \mathbb{N}}]a, b - \frac{1}{n}]$
11. $]a, b[= \bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, b[$
12. $]a, b[= \bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, b - \frac{1}{n}]$
13. $] -\infty, a[= \bigcup_{n \in \mathbb{N}}] -\infty, a - \frac{1}{n}]$
14. $]a, \infty[= \bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, \infty[$
15. $[a, b[= [a, \infty[\setminus]b, \infty[$
16. $]a, b] =] -\infty, b] \setminus] -\infty, a]$
17. $]a, \infty[= \mathbb{R} \setminus] -\infty, a]$

Proof.

1. Let $x \in]a, b]$ then $a < x \leq b$ and as $\forall n \in \mathbb{N}$ $b < b + \frac{1}{n}$ we have $a < x < b + \frac{1}{n}$ so it follows that $x \in]a, b + \frac{1}{n}[$. Hence

$$]a, b] \subseteq \bigcap_{n \in \mathbb{N}} \left] a, b + \frac{1}{n} \right[\quad (21.34)$$

If $x \in \bigcap_{n \in \mathbb{N}} \left] a, b + \frac{1}{n} \right[$ then $\forall n \in \mathbb{N}$ $x \in]a, b + \frac{1}{n}[$ or $a < x < b + \frac{1}{n}$ which by [corollary: 10.31] proves that $a < x \leq b$ hence $x \in]a, b]$. So it follows that $\bigcap_{n \in \mathbb{N}} \left] a, b + \frac{1}{n} \right[\subseteq]a, b]$ which using [eq: 21.34] proves that

$$]a, b] = \bigcap_{n \in \mathbb{N}} \left] a, b + \frac{1}{n} \right[$$

2. Let $x \in [a, b[$ then $a \leq x < b$ and as $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < a$ it follows that $x \in]a - \frac{1}{n}, b[$. Hence

$$[a, b[\subseteq \bigcap_{n \in \mathbb{N}} \left] a - \frac{1}{n}, b \right[\quad (21.35)$$

If $x \in \bigcap_{n \in \mathbb{N}} \left] a - \frac{1}{n}, b \right[$ then $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < x < b \Rightarrow a < x + \frac{1}{n} \wedge x < b$ which by [corollary: 10.31] proves that $a \leq x < b$ hence $x \in [a, b[$. So $\bigcap_{n \in \mathbb{N}} \left] a - \frac{1}{n}, b \right[\subseteq [a, b[$ which using [eq: 21.35] prove that

$$[a, b[= \bigcap_{n \in \mathbb{N}} \left] a - \frac{1}{n}, b \right[$$

3. Let $x \in [a, b]$ then $a \leq x < b$ and as $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < a \Rightarrow x \in]a - \frac{1}{n}, b]$. Hence

$$[a, b] \subseteq \bigcap_{n \in \mathbb{N}} \left] a - \frac{1}{n}, b \right] \quad (21.36)$$

If $x \in \bigcap_{n \in \mathbb{N}} \left] a - \frac{1}{n}, b \right]$ then $\forall n \in \mathbb{N}$ then $a - \frac{1}{n} < x \leq b$ or $a < x + \frac{1}{n}$ which by [corollary: 10.31] proves that $a \leq x$ giving $x \in [a, b]$. So we have $\bigcap_{n \in \mathbb{N}} \left] a - \frac{1}{n}, b \right] \subseteq [a, b]$ which combined with [eq: 21.36] gives

$$[a, b] = \bigcap_{n \in \mathbb{N}} \left] a - \frac{1}{n}, b \right]$$

4. Let $x \in [a, b]$ then $a \leq x \leq b$ then $\forall n \in \mathbb{N}$ we have $a \leq x \leq b < b + \frac{1}{n}$. Which proves that

$$[a, b] \subseteq \bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n} \right[\quad (21.37)$$

If $x \in \bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n} \right[$ then $\forall n \in \mathbb{N}$ we have $a \leq x < b + \frac{1}{n}$. Using [corollary: 10.31] we have $x \leq b$ proving that $x \in [a, b]$. Hence $\bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n} \right[\subseteq [a, b]$ which combined with [eq: 21.37] gives

$$[a, b] = \bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n} \right[$$

5. Let $x \in [a, b]$ then $a \leq x \leq b$ and as $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < x < b + \frac{1}{n}$ it follows that $x \in]a - \frac{1}{n}, b + \frac{1}{n}[$. Hence

$$[a, b] \subseteq \bigcap_{n \in \mathbb{N}} \left] a - \frac{1}{n}, b + \frac{1}{n} \right[\quad (21.38)$$

Let $x \in \bigcap_{n \in \mathbb{N}} \left] a - \frac{1}{n}, b + \frac{1}{n} \right[$ then $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < x < b + \frac{1}{n} \Rightarrow a < x + \frac{1}{n} \wedge x < b + \frac{1}{n}$. Using [corollary: 10.31] we have $a \leq x \wedge x \leq b$ or $x \in [a, b]$. Hence $\bigcap_{n \in \mathbb{N}} \left] a - \frac{1}{n}, b + \frac{1}{n} \right[\subseteq [a, b]$ which together with [eq: 21.38] proves

$$[a, b] = \bigcap_{n \in \mathbb{N}} \left] a - \frac{1}{n}, b + \frac{1}{n} \right[$$

6. Let $x \in]-\infty, a]$ then $x \leq a$ and as $\forall n \in \mathbb{N}$ we have $x < a + \frac{1}{n}$ it follows that $x \in]-\infty, a + \frac{1}{n}[$. Hence

$$]-\infty, a] \subseteq \bigcap_{n \in \mathbb{N}}]-\infty, a + \frac{1}{n}[\quad (21.39)$$

Let $x \in \bigcap_{n \in \mathbb{N}}]-\infty, a + \frac{1}{n}[$ then $\forall n \in \mathbb{N}$ we have $x < a + \frac{1}{n}$ which by [corollary: 10.31] gives $x \leq a$ or $x \in]-\infty, a]$. Hence $\bigcap_{n \in \mathbb{N}}]-\infty, a + \frac{1}{n}[\subseteq]-\infty, a]$ which together with [eq: 21.39] proves

$$\bigcap_{n \in \mathbb{N}}]-\infty, a + \frac{1}{n}[=]-\infty, a]$$

7. Let $x \in [a, \infty[$ then $a \leq x$ so that $\forall n \in \mathbb{N}_9$ we have $a - \frac{1}{n} < x$ giving $x \in]a - \frac{1}{n}, \infty[$ proving that

$$[a, \infty[\subseteq \bigcap_{n \in \mathbb{N}}]a - \frac{1}{n}, \infty[\quad (21.40)$$

Let $x \in \bigcap_{n \in \mathbb{N}}]a - \frac{1}{n}, \infty[$ then $\forall n \in \mathbb{N}$ we have $a - \frac{1}{n} < x \Rightarrow a < x + \frac{1}{n}$ which by [corollary: 10.31] proves that $x \in [a, \infty[$. Hence $\bigcap_{n \in \mathbb{N}}]a - \frac{1}{n}, \infty[\subseteq [a, \infty[$ which together with [eq: 21.40] proves that

$$[a, \infty[= \bigcap_{n \in \mathbb{N}}]a - \frac{1}{n}, \infty[$$

8. Let $x \in]a, b]$ then $a < x \leq b$ and using [corollary: 10.30] there exists a $n \in \mathbb{N}$ such that $a < a + \frac{1}{n} < x \leq b$ proving that $x \in [a + \frac{1}{n}, b]$. Hence

$$]a, b] \subseteq \bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, b] \quad (21.41)$$

Let $x \in \bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, b]$ then there exists a $n \in \mathbb{N}$ such that $x \in [a + \frac{1}{n}, b] \Rightarrow a < a + \frac{1}{n} \leq x \leq b$. Hence $x \in]a, b]$ proving that $\bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, b] \subseteq]a, b]$ which by [eq: 21.41] gives

$$]a, b] = \bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, b]$$

9. Let $x \in [a, b[$ then $a \leq x < b$ and using [corollary: 10.30] there exists a $n \in \mathbb{N}$ such that $a \leq x < x + \frac{1}{n} < b \Rightarrow a \leq x \wedge x < b - \frac{1}{n}$ proving that $x \in [a, b - \frac{1}{n}]$. So

$$[a, b[\subseteq \bigcup_{n \in \mathbb{N}} [a, b - \frac{1}{n}] \quad (21.42)$$

If $x \in \bigcup_{n \in \mathbb{N}} [a, b - \frac{1}{n}]$ then $\exists n \in \mathbb{N}$ such that $x \in [a, b - \frac{1}{n}] \Rightarrow a \leq x \leq b - \frac{1}{n} < b$ proving that $x \in [a, b[$. Hence $\bigcup_{n \in \mathbb{N}} [a, b - \frac{1}{n}] \subseteq [a, b[$ which combined with 21.42 gives

$$[a, b[= \bigcup_{n \in \mathbb{N}} [a, b - \frac{1}{n}]$$

10. Let $x \in]a, b[$ then $a < x < b$ and using [corollary: 10.30] there exists a $n \in \mathbb{N}$ such that $a < x < x + \frac{1}{n} < b$ hence $a < x < b - \frac{1}{n}$ proving that $x \in]a, b - \frac{1}{n}]$. So

$$]a, b[\subseteq \bigcup_{n \in \mathbb{N}}]a, b - \frac{1}{n}] \quad (21.43)$$

If $x \in \bigcup_{n \in \mathbb{N}}]a, b - \frac{1}{n}]$ then $\exists n \in \mathbb{N}$ such that $a < x \leq b - \frac{1}{n} < b \Rightarrow x \in]a, b[$ proving that $\bigcup_{n \in \mathbb{N}}]a, b - \frac{1}{n}] \subseteq]a, b[$. Combining this with [eq: 21.43] gives

$$]a, b[= \bigcup_{n \in \mathbb{N}}]a, b - \frac{1}{n}]$$

11. Let $x \in]a, b[$ then $a < x < b$ and using [corollary: 10.30] there exists a $n \in \mathbb{N}$ such that $a < a + \frac{1}{n} < x < b$ proving that $x \in [a + \frac{1}{n}, b[$. Hence

$$]a, b[\subseteq \bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, b \right[\quad (21.44)$$

If $x \in \bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, b[$ then $\exists n \in \mathbb{N}$ such that $a < a + \frac{1}{n} < x < b \Rightarrow x \in]a, b[$ proving that $\bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, b[\subseteq]a, b[$. Combining this with [eq: 21.44] gives

$$]a, b[= \bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, b \right[$$

12. Let $x \in]a, b[$ then $a < x < b$ and using [corollary: 10.30] there exists $n_1, n_2 \in \mathbb{N}$ such that $a < a + \frac{1}{n_1} < x < x + \frac{1}{n_2} < b \Rightarrow a + \frac{1}{n_1} < x < b - \frac{1}{n_2}$. Take $m = \max(n_1, n_2)$ then $\frac{1}{m} \leq \frac{1}{n_1}, \frac{1}{n_2}$ so that $a + \frac{1}{m} \leq a + \frac{1}{n_1} < x < b - \frac{1}{n_2} \leq b - \frac{1}{m}$ proving that $x \in [a + \frac{1}{m}, b - \frac{1}{m}]$. Hence

$$]a, b[\subseteq \bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, b - \frac{1}{n} \right] \quad (21.45)$$

If $x \in \bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, b - \frac{1}{n}]$ then $\exists n \in \mathbb{N}$ such that $x \in [a + \frac{1}{n}, b - \frac{1}{n}] \Rightarrow a < a + \frac{1}{n} \leq x < b - \frac{1}{n} < b$ proving that $a < x < b$ or $x \in]a, b[$. So $\bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, b - \frac{1}{n}] \subseteq]a, b[$ which together with [eq: 21.45] gives

$$]a, b[= \bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, b - \frac{1}{n} \right]$$

13. Let $x \in]-\infty, a[$ then $x < a$ and using [corollary: 10.30] there exists a $n \in \mathbb{N}$ such that $x + \frac{1}{n} < a \Rightarrow x < a - \frac{1}{n} \Rightarrow x \in]-\infty, a - \frac{1}{n}]$ proving that

$$]-\infty, a[\subseteq \bigcup_{n \in \mathbb{N}} \left] -\infty, a - \frac{1}{n} \right] \quad (21.46)$$

If $x \in \bigcup_{n \in \mathbb{N}}]-\infty, a - \frac{1}{n}]$ then $\exists n \in \mathbb{N}$ such that $x \in]-\infty, a - \frac{1}{n}] \Rightarrow x \leq a - \frac{1}{n} < a$ giving $x \in]-\infty, a[$ and proving that $\bigcup_{n \in \mathbb{N}}]-\infty, a - \frac{1}{n}] \subseteq]-\infty, a[$. Using this together with [eq: 21.46] proves

$$]-\infty, a[= \bigcup_{n \in \mathbb{N}} \left] -\infty, a - \frac{1}{n} \right]$$

14. Let $x \in]a, \infty[$ then $a < x$ and using [corollary: 10.30] there exists a $n \in \mathbb{N}$ such that $a + \frac{1}{n} < x \Rightarrow x \in [a + \frac{1}{n}, \infty[$. Hence

$$]a, \infty[\subseteq \bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, \infty \right[\quad (21.47)$$

If $x \in \bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, \infty[$ then $\exists n \in \mathbb{N}$ such that $x \in [a + \frac{1}{n}, \infty[\Rightarrow a < a + \frac{1}{n} \leq x$ hence $x \in]a, \infty[$. This proves that $\bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, \infty[\subseteq]a, \infty[$, combining this with [eq: 21.47] gives

$$]a, \infty[= \bigcup_{n \in \mathbb{N}+0} \left[a + \frac{1}{n}, \infty \right[$$

15. Let $x \in [a, b[$ then $a \leq x \wedge x < b \Rightarrow a \leq x \wedge \neg(b \leq x)$ so that $x \in [a, \infty[$ and $x \notin [b, \infty[$ proving that

$$[a, b[\subseteq [a, \infty[\setminus [b, \infty[\quad (21.48)$$

If $x \in [a, \infty[\setminus [b, \infty[$ then $a \leq x \wedge \neg(b \leq x)$ or $a \leq x$ and $x < b$ proving that $[a, \infty[\setminus [b, \infty[\subseteq [a, b[$. Combining this with [eq: 21.48] proves that

$$[a, b[= [a, \infty[\setminus [b, \infty[$$

16. Let $x \in]a, b]$ then $a < x \wedge x \leq b$ then $\neg(x \leq a) \wedge x \leq b$ so that $x \notin]-\infty, a] \wedge x \in]-\infty, b]$ proving that $x \in]-\infty, b] \setminus]-\infty, a]$. For the opposite inclusion let $x \in]-\infty, b] \setminus]-\infty, a]$ then $x \leq b$ and $\neg(x \leq a)$ proving that $x \leq b$ and $a < x$ or $x \in]a, b]$. Hence

$$]a, b] =]-\infty, b] \setminus]-\infty, a]$$

17. If $x \in]a, \infty[$ then $x \in \mathbb{R} \wedge a < x$ so that $x \not\leq a \Rightarrow x \notin]-\infty, a]$ hence $x \in \mathbb{R} \setminus]-\infty, a]$, further if $x \in \mathbb{R} \setminus]-\infty, a]$ then $x \in \mathbb{R} \wedge x \notin]-\infty, a] \Rightarrow x \not\leq a \Rightarrow a < x$ or $x \in]a, \infty[$ hence

$$]a, \infty[= \mathbb{R} \setminus]-\infty, a]$$

□

We are now ready to prove alternative forms for $\mathcal{B}[\mathbb{R}]$.

Theorem 21.52. *We have the following alternative forms for $\mathcal{B}[\mathbb{R}] \stackrel{\text{definition}}{=} \sigma[\mathcal{T}_{||}]$*

$$\begin{aligned} \sigma[\{C \subseteq \mathbb{R} \mid C \text{ is closed in } \mathcal{T}_{||}\}] &\stackrel{[\text{theorem: 21.44}]}{=} \mathcal{B}[\mathbb{R}] \\ &= \sigma[\mathcal{T}_{||}] \\ &= \sigma[\mathcal{I}_{||}] \\ &= \sigma[\mathcal{I}_{||}] \\ &= \sigma[\mathcal{I}_{||}] \\ &= \sigma[\mathcal{I}_{||}] \\ &= \sigma[\{[a, \infty[\mid a \in \mathbb{R}\}] \\ &= \sigma[\{]a, \infty[\mid a \in \mathbb{R}\}] \\ &= \sigma[\{]-\infty, a] \mid a \in \mathbb{R}\}] \\ &= \sigma[\{]-\infty, a[\mid a \in \mathbb{R}\}] \end{aligned}$$

Proof. Let $U \in \mathcal{T}_{||}$ then by [corollary: 14.105] there exist a countable family $\{]a_i, b_i[\mid i \in I \subseteq \mathcal{I}_{||}\}$ such that

$$\forall i \in I \]a_i, \beta_i[\neq \emptyset \text{ and } U = \bigcup_{i \in I}]a_i, \beta_i[\quad (21.49)$$

As $\mathcal{I}_{||} \subseteq \sigma[\mathcal{I}_{||}]$ which is a σ -algebra it follows from [theorem: 21.36] that $U = \bigcup_{i \in I}]a_i, \beta_i[\in \sigma[\mathcal{I}_{||}]$. As $U \in \mathcal{T}_{||}$ was chosen arbitrary it follows that $\mathcal{T}_{||} \subseteq \sigma[\mathcal{I}_{||}]$. Using then [theorem: 21.39] it follows that

$$\mathcal{B}[\mathbb{R}] \stackrel{\text{def}}{=} \sigma[\mathcal{T}_{||}] \subseteq \sigma[\mathcal{I}_{||}] \quad (21.50)$$

If $]a, b[\in \mathcal{I}_{||}$ then by [lemma: 21.51] $]a, b[= \bigcup_{n \in \mathbb{N}}]a, b - \frac{1}{n}]$. Let $n \in \mathbb{N}$ then we have either:

$$]a, b - \frac{1}{n}] = \emptyset. \text{ Then }]a, b - \frac{1}{n}] = \emptyset \in \sigma[\mathcal{I}_{||}]$$

$$]a, b - \frac{1}{n}] \neq \emptyset. \text{ Then }]a, b - \frac{1}{n}] \in \sigma[\mathcal{I}_{||}]$$

so that $\{]a, b - \frac{1}{n}]\}_{n \in \mathbb{N}} \subseteq \sigma[\mathcal{I}_{||}]$ from which it follows by [lemma: 21.36] that

$$]a, b[= \bigcup_{n \in \mathbb{N}}]a, b - \frac{1}{n}] \in \sigma[\mathcal{I}_{||}]$$

. Hence we have $\mathcal{I}_{||} \subseteq \sigma[\mathcal{I}_{||}]$ a σ -algebra on $\mathbb{R}$. Using [theorem: 21.39] it follows then that

$$\sigma[\mathcal{I}_{||}] \subseteq \sigma[\mathcal{I}_{||}] \quad (21.51)$$

If $]a, b[\in \mathcal{I}_{||}$ then by [lemma: 21.51] $]a, b[= \bigcup_{n \in \mathbb{N}} [a + \frac{1}{n}, b]$. For $n \in \mathbb{N}$ we have either:

$$[a + \frac{1}{n}, b] = \emptyset. \text{ Then } [a + \frac{1}{n}, b] = \emptyset \in \sigma[\mathcal{I}_{||}]$$

$$[a + \frac{1}{n}, b] \neq \emptyset. \text{ Then } [a + \frac{1}{n}, b] \in \mathcal{I}_{||} \subseteq \sigma[\mathcal{I}_{||}]$$

so that $\{[a + \frac{1}{n}, b]\}_{n \in \mathbb{N}} \subseteq \sigma[\mathcal{I}_{\square}]$ from which it follows by [theorem: 21.36] that

$$]a, b[= \bigcup_{n \in \mathbb{N}} \left[a + \frac{1}{n}, b \right] \in \sigma[\mathcal{I}_{\square}]$$

Hence we have $\mathcal{I}_{\square} \subseteq \sigma[\mathcal{I}_{\square}]$ a σ -algebra on $\mathbb{R}$ so that by [theorem: 21.39]

$$\sigma[\mathcal{I}_{\square}] \subseteq \sigma[\mathcal{I}_{\square}] \quad (21.52)$$

If $[a, b] \in \mathcal{I}_{\square}$ then by [lemma: 21.51] $[a, b] = \bigcap_{n \in \mathbb{N}} [a, b + \frac{1}{n}[$. For $n \in \mathbb{N}$ we have either:

$$[a, b + \frac{1}{n}[= \emptyset. \text{ Then } [a, b + \frac{1}{n}[= \emptyset \in \sigma[\mathcal{I}_{\square}]$$

$$[a, b + \frac{1}{n}[\neq \emptyset. \text{ Then } [a, b + \frac{1}{n}[\in \sigma[\mathcal{I}_{\square}]$$

so that $\{[a, b + \frac{1}{n}[\}_{n \in \mathbb{N}} \subseteq \sigma[\mathcal{I}_{\square}]$ from which it follows by [theorem: 21.36] that

$$[a, b] = \bigcap_{n \in \mathbb{N}} \left[a, b + \frac{1}{n}[\in \sigma[\mathcal{I}_{\square}]$$

Hence we have $\mathcal{I}_{\square} \subseteq \sigma[\mathcal{I}_{\square}]$ a σ -algebra on $\mathbb{R}$ so that by [theorem: 21.39]

$$\sigma[\mathcal{I}_{\square}] \subseteq \sigma[\mathcal{I}_{\square}] \quad (21.53)$$

If $[a, b[\in \mathcal{I}_{\square}$ then by [lemma: 21.51] $[a, b[= \bigcap_{n \in \mathbb{N}} [a - \frac{1}{n}, b[$. As $\forall n \in \mathbb{N}$ $[a - \frac{1}{n}, b[$ is open it follows that $\{[a - \frac{1}{n}, b[\}_{n \in \mathbb{N}} \subseteq \mathcal{T}_{\square}$ so that by [theorem 21.36] $[a, b[= \bigcap_{n \in \mathbb{N}} [a - \frac{1}{n}, b[\in \sigma[\mathcal{T}_{\square}]$. Hence we have that $\mathcal{I}_{\square} \subseteq \sigma[\mathcal{T}_{\square}]$ so that

$$\sigma[\mathcal{I}_{\square}] \subseteq \sigma[\mathcal{T}_{\square}] \stackrel{\text{def}}{=} \mathcal{B}[\mathbb{R}] \quad (21.54)$$

Combining [eqs: 21.50, 21.51, 21.52, 21.53 and 21.54] it follows that

$$\mathcal{B}[\mathbb{R}] = \sigma[\mathcal{T}_{\square}] = \sigma[\mathcal{I}_{\square}] = \sigma[\mathcal{I}_{\square}] = \sigma[\mathcal{I}_{\square}] = \sigma[\mathcal{I}_{\square}] \quad (21.55)$$

If $[a, b[\in \mathcal{I}_{\square}$ then using [lemma: 21.51] we have that

$$[a, b[= [a, \infty[\setminus [b, \infty[\stackrel{[theorem: 21.28]}{\in} \sigma[\{[a, \infty[| a \in \mathbb{R}\}]$$

proving $\mathcal{I}_{\square} \subseteq \sigma[\{[a, \infty[| a \in \mathbb{R}\}]$ a σ -algebra. Hence using [theorem: 21.39] we have

$$\sigma[\mathcal{I}_{\square}] \subseteq \sigma[\{[a, \infty[| a \in \mathbb{R}\}] \quad (21.56)$$

If $[a, \infty[\in \{[a, \infty[| a \in \mathbb{R}\}$ then using [lemma: 21.51] we have that $[a, \infty[= \bigcap_{n \in \mathbb{N}} [a - \frac{1}{n}, \infty[$. As $\{[a - \frac{1}{n}, \infty[\}_{n \in \mathbb{N}} \subseteq \{[a - \frac{1}{n}, \infty[| n \in \mathbb{N}\} \subseteq \sigma[\{[a, \infty[| a \in \mathbb{R}\}]$ it follows from [theorem: 21.36] that

$$[a, \infty[= \bigcap_{n \in \mathbb{N}} \left[a - \frac{1}{n}, \infty[\in \sigma[\{[a, \infty[| a \in \mathbb{R}\}]$$

Hence $\{[a, \infty[| a \in \mathbb{R}\} \subseteq \sigma[\{[a, \infty[| a \in \mathbb{R}\}]$ so that by [theorem: 21.39]

$$\sigma[\{[a, \infty[| a \in \mathbb{R}\}] \subseteq \sigma[\{[a, \infty[| a \in \mathbb{R}\}] \quad (21.57)$$

Let $]a, \infty[\in \{[a, \infty[| a \in \mathbb{R}\}$ then by [lemma: 21.51] $]a, \infty[= \mathbb{R} \setminus]-\infty, a] \in \sigma[\{]-\infty, a] | a \in \mathbb{R}\}]$ so that $\{[a, \infty[| a \in \mathbb{R}\} \subseteq \sigma[\{]-\infty, a] | a \in \mathbb{R}\}]$. Using [theorem: 21.39] it follows that

$$\sigma[\{[a, \infty[| a \in \mathbb{R}\}] \subseteq \sigma[\{]-\infty, a] | a \in \mathbb{R}\}] \quad (21.58)$$

Let $] -\infty, a] \in \{]-\infty, a] | a \in \mathbb{R}\}$ then by [lemma: 21.51] $] -\infty, a] = \bigcap_{n \in \mathbb{N}}] -\infty, a + \frac{1}{n}[$. As $\{]-\infty, a + \frac{1}{n}[\}_{n \in \mathbb{N}} \subseteq \{]-\infty, a] | a \in \mathbb{R}\} \subseteq \sigma[\{]-\infty, a] | a \in \mathbb{R}\}]$ it follows from [theorem: 21.36] that $] -\infty, a] = \bigcap_{n \in \mathbb{N}}] -\infty, a + \frac{1}{n}[\in \sigma[\{]-\infty, a] | a \in \mathbb{R}\}]$. Hence

$$\{]-\infty, a] | a \in \mathbb{R}\} \subseteq \sigma[\{]-\infty, a] | a \in \mathbb{R}\}]$$

which by [theorem: 21.39] proves that

$$\sigma[\{]-\infty, a] | a \in \mathbb{R}\}] \subseteq \sigma[\{]-\infty, a] | a \in \mathbb{R}\}] \quad (21.59)$$

Let $] -\infty, a[\in \{] -\infty, a[| a \in \mathbb{R} \}$ then as $] -\infty, a[$ is open it follows that $\{] -\infty, a[| a \in \mathbb{R} \} \subseteq \mathcal{T}_{||} \subseteq \sigma[\mathcal{T}_{||}]$ and using [theorem: 21.39] it follows that

$$\sigma[\{] -\infty, a[| a \in \mathbb{R} \}] \subseteq \sigma[\mathcal{T}_{||}] \stackrel{[\text{eq: 21.55}]}{=} \sigma[\mathcal{T}_{||}] \quad (21.60)$$

Combining [eqs: 21.56, 21.57, 21.58, 21.59 and 21.60] gives

$$\sigma[\mathcal{T}_{||}] = \sigma[\{ [a, \infty[| a \in \mathbb{R} \}] = \sigma[\{] a, \infty[| a \in \mathbb{R} \}] = \sigma[\{] -\infty, a[| a \in \mathbb{R} \}] = \sigma[\{] -\infty, a[| a \in \mathbb{R} \}]$$

Finally combining the above with [eq: 21.55] proves that

$$\begin{aligned} \mathcal{B}[\mathbb{R}] &= \sigma[\mathcal{T}_{||}] \\ &= \sigma[\mathcal{T}_{|}] \\ &= \sigma[\mathcal{T}_{|}] \\ &= \sigma[\mathcal{T}_{|}] \\ &= \sigma[\mathcal{T}_{|}] \\ &= \sigma[\{ [a, \infty[| a \in \mathbb{R} \}] \\ &= \sigma[\{] a, \infty[| a \in \mathbb{R} \}] \\ &= \sigma[\{] -\infty, a[| a \in \mathbb{R} \}] \\ &= \sigma[\{] -\infty, a[| a \in \mathbb{R} \}] \end{aligned}$$

□

21.2.1.2 Borel algebra on $\overline{\mathbb{R}}$

Definition 21.53. Let $\langle \overline{\mathbb{R}}, \mathcal{T}_{\overline{\mathbb{R}}} \rangle$ be the topological space consisting of the extended real numbers with the canonical topology $\mathcal{T}_{\overline{\mathbb{R}}}$ [see definition: 20.49] then the Borel algebra on $\overline{\mathbb{R}}$ is noted as $\mathcal{B}[\overline{\mathbb{R}}]$ hence

$$\mathcal{B}[\overline{\mathbb{R}}] = \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$$

Just as in the real case we formulate some alternative definitions for the Borel algebra on the extended real numbers.

Lemma 21.54. We have

1. $\forall a \in \mathbb{R}$ we have $[a, \infty] = \bigcap_{n \in \mathbb{N}_0}]a - \frac{1}{n}, \infty]$
2. $\{ \infty \} = \bigcap_{n \in \mathbb{N}_0}]n, \infty]$
3. $\{ -\infty \} = \bigcap_{n \in \mathbb{N}_0} [-\infty, -n[$

Proof.

1. Let $n \in \mathbb{N}$ then if $x \in [a, \infty]$ $a \leq x \leq \infty \Rightarrow a - \frac{1}{n} < a \leq x \leq \infty$ so that $[a, \infty] \subseteq]a - \frac{1}{n}, \infty]$, hence

$$[a, \infty] \subseteq \bigcap_{n \in \mathbb{N}}]a - \frac{1}{n}, \infty] \quad (21.61)$$

If $x \in \bigcap_{n \in \mathbb{N}}]a - \frac{1}{n}, \infty]$. Assume that $x < a$ then using [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $x + \frac{1}{n} < a$ or $x < a - \frac{1}{n}$ so that $x \notin]a - \frac{1}{n}, \infty]$ contradicting $x \in \bigcap_{n \in \mathbb{N}}]a - \frac{1}{n}, \infty]$. Hence the assumption is wrong and we have $a \leq x \leq \infty$ so that $x \in [a, \infty]$ proving that $\bigcap_{n \in \mathbb{N}}]a - \frac{1}{n}, \infty] \subseteq [a, \infty]$, combining this with [eq: 21.61] results in

$$[a, \infty] = \bigcap_{n \in \mathbb{N}}]a - \frac{1}{n}, \infty]$$

2. As $\forall n \in \mathbb{N}$ we have $n < \infty \leq \infty$ it follows that $\infty \in]n, \infty]$ so that

$$\{ \infty \} \subseteq \bigcap_{n \in \mathbb{N}}]n, \infty] \quad (21.62)$$

Let $x \in \bigcap_{n \in \mathbb{N}}]n, \infty]$. Then $x \in [1, \infty] \Rightarrow -\infty < 1 < x \leq \infty$ so that $x \notin -\infty$. Assume that $x \neq \infty$ then $x \in \mathbb{R}$ and by [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $x < n \Rightarrow x \notin]n, \infty]$ contradicting $x \in \bigcap_{n \in \mathbb{N}}]n, \infty]$, hence the assumption is wrong and we must have that $x = \infty \in \{\infty\}$. So $\bigcap_{n \in \mathbb{N}}]n, \infty] \subseteq \{\infty\}$ which combined with [eq: 21.62] proves that

$$\{\infty\} = \bigcap_{n \in \mathbb{N}}]n, \infty]$$

3. As $\forall n \in \mathbb{N}$ we have $-\infty \leq -\infty < -n$ it follows that $-\infty \in \bigcap_{n \in \mathbb{N}} [-\infty, -n[$ so that

$$\{-\infty\} \subseteq \bigcap_{n \in \mathbb{N}} [-\infty, -n[\quad (21.63)$$

Let $x \in \bigcap_{n \in \mathbb{N}} [-\infty, -n[$. Then $x \in [-\infty, -1[\Rightarrow x < -1 < \infty$ so that $x \notin \infty$. Assume that $x \neq -\infty$ then $x \in \mathbb{R}$ and by [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $-x < n \Rightarrow -n < x$ so that $x \notin [-\infty, -n[$ contradicting $x \in \bigcap_{n \in \mathbb{N}} [-\infty, -n[$, hence the assumption is wrong and we must have that $x = -\infty \in \{-\infty\}$. So $\bigcap_{n \in \mathbb{N}} [-\infty, -n[\subseteq \{-\infty\}$ which combined with [eq: 21.63] proves that

$$\{-\infty\} = \bigcap_{n \in \mathbb{N}} [-\infty, -n[\quad \square$$

Lemma 21.55. For $\sigma[\{[a, \infty] | a \in \mathbb{R}\}]$ we have the following

1. $\forall a \in \mathbb{R}$ we have that $[a, \infty] \in \sigma[\{[a, \infty] | a \in \mathbb{R}\}]$
2. $\forall a \in \mathbb{R}$ we have that $[-\infty, a] \in \sigma[\{[a, \infty] | a \in \mathbb{R}\}]$
3. $\forall a, b \in \mathbb{R}$ we have that $]a, b[\in \sigma[\{[a, \infty] | a \in \mathbb{R}\}]$
4. $\forall U \in \mathcal{T}_{||}$ we have that $U \in \sigma[\{[a, \infty] | a \in \mathbb{R}\}]$
5. $\{\infty\} \in \sigma[\{[a, \infty] | a \in \mathbb{R}\}]$
6. $\{-\infty\} \in \sigma[\{[a, \infty] | a \in \mathbb{R}\}]$

Proof.

1. Let $a \in \mathbb{R}$ then $\{[a - \frac{1}{n}, \infty]\}_{n \in \mathbb{N}_0} \subseteq \{[a, \infty] | a \in \mathbb{R}\} \subseteq \sigma(\{[a, \infty] | a \in \mathbb{R}\})$, hence $\bigcup_{n \in \mathbb{N}_0} [a - \frac{1}{n}, \infty] \in \sigma(\{[a, \infty] | a \in \mathbb{R}\})$. As $[a, \infty] \stackrel{[\text{lemma: 21.54}]}{=} \bigcup_{n \in \mathbb{N}_0} [a - \frac{1}{n}, \infty]$ we have that

$$[a, \infty] \in \sigma(\{[a, \infty] | a \in \mathbb{R}\})$$

2. Let $a \in \mathbb{R}$ then

$$\begin{aligned} x \in \overline{\mathbb{R}} \setminus [a, \infty] &\Leftrightarrow x \in [-\infty, \infty] \wedge x \notin [a, \infty] \\ &\Leftrightarrow (-\infty \leq x \wedge x \leq \infty) \wedge \neg(a \leq x \leq \infty) \\ &\Leftrightarrow (-\infty \leq x \wedge x \leq \infty) \wedge (x < a \vee \infty < x) \\ &\Leftrightarrow \begin{matrix} \infty < x \text{ is false} \\ \Leftrightarrow \end{matrix} -\infty \leq x \wedge x \leq \infty \wedge x < a \\ &\Leftrightarrow -\infty \leq x \wedge x < a \\ &\Leftrightarrow x \in [-\infty, a[\end{aligned}$$

proving that $[-\infty, a[= \overline{\mathbb{R}} \setminus [a, \infty]$ which, as by (1) $[a, \infty] \in \sigma(\{[a, \infty] | a \in \mathbb{R}\})$ and $\sigma(\{[a, \infty] | a \in \mathbb{R}\})$ is a σ -algebra, proves

$$[-\infty, a[\in \sigma(\{[a, \infty] | a \in \mathbb{R}\})$$

3. Let $a, b \in \mathbb{R}$ with $a \leq b$ then

$$\begin{aligned} x \in]a, \infty[\bigcap [-\infty, b[&\Leftrightarrow x \in]a, \infty[\wedge x \in [-\infty, b[\\ &\Leftrightarrow a < x \wedge x \leq \infty \wedge -\infty \leq x \wedge x < b \\ &\Leftrightarrow a < x \wedge x < b \\ &\Leftrightarrow x \in]a, b[\end{aligned}$$

proving that $]a, b[=]a, \infty[\cap [-\infty, b[$. As $]a, \infty[\in \sigma(\{]a, \infty[| a \in \mathbb{R}\})$ and by (2) $[-\infty, b[\in \sigma(\{]a, \infty[| a \in \mathbb{R}\})$ we have that $]a, \infty[\cap [-\infty, b[\in \sigma(\{]a, \infty[| a \in \mathbb{R}\})$. So

$$]a, b[\in \sigma(\{]a, \infty[| a \in \mathbb{R}\})$$

4. Let U be a open set in $\mathbb{R}$ then by [corollary: 14.105] there exist a countable set I and family $\{]a_i, b_i[\}_{i \in I}$ such that $U = \bigcup_{i \in I}]a_i, b_i[$. By (3) it follows that $\{]a_i, b_i[\}_{i \in I} \subseteq \sigma(\{]a, \infty[| a \in \mathbb{R}\})$ so that using [theorem: 21.36] $U = \bigcup_{i \in I}]a_i, b_i[\in \sigma(\{]a, \infty[| a \in \mathbb{R}\})$.
5. Using [lemma: 21.54] we have that $\{\infty\} = \bigcap_{n \in \mathbb{N}_0}]n, \infty[$ which, as $\{]n, \infty[\}_{n \in \mathbb{N}_0} \subseteq \sigma(\{]a, \infty[| a \in \mathbb{R}\})$, proves that

$$\{\infty\} \in \sigma(\{]a, \infty[| a \in \mathbb{R}\})$$

6. Using [lemma: 21.54] we have that $\{-\infty\} = \bigcap_{n \in \mathbb{N}_0} [-\infty, -n[$ which, as by (2) $\{[-\infty, -n[\}_{n \in \mathbb{N}_0} \in \sigma(\{]a, \infty[| a \in \mathbb{R}\})$, proves by [theorem: 21.33] that

$$\{-\infty\} \in \sigma(\{]a, \infty[| a \in \mathbb{R}\}) \quad \square$$

Lemma 21.56. $\mathcal{B}[\overline{\mathbb{R}}] \stackrel{\text{definition}}{=} \sigma[\mathcal{T}_{\overline{\mathbb{R}}}] = \sigma(\{]a, \infty[| a \in \mathbb{R}\})$

Proof. Let $I \in \{]a, \infty[| a \in \mathbb{R}\}$ then there exist a $a \in \mathbb{R}$ such that $I =]a, \infty[$. By [definition: 20.47] it follows that $I \in \mathcal{B}_{\infty} \subseteq \mathcal{T}_{\overline{\mathbb{R}}}$, so that $\{]a, \infty[| a \in \mathbb{R}\} \subseteq \mathcal{T}_{\overline{\mathbb{R}}} \subseteq \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$. Hence using [theorem: 21.39]

$$\sigma(\{]a, \infty[| a \in \mathbb{R}\}) \subseteq \sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \quad (21.64)$$

For the opposite inclusion, let $U \in \mathcal{T}_{\overline{\mathbb{R}}}$ then by [theorem: 20.50] we have that $U \cap \mathbb{R} \in \mathcal{T}_{\mathbb{R}}$. From $\overline{\mathbb{R}} = \mathbb{R} \cup \{-\infty\} \cup \{\infty\}$ it follows that

$$U = U \cap \overline{\mathbb{R}} = (U \cap \mathbb{R}) \cup (U \cap \{-\infty\}) \cup (U \cap \{\infty\}) \quad (21.65)$$

Now as $U \cap \mathbb{R} \in \mathcal{T}_{\mathbb{R}}$ we have by [lemma: 21.55] that

$$U \cap \mathbb{R} \in \sigma(\{]a, \infty[| a \in \mathbb{R}\}) \quad (21.66)$$

Also $U \cap \{-\infty\}$ is either $\emptyset \in \sigma(\{]a, \infty[| a \in \mathbb{R}\})$ or $\{-\infty\}$ and as by [lemma: 21.55] $\{-\infty\} \in \sigma(\{]a, \infty[| a \in \mathbb{R}\})$ we have that

$$U \cap \{-\infty\} \in \sigma(\{]a, \infty[| a \in \mathbb{R}\}) \quad (21.67)$$

Finally $U \cap \{\infty\}$ is either $\emptyset \in \sigma(\{]a, \infty[| a \in \mathbb{R}\})$ or $\{\infty\}$ and as by [lemma: 21.55] $\{\infty\} \in \sigma(\{]a, \infty[| a \in \mathbb{R}\})$ it follows that

$$U \cap \{\infty\} \in \sigma(\{]a, \infty[| a \in \mathbb{R}\}) \quad (21.68)$$

From [eqs: 21.65, 21.66, 21.67 and 21.68] it follows that $U \in \sigma(\{]a, \infty[| a \in \mathbb{R}\})$. Hence $\mathcal{T}_{\overline{\mathbb{R}}} \subseteq \sigma(\{]a, \infty[| a \in \mathbb{R}\})$ [a sigma algebra on $\overline{\mathbb{R}}$] so that $\sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \subseteq \sigma(\{]a, \infty[| a \in \mathbb{R}\})$, combining this with [eq: 21.64] gives

$$\sigma(\{]a, \infty[| a \in \mathbb{R}\}) = \sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \quad \square$$

The relation between $\mathcal{B}[\mathbb{R}]$ and $\mathcal{B}[\overline{\mathbb{R}}]$ is expressed in the following theorem.

Lemma 21.57. $\sigma[\mathcal{T}_{\overline{\mathbb{R}}}] = \{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} \stackrel{\mathcal{B}[\mathbb{R}] = \sigma[\mathcal{T}_{\mathbb{R}}]}{=} \{U \in \mathcal{P}(\overline{\mathbb{R}}) | U \cap \mathbb{R} \in \sigma[\mathcal{T}_{\mathbb{R}}]\}$

Proof. First we prove that

$$\{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} \text{ is a } \sigma\text{-algebra on } \overline{\mathbb{R}} \quad (21.69)$$

Proof. As $\overline{\mathbb{R}} \cap \mathbb{R} = \mathbb{R} \in \mathcal{B}[\mathbb{R}]$ it follows that

$$\overline{\mathbb{R}} \in \{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} \quad (21.70)$$

Let $U \in \{U \in \mathcal{P}(\bar{\mathbb{R}}) | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\}$ then $U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]$ hence $\mathbb{R} \setminus (U \cap \mathbb{R}) \in \mathcal{B}[\mathbb{R}]$, further

$$(\bar{\mathbb{R}} \setminus U) \cap \mathbb{R} \stackrel{[\text{theorem: 1.33}]}{=} (\bar{\mathbb{R}} \cap \mathbb{R}) \setminus U = \mathbb{R} \setminus U \text{ and } \mathbb{R} \setminus (U \cap \mathbb{R}) \stackrel{[\text{eq: 1.31}]}{=} (\mathbb{R} \setminus U) \cup (\mathbb{R} \setminus \mathbb{R}) = \mathbb{R} \setminus U$$

so that $(\bar{\mathbb{R}} \setminus U) \cap \mathbb{R} = \mathbb{R} \setminus (U \cap \mathbb{R}) \in \mathcal{B}[\mathbb{R}]$, proving that $(\bar{\mathbb{R}} \setminus U) \in \{U \in \mathcal{P}(\bar{\mathbb{R}}) | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\}$. In other words

$$\forall U \in \{U \in \mathcal{P}(\bar{\mathbb{R}}) | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} \text{ we have } \bar{\mathbb{R}} \setminus U \in \{U \in \mathcal{P}(\bar{\mathbb{R}}) | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} \quad (21.71)$$

Let $\{U_i\}_{i \in \mathbb{N}} \subseteq \{U \in \mathcal{P}(\bar{\mathbb{R}}) | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\}$ then $\forall i \in \mathbb{N} \quad U_i \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]$ so that $(\bigcup_{i \in \mathbb{N}} U_i) \cap \mathbb{R} = \bigcup_{i \in \mathbb{N}} (U_i \cap \mathbb{R}) \in \mathcal{B}[\mathbb{R}]$. Hence

$$\forall \{U_i\}_{i \in \mathbb{N}} \subseteq \{U \in \mathcal{P}(\bar{\mathbb{R}}) | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} \quad \bigcup_{i \in \mathbb{N}} (U_i \cap \mathbb{R}) \in \mathcal{B}[\mathbb{R}] \quad (21.72)$$

Finally [eqs: 21.70, 21.71 and 21.72] proves [eq: 21.69]. $\square$

Take $U \in \mathcal{T}_{\bar{\mathbb{R}}}$ then by [theorem: 20.50] we have that $U \cap \mathbb{R} \in \mathcal{T}_{||} \subseteq \sigma[\mathcal{T}_{||}] \stackrel{\text{definition}}{=} \mathcal{B}[\mathbb{R}]$ proving that $U \in \{U \in \mathcal{P}(\bar{\mathbb{R}}) | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\}$ so that

$$\mathcal{T}_{\bar{\mathbb{R}}} \subseteq \{U \in \mathcal{P}(\bar{\mathbb{R}}) | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\}$$

and as $\{U \in \mathcal{P}(\bar{\mathbb{R}}) | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\}$ is a σ -algebra on $\bar{\mathbb{R}}$ [see eq: 21.69] it follows from [theorem: 21.39] that

$$\mathcal{B}[\bar{\mathbb{R}}] \stackrel{\text{definition}}{=} \sigma(\mathcal{T}_{\bar{\mathbb{R}}}) \subseteq \{U \in \mathcal{P}(\bar{\mathbb{R}}) | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} \quad (21.73)$$

For the opposite inclusion define

$$S = \{U \cap \mathbb{R} | U \in \sigma[\mathcal{T}_{\bar{\mathbb{R}}}] \subseteq \mathcal{P}(\mathbb{R}) \quad (21.74)$$

then as $\mathcal{T}_{\bar{\mathbb{R}}} \subseteq \sigma[\mathcal{T}_{\bar{\mathbb{R}}}]$ we have

$$\mathcal{T}_{||} \stackrel{[\text{theorem: 20.50}]}{=} \{U \cap \mathbb{R} | U \in \mathcal{T}_{\bar{\mathbb{R}}}\} \subseteq \{U \cap \mathbb{R} | U \in \sigma[\mathcal{T}_{\bar{\mathbb{R}}}] \} = S \quad (21.75)$$

Further as $\mathbb{R} \in \mathcal{T}_{||} \stackrel{[\text{theorem: 20.50}]}{\subseteq} \mathcal{T}_{\bar{\mathbb{R}}} \subseteq \sigma[\mathcal{T}_{\bar{\mathbb{R}}}]$ we have for $U \in \sigma[\mathcal{T}_{\bar{\mathbb{R}}}]$ that $U \cap \mathbb{R} \in \sigma[\mathcal{T}_{\bar{\mathbb{R}}}]$ proving

$$S \subseteq \sigma[\mathcal{T}_{\bar{\mathbb{R}}}] \quad (21.76)$$

Next we prove that

$$S \text{ is a } \sigma\text{-algebra on } \mathbb{R} \quad (21.77)$$

Proof. As $\mathbb{R} = \mathbb{R} \cap \mathbb{R}$ and $\mathbb{R} \in \mathcal{T}_{\bar{\mathbb{R}}} \stackrel{[\text{theorem: 20.50}]}{\subseteq} \mathcal{T}_{\bar{\mathbb{R}}} \subseteq \sigma[\mathcal{T}_{\bar{\mathbb{R}}}]$ it follows that

$$\mathbb{R} \in S \quad (21.78)$$

If $A \in S$ then there exist a $U \in \sigma[\mathcal{T}_{\bar{\mathbb{R}}}]$ such that $A = U \cap \mathbb{R}$ so that

$$\mathbb{R} \setminus A = \mathbb{R} \setminus (U \cap \mathbb{R}) \stackrel{[\text{eq: 1.31}]}{=} (\mathbb{R} \setminus U) \cup (\mathbb{R} \setminus \mathbb{R}) = \mathbb{R} \setminus U$$

which, as $\mathbb{R}, U \in \sigma[\mathcal{T}_{\bar{\mathbb{R}}}] \stackrel{[\text{eq: 21.29}]}{\Rightarrow} \mathbb{R} \setminus U \in \sigma[\mathcal{T}_{\bar{\mathbb{R}}}]$, proves that

$$\mathbb{R} \setminus A \in \sigma[\mathcal{T}_{\bar{\mathbb{R}}}]$$

Hence $(\mathbb{R} \setminus A) \cap \mathbb{R} = \mathbb{R} \setminus A \in \sigma[\mathcal{T}_{\bar{\mathbb{R}}}]$ so that $\mathbb{R} \setminus A \in S$. Summarized

$$\forall A \in S \text{ we have } \mathbb{R} \setminus A \in S \quad (21.79)$$

If $\{A_i\}_{i \in \mathbb{N}} \subseteq S$ then there exists a $\{U_i\}_{i \in \mathbb{N}} \subseteq \sigma[\mathcal{T}_{\bar{\mathbb{R}}}]$ such that $\forall i \in \mathbb{N}$ we have $A_i = U_i \cap \mathbb{R}$, then $\bigcup_{i \in \mathbb{N}} A_i = (\bigcup_{i \in \mathbb{N}} (U_i \cap \mathbb{R})) = (\bigcup_{i \in \mathbb{N}} U_i) \cap \mathbb{R}$ which, as $\bigcup_{i \in \mathbb{N}} U_i \in \sigma[\mathcal{T}_{\bar{\mathbb{R}}}]$, proves that $\bigcup_{i \in \mathbb{N}} A_i \in S$. In other words

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq S \text{ we have } \bigcup_{i \in \mathbb{N}} A_i \in S \quad (21.80)$$

Finally [eqs: 21.78, 21.79 and 21.80] proves that S is a σ -algebra on $\mathbb{R}$ thus proving [eq: 21.77]. $\square$

So we have proved that $\mathcal{T}_{||} \subseteq S$ [see eq: 21.75] and S is a σ -algebra on $\mathbb{R}$ from which it follows, using [theorem: 21.39], that

$$\mathcal{B}[\mathbb{R}] \stackrel{\text{definition}}{=} \sigma[\mathcal{T}_{||}] \subseteq S \stackrel{\text{[eq: 21.76]}}{\subseteq} \sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \quad (21.81)$$

Let $A \in \{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\}$ then $A \subseteq \overline{\mathbb{R}}$ so that $A = A \cap \overline{\mathbb{R}} = A \cap (\mathbb{R} \cup \{-\infty\}, \{\infty\})$ giving

$$A = (A \cap \mathbb{R}) \cap (A \cap \{-\infty\}) \cap (A \cap \{\infty\}) \quad (21.82)$$

where

1. $A \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}] \stackrel{\text{[eq: 21.81]}}{\Rightarrow} A \cap \mathbb{R} \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$
2. $A \cap \{-\infty\}$ is either $\emptyset \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ or $\{-\infty\} \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ [as $-\infty$ is closed [theorem: 20.51] and closed sets are part of $\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ by [theorem: 21.44]].
3. $A \cap \{\infty\}$ is either $\emptyset \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ or $\{\infty\} \in \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ [as ∞ is closed by [theorem: 20.51] and closed sets are part of $\sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ by [theorem: 21.44]].

From the above we conclude that $\{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} \subseteq \sigma[\mathcal{T}_{\overline{\mathbb{R}}}]$ which combined with [eq: 21.73] proves that

$$\sigma[\mathcal{T}_{\overline{\mathbb{R}}}] = \{U \in \mathcal{P}[\overline{\mathbb{R}}] | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} \quad \square$$

Summarizing the above two lemmas in a theorem we get:

Theorem 21.58. *The Borel algebra on $\overline{\mathbb{R}}$ satisfies*

$$\begin{aligned} \mathcal{B}[\overline{\mathbb{R}}] &\stackrel{\text{definition}}{=} \sigma[\mathcal{T}_{\overline{\mathbb{R}}}] \\ &\stackrel{\text{[theorem: 21.44]}}{=} \sigma[\{C | C \text{ is closed in } \mathcal{T}_{\overline{\mathbb{R}}}\}] \\ &= \sigma[\{[a, \infty) | a \in \mathbb{R}\}] \\ &= \{U \subseteq \mathcal{P}[\overline{\mathbb{R}}] | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} \end{aligned}$$

Further we have that

$$\mathcal{B}[\mathbb{R}] \subseteq \mathcal{B}[\overline{\mathbb{R}}]$$

Proof. The first part of the theorem follows from [lemma: 21.57] and [lemma: 21.57]. For the last part. Let $A \in \mathcal{B}[\mathbb{R}]$ then $A \subseteq \mathbb{R} \subseteq \overline{\mathbb{R}}$ so that $A \in \mathcal{P}(\overline{\mathbb{R}})$ and $A = A \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]$ hence $A \in \{U \subseteq \mathcal{P}[\overline{\mathbb{R}}] | U \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]\} = \mathcal{B}[\overline{\mathbb{R}}]$. Hence we have $\mathcal{B}[\mathbb{R}] \subseteq \mathcal{B}[\overline{\mathbb{R}}]$. $\square$

21.2.1.3 Borel algebra on $\mathbb{R}^n$

Definition 21.59. *Let $n \in \mathbb{N}$ then the Borel algebra on $\mathbb{R}^n$ is noted as $\mathcal{B}[\mathbb{R}^n]$ so*

$$\mathcal{B}[\mathbb{R}^n] = \sigma[\mathbb{R}^n, \mathcal{T}_{||n}]$$

where $\mathcal{T}_{||n}$ is the canonical topology on $\mathbb{R}^n$ [see example: 14.95]

First we extend the concept of generalized intervals to intervals on $\mathbb{R}^n$

Definition 21.60. *Let $n \in \mathbb{N}$ and $x, y \in \mathbb{R}^n$ then $x \leq_n y$ if $\forall i \in \{1, \dots, n\} x_i \leq y_i$*

This relation makes $\langle \mathbb{R}^n, \leq_n \rangle$ a partial ordered set.

Theorem 21.61. *Let $n \in \mathbb{N}$ then $\langle \mathbb{R}^n, \leq_n \rangle$ is a partial ordered set.*

Note 21.62. *As for $(1, 2), (2, 1)$ we that $(1, 2) \not\leq_2 (2, 1)$ and $(2, 1) \not\leq_2 (1, 2) \leq_n$ is not a total or full order.*

Proof. We have

reflexivity. If $x \in \mathbb{R}^n$ then $\forall i \in \{1, \dots, n\}$ we have $x_i = x_i \Rightarrow x_i \leq x_i$ proving that $x \leq_n x$.

anti-symmetry. If $x, y \in \mathbb{R}^n$ satisfies $x \leq y \wedge y \leq x$ then we have $\forall i \in \mathbb{N}$ we have $x_i \leq y_i$ and $y_i \leq x_i$ so that $x_i = y_i$ from which it follows that $x = y$.

transitivity. If $x \leq_n y$ and $y \leq_n z$ then we have $\forall i \in \{1, \dots, n\}$ that $x_i \leq y_i \wedge y_i \leq z_i \Rightarrow x_i \leq z_i$ from which it follows that $x \leq_n z$. $\square$

Using this order relation we can extend the concept of intervals to intervals in $\mathbb{R}^n$.

Definition 21.63. Let $n \in \mathbb{N}_0$, $a, b \in \mathbb{R}^n$ such that $a \leq_n b$ then we have

$$\begin{aligned}
 [a, b] &= \{x \in \mathbb{R}^n \mid a \leq_n x \wedge x \leq_n b\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } a_i \leq x_i \wedge x_i \leq b_i\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } x_i \in [a_i, b_i]\} \\
 &= \prod_{i \in \{1, \dots, n\}} [a_i, b_i] \\
 [a, b[&= \{x \in \mathbb{R}^n \mid a \leq_n x \wedge x <_n b\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } a_i \leq x_i \wedge x_i < b_i\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } x_i \in [a_i, b_i[\} \\
 &= \prod_{i < \{1, \dots, n\}} [a_i, b_i[\\
]a, b] &= \{x \in \mathbb{R}^n \mid a <_n x \wedge x \leq_n b\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } a_i < x_i \wedge x_i \leq b_i\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } x_i \in]a_i, b_i]\} \\
 &= \prod_{i \in \{1, \dots, n\}}]a_i, b_i] \\
]a, b[&= \{x \in \mathbb{R}^n \mid a <_n x \wedge x <_n b\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } a_i < x_i \wedge x_i < b_i\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } x_i \in]a_i, b_i[\} \\
 &= \prod_{i < \{1, \dots, n\}}]a_i, b_i[\\
]-\infty, a] &= \{x \in \mathbb{R}^n \mid x \leq_n a\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } x_i \leq a_i\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } x_i \in]-\infty, a_i]\} \\
 &= \prod_{i < \{1, \dots, n\}}]-\infty, a_i] \\
]-\infty, a[&= \{x \in \mathbb{R}^n \mid x <_n a\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } x_i < a_i\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } x_i \in]-\infty, a_i[\} \\
 &= \prod_{i < \{1, \dots, n\}}]-\infty, a_i[\\
 [a, \infty[&= \{x \in \mathbb{R}^n \mid a \leq_n x\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } a_i \leq x_i\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } x_i \in [a_i, \infty[\} \\
 &= \prod_{i < \{1, \dots, n\}} [a_i, \infty[\\
]a, \infty[&= \{x \in \mathbb{R}^n \mid a <_n x\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } a_i < x_i\} \\
 &= \{x \in \mathbb{R}^n \mid \forall i \in \{1, \dots, n\} \text{ we have } x_i \in]a_i, \infty[\} \\
 &= \prod_{i < \{1, \dots, n\}}]a_i, \infty[
 \end{aligned}$$

To simply notation we have also the following definitions:

Definition 21.64. Let $n \in \mathbb{N}_0$ and $a, b \in \mathbb{R}$ then we define the following sets

1. $[a, b]^n = \{x \in \mathbb{R}^n | a \leq x_i \leq b\}$
2. $[a, b[^n = \{x \in \mathbb{R}^n | a \leq x_i < b\}$
3. $]a, b]^n = \{x \in \mathbb{R}^n | a < x_i \leq b\}$
4. $]a, b[^n = \{x \in \mathbb{R}^n | a < x_i < b\}$
5. $] -\infty, a]^n = \{x \in \mathbb{R}^n | x_i \leq a\}$
6. $] -\infty, a[^n = \{x \in \mathbb{R}^n | x_i < a\}$
7. $[a, \infty[^n = \{x \in \mathbb{R}^n | a \leq x_i\}$
8. $]a, \infty]^n = \{x \in \mathbb{R}^n | a < x_i\}$

Note 21.65. If we take $\alpha, \beta \in \mathbb{R}^n$ by $\alpha_i = a$ and $\beta_i = b$ then we have that

$$\begin{aligned} [a, b]^n &= [\alpha, \beta] \\ [a, b[^n &= [\alpha, \beta[\\]a, b]^n &=]\alpha, \beta] \\]a, b[^n &=]\alpha, \beta[\\] -\infty, a]^n &=]\infty, \alpha] \\] -\infty, a[^n &=]\infty, \alpha[\\ [a, \infty[^n &= [\alpha, \infty[\\]a, \infty]^n &=]\alpha, \infty[\end{aligned}$$

Proposition 21.66. $\forall n \in \mathbb{N}$ we have $\mathbb{R}^n = \bigcup_{i \in \mathbb{N}}]-i, i[^n = \bigcup_{i \in \mathbb{N}} [-i, i]^n$

Proof. Let $x \in \mathbb{R}^n$ then then $\forall j \in \{1, \dots, n\}$ $x_j \in \mathbb{R} \stackrel{[\text{corollary: 10.30}]}{=} \bigcup_{i \in \mathbb{N}}]-i, i[$ so that there exist a $i_j \in \mathbb{N}$ such that $x_j \in]-i_j, i_j[$. Take $k = \max(\{i_j | j \in \{1, \dots, n\}\})$ then we have $\forall j \in \{1, \dots, n\}$ $x_j \in]-i_j, i_j[\subseteq]-k, k[$ from which it follows that $x \in]-k, k[^n$. Hence $\mathbb{R}^n \subseteq \bigcup_{k \in \mathbb{N}}]-k, k[^n$ which as trivially $\bigcup_{k \in \mathbb{N}}]-k, k[^n \subseteq \mathbb{R}^n$ proves that

$$\bigcup_{k \in \mathbb{N}}]-k, k[^n \quad \square$$

We specify now the sufficient and necessary condition for a interval in $\mathbb{R}^n$ to be empty.

Lemma 21.67.

Let $n \in \mathbb{N}$ and $a, b \in \mathbb{R}^n$ then we have

1. $[a, b[= \emptyset \Leftrightarrow \exists i \in \{1, \dots, n\}$ such that $a_i \geq b_i$
2. $]a, b] = \emptyset \Leftrightarrow \exists i \in \{1, \dots, n\}$ such that $a_i \geq b_i$
3. $]a, b[= \emptyset \Leftrightarrow \exists i \in \{1, \dots, n\}$ such that $a_i \geq b_i$
4. $[a, b] = \emptyset \Leftrightarrow \exists i \in \{1, \dots, n\}$ such that $a_i > b_i$

Proof.

1. As $[a, b[= \prod_{i \in \{1, \dots, n\}} [a_i, b_i[$ we have

$\Rightarrow$. If $[a, b[= \emptyset$ then by [theorem 3.110] $\exists i \in \{1, \dots, n\}$ such that $[a_i, b_i[= \emptyset$. If $a_i < b_i$ then by [theorem: 10.32] there exists a $x \in \mathbb{R}$ such that $a_i < x < b_i \Rightarrow x \in [a_i, b_i[$ contradicting $[a_i, b_i[= \emptyset$, so we must have $a_i \geq b_i$.

$\Leftarrow$. If there exists a $i \in \{1, \dots, n\}$ with $a_i \geq b_i$ then if $x \in [a_i, b_i[$ we have $a_i \leq x \wedge x < b_i \leq a_i$ leading to the contradiction $a_i < a_i$ so $[a_i, b_i[= \emptyset$. Hence using [theorem 3.110] $[a, b[= \emptyset$.

2.

$\Rightarrow$. If $]a, b[= \emptyset$ then by [theorem 3.110] $\exists i \in \{1, \dots, n\}$ such that $]a_i, b_i[= \emptyset$. If $a_i < b_i$ then by [theorem: 10.32] there exists a $x \in \mathbb{R}$ such that $a_i < x < b_i \Rightarrow x \in]a_i, b_i[$ contradicting $]a_i, b_i[= \emptyset$, so we must have $a_i \geq b_i$.

$\Leftarrow$. If there exists a $i \in \{1, \dots, n\}$ with $a_i \geq b_i$ then if $x \in]a_i, b_i[$ we have $a_i < x \wedge x \leq b_i \leq a_i$ leading to the contradiction $a_i < a_i$ so $]a_i, b_i[= \emptyset$. Hence using [theorem 3.110] $]a, b[= \emptyset$.

3.

$\Rightarrow$. If $]a, b[= \emptyset$ then by [theorem 3.110] $\exists i \in \{1, \dots, n\}$ such that $]a_i, b_i[= \emptyset$. If $a_i < b_i$ then by [theorem: 10.32] there exists a $x \in \mathbb{R}$ such that $a_i < x < b_i \Rightarrow x \in]a_i, b_i[$ contradicting $]a_i, b_i[= \emptyset$, so we must have $a_i \geq b_i$.

$\Leftarrow$. If there exists a $i \in \{1, \dots, n\}$ with $a_i \geq b_i$ then if $x \in]a_i, b_i[$ we have $a_i < x \wedge x < b_i \leq a_i$ leading to the contradiction $a_i < a_i$ so $]a_i, b_i[= \emptyset$. Hence using [theorem 3.110] $]a, b[= \emptyset$.

4.

$\Rightarrow$. If $[a, b] = \emptyset$ then by [theorem 3.110] $\exists i \in \{1, \dots, n\}$ such that $[a_i, b_i] = \emptyset$. If $a_i \leq b_i$ then $a_i \in [a_i, b_i]$ contradicting $[a_i, b_i] = \emptyset$, so we must have $a_i > b_i$.

$\Leftarrow$. If there exists a $i \in \{1, \dots, n\}$ with $a_i > b_i$ then if $x \in [a_i, b_i]$ we have $a_i \leq x \wedge x < b_i < a_i$ leading to the contradiction $a_i < a_i$ so $[a_i, b_i] = \emptyset$. Hence using [theorem 3.110] $[a, b] = \emptyset$. $\square$

To be able to use half open intervals in $\mathbb{R}^n$ of the form $[a, b]$ to generate the Borel algebra on $\mathbb{R}^n$ we introduce Dyadic intervals. We prove then that any open sets in $\langle \mathbb{R}^n, \mathcal{T} \rangle$ is a countable union of Diadic intervals. First we define the set of half open intervals on $\mathbb{R}^n$

Definition 21.68. Let $n \in \mathbb{N}$ then

$$\mathcal{R}_{\square}^n = \{[a, b] \mid a, b \in \mathbb{R}^n \wedge a \leq b\}$$

$$\mathcal{R}_{\llbracket}^n = \{[a, b[\mid a, b \in \mathbb{R}^n \wedge a < b\}$$

$$\mathcal{R}_{\rrbracket}^n = \{]a, b] \mid a, b \in \mathbb{R}^n \wedge a < b\}$$

$$\mathcal{R}_{\llbracket\rrbracket}^n = \{]a, b[\mid a, b \in \mathbb{R}^n \wedge a < b\}$$

Note 21.69. Note as $a < b$ we have by [lemma: 21.67] that $\forall i \in \{1, \dots, n\}$ $a_i < b_i$ so that

$$[a, b[,]a, b],]a, b[\neq \emptyset$$

Like wise as $a < b$ we have by [lemma: 21.67] that $\forall i \in \{1, \dots, n\}$ $a_i \leq b_i$ so that

$$[a, b] \neq \emptyset$$

Theorem 21.70. Let $n \in \mathbb{N}$ then we have

1. $\forall R \in \mathcal{R}_{\square}^n$ we have that R is closed in $\mathcal{T}_{\square}$.
2. $\forall R \in \mathcal{R}_{\llbracket}^n$ we have that R is compact in $\mathcal{T}_{\square}$.
3. $\forall R \in \mathcal{R}_{\rrbracket}^n$ we have that R is open in $\mathcal{T}_{\square}$ [in other words $R \in \mathcal{T}_{\square}$]

Proof.

1. As $R \in \mathcal{R}_{\square}^n$ there exist a $a, b \in \mathbb{R}^n$ with $a \leq b$. If $x \in \mathbb{R}^n \setminus [a, b]$ then $\exists i \in \{1, \dots, n\}$ such that $x_i \notin [a_i, b_i]$. Hence we have either:

$\mathbf{x_i < a_i}$. Take then $\varepsilon = a_i - x_i \in \mathbb{R}^+$ then $\forall y \in B_{\|\cdot\|_n}(x, \varepsilon)$ we have

$$y_i - x_i \leq |y_i - x_i| \leq \max(\{|y_i - x_i| \mid i \in \{1, \dots, n\}\}) = \|x - y\|_n < \varepsilon = a_i - x_i$$

so that $y_i < a_i$ from which it follows that $y_i \notin [a_i, b_i]$. Hence $y \in \mathbb{R}^n \setminus [a, b]$ so that

$$x \in B_{\|\cdot\|_n}(x, \varepsilon) \subseteq \mathbb{R}^n \setminus [a, b]$$

$b_i < x_i$. Take then $\varepsilon = x_i - b_i \in \mathbb{R}^+$ then $\forall y \in B_{\|\cdot\|_n}(x, \varepsilon)$ we have that

$$x_i - y_i \leq |y_i - x_i| \leq \max(\{|y_i - x_i| : i \in \{1, \dots, n\}\}) = \|y_i - x_i\|_n < \varepsilon = x_i - b_i$$

so that $b_i < y_i$ from which it follows that $y_i \notin [a_i, b_i]$. Hence $y \in \mathbb{R}^n \setminus [a, b]$ so that

$$x \in B_{\|\cdot\|_n}(x, \varepsilon) \subseteq \mathbb{R}^n \setminus [a, b]$$

So $\forall x \in \mathbb{R}^n \setminus [a, b]$ we found a $\varepsilon \in \mathbb{R}^+$ such that $x \in B_{\|\cdot\|_n}(x, \varepsilon) \subseteq \mathbb{R}^n \setminus [a, b]$, from this it follows that $\mathbb{R}^n \setminus [a, b]$ is open which proves that

$R = [a, b]$ is a closed set

2. As $R \in \mathcal{R}_{\|\cdot\|}^n$ there exists, $a, b \in \mathbb{R}^n$ with $\forall i \in \{1, \dots, n\}$ $a_i \leq b_i$ such that $R = [a, b] = \prod_{i \in \{1, \dots, n\}} [a_i, b_i]$. Using [theorem: 14.276] it follows then that R is compact.

3. Let $R \in \mathcal{R}_{\|\cdot\|}^n$ then there exists $a, b \in \mathbb{R}^n$ with $a < b$ such that $R =]a, b[= \prod_{i \in \{1, \dots, n\}}]a_i, b_i[$. As $\forall i \in \{1, \dots, n\}$ $]a_i, b_i[$ is open in $\mathcal{T}_{\|\cdot\|}$ [see theorem: 14.100] it follows from [definition: 14.41] and [theorems: 14.47, 14.94] that

$\mathbb{R} =]a, b[$ is a open set in $\mathcal{T}_{\|\cdot\|_x}$ □

The following lemma allows us to define a function that maps a element of $\mathcal{R}_{\|\cdot\|}^n$ to its endpoints. Using this we can define then the volume of elements of $\mathcal{R}_{\|\cdot\|}^n$.

Lemma 21.71. *Let $n \in \mathbb{N}$ and $\{x_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}^+$ then $\prod_{i \in \{1, \dots, n\}} x_i \in \mathbb{R}^+$*

Proof. We prove this by induction, so let

$$S = \left\{ n \in \mathbb{N} \mid \text{If } \{x_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}^+ \text{ then } \prod_{i \in \{1, \dots, n\}} x_i \in \mathbb{R}^+ \right\}$$

then we have:

$1 \in S$. If $\{x_i\}_{i \in \{1\}} \subseteq \mathbb{R}^+$ then $\prod_{i \in \{1\}} x_i = x_1 \in \mathbb{R}^+$ which proves that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $\{x_i\}_{i \in \{1, \dots, n+1\}} \subseteq [0, \infty]$ then as $n \in S$ we have $\prod_{i=1}^n x_i \in \mathbb{R}^+$, as also $x_{n+1} \in \mathbb{R}^+$ it follows from [theorem: 10.14] that

$$0 \leq \left(\prod_{i \in \{1, \dots, n\}} x_i \right) \cdot x_{n+1} = \prod_{i \in \{1, \dots, n+1\}} x_i$$

so that $n+1 \in S$ □

Lemma 21.72. *Let $n \in \mathbb{N}$ and $I \in \mathcal{R}_{\|\cdot\|}^n$ then there exist a **unique** $a, b \in \mathbb{R}^n$ with $a < b$ such that $I = [a, b]$*

Proof. If $I \in \mathcal{R}_{\|\cdot\|}^n$ then by definition of $\mathcal{R}_{\|\cdot\|}^n$ there exist $a, b \in \mathbb{R}^n$ with $a < b$ such that $I = [a, b]$. Assume that there exists also $a', b' \in \mathbb{R}^n$ such that $I = [a', b']$. Then $\prod_{i \in \{1, \dots, n\}} [a_i, b_i] = \prod_{i \in \{1, \dots, n\}} [a'_i, b'_i]$ and $\forall i \in \{1, \dots, n\}$ $[a_i, b_i] \neq \emptyset$, hence using [theorem: 3.113] we have that

$$\forall i \in \{1, \dots, n\} \text{ that } \emptyset \neq [a_i, b_i] = [a'_i, b'_i]$$

Let $i \in \{1, \dots, n\}$ then as $\emptyset \neq [a_i, b_i] = [a'_i, b'_i]$ it follows from [theorem: 3.144] that $a_i = a'_i$ and $b_i = b'_i$ proving uniqueness. □

Thanks to the above lemmas the following is well defined.

Definition 21.73. Let $n \in \mathbb{N}$ then we define:

1. $\text{begin}: \mathcal{R}_{||}^n \rightarrow \mathbb{R}$ by $\text{begin}(I) = a$ where $I = [a, b[$ and $a < b$
2. $\text{end}: \mathcal{R}_{||}^n \rightarrow \mathbb{R}$ by $\text{end}(I) = b$ where $I = [a, b[$ and $a < b$
3. $v^n: \mathcal{R}_{||}^n \rightarrow]0, \infty[= \mathbb{R}^n$ where $v^n(I) = \prod_{i \in \{1, \dots, n\}} (\text{begin}(I)_i - \text{end}(I)_i)$

Note 21.74. As $\text{begin}(I) < \text{end}(I)$ we have $\forall i \in \{1, \dots, n\}$

$$\text{begin}(I)_i < \text{end}(I)_i \Rightarrow \text{end}(I)_i - \text{begin}(I)_i \in [0, \infty] \text{ so that by [lemma: 21.71]}$$

$v^n(R) \in \mathbb{R}^+$ as is needed in (3).

We introduce now Dyadic cubes that forms a countable subset of $\mathcal{R}_{||}^n$.

Definition 21.75. (Dyadic Cubes) Let $n \in \mathbb{N}$, $m \in \mathbb{N}_0$ then we define $\mathcal{D}_m^n$ by

$$\mathcal{D}_m^n = \left\{ \left[\frac{z}{2^m}, \frac{z+1}{2^m} \right] \mid z \in \mathbb{Z}^n \right\} \subseteq \mathcal{R}_{||}^n$$

Elements of $\mathcal{D}_m^n$ are called Dyadic cubes of order m . Further $\mathcal{D}^n$ defined by

$$\mathcal{D}^n = \bigcup_{m \in \mathbb{N}_0} \mathcal{D}_m^n \subseteq \mathcal{R}_{||}^n$$

is the set of all Dyadic cubes.

Note 21.76. As $\frac{z}{2^m} < \frac{z+1}{2^m}$ we have that $\frac{z}{2^m} \in \left[\frac{z}{2^m}, \frac{z+1}{2^m} \right[$ so that Dyadic cubes are not empty.

Lemma 21.77. Let $k, l \in \mathbb{N}_0$ with $k \leq l$, $r, q \in \mathbb{Z}$ then for $\left[\frac{r}{2^l}, \frac{r+1}{2^l} \right]$, $\left[\frac{q}{2^k}, \frac{q+1}{2^k} \right]$ we have

$$\begin{aligned} \left[\frac{r}{2^l}, \frac{r+1}{2^l} \right] \cap \left[\frac{q}{2^k}, \frac{q+1}{2^k} \right] \neq \emptyset &\Rightarrow \left[\frac{r}{2^l}, \frac{r+1}{2^l} \right] \subseteq \left[\frac{q}{2^k}, \frac{q+1}{2^k} \right] \\ \left[\frac{r}{2^l}, \frac{r+1}{2^l} \right] \cap \left[\frac{q}{2^k}, \frac{q+1}{2^k} \right] = \emptyset &\Rightarrow \left[\frac{r}{2^l}, \frac{r+1}{2^l} \right] \not\subseteq \left[\frac{q}{2^k}, \frac{q+1}{2^k} \right] \end{aligned}$$

in other words. We have either $\left[\frac{r}{2^l}, \frac{r+1}{2^l} \right] \cap \left[\frac{q}{2^k}, \frac{q+1}{2^k} \right] = \emptyset$ or $\left[\frac{r}{2^l}, \frac{r+1}{2^l} \right] \subseteq \left[\frac{q}{2^k}, \frac{q+1}{2^k} \right]$ but not both.

Proof. Take $I = \left[\frac{q}{2^l}, \frac{q+1}{2^l} \right]$ and $J = \left[\frac{r}{2^k}, \frac{r+1}{2^k} \right]$. As $k \leq l$ we have $0 \leq l - k = n$. Next

$$\begin{aligned} J &= \left[\frac{r}{2^k}, \frac{r+1}{2^k} \right] \\ &= \left[\frac{r}{2^k} \cdot \frac{2^{l-k}}{2^{l-k}}, \frac{r+1}{2^k} \cdot \frac{2^{l-k}}{2^{l-k}} \right] \\ &= \left[\frac{r \cdot 2^{l-k}}{2^l}, \frac{r \cdot 2^{l-k} + 2^{l-k}}{2^l} \right] \\ &= \left[\frac{r \cdot 2^n}{2^l}, \frac{r \cdot 2^n + 2^n}{2^l} \right] \end{aligned} \tag{21.83}$$

Assume that $I \cap J \neq \emptyset$ so that $\exists x \in I \cap J$ giving

$$\frac{q}{2^l} \leq x < \frac{q+1}{2^l} \wedge \frac{r \cdot 2^n}{2^l} \leq x < \frac{r \cdot 2^n + 2^n}{2^l} \tag{21.84}$$

If now $\frac{q+1}{2^l} \leq \frac{r \cdot 2^n}{2^l}$ then $x < \frac{q+1}{2^l} \leq \frac{r \cdot 2^n}{2^l} \leq x$ giving the contradiction $x < x$ so we must have

$$\frac{r \cdot 2^n}{2^l} < \frac{q+1}{2^l} \tag{21.85}$$

Further if $\frac{r \cdot 2^n + 2^n}{2^l} \leq \frac{q}{2^l}$ then $x < \frac{r \cdot 2^n + 2^n}{2^l} \leq \frac{q}{2^l} \leq x$ giving the contradiction $x < x$ again so we must have that

$$\frac{q}{2^l} < \frac{r \cdot 2^n + 2^n}{2^l} \quad (21.86)$$

Multiplying 21.85 and 21.86 by 2^l gives $r \cdot 2^n < q + 1 \wedge q < r \cdot 2^n + 2^n$. As $r \cdot 2^n, q + 1, r \cdot 2^n + 2^n \in \mathbb{Z}$ we have by [theorem: 10.28] that $r \cdot 2^n + 1 \leq q + 1 \wedge q + 1 \leq r \cdot 2^n + 2^n \Rightarrow r \cdot 2^n \leq q \wedge q + 1 \leq r \cdot 2^n + 2^n$. Dividing by 2^l gives:

$$\frac{r \cdot 2^n}{2^l} \leq \frac{q}{2^l} \wedge \frac{q + 1}{2^l} \leq \frac{r \cdot 2^n + 2^n}{2^l} \quad (21.87)$$

Next if $x \in I \cap J$ then $\frac{q}{2^l} \leq x < \frac{q + 1}{2^l} \xrightarrow{21.87} \frac{r \cdot 2^n}{2^l} \leq x < \frac{r \cdot 2^n + 2^n}{2^l}$ proving using 21.83 that $x \in J$. Hence we have

$$\text{If } I \cap J \neq \emptyset \text{ then } I \subseteq J$$

Finally if $I \cap J = \emptyset$ then if $I \subseteq J$ we have $\emptyset = I \cap J = I$ a contradiction as $\frac{q}{2^l} \in I$. Hence we have either $I \cap J = \emptyset$ or $I \subseteq J$ but not both. $\square$

Theorem 21.78. *Let $n \in \mathbb{N}$ then we have*

1. $\forall m \in \mathbb{N}_0$ and $\forall R, Q \in \mathcal{D}_m^n$ with $R \neq Q$ we have $R \cap Q = \emptyset$
2. Let $k, l \in \mathbb{N}_0$ with $k \leq l$ then if $R \in \mathcal{D}_l^n$ and $R \in \mathcal{D}_k^n$ we have that

$$\begin{aligned} R \cap Q \neq \emptyset &\Rightarrow R \subseteq Q \\ R \cap Q = \emptyset &\Rightarrow R \not\subseteq Q \end{aligned}$$

3. $\forall m \in \mathbb{N}_0$ we have that $\mathbb{R}^n = \bigsqcup_{R \in \mathcal{D}_m^n} R$ [here $\bigsqcup_{R \in \mathcal{D}_m^n} R$ is a disjoint union because of (1)].
4. $\forall m \in \mathbb{N}_0$ and $\forall R \in \mathcal{D}_m^n$ we have that $v^n(R) = \frac{1}{2^{n \cdot m}} < 1$

Proof.

1. Let $m \in \mathbb{N}_0$ and $R, Q \in \mathcal{D}_m^n$ with $R \neq Q$. Then there exist $r, z \in \mathbb{Z}^n$ such that

$$R = \left[\frac{r}{2^m}, \frac{r+1}{2^m} \right] = \prod_{i \in \{1, \dots, n\}} \left[\frac{r_i}{2^m}, \frac{r_i+1}{2^m} \right] \text{ and } Q = \left[\frac{z}{2^m}, \frac{z+1}{2^m} \right] = \prod_{i \in \{1, \dots, n\}} \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m} \right]$$

As $R \neq Q$ there exist a $i \in \{1, \dots, n\}$ such that $\left[\frac{r_i}{2^m}, \frac{r_i+1}{2^m} \right] \neq \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m} \right]$, hence we must have that $r_i \neq z_i$. We can always assume that $r_i < z_i$ [if not exchange R and Q] so that $r_i + 1 \leq z_i$ [as $r_i, z_i \in \mathbb{Z}$ we can use [theorem: 10.28]]. Assume that $x \in \left[\frac{r_i}{2^m}, \frac{r_i+1}{2^m} \right] \cap \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m} \right]$ then $\frac{r_i}{2^m} \leq x < \frac{r_i+1}{2^m} \leq \frac{z_i}{2^m} \leq x < \frac{z_i+1}{2^m}$ leading to the contradiction $x < x$ hence we must have that $\left[\frac{r_i}{2^m}, \frac{r_i+1}{2^m} \right] \cap \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m} \right] = \emptyset$. Using [theorem: 3.110] it follows that $\prod_{i \in \{1, \dots, n\}} \left[\frac{r_i}{2^m}, \frac{r_i+1}{2^m} \right] \cap \prod_{i \in \{1, \dots, n\}} \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m} \right] = \emptyset$ or

$$R \cap Q = \emptyset$$

2. Let $k, l \in \mathbb{N}_0$ with $k \leq l$ and $R \in \mathcal{D}_l^n, Q \in \mathcal{D}_k^n$ then there exists $r, q \in \mathbb{Z}^n$ with $R = \left[\frac{r}{2^m}, \frac{r+1}{2^m} \right], Q = \left[\frac{z}{2^m}, \frac{z+1}{2^m} \right]$. Assume that $R \not\subseteq Q$ then we have either

$$\exists i \in \{1, \dots, n\} \models \left[\frac{r_i}{2^m}, \frac{r_i+1}{2^m} \right] \cap \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m} \right] = \emptyset. \text{ Then using [theorem: 3.110] we have } R \cap Q = \emptyset$$

$$\begin{aligned} \exists i \in \{1, \dots, n\} \models \left[\frac{r_i}{2^m}, \frac{r_i+1}{2^m} \right] \cap \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m} \right] \neq \emptyset. \text{ Then using [lemma: 21.77] we have} \\ \forall i \in \{1, \dots, n\} \text{ that } \left[\frac{r_i}{2^m}, \frac{r_i+1}{2^m} \right] \subseteq \left[\frac{z_i}{2^m}, \frac{z_i+1}{2^m} \right]. \text{ Applying [theorem: 3.111] proves that} \\ R \subseteq Q \text{ contradicting } R \not\subseteq Q. \text{ So this case never applies.} \end{aligned}$$

So we conclude that if $R \not\subseteq Q$ then $R \cap Q = \emptyset$ or using contraposition we have

$$\text{If } R \cap Q \neq \emptyset \text{ then } R \subseteq Q$$

On the other hand if $R \cap Q = \emptyset$ and $R \subseteq Q$ then $\emptyset \neq R = R \cap Q = \emptyset$ contradiction so we have

$$\text{If } R \cap Q = \emptyset \text{ then } R \not\subseteq Q$$

3. Let $m \in \mathbb{N}$ and $x \in \mathbb{R}^n$ then $\forall i \in \{1, \dots, n\}$ we have $x_i \in \mathbb{R}$. Using [theorem: 10.30] there exist a $z_i \in \mathbb{Z}$ such that $z_i \leq x_i \cdot 2^m < z_i + 1$, hence $\frac{z_i}{2^m} \leq x_i < \frac{z_i + 1}{2^m}$. So if we take $z = (z_1, \dots, z_m)$ then $x \in \prod_{i \in \{1, \dots, n\}} \left[\frac{z_i}{2^m}, \frac{z_i + 1}{2^m} \right] = \left[\frac{z}{2^m}, \frac{z + 1}{2^m} \right] \in \mathcal{D}_m^n$ proving that $\mathbb{R}^n \subseteq \bigcup_{R \in \mathcal{D}_m^n} R$. As $\forall R \in \mathcal{D}_m^n$ $R \subseteq \mathbb{R}^n$ we have proved that

$$\mathbb{R}^n = \bigcup_{R \in \mathcal{D}_m^n} R$$

Finally by (1) we have that $\forall R, R' \in \mathcal{D}_m^n$ with $R \neq R'$ we have $R \cap R' = \emptyset$ so that

$$\mathbb{R}^n = \bigsqcup_{R \in \mathcal{D}_m^n} R$$

4. If $R \in \mathcal{R}_{||}^n$ then $\exists z \in \mathbb{Z}^n$ such that $R = \prod_{i \in \{1, \dots, n\}} \left[\frac{z_i}{2^n}, \frac{z_i + 1}{2^n} \right]$ so that

$$v^n(R) = \prod_{i=1}^n \left(\frac{z_i + 1 - z_i}{2^n} \right) = \prod_{i=1}^n \frac{1}{2^n} = \frac{1}{2^{n \cdot n}} \quad \square$$

One of the reasons that we introduce the Dyadic cubes as a subset of $\mathcal{R}_{||}^n$ is that $\mathcal{D}_m^n$ is a denumerable set in contrast with $\mathcal{R}_{||}^n$ which we need giving the definition of a σ -algebra. This is proved in the next lemma.

Lemma 21.79. *Let $n \in \mathbb{N}$ then*

1. $\forall m \in \mathbb{N}_0$ $\mathcal{D}_m^n$ is denumerable.
2. $\mathcal{D}^n$ is denumerable

Proof.

1. Let $m \in \mathbb{N}_0$ then as $\mathbb{Z}$ is denumerable [see theorem: 10.5] we have by [theorem: 6.67] that $\mathbb{Z}^n$ is also denumerable. Define now $\beta: \mathbb{Z}^n \rightarrow \mathcal{D}_m^n$ by $\beta(z) = \left[\frac{z}{2^m}, \frac{z + 1}{2^m} \right]$ then β is a bijection.

injectivity. If $\beta(z) = \beta(w)$ then $\left[\frac{z}{2^m}, \frac{z + 1}{2^m} \right] = \left[\frac{w}{2^m}, \frac{w + 1}{2^m} \right]$. Using the fact that a Dyadic cube is not empty together with [lemma: 21.72] gives $\frac{z}{2^m} = \frac{w}{2^m}$ proving that $z = w$.

surjectivity. This follows from the definition of $\mathcal{D}_m^n$

So $\mathcal{D}_m^n$ is denumerable.

2. Using [theorem: 6.69] it follows that $\mathcal{D}^n = \bigcup_{m \in \mathbb{N}} \mathcal{D}_m^n$ is denumerable $\square$

We are now finally ready to prove that every non empty open set on $\mathbb{R}^n$ can be written as a denumerable union of pairwise disjoint Dyadic cubes.

Lemma 21.80. *Let $n \in \mathbb{N}$, $\mathcal{T}_{|||n}$ the canonical topology on $\mathbb{R}$ [see example: 14.95] then if $\emptyset \neq U \in \mathcal{T}_{|||n}$ there exist a **pairwise disjoint family** $\{D_i\}_{i \in \mathbb{N}} \subseteq \mathcal{D}^n$ such that $U = \bigsqcup_{i \in \mathbb{N}} D_i$.*

Proof. Let $\emptyset \neq U \in \mathcal{T}_{|||n}$ be a non empty open set in $\mathbb{R}^n$. Given $m \in \mathbb{N}_0$ define

$$\mathcal{S}_m = \{D \in \mathcal{D}_m^n \mid D \subseteq U\} \subseteq \mathcal{D}_m^n \quad (21.88)$$

and recursively

$$\mathcal{T}_m = \begin{cases} S_0 & \text{if } m=0 \\ \{D \in \mathcal{S}_m \mid \forall i \in \{0, \dots, m-1\} \text{ we have } \forall R \in \mathcal{T}_i \text{ that } R \cap D = \emptyset\} & \text{if } m \in \mathbb{N} \end{cases} \quad (21.89)$$

Using the above definitions we have the following inclusions

$$\forall m \in \mathbb{N}_0 \text{ we have } \mathcal{T}_m \subseteq \mathcal{S}_m \subseteq \mathcal{D}_m^n \subseteq \mathcal{D}^n \quad (21.90)$$

Further we define

$$\mathcal{T} = \bigcup_{m \in \mathbb{N}_0} \mathcal{T}_m \quad (21.91)$$

If $D \in \mathcal{D}$ then there exist a $i \in \mathbb{N}_0$ such that $D \in \mathcal{T}_i \subseteq \mathcal{S}_i$ proving by [eq: 21.88] that $D \subseteq U$, hence we have

$$\bigcup_{D \in \mathcal{T}} D \subseteq U \quad (21.92)$$

Proving the opposite inclusion is a little more difficult. Let $x \in U$ then there exist a $\varepsilon \in \mathbb{R}^+$ such that $x \in B_{\|\cdot\|_n}(x, \varepsilon) \subseteq U$. Using the Archimedean property of the real numbers [see theorem: 10.30] there exist $n_\varepsilon \in \mathbb{N}$ such that

$$0 < \frac{1}{n_x} < \varepsilon \quad (21.93)$$

Using [theorem: 21.78 (3)] there exist a $D_x \in \mathcal{D}_{n_x}^n$ such that

$$D_x = \left[\frac{z}{2^{n_x}}, \frac{z+1}{2^{n_x}} \right] = \prod_{i \in \{1, \dots, n\}} \left[\frac{z_i}{2^{n_x}}, \frac{z_i+1}{2^{n_x}} \right] \in \mathcal{D}_{n_x}^n \text{ such that } x \in D_x$$

from which it follows that

$$\forall i \in \{1, \dots, n\} \text{ we have } \frac{z_i}{2^{n_x}} \leq x_i < \frac{z_i+1}{2^{n_x}} \quad (21.94)$$

Let $y \in D_x$ then $y \in \prod_{i \in \{1, \dots, n\}} \left[\frac{z_i}{2^{n_x}}, \frac{z_i+1}{2^{n_x}} \right]$ so that

$$\forall i \in \{1, \dots, n\} \text{ we have } \frac{z_i}{2^{n_x}} \leq y_i < \frac{z_i+1}{2^{n_x}} \quad (21.95)$$

Hence we have

$$\begin{aligned} y_i - x_i & \underset{[\text{eq: 21.95}]}{<} \frac{z_i+1}{2^{n_x}} - x_i \\ & \underset{[\text{eq: 21.94}]}{\leq} \frac{z_i+1}{2^{n_x}} - \frac{z_i}{2^{n_x}} \\ & = \frac{1}{2^{n_x}} \\ & \underset{[\text{eq: 21.93}]}{<} \varepsilon \\ x_i - y_i & \underset{[\text{eq: 21.94}]}{<} \frac{z_i+1}{2^{n_x}} - y_i \\ & \underset{[\text{eq: 21.95}]}{\leq} \frac{z_i+1}{2^{n_x}} - \frac{z_i}{2^{n_x}} \\ & \underset{[\text{eq: 21.93}]}{<} \varepsilon \end{aligned}$$

which proves that $\forall i \in \{1, \dots, n\} \mid y_i - x_i < \varepsilon$. Hence $\|y - x\|_n = \max(\{|y_i - x_i| \mid i \in \{1, \dots, n\}\}) < \varepsilon$ so that $y \in B_{\|\cdot\|_n}(x, \varepsilon)$. In conclusion

$$x \in D_x \subseteq B_{\|\cdot\|_n}(x, \varepsilon) \subseteq U$$

As $D_x \in \mathcal{D}_{n_x}^n$ it follows from the above and [eq: 21.88] that

$$x \in D_x \in \mathcal{S}_{n_x} \quad (21.96)$$

Define now

$$\mathcal{K}_x = \{i \in \{0, \dots, n_x\} \mid \exists D \in \mathcal{S}_i \mid x \in D\} \subseteq \{0, \dots, n_x\} \quad (21.97)$$

Then by [eq: 21.96] $n_x \in \mathcal{K}_x$ so that $\mathcal{K}_x \neq \emptyset$, as further $\mathcal{K}_x$ is finite it follows that

$$m_x = \min(\mathcal{K}_x) \text{ exist} \quad (21.98)$$

For $m_x \in \mathcal{K}_x \subseteq \{0, \dots, n_x\}$ we have now two possible cases:

$m_x = 0$. then $\exists D \in \mathcal{S}_0$ such that $x \in D$. As by [eqs: 21.89, 21.91] $\mathcal{S}_0 = \mathcal{T}_0$ and $\mathcal{T}_0 \in \mathcal{T}$ we that $x \in D \in \mathcal{T}$. In other words $x \in \bigcup_{D \in \mathcal{T}} D$.

$m_x \in \{1, \dots, n_x\}$. Then $\exists D \in \mathcal{S}_{m_x} \subseteq \mathcal{D}_{m_x}^n$ such that $x \in D$ and $\forall i \in \{0, \dots, m_x - 1\}$ we have that $\forall R \in \mathcal{S}_i$ that $x \notin R$. Let $i \in \{0, \dots, m_x - 1\}$ and assume that $\exists R \in \mathcal{S}_i \subseteq \mathcal{D}_i^n$ such that $R \cap D \neq \emptyset$ then by [theorem: 21.78 (2)] and the fact that $i \leq m_x$ it follows that $D \subseteq R$, as $x \in D$ it follows that $x \in R$ contradicting $x \notin R$ hence the assumption is wrong and we must have that $\forall R \in \mathcal{S}_i$ we have that $R \cap D = \emptyset$. As this is true $\forall i \in \{0, \dots, m_x - 1\}$ it follows from [definition: 21.89] that $D \in \mathcal{T}_{m_x} \subseteq \mathcal{T}$. In other words we have $x \in D \in \mathcal{T}$ which proves that $x \in \bigcup_{D \in \mathcal{T}} D$.

So in all cases we have that $x \in \bigcup_{D \in \mathcal{T}} D$ which as $x \in U$ was chosen arbitrary proves that $U \subseteq \bigcup_{D \in \mathcal{T}} D$. Combining this with [eq: 21.91] proves that

$$U = \bigcup_{D \in \mathcal{T}} D \quad (21.99)$$

Next we must prove that U is a pairwise disjoint union. Let $D, E \in \mathcal{T} = \bigcup_{m \in \mathbb{N}_0} \mathcal{T}_m$ with $D \neq E$ then there exist $k, l \in \mathbb{N}_0$ such that $D \in \mathcal{T}_k \subseteq \mathcal{D}_k^n$ and $E \in \mathcal{T}_l \subseteq \mathcal{D}_l^n$. For k, l we have the following possible cases:

$k = l$. Then using [theorem: 21.78 (1)] it follows that $D \cap E = \emptyset$.

$k < l$. Then using [eq: 21.89] that $D \cap E = \emptyset$.

$l < k$. Then using [eq: 21.89] that $D \cap E = \emptyset$.

combining the above with [eq: 21.99] gives then

$$\forall D, E \in \mathcal{T} \text{ with } D \neq E \text{ we have } D \cap E = \emptyset \quad (21.100)$$

Next we prove that $\mathcal{T}$ is denumerable, first we prove that $\mathcal{T}$ is not finite (hence by definition infinite). Assume that $\mathcal{T}$ is finite. As $U \neq \emptyset$ we must have that $\mathcal{T} \neq \emptyset$ [because $\bigcup_{D \in \emptyset} D = \emptyset$] so that $m = \min(\{(\text{begin}(D))_1 \mid D \in \mathcal{T}\})$ exist. Hence there exist a $R = [a, b[\in \mathcal{T}$ such that $a_1 = m$. As $a \in [a, b[= R$ and by [eq: 21.100] $R \subseteq U$ it follows that $a \in U$. Hence there exist a $\varepsilon \in \mathbb{R}^+$ such that $a \in B_{\|\cdot\|_n}(a, \varepsilon) \subseteq U$. Define e by $(e)_i = \begin{cases} 1 & i=1 \\ 0 & \text{if } i \in \{2, \dots, n\} \end{cases}$ then for $i \in \{1, \dots, n\}$ we have

$$\left| \left(a - \left(a - \frac{\varepsilon}{2} \cdot e \right) \right)_i \right| = \left| \frac{\varepsilon}{2} \cdot e_i \right| = \left| \frac{\varepsilon}{2} \right| \cdot \left| \begin{cases} 1 & \text{if } i=1 \\ 0 & \text{if } i \in \{2, \dots, n\} \end{cases} \right| \leq \frac{\varepsilon}{2} < \varepsilon$$

so that $\|a - (a - \frac{\varepsilon}{2} \cdot e)\|_n < \varepsilon$. Hence $a - \frac{\varepsilon}{2} \cdot e \in B_{\|\cdot\|_n}(a, \varepsilon) \subseteq U$ then by [eq: 21.100] there exist a $D' \in \mathcal{T}$ such that $a - \frac{\varepsilon}{2} \cdot e \in D'$. As $D' = [\text{begin}(D'), \text{end}(D')[$ it follows that $\text{begin}(D') \leq a - \frac{\varepsilon}{2} \cdot e$ so that $(\text{begin}(D'))_1 \leq (a - \frac{\varepsilon}{2} \cdot e)_1 = a_1 - \frac{\varepsilon}{2} \cdot 1 = m - \frac{\varepsilon}{2}$. As $m = \min(\{(\text{begin}(D))_1 \mid D \in \mathcal{T}\})$ $m \leq (\text{begin}(D'))_1$ which leads to the contradiction $m \leq m - \frac{\varepsilon}{2} < m$, so the assumption is wrong and we must have that

$$\mathcal{T} \text{ is not finite or } \mathcal{T} \text{ is infinite} \quad (21.101)$$

As $\mathcal{D}^n$ is denumerable [see theorem: 21.79] and $\mathcal{T} \subseteq \mathcal{D}^n$ it follows from the above and [theorem: 6.60] that

$\mathcal{T}$ is denumerable

So there exist a bijection $\beta: \mathbb{N} \rightarrow \mathcal{T}$. Define then $\{D_i\}_{i \in \mathbb{N}} \subseteq \mathcal{T} \subseteq \mathcal{D}^n$ by $D_i = \beta(i)$ then we have

$$\bigcup_{i \in \mathbb{N}} D_i \stackrel{[\text{theorem: 2.119}]}{=} \bigcup_{D \in \mathcal{T}} D = U$$

Further if $i, j \in \mathbb{N}$ with $i \neq j$ then as β is a bijection, hence injective, it follows that $D_i \neq D_j$, so that using [eq: 21.100] we have $D_i \cap D_j = \emptyset$. Hence

$$U = \bigsqcup_{i \in \mathbb{N}} D_i \quad \square$$

Lemma 21.81. *Let $n \in \mathbb{N}$ and $R \in \mathcal{R}_{\parallel}^n$ with $R \neq \emptyset$ then there exist a sequence $\{U_i\}_{i \in \mathbb{N}} \subseteq \mathcal{T}_{\parallel n}$ of open sets such that $R = \bigcap_{i \in \mathbb{N}} U_i$*

Proof. As $R \in \mathcal{R}_{\parallel}^n$ there exists a $a, b \in \mathbb{R}^n$ with $a \leq b$ such that $R = [a, b[= \prod_{i \in \{1, \dots, n\}} [a_i, b_i[$. Define then $\{U_i\}_{i \in \mathbb{N}}$ by $U_i = \prod_{j \in \{1, \dots, n\}}]a_j - \frac{1}{j}, b_j[$. As $]a_j - \frac{1}{i}, b_j[\in \mathcal{T}_{\parallel}$ [see theorem: 14.99] and $\mathcal{T}_{\parallel n}$ is the product topology based on $\mathcal{T}_{\parallel}$ [see 14.95] it follows that $\{U_i\}_{i \in \mathbb{N}} \subseteq \mathcal{T}_{\parallel n}$. Let $i \in \mathbb{N}$ and $x \in R$ then we have $\forall j \in \{1, \dots, n\}$ that $x_j \in [a_j, b_j[\Rightarrow a_j \leq x_j < b_j \Rightarrow a_j - \frac{1}{i} < a_j \leq x_j < b_j \Rightarrow x_j \in]a_j - \frac{1}{i}, b_j[$, proving using [theorem: 3.111] that $R \subseteq U_i$. Hence we have

$$R \subseteq \bigcap_{i \in \mathbb{N}} U_i \quad (21.102)$$

For the opposite inequality let $x \in \bigcap_{i \in \mathbb{N}} U_i$ then $\forall i \in \mathbb{N}$ we have $x \in U_i$ so that $\forall j \in \{1, \dots, n\}$ we have $x_j \in]a_j - \frac{1}{i}, b_j[\Rightarrow a_j - \frac{1}{i} < x_j < b_j$. Assume that $\exists j \in \{1, \dots, n\}$ such that $x_j < a_j$ then using [theorem: 10.30] there exists a $i \in \mathbb{N}$ such that $x_j < x_j + \frac{1}{i} < a_j \Rightarrow x_j < a_j - \frac{1}{i}$ contradicting the fact that $a_j - \frac{1}{i} < x_j$. Hence $\forall j \in \{1, \dots, n\}$ we have $a_j \leq x_j < b_j$ proving that $x \in R$ so that $\bigcap_{i \in \mathbb{N}} U_i \subseteq R$. This together with [eq: 21.102] proves

$$R = \bigcap_{i \in \mathbb{N}} U_i \quad \square$$

We are ready now to prove a alternative definition for the Borel algebra on $\mathbb{R}^n$.

Theorem 21.82. *Let $n \in \mathbb{N}$ then we have*

$$\sigma[\{C \subseteq \mathbb{R}^n \mid C \text{ is close in } \mathcal{T}_{\parallel n}\}] = \mathcal{B}[\mathbb{R}^n] = \sigma[\mathcal{R}_{\parallel}^n]$$

Proof. Using [theorem: 21.44] we have

$$\sigma[\{C \subseteq \mathbb{R}^n \mid C \text{ is close in } \mathcal{T}_{\parallel n}\}] \stackrel{[\text{theorem: 21.44}]}{=} \mathcal{B}[\mathbb{R}^n, \mathcal{T}_{\parallel n}] \stackrel{\text{def}}{=} \mathcal{B}[\mathbb{R}^n]$$

so we only have to prove that $\mathcal{B}[\mathbb{R}^n, \mathcal{T}_{\parallel n}] = \sigma[\mathcal{R}_{\parallel}^n]$. Let $U \in \mathcal{T}_{\parallel n}$ then we have either:

$U = \emptyset$. Then $U = \emptyset \in \sigma[\mathcal{R}_{\parallel}^n]$.

$U \neq \emptyset$. Then using [lemma: 21.80] there exist a sequence $\{D_i\}_{i \in \mathbb{N}} \subseteq \mathcal{D}^n \subseteq \mathcal{R}_{\parallel}^n$ such that $U = \bigcup_{i \in \mathbb{N}} D_i$ which as $\sigma[\mathcal{R}_{\parallel}^n]$ is a σ -algebra proves that $U \in \sigma[\mathcal{R}_{\parallel}^n]$

Hence we have $\mathcal{T}_{\parallel n} \subseteq \sigma[\mathcal{R}_{\parallel}^n]$ which by [theorem: 21.39] gives

$$\sigma[\mathcal{T}_{\parallel n}] \subseteq \sigma[\mathcal{R}_{\parallel}^n] \quad (21.103)$$

For the opposite inclusion let $R \in \mathcal{R}_{\parallel}^n$ then by [lemma: 21.81] there exist a $\{U_i\}_{i \in \mathbb{N}} \subseteq \mathcal{T}_{\parallel n}$ such that $R = \bigcap_{i \in \mathbb{N}} U_i$. As $\sigma[\mathcal{T}_{\parallel n}]$ is a σ -algebra we have by [theorem: 21.36] that $R \in \sigma[\mathcal{T}_{\parallel n}]$. Hence $\mathcal{R}_{\parallel}^n \subseteq \sigma[\mathcal{T}_{\parallel n}]$ which by [theorem: 21.39] gives $\sigma[\mathcal{R}_{\parallel}^n] \subseteq \sigma[\mathcal{T}_{\parallel n}]$. Combining this with [eq: 21.103] gives

$$\sigma[\mathcal{R}_{\parallel}^n] = \sigma[\mathcal{T}_{\parallel n}] \stackrel{\text{def}}{=} \mathcal{B}[\mathbb{R}^n, \mathcal{T}_{\parallel n}] = \mathcal{B}[\mathbb{R}^n] \quad \square$$

Definition 21.83. Let $n \in \mathbb{N}$ then for $i \in \{1, \dots, n\}$ and $a \in \mathbb{R}$ we define $] -\infty, a[_i \subseteq \mathbb{R}^n$ by

$$]-\infty, a[_i = \{x \in \mathbb{R}^n | x_i < a\}$$

The set $] -\infty, a[_i$ is called a lower half open space. The set of all lower half spaces is noted as $\mathcal{H}^n$ hence

$$\mathcal{H}^n = \{]-\infty, a[_i | i \in \{1, \dots, n\} \wedge a \in \mathbb{R}\}$$

It turns out that every lower half space is a open set.

Lemma 21.84. Let $n \in \mathbb{N}$ then $\mathcal{H}^n \subseteq \mathcal{T}_{|||_n}$ [the canonical topology on $\mathbb{R}^n$]

Proof. Let $H \in \mathcal{H}^n$ then there exists a $i \in \{1, \dots, n\}$ and a $a \in \mathbb{R}$ such that $H = \{x \in \mathbb{R}^n | x_i < a\}$. Take $x \in H$ then $x_i < a$ so that $\varepsilon = a - x_i > 0$. Let $y \in B_{|||_n}(x, \varepsilon)$ then

$$y_i - x_i \leq |y_i - x_i| \leq \max(\{|y_i - x_i| | i \in \{1, \dots, n\}\}) < \varepsilon = a - x_i$$

proving that $y_i < a$ so that $y \in H$. Hence $x \in B_{|||_{\max}}(x, \varepsilon) \subseteq H$ which proves that H is open. $\square$

Next we show that every half open interval can be written as a finite intersection of lower half open spaces.

Lemma 21.85. Let $n \in \mathbb{N}$, $a, b \in \mathbb{R}^n$ then $[a, b[= \bigcap_{i \in \{1, \dots, n\}} (]-\infty, b_i[_i \setminus]-\infty, a_i[_i)$

Proof. Let $x \in [a, b[$ then $\forall i \in \{1, \dots, n\}$ we have $a_i \leq x_i \wedge x_i < b_i$ or $\neg(x_i < a_i) \wedge x_i < b_i$ so that $x \notin]-\infty, a_i[_i \wedge x \in]-\infty, b_i[_i \Rightarrow x \in]-\infty, b_i[_i \setminus]-\infty, a_i[_i$. Hence we have

$$[a, b[\subseteq \bigcap_{i \in \{1, \dots, n\}} (]-\infty, b_i[_i \setminus]-\infty, a_i[_i) \quad (21.104)$$

For the opposite inclusion, let $x \in \bigcap_{i \in \{1, \dots, n\}} (]-\infty, b_i[_i \setminus]-\infty, a_i[_i)$ then $\forall i \in \{1, \dots, n\}$ we have $x \in]-\infty, b_i[_i \setminus]-\infty, a_i[_i$ hence $x_i < b_i \wedge \neg(x_i < a_i) \Rightarrow x_i < b_i \wedge a_i \leq x_i$ proving that $x \in [a, b[$. So $\bigcap_{i \in \{1, \dots, n\}} (]-\infty, b_i[_i \setminus]-\infty, a_i[_i) \subseteq [a, b[$ which together with [eq: 21.104] proves that

$$[a, b[= \bigcap_{i \in \{1, \dots, n\}} (]-\infty, b_i[_i \setminus]-\infty, a_i[_i) \quad \square$$

Theorem 21.86. Let $n \in \mathbb{N}$ then $\mathcal{B}[\mathbb{R}^n] = \sigma[\mathcal{H}^n]$

Proof. If $H \in \mathcal{H}^n$ then H is open [see lemma: 21.84], so that $H \in \sigma[\mathcal{T}_{\mathbb{R}^n}] \stackrel{[\text{theorem: 21.189}]}{=} \mathcal{B}[\mathbb{R}^n]$. Hence $\mathcal{H}^n \subseteq \mathcal{B}[\mathbb{R}^n]$ giving

$$\sigma[\mathcal{H}^n] \subseteq \mathcal{B}[\mathbb{R}^n] \quad (21.105)$$

Let $R \in \mathcal{R}_{||}^n$ then $\exists a, b \in \mathbb{R}^n$ such that $R = [a, b[$, using the previous lemma [see lemma: 21.85] we have then that $R = [a, b[= \bigcap_{i \in \{1, \dots, n\}} (]-\infty, b_i[_i \setminus]-\infty, a_i[_i) \in \sigma[\mathcal{H}^n]$. So $\sigma[\mathcal{R}_{||}^n] \subseteq \sigma[\mathcal{H}^n]$ which as $\sigma[\mathcal{R}] \stackrel{[\text{theorem: 21.189}]}{=} \mathcal{B}[\mathbb{R}^n]$ proves that $\mathcal{B}[\mathbb{R}^n] \subseteq \sigma[\mathcal{H}^n]$. Combining this with 21.105] gives

$$\sigma[\mathcal{H}^n] = \mathcal{B}[\mathbb{R}^n] \quad \square$$

TODO check this again

Theorem 21.87. Let $n \in \mathbb{N}$ then $\mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \subseteq \mathcal{B}[\mathbb{R}^n]$

Proof. If $R \in \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n$ then we have either:

$R \in \mathcal{R}_{||}^n$. By [theorem: 21.70] R is a closed set so that by [theorem: 21.44] $R \in \mathcal{B}[\mathbb{R}^n]$.

$R \in \mathcal{R}_{||}^n$. By [theorem: 21.70] R is a open set so that $R \in \mathcal{B}[\mathbb{R}^n]$.

$R \in \mathcal{R}_{||}^n$. By [theorem: 21.189] it follows that $R \in \mathcal{B}[\mathbb{R}^n]$

$R \in \mathcal{R}_n^n$. Then there exists $a, b \in \mathbb{R}^n$ with $a < b$ such that $R =]a, b]$. As is already proved we have that $[a, b] \in \mathcal{B}[\mathbb{R}^n]$ and $]a, b + 1[\in \mathcal{B}[\mathbb{R}^n]$, hence we have that

$$[a, b] \cap]a, b + 1[\in \mathcal{B}[\mathbb{R}^n]$$

Now

$$\begin{aligned} x \in [a, b] \cap]a, b + 1[&\Leftrightarrow \forall i \in \{1, \dots, n\} \ x_i \in [a_i, b_i] \wedge x_i \in]a_i, b_i + 1[\\ &\Leftrightarrow \forall i \in \{1, \dots, n\} \ a_i \leq x_i \wedge x_i \leq b_i \wedge a_i < x_i \wedge x_i < b_i + 1 \\ &\Leftrightarrow \forall i \in \{1, \dots, n\} \ a_i < x_i \wedge x_i \leq b_i \\ &\Leftrightarrow x \in]a, b] \end{aligned}$$

so that

$$R =]a, b] = [a, b] \cap]a, b + 1[\in \mathcal{B}[\mathbb{R}^n]$$

□

21.3 Measures

21.3.1 Measure definition and properties

For a measurable space we have some simplification in the definitions of additivity, sub-additivity, countable additivity and countable sub-additivity because of the extra properties of a σ -algebra.

Theorem 21.88. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space [see definition: 21.32] and $\mu: \mathcal{A} \rightarrow [0, \infty[$ a function then we say that:*

1. μ is **finite additive** $\Leftrightarrow$ for every **pairwise disjoint** families $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ where $n \in \mathbb{N}$ we have

$$\mu\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^n \mu(A_i)$$

2. μ is **finite sub-additive** $\Leftrightarrow$ for every $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$, $n \in \mathbb{N}$ we have that

$$\mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) \leq \sum_{i=1}^n \mu(A_i)$$

3. μ is **countable additive** $\Leftrightarrow$ for all **pairwise disjoint** $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have that

$$\mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \mu(A_i)$$

4. μ is **countable sub-additive** if $\Leftrightarrow$ for all $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \leq \sum_{i=1}^{\infty} \mu(A_i)$$

Proof.

1. This follows from the fact that $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ we have as $\mathcal{A}$ is a σ -algebra that $\bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{A}$ and the definition of additivity [see definition: 21.14].
2. This follows from the fact that $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ we have as $\mathcal{A}$ is a σ -algebra that $\bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{A}$ and the definition of sub-additivity [see definition: 21.15].
3. This follows from the fact that $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have as $\mathcal{A}$ is a σ -algebra that $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$ and the definition of countable additivity [see definition: 21.16].
4. This follows from the fact that $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have as $\mathcal{A}$ is a σ -algebra that $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}$ and the definition of countable sub-additivity [see definition: 21.17]. □

Using mathematical induction it is easy to specify a necessary and sufficient condition for finite additivity and finite sub additivity.

Lemma 21.89. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \rightarrow [0, \infty]$ a function then we have*

1. μ is finite additive $\Leftrightarrow \forall A, B \in \mathcal{A}$ with $A \cap B = \emptyset$ we have $\mu(A \cup B) = \mu(A) + \mu(B)$
2. μ is finite sub additive $\Leftrightarrow \forall A, B \in \mathcal{A}$ we have $\mu(A \cup B) \leq \mu(A) + \mu(B)$

Proof.

1.

$\Rightarrow$. Let $A, B \in \mathcal{A}$ with $A \cap B = \emptyset$ then $\{A_i\}_{i \in \{1, \dots, 2\}}$ defined by $A_i = \begin{cases} A & \text{if } i = 1 \\ B & \text{if } i = 2 \end{cases}$ is pairwise disjoint and $\{A_i\}_{i \in \{1, \dots, 2\}} \subseteq \mathcal{A}$. So by assumption we have that

$$\mu(A \cup B) = \mu\left(\bigcup_{i \in \{1, \dots, 2\}} A_i\right) = \sum_{i=1}^2 \mu(A_i) = \mu(A_1) + \mu(A_2) = \mu(A) + \mu(B)$$

$\Leftarrow$. Let

$$\mathcal{S} = \left\{ n \in \mathbb{N}_0 \mid \text{If } \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \text{ is a pairwise disjoint family then we have that } \mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) = \sum \mu(A_i) \right\}$$

then we have:

$1 \in \mathcal{S}$. Let $\{A_i\}_{i \in \{1, \dots, 1\}} \subseteq \mathcal{A}$ then $\mu(\bigcup_{i \in \{1, \dots, 1\}} A_i) = \mu(A_1) = \sum_{i=1}^1 \mu(A_i)$ proving that $1 \in \mathcal{S}$

$n \in \mathcal{S} \Rightarrow n+1 \in \mathcal{S}$. Let $\{A_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{A}$ be pairwise disjoint. Take $A = \bigcup_{i \in \{1, \dots, n\}} A_i$ and $B = A_{n+1}$, then $A \cup B = \bigcup_{i \in \{1, \dots, n+1\}} A_i$ and $A \cap B = (\bigcup_{i \in \{1, \dots, n\}} A_i) \cap A_{n+1} = \bigcup_{i \in \{1, \dots, n\}} (A_i \cap A_{n+1}) = \emptyset$. Hence we have

$$\begin{aligned} \mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) &= \mu(A \cup B) \\ &= \mu(A) + \mu(B) \\ &= \mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) + \mu(A_{n+1}) \\ &\stackrel{n \in \mathcal{S}}{=} \left(\sum_{i=1}^n \mu(A_i)\right) + \mu(A_{n+1}) \\ &= \sum_{i=1}^{n+1} \mu(A_i) \end{aligned}$$

proving that $n+1 \in \mathcal{S}$.

Using mathematical induction we have that $\mathbb{N} = \mathcal{S}$. So $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ pairwise disjoint we have $\mu(\bigcup_{i \in \{1, \dots, n+1\}} A_i) = \sum_{i=1}^n \mu(A_i)$

2.

$\Rightarrow$. Let $A, B \in \mathcal{A}$ then $\{A_i\}_{i \in \{1, \dots, 2\}}$ defined by $A_i = \begin{cases} A & \text{if } i = 1 \\ B & \text{if } i = 2 \end{cases}$ satisfies $\{A_i\}_{i \in \{1, \dots, 2\}} \subseteq \mathcal{A}$. So by assumption we have that

$$\mu(A \cup B) = \mu\left(\bigcup_{i \in \{1, \dots, 2\}} A_i\right) \leq \sum_{i=1}^2 \mu(A_i) = \mu(A_1) + \mu(A_2) = \mu(A) + \mu(B)$$

$\Leftarrow$. Let

$$\mathcal{S} = \left\{ n \in \mathbb{N}_0 \mid \forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \text{ we have } \mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) \leq \sum_{i=1}^n \mu(A_i) \right\}$$

then:

$1 \in \mathcal{S}$. Let $\{A_i\}_{i \in \{1, \dots, 1\}} \subseteq \mathcal{A}$ then $\mu(\bigcup_{i \in \{1, \dots, 1\}} A_i) = \mu(A_1) = \sum_{i=1}^1 \mu(A_i)$ proving that $1 \in \mathcal{S}$

$n \in \mathcal{S} \Rightarrow n+1 \in \mathcal{S}$. Let $\{A_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{A}$ pairwise disjoint. Take $A = \bigcup_{i \in \{1, \dots, n\}} A_i$ and $B = A_{n+1}$, then $A \cup B = \bigcup_{i \in \{1, \dots, n+1\}} A_i$. Hence we have

$$\begin{aligned} \mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) &= \mu(A \cup B) \\ &\leq \mu(A) + \mu(B) \\ &= \mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) + \mu(A_{n+1}) \\ &\leq_{n \in \mathcal{S}} \left(\sum_{i=1}^n \mu(A_i)\right) + \mu(A_{n+1}) \\ &= \sum_{i=1}^{n+1} \mu(A_i) \end{aligned}$$

proving that $n+1 \in \mathcal{S}$.

Using mathematical induction we have that $\mathbb{N} = \mathcal{S}$. So $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ we have $\mu(\bigcup_{i \in \{1, \dots, n+1\}} A_i) \leq \sum_{i=1}^n \mu(A_i)$ $\square$

Theorem 21.90. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then if $\mu: \mathcal{A} \rightarrow [0, \infty]$ satisfies:

1. $\mu(\emptyset) = 0$
2. μ is countable additive

then μ is additive.

Proof. This was actually proved in [theorem: 21.90]. $\square$

Definition 21.91. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then $\mu: \mathcal{A} \rightarrow [0, \infty]$ is a measure on $\mathcal{A}$ if

1. $\mu(\emptyset) = 0$
2. For every **pairwise disjoint** $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \mu(A_i)$$

[in other word μ is countable additive].

A trivial example of a measure is the following.

Example 21.92. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then $\mu: \mathcal{A} \rightarrow [0, \infty]$ defined by $\mu(A) = 0$ is a measure on $\mathcal{A}$.

Proof. We have

1. $\mu(\emptyset) = 0$
2. If $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ then $\sum_{i=1}^{\infty} \mu(A_i) = \sum_{i=1}^{\infty} 0 \underset{[\text{example: 20.96}]}{=} 0 = \mu(\bigcup_{i \in \mathbb{N}} A_i)$ $\square$

Definition 21.93. (Measure Space) A measure space is a triple $\langle X, \mathcal{A}, \mu \rangle$ where X is a non empty set, $\mathcal{A}$ is a σ -algebra on X and $\mu: \mathcal{A} \rightarrow [0, \infty]$ is a measure on $\mathcal{A}$.

Theorem 21.94. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ then there exist a **pairwise disjoint family** $\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ such that

$$\forall i \in \mathbb{N} \text{ we have } B_i \subseteq A_i$$

and

$$\bigcup_{i \in \mathbb{N}} A_i = \bigsqcup_{i \in \mathbb{N}} B_i$$

Proof. Using [lemma: 21.5] we have for $\{B_i\}_{i \in \mathbb{N}}$ defined by

$$B_i = \begin{cases} A_1 & \text{if } i = 1 \\ A_i \setminus \bigcup_{j \in \{1, \dots, i-1\}} A_j & \text{if } i \in \{2, \dots, \infty\} \end{cases}$$

that

$$\forall i \in \mathbb{N} \text{ we have } B_i \subseteq A_i$$

$$\bigcup_{i \in \mathbb{N}} B_i = \bigcup_{i \in \mathbb{N}} A_i$$

and

$$\forall i, j \in \mathbb{N} \text{ with } i \neq j \text{ then } B_i \cap B_j = \emptyset$$

Let $i \in \mathbb{N}$ then we have either:

$$i = 1. \text{ Then } B_i = B_1 = A_1 \in \mathcal{A}$$

$$1 < i. \text{ Then by [theorems: 21.33, 21.28] } B_i = A_i \setminus \bigcup_{j \in \{1, \dots, i-1\}} A_j \in \mathcal{A}$$

so that

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$$

□

Theorem 21.95. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then for every $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ we have

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \leq \sum_{i=1}^{\infty} \mu(A_i)$$

Proof. Using [theorem: 21.94] there exists a **pairwise disjoint family** $\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ such that

$$\forall i \in \mathbb{N} \ B_i \subseteq A_i \text{ and } \bigcup_{i \in \mathbb{N}} B_i = \bigcup_{i \in \mathbb{N}} A_i \quad (21.106)$$

So

$$\begin{aligned} \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) & \stackrel{[\text{eq: 21.106}]}{=} \mu\left(\bigsqcup_{i \in \mathbb{N}} B_i\right) \\ & = \sum_{i=1}^{\infty} \mu(B_i) \\ & \stackrel{[\text{eq: 21.106}] \wedge [\text{theorem: 20.98}]}{\leq} \sum_{i=1}^{\infty} \mu(A_i) \end{aligned}$$

□

Corollary 21.96. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $n \in \mathbb{N}$ then for every $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ we have

$$\mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) \leq \sum_{i=1}^n \mu(A_i)$$

Proof. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \begin{cases} A_i & \text{if } i \in \{1, \dots, n\} \\ \emptyset & \text{if } i \in \mathbb{N} \setminus \{1, \dots, n\} \end{cases}$$

then we have

$$\begin{aligned}
 \mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) &= \mu\left(\left(\bigcup_{i \in \{1, \dots, n\}} B_i\right) \cup \emptyset\right) \\
 &= \mu\left(\left(\bigcup_{i \in \{1, \dots, n\}} B_i\right) \cup \left(\bigcup_{i \in \mathbb{N} \setminus \{1, \dots, n\}} B_i\right)\right) \\
 &\stackrel{[\text{theorem: 2.128}]}{=} \mu\left(\bigcup_{i \in \{1, \dots, n\}} B_i\right) \\
 &\stackrel{[\text{theorem: 21.95}]}{\leq} \sum_{i=1}^{\infty} \mu(B_i) \\
 &\stackrel{[\text{theorem: 20.99}]}{=} \sum_{i=1}^n \mu(B_i) + \sum_{i=n+1}^{\infty} \mu(B_i) \\
 &= \sum_{i=1}^n \mu(A_i)
 \end{aligned}$$

□

Once we have defined a measure space we can define σ -finite sets and σ -finite measures.

Definition 21.97. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $A \subseteq X$ is **σ -finite under μ** if there exist a $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N} \mu(A_i) < \infty$ such that $A = \bigcup_{i \in \mathbb{N}} A_i$.

We can refine the above condition to disjoint sets or increasing sets.

Theorem 21.98. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $A \subseteq X$ then we have:

A is σ -finite under $\mu \Leftrightarrow \exists \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ pairwise disjoint with $\forall i \in \mathbb{N} \mu(A_i) < \infty$ such that $A = \bigsqcup_{i \in \mathbb{N}} A_i$

Proof.

$\Rightarrow$. As A is σ -finite under μ there exist a $\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ such that $A = \bigcup_{i \in \mathbb{N}} B_i$. Define now

$$\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } A_i = \begin{cases} B_i & \text{if } i = 1 \\ A_i \setminus \bigcup_{j \in \{1, \dots, i-1\}} B_j & \text{if } i \in \mathbb{N} \setminus \{1\} \end{cases} \in \mathcal{A} \text{ and } \forall i \in \mathbb{N} A_i \subseteq B_i$$

then by [lemma: 21.5] we have that 0

$$\{A_i\}_{i \in \mathbb{N}} \text{ is pairwise disjoint and } \bigsqcup_{i \in \mathbb{N}} A_i = \bigcup_{i \in \mathbb{N}} B_i = A$$

Further, as $\forall i \in \mathbb{N}$ we have $A_i \subseteq B_i$, it follows that $\mu(A_i) \leq \mu(B_i) < \infty$.

$\Leftarrow$. This is trivial. □

Theorem 21.99. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $A \subseteq X$ then we have:

$$\begin{aligned}
 &A \text{ is } \sigma\text{-finite under } \mu \\
 &\quad \Updownarrow \\
 &\exists \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ with } \forall i \in \mathbb{N} \mu(A_i) \leq \mu(A_{i+1}) \wedge \mu(A_i) < \infty \text{ such that } A = \bigcup_{i \in \mathbb{N}} A_i
 \end{aligned}$$

Proof.

$\Rightarrow$. As A is σ -finite there exist a $\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ such that $A = \bigcup_{i \in \mathbb{N}} B_i$. Define now

$$\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } A_i = \bigcup_{j \in \{1, \dots, i\}} B_j \stackrel{[\text{theorem: 21.36}]}{\in} \mathcal{A}$$

Using [lemma: 21.6] it follows that

$$\forall i \in \mathbb{N} \ A_i \subseteq A_{i+1} \text{ and } \bigcup_{i \in \mathbb{N}} A_i = \bigcup_{i \in \mathbb{N}} B_i = A$$

Finally we have also

$$\forall i \in \mathbb{N} \text{ that } \mu(A_i) = \mu\left(\bigcup_{j \in \{1, \dots, i\}} B_j\right) \underset{[\text{corollary: 21.96}]}{\leq} \sum_{j=1}^i \mu(B_j) < \infty$$

$\Leftarrow$. This is trivial

□

Definition 21.100. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then a measure $\mu: \mathcal{A} \rightarrow [0, \infty]$ is a **σ -finite measure** if X is σ -finite. In other words μ is σ -finite if there exists a $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N} \ \mu(A_i) < \infty$ such that $X = \bigcup_{i \in \mathbb{N}} A_i$.

We look now at new ways of defining new measures based on existing measures.

Theorem 21.101. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then we have:

1. If $\mu_1: \mathcal{A} \rightarrow [0, \infty]$ and $\mu_2: \mathcal{A} \rightarrow [0, \infty]$ are measures on $\mathcal{A}$ then

$$\mu_1 + \mu_2: \mathcal{A} \rightarrow [0, \infty] \text{ defined by } (\mu_1 + \mu_2)(A) = \mu_1(A) + \mu_2(A)$$

is a measure on $\mathcal{A}$.

2. If $\mu: \mathcal{A} \rightarrow [0, \infty]$ is a measure on $\mathcal{A}$ and $\alpha \in [0, \infty]$ then

$$\alpha \cdot \mu: \mathcal{A} \rightarrow [0, \infty] \text{ defined by } (\alpha \cdot \mu)(A) = \alpha \cdot \mu(A)$$

is a measure on $\mathcal{A}$.

3. If $\mu: \mathcal{A} \rightarrow [0, \infty]$ is a measure and $B \in \mathcal{A}$ then

$$\mu_{[B]}: \mathcal{A} \rightarrow [0, \infty] \text{ defined by } \mu_{[B]}(A) = \mu(A \cap B)$$

is a measure on $\mathcal{A}$.

Note 21.102. As $A, B \in \mathcal{A}$ we have $A \cap B \in \mathcal{A}$ so that μ_B is well defined.

Proof.

1. First we have

$$(\mu_1 + \mu_2)(\emptyset) = \mu_1(\emptyset) + \mu_2(\emptyset) = 0 + 0 = 0$$

Secondly if $\{A_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{A}$ is pairwise disjoint then

$$\begin{aligned} (\mu_1 + \mu_2)\left(\bigsqcup_{i \in \mathbb{N}_0} A_i\right) &= \mu_1\left(\bigsqcup_{i \in \mathbb{N}_0} A_i\right) + \mu_2\left(\bigsqcup_{i \in \mathbb{N}_0} A_i\right) \\ &= \sum_{i=1}^{\infty} \mu_1(A_i) + \sum_{i=1}^{\infty} \mu_2(A_i) \\ &\underset{[\text{theorem: 20.98}]}{=} \sum_{i=1}^{\infty} (\mu_1(A_i) + \mu_2(A_i)) \\ &= \sum_{i=1}^{\infty} (\mu_1 + \mu_2)(A_i) \end{aligned}$$

proving that $\mu_1 + \mu_2$ is a measure.

2. First we have

$$(\alpha \cdot \mu)(\emptyset) = \alpha \cdot \mu(\emptyset) = \alpha \cdot 0 = 0$$

Secondly if $\{A_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{A}$ is pairwise disjoint then

$$\begin{aligned} (\alpha \cdot \mu) \left(\bigsqcup_{i \in \mathbb{N}_0} A_i \right) &= \alpha \cdot \mu \left(\bigsqcup_{i \in \mathbb{N}_0} A_i \right) \\ &= \alpha \cdot \sum_{i=1}^{\infty} \mu(A_i) \\ &\stackrel{[\text{theorem: 20.98}]}{=} \sum_{i=1}^{\infty} (\alpha \cdot \mu(A_i)) \\ &= \sum_{i=1}^{\infty} (\alpha \cdot \mu)(A_i) \end{aligned}$$

proving that $\alpha \cdot \mu$ is a measure.

3. First we have

$$\mu_{[B]}(\emptyset) = \mu(\emptyset \cap B) = \mu(\emptyset) = 0$$

Secondly if $\{A_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{A}$ is pairwise disjoint then

$$\mu_{[B]} \left(\bigsqcup_{i \in \mathbb{N}} A_i \right) = \mu \left(\left(\bigsqcup_{i \in \mathbb{N}} A_i \right) \cap B \right) = \mu \left(\bigsqcup_{i \in \mathbb{N}} (A_i \cap B) \right) = \sum_{i=1}^{\infty} \mu(A_i \cap B) = \sum_{i=1}^{\infty} \mu_{[B]}(A_i)$$

□

Theorem 21.103. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and let $\mathcal{B}$ a σ -algebra on X such that $\mathcal{B} \subseteq \mathcal{A}$ then $\langle X, \mathcal{B}, \mu_{|\mathcal{B}} \rangle$ is a measure space where $\mu_{|\mathcal{B}}$ is the restriction of μ to $\mathcal{B}$ defined by

$$\mu_{|\mathcal{B}}: \mathcal{B} \rightarrow [0, \infty] \text{ where } \mu_{|\mathcal{B}}(B) = \mu(B)$$

Proof. As $\mathcal{B}$ is already a σ -algebra on X we only have to proof that $\mu_{|\mathcal{B}}$ is a measure on $\mathcal{B}$.

1. As $\emptyset \in \mathcal{B} \subseteq \mathcal{A}$ we have $\mu_{|\mathcal{B}}(\emptyset) = \mu(\emptyset) = 0$
2. If $\{A_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{B} \subseteq \mathcal{A}$ is a pairwise disjoint family then

$$\mu_{|\mathcal{B}} \left(\bigsqcup_{i \in \mathbb{N}_0} A_i \right) = \mu \left(\bigsqcup_{i \in \mathbb{N}_0} A_i \right) = \sum_{i=1}^{\infty} \mu(A_i) = \sum_{i=1}^{\infty} \mu_{|\mathcal{B}}(A_i) \quad \square$$

Theorem 21.104. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $A \in \mathcal{A}$ and define

$$\mathcal{A}_{|A} = \{B \in \mathcal{A} \mid B \subseteq A\} \subseteq \mathcal{A}$$

$$\mu_{|\mathcal{A}_{|A}}: \mathcal{A}_{|A} \rightarrow [0, \infty] \text{ by } \mu_{|\mathcal{A}_{|A}}(B) = \mu(B)$$

then we have that

1. $\mathcal{A}_{|A} = \{A \cap B \mid B \in \mathcal{A}\}$
2. $\mathcal{A}_{|A}$ is a σ -algebra on A
3. $\mu_{|\mathcal{A}_{|A}}$ is a measure on $\mathcal{A}_{|A}$ making $\langle A, \mathcal{A}_{|A}, \mu_{|\mathcal{A}_{|A}} \rangle$ a measure space

Measure spaces of the form $\langle A, \mathcal{A}_{|A}, \mu_{|\mathcal{A}_{|A}} \rangle$ are called **measure subspaces of** $\langle X, \mathcal{A}, \mu \rangle$

Note 21.105. If $A = X$ then $\mathcal{A}_{|X} = \{X \cap B \mid B \in \mathcal{A}\} = \mathcal{A}$ so that $\mu_{|\mathcal{A}_{|X}} = \mu$, in other words we have that $\langle X, \mathcal{A}_{|X}, \mu_{|\mathcal{A}_{|X}} \rangle = \langle X, \mathcal{A}, \mu \rangle$.

Proof. Using [theorem: 21.41] it follows that

$$\mathcal{A}_{|A} = \{B \cap A \mid B \in \mathcal{A}\} \text{ and } \mathcal{A}_{|A} \text{ is a } \sigma\text{-algebra}$$

As additional $\mathcal{A}_{|B} \subseteq \mathcal{A}$ it follows from the previous theorem [theorem: 21.103] that $\mu_{|\mathcal{A}_{|A}}$ is a measure on $\mathcal{A}_{|A}$. □

Theorem 21.106. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then

1. $\forall A, B \in \mathcal{A}$ with $A \subseteq B$ we have $\mu(A) \leq \mu(B)$

2. $\forall A, B \in \mathcal{A}$ with $A \subseteq B$ and $\mu(A) < \infty$ we have $\mu(B \setminus A) = \mu(B) - \mu(A)$

Proof.

1. If $A \subseteq B$ then $A \cap (B \setminus A) = \emptyset$ and $B = A \cup (B \setminus A)$ so that by [theorem: 21.90] we have

$$\mu(B) = \mu(A) + \mu(B \setminus A)$$

Further as $0 \leq \mu(B \setminus A)$ we have by [theorem: 20.34] that $\mu(A) \leq \mu(B)$.

2. If $A \subseteq B$ and $\mu(A) < \infty$ then as $0 \leq \mu(A)$ we have that $\mu(A) \in \mathbb{R}$, further by (1)

$$\mu(B) = \mu(A) + \mu(B \setminus A)$$

so that by [theorem: 20.28] $\mu(B \setminus A) = \mu(B) - \mu(A)$. $\square$

Definition 21.107. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then μ is a **finite measure** if $\mu(X) < \infty$

We have the following equivalent definition of a finite measure.

Theorem 21.108. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space

$$\mu \text{ is a finite measure} \Leftrightarrow \forall A \in \mathcal{A} \text{ we have } \mu(A) < \infty$$

Proof.

$\Rightarrow$. If $A \in \mathcal{A}$ then $A \subseteq X$ so that by [theorem: 21.106] $\mu(A) \leq \mu(X) < \infty$.

$\Leftarrow$. If $\forall A \in \mathcal{A} \mu(A) < \infty$ we have as $X \in \mathcal{A}$ that $\mu(X) < \infty$. $\square$

Theorem 21.109. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then

1. If $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ satisfies $\forall i \in \mathbb{N} A_i \subseteq A_{i+1}$ then

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \lim_{i \rightarrow \infty} \mu(A_i) = \sup\{\mu(A_i) | i \in \mathbb{N}\}$$

2. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ satisfies $\forall i \in \mathbb{N} A_{i+1} \subseteq A_i$ and $\exists k \in \mathbb{N}$ such that $\mu(A_k) < \infty$ then

$$\mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) = \lim_{i \rightarrow \infty} \mu(A_i) = \inf\{\mu(A_i) | i \in \mathbb{N}\}$$

Proof.

1. Define

$$\{B_i\}_{i \in \mathbb{N}} \text{ by } B_i = \begin{cases} A_1 & \text{if } i = 1 \\ A_i \setminus A_{i-1} & \text{if } i \in \{2, \dots, \infty\} \end{cases} \in \mathcal{A}$$

Let $i, j \in \mathbb{N}$ with $i \neq j$ then we may always assume that $i < j$ [otherwise exchange i and j]. Assume that $x \in B_i \cap B_j$ then we have for i either:

$i = 1$. Then $1 = i < j \Rightarrow 1 \leq j - 1$ so that $x \in B_i = B_1 = A_1 \subseteq A_{j-1}$. Further as $x \in B_j = A_j \setminus A_{j-1}$ we have $x \notin A_{j-1}$ contradicting that we have also $x \in A_{j-1}$.

$1 < i$. Then $i < j \Rightarrow i \leq j - 1$ so that $A_i \subseteq A_{j-1}$. As $x \in B_i = A_i \setminus A_{i-1}$ it follows that $x \in A_i \Rightarrow x \in A_{j-1}$ but as $x \in B_j = A_j \setminus A_{j-1}$ we have that $x \notin A_{j-1}$ hence we have a contradiction.

so the assumption must be wrong proving that $B_i \cap B_j = \emptyset$. Hence

$$\forall i, j \in \mathbb{N} \text{ we have } B_i \cap B_j = \emptyset \quad (21.107)$$

Next if $n \in \mathbb{N}$ then $\forall i \in \{1, \dots, n\}$ we have that $B_i = \begin{cases} A_1 \subseteq A_i & \text{if } i = 1 \\ A_i \setminus A_{i-1} \subseteq A_i & \text{if } i \in \{2, \dots, \infty\} \end{cases} \subseteq A_i \subseteq A_n$ so that

$$\bigcup_{i \in \{1, \dots, n\}} B_i \subseteq A_n \quad (21.108)$$

Further if $x \in A_n$ then $n \in \{i \in \{1, \dots, n\} | x \in A_i\} \subseteq \{1, \dots, n\}$ so that $m = \min(\{i \in \{1, \dots, n\} | x \in A_i\})$ exists. We have now two cases to consider for m :

$m = 1$. then $x \in A_1 = B_1 \subseteq \bigcup_{i \in \{1, \dots, n\}} B_i$

$1 < m$. then $x \notin A_{m-1}$ and $x \in A_m$ so that $x \in A_m \setminus A_{m-1} = B_m \subseteq \bigcup_{i \in \{1, \dots, n\}} B_i$

proving that $A_n \subseteq \bigcup_{i \in \{1, \dots, n\}} B_i$ which by [eq: 21.108] gives $A_n = \bigcup_{i \in \{1, \dots, n\}} B_i$. Hence

$$\forall n \in \mathbb{N} \text{ we have } A_n = \bigsqcup_{i \in \{1, \dots, n\}} B_i \quad (21.109)$$

From the above it follows that $\forall n \in \mathbb{N} A_n \subseteq \bigcup_{i \in \{1, \dots, n\}} B_i \subseteq \bigcup_{i \in \mathbb{N}} B_i$ proving that $\bigcup_{n \in \mathbb{N}} A_n \subseteq \bigcup_{n \in \mathbb{N}} B_n$, further $\forall i \in \mathbb{N}$ we have $B_i = \begin{cases} A_1 \subseteq A_i & \text{if } i = 1 \\ A_i \setminus A_{i-1} \subseteq A_i & \text{if } i \in \{2, \dots, \infty\} \end{cases} \subseteq A_i$ so that $\bigcup_{i \in \mathbb{N}} B_i \subseteq \bigcup_{i \in \mathbb{N}} A_i$. Hence we have taking in account [eq: 21.107]

$$\bigcup_{i \in \mathbb{N}} A_i = \bigsqcup_{i \in \mathbb{N}} B_i \quad (21.110)$$

Next we have

$$\begin{aligned} \mu\left(\bigcup_{i \in \mathbb{N}_0} A_i\right) &= \mu\left(\bigsqcup_{i \in \mathbb{N}_0} B_i\right) \\ &= \sum_{i=1}^{\infty} \mu(B_i) \\ &\stackrel{\text{def}}{=} \lim_{n \rightarrow \infty} \left(\sum_{i=1}^n \mu(B_i) \right) \\ &\stackrel{[\text{theorem: 21.90}]}{=} \lim_{n \rightarrow \infty} \left(\mu\left(\bigsqcup_{i \in \{1, \dots, n\}} B_i\right) \right) \\ &\stackrel{21.109}{=} \lim_{n \rightarrow \infty} \mu(A_n) \end{aligned}$$

So that

$$\mu\left(\bigcup_{i \in \mathbb{N}_0} A_i\right) = \lim_{n \rightarrow \infty} \mu(A_n)$$

As $\forall i \in \mathbb{N}$ we have $A_i \subseteq A_{i+1} \stackrel{[\text{theorem: 21.106}]}{\Rightarrow} \mu(A_i) \leq \mu(A_{i+1})$ so that by [theorem: 20.91]

$$\lim_{n \rightarrow \infty} \mu(A_n) = \sup(\{\mu(A_n) | n \in \mathbb{N}\})$$

2. First we consider the cases where $k = 1$. Then $\forall i \in \mathbb{N}$ we have $A_i \subseteq A_1$ so that by [theorem: 21.106] $\mu(A_i) \leq \mu(A_1) < \infty$ proving that

$$\forall i \in \mathbb{N} \text{ we have } \mu(A_i) < \infty \quad (21.111)$$

Define $\{B_i\}_{i \in \mathbb{N}}$ by $B_i = A \setminus A_i$. Let $i \in \mathbb{N}$ then for $x \in B_i$ we have $x \in A_1 \wedge x \notin A_i \supseteq A_{i+1}$ so that $x \in A_1 \setminus A_{i+1} = B_{i+1}$. Hence we have

$$\forall i \in \mathbb{N} B_i \subseteq B_{i+1} \quad (21.112)$$

So using (1) it follows that

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \lim_{i \rightarrow \infty} \mu(B_i) \quad (21.113)$$

Now

$$\begin{aligned} A_1 \setminus \left(\bigcup_{i \in \mathbb{N}} B_i\right) &\stackrel{[\text{theorem: 2.132}]}{=} \bigcap_{i \in \mathbb{N}} (A_1 \setminus B_i) \\ &= \bigcap_{i \in \mathbb{N}} (A_1 \setminus (A_1 \setminus A_i)) \\ &\stackrel{A_i \subseteq A_1 \wedge [\text{theorem: 2.132}]}{=} \bigcap_{i \in \mathbb{N}} A_i \end{aligned} \quad (21.114)$$

As $\forall i \in \mathbb{N} \ B_i = A_1 \setminus A_i \subseteq A_1$ it follows that

$$\mu(B_i) \underset{[\text{theorem: 21.106}]}{\leq} \mu(A_1) < \infty \quad (21.115)$$

and $\bigcup_{i \in \mathbb{N}} B_i \subseteq A_1$ so that

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \underset{[\text{theorem: 21.106}]}{\leq} \mu(A_1) < \infty \quad (21.116)$$

Next

$$\begin{aligned} \mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) & \underset{[\text{eq: 21.114}]}{=} \mu\left(A_1 \setminus \left(\bigcup_{i \in \mathbb{N}} B_i\right)\right) \\ & \underset{[\text{eq: 21.116}] \wedge [\text{theorem: 21.106}]}{=} \mu(A_1) - \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \\ & \underset{[\text{eq: 21.113}]}{=} \mu(A_1) - \lim_{i \rightarrow \infty} \mu(B_i) \\ & = \mu(A_1) - \lim_{i \rightarrow \infty} \mu(A_1 \setminus A_i) \\ & \underset{[\text{eq: 21.115}] \wedge [\text{theorem: 21.106}]}{=} \mu(A_1) - \lim_{i \rightarrow \infty} (\mu(A_1) - \mu(A_i)) \\ & \underset{[\text{theorems: 20.84, 20.73}]}{=} \mu(A_1) - \left(\mu(A_1) - \lim_{i \rightarrow \infty} \mu(A_i)\right) \\ & = \lim_{i \rightarrow \infty} \mu(A_i) \end{aligned}$$

hence we have that

$$\forall \{A_i\}_{i \in \mathbb{N}} \text{ with } \mu(A_1) < \infty \text{ and } \forall i \in \mathbb{N} \ A_{i+1} \subseteq A_i \text{ we have } \mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) = \lim_{i \rightarrow \infty} \mu(A_i) \quad (21.117)$$

Next we proof the general case where $1 < k$. Define $\{C_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ by $C_i = A_{i+(k-1)}$ then we have as $\mu(A_k) < \infty$ that $\mu(C_1) = A_{1+(k-1)} = A_1 < \infty$. Further $\forall i \in \mathbb{N}$ we have that $C_{i+1} = A_{(i+(k-1))+1} \subseteq A_{i+(k-1)} = C_i$. So all conditions of [eq: 21.117] are satisfied and we have that

$$\mu\left(\bigcap_{i \in \mathbb{N}} C_i\right) = \lim_{i \rightarrow \infty} \mu(C_i)$$

As $\lim_{i \rightarrow \infty} \mu(C_i) = \lim_{i \rightarrow \infty} \mu(A_{i+(k-1)}) \underset{[\text{theorem: 20.83}]}{=} \lim_{i \rightarrow \infty} \mu(A_i)$ so that we have

$$\mu\left(\bigcap_{i \in \mathbb{N}} C_i\right) = \lim_{i \rightarrow \infty} \mu(A_i) \quad (21.118)$$

Let $x \in \bigcap_{i \in \mathbb{N}} A_i$. Then $\forall i \in \mathbb{N}$ we have, as $i + (k-1) \in \mathbb{N}$ [because $1 < k$], that $x \in A_{i+(k-1)} = C_i$ hence

$$\bigcap_{i \in \mathbb{N}} A_i \subseteq \bigcap_{i \in \mathbb{N}} C_i \quad (21.119)$$

Let $x \in \bigcap_{i \in \mathbb{N}} C_i$. Let $i \in \mathbb{N}$ then we have for i either:

$i \in \{1, \dots, k-1\}$. Then $x \in C_1 = A_{1+(k-1)} = A_k \subseteq A_i$ so that $x \in A_i$.

$i \in \{k, \dots, \infty\}$. Then $i - (k-1) \in \mathbb{N}$ so that $x \in C_{i-(k-1)} = A_{(i-(k-1))+(k-1)} = A_i$ hence $x \in A_i$

as $i \in \mathbb{N}$ was chosen arbitrary it follows that $x \in \bigcap_{i \in \mathbb{N}} A_i$. Hence $\bigcap_{i \in \mathbb{N}} C_i \subseteq \bigcap_{i \in \mathbb{N}} A_i$ which combined with [eq: 21.119] proves that

$$\bigcap_{i \in \mathbb{N}} A_i = \bigcap_{i \in \mathbb{N}} C_i \quad (21.120)$$

So combining [eq: 21.118] and [eq: 21.120] it follows that

$$\mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) = \lim_{i \rightarrow \infty} \mu(A_i)$$

which proves the case $1 < k$. $\square$

The above theorem has the following inverse which provides ways to prove if a set function is actually a measure.

Theorem 21.110. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \rightarrow [0, \infty]$ a function that satisfies:*

1. $\mu(\emptyset) = 0$
2. *If $n \in \mathbb{N}$, $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ is a **pairwise disjoint family** then*

$$\mu\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^n \mu(A_i)$$

then we have:

1. *If $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ that satisfies $\forall i \in \mathbb{N} A_i \subseteq A_{i+1}$ we have that $\lim_{i \rightarrow \infty} \mu(A_i)$ exists and $\mu(\bigcup_{i \in \mathbb{N}} A_i) = \lim_{i \rightarrow \infty} \mu(A_i)$ then μ is a measure on $\mathcal{A}$.*
2. *If $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ that satisfies $\forall i \in \mathbb{N} A_{i+1} \subseteq A_i$ and $\bigcap_{i \in \mathbb{N}} A_i = \emptyset$ we have that $\lim_{i \rightarrow \infty} \mu(A_i)$ exists and $\mu(\bigcap_{i \in \mathbb{N}} A_i) = 0$ then μ is a measure on $\mathcal{A}$.*

Proof.

1. Let $\{A_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{A}$ be a pairwise disjoint family. Define

$$\{B_i\}_{i \in \mathbb{N}} \text{ by } B_i = \bigsqcup_{j \in \{1, \dots, i\}} A_j \in \mathcal{A}$$

then by [lemma: 21.6] we have that

$$\bigsqcup_{i \in \mathbb{N}} A_i = \bigcup_{i \in \mathbb{N}} B_i \text{ and } \forall i \in \mathbb{N} \text{ we have } B_i \subseteq B_{i+1} \quad (21.121)$$

Then by the hypothesis

$$\lim_{i \rightarrow \infty} B_i \text{ exist and } \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \lim_{i \rightarrow \infty} \mu(B_i) \quad (21.122)$$

Next

$$\begin{aligned} \mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &\stackrel{[\text{eq: 21.121}]}{=} \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \\ &\stackrel{[\text{eq: 21.122}]}{=} \lim_{i \rightarrow \infty} \mu(B_i) \\ &= \lim_{i \rightarrow \infty} \mu\left(\bigsqcup_{j \in \{1, \dots, i\}} A_j\right) \\ &\stackrel{\text{hypothesis}}{=} \lim_{i \rightarrow \infty} \left(\sum_{j=1}^i \mu(A_j)\right) \\ &\stackrel{\text{def}}{=} \sum_{j=1}^{\infty} \mu(A_j) \end{aligned}$$

proving countable additivity. Hence μ is a measure on $\mathcal{A}$.

2. Let $\{A_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{A}$ be a pairwise disjoint family. Define

$$\{B_i\}_{i \in \mathbb{N}} \text{ by } B_i = \bigsqcup_{j \in \{i+1, \dots, \infty\}} A_j \stackrel{[\text{theorem: 21.90}]}{\in} \mathcal{A}$$

Let $i \in \mathbb{N}$ then $B_{i+1} = \bigcup_{j \in \{i+2, \dots, \infty\}} A_j \subseteq \bigcup_{j \in \{i+1, \dots, \infty\}} A_j = B_i$ so that

$$\forall i \in \mathbb{N} \text{ we have } B_{i+1} \subseteq B_i$$

Let $x \in \bigcap_{i \in \mathbb{N}} B_i$ then $x \in B_1 = \bigcup_{j \in \{2, \dots, \infty\}} A_j$ so that $\exists k \in \{2, \dots, \infty\}$ such that $x \in A_k$, as $x \in \bigcap_{i \in \mathbb{N}} B_i$ we must have that $x \in B_k = \bigcup_{j \in \{k+1, \dots, \infty\}} A_j$ so that $\exists l \in \{k+1, \dots, \infty\}$ such that $x \in A_l$. Hence it follows that $x \in A_k \cap A_l \stackrel{k \neq l}{=} \emptyset$ leading to the contradiction $x \in \emptyset$. Hence we have that

$$\bigcap_{i \in \mathbb{N}} B_i = \emptyset$$

Let $i \in \mathbb{N}$ then $\bigsqcup_{j \in \mathbb{N}} A_j = (\bigsqcup_{j \in \{1, \dots, i\}} A_j) \cup (\bigsqcup_{j \in \{i+1, \dots, \infty\}} A_j)$. Assume $x \in (\bigsqcup_{j \in \{1, \dots, i\}} A_j) \cap (\bigsqcup_{j \in \{i+1, \dots, \infty\}} A_j)$ then there exist a $k \in \{1, \dots, i\}$ and a $l \in \{i+1, \dots, \infty\}$ such that $x \in A_k \wedge x \in A_l \Rightarrow x \in A_k \cap A_l \stackrel{k \neq l}{=} \emptyset$ leading to the contradiction $x \in \emptyset$. Hence we must have that $(\bigsqcup_{j \in \{1, \dots, i\}} A_j) \cap (\bigsqcup_{j \in \{i+1, \dots, \infty\}} A_j) = \emptyset$. By the hypothesis we have then

$$\begin{aligned} \mu\left(\bigcup_{j \in \mathbb{N}} A_j\right) &= \mu\left(\left(\bigsqcup_{j \in \{1, \dots, i\}} A_j\right) \sqcup \left(\bigsqcup_{j \in \{i+1, \dots, \infty\}} A_j\right)\right) \\ &\stackrel{\mu \text{ is finite additive}}{=} \mu\left(\bigsqcup_{j \in \{1, \dots, i\}} A_j\right) + \mu\left(\bigsqcup_{j \in \{i+1, \dots, \infty\}} A_j\right) \\ &\stackrel{\mu \text{ is finite additive}}{=} \sum_{j=1}^i \mu(A_j) + \mu\left(\bigsqcup_{j \in \{i+1, \dots, \infty\}} A_j\right) \\ &= \sum_{j=1}^i \mu(A_j) + \mu(B_i) \end{aligned} \quad (21.123)$$

By [definition: 20.94]

$$\lim_{i \rightarrow \infty} \sum_{j=1}^i \mu(A_j) \text{ exist and } \sum_{i=1}^{\infty} \mu(A_i) = \lim_{i \rightarrow \infty} \sum_{j=1}^i \mu(A_j) \quad (21.124)$$

and by the hypothesis

$$\lim_{i \rightarrow \infty} \mu(B_i) \text{ exist and } \lim_{i \rightarrow \infty} \mu(B_i) = 0 \quad (21.125)$$

Next we have

$$\begin{aligned} \mu\left(\bigcup_{j \in \mathbb{N}} A_j\right) &\stackrel{[\text{theorem: 20.73}]}{=} \lim_{i \rightarrow \infty} \left(\mu\left(\bigcup_{j \in \mathbb{N}} A_j\right) \right) \\ &\stackrel{[\text{eq: 21.123}]}{=} \lim_{i \rightarrow \infty} \left(\sum_{j=1}^i \mu(A_j) + \mu(B_i) \right) \\ &\stackrel{[\text{theorem: 20.84}] \wedge [\text{eqs: 21.124, 21.125}]}{=} \lim_{i \rightarrow \infty} \sum_{j=1}^i \mu(A_j) + \lim_{i \rightarrow \infty} \mu(B_i) \\ &\stackrel{[\text{eqs: 21.124, 21.125}]}{=} \sum_{i=1}^{\infty} \mu(A_i) + 0 \\ &= \sum_{i=1}^{\infty} \mu(A_i) \end{aligned}$$

So μ is countable additive proving that μ is a measure. □

21.3.2 Carathéodory Theorem

The Carathéodory theorem provides a general method for constructing a measure. Given a set X and a non negative set function on $\mathcal{P}(X)$ the Carathéodory theorem allows us to reduce $\mathcal{P}(X)$ to a σ -algebra on X such that the restriction of the set function to this σ -algebra is a measure on this σ -algebra. The idea is that $\mathcal{P}(X)$ is in general too big to be used as a σ -algebra on which we can define a measure. As the restriction of the set function is a measure it must satisfy some extra conditions. For example every σ -algebra contains $\emptyset$ and a measure must map $\emptyset$ to 0 so the set function on $\mathcal{P}(X)$ must also map $\emptyset$ to 0. This is the idea of an outer-measure.

Definition 21.111. (Outer Measure) Let X be a set then $\mu^*: \mathcal{P}(X) \rightarrow [0, \infty]$ is an **outer measure** on X if

1. $\mu^*(\emptyset) = 0$
2. For $A, B \in \mathcal{P}(X)$ with $A \subseteq B$ we have $\mu^*(A) \leq \mu^*(B)$ [in other words μ^* is monotone]
3. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{P}(X)$ we have $\mu^*(\bigcup_{i \in \mathbb{N}} A_i) \leq \sum_{i=1}^{\infty} \mu^*(A_i)$ [in other words μ^* is countable sub-additive]

It is easy to prove that an outer measure is finitely sub-additive.

Theorem 21.112. Let X be a set and $\mu^*: \mathcal{P}(X) \rightarrow [0, \infty]$ is an outer measure on X , $n \in \mathbb{N}$ and $\{A_i\}_{i \in \{1, \dots, n\}} \in \mathcal{P}(X)$ then $\mu^*(\bigcup_{i \in \{1, \dots, n\}} A_i) \leq \sum_{i=1}^n \mu^*(A_i)$

Proof. Define $\{C_i\}_{i \in \mathbb{N}} \subseteq \mathcal{P}(X)$ by $C_i = \begin{cases} A_i & \text{if } i \in \{1, \dots, n\} \\ \emptyset & \text{if } i \in \{n+1, \dots, \infty\} \end{cases}$ then we have

$$\begin{aligned}
 \mu^*\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) &= \mu^*\left(\bigcup_{i \in \{1, \dots, n\}} C_i\right) \\
 &\stackrel{\mu^* \text{ is an outer measure}}{\leq} \sum_{i=1}^{\infty} \mu^*(C_i) \\
 &\stackrel{[\text{theorem: 20.99}]}{=} \sum_{i=1}^n \mu^*(C_i) + \sum_{i=n+1}^{\infty} \mu^*(C_i) \\
 &= \sum_{i=1}^n \mu^*(A_i) + \sum_{i=n+1}^{\infty} 0 \\
 &\stackrel{[\text{theorem: 20.96}]}{=} \sum_{i=1}^n \mu^*(A_i)
 \end{aligned}$$

□

We need now to reduce $\mathcal{P}(X)$ to a σ -algebra in such a way that the restriction of the outer-measure to this σ -algebra becomes a measure. This is the idea of μ^* -measurable sets.

Definition 21.113. (μ^* -measurable sets) Let X be a set and $\mu^*: \mathcal{P}(X) \rightarrow [0, \infty]$ an outer measure on X then $A \in \mathcal{P}(X)$ is μ^* -measurable if

$$\forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) = \mu^*(B \cap A) + \mu^*(B \setminus A)$$

The set of all μ^* -measurable sets in $\mathcal{P}(X)$ is noted as $\mathcal{M}[\mu^*]$, hence

$$\mathcal{M}[\mu^*] = \{A \in \mathcal{P}(X) \mid \forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) = \mu^*(B \cap A) + \mu^*(B \setminus A)\}$$

Using the properties of an outer-measure we can simplify the above definition.

Theorem 21.114. Let X be a set and $\mu^*: \mathcal{P}(X) \rightarrow [0, \infty]$ and $A \in \mathcal{P}(X)$ then we have

$$A \text{ is } \mu^*\text{-measurable} \Leftrightarrow \forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) \geq \mu^*(B \cap A) + \mu^*(B \setminus A)$$

Hence we have the following alternative definition for $\mathcal{M}[\mu^*]$

$$\mathcal{M}[\mu^*] = \{A \in \mathcal{P}(X) \mid \forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) \geq \mu^*(B \cap A) + \mu^*(B \setminus A)\}$$

Proof.

$\Rightarrow$. This is trivial as $\mu^*(B) = \mu^*(B \cap A) + \mu^*(B \setminus A)$ implies $\mu^*(B) \geq \mu^*(B \cap A) + \mu^*(B \setminus A)$.

$\Leftarrow$. Let $B \in \mathcal{P}(X)$ then as $B = (B \cap A) \cup (B \setminus A)$ we have by [theorem: 21.112] that $\mu^*(B) \leq \mu^*(B \cap A) + \mu^*(B \setminus A)$, combining this with the hypothesis it follows that

$$\mu^*(B) = \mu^*(B \cap A) + \mu^*(B \setminus A) \quad \square$$

Theorem 21.115. Let X be a set, $\mu^*: \mathcal{P}(X) \rightarrow [0, \infty]$ a outer measure and $A \in \mathcal{P}(X)$ then

1. If $\mu^*(A) = 0$ then $A \in \mathcal{M}[\mu^*]$.
2. If $\mu^*(X \setminus A) = 0$ then $A \in \mathcal{M}[\mu^*]$.

Proof.

1. Let $B \in \mathcal{P}(X)$ then as $B \cap A \subseteq A$ we have $\mu^*(B \cap A) \leq \mu^*(A) = 0$ so that $\mu^*(B \cap A) = 0$, further as $B \setminus A \subseteq B$ we have $\mu^*(B \setminus A) \leq \mu^*(B)$. Hence it follows that $\forall B \in \mathcal{P}(X)$ we have

$$\mu^*(B \cap A) + \mu^*(B \setminus A) \leq \mu^*(B)$$

proving by the previous theorem [theorem: 21.114] that $A \in \mathcal{M}[\mu^*]$.

2. Let $B \in \mathcal{P}(X)$ then as $B \setminus A \subseteq X \setminus A$ we have $\mu^*(B \setminus A) \leq \mu^*(X \setminus A) = 0$ so that $\mu^*(B \setminus A) = 0$, further as $B \cap A \subseteq B$ we have $\mu^*(B \cap A) \leq \mu^*(B)$. Hence it follows that

$$\mu^*(B \cap A) + \mu^*(B \setminus A) \leq \mu^*(B)$$

proving by the previous theorem [theorem: 21.114] that $A \in \mathcal{M}[\mu^*]$. $\square$

We prove now that $\mathcal{M}[\mu^*]$ is a σ -algebra and the restriction of μ^* on $\mathcal{M}[\mu^*]$ is a measure on $\mathcal{M}[\mu^*]$.

Theorem 21.116. (Carathéodory Theorem) Let X be a set and $\mu^*: \mathcal{P}(X) \rightarrow [0, \infty]$ a outer measure on X then we have:

1. $\mathcal{M}[\mu^*]$ is a σ -algebra on X .
2. $(\mu^*)|_{\mathcal{M}[\mu^*]}: \mathcal{M}[\mu^*] \rightarrow [0, \infty]$ is a measure on $\mathcal{M}[\mu^*]$.

Proof.

1. Let $B \in \mathcal{P}(X)$ then

$$\mu^*(B) = \mu^*(B \cap X) + 0 = \mu^*(B \cap X) + \mu^*(\emptyset) = \mu^*(B \cap X) + \mu^*(B \setminus X)$$

proving that

$$X \in \mathcal{M}[\mu^*] \quad (21.126)$$

If $A \in \mathcal{M}[\mu^*]$ then for $B \in \mathcal{P}(X)$ we have

$$\begin{aligned} \mu^*(B \cap (X \setminus A)) + \mu^*(B \setminus (X \setminus A)) &\stackrel{B \subseteq X \wedge [\text{theorem: 1.33 (6)}]}{=} \mu^*(B \cap (X \setminus A)) + \mu^*(B \cap A) \\ &\stackrel{B \subseteq X \wedge [\text{theorem: 1.33 (8)}]}{=} \mu^*(B \setminus A) + \mu^*(B \cap A) \\ &\stackrel{A \in \mathcal{M}[\mu^*]}{=} \mu^*(B) \end{aligned}$$

so that $X \setminus A \in \mathcal{M}[\mu^*]$. Hence we have

$$\forall A \in \mathcal{M}[\mu^*] \text{ we have } X \setminus A \in \mathcal{M}[\mu^*] \quad (21.127)$$

Let $A, B \in \mathcal{M}[\mu^*]$ then for $C \in \mathcal{P}(X)$ we have

$$\begin{aligned}
 \mu^*(C \cap (A \cup B)) & \stackrel{A \in \overline{\mathcal{M}}[\mu^*]}{=} \mu^*((C \cap (A \cup B)) \cap A) + \mu^*((C \cap (A \cup B)) \setminus A) \\
 & = \mu^*(C \cap ((A \cup B) \cap A)) + \mu^*((C \cap (A \cup B)) \setminus A) \\
 & = \mu^*(C \cap A) + \mu^*((C \cap (A \cup B)) \setminus A) \\
 & \stackrel{[\text{theorem: 1.25 (7)}]}{=} \mu^*(C \cap A) + \mu^*(C \cap ((A \cup B) \setminus A)) \\
 & \stackrel{[\text{theorem: 1.25 (6)}]}{=} \mu^*(C \cap A) + \mu^*(C \cap ((A \setminus A) \cup (B \setminus A))) \\
 & = \mu^*(C \cap A) + \mu^*(C \cap (B \setminus A))
 \end{aligned}$$

proving that

$$\mu^*(C \cap (A \cup B)) = \mu^*(C \cap A) + \mu^*(C \cap (B \setminus A)) \quad (21.128)$$

So we have

$$\begin{aligned}
 & \mu^*(C \cap (A \cup B)) + \mu^*(C \setminus (A \cup B)) \stackrel{[\text{eq: 21.128}]}{=} \\
 & \mu^*(C \cap A) + \mu^*(C \cap (B \setminus A)) + \mu^*(C \setminus (A \cup B)) \stackrel{[\text{theorem: 1.31(1)}]}{=} \\
 & \mu^*(C \cap A) + \mu^*(C \cap (B \setminus A)) + \mu^*((C \setminus A) \setminus B) \stackrel{[\text{theorem: 1.25(7)}]}{=} \\
 & \mu^*(C \cap A) + \mu^*((C \setminus A) \cap B) + \mu^*((C \setminus A) \setminus B) \stackrel{B \in \overline{\mathcal{M}}[\mu^*]}{=} \\
 & \mu^*(C \cap A) + \mu^*(C \setminus A) \stackrel{A \in \overline{\mathcal{M}}[\mu^*]}{=} \\
 & \mu^*(C)
 \end{aligned}$$

proving that $A \cup B$ is μ^* -measurable. Hence we have

$$\forall A, B \in \mathcal{M}[\mu^*] \text{ we have that } A \cup B \in \mathcal{M}[\mu^*] \text{ [in other words } \mathcal{M}[\mu^*] \text{ is } \cup\text{-stable}] \quad (21.129)$$

From [eqs: 21.126, 21.127 and 21.129] and [theorem: 21.29] it follows that

$$\mathcal{M}[\mu^*] \text{ is a algebra} \quad (21.130)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[\mu^*]$ **pairwise disjoint** and $B \in \mathcal{P}(X)$. We show then by mathematical induction that $\forall n \in \mathbb{N}$

$$\mu^*(B) = \sum_{i=1}^n \mu^*(B \cap A_i) + \mu^*\left(B \setminus \bigsqcup_{i \in \{1, \dots, n\}} A_i\right) \quad (21.131)$$

Proof. Define

$$S = \left\{ n \in \mathbb{N} \mid \mu^*(B) = \sum_{i=1}^n \mu^*(B \cap A_i) + \mu^*\left(B \setminus \bigsqcup_{i \in \{1, \dots, n\}} A_i\right) \right\}$$

then we have:

$1 \in S$. As $A_1 \in \mathcal{M}[\mu^*]$ we have

$$\begin{aligned}
 \mu^*(B) & = \mu^*(B \cap A_1) + \mu^*(B \setminus A_1) \\
 & = \sum_{i=1}^1 \mu^*[B \cap A_i] + \mu^*\left(B \setminus \bigsqcup_{i \in \{1\}} A_i\right)
 \end{aligned}$$

which proves that $1 \in S$

$n \in S \Rightarrow n+1 \in S$. If $x \in B \cap A_{n+1}$ then $x \in B$ and $x \in A_{n+1}$ then $\forall i \in \{1, \dots, n\}$ we have by pairwise disjointedness $x \notin A_i$ so that $x \notin \bigsqcup_{i \in \{1, \dots, n\}} A_i$ or $x \in (B \setminus \bigsqcup_{i \in \{1, \dots, n\}} A_i) \cap A_{n+1}$. Hence $B \cap A_{n+1} \subseteq (B \setminus \bigsqcup_{i \in \{1, \dots, n\}} A_i) \cap A_{n+1} \subseteq B \cap A_{n+1}$. Summarized

$$\left(B \setminus \bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \cap A_{n+1} = B \cap A_{n+1} \quad (21.132)$$

As $A_{n+1} \in \mathcal{M}[\mu^*]$ we have

$$\begin{aligned}
 & \mu^*\left(B \setminus \bigsqcup_{i \in \{1, \dots, n\}} A_i\right) = \\
 & \mu^*\left(\left(B \setminus \bigsqcup_{i \in \{1, \dots, n\}} A_i\right) \cap A_{n+1}\right) + \mu^*\left(\left(B \setminus \bigsqcup_{i \in \{1, \dots, n\}} A_i\right) \setminus A_{n+1}\right) \quad [\text{eq: 21.132}] \\
 & \mu^*(B \cap A_{n+1}) + \mu^*\left(\left(B \setminus \bigsqcup_{i \in \{1, \dots, n\}} A_i\right) \setminus A_{n+1}\right) \quad [\text{theorem: 1.31}] \\
 & \mu^*(B \cap A_{n+1}) + \mu^*\left(B \setminus \left(\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) \cup A_{n+1}\right)\right) = \\
 & \mu^*(B \cap A_{n+1}) + \mu^*\left(B \setminus \left(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i\right)\right)
 \end{aligned}$$

proving that

$$\mu^*\left(B \setminus \bigsqcup_{i \in \{1, \dots, n\}} A_i\right) = \mu^*(B \cap A_{n+1}) + \mu^*\left(B \setminus \left(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i\right)\right) \quad (21.133)$$

Finally

$$\begin{aligned}
 \mu^*(B) & \stackrel{=}{=}_{n \in S} \sum_{i=1}^n \mu^*(B \cap A_i) + \mu^*\left(B \setminus \bigsqcup_{i \in \{1, \dots, n\}} A_i\right) \\
 & \stackrel{=}{=}_{[\text{eq: 21.133}]} \sum_{i=1}^n \mu^*(B \cap A_i) + \mu^*(B \cap A_{n+1}) + \mu^*\left(B \setminus \left(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i\right)\right) \\
 & = \sum_{i=1}^{n+1} \mu^*(B \cap A_i) + \mu^*\left(B \setminus \left(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i\right)\right)
 \end{aligned}$$

which proves that $n+1 \in \mathcal{S}$.

Mathematical induction proves then [eq: 21.131]. $\square$

Let $n \in \mathbb{N}$ then we have $\bigsqcup_{i \in \{1, \dots, n\}} A_i \subseteq \bigsqcup_{i \in \mathbb{N}} A_i$ so that $B \setminus \bigcup_{i \in \mathbb{N}} A_i \subseteq B \setminus \bigcup_{i \in \{1, \dots, n\}} A_i$ hence $\mu^*(B \setminus \bigcup_{i \in \mathbb{N}} A_i) \leq \mu^*(B \setminus \bigcup_{i \in \{1, \dots, n\}} A_i)$. So

$$\begin{aligned}
 \sum_{i=1}^n \mu^*(B \cap A_i) + \mu^*\left(B \setminus \bigcup_{i \in \mathbb{N}} A_i\right) & \leq \sum_{i=1}^n \mu^*(B \cap A_i) + \mu^*\left(B \setminus \bigcup_{i \in \{1, \dots, n\}} A_i\right) \\
 & \stackrel{=}{=}_{[\text{eq: 21.131}]} \mu^*(B) \quad (21.134)
 \end{aligned}$$

Next

$$\begin{aligned}
 & \sum_{i=1}^{\infty} \mu^*(B \cap A_i) + \mu^*\left(B \setminus \bigsqcup_{i \in \mathbb{N}} A_i\right) = \\
 & \lim_{n \rightarrow \infty} \left(\sum_{i=1}^n \mu^*(B \cap A_i) \right) + \mu^*\left(B \setminus \bigsqcup_{i \in \mathbb{N}} A_i\right) \quad [\text{theorem: 20.84}] \\
 & \lim_{n \rightarrow \infty} \left(\sum_{i=1}^n \mu^*(B \cap A_i) + \mu^*\left(B \setminus \bigsqcup_{i \in \mathbb{N}} A_i\right) \right) \leq \quad [\text{theorem: 20.84} \wedge [\text{eq: 21.134}]] \\
 & \lim_{n \rightarrow \infty} \mu^*(B) \stackrel{=}{=} \mu^*(B) \quad [\text{theorem: 20.73}]
 \end{aligned}$$

proving that $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[\mu^*]$ and $B \in \mathcal{P}(X)$

$$\sum_{i=1}^{\infty} \mu^*(B \cap A_i) + \mu^*\left(B \setminus \bigcup_{i \in \mathbb{N}} A_i\right) \leq \mu^*(B) \quad (21.135)$$

Hence we have for $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[\mu^*]$ and $B \in \mathcal{P}(X)$ that

$$\begin{aligned} & \mu^*\left(B \cap \left(\bigcup_{i \in \mathbb{N}} A_i\right)\right) + \mu^*\left(B \setminus \bigcup_{i \in \mathbb{N}} A_i\right) = \\ & \mu^*\left(\bigcup_{i \in \mathbb{N}} (B \cap A_i)\right) + \mu^*\left(B \setminus \bigcup_{i \in \mathbb{N}} A_i\right) \stackrel{\mu^* \text{ is a outer measure}}{\leq} \\ & \sum_{i=1}^{\infty} \mu^*(B \cap A_i) + \mu^*\left(B \setminus \bigcup_{i \in \mathbb{N}} A_i\right) \stackrel{[\text{eq: 21.135}]}{\leq} \mu^*(B) \end{aligned}$$

So by [theorem: 21.114] it follows that $\bigcup_{i \in \mathbb{N}} A_i$ is μ^* -measureable. Hence we have proved that

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[\mu^*] \text{ pairwise disjoint we have } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{M}[\mu^*] \quad (21.136)$$

As $\mathcal{M}[\mu^*]$ is a algebra [see eq: 21.130] we can use the alternative definition for a σ -algebra [see theorem: 21.33] and the above to prove that

$\mathcal{M}[\mu^*]$ is a σ -algebra

2. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[\mu^*]$ a pairwise disjoint family then for $B = \bigcup_{j \in \mathbb{N}} A_j \in \mathcal{P}(X)$ we have

$$\begin{aligned} \sum_{i=1}^{\infty} (\mu^*)|_{\mathcal{M}[\mu^*]}(A_i) &= \sum_{i=1}^{\infty} \mu^*(A_i) \\ &= \sum_{i=1}^{\infty} \mu^*\left(\left(\bigcup_{j \in \mathbb{N}} A_j\right) \cap A_i\right) + 0 \\ &= \sum_{i=1}^{\infty} \mu^*\left(\left(\bigcup_{j \in \mathbb{N}} A_j\right) \cap A_i\right) + \mu^*\left(\left(\bigcup_{j \in \mathbb{N}} A_j\right) \setminus \left(\bigcup_{j \in \mathbb{N}} A_j\right)\right) \\ &= \sum_{i=1}^{\infty} \mu^*(B \cap A_i) + \mu^*\left(B \setminus \left(\bigcup_{j \in \mathbb{N}} A_j\right)\right) \\ &\stackrel{[\text{eq: 21.135}]}{\leq} \mu^*(B) \\ &= \mu^*\left(\bigcup_{i \in \mathbb{N}} A_i\right) \\ &= (\mu^*)|_{\mathcal{M}[\mu^*]}\left(\bigcup_{i \in \mathbb{N}} A_i\right) \end{aligned}$$

As further by the sub-additivity of μ^* we have

$$(\mu^*)|_{\mathcal{M}[\mu^*]}\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \mu^*\left(\bigcup_{i \in \mathbb{N}} A_i\right) \leq \sum_{i=1}^{\infty} \mu^*(A_i) = \sum_{i=1}^{\infty} (\mu^*)|_{\mathcal{M}[\mu^*]}(A_i)$$

it follows that

$$(\mu^*)|_{\mathcal{M}[\mu^*]}\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} (\mu^*)|_{\mathcal{M}[\mu^*]}(A_i)$$

which together with $(\mu^*)|_{\mathcal{M}[\mu^*]}(\emptyset) = \mu^*(\emptyset) = 0$ proves

$$(\mu^*)|_{\mathcal{M}[\mu^*]} \text{ is a measure on } \mathcal{M}[\mu^*]$$

□

21.3.3 Uniqueness of measure extensions

Let X be a set, $\mathcal{G} \subseteq \mathcal{P}(X)$ and $\sigma[\mathcal{G}]$ is the σ -algebra generated by $\mathcal{G}$ [see theorem: 21.39] then if we have a set function on $\mathcal{G}$ that we extend to a measure on $\sigma[\mathcal{G}]$ we can ask ourselves if the extension is unique. The answer is true if $\mathcal{G}$ and the set function satisfies certain conditions. To prove this we introduce the concept of a Dynkin system.

21.3.3.1 Dynkin systems

Definition 21.117. (Dynkin System) Let X be a set then $\mathfrak{D} \subseteq \mathcal{P}(X)$ is a **Dynkin system** on X if

1. $X \in \mathfrak{D}$
2. If $D \in \mathfrak{D}$ then $X \setminus D \in \mathfrak{D}$
3. If $\{D_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}$ is a **pairwise disjoint family** then $\bigsqcup_{i \in \mathbb{N}} D_i \in \mathfrak{D}$

Note 21.118. Using [definition: 21.30] every σ -algebra is automatical a Dynkin system however the opposite is in general not true.

Some of the properties of a Dynkin system are similar to the properties of a σ -algebra.

Theorem 21.119. Let X be a set and $\mathfrak{D}$ is a Dynkin system on X then we have:

1. $\emptyset \in \mathfrak{D}$
2. Let $n \in \mathbb{N}$ and $\{D_i\}_{i \in \{1, \dots, n\}} \subseteq \mathfrak{D}$ pairwise disjoint then $\bigsqcup_{i \in \{1, \dots, n\}} D_i \in \mathfrak{D}$

Proof.

1. As $X \in \mathfrak{D}$ we have that $\emptyset = X \setminus X \in \mathfrak{D}$
2. Define $\{E_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}$ by $E_i = \begin{cases} \emptyset & \text{if } i \in \{n+1, \dots, \infty\} \\ D_i & \text{if } i \in \{1, \dots, n\} \end{cases}$. Let $i, j \in \mathbb{N}$ with $i \neq j$ then we have either
 - $i \leq n \wedge j \leq n$. Then $E_i \cap E_j = D_i \cap D_j = \emptyset$
 - $n < i \wedge j \leq n$. Then $E_i \cap E_j = \emptyset \cap D_j = \emptyset$
 - $i \leq n \wedge n < j$. Then $E_i \cap E_j = D_i \cap \emptyset = \emptyset$
 - $n < i \wedge n < j$. Then $E_i \cap E_j = \emptyset \cap \emptyset = \emptyset$

which proves that $\{E_i\}_{i \in \mathbb{N}}$ is pairwise disjoint. So

$$\bigsqcup_{i \in \mathbb{N}} E_i \in \mathfrak{D}$$

If $x \in \bigsqcup_{i \in \{1, \dots, n\}} D_i$ then $\exists i \in \{1, \dots, n\}$ such that $x \in D_i = E_i$ so that $x \in \bigsqcup_{i \in \mathbb{N}} E_i$. If $x \in \bigsqcup_{i \in \mathbb{N}} E_i$ then there exist a $i \in \mathbb{N}$ such that $x \in E_i$, as $\forall i \in \{n+1, \dots, \infty\} E_i = \emptyset$ we must have that $i \in \{1, \dots, n\}$ so that $E_i = D_i$ proving that $x \in \bigsqcup_{i \in \{1, \dots, n\}} D_i$. Hence we have

$$\bigsqcup_{i \in \{1, \dots, n\}} D_i = \bigsqcup_{i \in \mathbb{N}} E_i \in \mathfrak{D}$$

□

Example 21.120. Let X be a set then $\mathcal{P}(X)$ is a Dynkin system on X

Proof. As $\mathcal{P}(X)$ is a σ -algebra on X [see example: 21.35] and every σ -algebra is a Dynkin system it follows that $\mathcal{P}(X)$ is a Dynkin system on X . □

Given a set of subsets of X we can, just like with σ -algebras, find the smallest Dynkin system that contains the set of subsets.

Lemma 21.121. Let X be a set and $\mathcal{X}$ a non empty set of Dynkin systems on X then $\bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D}$ is a Dynkin system on X .

Proof. As $\mathcal{X} \neq \emptyset$ there exist a $\mathfrak{D} \in \mathcal{X}$ with $\mathfrak{D} \subseteq \mathcal{P}(X)$ so that we have by [theorem: 1.63] that $\bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D} \subseteq \mathcal{P}(X)$ proving that

$$\bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D} \subseteq \mathcal{P}(X)$$

As $\forall \mathfrak{D} \in \mathfrak{D}$ $\mathfrak{D}$ is a Dynkin system on X we have $X \in \mathfrak{A}$ hence

$$X \in \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D}$$

Let $A \in \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D}$ then for $\mathfrak{D} \in \mathcal{X}$ we have $A \in \mathfrak{D}$ so that $X \setminus A \in \mathfrak{D}$ which as $\mathfrak{D} \in \mathcal{X}$ was chosen arbitrary proves that $X \setminus A \in \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D}$. Hence as $A \in \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D}$ was chosen arbitrary we have that

$$\forall A \in \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D} \text{ we have } X \setminus A \in \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D}$$

If $\{D_i\}_{i \in \mathbb{N}} \subseteq \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D}$ is pairwise disjoint then for $\mathfrak{D} \in \mathcal{X}$ we have $\{D_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}$ so that $\bigsqcup_{i \in \mathbb{N}} D_i \in \mathfrak{D}$ which as $\mathfrak{D} \in \mathcal{X}$ was chosen arbitrary proves that $\bigsqcup_{i \in \mathbb{N}} D_i \in \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D}$. Hence as $\{D_i\}_{i \in \mathbb{N}} \subseteq \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D}$ was chosen arbitrary we have that

$$\text{For every pairwise disjoint family } \{D_i\}_{i \in \mathbb{N}} \subseteq \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D} \text{ we have } \bigsqcup_{i \in \mathbb{N}} D_i \in \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D} \quad \square$$

Theorem 21.122. Let X be a set $\mathcal{D} \subseteq \mathcal{P}(X)$ then there exist a **unique** Dynkin system $\delta[\mathcal{A}]$ on X such that:

1. $\mathcal{D} \subseteq \delta[\mathcal{D}]$
2. If $\mathfrak{D}'$ is another Dynkin system with $\mathcal{D} \subseteq \mathfrak{D}'$ then $\delta[\mathcal{D}] \subseteq \mathfrak{D}'$
3. $\delta[\mathcal{D}] \subseteq \sigma[\mathcal{D}]$

This unique smallest Dynkin system that contains $\mathcal{D}$ is called the Dynkin system generated by $\mathcal{D}$

Proof.

1. Define $\mathcal{X} = \{\mathfrak{D} \subseteq \mathcal{P}(X) | \mathfrak{D} \text{ is a Dynkin system on } X \text{ and } \mathcal{D} \subseteq \mathfrak{D}\}$ then as $\mathcal{P}(X)$ is a Dynkin system [see example: 21.120] and $\mathcal{D} \subseteq \mathcal{P}(X)$ it follows that $\mathcal{X} \neq \emptyset$. Hence by [lemma: 21.121] it follows that, if we take $\delta[\mathcal{D}] = \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D}$, that

$$\delta[\mathcal{D}] \text{ is a Dynkin system on } X$$

If $D \in \mathcal{D}$ then, as $\forall \mathfrak{D} \in \mathcal{X}$ we have by definition of $\mathcal{X}$ that $\mathcal{D} \subseteq \mathfrak{D}$, it follows that $D \in \mathfrak{D}$, hence $D \in \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D}$. So that

$$\mathcal{D} \subseteq \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D} = \delta[\mathcal{D}]$$

2. Assume that $\mathfrak{D}'$ is another Dynkin system on X such that $\mathcal{D} \subseteq \mathfrak{D}'$ then $\mathfrak{D}' \in \mathcal{X}$ so that by [theorem: 1.63]

$$\delta[\mathcal{D}] = \bigcap_{\mathfrak{D} \in \mathcal{X}} \mathfrak{D} \subseteq \mathfrak{D}'$$

3. As $\mathcal{D} \subseteq \sigma[\mathcal{D}]$, $\sigma[\mathcal{D}]$ is a σ -algebra hence a Dynkin system on X it follows from (2) that

$$\delta[\mathcal{D}] \subseteq \sigma[\mathcal{D}] \quad \square$$

We show now the sufficient and necessary condition for a Dynkin system to be a σ -algebra.

Theorem 21.123. Let X be a set and $\mathfrak{D}$ a Dynkin system on X then we have

$$\mathfrak{D} \text{ is a } \sigma\text{-algebra} \Leftrightarrow \forall A, B \in \mathfrak{D} \text{ we have } A \bigcap B \in \mathfrak{D} \text{ [in other words } \mathfrak{D} \text{ is } \cap\text{-stable}]$$

Proof.

$\Rightarrow$. Let $A, B \in \mathfrak{D}$ then, as $\mathfrak{D}$ is a σ -algebra, it follows from [theorems: 21.33, 21.29] that $A \bigcap B \in \mathfrak{A}$.

$\Leftarrow$. As $\mathfrak{D}$ is a Dynkin system and $\cap$ -stable we have already that

$$X \in \mathfrak{D}, \forall D \in \mathfrak{D} \text{ we have } X \setminus D \in \mathfrak{D} \text{ and } \forall A, B \in \mathfrak{D} \text{ we have } A \cap B \in \mathfrak{D} \quad (21.137)$$

Let $\{D_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}$. Define

$$\{E_i\}_{i \in \mathbb{N}} \text{ by } E_i = \begin{cases} D_1 & \text{if } i = 1 \\ D_i \cap \left(\bigcap_{j \in \{1, \dots, i-1\}} (X \setminus D_j) \right) & \text{if } i \in \{2, \dots, \infty\} \end{cases} \stackrel{[\text{eq: 21.137}] \wedge [\text{theorem: 21.8}]}{\in} \mathfrak{D}$$

Then $\forall i \in \mathbb{N}$ we have

$$E_i = \begin{cases} D_1 \subseteq D_i & \text{if } i = 1 \\ D_i \cap \left(\bigcap_{j \in \{1, \dots, i-1\}} (X \setminus D_j) \right) \subseteq D_i & \text{if } i \in \{2, \dots, \infty\} \end{cases} \subseteq D_i \quad (21.138)$$

so that

$$\bigcup_{i \in \mathbb{N}} E_i \subseteq \bigcup_{i \in \mathbb{N}} D_i \quad (21.139)$$

If $x \in \bigcup_{i \in \mathbb{N}} D_i$ then there exist a $k \in \mathbb{N}$ such that $x \in D_k$. Define

$$S = \{i \in \{1, \dots, k\} \mid x \in D_i\} \subseteq \{1, \dots, k\}$$

then $k \in S \Rightarrow S \neq \emptyset$ and S is finite so that $m = \min(S)$ exists. For m we have either:

$m = 1$. Then $x \in D_1 = E_1 \subseteq \bigcup_{i \in \mathbb{N}} E_i$

$1 < m$. Then $x \in D_m$ and $\forall i \in \{1, \dots, m-1\} \ x \notin D_i \Rightarrow x \in X \setminus D_i$ so that

$$x \in D_m \cap \left(\bigcap_{i \in \{1, \dots, m-1\}} (X \setminus D_i) \right) = E_m \subseteq \bigcup_{i \in \mathbb{N}} E_i$$

Hence $\bigcup_{i \in \mathbb{N}} D_i \subseteq \bigcup_{i \in \mathbb{N}} E_i$ and we have by [eq: 21.139] that

$$\bigcup_{i \in \mathbb{N}} E_i = \bigcup_{i \in \mathbb{N}} D_i \quad (21.140)$$

Let $i, j \in \mathbb{N}$ with $i \neq j$ then we may always assume that $i < j$ [otherwise exchange i and j]. Assume that $x \in E_i \cap E_j$ then $x \in E_i \subseteq D_i$ and

$x \in E_j = D_j \cap \left(\bigcap_{k \in \{1, \dots, j-1\}} (X \setminus D_k) \right) \subseteq (X \setminus D_i) \Rightarrow x \notin D_i$ so that we reach the contradiction $x \in D_i$ and $x \notin D_i$. Hence we have

$$\forall i, j \in \mathbb{N} \text{ with } i \neq j \text{ we have } E_i \cap E_j = \emptyset$$

So by the definition of a Dynkin system it follows that

$$\bigcup_{i \in \mathbb{N}} D_i \stackrel{[\text{eq: 21.140}]}{=} \bigcup_{i \in \mathbb{N}} E_i \in \mathfrak{D}$$

Finally by the above, [eq: 21.137] and [definition: 21.30] it follows that $\mathfrak{D}$ is a σ -algebra on X . $\square$

Theorem 21.124. If $\mathcal{D} \subseteq \mathcal{P}(A)$ is such that $\forall A, B \in \mathcal{D} \ A \cap B \in \mathcal{D}$ [in other words $\mathcal{D}$ is $\cap$ -stable] then $\delta(\mathcal{D}) = \sigma(\mathcal{D})$

Proof. Using [theorem: 21.122] it follows that

$$\delta[\mathcal{D}] \subseteq \sigma[\mathcal{D}] \quad (21.141)$$

For the opposite inclusion. Define for every $D \in \delta[\mathcal{D}]$

$$\mathfrak{D}_D = \{E \subseteq X \mid E \cap D \in \delta[\mathcal{D}]\} \quad (21.142)$$

As $X \subseteq X$ and $X \cap D = D \in \delta[\mathcal{D}]$ it follows that

$$X \in \mathfrak{D}_D \quad (21.143)$$

Let $E \in \mathfrak{D}_D$ then $X \setminus E \subseteq X$ and

$$\begin{aligned}
 X \setminus ((E \cap D) \cup (X \setminus D)) &\stackrel{[\text{theorem: 1.31}]}{=} (X \setminus (E \cap D)) \cap (X \setminus (X \setminus D)) \\
 &\stackrel{[\text{theorem: 1.33}] \wedge D \subseteq X}{=} (X \setminus (E \cap D)) \cap D \\
 &\stackrel{[\text{theorem: 1.31}]}{=} ((X \setminus E) \cup (X \setminus D)) \cap D \\
 &\stackrel{[\text{theorem: 1.30}]}{=} ((X \setminus E) \cap D) \cup ((X \setminus D) \cap D) \\
 &= ((X \setminus E) \cap D) \cup \emptyset \\
 &= (X \setminus E) \cap D
 \end{aligned}$$

Further $(E \cap D) \cap (X \setminus D) = \emptyset$ so that

$$(X \setminus E) \cap D = X \setminus ((E \cap D) \cup (X \setminus D)) \quad (21.144)$$

As $E \in \mathfrak{D}_D$ we have by [eq: 21.142] that $E \cap D \in \delta[\mathcal{D}]$, further as $\delta[\mathcal{D}]$ is a Dynkin system and $D \in \delta[\mathcal{D}]$ it follows that $X \setminus D \in \delta[\mathcal{D}]$ so that $(E \cap D) \cup (X \setminus D) \in \delta[\mathcal{D}]$ and finally that

$$X \setminus ((E \cap D) \cup (X \setminus D)) \in \delta[\mathcal{D}]$$

Hence by [eq: 21.144] it follows that

$$\forall E \in \mathfrak{D}_D \text{ that } X \setminus E \in \mathfrak{D}_D \quad (21.145)$$

Let $\{D_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}_D$ be pairwise disjoint then $\forall i, j \in \mathbb{N}$ with $i \neq j$ we have $(D_i \cap D) \cap (D_j \cap D) \subseteq D_i \cap D_j = \emptyset$, further $\forall i \in \mathbb{N}$ we have by the definition of $\mathfrak{D}_D$ that $D_i \cap D \in \delta[\mathcal{D}]$. Hence $\{D_i \cap D\}_{i \in \mathbb{N}} \subseteq \delta[\mathcal{D}]$ is pairwise disjoint, so that, as $\delta[\mathcal{D}]$ is a Dynkin system, we have

$$\left(\bigsqcup_{i \in \mathbb{N}} D_i \right) \cap D = \bigsqcup_{i \in \mathbb{N}} (D_i \cap D) \in \delta[\mathcal{D}]$$

proving that

$$\bigsqcup_{i \in \mathbb{N}} D_i \in \mathfrak{D}_D \quad (21.146)$$

From [eqs: 21.143, 21.145 and 21.146] it follows that $\mathfrak{D}_D$ is a Dynkin system on X , hence

$$\forall D \in \delta[\mathcal{D}] \text{ we have that } \mathfrak{D}_D \text{ is a Dynkin system} \quad (21.147)$$

Let $G \in \mathcal{D} \subseteq \delta[\mathcal{D}]$ then by the hypothesis we have $\forall D \in \mathcal{D}$ that $G \cap D \in \mathcal{D} \Rightarrow D \in \mathfrak{D}_G$, hence $\mathcal{D} \subseteq \mathfrak{D}_G$. As $\mathfrak{D}_G$ is a Dynkin system and $\delta[\mathcal{D}]$ is the smallest Dynkin system containing $\mathcal{D}$ it follows that $\delta[\mathcal{D}] \subseteq \mathfrak{D}_G$. Hence we have proved that

$$\forall G \in \mathcal{D} \text{ we have } \delta[\mathcal{D}] \subseteq \mathfrak{D}_G \quad (21.148)$$

Let $G \in \mathcal{D}$ and $D \in \delta[\mathcal{D}] \subseteq \mathfrak{D}_G$ then by the definition of $\mathfrak{D}_G$ we have $G \cap D \in \delta[\mathcal{D}]$ so that $G \in \mathfrak{D}_D$. In other words $\forall D \in \delta[\mathcal{D}]$ we have $\forall G \in \mathcal{D}$ that $G \in \mathfrak{D}_D$ proving that

$$\forall D \in \delta[\mathcal{D}] \text{ we have } \mathcal{D} \subseteq \mathfrak{D}_D$$

As $\delta[\mathcal{D}]$ is the smallest Dynkin system containing $\mathcal{D}$ and $\mathfrak{D}_D$ is a Dynkin system [see eq: 21.147] it follows from the above that

$$\forall D \in \delta[\mathcal{D}] \text{ that } \delta[\mathcal{D}] \subseteq \mathfrak{D}_D$$

Let $A, B \in \delta[\mathcal{D}]$ then by the above $\delta[\mathcal{D}] \subseteq \mathfrak{D}_B$ and as $A \in \delta[\mathcal{D}]$ we have $A \in \mathfrak{D}_B \stackrel{[\text{eq: 21.142}]}{\Rightarrow} A \cap B \in \delta[\mathcal{D}]$. So we have that

$$\forall A, B \in \delta[\mathcal{D}] \text{ we have } A \cap B \in \delta[\mathcal{D}] \text{ where } \delta[\mathcal{D}] \text{ is a Dynkin system}$$

Hence by [theorem: 21.123] it follows finally that

$$\delta[\mathcal{D}] \text{ is a } \sigma\text{-algebra}$$

□

21.3.3.2 Uniqueness theorem

We are now ready to prove that every set function on $\mathcal{G} \subseteq \mathcal{P}(X)$ has a unique extension to a measure on $\sigma[\mathcal{G}]$ if certain conditions are met.

Theorem 21.125. *Let X be a set, $\mathcal{G} \subseteq \mathcal{P}(X)$ such that*

1. $\forall A, B \in \mathcal{G}$ we have $A \cap B \in \mathcal{G}$ [in other words $\mathcal{G}$ is $\cap$ -stable]
2. $\exists \{G_i\}_{i \in \mathbb{N}} \subseteq \mathcal{G}$ such that $\forall i \in \mathbb{N}$ we have $G_i \subseteq G_{i+1}$ and $\bigcup_{i \in \mathbb{N}} G_i = X$

and μ, ν a measures on $\sigma[\mathcal{G}]$ such that

1. $\forall A \in \mathcal{G} \mu(A) = \nu(A)$
2. $\forall i \in \mathbb{N} \mu(G_i) < \infty$ [hence as $G_i \in \mathcal{G}$ we have also $\nu(G_i) < \infty$]

then we have that

$$\mu = \nu$$

Proof. Given $n \in \mathbb{N}$ define

$$\mathfrak{D}_n = \{A \in \sigma[\mathcal{G}] \mid \mu(G_n \cap A) = \nu(G_n \cap A)\} \subseteq \sigma[\mathcal{G}] \quad (21.149)$$

We prove then that $\mathfrak{D}_n$ is a Dynkin system for every $n \in \mathbb{N}$. Take $G \in \mathcal{G}$ then $G, G_n \in \mathcal{G}$ so that by (1) $G_n \cap G \in \mathcal{G}$, as μ, ν are the same on $\mathcal{G}$ we have $\mu(G_n \cap G) = \nu(G_n \cap G)$. Hence we have

$$\mathcal{G} \subseteq \mathfrak{D}_n \quad (21.150)$$

As $X \in \sigma[\mathcal{G}]$ and $\mu(G_n \cap X) = \mu(G_n) \stackrel{G_n \in \mathcal{G}}{=} \nu(G_n) = \nu(G_n \cap X)$ it follows that

$$X \in \mathfrak{D}_n \quad (21.151)$$

Let $A \in \mathfrak{D}_n$ then we have $G_n \setminus (G_n \cap A) \stackrel{[\text{theorem: 1.31}]}{=} (G_n \setminus G_n) \cup (G_n \setminus A) = \emptyset \cup (G_n \setminus A) = G_n \setminus A$ so that

$$G_n \setminus (G_n \cap A) = G_n \setminus A \quad (21.152)$$

Further $\mu(G_n \cap A) \stackrel{[\text{theorem: 21.106}]}{\leq} \mu(G_n) < \infty$ and $\nu(G_n \cap A) \stackrel{[\text{theorem: 21.106}]}{\leq} \nu(G_n) < \infty$ so that by [theorem: 21.106]

$$\mu(G_n \setminus (G_n \cap A)) = \mu(G_n) - \mu(G_n \cap A) \wedge \nu(G_n \setminus (G_n \cap A)) = \nu(G_n) - \nu(G_n \cap A) \quad (21.153)$$

hence

$$\begin{aligned} \mu(G_n \cap (X \setminus A)) &\stackrel{[\text{theorem: 1.33(8)}]}{=} \mu(G_n \setminus A) \\ &\stackrel{[\text{eq: 21.152}]}{=} \mu(G_n \setminus (G_n \cap A)) \\ &\stackrel{[\text{eq: 21.153}]}{=} \mu(G_n) - \mu(G_n \cap A) \\ &\stackrel{A \in \mathfrak{D}_n}{=} \mu(G_n) - \nu(G_n \cap A) \\ &\stackrel{G_n \in \mathcal{G}}{=} \nu(G_n) - \nu(G_n \cap A) \\ &\stackrel{[\text{eq: 21.153}]}{=} \nu(G_n \setminus (G_n \cap A)) \\ &\stackrel{[\text{eq: 21.152}]}{=} \nu(G_n \setminus A) \\ &\stackrel{[\text{theorem: 1.33}]}{=} \nu(G_n \cap (X \setminus A)) \end{aligned}$$

proving that $(X \setminus A) \in \mathfrak{D}_n$, further as $A \in \mathfrak{D}_n \subseteq \sigma[\mathcal{G}]$ we have $X \setminus A \in \sigma[\mathcal{G}]$. Hence

$$\forall A \in \mathfrak{D}_n \text{ we have } X \setminus A \in \mathfrak{D}_n \quad (21.154)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}_n$ be a pairwise disjoint family. Then $\forall i \in \mathbb{N}$ with $i \neq j$ we have $(G_n \cap A_i) \cap (G_n \cap A_j) \subseteq A_i \cap A_j = \emptyset$ so that $\{G_n \cap A_i\}_{i \in \mathbb{N}}$ is pairwise disjoint. Hence

$$\mu\left(\bigcup_{i \in \mathbb{N}} (G_n \cap A_i)\right) = \sum_{i \in \mathbb{N}} \mu(G_n \cap A_i) \stackrel{A_i \in \mathfrak{D}_n}{=} \sum_{i \in \mathbb{N}} \nu(G_n \cap A_i) = \nu\left(\bigcup_{i \in \mathbb{N}} (G_n \cap A_i)\right)$$

which, as $G_n \cap (\bigsqcup_{i \in \mathbb{N}} A_i) = \bigsqcup_{i \in \mathbb{N}} (G_n \cap A_i)$ and $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}_n \subseteq \sigma[\mathcal{G}]$, proves that

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathfrak{D}_n \text{ we have } \bigsqcup_{i \in \mathbb{N}} A_i \in \mathfrak{D}_n \quad (21.155)$$

By [eqs: 21.151, 21.154 and 21.155] we have

$$\mathfrak{D}_n \text{ is a Dynkin system} \quad (21.156)$$

As $\forall A, B \in \mathcal{G}$ we have by (1) that $A \cap B \in \mathcal{G}$ we have by [theorem: 21.124] that

$$\delta[\mathcal{G}] = \sigma[\mathcal{G}] \quad (21.157)$$

As by [eq: 21.150] $\mathcal{G} \subseteq \mathfrak{D}_n$ and $\mathfrak{D}_n$ is a Dynkin system it follows that

$$\sigma[\mathcal{G}] \underset{\text{[eq: 21.157]}}{=} \delta[\mathcal{G}] \subseteq \mathfrak{D}_n \underset{\text{[eq: 21.149]}}{\subseteq} \sigma[\mathcal{G}]$$

Hence we have $\forall n \in \mathbb{N}$ that $\sigma[\mathcal{G}] = \mathfrak{D}_n$ so that using the definition of $\mathfrak{D}_n$ [see eq: 21.149]

$$\forall n \in \mathbb{N} \text{ we have } \forall A \in \sigma[\mathcal{G}] \text{ that } \mu(G_n \cap A) = \nu(G_n \cap A) \quad (21.158)$$

Let $A \in \sigma[\mathcal{G}]$ then $\forall i \in \mathbb{N}$ we have $G_i \cap A \subseteq G_{i+1} \cap A \in \sigma[\mathcal{G}]$ and

$$A = A \cap X = A \cap \left(\bigcup_{i \in \mathbb{N}} G_i \right) = \bigcup_{i \in \mathbb{N}} (G_i \cap A) \quad (21.159)$$

so that by [theorem: 21.109] we have that

$$\lim_{i \rightarrow \infty} \mu(G_i \cap A) \text{ exists and } \lim_{i \rightarrow \infty} \mu(G_i \cap A) = \mu \left(\bigcup_{i \in \mathbb{N}} (G_i \cap A) \right) \underset{\text{[eq: 21.159]}}{=} \mu(A) \quad (21.160)$$

and

$$\lim_{i \rightarrow \infty} \nu(G_i \cap A) \text{ exists and } \lim_{i \rightarrow \infty} \nu(G_i \cap A) = \mu \left(\bigcup_{i \in \mathbb{N}} (G_i \cap A) \right) \underset{\text{[eq: 21.159]}}{=} \nu(A) \quad (21.161)$$

Hence we have for $A \in \sigma[\mathcal{G}]$ that

$$\mu(A) \underset{\text{[eq: 21.160]}}{=} \lim_{i \rightarrow \infty} \mu(G_i \cap A) \underset{\text{[eq: 21.158]}}{=} \lim_{i \rightarrow \infty} \nu(G_i \cap A) \underset{\text{[eq: 21.161]}}{=} \nu(A)$$

proving that

$$\mu = \nu \quad \square$$

21.3.4 Constructing measures and σ -algebras

21.3.4.1 Constructing outer measures

Let X be a set then given $\mathcal{G} \subseteq \mathcal{P}(X)$ we want to extend a function $\mu: \mathcal{G} \rightarrow [0, \infty]$ to a measure on a σ -algebra containing $\mathcal{G}$. To use the Carathéodory theorem for this task we have to construct a outer measure out of μ . This is the subject of this section. First we need some definitions that specifies the minimum requirements for this task.

Definition 21.126. (Proto-Ring) Let X be a set then $\mathcal{S} \subseteq \mathcal{P}(X)$ is a **proto-ring** on X if

$$\emptyset \subseteq \mathcal{S}$$

Definition 21.127. (Proto-Measure) Let X be a set then and $\mathcal{S}$ a proto-ring on X then a function $\mu: \mathcal{S} \rightarrow [0, \infty]$ is a **proto-measure** on $\mathcal{S}$ if

$$\mu(\emptyset) = 0$$

Next we shown how to construct a outer-measure from a proto-measure.

Theorem 21.128. Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a proto-ring and $\mu: \mathcal{S} \rightarrow [0, \infty]$ a proto-measure on $\mathcal{S}$ then

1.

$$\mu^*: \mathcal{P}(X) \rightarrow [0, \infty] \text{ defined by } \mu^*(A) = \begin{cases} \inf(\{\sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[A]\}) & \text{if } \mathcal{S}[A] \neq \emptyset \\ \infty & \text{if } \mathcal{S}[A] = \emptyset \end{cases}$$

where

$$\mathcal{S}[A] = \left\{ \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S} \mid A \subseteq \bigcup_{i \in \mathbb{N}} A_i \right\}$$

is a outer measure.

2. If additional we have that

a. $\forall A, B \in \mathcal{S}$ that $A \cap B \in \mathcal{S}$

b. $\forall A, B \in \mathcal{S}$ with $A \subseteq B$ we have $\mu(A) \leq \mu(B)$

c. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}$ with $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{S}$ we have $\mu(\bigcup_{i \in \mathbb{N}} A_i) \leq \sum_{i=1}^{\infty} \mu(A_i)$

then

$$\forall A \in \mathcal{S} \text{ we have } \mu^*(A) = \mu(A)$$

Note 21.129. The outer measure defined in (1) is not necessary a extension of μ , for that we need the extra conditions 2.a, 2.b, 2.c.

Proof.

1. Define $\{N_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}$ by $N_i = \emptyset \in \mathcal{S}$ then $\emptyset \subseteq \bigcup_{i \in \mathbb{N}} N_i$ so that $\{N_i\}_{i \in \mathbb{N}} \in \mathcal{S}[\emptyset]$, hence $\mathcal{S}[\emptyset] \neq \emptyset$. So $0 = \sum_{i=1}^{\infty} \mu(\emptyset) = \sum_{i=1}^{\infty} \mu(N_i) \in \{\sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[A]\}$, hence

$$0 \leq \inf \left(\left\{ \sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[A] \right\} \right) \leq 0$$

proving that $\mu^*(\emptyset) = \inf(\{\sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[A]\}) = 0$. Hence we have

$$\mu^*(\emptyset) = 0 \tag{21.162}$$

Let $A, B \in \mathcal{P}(X)$ with $A \subseteq B$. Then for $\mathcal{S}[B]$ we have either:

$\mathcal{S}[B] = \emptyset$. Then $\mu^*[A] \leq \infty = \mu^*[B]$

$\mathcal{S}[B] \neq \emptyset$. If $\{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[B]$ then $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}$ and $B \subseteq \bigcup_{i \in \mathbb{N}} A_i$ hence, as $A \subseteq B$ we have $A \subseteq \bigcup_{i \in \mathbb{N}} A_i$ so that $\{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[A]$. Hence

$$\emptyset \neq \mathcal{S}[B] \subseteq \mathcal{S}[A]$$

From the above it follows that

$$\left\{ \sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[B] \right\} \subseteq \left\{ \sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[A] \right\},$$

so that by [theorem: 3.77]

$$\begin{aligned} \mu^*[A] &= \inf \left(\left\{ \sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[A] \right\} \right) \\ &\leq \inf \left(\left\{ \sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[B] \right\} \right) \\ &= \mu^*[B] \end{aligned}$$

To summarize

$$\forall A, B \in \mathcal{P}(X) \text{ with } A \subseteq B \text{ we have } \mu^*(A) \leq \mu^*(B) \tag{21.163}$$

Let $\{T_i\}_{i \in \mathbb{N}} \subseteq \mathcal{P}(X)$ then we have two cases to consider:

$\exists i \in \mathbb{N}$ such that $\mu^*(T_i) = \infty$. Then $\mu^*(\bigcup_{i \in \mathbb{N}} T_i) \leq \infty = \sum_{i=1}^{\infty} \mu^*(T_i)$

$\forall i \in \mathbb{N}$ we have $\mu^*(T_i) < \infty$. Then we must have $\forall i \in \mathbb{N}$ that $\mathcal{S}[T_i] \neq \emptyset$ so that

$$\mu^*(T_i) = \inf \left(\left\{ \sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[T_i] \right\} \right)$$

Take $\varepsilon \in \mathbb{R}^+$. Given $n \in \mathbb{N}$ we have, as $\mu^*(T_n) < \infty$, that $\mu^*(T_n) < \mu^*(T_n) + \frac{\varepsilon}{2^n}$, so as $\mu^*(T_n) = \inf (\{\sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[T_n]\})$, there exist a $\{I_{n,i}\}_{i \in \mathbb{N}} \in \mathcal{S}[T_n]$ with $T_n \subseteq \bigcup_{i \in \mathbb{N}} I_{n,i}$ such that $\mu^*(T_n) \leq \sum_{i=1}^{\infty} \mu(I_{n,i}) < \mu^*(T_n) + \frac{\varepsilon}{2^n}$. Hence we have

$$\mu^*(T_n) \leq \sum_{i=1}^{\infty} \mu(I_{n,i}) < \mu^*(T_n) + \frac{\varepsilon}{2^n} \text{ and } T_n \subseteq \bigcup_{i \in \mathbb{N}} I_{n,i} \quad (21.164)$$

As $\mathbb{N} \times \mathbb{N}$ is denumerable [see theorem: 6.63] there exist a bijection $\beta: \mathbb{N} \rightarrow \mathbb{N} \times \mathbb{N}$. Let $x \in \bigcup_{i \in \mathbb{N}} T_i$ then $\exists k \in \mathbb{N}$ such that $x \in T_k \subseteq \bigcup_{i \in \mathbb{N}} I_{k,i}$, hence $\exists l \in \mathbb{N}$ such that $x \in I_{k,l}$. As $(k, l) \in \mathbb{N} \times \mathbb{N}$ there exist a $i \in \mathbb{N}$ such that $\beta(i) = (k, l)$ so that $x \in I_{\beta(i)_1, \beta(i)_2} \subseteq \bigcup_{i \in \mathbb{N}} I_{\beta(i)_1, \beta(i)_2}$. To summarize we have proved that

$$\bigcup_{i \in \mathbb{N}} T_i \subseteq \bigcup_{i \in \mathbb{N}} I_{\beta(i)_1, \beta(i)_2} \text{ so that } \{I_{\beta(i)_1, \beta(i)_2}\}_{i \in \mathbb{N}} \in \mathcal{S} \left[\bigcup_{i \in \mathbb{N}} T_i \right] \quad (21.165)$$

Hence $\mathcal{S}[\bigcup_{i \in \mathbb{N}} T_i] \neq \emptyset$ so that

$$\begin{aligned} \mu^* \left(\bigcup_{i \in \mathbb{N}} T_i \right) &= \inf \left(\left\{ \sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S} \left[\bigcup_{i \in \mathbb{N}} T_i \right] \right\} \right) \\ &\stackrel{[\text{eq: 21.165}]}{\leq} \sum_{i=1}^{\infty} \mu(I_{\beta(i)_1, \beta(i)_2}) \\ &\stackrel{[\text{lemma: 20.107}]}{=} \sum_{i=1}^{\infty} \left(\sum_{j=1}^{\infty} \mu(I_{i,j}) \right) \\ &\stackrel{[\text{eq: 21.164}]}{\leq} \sum_{i=1}^{\infty} \left(\mu^*(T_i) + \frac{\varepsilon}{2^i} \right) \\ &\stackrel{[\text{theorem: 20.98}]}{=} \sum_{i=1}^{\infty} \mu^*(T_i) + \sum_{i=1}^{\infty} \frac{\varepsilon}{2^i} \\ &\stackrel{[\text{theorem: 20.98}]}{=} \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon \cdot \sum_{i=1}^{\infty} \frac{1}{2^i} \\ &= \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon \cdot \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{1}{2^i} \\ &\stackrel{[\text{theorem: 20.70}] \wedge [\text{examlle: 14.354}]}{=} \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon \cdot \frac{1}{1 - \frac{1}{2}} \\ &= \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon \end{aligned}$$

Hence we have

$$\forall \varepsilon \in \mathbb{R}^+ \text{ that } \mu^* \left(\bigcup_{i \in \mathbb{N}} T_i \right) \leq \sum_{i=1}^{\infty} \mu^*(T_i) + \varepsilon$$

which, as $\varepsilon \in \mathbb{R}^+$ is choosen arbitrary, proves by [theorem: 20.42] that

$$\mu^* \left(\bigcup_{i \in \mathbb{N}} T_i \right) < \sum_{i=1}^{\infty} \mu^*(T_i).$$

To summarize we have in all cases that

$$\forall \{T_i\}_{i \in \mathbb{N}} \subseteq \mathcal{P}(X) \text{ we have } \mu^* \left(\bigcup_{i \in \mathbb{N}} T_i \right) \leq \sum_{i=1}^{\infty} \mu^*(T_i) \quad (21.166)$$

Taking in account the definition of a outer measure and [eqs: 21.162, 21.163 and 21.166] it follows that

μ^* is a outer measure on X

2. If $A \in \mathcal{S}$ then for $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}$ defined by $A_i = \begin{cases} A & \text{if } i=1 \\ \emptyset & \text{if } i \in \{2, \dots, \infty\} \end{cases} \in \mathcal{S}$ we have $A = \bigcup_{i \in \mathbb{N}} A_i$ so that $A \in S[A] \Rightarrow \mathcal{S}[A] \neq \emptyset$ and

$$\sum_{i=1}^{\infty} \mu(A_i) \underset{[\text{theorem: 20.99}]}{=} \sum_{i=1}^1 \mu(A_i) + \sum_{i=2}^{\infty} \mu(A_i) = \mu(A_1) + \sum_{i=2}^{\infty} 0 = \mu(A)$$

so that $\mu(A) \in \{\sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in S[A]\}$. Hence

$$\mu^*(A) = \inf \left(\left\{ \sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in S[A] \right\} \right) \leq \mu(A)$$

proving that

$$\forall A \in \mathcal{S} \text{ we have } \mu^*(A) \leq \mu(A) \quad (21.167)$$

For the opposite inequality, let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}[A]$ then $A \subseteq \bigcup_{i \in \mathbb{N}} A_i$ so that $\bigcup_{i \in \mathbb{N}} (A \cap A_i) = A \in \mathcal{S}$. By (2.a) we have $\{A \cap A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}$ and further

$$\mu(A) = \mu \left(\bigcup_{i \in \mathbb{N}} (A \cap A_i) \right) \underset{(2.c)}{\leq} \sum_{i=1}^{\infty} \mu(A \cap A_i) \underset{(2.b)}{\leq} \sum_{i=1}^{\infty} \mu(A_i)$$

Hence $\mu(A)$ is a lower bound of $\{\sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in S[A]\}$, therefore $\mu(A) \leq \mu^*(A)$. Combining this with [eq: 21.167] gives finally

$$\mu(A) = \mu^*(A) \quad \square$$

As is mentioned in [note: 21.129] if we want that the above theorem extend a proto-measure to a outer measure we need extra conditions on the proto-ring and the proto-measure. This motivates the definition of a semi-ring and a pre-measure below.

Definition 21.130. (Semi-Ring) Let X be a set then $\mathcal{S} \subseteq \mathcal{P}(X)$ is a **semi-ring** on X if

1. $\emptyset \in \mathcal{S}$
2. $\forall A, B \in \mathcal{S}$ we have $A \cap B \in \mathcal{S}$ [in other words $\mathcal{S}$ is $\cap$ -stable]
3. $\forall A, B \in \mathcal{S}$ there exist a finite pairwise disjoint family $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that

$$A \setminus B = \bigsqcup_{i \in \{1, \dots, n\}} A_i$$

Note 21.131. As by (2) $\mathcal{S}$ is $\cap$ -stable it follows from [lemma: 21.8] that $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ we have that $\bigcap_{i \in \{1, \dots, n\}} A_i \in \mathcal{S}$.

Note 21.132. As $\emptyset \in \mathcal{S}$ it follows from the definition of a proto-ring [see definition: 21.126] that every semi-ring is a proto-ring.

Definition 21.133. (Pre-Measure) Let X be a set, $\mathcal{S}$ a semi-ring on X then a set function $\mu: \mathcal{S} \rightarrow [0, \infty]$ is a pre-measure if

1. $\mu(\emptyset) = 0$
2. For every pairwise disjoint family $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}$ such that $\bigsqcup_{i \in \mathbb{N}} A_i \in \mathcal{S}$ we have that

$$\mu \left(\bigsqcup_{i \in \mathbb{N}} A_i \right) = \sum_{i=1}^{\infty} \mu(A_i)$$

In other words $\mu: \mathcal{S} \rightarrow [0, \infty]$ is countable additive on $\mathcal{A}$

Note 21.134. As $\mu(\emptyset) = 0$ it follows from the definition of a proto-measure [see definition: 21.127] that a pre-measure on a semi-ring is a proto-measure on a proto-ring.

The above definitions do not exactly cover the extra conditions 1.a, 2.b and 2.c in [theorem: 21.128]. The next theorems will ensure that this will be satisfied by semi-rings and pre-measures.

Lemma 21.135. Let X be a set, $\mathcal{S}$ a semi-ring on X , $n \in \mathbb{N}$, $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$ and $A \in \mathcal{S}$ then there exist a pairwise disjoint family $\{B_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{S}$, $m \in \mathbb{N}$ such that

$$A \setminus \bigcup_{i \in \{1, \dots, n\}} A_i = \bigsqcup_{i \in \{1, \dots, m\}} B_i$$

Proof. We use induction to prove this. Let $A \in \mathcal{S}$ and define

$$S_A = \left\{ n \in \mathbb{N} \mid \text{If } \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S} \text{ then there exist a pairwise disjoint } \{B_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{S}, m \in \mathbb{N} \text{ such that } A \setminus \bigcup_{i \in \{1, \dots, n\}} A_i = \bigsqcup_{i \in \{1, \dots, m\}} B_i \right\}$$

then we have:

1 $\in S_A$. If $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}$ then $A \setminus \bigcup_{i \in \{1\}} A_i = A \setminus A_1$. As $\mathcal{S}$ is a semi-ring it follows that there exist a pairwise disjoint family $\{B_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{S}$, $m \in \mathbb{N}$ such that $A \setminus \bigcup_{i \in \{1\}} A_i = A \setminus A_1 = \bigsqcup_{i \in \{1, \dots, m\}} B_i$ which proves that $1 \in S_A$.

$n \in S_A \Rightarrow n+1 \in S_A$. Let $\{A_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{S}$ then as $n \in S_A$ there exist a $\{B_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{S}$ pairwise disjoint such that

$$A \setminus \bigcup_{i \in \{1, \dots, n\}} A_i = \bigsqcup_{i \in \{1, \dots, m\}} B_i \quad (21.168)$$

Further we have

$$\begin{aligned} A \setminus \bigcup_{i \in \{1, \dots, n+1\}} A_i &= A \setminus \left(\left(\bigcup_{i \in \{1, \dots, n\}} A_i \right) \cup A_{n+1} \right) \\ &\stackrel{[\text{theorem: 1.31}]}{=} \left(A \setminus \left(\bigcup_{i \in \{1, \dots, n\}} A_i \right) \right) \setminus A_{n+1} \\ &\stackrel{[\text{eq: 21.168}]}{=} \left(\bigsqcup_{i \in \{1, \dots, m\}} B_i \right) \setminus A_{n+1} \\ &\stackrel{[\text{theorem: 2.133}]}{=} \bigsqcup_{i \in \{1, \dots, m\}} (B_i \setminus A_{n+1}) \end{aligned} \quad (21.169)$$

If $i, j \in \{1, \dots, m\}$ with $i \neq j$ then we have $(B_i \setminus A_{n+1}) \cap (B_j \setminus A_{n+1}) \subseteq B_i \cap B_j = \emptyset$ proving that

$$\{B_i \setminus A_{n+1}\}_{i \in \{1, \dots, m\}} \text{ is pairwise disjoint} \quad (21.170)$$

Let $i \in \{1, \dots, m\}$ then as $\mathcal{S}$ is a semi-ring and $B_i, A_{n+1} \in \mathcal{S}$ there exist a pairwise disjoint $\{C_{i,j}\}_{j \in \{1, \dots, n_i\}} \subseteq \mathcal{S}$ such that

$$B_i \setminus A_{n+1} = \bigsqcup_{j \in \{1, \dots, n_i\}} C_{i,j} \quad (21.171)$$

Hence using [lemma: 21.10]

$$\bigsqcup_{i \in \{1, \dots, m\}} (B_i \setminus A_{n+1}) = \bigsqcup_{\sigma \in \bigcup_{i \in \{1, \dots, m\}} \{i\} \times \{1, \dots, n_i\}} C_{\sigma_1, \sigma_2} \quad (21.172)$$

and

$$\{C_{\sigma_1, \sigma_2}\}_{\sigma \in \bigcup_{i \in \{1, \dots, m\}} \{i\} \times \{1, \dots, n_i\}} \subseteq \mathcal{S} \text{ is pairwise disjoint} \quad (21.173)$$

As $\bigcup_{i \in \{1, \dots, m\}} \{i\} \times \{1, \dots, n_i\}$ is finite [see theorems: 6.41, 6.36] there exist a bijection such that $\beta: \{1, \dots, N\} \rightarrow \bigcup_{i \in \{1, \dots, m\}} \{i\} \times \{1, \dots, n_i\}$. Let $i, j \in \{1, \dots, N\}$ with $i \neq j$ then, as β is injective, we have $\beta(i) \neq \beta(j)$. For $\beta(i)_1, \beta(j)_1$ we have either:

$\beta(i)_1 = \beta(j)_1$. Then we must have that $\beta(i)_2 \neq \beta(j)_2$ so that

$$C_{\beta(i)_1, \beta(i)_2} \cap C_{\beta(j)_1, \beta(j)_2} = C_{\beta(i)_1, \beta(i)_2} \cap C_{\beta(i)_1, \beta(j)_2} = \emptyset$$

$\beta(i)_1 \neq \beta(j)_1$. Then we have

$$\begin{aligned} C_{\beta(i)_1, \beta(i)_2} \cap C_{\beta(j)_1, \beta(j)_2} &\subseteq \left(\bigcup_{k \in \{1, \dots, n_{\beta(i)_1}\}} C_{\beta(i)_1, k} \right) \cap \left(\bigcup_{k \in \{1, \dots, n_{\beta(j)_1}\}} C_{\beta(j)_1, k} \right) \\ &= B_{\beta(i)_1} \cap B_{\beta(j)_1} \\ &= \emptyset \end{aligned}$$

which proves that

$$\{C_{\beta(i)_1, \beta(i)_2}\}_{i \in \{1, \dots, N\}} \subseteq \mathcal{S} \text{ is pairwise disjoint} \quad (21.174)$$

Further

$$\begin{aligned} A \setminus \bigcup_{i \in \{1, \dots, n+1\}} A_i &\stackrel{[\text{eq: 21.169}]}{=} \bigcap_{i \in \{1, \dots, m\}} (B_i \setminus A_{n+1}) \\ &\stackrel{[\text{eq: 21.171}]}{=} \bigcap_{\sigma \in \bigcup_{i \in \{1, \dots, m\}} \{i\} \times \{1, \dots, n_i\}} C_{\sigma_1, \sigma_2} \\ &\stackrel{[\text{theorem: 2.119}]}{=} \bigcap_{i \in \{1, \dots, N\}} C_{\beta(i)_1, \beta(i)_2} \end{aligned}$$

which proves that $n+1 \in \mathcal{S}$. $\square$

Theorem 21.136. Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu: \mathcal{S} \rightarrow [0, \infty]$ a pre-measure then $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$ pairwise disjoint, $n \in \mathbb{N}$ with $\bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{S}$ we have

$$\mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^n \mu(A_i)$$

In other words a pre-measure is additive.

Proof. As for a pre-measure we have $\mu(\emptyset) = 0$ and $\mu: \mathcal{S} \rightarrow [0, \infty]$ is countable additive it follows from [theorem: 21.90] that $\mu: \mathcal{S} \rightarrow [0, \infty]$ is additive. In other words $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$ pairwise disjoint, $n \in \mathbb{N}$ with $\bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{S}$ we have

$$\mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^n \mu(A_i) \quad \square$$

Theorem 21.137. Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu: \mathcal{S} \rightarrow [0, \infty]$ a additive set function [see definition: 21.14] then we have:

1. $\forall A \in \mathcal{S}$ and $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ **pairwise disjoint** such that $\bigcup_{i \in \{1, \dots, n\}} A_i \subseteq A$ we have

$$\sum_{i=1}^n \mu(A_i) \leq \mu(A)$$

2. $\forall A, B \in \mathcal{S}$ with $A \subseteq B$ we have $\mu(A) \leq \mu(B)$

Proof.

1. As $A \in \mathcal{S}$ and $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ then by [lemma: 21.135] there exist a pairwise disjoint $\{B_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{S}$, $m \in \mathbb{N}$ such that

$$A \setminus \bigcup_{i \in \{1, \dots, m\}} A_i = \bigcup_{i \in \{1, \dots, m\}} B_i \quad (21.175)$$

Define

$$\{D_i\}_{i \in \{1, \dots, n+m\}} \subseteq \mathcal{S} \text{ by } D_i = \begin{cases} A_i & \text{if } i \in \{1, \dots, n\} \\ B_{i-n} & \text{if } i \in \{n+1, \dots, n+m\} \end{cases} \subseteq \mathcal{S}$$

Let $i, j \in \{1, \dots, n+m\}$ with $i \neq j$ then we can always assume that $i < j$ [otherwise exchange i and j]. For i we have either:

$i \in \{1, \dots, n\}$. Then for j we have either:

$j \in \{1, \dots, n\}$. Then $D_i \cap D_j = A_i \cap A_j$ $\stackrel{\{A_i\}_{i \in \{1, \dots, n\}} \text{ is pairwise disjoint}}{=} \emptyset$

$j \in \{n+1, \dots, n+m\}$. Then

$$D_i \cap D_j = A_i \cap B_{j-n} \subseteq A_i \cap \left(A \setminus \bigcup_{i \in \{1, \dots, n\}} A_i \right) = \emptyset$$

$i \in \{n+1, \dots, n+m\}$. Then as $i < j$ we have $j \in \{n+1, \dots, n+m\}$ so that

$$D_i \cap D_j = B_{i-n} \cap B_{j-n} \stackrel{i-n \neq j-n}{=} \emptyset$$

hence

$$\{D_i\}_{i \in \{1, \dots, n+m\}} \subseteq \mathcal{S} \text{ is pairwise disjoint} \quad (21.176)$$

Further as $\bigsqcup_{i \in \{1, \dots, n\}} A_i \subseteq A$ we have

$$\begin{aligned} A &\stackrel{[\text{theorem: 1.35}]}{=} \left(A \setminus \bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \cup \left(\bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \\ &= \left(\bigsqcup_{i \in \{1, \dots, m\}} B_i \right) \sqcup \left(\bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \\ &= \left(\bigsqcup_{i \in \{1, \dots, m\}} D_{i+n} \right) \sqcup \left(\bigsqcup_{i \in \{1, \dots, n\}} D_i \right) \\ &\stackrel{[\text{theorem: 2.119}]}{=} \left(\bigsqcup_{i \in \{n+1, \dots, n+m\}} D_i \right) \sqcup \left(\bigsqcup_{i \in \{1, \dots, n\}} D_i \right) \\ &\stackrel{[\text{theorem: 2.128}]}{=} \bigsqcup_{i \in \{1, \dots, n+m\}} D_i \end{aligned} \quad (21.177)$$

So as $\bigsqcup_{i \in \{1, \dots, n+m\}} D_i = A \in \mathcal{S}$ we have

$$\begin{aligned} \mu(A) &\stackrel{[\text{eq: 21.177}]}{=} \mu \left(\bigsqcup_{i \in \{1, \dots, n+m\}} D_i \right) \\ &\stackrel{\mu \text{ is additive}}{=} \sum_{i=1}^{n+m} \mu(D_i) \\ &= \sum_{i=1}^n \mu(D_i) + \sum_{i=n+1}^{n+m} \mu(D_i) \\ &= \sum_{i=1}^n \mu(A_i) + \sum_{i=n+1}^{n+m} \mu(D_i) \end{aligned}$$

so that by [theorem: 20.34] we have

$$\sum_{i=1}^n \mu(A_i) \leq \mu(A)$$

2. Let $A, B \in \mathcal{S}$ with $A \subseteq B$. Take then $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}$ by $A_i = A$ then we have $\bigsqcup_{i \in \{1\}} A_i = A \subseteq B$, hence by (1) it follows that $\mu(A) = \sum_{i=1}^1 \mu(A_i) \leq \mu(B)$ $\square$

Corollary 21.138. Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu: \mathcal{S} \rightarrow [0, \infty]$ a pre-measure on $\mathcal{S}$ [see definition: 21.133] then we have:

1. $\forall A \in \mathcal{S}$ and $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ pairwise disjoint such that $\bigcup_{i \in \{1, \dots, n\}} A_i \subseteq A$ we have

$$\sum_{i=1}^n \mu(A_i) \leq \mu(A)$$

2. $\forall A, B \in \mathcal{S}$ with $A \subseteq B$ we have $\mu(A) \leq \mu(B)$

Proof. As a pre-measure is additive [see theorem: 21.136] this follows from the previous theorem [theorem: 21.137]. $\square$

Theorem 21.139. Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu: \mathcal{S} \rightarrow [0, \infty]$ a pre-measure then

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S} \text{ with } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{S} \text{ we have } \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \leq \sum_{i=0}^{\infty} \mu(A_i)$$

In other words μ is countable sub-additive.

Proof. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}$ be a sequence such that $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{S}$. Define

$$\{B_i\}_{i \in \mathbb{N}} \text{ by } B_i = \begin{cases} A_1 & \text{if } i = 1 \\ A_i \setminus \bigcup_{j \in \{1, \dots, i-1\}} A_j & \text{if } i \in \{2, \dots, \infty\} \end{cases}$$

then by [lemma: 21.5]

$$\{B_i\}_{i \in \mathbb{N}} \text{ is pairwise disjoint and } \bigcup_{i \in \mathbb{N}} A_i = \bigsqcup_{i \in \mathbb{N}} B_i \text{ and } \forall i \in \mathbb{N} \ B_i \subseteq A_i \quad (21.178)$$

Note that the sets B_i are not elements of $\mathcal{S}$, however we will show that each B_i is a finite pairwise disjoint union of sets in $\mathcal{S}$ so that we can write $\bigcup_{i \in \mathbb{N}} A_i$ as countable pairwise disjoint union of elements of $\mathcal{S}$, allowing use to apply countable additivity. Let $i \in \mathbb{N}$ then we have either:

$i = 1$. Define $n_1 = 1$ and $\{C_{1,j}\}_{j \in \{1, \dots, n_1\}} \subseteq \mathcal{S}$ by $C_{1,1} = A_1 \in \mathcal{S}$ then $\{C_{1,j}\}_{j \in \{1, \dots, n_1\}} \subseteq \mathcal{S}$ is pairwise disjoint and $B_1 = A_1 = \bigsqcup_{j \in \{1, \dots, n_1\}} C_{1,j}$

$i \in \{2, \dots, \infty\}$. By [lemma: 21.135] there exist a pairwise disjoint family $\{C_{i,j}\}_{j \in \{1, \dots, n_i\}} \subseteq \mathcal{S}$ such that $B_i = A_i \setminus \bigcup_{j \in \{1, \dots, i-1\}} A_j = \bigsqcup_{j \in \{1, \dots, n_i\}} C_{i,j}$.

Hence we have

$$\forall i \in \mathbb{N} \ \exists \{C_{i,j}\}_{j \in \{1, \dots, n_i\}} \subseteq \mathcal{S} \text{ pairwise disjoint such that } B_i = \bigsqcup_{j \in \{1, \dots, n_i\}} C_{i,j} \quad (21.179)$$

By [corollary: 6.75] it follows that $\bigcup_{i \in \mathbb{N}} \{i\} \times \{1, \dots, n_i\}$ is denumerable, hence there exist a bijection

$$\beta: \mathbb{N} \rightarrow \bigcup_{i \in \mathbb{N}} \{i\} \times \{1, \dots, n_i\}$$

Using the above and [eq: 21.179] allows us to use [corollary: 21.11] giving

$$\{C_{\beta(i)_1, \beta(i)_2}\}_{i \in \mathbb{N}} \subseteq \mathcal{S} \text{ is pairwise disjoint and } \bigcup_{i \in \mathbb{N}} A_i \stackrel{[\text{eq: 21.178}]}{=} \bigsqcup_{i \in \mathbb{N}} B_i = \bigsqcup_{i \in \mathbb{N}} C_{\beta(i)_1, \beta(i)_2} \quad (21.180)$$

So we have as $\bigsqcup_{i \in \mathbb{N}} C_{\beta(i)_1, \beta(i)_2} = \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{S}$ that

$$\begin{aligned} \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) &\stackrel{[\text{eq: 21.180}]}{=} \mu\left(\bigsqcup_{i \in \mathbb{N}} C_{\beta(i)_1, \beta(i)_2}\right) \\ &\stackrel{\mu \text{ is a pre-measure}}{=} \sum_{i=1}^{\infty} \mu(C_{\beta(i)_1, \beta(i)_2}) \\ &\stackrel{[\text{theorem: 20.106}]}{=} \sum_{i=1}^{\infty} \left(\sum_{j=1}^{n_i} \mu(C_{i,j}) \right) \end{aligned} \quad (21.181)$$

As $\forall i \in \mathbb{N} \bigcup_{j \in \{1, \dots, n_i\}} C_{i,j} \stackrel{\text{[eq: 21.179]}}{=} B_i \subseteq A_i$ it follows from [corollary: 21.138(1)] and [eq: 21.180] that $\sum_{j=1}^{n_i} \mu(C_{i,j}) \leq \mu(A_i)$, which combined with [eq: 21.181] and [theorem: 20.98] gives

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \leq \sum_{i=1}^{\infty} \mu(A_i) \quad \square$$

We can now combine the above theorems to prove a version of [theorem: 21.128] for semi-rings and pre-measures.

Theorem 21.140. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring and $\mu: \mathcal{S} \rightarrow [0, \infty]$ a pre-measure on $\mathcal{S}$ then*

$$\mu^*: \mathcal{P}(X) \rightarrow [0, \infty] \text{ defined by } \mu^*(A) = \begin{cases} \inf(\{\sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[A]\}) & \text{if } \mathcal{S}[A] \neq \emptyset \\ \infty & \text{if } \mathcal{S}[A] = \emptyset \end{cases}$$

where

$$\mathcal{S}[A] = \left\{ \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S} \mid A \subseteq \bigcup_{i \in \mathbb{N}} A_i \right\}$$

is a outer measure and

$$\forall A \in \mathcal{S} \text{ we have } \mu^*(A) = \mu(A)$$

so that

$$\mu^* \text{ is a extension of } \mu$$

Proof. As μ is a pre-measure [see definition: 21.133] we have that $\mu(\emptyset) = 0$ hence

$$\mu \text{ is a proto-measure on } \mathcal{S}$$

Using [theorems: 21.138, 21.139] it follows that

$$\begin{aligned} & \forall A, B \in \mathcal{S} \text{ with } A \subseteq B \text{ we have } \mu(A) \leq \mu(B) \\ & \forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S} \text{ such that } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{S} \text{ we have } \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \leq \sum_{i=1}^{\infty} \mu(A_i) \end{aligned}$$

and as $\mathcal{S}$ is a semi-ring we have

$$\forall A, B \in \mathcal{S} \text{ we have } A \cap B \in \mathcal{S}$$

So all conditions for [theorem: 21.128] are satisfied so that

$$\mu^* \text{ is a outer measure on } S \text{ and } \forall A \in \mathcal{S} \text{ we have } \mu^*(A) = \mu(A) \quad \square$$

In the above proof we use the fact that a pre-measure is countable sub-additive [see theorem 21.139] but never the countable additivity that is part of the definition of a pre-measure. So why do we define a pre-measure to be countable additive and not just countable sub-additive? The answer lies in proving the existence of a **unique extension** of a pre-measure on a semi-ring $\mathcal{S}$ to a measure on $\sigma[\mathcal{S}]$. To extend the pre-measure μ on $\mathcal{S}$ we first use the previous theorem [theorem: 21.128] to create a outer-measure μ^* that extend μ [here the need for countable sub-additivity], next use the Carathéodory theorem [theorem: 21.116] to find a measure on $\mathcal{M}[\mu^*]$. However to make sure that the constructed measure is also a measure on $\sigma[\mathcal{S}]$ we still have to prove that $\sigma[\mathcal{S}] \subseteq \mathcal{M}[\mu^*]$ and this is where we need additivity of μ . The countable additivity of a pre-measure ensures additional the additivity and countable sub-additivity of the pre-measure. Another way to look at this is the following, if μ on $\mathcal{S}$ is extended to a countable additive measure on $\sigma[\mathcal{S}]$ then we must have, as $\mathcal{S} \subseteq \sigma[\mathcal{S}]$, that μ is also countable additive.

Theorem 21.141. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu: \mathcal{S} \rightarrow [0, \infty]$ a pre-measure on $\mathcal{S}$ and define*

$$\mu^*: \mathcal{P}(X) \rightarrow [0, \infty] \text{ defined by } \mu^*(A) = \begin{cases} \infty & \text{if } \mathcal{S}[A] = \emptyset \\ \inf(\{\sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[A]\}) & \end{cases}$$

where

$$\mathcal{S}[A] = \left\{ \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S} \mid A \subseteq \bigcup_{i \in \mathbb{N}} A_i \right\}$$

and

$$\mathcal{M}[\mu^*] = \{A \in \mathcal{P}(X) \mid \forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) = \mu^*(B \cap A) + \mu^*(B \setminus A)\}$$

then

μ^* is a outer measure

$\mathcal{M}[\mu^*]$ is a σ -algebra on X

and

$$(\mu^*)|_{\mathcal{S}} = \mu \text{ [in other words } \mu^* \text{ extends } \mu]$$

and

$$(\mu^*)|_{\mathcal{M}[\mu^*]}: \mathcal{M}[\mu^*] \rightarrow [0, \infty] \text{ is a measure on } \mathcal{M}[\mu^*]$$

and

$$\mathcal{S} \subseteq \mathcal{M}[\mu^*]$$

so that by [theorem: 21.39]

$$\sigma[\mathcal{S}] \subseteq \mathcal{M}[\mu^*]$$

and by [theorem: 21.103]

$$(\mu^*)|_{\sigma[\mathcal{S}]}: \sigma[\mathcal{S}] \rightarrow [0, \infty] \text{ is a measure on } \sigma[\mathcal{S}]$$

Hence

$$\langle X, \mathcal{M}[\mu^*], (\mu^*)|_{\mathcal{M}[\mu^*]} \rangle \text{ and } \langle X, \sigma[\mathcal{S}], (\mu^*)|_{\sigma[\mathcal{S}]} \rangle \text{ are measure spaces}$$

where

$$\forall A \in \mathcal{S} \text{ we have } \mu(A) = \mu^*(A) = (\mu^*)|_{\mathcal{M}[\mu^*]}(A) = (\mu^*)|_{\sigma[\mathcal{S}]}(A)$$

If additional there exist a $\{G_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}$ such that $\forall i \in \mathbb{N} \ G_i \subseteq G_{i+1} \wedge \mu(G_i) < \infty$ and $X = \bigcup_{i \in \mathbb{N}} G_i$ then if $\nu: \sigma[\mathcal{S}] \rightarrow [0, \infty]$ is a another measure on $\sigma[\mathcal{S}]$ such that $\nu|_{\mathcal{S}} = (\mu^*)|_{\mathcal{S}}$ then

$$\nu = (\mu^*)|_{\sigma[\mathcal{S}]}$$

In other words the extension of μ to a measure $(\mu^*)|_{\sigma[\mathcal{S}]}$ on $\sigma[\mathcal{S}]$ is unique.

Note 21.142. We need additivity on μ to prove that $\mathcal{S} \subseteq \mathcal{M}[\mu^*]$ which is essential for the last part of the theorem.

Proof. Using [theorem: 21.140] we have

$$\mu^*: \mathcal{P}(X) \rightarrow [0, \infty] \text{ defined by } \mu^*(A) = \begin{cases} \inf(\{\sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[A]\}) & \text{if } \mathcal{S}[A] \neq \emptyset \\ \infty & \text{if } \mathcal{S}[A] = \emptyset \end{cases} \quad (21.182)$$

where

$$\mathcal{S}[A] = \left\{ \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S} \mid A \subseteq \bigcup_{i \in \mathbb{N}} A_i \right\} \quad (21.183)$$

is a outer measure and

$$\forall A \in \mathcal{S} \text{ we have } \mu^*(A) = \mu(A) \text{ hence } (\mu^*)|_{\mathcal{S}} = \mu \quad (21.184)$$

As μ^* is a outer measure we can use the Carathéodory [theorem: 21.116] so that

$$\mathcal{M}[\mu^*] = \{A \in \mathcal{P}(X) \mid \forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) = \mu^*(B \cap A) + \mu^*(B \setminus A)\}$$

is a σ -algebra on X and

$$(\mu^*)|_{\mathcal{M}[\mu^*]}: \mathcal{M}[\mu^*] \rightarrow [0, \infty] \text{ is a measure on the } \sigma\text{-algebra } \mathcal{M}[\mu^*] \quad (21.185)$$

so that

$$\langle X, \mathcal{M}[\mu^*], (\mu^*)|_{\mathcal{M}[\mu^*]} \rangle \text{ a measure space} \quad (21.186)$$

Next we have to prove that $\mathcal{S} \subseteq \mathcal{M}[\mu^*]$. Let $R, T \in \mathcal{S}$ then as $\mathcal{S}$ is a semi-ring there exist a $m \in \mathbb{N}$, $\{S_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{S}$ pairwise disjoint such that

$$T \setminus R = \bigsqcup_{i \in \{1, \dots, m\}} S_i \text{ and } R \cap T \in \mathcal{S} \quad (21.187)$$

Define now

$$\{D_i\}_{i \in \{1, \dots, m+1\}} \subseteq \mathcal{S} \text{ by } D_i = \begin{cases} S_i & \text{if } i \in \{1, \dots, m\} \\ R \cap T & \text{if } i = m+1 \end{cases} \in \mathcal{S}$$

Let $i, j \in \{1, \dots, m+1\}$ with $i \neq j$ then we may always assume that $i < j$ [otherwise exchange i and j], so that we have the following possibilities for j :

$j = m+1$. Then, as $i < j$, $i \in \{1, \dots, m\}$ so that

$$\begin{aligned} D_i \cap D_j &= S_i \cap (R \cap T) \\ &\subseteq \left(\bigsqcup_{i \in \{1, \dots, m\}} S_i \right) \cap (R \cap T) \\ &\stackrel{[\text{eq: 21.187}]}{=} (T \setminus R) \cap (R \cap T) \\ &\subseteq (T \setminus R) \cap R \\ &= \emptyset \end{aligned}$$

hence we have $D_i \cap D_j = \emptyset$.

$j \in \{1, \dots, m\}$. Then, as $i < j$, $i \in \{1, \dots, m\}$ so that $D_i \cap D_j = S_i \cap S = \emptyset$

which proves that

$$\{D_i\}_{i \in \{1, \dots, m+1\}} \subseteq \mathcal{S} \text{ is pairwise disjoint}$$

Further

$$\begin{aligned} T &= (T \setminus R) \cup (T \cap R) \\ &= \left(\bigsqcup_{i \in \{1, \dots, m\}} S_i \right) \cup (T \cap R) \\ &= \left(\bigsqcup_{i \in \{1, \dots, m\}} D_i \right) \cup D_{m+1} \\ &= \bigsqcup_{i \in \{1, \dots, m+1\}} D_i \end{aligned}$$

Hence

$$\bigsqcup_{i \in \{1, \dots, m+1\}} D_i = T \in \mathcal{S} \quad (21.188)$$

As by [theorem: 21.136] μ is additive on $\mathcal{S}$ we have

$$\begin{aligned} \mu(T) &\stackrel{[\text{eq: 21.188}]}{=} \mu\left(\bigsqcup_{i \in \{1, \dots, m+1\}} D_i\right) \\ &\stackrel{\mu \text{ is additive}}{=} \sum_{i=1}^{m+1} \mu(D_i) \\ &= \mu(D_{m+1}) + \sum_{i=1}^m \mu(D_i) \\ &= \mu(R \cap T) + \sum_{i=1}^m \mu(S_i) \end{aligned}$$

hence

$$\mu(T) = \mu(R \cap T) + \sum_{i=1}^m \mu(S_i) \quad (21.189)$$

Further as a outer measure is sub-additive [see definition: 21.111 and theorem: 21.20] we have

$$\begin{aligned}
 \mu^*(R \cap T) + \mu^*(T \setminus R) & \stackrel{[\text{eq: 21.187}]}{=} \mu^*(R \cap T) + \mu^*\left(\bigsqcup_{i \in \{1, \dots, m\}} S_i\right) \\
 & \stackrel{\text{sub-additivity of } \mu^*}{\leq} \mu^*(R \cap T) + \sum_{i=1}^m \mu^*(S_i) \\
 & \stackrel{[\text{eq: 21.184}]}{=} \mu(R \cap T) + \sum_{i=1}^m \mu(S_i) \\
 & \stackrel{[\text{eq: 21.189}]}{=} \mu(T)
 \end{aligned}$$

To summarize we have proved the following:

$$\forall R, S \in \mathcal{S} \text{ we have that } \mu^*(R \cap T) + \mu^*(T \setminus R) \leq \mu(T) \quad (21.190)$$

Let $A \in \mathcal{S}$ and take $B \in \mathcal{P}(X)$. For B we have either:

$\mathcal{S}[B] = \emptyset$. Then $\mu^*(B \setminus A) + \mu^*(B \cap A) \leq \infty = \mu^*(B)$

$\mathcal{S}[B] \neq \emptyset$. Let $\{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[B]$ then we have

$$\begin{aligned}
 \sum_{i=1}^{\infty} \mu^*(A_i \cap A) + \sum_{i=1}^{\infty} \mu^*(A_i \setminus A) & \stackrel{[\text{theorem: 20.98}]}{=} \\
 \sum_{i=1}^{\infty} (\mu^*(A_i \cap A) + \mu^*(A_i \setminus A)) & \stackrel{[\text{theorem: 20.98}] \text{ and } [\text{eq: 21.190}]}{\leq} \sum_{i=1}^{\infty} \mu(A_i) \quad (21.191)
 \end{aligned}$$

As $\{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[B]$ we have $B \subseteq \bigcup_{i \in \mathbb{N}} A_i$ so that

$$B \setminus A \subseteq \left(\bigcup_{i \in \mathbb{N}} A_i \right) \setminus A = \bigcup_{i \in \mathbb{N}} (A_i \setminus A) \text{ and } B \cap A \subseteq \left(\bigcup_{i \in \mathbb{N}} A_i \right) \cap A = \bigcup_{i \in \mathbb{N}} (A_i \cap A)$$

As μ^* is a outer measure hence monotone by definition [see definition: 21.111(2)] it follows from the above that

$$\mu^*(B \setminus A) \leq \mu^*\left(\bigcup_{i \in \mathbb{N}} (A_i \setminus A)\right) \text{ and } \mu^*(B \cap A) \leq \mu^*\left(\bigcup_{i \in \mathbb{N}} (A_i \cap A)\right) \quad (21.192)$$

Further using the sub-additivity of a outer measure [see definition: 21.111(3)] we have

$$\mu^*\left(\bigcup_{i \in \mathbb{N}} (A_i \setminus A)\right) \leq \sum_{i=1}^{\infty} \mu^*(A_i \setminus A) \text{ and } \mu^*\left(\bigcup_{i \in \mathbb{N}} (A_i \cap A)\right) \leq \sum_{i=1}^{\infty} \mu^*(A_i \cap A)$$

which combined with [eq: 21.192] gives

$$\mu^*(B \setminus A) \leq \sum_{i=1}^{\infty} \mu^*(A_i \setminus A) \text{ and } \mu^*(B \cap A) \leq \sum_{i=1}^{\infty} \mu^*(A_i \cap A)$$

so that

$$\begin{aligned}
 \mu^*(B \setminus A) + \mu^*(B \cap A) & \leq \sum_{i=1}^{\infty} \mu^*(A_i \setminus A) + \sum_{i=1}^{\infty} \mu^*(A_i \cap A) \\
 & \stackrel{[\text{eq: 21.191}]}{\leq} \sum_{i=1}^{\infty} \mu(A_i)
 \end{aligned}$$

So $\mu^*(B \setminus A) + \mu^*(B \cap A)$ is a lower bound for $\{\sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[B]\}$ so that

$$\mu^*(B \setminus A) + \mu^*(B \cap A) \leq \inf \left(\left\{ \sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[B] \right\} \right) \stackrel{[\text{eq: 21.182}]}{=} \mu^*(B)$$

So in all cases we have that $\mu^*(B \setminus A) + \mu^*(B \cap A) \leq \mu^*(B)$ which by [theorem: 21.114] means that $A \in \mathcal{M}[\mu^*]$. As $A \in \mathcal{S}$ was chosen arbitrary we conclude that

$$\mathcal{S} \subseteq \mathcal{M}[\mu^*] \quad (21.193)$$

As $\mathcal{M}[\mu^*]$ is a σ -algebra it follows from [theorem: 21.39] that

$$\mathcal{S} \subseteq \sigma[\mathcal{S}] \subseteq \mathcal{M}[\mu^*] \quad (21.194)$$

From the above, [eq: 21.185] and [theorem: 21.103] it follows that

$$(\mu^*)|_{\sigma[\mathcal{S}]} \stackrel{[theorem: 2.86 (3)]}{=} ((\mu^*)|_{\mathcal{M}[\mu^*]})|_{\sigma[\mathcal{S}]} \text{ is a measure on } \sigma[\mathcal{S}]$$

making

$$\langle X, \sigma[\mathcal{S}], (\mu^*)|_{\sigma[\mathcal{S}]} \rangle \text{ a measure space}$$

Finally assume additional that there exist a $\{G_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}$ such that $\forall i \in \mathbb{N} \ G_i \subseteq G_{i+1} \wedge \mu(G_i) < \infty$. Let $\nu: \sigma[\mathcal{S}] \rightarrow [0, \infty]$ be a measure such that $\forall A \in \mathcal{S}$ we have $\mu(A) = \nu(A)$ then as $(\mu^*)|_{\sigma[\mathcal{S}]}(A) = \mu^*(A) \stackrel{[eq: 21.184]}{=} \mu(A)$ it follows that $\forall A \in \mathcal{S} \ (\mu^*)|_{\sigma[\mathcal{S}]}(A) = \nu(A)$. Hence by [theorem: 21.125] it follows that

$$(\mu^*)|_{\sigma[\mathcal{S}]} = \nu$$

proving uniqueness. $\square$

21.3.4.2 Contents and pre-measures

So given a pre-measure μ on a semi-ring $\mathcal{S}$ we can extend μ to a measure on $\sigma[\mathcal{S}]$ and from there to a measure on $\mathcal{M}[\mathcal{S}]$. In the next section we show a way of proving that a additive set-function on a ring [see definition: 21.21] can be extended [if certain conditions are satisfied] to a pre-measure. First we show that every ring is actually a semi-ring.

Theorem 21.143. *Let X be a set, $\mathcal{R} \subseteq \mathcal{P}(X)$ a ring [see definition: 21.21] then $\mathcal{R}$ is a semi-ring [see definition: 21.130].*

Proof. As $\mathcal{R}$ is a ring we have by [theorem: 21.24] that

$$\emptyset \in \mathcal{R} \text{ and } \forall A, B \in \mathcal{R} \text{ we have } A \cap B \in \mathcal{R}$$

Further if $A, B \in \mathcal{R}$ then by the definition of a ring [see definition: 21.21] $A \setminus B \in \mathcal{R}$. So if we define $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{R}$ by $A_1 = A \setminus B$ we have that $A \setminus B = \bigsqcup_{i \in \{1\}} A_i$. Hence we have proved that

$$\forall A, B \in \mathcal{R} \ \exists \{A_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{R} \text{ pairwise disjoint such that } A \setminus B = \bigsqcup_{i \in \{1, \dots, m\}} A_i \quad \square$$

Next we define what a **content** is.

Definition 21.144. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring then $\mu: \mathcal{S} \rightarrow [0, \infty]$ is a **content** on $\mathcal{S}$ if*

1. $\mu(\emptyset) = 0$
2. $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}, n \in \mathbb{N}$ pairwise disjoint such that $\bigsqcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{S}$ we have $\mu(\bigsqcup_{i \in \{1, \dots, n\}} A_i) = \sum_{i=1}^n \mu(A_i)$.

A content is **finite** if $\forall A \in \mathcal{S} \ \mu(A) < \infty$.

Note 21.145. *If $\mathcal{S}$ is a ring then (2) can be replaced by*

$$\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}, n \in \mathbb{N} \text{ we have } \mu\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^n \mu(A_i)$$

because [theorem: 21.24] ensures that $\bigsqcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{S}$.

Lemma 21.146. *Let X be a set $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring then a pre-measure $\mu: \mathcal{S} \rightarrow [0, \infty]$ is a content*

Proof. From the definition of a pre-measure [see definition: 21.133] it follows that

$$\mu(\emptyset) = 0$$

Further $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}, n \in \mathbb{N}$ pairwise disjoint such that $\bigsqcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{S}$ we have by [theorem: 21.136] that

$$\mu\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^n \mu(A_i)$$

□

We have a simpler equivalent definition of a content on a ring.

Theorem 21.147. *Let X be a set, $\mathcal{R}$ a ring on X and $\mu: \mathcal{R} \rightarrow [0, \infty]$ a function such that $\mu(\emptyset) = 0$ [in other words μ is a proto-measure] then*

$$\mu \text{ is a content} \Leftrightarrow \forall A, B \in \mathcal{R} \text{ with } A \cap B = \emptyset \text{ we have } \mu(A \sqcup B) = \mu(A) + \mu(B)$$

Proof.

$\Rightarrow$. Let $A, B \in \mathcal{R}$ with $A \cap B = \emptyset$ and define $\{A_i\}_{i \in \{1, 2\}} \subseteq \mathcal{R}$ by $A_1 = A$ and $A_2 = B$, then $\{A_i\}_{i \in \{1, 2\}}$ is pairwise disjoint and $\mu(A \sqcup B) = \mu(\bigcup_{i \in \{1, 2\}} A_i) = \sum_{i=1}^2 \mu(A_i) = \mu(A) + \mu(B)$.

$\Leftarrow$. We prove this by induction so let

$$\mathcal{S} = \{n \in \mathbb{N} \mid \text{if } \{A_i\}_{i \in \{1, \dots, n\}} \text{ is a pairwise disjoint family of sets in } \mathcal{R}\}$$

then we have

1 $\in \mathcal{S}$. If $\{A_i\}_{i \in \{1, \dots, 1\}}$ is a pairwise disjoint family of sets in $\mathcal{R}$ then

$$\mu\left(\bigsqcup_{i \in \{1, \dots, 1\}} A_i\right) = \mu(A_1) = \sum_{i=1}^1 \mu(A_i)$$

proving that $1 \in \mathcal{S}$.

$n \in \mathcal{S} \Rightarrow n+1 \in \mathcal{S}$. If $\{A_i\}_{i \in \{1, \dots, n+1\}}$ is a pairwise disjoint family of sets in $\mathcal{R}$ then we have $\bigsqcup_{i \in \{1, \dots, n+1\}} A_i = (\bigsqcup_{i \in \{1, \dots, n\}} A_i) \sqcup A_{n+1}$ so that

$$\begin{aligned} \mu\left(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i\right) &= \mu\left(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i\right) \\ &= \mu\left(\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) \sqcup A_{n+1}\right) \\ &= \mu\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) + \mu(A_{n+1}) \\ &\stackrel{n \in \mathcal{S}}{=} \left(\sum_{i=1}^n \mu(A_i)\right) + \mu(A_{n+1}) \\ &= \sum_{i=1}^{n+1} \mu(A_i) \end{aligned}$$

proving that $n+1 \in \mathcal{S}$. □

A content has the following properties:

Theorem 21.148. *Let X be a set, $\mathcal{R}$ a ring on X and $\mu: \mathcal{R} \rightarrow [0, \infty]$ a content on $\mathcal{R}$ then we have:*

1. $\forall A, B \in \mathcal{R}$ we have $\mu(A \cup B) + \mu(A \cap B) = \mu(A) + \mu(B)$
2. $\forall A, B \in \mathcal{R}$ with $A \subseteq B$ we have $\mu(A) \leq \mu(B)$ [μ is monotone].
3. $\forall A, B \in \mathcal{R}$ with $A \subseteq B$ and $\mu(A) < \infty$ we have $\mu(B \setminus A) = \mu(B) - \mu(A)$.

4. $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{R}$, $n \in \mathbb{N}$ we have $\mu(\bigcup_{i \in \{1, \dots, n\}} A_i) \leq \sum_{i=1}^n \mu(A_i)$ [sub-additivity]
 5. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ pairwise disjoint such that $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{R}$ we have $\sum_{i=1}^{\infty} \mu(A_i) \leq \mu(\bigcup_{i \in \mathbb{N}} A_i)$.

Proof. First as $\mathcal{R}$ is a ring we have that $\forall A, B \in \mathcal{R}$ $B \setminus A \in \mathcal{R}$, further

1. As $A \cup (B \setminus A) \stackrel{[\text{theorem: 1.35}]}{=} A \cup B$ with $A \cap (B \setminus A) \stackrel{[\text{theorem: 1.35}]}{=} \emptyset$ and μ is a content we have

$$\mu(A \cup B) = \mu(A) + \mu(B \setminus A) \quad (21.195)$$

Further $B \stackrel{[\text{theorem: 1.35}]}{=} (A \cap B) \cup (B \setminus A)$ with $(A \cap B) \cap (B \setminus A) \stackrel{[\text{theorem: 1.35}]}{=} \emptyset$ so that

$$\mu(B) = \mu(A \cap B) + \mu(B \setminus A) \quad (21.196)$$

For $\mu(B \setminus A)$ we have either:

$\mu(B \setminus A) < \infty$. As μ is non negative we can sum [eq: 21.195] and [eq: 21.196] giving

$$\mu(A \cup B) + \mu(A \cap B) + \mu(B \setminus A) = \mu(B) + \mu(A) + \mu(B \setminus A)$$

and we can use [theorem: 20.28] to get

$$\mu(A \cup B) + \mu(A \cap B) = \mu(B) + \mu(A)$$

$\mu(B \setminus A) = \infty$. Then

$$\mu(A \cup B) \stackrel{[\text{eq: 21.195}]}{=} \mu(A) + \mu(B \setminus A) = \mu(A) + \infty = \infty$$

and

$$\mu(B) \stackrel{[\text{eq: 21.196}]}{=} \mu(A \cap B) + \mu(B \setminus A) = \mu(A \cap B) + \infty = \infty$$

so that

$$\mu(A \cup B) + \mu(A \cap B) = \infty + \mu(A \cap B) = \infty = \mu(A) + \infty = \mu(A) + \mu(B)$$

So in all cases we have

$$\mu(A \cup B) + \mu(A \cap B) = \mu(B) + \mu(A)$$

2. If $A, B \in \mathcal{R}$ with $A \subseteq B$ then $A \cup B = B$ so that

$$\mu(B) = \mu(A \cup B) \stackrel{[\text{eq: 21.195}]}{=} \mu(A) + \mu(B \setminus A) \quad (21.197)$$

then by [theorem: 20.34] it follows that

$$\mu(A) \leq \mu(B)$$

3. As $A \subseteq B$ we have by [eq: 21.197] that $\mu(B) = \mu(A) + \mu(B \setminus A)$ so as $\mu(A) < \infty$ we can safely add $-\mu(A)$ to both sides giving

$$\mu(B) - \mu(A) = \mu(A) + \mu(B \setminus A) - \mu(A) = \mu(B \setminus A)$$

4. Let $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{R}$ and define

$$\{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{R} \text{ by } B_i = \begin{cases} A_1 & \text{if } i = 1 \\ A_i \setminus \bigcup_{j \in \{1, \dots, i-1\}} A_j & \text{if } i > 1 \end{cases} \in \mathcal{R} \text{ as } \mathcal{R} \text{ is a ring and } [\text{theorem: 21.24}]$$

so that

$$\{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{R} \text{ and } \forall i \in \{1, \dots, n\} \ B_i \subseteq A_i \stackrel{(2)}{\Rightarrow} \mu(B_i) \leq \mu(A_i) \quad (21.198)$$

Using [lemma: 21.5] we have that

$$\{B_i\}_{i \in \{1, \dots, n\}} \text{ is pairwise disjoint and } \bigcup_{i \in \{1, \dots, n\}} A_i = \bigsqcup_{i \in \{1, \dots, n\}} B_i \quad (21.199)$$

Hence

$$\begin{aligned} \mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) &\stackrel{[\text{eq: 21.199}]}{=} \mu\left(\bigsqcup_{i \in \{1, \dots, n\}} B_i\right) \\ &\stackrel{[\text{definition: 21.144}]}{=} \sum_{i=1}^n \mu(B_i) \\ &\stackrel{[\text{eq: 21.198}]}{\leq} \sum_{i=1}^n \mu(A_i) \end{aligned}$$

5. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ be a pairwise disjoint sequence of sets in $\mathcal{R}$ such that $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{R}$. Let $n \in \mathbb{N}$ then we have $\bigsqcup_{i \in \{1, \dots, n\}} A_i \subseteq \bigsqcup_{i \in \mathbb{N}} A_i$ so that

$$\sum_{i=1}^n \mu(A_i) \stackrel{[\text{definition: 21.144}]}{=} \mu\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) \stackrel{(2)}{\leq} \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \quad (21.200)$$

Hence $\mu(\bigcup_{i \in \mathbb{N}} A_i)$ is an upper bound of $\{\sum_{i=1}^n \mu(A_i) | n \in \mathbb{N}\}$ so that

$$\sup\left(\left\{\sum_{i=1}^n \mu(A_i) | n \in \mathbb{N}\right\}\right) \leq \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right)$$

Hence

$$\sum_{i=1}^{\infty} \mu(A_i) \stackrel{[\text{definition: 20.94}]}{=} \sup\left(\left\{\sum_{i=1}^n \mu(A_i) | n \in \mathbb{N}\right\}\right) \leq \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right)$$

□

Similar to [theorems: 21.109, 21.110] we have the following necessary and sufficient conditions for a content to be a pre-measure.

Theorem 21.149. *Let X be a set, $\mathcal{R} \subseteq X$ a ring on X and $\mu: \mathcal{R} \rightarrow [0, \infty]$ a content then for the following statements:*

1. μ is a pre-measure
2. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ such that $\forall i \in \mathbb{N} A_i \subseteq A_{i+1}$ and $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{R}$ we have $\mu(\bigcup_{i \in \mathbb{N}} A_i) = \lim_{i \rightarrow \infty} \mu(A_i)$.
3. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ such that $\forall i \in \mathbb{N} A_{i+1} \subseteq A_i$ and $\mu(A_i) < \infty$ and $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{R}$ we have $\mu(\bigcap_{i \in \mathbb{N}} A_i) = \lim_{i \rightarrow \infty} \mu(A_i)$.
4. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ such that $\forall i \in \mathbb{N} A_{i+1} \subseteq A_i$ and $\mu(A_i) < \infty$ and $\bigcap_{i \in \mathbb{N}} A_i = \emptyset$ we have $\lim_{i \rightarrow \infty} \mu(A_i) = 0$.

we have $(1) \Leftrightarrow (2) \Rightarrow (3) \Leftrightarrow (4)$, Further if μ is finite then $(1) \Leftrightarrow (2) \Leftrightarrow (3) \Leftrightarrow (4)$

Proof. First as $\mathcal{R}$ is a ring we have by [theorem: 21.24] that

$$\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{R} \quad \bigcup_{i \in \{1, \dots, n\}} A_i \in \mathcal{R} \text{ and } \bigcap_{i \in \{1, \dots, n\}} A_i \in \mathcal{R} \quad (21.201)$$

(1) $\Rightarrow$ (2). Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ be such that $\forall i \in \mathbb{N} A_i \subseteq A_{i+1}$ and $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{R}$. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R} \text{ by } B_i = \begin{cases} A_1 & \text{if } i = 1 \\ A_i \setminus A_{i-1} & \text{if } i \in \{2, \dots, \infty\} \end{cases} \in \mathcal{R}$$

Then by the above definition we have

$$\forall i \in \mathbb{N} B_i \subseteq A_i \quad (21.202)$$

Let $i, j \in \mathbb{N}$ with $i \neq j$. We may always assume that $i < j$ [otherwise exchange i and j], then for i we have either

$i = 1$. Then $1 < j$ so that $B_1 = A_1$ and $B_j = A_j \setminus A_{j-1}$. As $1 < j \Rightarrow 1 \leq j-1$ we have $A_1 \subseteq A_{j-1}$ so that by [theorem: 1.33] $B_j = A_j \setminus A_{j-1} \subseteq A_j \setminus A_1 = A_j \setminus B_1$. Hence

$$B_i \cap B_j = B_1 \cap (A_j \setminus B_1) = \emptyset$$

$i \in \{2, \dots, \infty\}$. Then $i, j \in \{2, \dots, \infty\}$ so that $B_i = A_i \setminus A_{i-1} \wedge B_j = A_j \setminus A_{j-1}$. As $i < j \Rightarrow i \leq j-1$ we have $B_i \subseteq A_i \subseteq A_{j-1}$ so that by [theorem: 1.33] $B_j = A_j \setminus A_{j-1} \subseteq A_j \setminus B_i$. Hence

$$B_j \cap B_i \subseteq (A_j \setminus B_i) \cap B_i = \emptyset$$

Hence it follows that

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R} \text{ is pairwise disjoint} \quad (21.203)$$

Let $n \in \mathbb{N}$. As $\forall i \in \{1, \dots, n\}$ we have $B_i \subseteq A_n$ so that

$$\bigsqcup_{i \in \{1, \dots, n\}} B_i \subseteq A_n \quad (21.204)$$

If $x \in A_n$ then $n \in \{i \in \{1, \dots, n\} | x \in A_i\}$ a finite set so that $j = \min(\{i \in \{1, \dots, n\} | x \in A_i\})$ exists. For j we have either:

$j = 1$. Then $x \in A_1 = B_1$ so that $x \in \bigsqcup_{i \in \{1, \dots, n\}} B_i$

$1 < j$. Then $x \in A_j$ and $x \notin A_{j-1}$ so that $x \in A_j \setminus A_{j-1} = B_j \subseteq \bigsqcup_{i \in \{1, \dots, n\}} B_i$

hence $A_n \subseteq \bigsqcup_{i \in \{1, \dots, n\}} B_i$ which combined with [eq: 21.204] we have

$$\forall n \in \mathbb{N} \text{ we have } A_n = \bigsqcup_{i \in \{1, \dots, n\}} B_i \quad (21.205)$$

Let $x \in \bigcup_{n \in \mathbb{N}} A_n$ then $\exists n \in \mathbb{N}$ so that $x \in A_n$ and by [eq: 21.205] $\exists m \in \{1, \dots, n\} \subseteq \mathbb{N}$ such that $x \in B_m$, hence $\bigcup_{n \in \mathbb{N}} A_n \subseteq \bigcup_{i \in \mathbb{N}} B_i$. As also $B_n \subseteq A_n \subseteq \bigcup_{n \in \mathbb{N}} A_n$ it follows that

$$\bigsqcup_{i \in \mathbb{N}} B_i = \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{S} \quad (21.206)$$

As μ is a pre-measure hence countable additive we have that

$$\begin{aligned} \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) &= \mu\left(\bigsqcup_{i \in \mathbb{N}} B_i\right) \\ &= \sum_{i=1}^{\infty} \mu(B_i) \\ &\stackrel{[\text{definition: 20.94}]}{=} \lim_{i \rightarrow \infty} \sum_{j=1}^i \mu(B_j) \\ &\stackrel{[\text{theorem: 21.136}]}{=} \lim_{i \rightarrow \infty} \mu\left(\bigcup_{j=1}^i B_j\right) \\ &\stackrel{[\text{eq: 21.205}]}{=} \lim_{i \rightarrow \infty} \mu(A_i) \end{aligned}$$

Hence we have

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \lim_{i \rightarrow \infty} \mu(A_i)$$

(2) $\Rightarrow$ (1). As for a content $\mu(\emptyset) = 0$ we only have to prove countable additivity. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ be a pairwise disjoint sequence of sets in $\mathcal{R}$ such that $\bigcup_{i \in \mathbb{N}} A_i$. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R} \text{ by } B_i = \bigsqcup_{j \in \{1, \dots, i\}} A_j$$

Then we have

$$\forall i \in \mathbb{N} \quad B_i = \bigsqcup_{j \in \{1, \dots, i\}} A_j \subseteq \left(\bigsqcup_{j \in \{1, \dots, i\}} A_j \right) \cup A_{i+1} = \bigsqcup_{j \in \{1, \dots, i+1\}} A_j = B_{i+1} \quad (21.207)$$

If $x \in \bigsqcup_{i \in \mathbb{N}} A_i$ then $\exists i \in \mathbb{N}$ such that $x \in A_i \subseteq \bigsqcup_{j \in \{1, \dots, i\}} A_j = B_i \subseteq \bigcup_{i \in \mathbb{N}} B_i$, hence $\bigcup_{i \in \mathbb{N}} A_i \subseteq \bigcup_{i \in \mathbb{N}} B_i$, as also $B_i = \bigcup_{j \in \{1, \dots, i\}} A_j \subseteq \bigcup_{j \in \mathbb{N}} B_j$ it follows that $\bigcup_{i \in \mathbb{N}} B_i \subseteq \bigcup_{j \in \mathbb{N}} B_j$. Hence

$$\bigcup_{i \in \mathbb{N}} B_i = \bigsqcup_{i \in \mathbb{N}} A_i \in \mathcal{R} \quad (21.208)$$

Using (1) together with [eqs: 21.207, 21.208] it follows that

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \lim_{i \rightarrow \infty} \mu(B_i) = \lim_{i \rightarrow \infty} \mu\left(\bigsqcup_{j \in \{1, \dots, i\}} A_j\right) \quad (21.209)$$

A μ is a content hence additive we have $\forall i \in \mathbb{N}$ that $\mu(\bigsqcup_{j \in \{1, \dots, i\}} A_j) = \sum_{j=1}^i \mu(A_j)$ so that by the above

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \lim_{i \rightarrow \infty} \sum_{j=1}^i \mu(A_j) \stackrel{[\text{definition: 20.94}]}{=} \sum_{i=1}^{\infty} \mu(A_i)$$

Finally using [eq: 21.208] it follows that

$$\mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \mu(A_i)$$

proving countable additivity.

(2) $\Rightarrow$ (3). Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ such that $\forall i \in \mathbb{N} \quad \mu(A_i) < \infty$, $A_{i+1} \subseteq A_i$ and $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{R}$. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R} \text{ by } B_i = A_1 \setminus A_i \underset{\mathcal{R} \text{ is a ring}}{\in} \mathcal{R}$$

Then we have

$$\forall i \in \mathbb{N} \quad B_i = A_1 \setminus A_i \underset{[\text{theorem: 1.33}]}{\subseteq} A_1 \setminus A_{i+1} = B_{i+1} \quad (21.210)$$

and

$$A_1 \setminus \left(\bigcap_{i \in \mathbb{N}} A_i \right) \stackrel{[\text{theorem: 2.132}]}{=} \bigcup_{i \in \mathbb{N}} (A_1 \setminus A_i) = \bigcup_{i \in \mathbb{N}} B_i \quad (21.211)$$

As $\mathcal{R}$ is a ring and $A_1, \bigcap_{i \in \mathbb{N}} A_i \in \mathcal{R}$ we have that $\bigcup_{i \in \mathbb{N}} B_i = A_1 \setminus (\bigcap_{i \in \mathbb{N}} A_i) \in \mathcal{R}$. Hence we can apply (2)

$$\mu\left(A_1 \setminus \bigcap_{i \in \mathbb{N}} A_i\right) = \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \stackrel{(2)}{=} \lim_{i \rightarrow \infty} \mu(B_i) = \lim_{i \rightarrow \infty} \mu(A_1 \setminus A_i) \quad (21.212)$$

Let $i \in \mathbb{N}$ then $\bigcap_{i \in \mathbb{N}} A_i \subseteq A_i$ so that by [theorem: 21.148 (2)] $\mu(\bigcap_{i \in \mathbb{N}} A_i) \leq \mu(A_i) < \infty$, further we have $A_1 \setminus A_i \subseteq A_1 \Rightarrow \mu(A_1 \setminus A_i) \leq \mu(A_1) < \infty$. Hence using [theorem: 21.148(3)] we have

$$\forall i \in \mathbb{N} \text{ that } \mu(B_i) = \mu(A_1 \setminus A_i) = \mu(A_1) - \mu(A_i) \quad (21.213)$$

and

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \stackrel{[\text{eq: 21.211}]}{=} \mu\left(A_1 \setminus \bigcap_{i \in \mathbb{N}} A_i\right) = \mu(A_1) - \mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) \quad (21.214)$$

So

$$\begin{aligned} \mu(A_1) - \mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) &\stackrel{[\text{eqs: 21.212, 21.214}]}{=} \lim_{i \rightarrow \infty} \mu(A_1 \setminus A_i) \\ &\stackrel{[\text{eq: 21.213}]}{=} \lim_{i \rightarrow \infty} (\mu(A_1) - \mu(A_i)) \\ &\stackrel{[\text{theorem: 20.84}]}{=} \mu(A_1) - \lim_{i \rightarrow \infty} \mu(A_i) \end{aligned}$$

As $\mu(A_1) < \infty \Rightarrow \mu(A_1) \in \mathbb{R}$ we can safely subtract $\mu(A)$ from both sides from the above equation to get $-\mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) = -\lim_{i \rightarrow \infty} \mu(A_i)$ from which it follows that

$$\mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) = \lim_{i \rightarrow \infty} \mu(A_i)$$

(3) $\Rightarrow$ (4). Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ be such that $\forall i \in \mathbb{N} \ A_{i+1} \subseteq A_i$ and $\mu(A_i) < \infty$ and $\bigcap_{i \in \mathbb{N}} A_i = \emptyset \in \mathcal{S}$ then by (3) we have

$$0 = \mu(\emptyset) = \mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) = \lim_{i \rightarrow \infty} \mu(A_i)$$

(4) $\Rightarrow$ (3). Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ be such that $\forall i \in \mathbb{N} \ A_{i+1} \subseteq A_i$ and $\mu(A_i) < \infty$ and $\bigcap_{i \in \mathbb{N}} A_i \in \mathcal{R}$. Take $A = \bigcap_{i \in \mathbb{N}} A_i \in \mathcal{R}$ and define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R} \text{ by } B_i = A_i \setminus A \underset{\mathcal{R} \text{ is a ring}}{\in} \mathcal{R}$$

then we have

$$\forall i \in \mathbb{N} \text{ that } B_{i+1} = A_{i+1} \setminus A \subseteq A_i \setminus A = B_i$$

Further we have

$$\emptyset = A \setminus A = \left(\bigcap_{i \in \mathbb{N}} A_i\right) \setminus A \underset{[\text{theorem: 2.133}]}{=} \bigcap_{i \in \mathbb{N}} (A_i \setminus A) = \bigcap_{i \in \mathbb{N}} B_i$$

Hence using (4) we have

$$0 = \lim_{i \rightarrow \infty} \mu(B_i) = \lim_{i \rightarrow \infty} \mu(A_i \setminus A) \quad (21.215)$$

As $A = \bigcap_{i \in \mathbb{N}} A_i \subseteq A_i$ it follows from [theorem: 21.148(2)] that $\mu(A) \leq \mu(A_i) < \infty$, hence we have by [theorem: 21.148(3)] that

$$\forall i \in \mathbb{N} \text{ we have } \mu(A_i \setminus A) = \mu(A_i) - \mu(A) \quad (21.216)$$

Hence we have

$$\begin{aligned} 0 & \underset{[\text{eq: 21.215}]}{=} \lim_{i \rightarrow \infty} \mu(A_i \setminus A) \\ & \underset{[\text{eq: 21.216}]}{=} \lim_{i \rightarrow \infty} (\mu(A_i) - \mu(A)) \\ & \underset{[\text{theorem: 20.84}]}{=} \lim_{i \rightarrow \infty} \mu(A_i) - \mu(A) \end{aligned}$$

As $\mu(A) < \infty \Rightarrow \mu(A) \in \mathbb{R}$ we have

$$\mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) = \mu(A) = \lim_{i \rightarrow \infty} \mu(A_i)$$

Now for the last part we have to prove that if μ is finite then (4) $\Rightarrow$ (2) [because then from (1) $\Leftrightarrow$ (2) $\Rightarrow$ (3) $\Leftrightarrow$ (4) it follows that (1) $\Leftrightarrow$ (2) $\Leftrightarrow$ (3) $\Leftrightarrow$ (4)].

(4) $\Rightarrow$ (2). Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ is such that $\forall i \in \mathbb{N}$ we have $A_i \subseteq A_{i+1}$ and $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{R}$. Take $A = \bigcup_{i \in \mathbb{N}} A_i$ and define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R} \text{ by } B_i = A \setminus A_i \underset{\mathcal{R} \text{ is a ring}}{\in} \mathcal{R}$$

Then we have

$$\forall i \in \mathbb{N} \text{ that } B_{i+1} = A \setminus A_{i+1} \underset{[\text{theorem: 1.33}]}{\subseteq} A \setminus A_i = B_i \text{ and } \mu(B_i) \underset{\mu \text{ is finite}}{<} \infty$$

Further we have

$$\emptyset = A \setminus A = A \setminus \left(\bigcup_{i \in \mathbb{N}} A_i\right) \underset{[\text{theorem: 2.133}]}{=} \bigcap_{i \in \mathbb{N}} (A \setminus A_i) = \bigcap_{i \in \mathbb{N}} B_i$$

So using (4) we have that

$$\lim_{i \rightarrow \infty} \mu(A \setminus A_i) = \lim_{i \rightarrow \infty} \mu(B_i) = 0 \quad (21.217)$$

Let $i \in \mathbb{N}$ then, as $A_i \subseteq \bigcup_{i \in \mathbb{N}} A_i = A$ and $\mu(A_i) < \infty$, it follows from [theorem: 21.148(3)] that $\mu(A \setminus A_i) = \mu(A) - \mu(A_i)$. Hence we have

$$\begin{aligned} 0 & \stackrel{[\text{eq: 21.217}]}{=} \lim_{i \rightarrow \infty} \mu(A \setminus A_i) \\ & = \lim_{i \rightarrow \infty} (\mu(A) - \mu(A_i)) \\ & \stackrel{[\text{theorem: 20.84}]}{=} \mu(A) - \lim_{i \rightarrow \infty} \mu(A_i) \end{aligned}$$

As μ is finite it follows from the above that

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \mu(A) = \lim_{i \rightarrow \infty} \mu(A_i) \quad \square$$

The above equivalences allows us to determine if a content on a ring is a pre-measure. However this is not always simple. If we assume a ring on a topological space then proving becomes easier if we make use of the properties of the topological space. For this we introduce approximation by compact classes. First recap the definition of a compact class [see definition: 14.243].

Definition 21.150. Let X be a set then $\mathcal{C} \subseteq \mathcal{P}(X)$ is a **compact class** if $\forall \{K_i\}_{i \in \mathbb{N}} \subseteq \mathcal{C}$ with $\bigcap_{i \in \mathbb{N}} K_i = \emptyset$ there exist a $N \in \mathbb{N}$ such that $\bigcap_{i \in \{1, \dots, N\}} K_i = \emptyset$.

We have then the following theorem that can be used to determine if a content is a pre-measure.

Theorem 21.151. Let X be a set, $\mathcal{R}$ a ring on X and $\mu: X \rightarrow [0, \infty]$ a **finite** content. If there exist a compact class $\mathcal{C} \subseteq \mathcal{P}(X)$ such that $\forall A \in \mathcal{R}$ and $\forall \varepsilon \in \mathbb{R}^+$ we have that $\exists K_\varepsilon \in \mathcal{C}$ and $\exists A_\varepsilon \in \mathcal{R}$ such that

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A \text{ and } \mu(A \setminus A_\varepsilon) < \varepsilon$$

then μ is a pre-measure. In other words if we can 'approximate' $\mathcal{R}$ by a complex class $\mathcal{C}$ then μ is a pre-measure.

Proof. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}$ be such that

$$\forall i \in \mathbb{N} \text{ we have } A_{i+1} \subseteq A_i \text{ and } \bigcap_{i \in \mathbb{N}} A_i = \emptyset \quad (21.218)$$

As μ is finite we have also

$$\forall i \in \mathbb{N} \text{ we have } \mu(A_i) < \infty \quad (21.219)$$

So if we prove that $\lim_{i \rightarrow \infty} \mu(A_i) = 0$ then it follows from [theorem: 21.149] that μ is a pre-measure.

Let $\varepsilon \in \mathbb{R}^+$ and $n \in \mathbb{N}$ then by the assumption there exist a $K_{n,\varepsilon} \in \mathcal{C}$ and a $R_{n,\varepsilon} \in \mathcal{R}$ such that $R_{n,\varepsilon} \subseteq K_{n,\varepsilon} \subseteq A_n$ and $\mu(A \setminus R_{n,\varepsilon}) < \frac{\varepsilon}{2^n}$. Hence there exist a $\{K_{n,\varepsilon}\}_{n \in \mathbb{N}} \subseteq \mathcal{C}$ and $\{R_{n,\varepsilon}\}_{n \in \mathbb{N}} \subseteq \mathcal{R}$ such that

$$\forall n \in \mathbb{N} \text{ we have } R_{n,\varepsilon} \subseteq K_{n,\varepsilon} \subseteq A_n \text{ and } \mu(A \setminus R_{n,\varepsilon}) < \frac{\varepsilon}{2^n} \quad (21.220)$$

Then we have

$$\bigcap_{n \in \mathbb{N}} K_{n,\varepsilon} \subseteq \bigcap_{n \in \mathbb{N}} A_n \stackrel{[\text{eq: 21.218}]}{=} \emptyset$$

so that by the definition of a compact class there exist a $N_\varepsilon \in \mathbb{N}$ such that $\bigcap_{n \in \{1, \dots, N_\varepsilon\}} K_{n,\varepsilon} = \emptyset$.

As $\bigcap_{n \in \{1, \dots, N_\varepsilon\}} R_{n,\varepsilon} \subseteq \bigcap_{n \in \{1, \dots, N_\varepsilon\}} K_{n,\varepsilon}$ it follows that

$$\bigcap_{n \in \{1, \dots, N_\varepsilon\}} R_{n,\varepsilon} = \bigcap_{n \in \{1, \dots, N_\varepsilon\}} K_{n,\varepsilon} = \emptyset \quad (21.221)$$

Let $n \in \{1, \dots, N_\varepsilon\}$ then $A_{N_\varepsilon} \stackrel{[\text{eq: 21.218}]}{\subseteq} A_n$ so that $A_{N_\varepsilon} \subseteq \bigcap_{n \in \{1, \dots, N_\varepsilon\}} A_n \subseteq A_{N_\varepsilon}$ proving that

$$A_{N_\varepsilon} = \bigcap_{n \in \{1, \dots, N_\varepsilon\}} A_n \quad (21.222)$$

Let $x \in \bigcap_{n \in \{1, \dots, N_\varepsilon\}} A_n$. Assume that $x \notin \bigcup_{n \in \{1, \dots, N_\varepsilon\}} (A_n \setminus R_{n, \varepsilon})$ then $\forall n \in \{1, \dots, N_\varepsilon\}$ we have $x \notin A_n \setminus R_{n, \varepsilon}$, as $x \in \bigcap_{n \in \{1, \dots, N_\varepsilon\}} A_n \subseteq A_n$, it follows that $x \in R_{n, \varepsilon}$. So $x \in \bigcap_{n \in \{1, \dots, N_\varepsilon\}} R_{n, \varepsilon}$ contradicting [eq: 21.221]. Hence the assumption is wrong and we must have that $x \in \bigcup_{n \in \{1, \dots, N_\varepsilon\}} (A_n \setminus R_{n, \varepsilon})$ proving

$$A_{N_\varepsilon} \stackrel{[\text{eq: 21.222}]}{=} \bigcap_{n \in \{1, \dots, N_\varepsilon\}} A_n \subseteq \bigcup_{n \in \{1, \dots, N_\varepsilon\}} (A_n \setminus R_{n, \varepsilon}) \stackrel{\mathcal{R} \text{ is a ring}}{\in} \mathcal{R} \quad (21.223)$$

Hence using the above we have

$$\begin{aligned} \mu(A_{N_\varepsilon}) &\stackrel{[\text{theorem: 21.148(2)}] \wedge [\text{eq: 21.223}]}{\leq} \mu\left(\bigcup_{n \in \{1, \dots, N_\varepsilon\}} (A_n \setminus R_{n, \varepsilon})\right) \\ &\stackrel{[\text{definition: 21.144}] \wedge [\text{eq: 21.223}]}{=} \sum_{i=1}^{N_\varepsilon} \mu(A_n \setminus R_{n, \varepsilon}) \\ &\stackrel{[\text{eq: 21.220}]}{\leq} \sum_{i=1}^{N_\varepsilon} \frac{\varepsilon}{2^n} \\ &= \varepsilon \cdot \sum_{i=1}^N \left(\frac{1}{2}\right)^n \\ &\stackrel{[\text{lemma: 14.353}]}{=} \varepsilon \cdot \left(\frac{1}{2}\right) \cdot \frac{1 - \left(\frac{1}{2}\right)^n}{1 - \frac{1}{2}} \\ &= \varepsilon \cdot \left(1 - \frac{1}{2^n}\right) \\ &< \varepsilon \end{aligned}$$

So we have proved that

$\forall \varepsilon \in \mathbb{R}^+$ there exist a $N_\varepsilon \in \mathbb{N}$ such that $\forall n \in \{N_\varepsilon, \dots, \infty\}$ we have $|\mu(A_n) - 0| = \mu(A_n) \leq \mu(A_{N_\varepsilon}) < \varepsilon$ which proves that $\lim_{n \rightarrow \infty} \mu(A_n) = 0$. Using the fact that μ is finite and [theorem: 20.76] it follows that

$$\lim_{n \rightarrow \infty} \mu(A_i) = 0$$

So using [theorem: 21.149] it follows that μ is a pre-measure. $\square$

The above theorem is especially usefull if we have a ring on a topological Hausdorff space because every set of compact sets is a compact class [see theorem: 14.244]. This is expressed in the following theorem.

Theorem 21.152. *Let $\langle X, \mathcal{T} \rangle$ be a Hausdorff topological space,, $\mathcal{R}$ a ring on X and $\mu: X \rightarrow [0, \infty]$ a **finite** content. If $\forall A \in \mathcal{R}$ and $\forall \varepsilon \in \mathbb{R}^+$ we have that $\exists K_\varepsilon$ compact and $\exists A_\varepsilon \in \mathcal{R}$ such that*

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A \text{ and } \mu(A \setminus A_\varepsilon) < \varepsilon$$

then μ is a pre-measure.

Proof. If $\mathcal{C} = \{A \in \mathcal{P}(X) | A \text{ is compact}\}$ is the set of compact subsets of X then by [theorem: 14.244] $\mathcal{C}$ is a compact class. The proof follows then from [theorem: 21.151]. $\square$

Proving that $\mathcal{R} \subseteq \mathcal{P}(X)$ is a ring is not always possible, especially proving that $\forall A, B \in \mathcal{R}$ we have that $A \setminus B \in \mathcal{R}$. For example the difference of two half-open intervals in $\mathcal{I}_{[|]}$ is not always a half-open interval, hence $\mathcal{R}_{[|]}$ is not a ring, however it will be proved later that $\mathcal{I}_{[|]}$ is a semi-ring on $\mathbb{R}$. Luckily it turns out that a semi-ring with a content on it can easily be extended to a ring with a content on it. First we show how we can extend a semi-ring to a smallest ring containing the semi-ring.

Definition 21.153. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring on X then $\mathcal{R}[\mathcal{S}]$ is defined by*

$$\mathcal{R}[\mathcal{S}] = \left\{ \bigsqcup_{i \in \{1, \dots, n\}} A_i | n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S} \text{ is pairwise disjoint} \right\}$$

Note 21.154. As for $A, B \in \mathcal{S}$ we have by definition of a semi-ring that $\exists \{C_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ pairwise disjoint such that $A \setminus B = \bigsqcup_{i \in \{1, \dots, n\}} C_i$ it follows that

$$\forall A, B \in \mathcal{S} \text{ we have } A \setminus B \in \mathcal{S}$$

To prove that $\mathcal{R}[\mathcal{S}]$ we have to prove that $\emptyset \in \mathcal{R}[\mathcal{S}]$ and $\forall A, B \in \mathcal{R}[\mathcal{S}]$ that $A \cup B \in \mathcal{R}[\mathcal{S}] \wedge A \setminus B \in \mathcal{R}[\mathcal{S}]$. We start with proving that $\forall A, B \in \mathcal{R}[\mathcal{S}]$ $A \cup B \in \mathcal{R}[\mathcal{S}]$ using the following two lemma's.

Lemma 21.155. Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring on X , $A \in \mathcal{S}$ and $B \in \mathcal{R}[\mathcal{S}]$ then

$$A \cup B \in \mathcal{R}[\mathcal{S}]$$

Proof. As $B \in \mathcal{R}[\mathcal{S}]$ there exist a pairwise disjoint $\{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that

$$B = \bigsqcup_{i \in \{1, \dots, n\}} B_i$$

Define

$$\{C_i\}_{i \in \{1, \dots, n+1\}} \text{ by } C_i = \begin{cases} B_i \setminus A & \text{if } i \in \{1, \dots, n\} \\ A & \text{if } i = n+1 \end{cases}$$

Then if $x \in A \cup B$ we have either:

$x \in A$. Then $x \in C_{n+1} \subseteq \bigcup_{i \in \{1, \dots, n+1\}} C_i$

$x \notin A$. Then we must have that $x \in B$ so that there exist a $i \in \{1, \dots, n\}$ such that

$$x \in B_i \xrightarrow{x \notin A} x \in B_i \setminus A \in C_i \subseteq \bigcup_{i \in \{1, \dots, n+1\}} C_i$$

proving that

$$A \cup B \subseteq \bigcup_{i \in \{1, \dots, n+1\}} C_i \quad (21.224)$$

Let $x \in \bigcup_{i \in \{1, \dots, n+1\}} C_i$ then there exist a $i \in \{1, \dots, n+1\}$ such that $x \in C_i$. For i we have either

$i \in \{1, \dots, n\}$. Then $x \in C_i = B_i \setminus A \subseteq B_i \subseteq \bigcup_{i \in \{1, \dots, n\}} B_i = B \subseteq A \cup B$

$i = n+1$. Then $x \in C_{n+1} = A \subseteq A \cup B$

hence $\bigcup_{i \in \{1, \dots, n+1\}} C_i \subseteq A \cup B$. Combining this with [eq: 21.224] results in

$$A \cup B = \bigcup_{i \in \{1, \dots, n+1\}} C_i \quad (21.225)$$

Let $i, j \in \{1, \dots, n+1\}$ with $i \neq j$ then for i we have either:

$i \in \{1, \dots, n\}$. Then for j we have either:

$j \in \{1, \dots, n\}$. Then $C_i \cap C_j = (B_i \setminus A) \cap (B_j \setminus A) \subseteq B_i \cap B_j = \emptyset$

$j = n+1$. Then $C_i \cap C_j = (B_i \setminus A) \cap A = \emptyset$

$i = n+1$. Then as $i \neq j$ we have that $j \in \{1, \dots, n\}$ so that $C_i \cap C_j = A \cap (B_j \setminus A) = \emptyset$

hence

$$\{C_i\}_{i \in \{1, \dots, n+1\}} \text{ is pairwise disjoint so that } A \cup B = \bigsqcup_{i \in \{1, \dots, n+1\}} C_i \quad (21.226)$$

Let $i \in \{1, \dots, n+1\}$ then we have either:

$i \in \{1, \dots, n\}$. As $A, B_i \in \mathcal{S}$ and $\mathcal{S}$ is a semi-ring there exist a pairwise disjoint $\{D_{i,j}\}_{j \in \{1, \dots, n_i\}} \subseteq \mathcal{S}$ such that $C_i = B_i \setminus A = \bigsqcup_{j \in \{1, \dots, n_i\}} D_{i,j}$.

$i = n+1$. Take $n_1 = 1$ and $\{D_{1,j}\}_{j \in \{1\}} \subseteq \mathcal{S}$ by $D_{1,1} = A$ so that $C_{n+1} = \bigsqcup_{i \in \{1, \dots, n_i\}} D_{1,j}$

Summarized we have that

$$\forall i \in \{1, \dots, n+1\} \exists \{D_{i,j}\}_{j \in \{1, \dots, n_i\}} \subseteq \mathcal{S} \text{ with } C_i = \bigsqcup_{j \in \{1, \dots, n_i\}} D_{i,j} \quad (21.227)$$

As $\bigcup_{i \in \{1, \dots, n+1\}} \{i\} \times \{1, \dots, n_i\}$ is finite by [theorems: 6.41, 6.36] there exists a bijection

$$\beta: \{1, \dots, N\} \rightarrow \bigcup_{i \in \{1, \dots, n+1\}} \{i\} \times \{1, \dots, n_i\} \quad (21.228)$$

Using [eqs: 21.226, 21.227 and 21.228] allows us to apply [theorem: 21.11] that

$$\{D_{\beta(i)_1, \beta(i)_2}\}_{i \in \{1, \dots, N\}} \subseteq \mathcal{S} \text{ is pairwise disjoint and } \bigsqcup_{i \in \{1, \dots, n+1\}} C_i = \bigsqcup_{i \in \{1, \dots, N\}} D_{\beta(i)_1, \beta(i)_2}$$

Hence using [eq: 21.226] it follows that $A \cup B = \bigsqcup_{i \in \{1, \dots, N\}} D_{\beta(i)_1, \beta(i)_2}$ which proves that

$$A \cup B \in \mathcal{S}[\mathcal{R}] \quad \square$$

We use the above lemma in a proof by induction to prove that that $\mathcal{R}[\mathcal{S}]$ is $\cup$ -stable.

Lemma 21.156. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring on X and $A, B \in \mathcal{R}[\mathcal{S}]$ then $A \cup B \in \mathcal{R}[\mathcal{S}]$*

Proof. Let $B \in \mathcal{R}[\mathcal{S}]$ and define

$$\mathcal{S}_B = \left\{ n \in \mathbb{N} \mid \text{If } \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S} \text{ pairwise disjoint then } \left(\bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \cup B \in \mathcal{R}[\mathcal{S}] \right\}$$

then we have:

1 $\in \mathcal{S}_B$. If $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}$ is pairwise disjoint then, as $A_1 \in \mathcal{S}$, we have by [lemma: 21.155] that $(\bigsqcup_{i \in \{1\}} A_i) \cup B = A_1 \cup B \in \mathcal{R}[\mathcal{S}]$ which proves that $1 \in \mathcal{S}_B$.

$n \in \mathcal{S}_B \Rightarrow n+1 \in \mathcal{S}_B$. Let $\{A_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{S}$ be a pairwise disjoint family of sets in $\mathcal{S}$. As $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$ is pairwise disjoint and $n \in \mathcal{R}[\mathcal{S}]$ we have that

$$\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \cup B \in \mathcal{R}[\mathcal{S}]$$

Hence, as $A_{n+1} \in \mathcal{S}$, we have by the previous lemma [lemma: 21.155] that

$$A_{n+1} \cup \left(\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \cup B \right) \in \mathcal{R}[\mathcal{S}]$$

which as $A_{n+1} \cup ((\bigsqcup_{i \in \{1, \dots, n\}} A_i) \cup B) = (\bigsqcup_{i \in \{1, \dots, n+1\}} A_i) \cup B$ proves that

$$\left(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i \right) \cup B$$

so that $n+1 \in \mathcal{S}_B$.

Mathematical induction proves then that $\mathcal{S}_B = \mathbb{N}$. Finally if $A \in \mathcal{R}[\mathcal{S}]$ then there exist a $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$ such that $A = \bigsqcup_{i \in \{1, \dots, n\}} A_i$, hence, as $n \in \mathbb{N} = \mathcal{S}_B$, it follows that $A \cup B = (\bigsqcup_{i \in \{1, \dots, n\}} A_i) \cup B \in \mathcal{R}[\mathcal{S}]$. $\square$

Next we have to prove that $\forall A, B \in \mathcal{R}[\mathcal{S}]$.

Lemma 21.157. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring on X , $A \in \mathcal{R}[\mathcal{S}]$ and $B \in \mathcal{S}$ then $A \setminus B \in \mathcal{R}[\mathcal{S}]$.*

Proof. We use mathematical induction in the proof. Define

$$\mathcal{S}_B = \left\{ n \in \mathbb{N} \mid \text{If } \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S} \text{ pairwise disjoint then } \left(\bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \setminus B \in \mathcal{R}[\mathcal{S}] \right\}$$

then we have:

1 $\in \mathcal{S}_B$. Let $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}$ pairwise disjoint then $(\bigsqcup_{i \in \{1\}} A_i) \setminus B = A_1 \setminus B \in \mathcal{R}[\mathcal{S}]$ [using the note in the definition of $\mathcal{R}[\mathcal{S}]$ see [definition: 21.153]], hence $1 \in \mathcal{S}_B$.

$n \in S_B \Rightarrow n+1 \in S_B$. Let $\{A_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{S}$ pairwise disjoint. Then we have

$$\begin{aligned} \left(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i \right) \setminus B &= \left(\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \sqcup A_{n+1} \right) \setminus B \\ &= \left(\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \setminus B \right) \sqcup (A_{n+1} \setminus B) \end{aligned} \quad (21.229)$$

As $n \in S_B$ we have that $(\bigsqcup_{i \in \{1, \dots, n\}} A_i) \setminus B \in \mathcal{R}[\mathcal{S}]$ so that there exists a pairwise disjoint $\{C_i\}_{i \in \{1, \dots, k\}} \subseteq \mathcal{S}$, $k \in \mathbb{N}$ such that

$$\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \setminus B = \bigsqcup_{j \in \{1, \dots, k\}} C_j \quad (21.230)$$

Further as $A_{n+1}, B \in S$ and S is a semi-ring there exist a pairwise disjoint $\{D_i\}_{i \in \{1, \dots, l\}} \subseteq \mathcal{S}$, $l \in \mathbb{N}$ such that

$$A_{n+1} \setminus B = \bigsqcup_{i \in \{1, \dots, l\}} D_i \quad (21.231)$$

Define

$$\{E_i\}_{i \in \{1, \dots, k+l\}} \subseteq \mathcal{S} \text{ by } E_i = \begin{cases} C_i \in \mathcal{S} & \text{if } i \in \{1, \dots, k\} \\ D_{i-k} \in \mathcal{S} & \text{if } i \in \{k+1, \dots, k+l\} \end{cases} \quad (21.232)$$

Let $i \in \{1, \dots, k+l\}$ then we have either

$i \in \{1, \dots, k\}$. Then

$$E_i = C_i \underset{\text{[eq: 21.230]}}{\subseteq} \left(\bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \setminus B \underset{\text{[eq: 21.229]}}{\subseteq} \left(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i \right) \setminus B$$

$i \in \{k+1, \dots, k+l\}$. Then

$$E_i = D_{i-k} \underset{\text{[eq: 21.231]}}{\subseteq} A_{n+1} \setminus B \underset{\text{[eq: 21.229]}}{\subseteq} \left(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i \right) \setminus B$$

which proves that

$$\bigcup_{i \in \{1, \dots, k+l\}} E_i \subseteq \left(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i \right) \setminus B \quad (21.233)$$

If $x \in (\bigsqcup_{i \in \{1, \dots, n+1\}} A_i) \setminus B = ((\bigsqcup_{i \in \{1, \dots, n\}} A_i) \setminus B) \sqcup (A_{n+1} \setminus B)$ then we have either:

$x \in (\bigsqcup_{i \in \{1, \dots, n\}} A_i) \setminus B$. Then by [eq: 21.231] there exist a $i \in \{1, \dots, k\}$ such that $x \in C_i \underset{\text{[eq: 21.232]}}{=} E_i \subseteq \bigcup_{i \in \{1, \dots, k+l\}} E_i$

$x \in A_{n+1} \setminus B$. Then by [eq: 21.231] there exist a $i \in \{1, \dots, l\}$ such that

$$x \in D_i = D_{(i+k)-k} = E_{i+k} \subseteq \bigcup_{i \in \{1, \dots, k+l\}} E_i$$

which proves that $(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i) \setminus B \subseteq \bigcup_{i \in \{1, \dots, k+l\}} E_i$. Combininig this with [eq: 21.233] proves that

$$\left(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i \right) \setminus B = \bigcup_{i \in \{1, \dots, k+l\}} E_i \quad (21.234)$$

Let $i, j \in \{1, \dots, k+l\}$ with $i \neq j$ then without losing generality we may assume that $i < j$ [otherwise exchange i and j]. For i we have either:

$i \in \{1, \dots, k\}$. Then for j we have either:

$j \in \{1, \dots, k\}$. Then $E_i \cap E_j = C_i \cap C_j = \emptyset$

$j \in \{k+1, \dots, k+l\}$. Then

$$\begin{aligned}
 E_i \cap E_j &= C_i \cap D_{j-k} \\
 &\stackrel{[\text{eq: 21.230}]}{\subseteq} \left(\bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \cap D_{j-k} \\
 &\stackrel{[\text{eq: 21.231}]}{\subseteq} \left(\bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \cap A_{n+1} \\
 &= \bigsqcup_{i \in \{1, \dots, n\}} (A_i \cap A_{n+1}) \\
 &\stackrel{i \neq n+1}{=} \emptyset
 \end{aligned}$$

$i \in \{k+1, \dots, k+l\}$. As $i < j$ we have $j \in \{k+1, \dots, k+l\}$ so that

$$E_i \cap E_j = D_{i-k} \cap D_{j-k} = \emptyset$$

which proves that

$$\{E_i\}_{i \in \{1, \dots, k+l\}} \subseteq \mathcal{S} \text{ is pairwise disjoint and } \left(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i \right) \setminus B \stackrel{[\text{eq: 21.234}]}{=} \bigsqcup_{i \in \{1, \dots, k+l\}} E_i$$

So using the definition of $\mathcal{R}[\mathcal{S}]$ it follows that $(\bigsqcup_{i \in \{1, \dots, n+1\}} A_i) \setminus B \in \mathcal{R}[\mathcal{S}]$ which proves that $n+1 \in \mathcal{S}_B$

By mathematical induction it follows that

$$\mathcal{S}_B = \mathbb{N}$$

Finally let $A \in \mathcal{R}[\mathcal{S}]$ then there exist a pairwise disjoint $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$ such that $A = \bigsqcup_{i \in \{1, \dots, n\}} A_i$. As $n \in \mathbb{N} = \mathcal{S}_B$ we have that $A \setminus B = (\bigsqcup_{i \in \{1, \dots, n\}} A_i) \setminus B \in \mathcal{R}[\mathcal{S}]$. $\square$

Next we use mathematical induction to prove that $\forall A, B \in \mathcal{R}[\mathcal{S}]$ we have $A \setminus B \in \mathcal{R}[\mathcal{S}]$.

Lemma 21.158. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring on X then $\forall A, B \in \mathcal{R}[\mathcal{S}]$ we have that $A \setminus B \in \mathcal{R}[\mathcal{S}]$.*

Proof. Let $A \in \mathcal{R}[\mathcal{S}]$ and define

$$\mathcal{S}_A = \left\{ n \in \mathbb{N} \mid \text{If } \{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S} \text{ is pairwise disjoint then } A \setminus \bigsqcup_{i \in \{1, \dots, n\}} B_i \in \mathcal{R}[\mathcal{S}] \right\}$$

then we have:

$1 \in \mathcal{S}_A$. Let $\{B_i\}_{i \in \{1\}} \subseteq \mathcal{S}$ be pairwise disjoint then by the previous lemma [lemma: 21.157] we have that $A \setminus \bigsqcup_{i \in \{1\}} B_i = A \setminus B_1 \in \mathcal{R}[\mathcal{S}]$ which proves that $1 \in \mathcal{S}_A$.

$n \in \mathcal{S}_A \Rightarrow n+1 \in \mathcal{S}_A$. Let $\{B_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{S}$ be pairwise disjoint. Then

$$\begin{aligned}
 A \setminus \bigsqcup_{i \in \{1, \dots, n+1\}} B_i &= A \setminus \left(\left(\bigsqcup_{i \in \{1, \dots, n\}} B_i \right) \bigsqcup B_{n+1} \right) \\
 &\stackrel{[\text{theorem: 1.31}]}{=} \left(A \setminus \bigsqcup_{i \in \{1, \dots, n\}} B_i \right) \setminus B_{n+1}
 \end{aligned}$$

As $n \in \mathcal{S}_A$ we have that $A \setminus \bigsqcup_{i \in \{1, \dots, n\}} B_i \in \mathcal{R}[\mathcal{S}]$ so that by [lemma: 21.157] $(A \setminus \bigsqcup_{i \in \{1, \dots, n\}} B_i) \setminus B_{n+1} \in \mathcal{R}[\mathcal{S}]$. Hence $A \setminus \bigsqcup_{i \in \{1, \dots, n+1\}} B_i \in \mathcal{R}[\mathcal{S}]$ which proves that $n+1 \in \mathcal{S}_A$.

Mathematical induction proves that

$$\mathcal{S}_A = \mathbb{N}$$

Finally if $B \in \mathcal{R}[\mathcal{S}]$ then by definition of $\mathcal{R}[\mathcal{S}]$ there exist a pairwise disjoint $\{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that $B = \bigsqcup_{i \in \{1, \dots, n\}} B_i$. As $n \in \mathbb{N} = \mathcal{S}_A$ $A \setminus B = A \setminus \bigsqcup_{i \in \{1, \dots, n\}} B_i \in \mathcal{R}[\mathcal{S}]$. $\square$

We are now ready to prove that $\mathcal{R}[\mathcal{S}]$ is a ring

Theorem 21.159. *Let X be a set, $\mathcal{S} \subseteq \mathcal{P}(X)$ a semi-ring on X then $\mathcal{R}[\mathcal{S}]$ is a ring on X such that:*

1. $\mathcal{S} \subseteq \mathcal{R}[\mathcal{S}]$
2. If $\mathcal{T}$ is another ring on X with $\mathcal{S} \subseteq \mathcal{T}$ then $\mathcal{R}[\mathcal{S}] \subseteq \mathcal{T}$

In other words the set of all disjoint finite unions of sets in $\mathcal{S}$ is the smallest ring covering $\mathcal{S}$

Proof. Let $A \in \mathcal{S}$ and define $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}$ by $A_1 = A$ then $\{A_i\}_{i \in \{1\}}$ is pairwise disjoint and $A = \bigsqcup_{i \in \{1\}} A_i$, hence $A \in \mathcal{R}[\mathcal{S}]$ proving that

$$\mathcal{S} \subseteq \mathcal{R}[\mathcal{S}] \quad (21.235)$$

As $\mathcal{S}$ is a semi-ring we have $\emptyset \in \mathcal{S}$ so by the above we have

$$\emptyset \in \mathcal{R}[\mathcal{S}] \quad (21.236)$$

Let $A, B \in \mathcal{R}[\mathcal{S}]$ then by [lemma: 21.156] and [lemma: 21.158] we have that

$$A \setminus B \in \mathcal{R}[\mathcal{S}] \text{ and } A \cap B \in \mathcal{R}[\mathcal{S}] \quad (21.237)$$

So by [eqs: 21.235, 21.236 and 21.237] it follows that

$$\mathcal{R}[\mathcal{S}] \text{ is a ring on } X$$

It remains to prove that $\mathcal{R}[\mathcal{S}]$ is the smallest ring containing $\mathcal{S}$. So let $\mathcal{T}$ be another ring such that $\mathcal{S} \subseteq \mathcal{T}$. If $A \in \mathcal{R}[\mathcal{S}]$ then there exist a pairwise disjoint finite family $\{A_i\}_{i \in \{1, \dots, k\}} \subseteq \mathcal{S} \subseteq \mathcal{T}$ such that $A = \bigsqcup_{i \in \{1, \dots, k\}} A_i$. As $\mathcal{T}$ is a ring it follows from [theorem: 21.24] that $A = \bigsqcup_{i \in \{1, \dots, k\}} A_i \in \mathcal{T}$ which proves that

$$\mathcal{R}[\mathcal{S}] \subseteq \mathcal{T} \quad \square$$

Next we want to extend a content on a semi-ring $\mathcal{S}$ to a content on the ring $\mathcal{R}[\mathcal{S}]$.

Theorem 21.160. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu: \mathcal{S} \rightarrow [0, \infty]$ a content on $\mathcal{S}$ then*

1. *There exist a content $\nu: \mathcal{R}[\mathcal{S}] \rightarrow [0, \infty]$ such that $\nu|_{\mathcal{S}} = \mu$ [in other words ν is an extension of μ]*
2. *If $\omega: \mathcal{R}[\mathcal{S}] \rightarrow [0, \infty]$ is another content such that $\omega|_{\mathcal{S}} = \mu$ then $\omega = \nu$ [in other words the extension is unique].*
3. *If μ is finite then ν is finite.*

Proof.

1. First we proof existence. Let $A \in \mathcal{R}[\mathcal{S}]$ then there exist a pairwise disjoint finite family $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that $A = \bigsqcup_{i \in \{1, \dots, n\}} A_i$. As ν will be a content on $\mathcal{R}[\mathcal{S}]$ we must have that $\nu(A) = \sum_{i=1}^n \nu(A_i) = \sum_{i=1}^n \mu(A_i)$. So it make sense to define

$$\nu: \mathcal{R}[\mathcal{S}] \rightarrow [0, \infty] \text{ by } \nu(A) = \sum_{i=1}^n \mu(A_i)$$

$$\text{where } \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}, n \in \mathbb{N} \text{ is pairwise disjoint and } A = \bigsqcup_{i \in \{1, \dots, n\}} A_i$$

Of course this only works if $\nu(A)$ is independent of the chosen family $\{A_i\}_{i \in \{1, \dots, n\}}$. So assume that for $A \in \mathcal{R}[\mathcal{S}]$ we have two pairwise disjoint families $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ and $\{B_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{S}$, $m \in \mathbb{N}$ such that

$$A = \bigsqcup_{i \in \{1, \dots, n\}} A_i = \bigsqcup_{i \in \{1, \dots, m\}} B_i$$

Then we have

$$\begin{aligned}
\sum_{i=1}^n \mu(A_i) & \stackrel{A_i \cap \overline{A} = A_i}{=} \sum_{i=1}^n \mu(A_i \cap A) \\
& = \sum_{i=1}^n \mu\left(A_i \cap \left(\bigsqcup_{j \in \{1, \dots, m\}} B_j\right)\right) \\
& \stackrel{[\text{theorem: 2.130}]}{=} \sum_{i=1}^n \mu\left(\bigsqcup_{j \in \{1, \dots, m\}} \mu(A_i \cap B_j)\right) \\
& \stackrel{A_i \cap \overline{B_j} \in \mathcal{S}}{=} \sum_{i=1}^n \left(\sum_{j=1}^m \mu(A_i \cap B_j)\right) \\
& \stackrel{[\text{theorem: 20.103}]}{=} \sum_{j=1}^m \left(\sum_{i=1}^n \mu(A_i \cap B_j)\right) \\
& \stackrel{A_i \cap \overline{B_j} \in \mathcal{S}}{=} \sum_{j=1}^m \mu\left(\bigsqcup_{i \in \{1, \dots, n\}} (A_i \cap B_j)\right) \\
& \stackrel{[\text{theorem: 2.130}]}{=} \sum_{j=1}^m \mu\left(\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) \cap B_j\right) \\
& = \sum_{j=1}^m \mu(A \cap B_j) \\
& = \sum_{j=1}^m \mu(B_j)
\end{aligned}$$

proving that $\nu: \mathcal{R}[\mathcal{S}] \rightarrow [0, \infty]$ is well defined. Next we prove that ν is an extension of $\mathcal{S}$. Let $A \in \mathcal{S}$ then if we define $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}$ by $A_1 = A$ then $\{A_i\}_{i \in \{1\}}$ is clearly disjoint and $\bigsqcup_{i \in \{1\}} A_i = A_1 = A$ so that $\nu(A) = \sum_{i=1}^1 \mu(A_i) = \mu(A_1) = \mu(A)$ proving that

$$\nu|_{\mathcal{S}} = \mu \quad (21.238)$$

Next we use [theorem: 21.147] to prove that ν is a content on $\mathcal{R}[\mathcal{S}]$. As $\emptyset \in \mathcal{S}$ we have by [eq: 21.238] that

$$\nu(\emptyset) \stackrel{\emptyset \in \mathcal{S}}{=} \mu(\emptyset) = 0 \quad (21.239)$$

Let $A, B \in \mathcal{R}[\mathcal{S}]$ such that $A \cap B = \emptyset$ then there exist pairwise disjoint families $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ and $\{B_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{S}$, $m \in \mathbb{N}$ such that $A = \bigsqcup_{i \in \{1, \dots, n\}} A_i$, $B = \bigsqcup_{i \in \{1, \dots, m\}} B_i$. Define

$$\{C_i\}_{i \in \{1, \dots, n+m\}} \subseteq \mathcal{S} \text{ by } C_i = \begin{cases} A_i & \text{if } i \in \{1, \dots, n\} \\ B_{i-n} & \text{if } i \in \{n+1, \dots, n+m\} \end{cases}$$

Let $i, j \in \{1, \dots, n+m\}$ with $i \neq j$ then we may assume that $i < j$ [otherwise exchange i and j], for i we have either:

$i \in \{1, \dots, n\}$. Then for j we have either:

$$j \in \{1, \dots, n\}. \text{ Then } C_i \cap C_j = A_i \cap A_j \stackrel{i \neq j}{=} \emptyset.$$

$$j \in \{n+1, \dots, n+m\}. \text{ Then } C_i \cap C_j = A_i \cap B_{j-n} \subseteq A \cap B = \emptyset.$$

$$i \in \{n+1, \dots, n+m\}. \text{ Then } j \in \{n+1, \dots, n+m\} \text{ } C_i \cap C_j = A_{i-n} \cap B_{j-n} \stackrel{i-n \neq j-n}{=} \emptyset$$

proving that

$$\{C_i\}_{i \in \{1, \dots, n+m\}} \subseteq \mathcal{S} \text{ is pairwise disjoint} \quad (21.240)$$

Let $x \in A \cup B$ then either $x \in A = \bigcup_{i \in \{1, \dots, n\}} A_i \Rightarrow \exists i \in \{1, \dots, n\}$ with $x \in A_i = C_i$ or $x \in B = \bigcup_{i \in \{1, \dots, m\}} B_i \Rightarrow \exists i \in \{1, \dots, m\}$ with $x \in B_i = C_{i+n}$, hence $x \in \bigcup_{i \in \{1, \dots, n+m\}} C_i$, proving that

$$A \sqcup B \subseteq \bigcup_{i \in \{1, \dots, n+m\}} C_i. \quad (21.241)$$

For $i \in \{1, \dots, n+m\}$ we have either $i \in \{1, \dots, n\}$ then $C_i = A_i \subseteq A \cup B$ or $i \in \{n+1, \dots, n+m\}$ then $C_i = B_{i-n} \subseteq A \cup B$, hence in all cases we have $C_i \subseteq A \cup B$. This proves that $\bigcup_{i \in \{1, \dots, n+m\}} C_i \subseteq A \cup B$ which combines with [eq: 21.241] gives

$$A \sqcup B = \bigcup_{i \in \{1, \dots, n+m\}} C_i \quad (21.242)$$

Hence we have

$$\begin{aligned} \nu(A \cup B) &= \nu\left(\bigcup_{i \in \{1, \dots, n+m\}} C_i\right) \\ &\stackrel{\text{def}}{=} \sum_{i=1}^{n+m} \mu(C_i) \\ &\stackrel{[\text{theorem: 11.23}]}{=} \sum_{i=1}^n \mu(C_i) + \sum_{i=n+1}^{n+m} \mu(C_i) \\ &= \sum_{i=1}^n \mu(A_i) + \sum_{i=n+1}^{n+m} \mu(B_{i-n}) \\ &\stackrel{[\text{theorem: 11.12}]}{=} \sum_{i=1}^n \mu(A_i) + \sum_{i=1}^m \mu(B_i) \\ &= \nu(A) + \nu(B) \end{aligned}$$

proving that

$$\forall A, B \in \mathcal{R}[\mathcal{S}] \text{ with } A \cap B = \emptyset \text{ we have } \nu(A \sqcup B) = \nu(A) + \nu(B) \quad (21.243)$$

Using [eqs: 21.239, 21.243] we can apply [theorem: 21.147] to prove that

$$\nu: \mathcal{R}[\mathcal{S}] \rightarrow [0, \infty] \text{ is a content on } \mathcal{R}[\mathcal{S}]$$

2. Let $\omega: \mathcal{R}[\mathcal{S}] \rightarrow [0, \infty]$ be another content on $\mathcal{R}[\mathcal{S}]$ such that $\omega|_{\mathcal{S}} = \mu$. Let $A \in \mathcal{R}[\mathcal{S}]$ then there exist a pairwise disjoint family $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that $A = \bigsqcup_{i \in \{1, \dots, n\}} A_i$. Hence

$$\begin{aligned} \omega(A) &= \omega\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) \\ &\stackrel{\omega \text{ is a content}}{=} \sum_{i=1}^n \omega(A_i) \\ &\stackrel{\omega|_{\mathcal{S}} = \mu}{=} \sum_{i=1}^n \mu(A_i) \\ &\stackrel{\text{def of } \nu}{=} \nu(A) \end{aligned}$$

so that

$$\omega = \nu$$

3. If $A \in \mathcal{R}[\mathcal{S}]$ then there exist a finite pairwise disjoint family $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that $A = \bigsqcup_{i \in \{1, \dots, n\}} A_i$. Then $\nu(A) = \sum_{i=1}^n \mu(A_i) < \infty$ [because μ is assumed to be finite]. $\square$

We can now rephrase [theorem: 21.151] to work with semi-rings instead of rings.

Theorem 21.161. *Let X be a set, $\mathcal{S}$ a semi-ring on X and $\mu: X \rightarrow [0, \infty]$ a **finite** content. If there exist a compact class $\mathcal{C} \subseteq \mathcal{P}(X)$ such that*

1. $\forall \{K_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{C}$, $n \in \mathbb{N}$ we have that $\bigcup_{i \in \{1, \dots, n\}} K_i \in \mathcal{C}$
2. $\forall A \in \mathcal{S}$ and $\forall \varepsilon \in \mathbb{R}^+$ we have that $\exists K_\varepsilon \in \mathcal{C}$ and $\exists A_\varepsilon \in \mathcal{S}$ such that

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A \text{ and } \mu(A) - \mu(A_\varepsilon) < \varepsilon$$

then

μ is a pre-measure

Proof. Using [theorem: 21.160] there exist a **finite** content $\bar{\mu}: \mathcal{R}[\mathcal{S}] \rightarrow [0, \infty]$ on the ring $\mathcal{R}[\mathcal{S}]$ such that

$$(\bar{\mu})|_{\mathcal{S}} = \mu \quad (21.244)$$

Let $A \in \mathcal{R}[\mathcal{S}]$ then by definition there exist a pairwise disjoint $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that $A = \bigsqcup_{i \in \{1, \dots, n\}} A_i$. Let $\varepsilon \in \mathbb{R}^+$ then by the hypothesis there exists $\{A_{i,\varepsilon}\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$ and $\{K_{i,\varepsilon}\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{C}$ such that

$$\forall i \in \{1, \dots, n\} \text{ we have } A_{i,\varepsilon} \subseteq K_{i,\varepsilon} \subseteq A_i \text{ and } \mu(A_i) - \mu(A_{i,\varepsilon}) < \frac{\varepsilon}{2^n} \quad (21.245)$$

Define

$$K_\varepsilon = \bigcup_{i \in \{1, \dots, n\}} K_{i,\varepsilon} \in \mathcal{C} \text{ [hypothesis]} \quad (21.246)$$

and

$$A_\varepsilon = \bigcup_{i \in \{1, \dots, n\}} A_{i,\varepsilon} \in \mathcal{R}[\mathcal{S}] \text{ [because } \mathcal{S} \subseteq \mathcal{R}[\mathcal{S}] \text{ and } \mathcal{R}[\mathcal{S}] \text{ is a ring hence } \cup\text{-stable}] \quad (21.247)$$

then we have

$$A_\varepsilon = \bigcup_{i \in \{1, \dots, n\}} A_{i,\varepsilon} \subseteq_{[\text{eq: 21.245}]} \bigcup_{i \in \{1, \dots, n\}} K_{i,\varepsilon} = K_\varepsilon$$

and

$$K_\varepsilon = \bigcup_{i \in \{1, \dots, n\}} K_{i,\varepsilon} \subseteq_{[\text{eq: 21.245}]} \bigcup_{i \in \{1, \dots, n\}} A_i = A$$

so that we have

$$A_\varepsilon \in \mathcal{R}[\mathcal{S}], K_\varepsilon \in \mathcal{C} \text{ and } A_\varepsilon \subseteq K_\varepsilon \subseteq A \quad (21.248)$$

Next

$$\begin{aligned} A \setminus A_\varepsilon &= \left(\bigcup_{i \in \{1, \dots, n\}} A_i \right) \setminus \left(\bigcup_{j \in \{1, \dots, n\}} A_{j,\varepsilon} \right) \\ &\stackrel{[\text{theorem: 2.133}]}{=} \bigcup_{i \in \{1, \dots, n\}} \left(A_i \setminus \left(\bigcup_{j \in \{1, \dots, n\}} A_{j,\varepsilon} \right) \right) \\ &\stackrel{[\text{theorem: 2.132}]}{=} \bigcup_{i \in \{1, \dots, n\}} \left(\bigcap_{j \in \{1, \dots, n\}} (A_i \setminus A_{j,\varepsilon}) \right) \\ &\subseteq \bigcup_{i \in \{1, \dots, n\}} (A_i \setminus A_{i,\varepsilon}) \end{aligned}$$

Further if $i, j \in \{1, \dots, n\}$ with $i \neq j$ then $(A_i \setminus A_{i,\varepsilon}) \cap (A_j \setminus A_{j,\varepsilon}) \subseteq A_i \cap A_j = \emptyset$. To summarize we have that

$$A \setminus A_\varepsilon \subseteq \bigsqcup_{i \in \{1, \dots, n\}} (A_i \setminus A_{i,\varepsilon}) \text{ and } \{A_i \setminus A_{i,\varepsilon}\}_{i \in \{1, \dots, n\}} \text{ is pairwise disjoint} \quad (21.249)$$

As $\bar{\mu}$ is a **finite** content on the ring $\mathcal{R}[\mathcal{S}]$ and $\forall i \in \{1, \dots, n\} \ A_i \setminus A_{i,\varepsilon} \in \mathcal{R}[\mathcal{S}]$ [because $\mathcal{R}[\mathcal{S}]$ is a ring and $A, A_\varepsilon, A_i, A_{i,\varepsilon} \in \mathcal{R}[\mathcal{S}]$] we have

$$\begin{aligned}
 \bar{\mu}(A \setminus A_\varepsilon) &\stackrel{[\text{theorem: 21.148(2)}]}{\leq} \bar{\mu}\left(\bigsqcup_{i \in \{1, \dots, n\}} (A_i \setminus A_{i,\varepsilon})\right) \\
 &= \sum_{i=1}^n \bar{\mu}(A_i \setminus A_{i,\varepsilon}) \\
 &\stackrel{[\text{theorem: 21.148(3)}]}{=} \sum_{i=1}^n (\bar{\mu}(A_i) - \bar{\mu}(A_{i,\varepsilon})) \\
 &\stackrel{\bar{\mu} \text{ extends } \mu}{=} \sum_{i=1}^n (\mu(A_i) - \mu(A_{i,\varepsilon})) \\
 &\stackrel{[\text{eq: 21.245}]}{\leq} \sum_{i=1}^n \frac{\varepsilon}{2^i} \\
 &= \varepsilon \cdot \sum_{i=1}^n \left(\frac{1}{2}\right)^i \\
 &\stackrel{[\text{lemma: 14.353}]}{=} \varepsilon \cdot \left(\frac{1}{2}\right) \cdot \frac{1 - \left(\frac{1}{2}\right)^n}{1 - \frac{1}{2}} \\
 &= \varepsilon \cdot \left(1 - \left(\frac{1}{2}\right)^n\right) \\
 &< \varepsilon
 \end{aligned}$$

Hence

$$\bar{\mu}(A \setminus A_\varepsilon) < \varepsilon \quad (21.250)$$

Using [eq: 21.248] and [eq: 21.250] allows us to apply [theorem: 21.151] proving that

$$\bar{\mu} \text{ is a pre-measure on } \mathcal{R}[\mathcal{S}]$$

As μ is a content

$$\mu(\emptyset) = 0 \quad (21.251)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}$ be pairwise disjoint such that $\bigsqcup_{i \in \mathbb{N}} A_i \in \mathcal{S}$ then we have

$$\begin{aligned}
 \mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &\stackrel{[\text{eq: 21.244}]}{=} \bar{\mu}\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) \\
 &\stackrel{\bar{\mu} \text{ is a pre-measure}}{=} \sum_{i=1}^{\infty} \bar{\mu}(A_i) \\
 &\stackrel{[\text{eq: 21.244}]}{=} \sum_{i=1}^{\infty} \mu(A_i)
 \end{aligned}$$

which together with [eq: 21.253] proves that μ is a pre-measure. $\square$

If we deal with topological spaces then we have a even simpler test to see if the extension of a content on a semi-ring $\mathcal{S}$ to the ring $\mathcal{R}[\mathcal{S}]$.

Theorem 21.162. *Let $\langle X, \mathcal{T} \rangle$ be a topological space, $\mathcal{S}$ a semi-ring on X and $\mu: X \rightarrow [0, \infty]$ a **finite** content. If $\forall A \in \mathcal{S}$ and $\forall \varepsilon \in \mathbb{R}^+$ there exists a compact K_ε and a $A_\varepsilon \in \mathcal{S}$ such that*

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A \text{ and } \mu(A) - \mu(A_\varepsilon) < \varepsilon$$

then

$$\mu: \mathcal{R}[\mathcal{S}] \rightarrow [0, \infty] \text{ is a pre-measure}$$

Proof. First using [theorem: 14.244] it follows that

$$\mathcal{C} = \{A \in \mathcal{P}(X) | A \text{ is compact}\} \text{ is a compact class} \quad (21.252)$$

Further:

1. $\forall \{K_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{C}$, $n \in \mathbb{N}$ we have by [theorem: 14.229] that $\bigcup_{i \in \{1, \dots, n\}} K_i$ is compact hence $\bigcup_{i \in \{1, \dots, n\}} K_i \in \mathcal{C}$.
2. $\forall A \in \mathcal{S}$ and $\forall \varepsilon \in \mathbb{R}^+$ we have by the hypothesis that $\exists K_\varepsilon \in \mathcal{C}$ and $\exists A_\varepsilon \in \mathcal{S}$ such that

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A \text{ and } \mu(A) - \mu(A_\varepsilon) < \varepsilon$$

So using the previous theorem [theorem: 21.161] we have that μ is a pre-measure. $\square$

21.3.4.3 Using the Carathéodory theorem on $\mathbb{R}$

We use now the theory developed in the previous sections to construct a σ -algebra and a measure on $\mathbb{R}$. The procedure that we will follow is the following:

1. Prove that $\mathcal{I}_{||} = \{[a, b[| a, b \in \mathbb{R} \wedge [a, b] \neq \emptyset\} \cup \{\emptyset\}$ [see theorem: 21.52] is semi-ring.
2. Prove that $\text{len}: \mathcal{I}_{||} \cup \{\emptyset\} \rightarrow [0, \infty]$ defines by $\text{len}(I) = \begin{cases} b - a & \text{if } I = [a, b[\in \mathcal{I}_{||} \\ 0 & \text{if } I = \emptyset \end{cases}$ [the function that calculates the length of a half-open interval] is a finite content on the semi-ring $\mathcal{I}_{||}$.
3. Use [theorem: 21.161] to extend the function len to a pre-measure on the ring $\mathcal{R}[\mathcal{S}]$
4. Use [theorem: 21.141] a derivate of the Carathéodore Theorem to extend the pre-measure to a measure [the Lebesgue measure] on a σ -algebra [the Lebesgue algebra on $\mathbb{R}$] that contains $\sigma[\mathcal{I}_{||}] = \mathcal{B}[\mathbb{R}]$ and whose restriction on $\mathcal{B}[\mathbb{R}]$ is also a measure that we also call the Lebesgue measure.

Definition 21.163. The set $\mathcal{S}_{||} \subseteq \mathcal{P}(\mathbb{R})$ is defined by

$$\mathcal{S}_{||} = \{[a, b[| a, b \in \mathbb{R}\}$$

Theorem 21.164. $\mathcal{S}_{||} = \mathcal{I}_{||} \cup \{\emptyset\}$ and $\{\emptyset\} \cap \mathcal{I}_{||} = \emptyset$ in other words

$$\mathcal{S}_{||} = \mathcal{I}_{||} \bigsqcup \{\emptyset\}$$

where $\mathcal{I}_{||} \stackrel{\text{definition: 21.48}}{=} \{[a, b[| a, b \in \mathbb{R} \wedge [a, b] \neq \emptyset\}$

Proof. If $I \in \mathcal{S}_{||}$ then there exists $a, b \in \mathbb{R}$ such that $I = [a, b[$. For a, b we have either

$a < b$. Then $[a, b[\neq \emptyset$ so that $I \in \mathcal{I}_{||} \subseteq \mathcal{I}_{||} \cup \{\emptyset\}$

$b \leq a$. Then $[a, b[= \emptyset$ so that $I \in \{\emptyset\} = \mathcal{I}_{||} \cup \{\emptyset\}$

hence we have that

$$\mathcal{S}_{||} \subseteq \mathcal{I}_{||} \bigsqcup \{\emptyset\} \quad (21.253)$$

If $I \in \mathcal{I}_{||} \cup \{\emptyset\}$ then either we have:

$I \in \mathcal{I}_{||}$. Then $\exists a, b \in \mathbb{R}$ such that $I = [a, b[$ so that $I \in \mathcal{S}_{||}$.

$I \in \{\emptyset\}$. Then $I = \emptyset = [0, 0[$ so that $I \in \mathcal{S}_{||}$

which proves that $\mathcal{I}_{||} \cup \{\emptyset\} \subseteq \mathcal{S}_{||}$. Combining this with [eq: 21.253] gives

$$\mathcal{S}_{||} = \mathcal{I}_{||} \bigsqcup \{\emptyset\}$$

Further if $I \in \mathcal{I}_{||} \cap \{\emptyset\}$ then $I = \emptyset$ and there exists $a, b \in \mathbb{R}$ such that $I = [a, b[\neq \emptyset$ which is a contradiction. Hence

$$\mathcal{I}_{||} \cap \{\emptyset\} = \emptyset \quad \square$$

Theorem 21.165. $\mathcal{S}_{||} = \mathcal{I}_{||} \sqcup \{\emptyset\}$ where $\mathcal{I}_{||} = \{[a, b[\mid a, b \in \mathbb{R} \text{ such that } [a, b[\neq \emptyset\}$ is a semi-ring.

Proof.

$$1. \emptyset \in \mathcal{I}_{||} \cup \{\emptyset\} = \mathcal{S}_{||}$$

2. If $[a, b[, [c, d[\in \mathcal{S}_{||}$ then we have either:

$$[a, b[= \emptyset \wedge [c, d[= \emptyset. \text{ Then } [a, b[\cap [c, d[= \emptyset \cap \emptyset = \emptyset \in \mathcal{S}_{||}.$$

$$[a, b[\in \mathcal{I}_{||} \wedge [c, d[= \emptyset. \text{ Then } [a, b[\cap [c, d[= [a, b[\cap \emptyset = \emptyset \in \mathcal{S}_{||}.$$

$$[a, b[= \emptyset \wedge [c, d[\in \mathcal{I}_{||}. \text{ Then } [a, b[\cap [c, d[= \emptyset \cap [c, d[= \emptyset \in \mathcal{S}_{||}.$$

$$[a, b[\in \mathcal{I}_{||} \wedge [c, d[\in \mathcal{I}_{||}. \text{ Then for } [a, b[\cap [c, d[\text{ we have either}$$

$$[a, b[\cap [c, d[= \emptyset. \text{ Then } [a, b[\cap [c, d[= \emptyset \in \mathcal{S}_{||}$$

$$[a, b[\cap [c, d[\neq \emptyset. \text{ Then for } a \text{ we have either:}$$

$a \leq c$. For b we have either:

$$b \leq d. \text{ Let } y \in [c, b[\text{ then } a \leq c \leq y < b \leq d \text{ so that } y \in [a, b[\wedge y \in [c, d[\\ \text{hence } y \in [a, b[\cap [c, d[, \text{ proving that}$$

$$[c, b[\subseteq [a, b[\cap [c, d[$$

$$\text{Let } y \in [a, b[\cap [c, d[\text{ then } y \in [a, b[\wedge y \in [c, d[\text{ so that}$$

$$a \leq y < b \wedge c \leq y < d \Rightarrow c \leq y < b$$

$$\text{proving that } y \in [c, b[\text{ so that } [a, b[\cap [c, d[\subseteq [c, b[. \text{ Hence}$$

$$\emptyset \neq [a, b[\cap [c, d[= [c, b[\in \mathcal{I}_{||} \subseteq \mathcal{S}_{||}$$

$$d < b. \text{ Let } y \in [c, d[\text{ then } a \leq c \leq y < d < b \text{ so that } y \in [a, b[\text{ hence} \\ [c, d[\subset [a, b[\text{ so that}$$

$$\emptyset \neq [c, d[= [a, b[\cap [c, d[$$

$c < a$. For b we have either:

$$b \leq d. \text{ Let } y \in [a, b[\text{ then } c < a \leq y < b \leq d \text{ so that } y \in [c, d[\text{ hence} \\ [a, b[\subseteq [c, d[\text{ so that}$$

$$\emptyset \neq [a, b[\subseteq [a, b[\cap [c, d[$$

$$d < b. \text{ Let } y \in [a, d[\text{ then } c < a \leq y < d < b \text{ so that } y \in [a, b[\wedge y \in [c, d[\\ \text{hence } y \in [a, b[\cap [c, d[, \text{ proving that}$$

$$\emptyset \neq [a, d[\subseteq [a, b[\cap [c, d[$$

$$\text{Let } y \in [a, b[\cap [c, d[\text{ then } y \in [a, b[\wedge y \in [c, d[\text{ so that}$$

$$a \leq y < b \wedge c \leq y < d \Rightarrow a \leq y < d$$

$$\text{proving that } y \in [a, d[\text{ or } [a, b[\cap [c, d[\subseteq [a, d[. \text{ Hence}$$

$$\emptyset \neq [a, b[\cap [c, d[= [a, d[\in \mathcal{I}_{||} \subseteq \mathcal{S}_{||}$$

so in all cases we have that

$$[a, b[\cap [c, d[\in \mathcal{S}_{||}$$

3. Let $[a, b[, [c, d[\in \mathcal{S}_{||}$ then we have either:

$$[a, b[= \emptyset \wedge [c, d[= \emptyset. \text{ Then } [a, b[\setminus [c, d[= \emptyset \setminus \emptyset = \emptyset = \bigsqcup_{i \in \{1\}} A_i \text{ where } \{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}_{||} \\ \text{is defined by } A_i = \emptyset.$$

$[a, b[\in \mathcal{I}_{[[} \wedge [c, d[= \emptyset$. Then $[a, b[\setminus [c, d[= [a, b[\setminus \emptyset = [a, b[= \bigsqcup_{i \in \{1\}} A_i$ where $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}_{[[}$ is defined by $A_i = [a, b[$.

$[a, b[= \emptyset \wedge [c, d[\in \mathcal{I}_{[[}$. Then $[a, b[\setminus [c, d[= \emptyset \setminus [c, d[= \emptyset = \bigsqcup_{i \in \{1\}} A_i$ where $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}_{[[}$ is defined by $A_i = \emptyset$.

$[a, b[\in \mathcal{I}_{[[} \wedge [c, d[\in \mathcal{I}_{[[}$. Then for $[a, b[\cap [c, d[$ we have either:

$[a, b[\cap [c, d[= \emptyset$. Then $[a, b[\setminus [c, d[= [a, b[= \bigsqcup_{i \in \{1\}} A_i$ where $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}_{[[}$ is defined by $A_i = [a, b[$.

$[a, b[\cap [c, d[\neq \emptyset$. As $[a, b[\neq \emptyset \neq [c, d[$ we have

$$a < b \wedge c < d \quad (21.254)$$

further there exist a x such that

$$a \leq x < b \wedge c \leq x < d \Rightarrow a < d \wedge c < b \quad (21.255)$$

$a \leq c$. Then for b we have either:

$b \leq d$. Let $y \in [a, c[$ then $a \leq y < c \stackrel{[\text{eq: 21.255}]}{<} b$ so that $y \in [a, b[$. Assume that $y \in [c, d[$ then $c \leq y$ contradicting $y < c$ hence $y \notin [c, d[$ so that $y \in [a, b[\setminus [c, d[$. Hence

$$[a, c[\subseteq [a, b[\setminus [c, d[\quad (21.256)$$

On the other hand if $y \in [a, b[\setminus [c, d[$ we have $a \leq y < b \leq d$ and $\neg(c \leq y < d) \Rightarrow y < c \vee d \leq y$. Assume that $d \leq y$ then as also $y < b \leq d \Rightarrow y < d$ we would have a contradiction so that we must have $y < c$. Hence we have $a \leq y < c$ which proves that $[a, b[\setminus [c, d[\subseteq [a, c[$ so that, using [eq: 21.256] we have

$$[a, b[\setminus [c, d[= [a, c[\in \mathcal{S}_{[[} = \mathcal{I}_{[[} \bigcup \{\emptyset\}$$

So if we define $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}_{[[}$ by $A_1 = [a, c[$ we have

$$[a, b[\setminus [c, d[= \bigsqcup_{i \in \{1\}} A_i$$

$d < b$. Let $y \in [a, c[\cap [d, b[$ then $a \leq y < c \wedge d \leq y < b$, as by [eq: 21.254] $c < d$ we reach the contradictib $y < y$ so that

$$[a, c[\cap [d, b[= \emptyset \quad (21.257)$$

Let $y \in [a, c[\cup [d, b[$ then we have either:

$y \in [a, c[$. Then $a \leq y < c \stackrel{[\text{eq: 21.255}]}{<} b$ so that $y \in [a, b[$. Assume that $y \in [c, d[$ then $c \leq y < d$ contradicting $y < c$ hence we have $y \notin [c, d[$ so

$$y \in [a, b[\setminus [c, d[$$

$y \in [d, b[$. Then $a \stackrel{[\text{eq: 21.255}]}{<} d \leq y < b$ so that $y \in [a, b[$. Assume that $y \in [c, d[$ then $c \leq y < d$ contradicting $d \leq y$ hence we must have $y \notin [c, d[$ or

$$y \in [a, b[\setminus [c, d[$$

as in all cases we have $y \in [a, b[\setminus [c, d[$ it follows that

$$[a, c[\bigcup [d, b[\subseteq [a, b[\setminus [c, d[\quad (21.258)$$

On the other hand if $y \in [a, b[\setminus [c, d[$ then

$$\begin{aligned} a \leq y < b \wedge \neg(c \leq y \wedge y < d) &= \\ a \leq y < b \wedge (y < c \vee d \leq y) &= \\ (a \leq y < b \wedge y < c) \vee (a \leq y < b \wedge d \leq y) & \end{aligned}$$

so that $y \in [a, c[\vee y \in [d, b[\Rightarrow y \in [a, c[\cup [d, b[$ which proves that $[a, b[\setminus [c, d[\subseteq [a, c[\cup [d, b[$. Combining this with [eq: 21.258]

$$[a, b[\setminus [c, d[= [a, c[\cup [d, b[$$

Hence if we define $\{A_i\}_{i \in \{1,2\}} \subseteq \mathcal{I}_{[[} \cup \{\emptyset\}$ by $A_1 = [a, c[$, $A_2 = [d, b[$ then $\{A_i\}_{i \in \{1,2\}}$ is pairwise disjoint and

$$[a, b[\setminus [c, d[= \bigsqcup_{i \in \{1,2\}} A_i$$

$c < a$. Then for b we have either:

$b \leq d$. If $y \in [a, b[$ then $c < a \leq y < b \leq d$ so that $y \in [c, d[$, hence $[a, b[\subseteq [c, d[$ so that $[a, b[\setminus [c, d[= \emptyset$. Hence if we define $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}_{[[}$ by $A_1 = \emptyset$ it follows that

$$[a, b[\setminus [c, d[= \bigsqcup_{i \in \{1\}} A_i$$

$d < b$. Let $y \in [d, b[$ then $a \leq d \leq y < b$ so that $y \in [a, b[$. [eq: 21.255]

Assume that $y \in [c, d[$ then $c \leq y < d$ contradicting $d \leq y$. Hence $y \in [a, b[\setminus [c, d[$ proving that

$$[d, b[\subseteq [a, b[\setminus [c, d[\quad (21.259)$$

If $y \in [a, b[\setminus [c, d[$ then

$$\begin{aligned} a \leq y < b \wedge \neg(c \leq y < d) &= \\ a \leq y < b \wedge (y < c \vee d \leq y) &= \\ (a \leq y < b \wedge y < c) \vee (a \leq y < b \wedge d \leq y) &\stackrel{c < a}{=} \\ (c < a \leq y < b \wedge y < c) \vee (c < a \leq y < b \wedge d \leq y) &\stackrel{c \not\leq c}{=} \\ c < a \leq y < b \wedge d \leq y & \end{aligned}$$

so that $y \in [d, b[$. Hence $[a, b[\setminus [c, d[\subseteq [d, b[$ which combined with [eq: 21.259] gives

$$[a, b[\setminus [c, d[= [d, b[$$

Define $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{S}_{[[}$ by $A_1 = [d, b[$ then

$$[a, b[\setminus [c, d[= \bigsqcup_{i \in \{1\}} A_i$$

So in all cases we found a pairwise disjoint family $\{A_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{S}_{[[}$ such that

$$[a, b[\setminus [c, d[= \bigsqcup_{i \in \{1, \dots, m\}} A_i$$

□

Theorem 21.166. For $\mathcal{S}_{[[} = \mathcal{I}_{[[} \cup \{\emptyset\}$ where $\mathcal{I}_{[[} = \{[a, b[\mid a, b \in \mathbb{R} \text{ such that } [a, b[\neq \emptyset\}$ then

$$\sigma[\mathcal{S}_{[[}] = \sigma[\mathcal{I}_{[[}]$$

so that using [theorem: 21.52]

$$\begin{aligned}
 \sigma[\{C \subseteq \mathbb{R} \mid C \text{ is closed in } \mathcal{I}_{[]}\}] &\stackrel{[\text{theorem: 21.44}]}{=} \mathcal{B}[\mathbb{R}] \\
 &= \sigma[\mathcal{I}_{[]}] \\
 &= \sigma[\mathcal{I}_{}] \\
 &= \sigma[\mathcal{I}_{[]}] \\
 &= \sigma[\mathcal{I}_{[]}] \\
 &= \sigma[\mathcal{I}_{[]}] \\
 &= \sigma[\mathcal{S}_{[]}] \\
 &= \sigma[\{[a, \infty[\mid a \in \mathbb{R}\}] \\
 &= \sigma[\{]a, \infty[\mid a \in \mathbb{R}\}] \\
 &= \sigma[\{]-\infty, a[\mid a \in \mathbb{R}\}] \\
 &= \sigma[\{]-\infty, a[\mid a \in \mathbb{R}\}]
 \end{aligned}$$

Proof. As $\mathcal{I}_{[]} \subseteq \mathcal{S}_{[]} \subseteq \sigma[\mathcal{S}_{[]}]$ it follows from [theorem: 21.39] and the fact that $\sigma[\mathcal{S}_{[]}]$ is a σ -algebra that

$$\sigma[\mathcal{I}_{[]}] \subseteq \sigma[\mathcal{S}_{[]}] \quad (21.260)$$

Let $A \in \mathcal{S}_{[]}$ then either $A \in \mathcal{I}_{[]} \subseteq \sigma[\mathcal{I}_{[]}]$ or $A = \emptyset \in \sigma[\mathcal{I}_{[]}]$ which proves that $\mathcal{S}_{[]} \subseteq \sigma[\mathcal{I}_{[]}]$. Hence using [theorem: 21.39] and the fact that $\sigma[\mathcal{I}_{[]}]$ is a σ -algebra it follows that $\sigma[\mathcal{S}_{[]}] \subseteq \sigma[\mathcal{I}_{[]}]$. Combining this with [eq: 21.260] proves that

$$\sigma[\mathcal{S}_{[]}] = \sigma[\mathcal{I}_{[]}]$$

□

Definition 21.167. We define

$$\begin{aligned}
 \text{begin}: \mathcal{I}_{[]} &\rightarrow \mathbb{R} \text{ by } \text{begin}(I) = a \text{ where } I = [a, b[\\
 \text{end}: \mathcal{I}_{[]} &\rightarrow \mathbb{R} \text{ by } \text{end}(I) = b \text{ where } I = [a, b[
 \end{aligned}$$

Note 21.168. If $\emptyset \neq I = [a, b[= [c, d[$ then by [theorem: 3.144(7)] we have $a = c \wedge b = d$ so these functions are well defined.

Note 21.169. As $I \neq \emptyset$ we have always that $\text{begin}(I) < \text{end}(I)$

We define

$$\begin{aligned}
 \text{begin}: \mathcal{I}_{[]} &\rightarrow \mathbb{R} \text{ by } \text{begin}(I) = a \text{ where } I = [a, b[\\
 \text{end}: \mathcal{I}_{[]} &\rightarrow \mathbb{R} \text{ by } \text{end}(I) = b \text{ where } I = [a, b[
 \end{aligned}$$

Note 21.170. If $\emptyset \neq I = [a, b[= [c, d[$ then by [theorem: 3.144(7)] we have $a = c \wedge b = d$ these functions are well defined.

Note 21.171. As $I \neq \emptyset$ we have that $\text{begin}(I) < \text{end}(I)$

Using the above two functions we can now define the length function.

Definition 21.172. We define

$$\text{len}: \mathcal{S}_{[]} \rightarrow [0, \infty] \text{ by } \text{len}(I) = \begin{cases} 0 & \text{if } I = \emptyset \\ \text{end}(I) - \text{begin}(I) & \text{if } I \in \mathcal{I}_{[]} \end{cases}$$

In other words the function len calculates the length of a interval.

To simplify the proof that len is a content we need to order the half open intervals based on their boundary points. We define now a total order on $\mathcal{I}_{[]}$ the set of half-open intervals.

Theorem 21.173. *The relation $\preceq \subseteq \mathcal{I}_{\llbracket} \times \mathcal{I}_{\llbracket}$ defined by*

$$[a, b[\preceq [c, d[\text{ if } a < c \vee (a = c \wedge b \leq d)$$

is a total order on $\mathcal{I}_{\llbracket}$ making $\langle \mathcal{I}_{\llbracket}, \preceq \rangle$ a totally ordered set.

Proof. We have

reflexivity. Let $[a, b[\in \mathcal{I}_{\llbracket}$ then as $a = a$ and $b = b \Rightarrow b \leq b$ it follows that $[a, b[\preceq [a, b[$ proving reflexivity.

anti-symmetry. Let $[a, b[, [c, d[\in \mathcal{I}_{\llbracket}$ be such that $[a, b[\preceq [c, d[$ and $[c, d[\preceq [a, b[$. As $[a, b[\preceq [c, d[$ we have either:

$a < c$. Then as $[c, d[\preceq [a, b[$ we have either $c = a$ or $c < a$ which both give a contradiction, so this cases never occurs.

$a = c$. Then from $[a, b[\preceq [c, d[$ it follows that $b \leq d$ and from $[c, d[\preceq [a, b[$ it follows that $d \leq b$. Hence we have $a = c \wedge b = d$ so that $[a, b[= [c, d[$

transitivity. Assume that $[a, b[\preceq [c, d[$ and $[c, d[\preceq [e, f[$. As $[a, b[\preceq [c, d[$ we have either:

$a < c$. Then as $[c, d[\preceq [e, f[$ we have either:

$c < e$. Then $a < e$ so that $[a, b[\preceq [e, f[$

$c = e$. Then $a < e$ so that $[a, b[\preceq [e, f[$

$a = c$. Then as $[a, b[\preceq [c, d[$ we must have that

$$b \leq d$$

As $[c, d[\preceq [e, f[$ we have either:

$c < e$. Then $a < e$ so that $[a, b[\preceq [e, f[$.

$c = e$. Then as $[c, d[\preceq [e, f[$ we have that $d \leq f$ which combined with $a = c = e$ proves that $[a, b[\preceq [e, f[$.

So in all cases we have $[a, b[\preceq [e, f[$ proving transitivity.

totally. If $[a, b[, [c, d[$ then, as $a, b, c, d \in \mathbb{R}$ and $\langle \mathbb{R}, \leq \rangle$ is totally ordered, we have for a, c either:

$a < c$. Then $[a, b[\preceq [c, d[$

$a = c$. Then as $\langle \mathbb{R}, \leq \rangle$ is totally ordered we have for b, d either:

$b < d$. Then $[a, b[\preceq [c, d[$

$d \leq b$. Then $[c, d[\preceq [a, b[$

$c < a$. Then $[c, d[\preceq [a, b[$

□

So we can sort half open intervals which will be used in the next lemma.

Theorem 21.174. *Let $n \in \mathbb{N}$, $\{[a_i, b_i[\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{I}_{\llbracket}$ pairwise disjoint such that*

$$\bigcup_{i \in \{1, \dots, n\}} [a_i, b_i[\in \mathcal{I}_{\llbracket}$$

then there exist a bijection $\sigma: \{1, \dots, n\} \rightarrow \{1, \dots, n\}$ such that

$$\forall i \in \{1, \dots, n-1\} \text{ we have } b_{\sigma(i)} = a_{\sigma(i+1)}$$

and

$$\bigcup_{i \in \{1, \dots, n\}} [a_i, b_i[= [a_{\sigma(1)}, b_{\sigma(n)}]$$

Proof. For $n \in \mathbb{N}$ we have either:

$n = 1$. Take $\sigma = \text{Id}_{\{1\}}: \{1\} \rightarrow \{1\}$ then σ is a bijection, further as $\{1, \dots, n-1\} = \emptyset$ we have vacuously that $\forall i \in \{1, \dots, n-1\} b_{\sigma(i)} = a_{\sigma(i+1)}$, finally $\bigcup_{i \in \{1\}} [a_i, b_i[= [a_1, b_1[= [a_{\sigma(1)}, b_{\sigma(1)}]$.

$n \in \{2, \dots, \infty\}$. As $\langle \mathcal{I}_[, \preccurlyeq \rangle$ is totally ordered there exist by [corollary: 6.55] a bijection $\sigma: \{1, \dots, n\} \rightarrow \{1, \dots, n\}$ such that

$$\forall i, j \in \{1, \dots, n\} \text{ with } i \leq j \text{ we have } [a_{\sigma(i)}, b_{\sigma(i)}[\preccurlyeq [a_{\sigma(j)}, b_{\sigma(j)}[\quad (21.261)$$

Let $i, j \in \{1, \dots, n\}$ with $i \leq j$ then as $[a_{\sigma(i)}, b_{\sigma(i)}[\preccurlyeq [a_{\sigma(j)}, b_{\sigma(j)}[$ we have either $a_{\sigma(i)} < a_{\sigma(j)} \Rightarrow a_{\sigma(i)} \leq a_{\sigma(j)}$ or $a_{\sigma(i)} = a_{\sigma(i+1)} \Rightarrow a_{\sigma(i)} \leq a_{\sigma(j)}$ so that

$$\forall i, j \in \{1, \dots, n\} \text{ with } i \leq j \text{ we have } a_{\sigma(i)} \leq a_{\sigma(j)} \quad (21.262)$$

Futher by [theorem: 21.4] we have that

$$\{[a_{\sigma(i)}, b_{\sigma(i)}[\}_{i \in \{1, \dots, n\}} \text{ is pairwise disjoint} \quad (21.263)$$

Assume that there exist a $k \in \{1, \dots, n-1\}$ such that $a_{\sigma(k+1)} < b_{\sigma(k)}$. Then by [eq: 21.262] $a_{\sigma(k)} \leq a_{\sigma(k+1)} < b_{\sigma(k)}$ from which it follows that $a_{\sigma(k+1)} \in [a_{\sigma(k)}, b_{\sigma(k)}[\cap [a_{\sigma(k+1)}, b_{\sigma(k+1)}[$ contradicting $[a_{\sigma(k)}, b_{\sigma(k)}[\cap [a_{\sigma(k+1)}, b_{\sigma(k+1)}[\stackrel{[eq: 21.263]}{=} \emptyset$. Hence the assumption is wrong and we conclude that

$$\forall i \in \{1, \dots, n-1\} \text{ we have } b_{\sigma(i)} \leq a_{\sigma(i+1)} \quad (21.264)$$

As $\bigcup_{i \in \{1, \dots, n\}} [a_i, b_i[\in \mathcal{I}_[$ there exist a $c, d \in \mathbb{R}$ with $c < d$ such that

$$\bigcup_{i \in \{1, \dots, n\}} [a_{\sigma(i)}, b_{\sigma(i)}[\stackrel{[theorem: 2.119]}{=} \bigcup_{i \in \{1, \dots, n\}} [a_i, b_i[= [c, d[\quad (21.265)$$

If $i = \{1, \dots, n-1\}$ then by [eq: 21.264] we have $b_{\sigma(i)} \leq a_{\sigma(i+1)}$ and as $i \leq n-1 < n \Rightarrow i+1 \leq n$ it follows from [eq: 21.262] that $a_{\sigma(i+1)} \leq a_{\sigma(n)} < b_{\sigma(n)}$ so that $b_{\sigma(i)} < b_{\sigma(n)}$, hence

$$\forall i \in \{1, \dots, n\} \text{ we have } b_{\sigma(i)} \leq b_{\sigma(n)} \quad (21.266)$$

Let $i \in \{1, \dots, n\}$ then for $x \in [a_{\sigma(i)}, b_{\sigma(i)}[$ we have $a_{\sigma(1)} \stackrel{[eq: 21.262]}{\leq} a_{\sigma(i)} < x < b_{\sigma(i)} \stackrel{[eq: 21.266]}{\leq} b_{\sigma(n)}$ so that $x \in [a_{\sigma(1)}, b_{\sigma(n)}[$ hence $[a_{\sigma(i)}, b_{\sigma(i)}[\subseteq [a_{\sigma(1)}, b_{\sigma(n)}[$. So

$$[c, d[\stackrel{[eq: 21.265]}{=} \bigcup_{i \in \{1, \dots, n\}} [a_{\sigma(i)}, b_{\sigma(i)}[\subseteq [a_{\sigma(1)}, b_{\sigma(n)}[\quad (21.267)$$

As $[c, d[\subseteq [a_{\sigma(1)}, b_{\sigma(n)}[$ it follows from [theorem: 3.144(9)] that

$$a_{\sigma(1)} \leq c \wedge d \leq b_{\sigma(n)} \quad (21.268)$$

As $a_{\sigma(1)} \in [a_{\sigma(1)}, b_{\sigma(1)}[\subseteq \bigcup_{i \in \{1, \dots, n\}} [a_{\sigma(i)}, b_{\sigma(i)}[\stackrel{[eq: 21.265]}{=} [c, d[$ it follows that $c \leq a_{\sigma(1)}$ which combined with [eq: 21.268] proves that

$$a_{\sigma(1)} = c \quad (21.269)$$

As $a_{\sigma(n)} \in [a_{\sigma(n)}, b_{\sigma(n)}[\subseteq \bigcup_{i \in \{1, \dots, n\}} [a_{\sigma(i)}, b_{\sigma(i)}[\stackrel{[eq: 21.265]}{=} [c, d[$ we have $c \leq a_{\sigma(n)} < d$. Assume that $d < b_{\sigma(n)}$ then $a_{\sigma(n)} < d < b_{\sigma(n)}$, proving that $d \in [a_{\sigma(n)}, b_{\sigma(n)}[\subseteq [c, d[$ leading to the contradiction $d < d$. Hence we must have $b_{\sigma(n)} \leq d$ which combined with [eq: 21.268] proves

$$b_{\sigma(n)} = d \quad (21.270)$$

Summarizing [eqs: 21.265, 21.269 and 21.270] we have

$$\bigsqcup_{i \in \{1, \dots, n\}} [a_i, b_i[= \bigsqcup_{i \in \{1, \dots, n\}} [a_{\sigma(i)}, b_{\sigma(i)}[= [a_{\sigma(1)}, b_{\sigma(n)}[\quad (21.271)$$

Assume now that there exist a $k \in \{1, \dots, n-1\}$ such that $b_{\sigma(k)} \neq a_{\sigma(k+1)}$. If $a_{\sigma(k+1)} < b_{\sigma(k)}$ then by [eq: 21.264] $b_{\sigma(k)} \leq a_{\sigma(k+1)}$ and we reach the contradiction $a_{\sigma(k+1)} < a_{\sigma(k+1)}$ so we must have that $b_{\sigma(k)} < a_{\sigma(k+1)}$. Hence there exist a $x \in \mathbb{R}$ such that

$$b_{\sigma(k)} < x < a_{\sigma(k+1)} \text{ so that } x \notin [a_{\sigma(k)}, b_{\sigma(k)}[\text{ and } x \notin [a_{\sigma(k+1)}, b_{\sigma(k+1)}[\quad (21.272)$$

If $i \in \{1, \dots, k-1\}$ then $b_{\sigma(i)} \underset{\text{[eq: 21.264]}}{\leq} a_{\sigma(i+1)} \underset{\text{[eq: 21.262]}}{\leq} a_{\sigma(k)} < b_{\sigma(k)} < x$ so that $x \notin [a_{\sigma(i)}, b_{\sigma(i)}[$. Further if $i \in \{k+1, \dots, n\}$ then $x < a_{\sigma(k+1)} \leq a_{\sigma(i)}$ so that $x \notin [a_{\sigma(i)}, b_{\sigma(i)}[$. From this we conclude that $\forall i \in \{1, \dots, n\}$ $x \notin [a_{\sigma(i)}, b_{\sigma(i)}[$ or

$$x \notin \bigcup_{i \in \{1, \dots, n\}} [a_{\sigma(i)}, b_{\sigma(i)}[= [a_{\sigma(1)}, b_{\sigma(n)}[\quad (21.273)$$

As $a_{\sigma(1)} \underset{\text{[eq: 21.262]}}{\leq} a_{\sigma(k)} < b_{\sigma(k)} < x$ and $x < a_{\sigma(k+1)} \underset{\text{[eq: 21.262]}}{\leq} a_{\sigma(n)} < b_{\sigma(n)}$ so that $x \in [a_{\sigma(1)}, b_{\sigma(n)}[$ which contradicts [eq: 21.273]. Hence the assumption is false and we must have

$$\forall i \in \{1, \dots, n-1\} \text{ that } b_{\sigma(i)} = a_{\sigma(i+1)} \quad \square$$

We are now ready to prove that len is a content on the semi-ring $\mathcal{S}_{[[$.

Lemma 21.175. *The length function $\text{len}: \mathcal{S}_{[[} \rightarrow [0, \infty]$ defined by $\text{len}(I) = \begin{cases} 0 & \text{if } I = \emptyset \\ \text{end}(I) - \text{begin}(I) & \text{if } I \in \mathcal{I}_{[[} \end{cases}$ [see definition: 21.172] is a finite content on the semi-ring $\mathcal{S}_{[[$.*

Proof. First by definition we have

$$\text{len}(\emptyset) = 0 \quad (21.274)$$

Second $\forall I \in \mathcal{S}_{[[}$ we have $\text{len}(I) = \begin{cases} 0 < \infty & \text{if } I = \emptyset \\ \text{end}(I) - \text{begin}(I) < \infty & \text{if } I \in \mathcal{I}_{[[} \end{cases}$ which proves that

$$\text{len} \text{ is a finite} \quad (21.275)$$

Next we prove that len is additive on $\mathcal{I}_{[[$. Let $\{I_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{I}_{[[}$, $n \in \mathbb{N}$ pairwise disjoint such that $\bigsqcup_{i \in \{1, \dots, n\}} I_i \in \mathcal{I}_{[[}$ then we have for $n \in \mathbb{N}$ either:

$$n = 1. \text{ Then } \text{len}\left(\bigsqcup_{i \in \{1, \dots, n\}} I_i\right) = \text{len}(I_1) = \sum_{i=1}^1 \text{len}(I_i) = \sum_{i=1}^n \text{len}(I_i)$$

$1 < n$. Then $\forall i \in \{1, \dots, n\}$ there exists $a_i, b_i \in \mathbb{R}$ with $a_i < b_i$ such that $I_i = [a_i, b_i[$. Using [theorem: 21.174] there exist a bijection $\sigma: \{1, \dots, n\} \rightarrow \{1, \dots, n\}$ such that

$$\bigsqcup_{i \in \{1, \dots, n\}} I_i = \bigsqcup_{i \in \{1, \dots, n\}} [a_i, b_i[= \bigsqcup_{i \in \{1, \dots, n\}} [a_{\sigma(i)}, b_{\sigma(i)}[= [a_{\sigma(1)}, b_{\sigma(n)}[\quad (21.276)$$

such that

$$\forall i \in \{1, \dots, n-1\} \text{ } b_{\sigma(i)} = a_{\sigma(i+1)} \quad (21.277)$$

Then

$$\begin{aligned} \sum_{i=1}^n \text{len}(I_i) &\underset{\text{[theorem: 11.31]}}{=} \sum_{i=1}^n \text{len}(I_{\sigma(i)}) \\ &= \sum_{i=1}^n \text{len}([a_{\sigma(i)}, b_{\sigma(i)}[) \\ &= \sum_{i=1}^n (b_{\sigma(i)} - a_{\sigma(i)}) \\ &\underset{1 < n}{=} (b_{\sigma(n)} - a_{\sigma(n)}) + \sum_{i=1}^{n-1} (b_{\sigma(i)} - a_{\sigma(i)}) \\ &\underset{\text{[eq: 21.277]}}{=} (b_{\sigma(n)} - a_{\sigma(n)}) + \sum_{i=1}^{n-1} (a_{\sigma(i+1)} - a_{\sigma(i)}) \\ &\underset{\text{[theorem: 11.10]}}{=} b_{\sigma(n)} - a_{\sigma(n)} + a_{\sigma(n)} - a_{\sigma(1)} \\ &= b_{\sigma(n)} - a_{\sigma(1)} \\ &= \text{len}([a_{\sigma(1)}, b_{\sigma(n)}[) \\ &\underset{\text{[eq: 21.276]}}{=} \text{len}\left(\bigsqcup_{i \in \{1, \dots, n\}} I_i\right) \end{aligned}$$

To summarize

$$\forall \{I_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{I}_{[[} \text{ pairwise disjoint with } \bigsqcup_{i \in \{1, \dots, n\}} I_i \in \mathcal{I}_{[[} \quad \text{len} \left(\bigsqcup_{i \in \{1, \dots, n\}} I_i \right) = \sum_{i=1}^n \text{len}(I_i) \quad (21.278)$$

Next we extend the above to $\mathcal{S}_{[[}$. Let $\{I_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}_{[[}$, $n \in \mathbb{N}$ such that $\bigsqcup_{i \in \{1, \dots, n\}} I_i \in \mathcal{S}_{[[}$. Define $N = \{i \in \{1, \dots, n\} | I_i \neq \emptyset\}$ then for N we have either:

$N = \emptyset$. Then

$$\text{len} \left(\bigsqcup_{i \in \{1, \dots, n\}} I_i \right) = \text{len}(\emptyset) = 0 = \sum_{i=1}^n 0 = \sum_{i=1}^n \text{len}(I_i)$$

$N \neq \emptyset$. Then as $\emptyset \neq N$ is finite there exist a $m \in \{1, \dots, n\}$ and a bijection $\beta: \{1, \dots, m\} \rightarrow N$. Further we have

$$\begin{aligned} \text{len} \left(\bigsqcup_{i \in \{1, \dots, n\}} I_i \right) &\stackrel{[\text{theorem: 2.134}]}{=} \text{len} \left(\bigsqcup_{i \in N} I_i \right) \\ &\stackrel{[\text{theorem: 2.119}]}{=} \text{len} \left(\bigsqcup_{i \in \{1, \dots, m\}} I_{\sigma(i)} \right) \\ &\stackrel{[\text{eq: 21.278}]}{=} \sum_{i=1}^m \text{len}(I_{\sigma(i)}) \\ &= \sum_{i \in \{1, \dots, m\}} \text{len}(I_{\sigma(i)}) \\ &\stackrel{[\text{theorem: 11.36}]}{=} \sum_{i \in N} \text{len}(I_i) \\ &= \sum_{i \in N} \text{len}(I_i) + \sum_{i \in \{1, \dots, n\} \setminus N} 0 \\ &= \sum_{i \in N} \text{len}(I_i) + \sum_{i \in \{1, \dots, n\} \setminus N} \text{len}(I_i) \\ &= \sum_{i \in \{1, \dots, n\}} \text{len}(I_i) \\ &= \sum_{i=1}^n \text{len}(I_i) \end{aligned}$$

So in all cases we have that

$$\text{Let } \{I_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}_{[[}, \quad n \in \mathbb{N} \text{ pairwise disjoint with } \bigsqcup_{i \in \{1, \dots, n\}} I_i \in \mathcal{S}_{[[} \text{ then} \\ \text{len} \left(\bigsqcup_{i \in \{1, \dots, n\}} I_i \right) = \sum_{i=1}^n \text{len}(I_i) \quad (21.279)$$

So using [eqs: 21.274, 21.275 and 21.279] it follows that len is a finite content on the semi-ring $\mathcal{S}_{[[}$. $\square$

Next we prove that len is a pre-measure on $\mathcal{S}_{[[}$.

Lemma 21.176. *The function $\text{len}: \mathcal{S}_{[[} \rightarrow [0, \infty]$ [see definition: 21.172] is a pre-measure on the semi-ring $\mathcal{S}_{[[}$*

Proof. Consider the topological space $\langle \mathbb{R}, \mathcal{T}_{|} \rangle$. Let $A \in \mathcal{S}_{[[}$ and $\varepsilon \in \mathbb{R}^+$ then for A we have either:

$A = \emptyset$. Take then $A_\varepsilon = \emptyset \in \mathcal{S}_{[[}$ and $K_\varepsilon = \emptyset$. Then K_ε is compact by [example: 14.227], $A_\varepsilon \subseteq K_\varepsilon \subseteq A$ and $\text{len}(A) - \text{len}(A_\varepsilon) = 0 - 0 = 0 < \varepsilon$.

$A \neq \emptyset$. Then there exists $a, b \in \mathbb{R}$ with $a < b$ such that $A = [a, b]$. Define then $A_\varepsilon = [a, b - \frac{\varepsilon}{2}]$ and $K_\varepsilon = [a, b - \frac{\varepsilon}{2}]$. Then by the Heine Borel theorem [theorem: 14.236] K_ε is compact. Further $A_\varepsilon \subseteq K_\varepsilon \subseteq A$ and $\text{len}(A) - \text{len}(A_\varepsilon) = \text{len}([a, b]) - \text{len}([a, b - \frac{\varepsilon}{2}]) = b - a - (b - \frac{\varepsilon}{2} - a) = \frac{\varepsilon}{2} < \varepsilon$

Hence using [theorem: 21.162] it follows that

$$\overline{\text{len}} \text{ is a pre-measure on } \mathcal{R}[\mathcal{S}] \quad \square$$

Next we use a derivate of the Carathéodry theorem [theorem: 21.141] to extend len to the Lebesgue measure on Lebesgue measurable sets in $\mathbb{R}$.

Theorem 21.177. *If we define*

$$\lambda^*: \mathcal{P}[\mathbb{R}] \rightarrow [0, \infty] \text{ by } \lambda^*(A) = \begin{cases} \infty & \text{if } \mathcal{S}[A] = \emptyset \\ \inf(\{\sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \mathbb{N}} \in \mathcal{S}[A]\}) \end{cases}$$

where

$$\mathcal{S}[A] = \left\{ \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S} \mid A \subseteq \bigcup_{i \in \mathbb{N}} A_i \right\}$$

then

λ^* is a outer measure

$$\mathcal{L}[\mathbb{R}] = \{A \in \mathcal{P}(\mathbb{R}) \mid \forall B \in \mathcal{P}(\mathbb{R}) \text{ we have } \lambda^*(B) = \lambda^*(B \cap A) + \lambda^*(B \setminus A)\}$$

is a σ -algebra on $\mathbb{R}$ such that

$$\sigma[\mathcal{S}_{[\cdot]}] \subseteq \mathcal{L}[\mathbb{R}]$$

and

$$\bar{\lambda} = (\lambda^*)|_{\mathcal{L}(\mathbb{R})}: \mathcal{L}[\mathbb{R}] \rightarrow [0, \infty] \text{ is a measure on } \mathcal{L}[\mathbb{R}]$$

and

$$\lambda = (\lambda^*)|_{\sigma[\mathcal{S}_{[\cdot]}]}: \sigma[\mathcal{S}_{[\cdot]}] \rightarrow [0, \infty] \text{ is a measure on } \sigma[\mathcal{S}_{[\cdot]}]$$

and

$$(\lambda^*)|_{\mathcal{S}_{[\cdot]}} = \text{len}$$

Further if $\mu: \sigma[\mathcal{S}_{[\cdot]}] \rightarrow [0, \infty]$ is another measure such that $\mu|_{\mathcal{S}_{[\cdot]}} = \text{len}$ then

$$\mu = \lambda$$

We have then

$$\langle \mathbb{R}, \mathcal{L}[\mathbb{R}], \bar{\lambda} \rangle \text{ is a measure space called the Lebesgue measure space on } \mathbb{R}$$

where

$$\mathcal{L}[\mathbb{R}] \text{ is called the set of Lebesgue measurable sets}$$

and

$$\bar{\lambda} \text{ the Lebesgue measure}$$

Note 21.178. As by [theorem: 21.166] $\mathcal{B}[\mathbb{R}] = \sigma[\mathcal{S}_{[\cdot]}]$ we have also that

$$\mathcal{B}[\mathbb{R}] \subseteq \mathcal{L}[\mathbb{R}]$$

and

$$\lambda: \mathcal{B}[\mathbb{R}] \rightarrow [0, \infty] \text{ is a measure on } \mathcal{B}[\mathbb{R}]$$

So

$$\langle \mathbb{R}, \mathcal{B}[\mathbb{R}], \lambda \rangle \text{ is a measure space called the Borel measure space on } \mathbb{R}$$

where

$\mathcal{B}[\mathbb{R}]$ is called the set of Borel sets on $\mathbb{R}$

and

λ is called the Borel measure on $\mathbb{R}$

Proof. Using [lemma: 21.176] we have that

len is a pre-measure on the semi-ring $\mathcal{S}_{\llbracket}$

Define $\{[-i, i]\}_{i \in \mathbb{N}} \subseteq \mathcal{S}_{\llbracket}$ then we have

$$\forall i \in \mathbb{N} \text{ that } [-i, i] \subseteq [-(i+1), i+1[\text{ and } \text{len}([-i, i]) = 2 \cdot i < \infty$$

If $x \in \mathbb{R}$ then by [theorem: 10.30] there exist $n, m \in \mathbb{N}$ such that $-n < x < m$. Let $i = \max(n, m)$ then $-i \leq -n < x < m < i$ so that $x \in [-i, i[$ from which it follows that $\mathbb{R} \subseteq \bigcup_{i \in \mathbb{N}} [-i, i[$. As $\forall i \in \mathbb{N}$ $[-i, i[\subseteq \mathbb{R}$ we have $\bigcup_{i \in \mathbb{N}} [-i, i[\subseteq \mathbb{R}$. Hence we have

$$\mathbb{R} = \bigcup_{i \in \mathbb{N}} [-i, i[$$

The proof follows then from applying [theorem: 21.141]. $\square$

21.3.4.4 Product of semi-rings

If we want to use the Carathéodory theorem to create a measure on $\mathcal{B}[\mathbb{R}^n]$ we have to start with a semi-ring, as $\mathcal{B}[\mathbb{R}^n] = \sigma[\mathcal{R}_{\llbracket}^n]$ it seems sensible to prove that $\mathcal{R}_{\llbracket}^n \cup \{\emptyset\}$ is a semi-ring on $\mathbb{R}^n$. First note that $R \in \mathcal{R}_{\llbracket}^n \cup \{\emptyset\}$ can be written as $R = \prod_{i \in \{1, \dots, n\}} I_i$ where $I_i \in \mathcal{T}_{\llbracket}$ which suggest the following definition that extends this note to the more general cases of a product of a finite number of semi-rings.

Definition 21.179. Let $n \in \{2, \dots, \infty\}$, $\{\langle X_i, \mathcal{S}_i \rangle\}_{i \in \{1, \dots, n\}}$ a finite family such that $\forall i \in \{1, \dots, n\}$ $\mathcal{S}_i \subseteq \mathcal{P}(X_i)$ then $\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i$ is defined by

$$\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i = \left\{ \prod_{i \in \{1, \dots, n\}} A_i \mid \forall i \in \{1, \dots, n\} A_i \in \mathcal{S}_i \right\}$$

Note 21.180. In the particular cases where $n=2$ we note $\odot_{i \in \{1, 2\}} \mathcal{S}_i$ as $\mathcal{S}_1 \odot \mathcal{S}_2$. In other words

$$\mathcal{S}_1 \odot \mathcal{S}_2 = \{A \cdot B \mid A \in \mathcal{S}_1 \wedge B \in \mathcal{S}_2\}$$

Next we will prove using mathematical induction that $\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i$ is a semi-ring on $\prod_{i \in \{1, \dots, n\}} X_i$. The next lemma will be used in the base case and the induction step.

Lemma 21.181. Let X_1, X_2 be two sets and $\mathcal{S}_1 \subseteq \mathcal{P}(X_1)$, $\mathcal{S}_2 \subseteq \mathcal{P}(X_2)$ be semi-rings on X_1 and X_2 respectively then $\mathcal{S}_1 \odot \mathcal{S}_2$ is a semi-ring on $X_1 \cdot X_2$.

Proof. As $\mathcal{S}_1, \mathcal{S}_2$ are semi-rings we have that $\emptyset \in \mathcal{S}_1 \wedge \emptyset \in \mathcal{S}_2$ so that

$$\emptyset = \emptyset \cdot \emptyset \in \mathcal{S}_1 \odot \mathcal{S}_2 \quad (21.280)$$

Let $R, S \in \mathcal{S}_1 \odot \mathcal{S}_2$ then there exists $A, C \in \mathcal{S}_1$ and $B, D \in \mathcal{S}_2$ such that

$$R = A \cdot B \text{ and } S = C \cdot D$$

Then we have

$$\begin{aligned} R \bigcap S &= (A \cdot B) \bigcap (C \cdot D) \\ &\stackrel{[\text{theorem: 6.84}]}{=} (A \bigcap C) \cdot (B \bigcap D) \end{aligned}$$

given that $\mathcal{S}_1, \mathcal{S}_2$ are semi-rings it follows that $A \cap C \in \mathcal{S}_1 \wedge B \cap D \in \mathcal{S}_2$ so that

$$R \cap S \in \mathcal{S}_1 \odot \mathcal{S}_2 \quad (21.281)$$

Using [theorem: 21.1] we have that

$$\begin{aligned} R \setminus S &= (A \cdot B) \setminus (C \cdot D) \\ &= (A \setminus C) \cdot (B \setminus D) \cup (A \setminus C) \cdot (B \cap D) \cup (A \cap C) \cdot (B \setminus D) \end{aligned}$$

where

1. $((A \setminus C) \cdot (B \setminus D)) \cap ((A \setminus C) \cdot (B \cap D)) = \emptyset$
2. $((A \setminus C) \cdot (B \setminus D)) \cap ((A \cap C) \cdot (B \setminus D)) = \emptyset$
3. $((A \setminus C) \cdot (B \cap D)) \cap ((A \cap C) \cdot (B \setminus D)) = \emptyset$

So if we define $\{R_i\}_{i \in \{1,2,3\}}$ by

$$\begin{aligned} R_1 &= (A \setminus C) \cdot (B \setminus D) \\ R_2 &= (A \setminus C) \cdot (B \cap D) \\ R_3 &= (A \cap C) \cdot (B \setminus D) \end{aligned}$$

then we have

$$\{R_i\}_{i \in \{1,2,3\}} \text{ is a pairwise disjoint and } R \setminus S = \bigcup_{i \in \{1,2,3\}} R_i \quad (21.282)$$

Now for $i \in \{1, 2, 3\}$ we have either:

$i = 1$. As $A, C \in \mathcal{S}_1$ a semi ring there exist a pairwise disjoint $\{A_i\}_{i \in \{1, \dots, m_1\}} \subseteq \mathcal{S}_1$ such that

$$A \setminus C = \bigcup_{i \in \{1, \dots, m_1\}} A_i \quad (21.283)$$

likewise as $B, D \in \mathcal{S}_1$ there exist a pairwise disjoint $\{B_i\}_{i \in \{1, \dots, m_2\}} \subseteq \mathcal{S}_2$ such that

$$B \setminus D = \bigcup_{i \in \{1, \dots, m_2\}} B_i \quad (21.284)$$

so that we have

$$\begin{aligned} R_1 &= (A \setminus C) \cdot (B \setminus D) \\ &= \left(\bigcup_{i \in \{1, \dots, m_1\}} A_i \right) \cdot \left(\bigcup_{j \in \{1, \dots, m_2\}} B_j \right) \\ &\stackrel{[\text{theorem: 6.85}]}{=} \bigcup_{i \in \{1, \dots, m_1\} \times \{1, \dots, m_2\}} (A_i \cdot B_j) \end{aligned}$$

By [theorem: 6.41] $\{1, \dots, m_1\} \times \{1, \dots, m_2\}$ is finite so there exist a bijection

$$\sigma: \{1, \dots, N_1\} \rightarrow \{1, \dots, m_1\} \times \{1, \dots, m_2\}$$

then we have

$$R_1 = \bigcup_{(i,j) \in \{1, \dots, m_1\} \times \{1, \dots, m_2\}} (A_i \cdot B_j) \stackrel{[\text{theorem: 2.119}]}{=} \bigcup_{i \in \{1, \dots, N_1\}} (A_{\sigma(i)_1} \cdot B_{\sigma(i)_2})$$

Define

$$\{R_{1,i}\}_{i \in \{1, \dots, N_1\}} \text{ by } R_{1,i} = A_{\sigma(i)_1} \cdot B_{\sigma(i)_2}$$

then we have $\forall i \in \{1, \dots, N_1\}$ that, as $A_{\sigma(i)_1} \in \mathcal{S}_1, B_{\sigma(i)_2} \in \mathcal{S}_2$ so that $R_{1,i} = A_{\sigma(i)_1} \cdot B_{\sigma(i)_2} \in \mathcal{S}_1 \odot \mathcal{S}_2$. Hence we have

$$\{R_{1,i}\}_{i \in \{1, \dots, N_1\}} \subseteq \mathcal{S}_1 \odot \mathcal{S}_2 \text{ and } R_1 = \bigcup_{i \in \{1, \dots, N_1\}} R_{1,i}$$

Further if $i, j \in \{1, \dots, N_1\}$ with $i \neq j$ we have, as σ is a bijection, that $\sigma(i) \neq \sigma(j)$, for $\sigma(i)_1, \sigma(j)_1$ we have either

$\sigma(i)_1 = \sigma(j)_1$. Then $\sigma(i)_2 \neq \sigma(j)_2$ so that

$$\begin{aligned} R_{1,i} \cap R_{1,j} &= (A_{\sigma(i)_1} \cdot B_{\sigma(i)_2}) \cap (A_{\sigma(j)_1} \cdot B_{\sigma(j)_2}) \\ &= (A_{\sigma(i)_1} \cap A_{\sigma(j)_1}) \cdot (B_{\sigma(i)_2} \cap B_{\sigma(j)_2}) \\ &= (A_{\sigma(i)_1} \cap A_{\sigma(j)_1}) \cdot \emptyset \\ &= \emptyset \end{aligned}$$

$\sigma(i)_1 \neq \sigma(j)_1$. Then

$$\begin{aligned} R_{1,i} \cap R_{1,j} &= (A_{\sigma(i)_1} \cdot B_{\sigma(i)_2}) \cap (A_{\sigma(j)_1} \cdot B_{\sigma(j)_2}) \\ &= (A_{\sigma(i)_1} \cap A_{\sigma(j)_1}) \cdot (B_{\sigma(i)_2} \cap B_{\sigma(j)_2}) \\ &= \emptyset \cdot (B_{\sigma(i)_2} \cap B_{\sigma(j)_2}) \\ &= \emptyset \end{aligned}$$

which proves that

$$\{R_{1,i}\}_{i \in \{1, \dots, N_1\}} \subseteq \mathcal{S}_1 \odot \mathcal{S}_2 \text{ is pairwise disjoint and } R_1 = \bigsqcup_{i \in \{1, \dots, N_1\}} R_{1,i}$$

$i = 2$. Then

$$\begin{aligned} R_2 &= (A \setminus C) \cdot (B \cap D) \\ &\stackrel{[\text{eq: 21.283}]}{=} \left(\bigsqcup_{i \in \{1, \dots, m_1\}} A_i \right) \cdot (B \cap D) \\ &\stackrel{[\text{theorem: 6.85}]}{=} \bigcup_{i \in \{1, \dots, m_1\}} (A_i \cdot (B \cap D)) \\ &= \bigcup_{i \in \{1, \dots, N_2\}} R_{2,i} \end{aligned}$$

where

$$N_2 = m_1 \text{ and } \{R_{2,i}\}_{i \in \{1, \dots, N_2\}} \text{ is defined by } R_{2,i} = A_i \cdot (B \cap D)$$

Let $i \in \{1, \dots, N_2\}$ then, as $A_i \in \mathcal{S}_1$, $B, D \in \mathcal{S}_2 \Rightarrow B \cap D \in \mathcal{S}_2$, $R_{2,i} = A_i \cdot (B \cap D) \in \mathcal{S}_1 \odot \mathcal{S}_2$ so that

$$\{R_{2,i}\}_{i \in \{1, \dots, N_2\}} \subseteq \mathcal{S}_1 \odot \mathcal{S}_2$$

Further if $i, j \in \{1, \dots, N_2\}$ with $i \neq j$ then we have

$$R_{2,i} \cap R_{2,j} = (A_i \cdot (B \cap D)) \cap (A_j \cdot (B \cap D)) = (A_i \cap A_j) \cdot (B \cap D) = \emptyset \cdot (B \cap D) = \emptyset$$

So we have proved that

$$\{R_{2,i}\}_{i \in \{1, \dots, N_2\}} \subseteq \mathcal{S}_1 \odot \mathcal{S}_2 \text{ is pairwise disjoint and } R_2 = \bigsqcup_{i \in \{1, \dots, N_2\}} R_{2,i}$$

$i = 3$. Then

$$\begin{aligned} R_3 &= (A \cap C) \cdot (B \setminus D) \\ &\stackrel{[\text{eq: 21.284}]}{=} (A \cap C) \cdot \left(\bigsqcup_{i \in \{1, \dots, m_2\}} B_i \right) \\ &\stackrel{[\text{theorem: 6.85}]}{=} \bigcup_{i \in \{1, \dots, m_2\}} ((A \cap C) \cdot B_i) \\ &= \bigcup_{i \in \{1, \dots, N_3\}} D_{3,i} \end{aligned}$$

where

$$N_3 = m_2 \text{ and } \{R_{3,i}\}_{i \in \{1, \dots, N_3\}} \text{ is defined by } R_{3,i} = (A \cap C) \cdot B_i$$

Let $i \in \{1, \dots, N_3\}$ then, as $B_i \in \mathcal{S}_2$, $A, C \in \mathcal{S}_1 \Rightarrow A \cap C \in \mathcal{S}_1$, $R_{3,i} = ((A \cap C) \cdot B_i) \in \mathcal{S}_1 \odot \mathcal{S}_2$ so that

$$\{R_{3,i}\}_{i \in \{1, \dots, N_3\}} \subseteq \mathcal{S}_1 \odot \mathcal{S}_2$$

Further if $i, j \in \{1, \dots, N_3\}$ with $i \neq j$ then we have

$$R_{3,i} \cap R_{3,j} = ((A \cap C) \cdot B_i) \cap ((A \cap C) \cdot B_j) = (A \cap C) \cdot (B_i \cap B_j) = (A \cap C) \cdot \emptyset = \emptyset$$

So we have proved that

$$\{R_{3,i}\}_{i \in \{1, \dots, N_3\}} \subseteq \mathcal{S}_1 \odot \mathcal{S}_2 \text{ is pairwise disjoint and } R_3 = \bigsqcup_{i \in \{1, \dots, N_3\}} R_{3,i}$$

To summarize the above, we have a pairwise disjoint $\{R_i\}_{i \in \{1, 2, 3\}}$ such that

$$R \setminus S \stackrel{[\text{eq: 21.282}]}{=} \bigsqcup_{i \in \{1, 2, 3\}} R_i$$

and $\forall i \in \{1, 2, 3\}$ there exist a pairwised disjoint $\{R_{i,j}\}_{j \in \{1, \dots, N_i\}} \subseteq \mathcal{S}_1 \odot \mathcal{S}_2$ such

$$R_i = \bigsqcup_{j \in \{1, \dots, N_i\}} R_{i,j}$$

Further as $\bigcup_{i \in \{1, 2, 3\}} \{i\} \cdot \{1, \dots, N_i\}$ is finite by [theorems: 6.41, 6.36] there exist a bijection

$$\sigma: \{1, \dots, N\} \rightarrow \bigcup_{i \in \{1, 2, 3\}} \{i\} \cdot \{1, \dots, N_i\}$$

Hence we can apply [corollary: 21.11] to get that

$$\{R_{\sigma(i)_1, \sigma(i)_2}\}_{i \in \{1, \dots, N\}} \subseteq \mathcal{S}_1 \odot \mathcal{S}_2 \text{ is pairwise disjoint and } R \setminus S = \bigsqcup_{i \in \{1, \dots, N\}} R_{\sigma(i)_1, \sigma(i)_2} \quad (21.285)$$

Finally from [eqs: 21.280, 21.281 and the above eq: 21.285] it follows that

$$\mathcal{S}_1 \odot \mathcal{S}_2 \text{ is a semi-ring on } X_1 \cdot X_2 \quad \square$$

If we want to use the above lemma in the proof by mathematical induction that $\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i$ is a semi-ring we have a small problem: $\prod_{i \in \{1, \dots, n+1\}} X_i$ is not equal to $(\prod_{i \in \{1, \dots, n\}} X_i) \cdot X_{n+1}$. Luckily we can prove that $(\prod_{i \in \{1, \dots, n\}} X_i) \cdot X_{n+1}$ is bijective to $\prod_{i \in \{1, \dots, n+1\}} X_i$. So it makes sense to see how a bijection can be used to generate a semi-ring on the image of the bijection based on a semi-ring on the domain of the bijection.

Theorem 21.182. *Let X, Y be sets, $\beta: X \rightarrow Y$ a bijection and $\mathcal{S} \subseteq X$ a semi-ring on X then $\{\beta(A) | A \in \mathcal{S}\}$ is a semi-ring on Y .*

Proof. As $\beta(\emptyset) = \emptyset$ it follows that

$$\emptyset \in \{\beta(A) | A \in \mathcal{S}\} \quad (21.286)$$

Let $R, S \in \{\beta(A) | A \in \mathcal{S}\}$ there exist $A, B \in \mathcal{S}$ such that $R = \beta(A)$, $S = \beta(B)$. Using [theorem: 2.95(4)] and the fact that β is a bijection hence injective we have that

$$R \cap S = \beta(A) \cap \beta(B) \stackrel{[\text{theorem: 2.95(4)}]}{=} \beta(A \cap B)$$

As $\mathcal{S}$ is a semi-ring $A \cap B \in \mathcal{S}$ so that $\beta(A \cap B) \in \{\beta(A) | A \in \mathcal{S}\}$ which combined with the above proves that

$$\forall R, S \in \{\beta(A) | A \in \mathcal{S}\} \text{ we have } R \cap S \in \{\beta(A) | A \in \mathcal{S}\} \quad (21.287)$$

Using [theorem: 2.94(5)] and the fact that β is injective it follows that

$$R \setminus S = \beta(A) \setminus \beta(B) \stackrel{[\text{theorem: 2.94(5)}]}{=} \beta(A \setminus B) \quad (21.288)$$

As $A, B \in \mathcal{S}$ and $\mathcal{S}$ is a semi-ring there exist a pairwise disjoint $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}$, $n \in \mathbb{N}$ such that

$$A \setminus B = \bigsqcup_{i \in \{1, \dots, n\}} A_i \quad (21.289)$$

Let $i, j \in \{1, \dots, n\}$ with $i \neq j$ then $\beta(A_i) \cap \beta(A_j) \stackrel{[\text{theorem: 2.95(4)}]}{=} \beta(A_i \cap A_j) = \beta(\emptyset) = \emptyset$ so that

$$\beta(A_i)_{i \in \{1, \dots, n\}} \subseteq \{\beta(A) | A \in \mathcal{S}\} \text{ is pairwise disjoint} \quad (21.290)$$

Further

$$\bigsqcup_{i \in \{1, \dots, n\}} \beta(A_i) \stackrel{[\text{theorem: 2.136}]}{=} \beta\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) \stackrel{[\text{eq: 21.289}]}{=} \beta(A \setminus B) \stackrel{[\text{eq: 21.288}]}{=} R \setminus S \quad (21.291)$$

Define $\{R_i\}_{i \in \{1, \dots, n\}} \subseteq \{\beta(A) | A \in \mathcal{S}\}$ by $R_i = \beta(A_i)$ then [eqs: 21.290, 21.291] can be summarized as

$$\forall R, S \in \{\beta(A) | A \in \mathcal{S}\} \exists \{R_i\}_{i \in \{1, \dots, n\}} \subseteq \{\beta(A) | A \in \mathcal{S}\} \text{ such that } R \setminus S = \bigsqcup_{i \in \{1, \dots, n\}} R_i \quad (21.292)$$

By [eqs: 21.286, 21.287 and 21.292] it follows that

$$\{\beta(A) | A \in \mathcal{S}\} \text{ is a semi-ring on } Y \quad \square$$

Next we construct a bijection between $(\prod_{i \in \{1, \dots, n\}} X_i) \cdot X_{n+1}$ and $\prod_{i \in \{1, \dots, n+1\}} X_i$.

Lemma 21.183. Let $n \in \mathbb{N}$, $\{\langle X_i, \mathcal{S}_i \rangle\}_{i \in \{1, \dots, n+1\}}$ a finite family such that $\forall i \in \{1, \dots, n\} \mathcal{S}_i \subseteq \mathcal{P}(X_i)$ then

1.

$$\beta: \left(\prod_{i \in \{1, \dots, n\}} X_i \right) \cdot X_{n+1} \rightarrow \prod_{i \in \{1, \dots, n+1\}} X_i \text{ defined by } \beta(x, y)_i = \begin{cases} x_i & \text{if } i \in \{1, \dots, n\} \\ y & \text{if } i = n+1 \end{cases}$$

is a bijection

$$2. \odot_{i \in \{1, \dots, n+1\}} \mathcal{S}_i = \{\beta(B) | B \in (\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i) \odot S_{n+1}\}$$

Note 21.184. Be carefull in the notation used in (2) $\beta(B)$ is the image of the set B in the domain $(\prod_{i \in \{1, \dots, n\}} X_i) \cdot X_{n+1}$ of the bijection β . So $\odot_{i \in \{1, \dots, n+1\}} \mathcal{S}_i$ is not equal to $\beta((\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i) \odot S_{n+1})$ which is by the way not well defined.

Proof.

1. We have:

injectivity. Assume that $\beta(x, y) = \beta(u, v)$ then $\forall i \in \{1, \dots, n\}$ we have

$$x_i = \beta(x, y)_i = \beta(u, v)_i = u_i$$

so that $x = u$ and $y = \beta(x, y)_{n+1} = \beta(u, v)_{n+1} = v$. So $(x, y) = (u, v)$ which proves injectivity.

surjectivity. Let $u \in \prod_{i \in \{1, \dots, n+1\}} X_i$ and define $x \in \prod_{i \in \{1, \dots, n\}} X_i$ by $x_i = u_i$ and $y \in X_{n+1}$ by $y = u_{n+1}$ then $\forall i \in \{1, \dots, n+1\}$ we have

$$\beta(x, y)_i = \begin{cases} x_i = u_i & \text{if } i \in \{1, \dots, n\} \\ u_{n+1} & \text{if } i = n+1 \end{cases} = u_i$$

proving that $\beta(x, y) = u$

2. Let $\{A_i\}_{i \in \{1, \dots, n+1\}}$ be a family of sets such that $\forall i \in \{1, \dots, n+1\} A_i \in \mathcal{S}_i \subseteq \mathcal{P}(X_i)$. Let $u \in \beta\left(\left(\prod_{i \in \{1, \dots, n\}} A_i\right) \cdot A_{n+1}\right)$ then $u = \beta(x, y)$ where $x \in \prod_{i \in \{1, \dots, n\}} A_i \Rightarrow \forall i \in \{1, \dots, n\} x_i \in A_i$ and $y \in A_{n+1}$. So

$$\forall i \in \{1, \dots, n+1\} \beta(x, y)_i = \begin{cases} x_i \in A_i & \text{if } i \in \{1, \dots, n\} \\ y \in A_i & \text{if } i = n+1 \end{cases} \in A$$

so that $u \in \prod_{i \in \{1, \dots, n+1\}} A_i$. Hence

$$\beta\left(\left(\prod_{i \in \{1, \dots, n\}} A_i\right) \cdot A_{n+1}\right) \subseteq \prod_{i \in \{1, \dots, n+1\}} A_i \quad (21.293)$$

If $u \in \prod_{i \in \{1, \dots, n+1\}} A_i$ then $\forall i \in \{1, \dots, n+1\}$ we have $u_i \in A_i$. Define $x \in \prod_{i \in \{1, \dots, n\}} A_i$ by $x_i = u_i \in A_i$ and $y = u_{n+1} \in A_{n+1}$ then $(x, y) \in \left(\prod_{i \in \{1, \dots, n\}} A_i\right) \cdot A_{n+1}$. further

$$\beta(x, y) = \begin{cases} x_i = u_i & \text{if } i \in \{1, \dots, n\} \\ y = u_{n+1} & \text{if } i = n+1 \end{cases} = u_i$$

proving that $u = \beta(x, y) \in \beta\left(\left(\prod_{i \in \{1, \dots, n\}} A_i\right) \cdot A_{n+1}\right)$. Hence

$$\prod_{i \in \{1, \dots, n+1\}} A_i \subseteq \beta\left(\left(\prod_{i \in \{1, \dots, n\}} A_i\right) \cdot A_{n+1}\right)$$

which combined with [eq: 21.293] proves that

$$\prod_{i \in \{1, \dots, n+1\}} A_i = \beta\left(\left(\prod_{i \in \{1, \dots, n\}} A_i\right) \cdot A_{n+1}\right) \quad (21.294)$$

Let now $A \in \odot_{i \in \{1, \dots, n+1\}} \mathcal{S}_i$ then $A = \prod_{i \in \{1, \dots, n+1\}} A$ where $\forall i \in \{1, \dots, n+1\} A_i \in \mathcal{S}_i$. Then $\prod_{i \in \{1, \dots, n\}} A_i \in \odot_{i \in \{1, \dots, n\}} \mathcal{S}_i$ and $A_{n+1} \in \mathcal{S}_{n+1}$ so that

$$\left(\prod_{i \in \{1, \dots, n\}} A_i\right) \cdot A_{n+1} \in \left(\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i\right) \odot \mathcal{S}_{n+1}$$

Hence as

$$A = \prod_{i \in \{1, \dots, n+1\}} A_i \stackrel{[\text{eq: 21.294}]}{=} \beta\left(\left(\left(\prod_{i \in \{1, \dots, n\}} A_i\right) \cdot A_{n+1}\right)\right)$$

it follows that $A \in \{\beta(B) | B \in (\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i) \odot \mathcal{S}_{n+1}\}$ which proves that

$$\odot_{i \in \{1, \dots, n+1\}} \mathcal{S}_i \subseteq \left\{ \beta(B) | B \in \left(\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i\right) \odot \mathcal{S}_{n+1} \right\} \quad (21.295)$$

On the other hand if $B \in \{\beta(B) | B \in (\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i) \odot \mathcal{S}_{n+1}\}$ then there exists a $A \in (\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i) \odot \mathcal{S}_{n+1}$ such that $B = \beta(A)$. As $A \in (\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i) \odot \mathcal{S}_{n+1}$ there exist a $\{A_i\}_{i \in \{1, \dots, n\}}$ with $\forall i \in \{1, \dots, n\} A_i \in \mathcal{S}_i$ and a $A_{n+1} \in \mathcal{S}_{n+1}$ such that

$$B = \beta(A) = \beta\left(\left(\prod_{i \in \{1, \dots, n\}} A_i\right) \cdot A_{n+1}\right)$$

Using [eq: 21.294] on the above proves that that

$$B = \prod_{i \in \{1, \dots, n+1\}} A_i \in \odot_{i \in \{1, \dots, n+1\}} \mathcal{S}_i$$

hence $\{\beta(B)|B \in (\bigodot_{i \in \{1, \dots, n\}} \mathcal{S}_i) \odot S_{n+1}\} \subseteq \bigodot_{i \in \{1, \dots, n+1\}} \mathcal{S}_i$ which combined with [eq: 21.295] proves that

$$\bigodot_{i \in \{1, \dots, n+1\}} \mathcal{S}_i = \left\{ \beta(B) | B \in \left(\bigodot_{i \in \{1, \dots, n\}} \mathcal{S}_i \right) \odot S_{n+1} \right\}$$

□

We are now ready to use mathematical induction to prove that $\bigodot_{i \in \{1, \dots, n\}} \mathcal{S}_i$ is a semi-ring on $\prod_{i \in \{1, \dots, n\}} X_i$.

Theorem 21.185. *Let $n \in \mathbb{N}$, $\{\langle X_i, \mathcal{S}_i \rangle\}_{i \in \{1, \dots, n\}}$ a finite family such that $\forall i \in \{1, \dots, n\}$ $\mathcal{S}_i$ is a semi-ring on X_i then for $\bigodot_{i \in \{1, \dots, n\}} \mathcal{S}_i$ defined by*

$$\bigodot_{i \in \{1, \dots, n\}} \mathcal{S}_i = \left\{ \prod_{i \in \{1, \dots, n\}} A_i | \forall i \in \{1, \dots, n\} A_i \in \mathcal{S}_i \right\}$$

we have that

$$\bigodot_{i \in \{1, \dots, n\}} \mathcal{S}_i \text{ is a semi-ring on } \prod_{i \in \{1, \dots, n\}} X_i$$

Proof. We prove this by mathematical induction, so define

$$\mathcal{S} = \left\{ n \in \mathbb{N} | \text{If } \{\langle X_i, \mathcal{S}_i \rangle\}_{i \in \{1, \dots, n\}} \text{ is a family such that } \forall i \in \{1, \dots, n\} \mathcal{S}_i \text{ is a semi-ring on } X_i \text{ then } \bigodot_{i \in \{1, \dots, n\}} \mathcal{S}_i \text{ is a semi-ring on } \prod_{i \in \{1, \dots, n\}} X_i \right\}$$

then we have:

1 $\in \mathcal{S}$. Let $\{\langle X_i, \mathcal{S}_i \rangle\}_{i \in \{1\}}$ be such that $\mathcal{S}_1$ is a semi-ring on X_1 . Define

$$\beta: X_1 \rightarrow \prod_{i \in \{1\}} X_i \text{ where } \beta(x) \text{ is defined by } \beta(x)_1 = x \text{ [in other words } \beta(x) = (x)]$$

then we have:

injectivity. If $\beta(x) = \beta(y)$ then $x = \beta(x)_1 = \beta(y)_1 = y$.

surjectivity. If $y \in \prod_{i \in \{1\}} X_i$ then for $x = y_1$ we have $\forall i \in \{1\}$ that $\beta(x)_1 = x = y_1$ so that $\beta(x) = y$.

so that

β is a bijection

Let $A \in \bigodot_{i \in \{1\}} \mathcal{S}_i = \{\prod_{i \in \{1\}} A_i | \forall i \in \{1\} A_i \in \mathcal{S}_i\}$ then $A = \prod_{i \in \{1\}} A_i$ where $A_1 \in \mathcal{S}_1$. If $x \in A = \prod_{i \in \{1\}} A_i$ then $x_1 \in A_1$ so that $x = \beta(x_1) \in \beta(A_1)$ and if $x \in \beta(A_1)$ then there exist a $a \in A_1$ such that $x = \beta(a) = (a)$ hence $x_1 = \beta(a)_1 = a \in A_1$ so that $x \in \prod_{i \in \{1\}} A_i = A$, proving that $A = \beta(A_1) \in \{\beta(B) | B \in \mathcal{S}_1\}$. Hence we have

$$\bigodot_{i \in \{1\}} \mathcal{S}_i \subseteq \{\beta(B) | B \in \mathcal{S}_1\} \quad (21.296)$$

For the opposite inclusion, let $A \in \{\beta(B) | B \in \mathcal{S}_1\}$ then there exist a $A_1 \in \mathcal{S}_1$ such that $A = \beta(A_1)$. If $x \in A = \beta(A_1)$ then there exist a $a \in A_1$ such that $x = \beta(a)$ so that $x_1 = \beta(a)_1 = a \in A_1$ hence $x \in \prod_{i \in \{1\}} A_i$ and if $x \in \prod_{i \in \{1\}} A_i$ then $x_1 \in A_1$ so that $x = \beta(x_1) \in \beta(A_1)$, proving that $A = \prod_{i \in \{1\}} A_i \in \bigodot_{i \in \{1\}} \mathcal{S}_i$. Hence we have that $\{\beta(B) | B \in \mathcal{S}_1\} \subseteq \bigodot_{i \in \{1\}} \mathcal{S}_i$ which combined with [eq: 21.296] proves that

$$\bigodot_{i \in \{1\}} \mathcal{S}_i = \{\beta(B) | B \in \mathcal{S}_1\}$$

Finally as $\mathcal{S}_1$ is a semi-ring it follows from [lemma: 21.182] that $\odot_{i \in \{1\}} \mathcal{S}_i$ is a semi-ring which proves that $1 \in \mathcal{S}$.

$2 \in \mathcal{S}$. If $\{\langle X_i, \mathcal{S}_i \rangle\}_{i \in \{1,2\}}$ is such that $\mathcal{S}_1$ is a semi-ring on X_1 and $\mathcal{S}_2$ is a semi-ring on X_2 then by [theorem: 21.179] $\odot_{i \in \{1,2\}} \mathcal{S}_i = \mathcal{S}_1 \odot \mathcal{S}_2$ is a semi-ring on $X_1 \cdot X_2 = \prod_{i \in \{1,2\}} X_i$. Hence $2 \in \mathcal{S}$.

$n \in \mathcal{S} \Rightarrow n+1 \in \mathcal{S}$. Let $\{\langle X_i, \mathcal{S}_i \rangle\}_{i \in \{1, \dots, n+1\}}$ be a finite family such that $\forall i \in \{1, \dots, n+1\}$ we have that $\mathcal{S}_i$ is a semi-ring on X_i . As $n \in \mathcal{S}$ it follows that $\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i$ is a semi-ring on $\prod_{i \in \{1, \dots, n\}} X_i$. As also $\mathcal{S}_{n+1}$ is a semi-ring on X_{n+1} it follows from [theorem: 21.179] that

$$\left(\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i \right) \odot \mathcal{S}_{n+1} \text{ is a semi-ring on } \left(\prod_{i \in \{1, \dots, n\}} X_i \right) \cdot X_{n+1}$$

Using the previous lemma [lemma: 21.183] there exist a bijection

$$\beta: \left(\prod_{i \in \{1, \dots, n\}} X_i \right) \cdot X_{n+1} \rightarrow \prod_{i \in \{1, \dots, n+1\}} X_i$$

such that

$$\odot_{i \in \{1, \dots, n+1\}} \mathcal{S}_i = \left\{ \beta(B) \mid B \in \left(\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i \right) \odot \mathcal{S}_{n+1} \right\}$$

By [theorem: 21.182] it follows then that $\{\beta(B) \mid B \in (\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i) \odot \mathcal{S}_{n+1}\}$ is a semi-ring on $\prod_{i \in \{1, \dots, n+1\}} X_i$. Hence $\odot_{i \in \{1, \dots, n+1\}} \mathcal{S}_i$ is a semi-ring on $\prod_{i \in \{1, \dots, n+1\}} X_i$ proving that $n+1 \in \mathcal{S}$

□

Corollary 21.186. *Let $n \in \mathbb{N}$, X a set and $\mathcal{S}$ a semi-ring on X then*

$$\mathcal{S}^n = \left\{ \prod_{i \in \{1, \dots, n\}} A_i \mid \forall i \in \{1, \dots, n\} A_i \in \mathcal{S} \right\} = \left\{ \prod_{i \in \{1, \dots, m\}} A_i \mid \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S} \right\}$$

is a semi-ring on X^n

Proof. Define $\{\langle X_i, \mathcal{S}_i \rangle\}_{i \in \{1, \dots, n\}}$ by $X_i = X$ and $\mathcal{S}_i = \mathcal{S}$. Then by the previous theorem [theorem: 21.185] we have that $\odot_{i \in \{1, \dots, n\}} \mathcal{S}_i$ is a semi-ring on $\prod_{i \in \{1, \dots, n\}} X_i$. Now by definition we have that

$$X^n \stackrel{\text{definition}}{=} \prod_{i \in \{1, \dots, n\}} X_i$$

and

$$\begin{aligned} \odot_{i \in \{1, \dots, n\}} \mathcal{S}_i &= \left\{ \prod_{i \in \{1, \dots, n\}} A_i \mid \forall i \in \{1, \dots, n\} A_i \in \mathcal{S}_i \right\} \\ \mathcal{S}_{i=\mathcal{S}} &= \left\{ \prod_{i \in \{1, \dots, n\}} A_i \mid \forall i \in \{1, \dots, n\} A_i \in \mathcal{S} \right\} \\ &= \mathcal{S}^n \end{aligned}$$

so that $\mathcal{S}^n$ is a semi-ring on X^n .

□

21.3.4.5 Semi-ring on $\mathbb{R}^n$

We are now ready to prove that $\mathcal{R}_{||}^n \cup \{\emptyset\}$ is a semi-ring.

Theorem 21.187. *Let $n \in \mathbb{N}$ then we have*

$$\begin{aligned}\mathcal{R}_{||}^n &= \left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \forall i \in \{1, \dots, n\} \ I_i \in \mathcal{I}_{||} \right\} \stackrel{\text{def}}{=} \left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \{I_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{I}_{||} \right\} \\ \mathcal{R}_{||}^n \cap \{\emptyset\} &= \emptyset \\ \mathcal{R}_{||}^n \cup \{\emptyset\} &= \left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \forall i \in \{1, \dots, n\} \ I_i \in \mathcal{S}_{||} \right\} \stackrel{\text{def}}{=} \left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \{I_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}_{||} \right\}\end{aligned}$$

Proof. If $R \in \mathcal{R}_{||}^n$ then by [definition: 21.68] there exists $a, b \in \mathbb{R}^n$ with $a < b \Rightarrow a_i < b_i$ such that

$$R = [a, b[\stackrel{[\text{definition: 21.63}]}{=} \prod_{i \in \{1, \dots, n\}} [a_i, b_i[$$

As $\forall i \in \{1, \dots, n\} \ a_i < b_i$ hence $[a_i, b_i[\in \mathcal{I}_{||}$ it follows that $R \in \left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \forall i \in \{1, \dots, n\} \ I_i \in \mathcal{I}_{||} \right\}$ proving that

$$\mathcal{R}_{||}^n \subseteq \left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \forall i \in \{1, \dots, n\} \ I_i \in \mathcal{I}_{||} \right\} \quad (21.297)$$

Further if $R \in \left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \forall i \in \{1, \dots, n\} \ I_i \in \mathcal{I}_{||} \right\}$ then there exists a $\{I_i\}_{i \in \{1, \dots, n\}}$ with $\forall i \in \{1, \dots, n\} \ I_i \in \mathcal{I}_{||}$ such that $R = \prod_{i \in \{1, \dots, n\}} I_i$. Hence $\forall i \in \{1, \dots, n\}$ there exists $a_i, b_i \in \mathbb{R}$ with $a_i < b_i$ such that $I_i = [a_i, b_i[$. Define $a = (a_1, \dots, a_n) \in \mathbb{R}^n$, $(b_1, \dots, b_n) \in \mathbb{R}^n$ then $a < b$ and $[a, b[\stackrel{[\text{definition: 21.63}]}{=} \prod_{i \in \{1, \dots, n\}} [a_i, b_i[= \prod_{i \in \{1, \dots, n\}} I_i = R$ from which it follows that $R \in \mathcal{R}_{||}^n$. So $\left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \forall i \in \{1, \dots, n\} \ I_i \in \mathcal{I}_{||} \right\} \subseteq \mathcal{R}_{||}^n$, combining this with [eq: 21.297] gives

$$\mathcal{R}_{||}^n = \left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \forall i \in \{1, \dots, n\} \ I_i \in \mathcal{I}_{||} \right\} \quad (21.298)$$

Let $R \in \mathcal{R}_{||}^n$ then there exists $\{I_i\}_{i \in \{1, \dots, n\}}$ with $I_i \in \mathcal{I}_{||}$ [so that $I_i \neq \emptyset$] such that $R = \prod_{i \in \{1, \dots, n\}} I_i$. Applying [theorem: 3.109] it follows that $R \neq \emptyset$ so that

$$\mathcal{R}_{||}^n \cap \{\emptyset\} = \emptyset \quad (21.299)$$

If $R \in \mathcal{R}_{||}^n \cup \{\emptyset\}$ then we have either:

$R \in \mathcal{R}_{||}^n$. Then by [eq: 21.298] $R = \prod_{i \in \{1, \dots, n\}} I_i$ where $\forall i \in \{1, \dots, n\} \ I_i \in \mathcal{I}_{||} \subseteq \mathcal{S}_{||}$ so that $R \in \left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \forall i \in \{1, \dots, n\} \ I_i \in \mathcal{S}_{||} \right\}$.

$R = \emptyset$. Define $\{I_i\}_{i \in \{1, \dots, n\}}$ by $I_i = \emptyset \in \mathcal{S}_{||}$ then $\emptyset \stackrel{[\text{theorem: 2.138}]}{=} \prod_{i \in \{1, \dots, n\}} I_i$ so that $R \in \left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \forall i \in \{1, \dots, n\} \ I_i \in \mathcal{S}_{||} \right\}$.

hence we have that

$$\mathcal{R}_{||}^n \cup \{\emptyset\} \subseteq \left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \forall i \in \{1, \dots, n\} \ I_i \in \mathcal{S}_{||} \right\} \quad (21.300)$$

Let $R \in \left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \forall i \in \{1, \dots, n\} \ I_i \in \mathcal{S}_{||} \right\}$ then $R = \prod_{i \in \{1, \dots, n\}} I_i$ where $\forall i \in \{1, \dots, n\} \ I_i \in \mathcal{S}_{||}$. Then we have either:

$\forall i \in \{1, \dots, n\} \ I_i \neq \emptyset$. Then by [theorem: 21.164] it follows that $\forall i \in I \ I_i \in \mathcal{I}_{||}$ so that $I_i = [a_i, b_i[\neq \emptyset \Rightarrow a_i < b_i$, hence for $a = (a_1, \dots, a_n), b = (b_1, \dots, b_n) \in \mathbb{R}$ we have $a < b$ so that

$$R = \prod_{i \in \{1, \dots, n\}} [a, b[\in \mathcal{R}_{||}^n \subseteq \mathcal{R}_{||}^n \cup \{\emptyset\}$$

$\exists i \in \{1, \dots, n\}$ such that $I_i = \emptyset$. Then

$$R = \prod_{i \in \{1, \dots, n\}} A_i \stackrel{[\text{theorem: 2.138}]}{=} \emptyset \in \mathcal{R}_{||}^n \cap \{\emptyset\}$$

proving that $\{\prod_{i \in \{1, \dots, n\}} I_i \mid \forall i \in \{1, \dots, n\} I_i \in \mathcal{S}_{||}\} \subseteq \mathcal{R}_{||}^n \cap \{\emptyset\}$. Combining this with [eq: 21.300] proves finally that

$$\mathcal{R}_{||}^n \cup \{\emptyset\} = \left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \forall i \in \{1, \dots, n\} I_i \in \mathcal{S}_{||} \right\} \quad \square$$

A direct consequence of the above theorem is the following

Theorem 21.188. *Let $n \in \mathbb{N}$ then $\mathcal{R}_{||}^n \cup \{\emptyset\}$ is a semi-ring on $\mathbb{R}^n$*

Proof. First we have

$$\mathcal{R}_{||}^n \cup \{\emptyset\} \stackrel{[\text{theorem: 21.187}]}{=} \mathcal{R}_{||}^n \cup \{\emptyset\} = \left\{ \prod_{i \in \{1, \dots, n\}} I_i \mid \forall i \in \{1, \dots, n\} I_i \in \mathcal{S}_{||} \right\} = (\mathcal{S}_{||})^n$$

so that by [theorem: 21.186]

$$\mathcal{R}_{||}^n \cup \{\emptyset\} \text{ is a semi-ring} \quad \square$$

Theorem 21.189. *Let $n \in \mathbb{N}$ then we have that*

$$\sigma[\{C \subseteq \mathbb{R}^n \mid C \text{ is closed in } \mathcal{T}_{||^n}\}] = \beta[\mathbb{R}^n] = \sigma[\mathcal{R}_{||}^n] = \sigma[\mathcal{R}_{||}^n \cup \{\emptyset\}]$$

Proof. By [theorem: 21.82] we only have to prove that $\sigma[\mathcal{R}_{||}^n] = \sigma[\mathcal{R}_{||}^n \cup \{\emptyset\}]$. As $\mathcal{R}_{||}^n \subseteq \mathcal{R}_{||}^n \cup \{\emptyset\} \subseteq \sigma[\mathcal{R}_{||}^n \cup \{\emptyset\}]$ and $\sigma[\mathcal{R}_{||}^n \cup \{\emptyset\}]$ is a σ -algebra it follows from [theorem: 21.39] that

$$\sigma[\mathcal{R}_{||}^n] \subseteq \sigma[\mathcal{R}_{||}^n \cup \{\emptyset\}] \quad (21.301)$$

Let $A \in \mathcal{R}_{||}^n \cup \{\emptyset\}$ then either $A \in \mathcal{R}_{||}^n \subseteq \sigma[\mathcal{R}_{||}^n]$ or $A = \emptyset \in \sigma[\mathcal{R}_{||}^n]$ so that $\mathcal{R}_{||}^n \cup \{\emptyset\} \subseteq \sigma[\mathcal{R}_{||}^n]$, as $\sigma[\mathcal{R}_{||}^n]$ is a σ -algebra it follows from [theorem: 21.39] that $\sigma[\mathcal{R}_{||}^n \cup \{\emptyset\}] \subseteq \sigma[\mathcal{R}_{||}^n]$. Combining this with [eq: 21.301] proves

$$\sigma[\mathcal{R}_{||}^n] = \sigma[\mathcal{R}_{||}^n \cup \{\emptyset\}] \quad \square$$

21.3.4.6 Content on the semi-ring $\mathcal{R}_{||}^n \cup \{\emptyset\}$

Definition 21.190. (Content of a rectangle) *Let $n \in \mathbb{N}$ then we define*

$$\text{vol}^n: \mathcal{R}_{||}^n \cup \{\emptyset\} \rightarrow [0, \infty] \text{ by } \text{vol}^n(R) = \begin{cases} 0 & \text{if } R = \emptyset \\ v^n(R) & \text{if } R \neq \emptyset \end{cases}$$

where $v^n(R): \mathcal{R}_{||}^n \rightarrow [0, \infty]$ is defined by $v^n(R) = \prod_{i=1}^n (\text{begin}(R)_i - \text{end}(R)_i) \in \mathbb{R}^+$ [see definition: 21.73].

Note 21.191. *Using the definition it follows that $\text{vol}^n(R)$ is finite and*

$$\forall R \in \mathcal{R}_{||}^n \cup \{\emptyset\} \text{ we have } \text{vol}^n(R) = 0 \Leftrightarrow R \in \mathcal{R}_{||}^n$$

Next it remains to prove that vol^n is actual a content on $\mathcal{R}_{||}^n \cup \{\emptyset\}$, the most difficult part is proving additivity of vol^n . To illustrate how to prove this consider the following 2-dimesional case [see figure:] where

$$R = \bigsqcup_{i \in \{1, \dots, 4\}} R_i$$

then we have to prove that

$$\text{vol}^2(R) = \sum_{i=1}^4 \text{vol}^2(R_i)$$

Figure 21.1.

To do this we divide R_1 , R_2 , R_3 , R_4 and R_5 in sub-cubes by partitioning their sides in sub intervals.

Figure 21.2.

so that

$$\begin{aligned} R_1 &= R_{1,1} + R_{1,2} + R_{1,3} + R_{1,4} \\ R_2 &= R_{2,1} + R_{2,2} \\ R_3 &= R_{3,1} \\ R_4 &= R_{4,1} \\ R_5 &= R_{5,1} \end{aligned}$$

then we prove that

$$\begin{aligned} \text{vol}^2(R) &= \text{vol}^2(R_{1,1}) + \text{vol}^2(R_{1,2}) + \text{vol}^2(R_{1,3}) + \text{vol}^2(R_{1,4}) + \text{vol}^2(R_{2,1}) + \text{vol}^2(R_{2,2}) + \text{vol}^2(R_{3,1}) + \\ &\quad \text{vol}^2(R_{4,1}) + \text{vol}^2(R_{5,1}) \end{aligned}$$

and apply associativity to get

$$\begin{aligned}\text{vol}^2(R) &= (\text{vol}^2(R_{1,1}) + \text{vol}^2(R_{1,2}) + \text{vol}^2(R_{1,3}) + \text{vol}^2(R_{1,4})) + (\text{vol}^2(R_{2,1}) + \text{vol}^2(R_{2,2})) + \\ &\quad (\text{vol}^2(R_{3,1})) + (\text{vol}^2(R_{3,1})) + (\text{vol}^2(R_{4,1})) + (\text{vol}^2(R_{5,1})) \\ &= \text{vol}^2(R_1) + \text{vol}^2(R_2) + \text{vol}^2(R_3) + \text{vol}^2(R_4) + \text{vol}^2(R_5)\end{aligned}$$

which proves additivity. First we show that every increasing finite family of real numbers can be used to construct a pairwise disjoint union of half open intervals that is itself a half open interval. This will be used later to turn a union of half open intervals that is itself a half open interval in a disjoint union of half open intervals.

Lemma 21.192. *Let $n, m \in \mathbb{N}$ with $n \leq m$, $\{a_i\}_{i \in \{n, \dots, m\}} \subseteq \mathbb{R}$ such that $\forall i \in \{n, \dots, m-1\}$ we have $a_i \leq a_{i+1}$ then*

$$\{[a_i, a_{i+1}[\}_{i \in \{n, \dots, m-1\}} \text{ is pairwise disjoint}$$

and

$$\bigsqcup_{i \in \{n, \dots, m-1\}} [a_i, a_{i+1}[= [a_n, a_m[$$

Proof. Let $i, j \in \{n, \dots, m-1\}$ with $i \neq j$ then we may assume that $i < j$ [otherwise exchange i and j]. Assume that $x \in [a_i, a_{i+1}[\cap [a_j, a_{j+1}[$ then $a_i \leq x < a_{i+1} \leq a_j \leq x < a_{j+1}$ leading to the contradiction $x < x$, hence the assumption is wrong proving that $[a_i, a_{i+1}[\cap [a_j, a_{j+1}[= \emptyset$. So

$$\{[a_i, a_{i+1}[\}_{i \in \{n, \dots, m-1\}} \text{ is pairwise disjoint}$$

Let $x \in [a_n, a_m[$ then $a_n \leq x < a_m$ so that $n \in \{i \in \{n, \dots, m\} | a_i \leq x\}$ a finite set. Hence $M = \max(\{i \in \{n, \dots, m\} | a_i \leq x\})$ exist. As $x < a_m \Rightarrow a_m \not\leq x$ we have $M \neq m$ so that $M \in \{n, \dots, m-1\} \Rightarrow M+1 \in \{n, \dots, m\}$. As $M = \max(\{i \in \{n, \dots, m\} | a_i \leq x\})$ it follows that $a_M \leq x < a_{M+1}$ so that $x \in [a_M, a_{M+1}[\subseteq \bigsqcup_{i \in \{n, \dots, m-1\}} [a_i, a_{i+1}[$. Hence we have proved that

$$[a_n, a_m[\subseteq \bigsqcup_{i \in \{n, \dots, m-1\}} [a_i, a_{i+1}[\quad (21.302)$$

Let $x \in \bigsqcup_{i \in \{n, \dots, m-1\}} [a_i, a_{i+1}[$ then there exist a $i \in \{n, \dots, m-1\}$ such that $a_i \leq x < a_{i+1}$. As $n \leq i$ and $i \leq m-1 < m$ we have by the hypothesis that $a_n \leq a_i \wedge a_{i+1} \leq a_m$ so that $a_n \leq x < a_m$ or $x \in [a_n, a_m[$. Hence $\bigsqcup_{i \in \{n, \dots, m-1\}} [a_i, a_{i+1}[\subseteq [a_n, a_m[$ which combined with [eq: 21.302] gives

$$\bigsqcup_{i \in \{n, \dots, m-1\}} [a_i, a_{i+1}[= [a_n, a_m[\quad \square$$

Next we show that a half open interval that is a union of half open subintervals is the disjoint union of sub intervals that are based on the boundary points of the half open subintervals. For example:

$$\begin{aligned}[-4, 2[&= [-3, 2[\cup [-1, 1[\cup [-4, 0[\cup [0, 2[\\ &= [-4, -3[\cup [-3, -1[\cup [-1, 0[\cup [0, 1[\cup [1, 2[\end{aligned}$$

to do this we sort the boundary points $\{-3, 2, -1, 1, -4, 0, 2\}$ giving the sorted set

$$\{-4, -3, -1, 0, 1, 2\}$$

and use the the previous lemma to create the final list of intervals

$$[-4, -3[, [-3, -1[, [-1, 0[, [0, 1[, [1, 2[$$

Lemma 21.193. *Let $n \in \mathbb{N}$ and $\{[a_i, b_i[\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{I}_[$ such that $\bigcup_{i \in \{1, \dots, n\}} [a_i, b_i[= [a, b[$ then if we take*

$$A = \{\alpha_i | i \in \{1, \dots, n\}\} \cup \{b_i | i \in \{1, \dots, n\}\}$$

there exists a $m \in \mathbb{N} \setminus \{1\}$ and a bijection $\beta: \{1, \dots, m\} \rightarrow A$ such that:

1. $\beta(1) = a \wedge \beta(m) = b$
2. $\forall i, j \in \{1, \dots, m\}$ with $i < j$ we have $\beta(i) < \beta(j)$
3. $\forall x, y \in A$ with $x < y$ we have $\beta^{-1}(x) < \beta^{-1}(y)$
4. $\forall i \in \{1, \dots, n\}$ we have $\beta^{-1}(a_i) < \beta^{-1}(b_i)$
5. $\forall i \in \{1, \dots, n\}$ $\{[\beta(j), \beta(j+1)]\}_{j \in \{\beta^{-1}(a_i), \dots, \beta^{-1}(b_i)-1\}}$ is pairwise disjoint and $[a_i, b_i[= \bigsqcup_{j \in \{\beta^{-1}(a_i), \dots, \beta^{-1}(b_i)-1\}} [\beta(j), \beta(j+1)[$
6. $\{[\beta(i), \beta(i+1)]\}_{i \in \{1, \dots, m-1\}}$ is pairwise disjoint and $\bigsqcup_{i \in \{1, \dots, m-1\}} [\beta(i), \beta(i+1)[= [a, b[$

Proof. Define $A = \{a_i | i \in \{1, \dots, n\}\} \cup \{b_i | i \in \{1, \dots, n\}\}$. As $[a_1, b_1[\neq \emptyset$ we have that $[a, b[= \bigcup_{i \in \{1, \dots, n\}} [a_i, b_i[\neq \emptyset$ so that

$$a < b \quad (21.303)$$

Assume that $a \notin A$. As $a \in [a, b[= \bigcup_{i \in \{1, \dots, n\}} [a_i, b_i[$ there exist a $i \in \{1, \dots, n\}$ such that $a \in [a_i, b_i[\Rightarrow a_i \leq a < b_i$ $\xRightarrow{a \notin A \Rightarrow a \neq a_i}$ $a_i < a < b_i$. Using the density of the real numbers [theorem: 10.32] there exist a $t \in \mathbb{R}$ such that $a_i < t < a < b_i \Rightarrow t \notin [a, b[\wedge t \in [a_i, b_i[\subseteq [a, b[$ a contradiction. So the assumption is wrong and we have

$$a \in A \quad (21.304)$$

Assume that $b \notin A$. Given $i \in \{1, \dots, n\}$ we have $[a_i, b_i[\subseteq \bigcup_{i \in \{1, \dots, n\}} [a_i, b_i[\subseteq [a, b[$ so that by [theorem: 3.144] $b_i \leq b$ $\xRightarrow{b \notin A \Rightarrow b \neq b_i}$ $b_i < b$. As also $a < b$ it follows that $\max(\{a\} \cup \{b_i | i \in \{1, \dots, n\}\}) < b$. Hence using the density of the real numbers [theorem: 10.32] there exists a $t \in \mathbb{R}$ with $\max(\{a\} \cup \{b_i | i \in \{1, \dots, n\}\}) < t < b$. Hence $\forall i \in \{1, \dots, n\}$ $t \notin [a_i, b_i[\wedge a < t < b$. So $t \notin \bigcup_{i \in \{1, \dots, n\}} [a_i, b_i[= [a, b[\wedge t \in [a, b[$ again a contradiction. Hence the assumption is wrong and we have

$$b \in A \quad (21.305)$$

As $\forall i \in \{1, \dots, n\}$ we have $[a_i, b_i[\subseteq \bigcup_{i \in \{1, \dots, n\}} [a_i, b_i[= [a, b[$ it follows from theorem: 3.144 that $a \leq a_i < b_i \leq b$ proving that

$$a = \min(A) \wedge b = \max(A)$$

Using [theorems: 6.34, 6.45] it follows that A is finite and as $a, b \in A$ $\text{card}(A) \in \mathbb{N}$, hence using [theorem: 10.97] it follows that there exist a bijection

$$\beta: \{1, \dots, m\} \rightarrow A \text{ where } m = \text{card}(A) \text{ such that } \forall i \in \{1, \dots, m-1\} \beta(i) < \beta(i+1) \quad (21.306)$$

As $\forall i \in \{1, \dots, m\}$ we have $\beta(1) \leq \beta(i)$ and $\beta(i) \leq \beta(m)$ it follows that $\beta(1) = \min(A) = a \wedge \beta(m) = \max(A) = b$, hence

$$a = \beta(1) \wedge b = \beta(m) \quad (21.307)$$

Let $x, y \in A$ such that $x < y$. If $\beta^{-1}(y) \leq \beta^{-1}(x)$ it follows that $y = \beta(\beta^{-1}(y)) \leq \beta(\beta^{-1}(x)) = x$ contradicting $x < y$. Hence we have

$$\forall x, y \in A \text{ with } x < y \text{ we have } \beta^{-1}(x) < \beta^{-1}(y) \quad (21.308)$$

Let $i \in \{1, \dots, n\}$ then $a_i, b_i \in A$ and $a_i < b_i$ [as $[a_i, b_i[\in \mathcal{I}_{[[]}$ so that by the above $\beta^{-1}(a_i) < \beta^{-1}(b_i)$. In other words

$$\forall i \in \{1, \dots, n\} \text{ we have } \beta^{-1}(a_i) < \beta^{-1}(b_i) \quad (21.309)$$

Let $i \in \{1, \dots, n\}$ then for $j \in \{\beta^{-1}(a_i), \dots, \beta^{-1}(b_i)-1\}$ we have $\beta(j) < \beta(j)$ so that by [lemma: 21.192] we have

$$\{[\beta(j), \beta(j+1)]\}_{j \in \{\beta^{-1}(a_i), \dots, \beta^{-1}(b_i)-1\}} \text{ is pairwise disjoint} \quad (21.310)$$

and

$$\bigsqcup_{j \in \{\beta^{-1}(a_i), \dots, \beta^{-1}(b_i)-1\}} [\beta(j), \beta(j+1)[= [\beta(\beta^{-1}(a_i)), \beta(\beta^{-1}(b_i))][= [a_i, b_i[\quad (21.311)$$

Using [lemma: 21.192] on [eq: 21.306] gives

$$\{[\beta(i), \beta(i+1)][_{i \in \{1, \dots, m-1\}} \text{ is pairwise disjoint} \quad (21.312)$$

and

$$\bigsqcup_{i \in \{1, \dots, m-1\}} [\beta(i), \beta(i+1)[= [\beta(1), \beta(n)[\stackrel{[\text{eq: 21.307}]}{=} [a, b[\quad (21.313)$$

So (1) is proved by [eq: 21.307], (2) is proved by [eq: 21.306], (3) is proved by [eq: 21.308], (4) is proved by [eq: 21.309], (5) by [eqs: 21.310, 21.311] and finally (6) by [eqs: 21.312, 21.313]. $\square$

Next we show how the volume of a half open rectangle partitioned by its sides can be calculated. Giving the follow example of a partitioned rectangle R

Figure 21.3.

we have then

$$\begin{aligned} \prod_{i \in \{1, \dots, n\}} [a_i, b_i[&= [a_1, b_1[\cdot [a_2, b_2[\\ &= [a_{1,1}, a_{1,2}[\cdot [a_{2,1}, a_{2,2}[\bigsqcup [a_{1,1}, a_{1,2}[\cdot [a_{2,2}, a_{2,3}[\bigsqcup [a_{1,1}, a_{1,2}[\cdot [a_{2,3}, a_{2,4}[\bigsqcup \\ &\quad [a_{1,2}, a_{1,3}[\cdot [a_{2,1}, a_{2,2}[\bigsqcup [a_{1,2}, a_{1,3}[\cdot [a_{2,2}, a_{2,3}[\bigsqcup [a_{1,2}, a_{1,3}[\cdot [a_{2,3}, a_{2,4}[\\ &= \bigsqcup_{\rho \in \{(1,1), (1,2), (1,3), (2,1), (2,2), (2,3)\}} [a_{1,\rho_1}, a_{1,\rho_1+1}[\cdot [a_{2,\rho_2}, a_{2,\rho_2+1}[\\ &= \bigsqcup_{\rho \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i-1\}} \left(\prod_{i \in \{1, \dots, n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \end{aligned}$$

and

$$\begin{aligned} \prod_{i \in \{1, \dots, n\}} (b_i - a_i) &= (b_1 - a_1) \cdot (b_2 - a_2) \\ &= (a_{1,2} - a_{1,1}) \cdot (a_{2,2} - a_{2,1}) + (a_{1,2} - a_{1,1}) \cdot (a_{2,3} - a_{2,2}) + (a_{1,2} - a_{1,1}) \cdot (a_{2,4} - a_{2,3}) \\ &\quad + (a_{1,3} - a_{1,2}) \cdot (a_{2,2} - a_{2,1}) + (a_{1,3} - a_{1,2}) \cdot (a_{2,3} - a_{2,2}) + (a_{1,3} - a_{1,2}) \cdot (a_{2,4} - a_{2,3}) \\ &= \bigsqcup_{\rho \in \{(1,1), (1,2), (1,3), (2,1), (2,2), (2,3)\}} (a_{1,\rho_1+1} - a_{1,\rho_1}) \cdot (a_{2,\rho_2+1} - a_{2,\rho_2}) \\ &= \bigsqcup_{\rho \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i-1\}} \left(\prod_{i \in \{1, \dots, n\}} (a_{i,\rho_i+1} - a_{i,\rho_i}) \right) \end{aligned}$$

Lemma 21.194. Let $n \in \mathbb{N}$, $\{[a_i, b_i]\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{I}_I$ such that $\forall i \in \{1, \dots, n\}$ there exists $n_i, m_i \in \mathbb{N}$ with $n_i \leq m_i$ and a $\{a_{i,j}\}_{j \in \{n_i, \dots, m_i\}} \subseteq \mathbb{R}$ such that $\forall j \in \{n_i, \dots, m_i - 1\}$ $a_{i,j} \leq a_{i,j+1}$ and $a_{i,n_i} = a_i \wedge a_{i,m_i} = b_i$ then

$$\left\{ \prod_{i \in \{1, \dots, n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right\}_{\rho \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i-1\}} \quad \text{is pairwise disjoint}$$

$$\prod_{i \in \{1, \dots, n\}} [a_i, b_i[= \bigsqcup_{\rho \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i-1\}} \left(\prod_{i \in \{1, \dots, n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right)$$

$$\prod_{i=1}^n (b_i - a_i) = \sum_{\rho \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i-1\}} \left(\prod_{i \in \{1, \dots, n\}} (a_{i,\rho_i+1} - a_{i,\rho_i}) \right)$$

Proof. Assume that $\exists i \in \{1, \dots, n\}$ such that $n_i = m_i$ then $a_i = a_{i,n_i} = a_{o,m_i} = b_i$ contradicting $a_i < b_i$ [because $[a_i, b_i] \neq \emptyset$], hence a assumption is false and we have

$$\forall i \in \{1, \dots, n\} \text{ we have } n_i < m_i \text{ or } n_i \leq m_i - 1 \quad (21.314)$$

Let $i \in \{1, \dots, n\}$ then, as $\forall j \in \{n_i, \dots, m_i - 1\}$ $a_{i,j} \leq a_{i,j+1}$ it follows from [lemma: 21.192] that

$$\{[a_{i,j}, a_{i,j+1}]\}_{j \in \{n_i, \dots, m_i-1\}} \text{ is pairwise disjoint} \quad (21.315)$$

and

$$[a_i, b_i[= [a_{i,n_i}, a_{i,m_i}[= \bigsqcup_{j \in \{n_i, \dots, m_i-1\}} [a_{i,j}, a_{i,j+1}[\quad (21.316)$$

Let $x \in \prod_{i \in \{1, \dots, n\}} [a_i, b_i[$ then $\forall i \in \{1, \dots, n\}$ we have $x_i \in [a_i, b_i[$, hence by the above there exist a $\rho_i \in \{n_i, \dots, m_i - 1\}$ such that $x_i \in [a_{i,\rho_i}, a_{i,\rho_i+1}[$. So for $\rho = (\rho_1, \dots, \rho_n) \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i - 1\}$ it follows that $\forall i \in \{1, \dots, n\}$ $x_i \in [a_{i,\rho_i}, a_{i,\rho_i+1}[$ proving that $x \in \prod_{i \in \{1, \dots, n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[$. Hence we have

$$\prod_{i \in \{1, \dots, n\}} [a_i, b_i[\subseteq \bigcup_{\rho \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i-1\}} \left(\prod_{i \in \{1, \dots, n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \quad (21.317)$$

If $x \in \bigcup_{\rho \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i-1\}} \left(\prod_{i \in \{1, \dots, n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right)$ then there exist a $\rho \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i - 1\}$ such that $x \in \prod_{i \in \{1, \dots, n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[$. Hence $\forall i \in \{1, \dots, n\}$ we have $x_i \in [a_{i,\rho_i}, a_{i,\rho_i+1}[$ [eq: 21.316] $\subseteq [a_i, b_i[$ proving that $x \in \prod_{i \in \{1, \dots, n\}} [a_i, b_i[$. So it follows that

$\bigcup_{\rho \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i-1\}} \left(\prod_{i \in \{1, \dots, n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \subseteq \prod_{i \in \{1, \dots, n\}} [a_i, b_i[$ which combined with [eq: 21.317] proves that

$$\prod_{i \in \{1, \dots, n\}} [a_i, b_i[= \bigcup_{\rho \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i-1\}} \left(\prod_{i \in \{1, \dots, n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \quad (21.318)$$

Let $\rho, \sigma \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i - 1\}$ with $\rho \neq \sigma$ then there exist a $k \in \{1, \dots, n\}$ such that $\rho(k) \neq \sigma(k)$. Assume that there exist a $x \in \left(\prod_{i \in \{1, \dots, n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \cap \left(\prod_{i \in \{1, \dots, n\}} [a_{i,\sigma_i}, a_{i,\sigma_i+1}[\right)$ then $x_k \in [a_{k,\rho_k}, a_{k,\rho_k+1}[\cap [a_{k,\sigma_k}, a_{k,\sigma_k+1}[\stackrel{\rho_k \neq \sigma_k}{=} \emptyset$ which is a contradiction, hence the assumption is wrong and we must have that $\left(\prod_{i \in \{1, \dots, n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right) \cap \left(\prod_{i \in \{1, \dots, n\}} [a_{i,\sigma_i}, a_{i,\sigma_i+1}[\right) = \emptyset$. So we have

$$\left\{ \prod_{i \in \{1, \dots, n\}} [a_{i,\rho_i}, a_{i,\rho_i+1}[\right\}_{\rho \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i-1\}} \quad \text{is pairwise disjoint} \quad (21.319)$$

Further we have

$$\begin{aligned}
\prod_{i=1}^n (b_i - a_i) &\stackrel{[\text{definition: 21.172}]}{=} \prod_{i=1}^n \text{len}([a_i, b_i[) \\
&\stackrel{[\text{eq: 21.315, 21.316}]}{=} \prod_{i=1}^n \text{len}\left(\bigsqcup_{j \in \{n_i, \dots, m_i\}} [a_{i,j}, a_{i,j+1}[\right) \\
&\stackrel{[\text{lemma: 21.175}]}{=} \prod_{i=1}^n \left(\sum_{j \in \{n_i, \dots, m_i\}} \text{len}([a_{i,j}, a_{i,j+1}[) \right) \\
&\stackrel{[\text{theorem: 11.49}]}{=} \sum_{\rho \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i\}} \left(\prod_{i \in \{1, \dots, n\}} \text{len}([a_{i,\rho_i}, a_{i,\rho_i+1}[) \right) \\
&= \sum_{\rho \in \prod_{i \in \{1, \dots, n\}} \{n_i, \dots, m_i\}} \left(\prod_{i \in \{1, \dots, n\}} (a_{i,\rho_i+1} - a_{i,\rho_i}) \right)
\end{aligned}$$

which proves the last part of the theorem. $\square$

The following lemma shows that if the union of half open rectangles is a half open rectangle then each side of the of the open rectangle is a union of the corresponding sides of the subrectangles. For example in the following 2-dimensional we have that

$$\begin{aligned}
[a_1, b_1[&= [a_{1,1}, b_{1,1}[\cup [a_{2,1}, b_{2,1}[\cup [a_{3,1}, b_{3,1}[\cup [a_{4,1}, b_{5,1}[\cup [a_{5,1}, b_{5,1}[\\
&= \bigcup_{i \in \{1, \dots, 5\}} [a_{i,1}, b_{i,1}[\\
[a_2, b_2[&= [a_{1,2}, b_{1,2}[\cup [a_{2,2}, b_{2,2}[\cup [a_{3,2}, b_{3,2}[\cup [a_{4,2}, b_{4,2}[\cup [a_{5,2}, b_{5,2}[\\
&= \bigcup_{i \in \{1, \dots, b\}} [a_{i,2}, b_{i,2}[
\end{aligned}$$

Figure 21.4.

Lemma 21.195. Let $n, m \in \mathbb{N}$ and let $\{\prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{R}_{\ll}^n$ such that

$$\bigcup_{i \in \{1, \dots, m\}} \left(\prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[\right) = \prod_{j \in \{1, \dots, n\}} [a_j, b_j[\in \mathcal{R}_{\ll}^n$$

then $\forall j \in \{1, \dots, n\}$ we have

$$[a_j, b_j[= \bigcup_{i \in \{1, \dots, m\}} [a_{i,j}, b_{i,j}[$$

Proof. Take $j \in \{1, \dots, n\}$. If $t \in \bigcup_{i \in \{1, \dots, m\}} [a_{i,j}, b_{i,j}[$ then there exist a $i \in \{1, \dots, m\}$ such that $t \in [a_{i,j}, b_{i,j}[$. As $\prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[\in \mathcal{R}_{||}^n$ $\prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[\neq \emptyset$ it follows from [theorems: 3.109, 3.108] that the projection function $\pi_j: \prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[\rightarrow [a_{i,j}, b_{i,j}[$ is a surjection hence there exists a $x \in \prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[$ such that $x_j = \pi_j(x) = t$. As

$$\prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[\subseteq \bigsqcup_{i \in \{1, \dots, m\}} \left(\prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[\right) = \prod_{j \in \{1, \dots, n\}} [a_j, b_j[$$

we have that $x \in \prod_{j \in \{1, \dots, n\}} [a_j, b_j[$ so that $t = \pi_j(x) \in [a_j, b_j[$. Hence we have

$$\bigcup_{i \in \{1, \dots, m\}} [a_{i,j}, b_{i,j}[\subseteq [a_j, b_j[\quad (21.320)$$

Let $t \in [a_j, b_j[$. As $\prod_{j \in \{1, \dots, n\}} [a_j, b_j[\in \mathcal{R}_{||}^n$ $\prod_{j \in \{1, \dots, n\}} [a_j, b_j[\neq \emptyset$ so that by [theorems: 3.109, 3.108] the projection function $\pi_j: \prod_{j \in \{1, \dots, n\}} [a_j, b_j[\rightarrow [a_j, b_j[$ is a surjection, hence there exist a $x \in \prod_{j \in \{1, \dots, n\}} [a_j, b_j[= \bigsqcup_{i \in \{1, \dots, m\}} \left(\prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[\right)$ such that $t = \pi_j(x)$. Then there exists a $i \in \{1, \dots, m\}$ such that $x \in \prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[$. So it follows that $t = \pi_j(x) \in [a_{i,j}, b_{i,j}[\subseteq \bigcup_{i \in \{1, \dots, m\}} [a_{i,j}, b_{i,j}[$ which proves that $[a_j, b_j[\subseteq \bigcup_{i \in \{1, \dots, m\}} [a_{i,j}, b_{i,j}[$. Combining this with [eq: 21.320] proves that

$$[a_j, b_j[= \bigcup_{i \in \{1, \dots, m\}} [a_{i,j}, b_{i,j}[\quad \square$$

We show now that the volume of the pairwise distinct union of half open non empty rectangles is equal to the sum of the volumes of these rectangles if this distinct union is also a half open rectangle.

Lemma 21.196. Let $n, m \in \mathbb{N}$, $\{\prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{R}_{||}^n$ pairwise disjoint such that $\bigsqcup_{i \in \{1, \dots, m\}} \left(\prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[\right) = \prod_{i \in \{1, \dots, n\}} [a_i, b_i[\in \mathcal{R}_{||}^n$ then we have

$$\prod_{i \in \{1, \dots, n\}} (b_i - a_i) = \sum_{i=1}^m \left(\prod_{j=1}^n (b_{i,j} - a_{i,j}) \right)$$

Proof. First using the previous lemma [lemma: 21.195] we have that

$$\forall j \in \{1, \dots, n\} [a_j, b_j[= \bigcup_{i \in \{1, \dots, m\}} [a_{i,j}, b_{i,j}[\quad (21.321)$$

Let $j \in \{1, \dots, n\}$. Using [lemma: 21.193] there exists a $n_j \in \mathbb{N}$ and a bijection

$$\beta_j: \{1, \dots, n_j\} \rightarrow \{a_{i,j} | i \in \{1, \dots, n_j\}\} \cup \{b_{i,j} | i \in \{1, \dots, n_j\}\} \quad (21.322)$$

such that

$$\beta_j(1) = a_j \wedge \beta_j(n_j) = b_j \quad (21.323)$$

$$\forall k, l \in \{1, \dots, n_j\} \text{ with } k < l \text{ we have } \beta_j(k) < \beta_j(l) \quad (21.324)$$

$$\forall x, y \in \{a_{i,j} | i \in \{1, \dots, n_j\}\} \cup \{b_{i,j} | i \in \{1, \dots, n_j\}\} \text{ with } x < y \text{ we have } (\beta_j)^{-1}(x) < (\beta_j)^{-1}(y) \quad (21.325)$$

$$\forall i \in \{1, \dots, m\} \text{ we have } (\beta_j)^{-1}(a_{i,j}) < (\beta_j)^{-1}(b_{i,j}) \quad (21.326)$$

$$\forall i \in \{1, \dots, m\} \quad [a_{i,j}, b_{i,j}[= \bigsqcup_{l \in \{(\beta_j)^{-1}(a_{i,j}), \dots, (\beta_j)^{-1}(b_{i,j})-1\}} [\beta_j(l), \beta_j(l+1)[\quad (21.327)$$

$$[a_j, b_j[= \bigsqcup_{i \in \{1, \dots, n_j\}} [\beta_j(i), \beta_j(i+1)[\quad (21.328)$$

Because of [eqs: 21.323 and 21.324] we can apply the previous lemma [lemma: 21.194] giving

$$\prod_{j \in \{1, \dots, n\}} [a_j, b_j[= \bigsqcup_{\rho \in \prod_{i \in \{1, \dots, n\}} \{1, \dots, n_j-1\}} \left(\prod_{j \in \{1, \dots, n\}} [\beta_j(\rho_j) - \beta_j(\rho_j+1)[\right) \quad (21.329)$$

$$\prod_{j=1}^n (b_j - a_j) = \sum_{\rho \in \prod_{i \in \{1, \dots, n\}} \{1, \dots, n_j-1\}} \left(\prod_{j \in \{1, \dots, n\}} (\beta_j(\rho_j+1) - \beta_j(\rho_j)) \right) \quad (21.330)$$

Let $i \in \{1, \dots, m-1\}$. As $a_{i,j} = \beta_j((\beta_j)^{-1}(a_{i,j}))$ and $b_{i,j} = \beta_j((\beta_j)^{-1}(b_{i,j}))$ and $\forall i \in \{(\beta_j)^{-1}(a_{i,j}), \dots, (\beta_j)^{-1}(b_{i,j})-1\}$ we have by [eq: 21.324] that $\beta_j(i) < \beta_j(i+1)$ we can use [lemma: 21.194] again to get

$$\prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[= \bigsqcup_{\rho \in \prod_{i \in \{1, \dots, n\}} \{(\beta_j)^{-1}(a_{i,j}), \dots, (\beta_j)^{-1}(b_{i,j})-1\}} \left(\prod_{j=1}^n [\beta_j(\rho_j), \beta_j(\rho_j)+1[\right) \quad (21.331)$$

$$\prod_{j \in \{1, \dots, n\}} (b_{i,j} - a_{i,j}) = \sum_{\rho \in \prod_{i \in \{1, \dots, n\}} \{(\beta_j)^{-1}(a_{i,j}), \dots, (\beta_j)^{-1}(b_{i,j})-1\}} \left(\prod_{j=1}^n (\beta_j(\rho_j+1) - \beta_j(j)) \right) \quad (21.332)$$

To relate [eq: 21.329] to [eq: 21.332] we prove now the following:

$$\bigsqcup_{i \in \{1, \dots, m\}} \left(\prod_{j \in \{1, \dots, n\}} \{(\beta_j)^{-1}(a_{i,j}), \dots, (\beta_j)^{-1}(b_{i,j})-1\} \right) = \prod_{j \in \{1, \dots, n\}} \{1, \dots, n_j-1\} \quad (21.333)$$

Proof. Let $i \in \{1, \dots, m\}$ and $j \in \{1, \dots, n\}$. From [eq: 21.322] it follows that $(\beta_j)^{-1}(a_{i,j}), (\beta_j)^{-1}(b_{i,j}) \in \{1, \dots, m_j\}$, further by [eq: 21.326] we have $(\beta_j)^{-1}(a_{i,j}) \leq (\beta_j)^{-1}(b_{i,j}) - 1$ so that $\{(\beta_j)^{-1}(a_{i,j}), \dots, (\beta_j)^{-1}(b_{i,j})-1\} \subseteq \{1, \dots, m_j-1\}$. Applying [theorem: 2.141] gives us then $\prod_{j \in \{1, \dots, n\}} \{(\beta_j)^{-1}(a_{i,j}), \dots, (\beta_j)^{-1}(b_{i,j})-1\} \subseteq \prod_{j \in \{1, \dots, m\}} \{1, \dots, n_j-1\}$ hence we have

$$\bigcup_{i \in \{1, \dots, m\}} \left(\prod_{j \in \{1, \dots, n\}} \{(\beta_j)^{-1}(a_{i,j}), \dots, (\beta_j)^{-1}(b_{i,j})-1\} \right) \subseteq \prod_{j \in \{1, \dots, n\}} \{1, \dots, n_j-1\} \quad (21.334)$$

For the opposite inclusion let $\rho \in \prod_{j \in \{1, \dots, n\}} \{1, \dots, n_j - 1\}$. For $j \in \{1, \dots, n\}$ $\rho_j \in \{1, \dots, n_j - 1\}$ we have by [eq: 21.324] that $\beta_j(\rho_j) < \beta_j(\rho_j + 1)$ so that $\beta_j(\rho_j) \in [\beta_j(\rho_j), \beta_j(\rho_j)[$. Hence

$$\begin{aligned} (\beta_1(\rho_1), \dots, \beta_n(\rho_n)) &\in \prod_{j \in \{1, \dots, n\}} [\beta_j(\rho_j), \beta_j(\rho_j)[\\ &\subseteq \bigsqcup_{\rho \in \prod_{i \in \{1, \dots, n\}} \{1, \dots, n_i - 1\}} \left(\prod_{j \in \{1, \dots, n\}} [\beta_j(\rho_j), \beta_j(\rho_j + 1)[\right) \\ &\stackrel{[\text{eq: 21.329}]}{=} \prod_{j \in \{1, \dots, n\}} [a_j, b_j[\\ &\stackrel{\text{hypothesis}}{=} \bigsqcup_{i \in \{1, \dots, m\}} \left(\prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[\right) \end{aligned}$$

Hence

$$\exists k \in \{1, \dots, m\} \text{ such that } (\beta_1(\rho_1), \dots, \beta_n(\rho_n)) \in \prod_{j \in \{1, \dots, n\}} [a_{k,j}, b_{k,j}[\quad (21.335)$$

Assume now that $\exists j \in \{1, \dots, n\}$ such that $b_{k,j} < \beta_j(\rho_j + 1)$ then $\beta_j(\rho_j) \stackrel{[\text{eq: 21.335}]}{<} b_{k,j} < \beta_j(\rho_j + 1)$ so that by [eq: 21.325] $(\beta_j)^{-1}(\beta_j(\rho_j)) < (\beta_j)^{-1}(b_{k,j}) < (\beta_j)^{-1}(\rho_j + 1)$, hence $\rho_j < (\beta_j)^{-1}(b_{k,j}) < \rho_j + 1$ from which it follows that $0 < (\beta_j)^{-1}(b_{k,j}) - 1 < 1$ which, as $(\beta_j)^{-1}(b_{k,j})$ is a whole number [because $(\beta_j)^{-1}(b_{k,j}) \in \{1, \dots, n_j\}$], is impossible. Hence the assumption is wrong and we must have that

$$\forall j \in \{1, \dots, n\} \quad \beta_j(\rho_j + 1) \leq b_{k,j} \quad (21.336)$$

So given $j \in \{1, \dots, n\}$ we have $a_{k,j} \stackrel{[\text{eq: 21.335}]}{\leq} \beta_j(\rho_j) \stackrel{[\text{eq: 21.324}]}{<} \beta_j(\rho_j + 1) \stackrel{[\text{eq: 21.336}]}{\leq} b_{k,j}$. applying then [eq: 21.325] proves that $(\beta_j)^{-1}(a_{k,j}) \leq \rho_j < \rho_j + 1 \leq (\beta_j)^{-1}(b_{k,j})$, hence $(\beta_j)^{-1}(a_{k,j}) \leq \rho_j \leq (\beta_j)^{-1}(b_{k,j}) - 1$ proving that $\rho_j \in \{(\beta_j)^{-1}(a_{k,j}), (\beta_j)^{-1}(b_{k,j}) - 1\}$ from which it follows that $\rho \in \prod_{j \in \{1, \dots, n\}} \{(\beta_j)^{-1}(a_{k,j}), (\beta_j)^{-1}(b_{k,j}) - 1\}$. This prove that

$$\prod_{j \in \{1, \dots, n\}} \{1, \dots, n_j - 1\} \subseteq \bigcup_{i \in \{1, \dots, m\}} \left(\prod_{j \in \{1, \dots, n\}} \{(\beta_j)^{-1}(a_{i,j}), \dots, (\beta_j)^{-1}(b_{i,j}) - 1\} \right)$$

which combined with [eq: 21.334] results in

$$\prod_{j \in \{1, \dots, n\}} \{1, \dots, n_j - 1\} = \bigcup_{i \in \{1, \dots, m\}} \left(\prod_{j \in \{1, \dots, n\}} \{(\beta_j)^{-1}(a_{i,j}), \dots, (\beta_j)^{-1}(b_{i,j}) - 1\} \right) \quad (21.337)$$

To finish the prove for [eq: 21.333] we must prove that it is a pairwise disjoint union. So let $k, l \in \{1, \dots, m\}$ with $k \neq l$ and assume that

$$\exists r \in \prod_{j \in \{1, \dots, n\}} \{(\beta_j)^{-1}(a_{k,j}), \dots, (\beta_j)^{-1}(b_{k,j}) - 1\} \cap \prod_{j \in \{1, \dots, n\}} \{(\beta_j)^{-1}(a_{l,j}), \dots, (\beta_j)^{-1}(b_{l,j}) - 1\}$$

then $\forall j \in \{1, \dots, n\}$

$$(\beta_j)^{-1}(a_{k,j}) \leq r \leq (\beta_j)^{-1}(b_{k,j}) - 1 \wedge (\beta_j)^{-1}(a_{l,j}) \leq r \leq (\beta_j)^{-1}(b_{l,j}) - 1$$

or

$$(\beta_j)^{-1}(a_{k,j}) \leq r < (\beta_j)^{-1}(b_{k,j}) \wedge (\beta_j)^{-1}(a_{l,j}) \leq r < (\beta_j)^{-1}(b_{l,j})$$

applying then [eq: 21.324] gives

$$a_{k,j} \leq \beta_j(r) < b_{k,j} \wedge a_{l,j} \leq \beta_j(r) < b_{l,j} \text{ or } \beta_j(r) \in [a_{k,j}, b_{k,j}[\wedge \beta_j(r) \in [a_{l,j}, b_{l,j}[$$

proving that $(\beta_1(r), \dots, \beta_n(r)) \in (\prod_{i \in \{1, \dots, n\}} [a_{k,i}, b_{k,i}[) \cap (\prod_{i \in \{1, \dots, n\}} [a_{l,i}, b_{l,i}[)$ which as by the hypothesis $(\beta_1(r), \dots, \beta_n(r)) \in (\prod_{i \in \{1, \dots, n\}} [a_{k,i}, b_{k,i}[) \cap (\prod_{i \in \{1, \dots, n\}} [a_{l,i}, b_{l,i}[) = \emptyset$ is a contradiction hence we must have that

$$\prod_{j \in \{1, \dots, n\}} \{(\beta_j)^{-1}(a_{k,j}), \dots, (\beta_j)^{-1}(b_{k,j}) - 1\} \cap \prod_{j \in \{1, \dots, n\}} \{(\beta_j)^{-1}(a_{l,j}), \dots, (\beta_j)^{-1}(b_{l,j}) - 1\}$$

the above together with [eq: 21.337] proves finally [eq: 21.333]. $\square$

Finally we are able to finish the prove of the lemma.

$$\begin{aligned}
 & \prod_{i=1}^n (b_i - a_i) \quad [\text{eq: 21.330}] \\
 & \sum_{\rho \in \prod_{i \in \{1, \dots, n\}} \{1, \dots, n_j - 1\}} \left(\prod_{j \in \{1, \dots, n\}} (\beta_j(\rho_j + 1) - \beta_j(\rho_j)) \right) \quad [\text{eq: 21.333}] \\
 & \quad [\text{theorem: 11.44}] \\
 & \sum_{i \in \{1, \dots, m\}} \left(\sum_{\rho \in \prod_{j \in \{1, \dots, n\}} \{(\beta_j)^{-1}(a_{i,j}), \dots, (\beta_j)^{-1}(b_{i,j}) - 1\}} (\beta_j(\rho_j + 1) - \beta_j(\rho_j)) \right) \quad [\text{eq: 21.332}] \\
 & \quad \sum_{i \in \{1, \dots, m\}} \left(\prod_{j \in \{1, \dots, n\}} (b_{i,j} - a_{i,j}) \right) \\
 & \quad \square
 \end{aligned}$$

Now we are finally ready to prove that $\text{vol}^n: \mathcal{R}_{||}^n \cup \{\emptyset\} \rightarrow [0, \infty]$ is a finite content.

Theorem 21.197. *Let $n \in \mathbb{N}$ then $\text{vol}^n: \mathcal{R}_{||}^n \cup \{\emptyset\} \rightarrow [0, \infty]$ [see definition: 21.190] is a finite content on the semi-ring $\mathcal{R}_{||}^n \cup \{\emptyset\}$ on $\mathbb{R}^n$ [see theorem: 21.188]*

Proof. First from the definition of vol^n [see definition: 21.190] it follows that

$$\text{vol}^n \text{ is finite} \quad (21.338)$$

and

$$\text{vol}^n(\emptyset) = 0 \quad (21.339)$$

Let $m \in \mathbb{N}$ and $\{R_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{R}_{||}^n \cup \{\emptyset\}$ be pairwise disjoint such that $\bigsqcup_{i \in \{1, \dots, m\}} R_i \in \mathcal{R}_{||}^n \cup \{\emptyset\}$ then we have two possibilities for $\bigsqcup_{i \in \{1, \dots, m\}} R_i$

$\bigsqcup_{i \in \{1, \dots, m\}} R_i = \emptyset$. Then we must have $\forall i \in \{1, \dots, m\}$ that $R_i = \emptyset$ so that

$$\text{vol}^n \left(\bigsqcup_{i \in \{1, \dots, m\}} R_i \right) = \text{vol}^n(\emptyset) = 0 = \sum_{i=1}^m 0 = \sum_{i=1}^m \text{vol}^n(\emptyset) = \sum_{i=1}^m \text{vol}^n(R_i)$$

$\bigsqcup_{i \in \{1, \dots, m\}} R_i \neq \emptyset$. Then for $R = \bigsqcup_{i \in \{1, \dots, m\}} R_i$ there exist a $\{[a_i, b_i[\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{I}_{||}$ such that

$$R = \prod_{i \in \{1, \dots, n\}} [a_i, b_i[\in \mathcal{R}_{||}^n \quad (21.340)$$

Then there exist a $i \in \{1, \dots, m\}$ such that $R_i \neq \emptyset$ so that $I = \{i \in \{1, \dots, m\} | R_i \neq \emptyset\} \neq \emptyset$ hence there exist a $k \in \mathbb{N}$ and a bijection

$$\beta: \{1, \dots, k\} \rightarrow I$$

Then $\forall i \in \{1, \dots, k\}$ $R_{\beta(i)} \neq \emptyset$ and $\forall i, j \in \{1, \dots, k\}$ with $i \neq j$ we have, as β is injective, that $\beta(i) \neq \beta(j)$ so that $R_{\beta(i)} \cap R_{\beta(j)} = \emptyset$. So that

$$\{R_{\beta(i)}\}_{i \in \{1, \dots, k\}} \subseteq \mathcal{R}_{||}^n \text{ is pairwise disjoint} \quad (21.341)$$

Let $R = \bigsqcup_{i \in \{1, \dots, m\}} R_i$ then we have

$$R = \bigsqcup_{i \in \{1, \dots, m\}} R_i \stackrel{[\text{theorem: 2.134}]}{=} \bigsqcup_{i \in I} R_i \stackrel{[\text{theorem: 2.119}]}{=} \bigsqcup_{i \in \{1, \dots, k\}} R_{\beta(i)} \quad (21.342)$$

Further as $\{R_{\beta(i)}\}_{i \in \{1, \dots, k\}} \subseteq \mathcal{R}_{||}^n$ we have $\forall i \in \{1, \dots, k\}$ that

$$R_{\beta(i)} = \prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[\subseteq \mathcal{R}_n. \quad (21.343)$$

So that

$$\prod_{i \in \{1, \dots, n\}} [a_i, b_i[\stackrel{[\text{eq: 21.340}]}{=} \bigsqcup_{i \in \{1, \dots, k\}} \left(\prod_{j \in \{1, \dots, n\}} [a_{i,j}, b_{i,j}[\right) \quad (21.344)$$

Then we have

$$\begin{aligned}
 \text{vol}^n(R) &= \prod_{i=1}^n (\text{begin}(R)_i = \text{end}(R)_i) \\
 &= \prod_{i=1}^n (b_i - a_i) \\
 &\stackrel{[\text{eq: 21.344}]}{=} \sum_{i=1}^k \left(\prod_{j=1}^n (b_{i,j} - a_{i,j}) \right) \\
 &\stackrel{[\text{lemma: 21.196}]}{=} \sum_{i=1}^k \left(\prod_{j=1}^n (\text{begin}(R_{\beta(i)})_j - \text{end}(R_{\beta(j)})_j) \right) \\
 &\stackrel{[\text{eq: 21.343}]}{=} \sum_{i=1}^k \text{vol}^n(R_{\beta(i)}) \\
 &= \sum_{i \in \{1, \dots, k\}} \text{vol}^n(R_{\beta(i)}) \\
 &\stackrel{[\text{theorem: 11.36}]}{=} \sum_{i \in I} \text{vol}^n(R_i) \\
 &= \sum_{i \in I} \text{vol}^n(R_i) + 0 \\
 &\stackrel{i \notin I = R_i = \emptyset}{=} \sum_{i \in I} \text{vol}^n(R_i) + \sum_{i \in \{1, \dots, m\} \setminus I} \text{vol}^n(R_i) \\
 &= \sum_{i \in \{1, \dots, m\}} \text{vol}^n(R_i) \\
 &= \sum_{i=1}^m \text{vol}^n(R_i)
 \end{aligned}$$

Hence

$$\text{vol}^n\left(\bigsqcup_{i \in \{1, \dots, m\}} R_i\right) = \sum_{i=1}^m \text{vol}^n(R_i)$$

which finished the proof of the theorem. $\square$

Next we use [theorem: 21.162] to prove that vol^n is actually a pre-measure on the semi-ring $\mathcal{R} \setminus \{\emptyset\}$. To do this we need the following lemma that will allow us to 'approximate' a half open rectangle by a compact set.

Lemma 21.198. *Let $n \in \mathbb{N}$, $\varepsilon \in \mathbb{R}^+$ and $\{x_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}^+$ then $\exists \{\varepsilon_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}^+$ with $0 < \varepsilon_i < x_i$ such that $\prod_{i=1}^n x_i < (\prod_{i=1}^n (x_i - \varepsilon_i)) + \varepsilon$*

Proof. We use induction on n . Let $\varepsilon \in \mathbb{R}^+$ and define

$$S_\varepsilon = \left\{ n \in \mathbb{N} \mid \text{If } \{x_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}^+ \text{ then } \exists \{\varepsilon_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}^+ \text{ with } \forall i \in \{1, \dots, n\} \ 0 < \varepsilon_i < x_i \text{ such that } \prod_{i=1}^n x_i < \left(\prod_{i=1}^n (x_i - \varepsilon_i) \right) + \varepsilon \right\}$$

then we have:

$1 \in S_\varepsilon$. If $\{x_i\}_{i \in \{1, \dots, 1\}} \subseteq \mathbb{R}^+$ then $x_1 \in \mathbb{R}^+$, define $\varepsilon_1 = \min\left(\frac{x_1}{2}, \frac{\varepsilon}{2}\right) \in \mathbb{R}^+$ then $0 < \varepsilon_1 \leq \frac{x_1}{2} < x_1$ and $\prod_{i=1}^1 x_i - \prod_{i=1}^1 (x_i - \varepsilon_i) = x_1 - (x_1 - \varepsilon_1) = \varepsilon_1 \leq \frac{\varepsilon}{2} < \varepsilon$ so that $\prod_{i=1}^1 x_i < (\prod_{i=1}^1 (x_i - \varepsilon_i)) + \varepsilon$ proving that $1 \in S_\varepsilon$.

$n \in S_\varepsilon \Rightarrow n+1 \in S_\varepsilon$. Assume that $\{x_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathbb{R}^+$ then as $n \in S$ there exists $\{\varepsilon_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}^+$ with $0 < \varepsilon_i < x_i$ and $\prod_{i=1}^n x_i < (\prod_{i=1}^n (x_i - \varepsilon_i)) + \frac{\varepsilon}{2 \cdot x_{n+1}}$ so that as $0 < x_{n+1}$ we have

$$x_{n+1} \cdot \prod_{i=1}^n x_i - x_{n+1} \cdot \prod_{i=1}^n (x_i - \varepsilon_i) < \frac{\varepsilon}{2} \quad (21.345)$$

Take now $\varepsilon_{n+1} = \min \left(\frac{\varepsilon}{4 \cdot \prod_{i=1}^n x_i}, \frac{x_{n+1}}{2} \right)$ then $0 < \varepsilon_{n+1} \leq \frac{x_{n+1}}{2} < x_{n+1}$ and $\varepsilon_{n+1} \cdot (\prod_{i=1}^n x_i) \leq \frac{\varepsilon}{4} < \frac{\varepsilon}{2}$. Now

$$\begin{aligned} \prod_{i=1}^{n+1} x_i - \prod_{i=1}^{n+1} (x_i - \varepsilon_i) &= x_{n+1} \cdot \prod_{i=1}^n x_i - (x_{n+1} - \varepsilon_{n+1}) \cdot \prod_{i=1}^n (x_i - \varepsilon_i) \\ &= x_{n+1} \cdot \left(\prod_{i=1}^n x_i - \prod_{i=1}^n (x_i - \varepsilon_i) \right) + \varepsilon_{n+1} \cdot \prod_{i=1}^n (x_i - \varepsilon_i) \\ &\leq x_{n+1} \cdot \left(\prod_{i=1}^n x_i - \prod_{i=1}^n (x_i - \varepsilon_i) \right) + \frac{\varepsilon}{4} \\ &\stackrel{[\text{eq: 21.345}]}{<} \frac{\varepsilon}{2} + \frac{\varepsilon}{4} \\ &< \varepsilon \end{aligned}$$

proving that $n+1 \in S_\varepsilon$. □

Now we can prove that the volume function is a pre-measure.

Theorem 21.199. *Let $n \in \mathbb{N}$ then the function $\text{vol}^n: \mathcal{R}_{||}^n \cup \{\emptyset\} \rightarrow [0, \infty]$ is a finite pre-measure on the semi-ring $\mathcal{R}_{||}^n \cup \{\emptyset\}$.*

Proof. Consider the topological space $\langle \mathbb{R}^n, |||_n \rangle$ based on the canonical topology $|||_n$ [see theorem: 14.95]. Let $A \in \mathcal{R}_{||}^n \cup \{\emptyset\}$ then for A we have either:

$A = \emptyset$. Take then $A_\varepsilon = \emptyset$ and $K_\varepsilon = \emptyset$. Then K_ε is compact by [example: 14.227], $A_\varepsilon \subseteq K_\varepsilon \subseteq A$ and $\text{vol}^n(A) - \text{vol}^n(A_\varepsilon) = 0 - 0 = 0 < \varepsilon$.

$A \neq \emptyset$. Then there exist $a, b \in \mathbb{R}^n$ with $a < b$ such that $A = [a, b[= \prod_{i \in \{1, \dots, n\}} [a_i, b_i[$. As $\forall i \in \{1, \dots, n\}$ $a_i < b_i \Rightarrow b_i - a_i \in \mathbb{R}^+$ we can use [lemma: 21.198] there exists a $\{\varepsilon_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}^+$ such that

$$\forall i \in \{1, \dots, n\} \quad 0 < \varepsilon_i < b_i - a_i \text{ and } \prod_{i=1}^n (b_i - a_i) < \left(\prod_{i=1}^n ((b_i - a_i) - \varepsilon_i) \right) + \varepsilon \quad (21.346)$$

From the above it follows that $\forall i \in \{1, \dots, n\}$ $a_i < b_i - \varepsilon_i$ so that

$$A_\varepsilon = \prod_{i \in \{1, \dots, n\}} [a_i, b_i - \varepsilon_i[\in \mathcal{R}_{||}^n \subseteq \mathcal{R}_{||}^n \cup \{\emptyset\}$$

Further by [theorem: 14.276]

$$K_\varepsilon = \prod_{i \in \{1, \dots, n\}} [a_i, b_i - \varepsilon_i] \text{ is compact}$$

As $\forall i \in \{1, \dots, n\}$ $[a_i, b_i - \varepsilon_i[\subseteq [a_i, b_i - \varepsilon_i] \subseteq [a_i, b_i]$ it follows from [theorem: 2.141] that

$$A_\varepsilon \subseteq K_\varepsilon \subseteq A$$

Further

$$\text{vol}^n(A) - \text{vol}^n(A_\varepsilon) = \prod_{i=1}^n (b_i - a_i) - \prod_{i=1}^n ((b_i - a_i) - \varepsilon_i) \stackrel{[\text{eq: 21.346}]}{<} \varepsilon$$

So in all cases we found a $A_\varepsilon \in \mathcal{R}_{||}^n \cup \{\emptyset\}$ and a compact set K_ε such that $A_\varepsilon \subseteq K_\varepsilon \subseteq A$ and $\text{vol}^n(A) - \text{vol}^n(A_\varepsilon) < \varepsilon$. Finally using [theorem: 21.162] it follows that

$$\text{vol}^n: \mathcal{R}_{||}^n \cup \{\emptyset\} \rightarrow [0, \infty] \text{ is a pre-measure on } \mathcal{R}_{||}^n \cup \{\emptyset\}$$

which is finite by [theorem: 21.197]. $\square$

Next we use a version of the Carathéodry theorem [theorem: 21.141] to extend vol^n to the Lebesgue measure on Lebesgue measurable sets in $\mathbb{R}^n$.

Theorem 21.200. *If we define*

$$(\lambda^n)^*: \mathcal{P}[\mathbb{R}^n] \rightarrow [0, \infty] \text{ by } (\lambda^n)^*(A) = \begin{cases} \infty & \text{if } \mathcal{S}[A] = \emptyset \\ \inf(\{\sum_{i=1}^{\infty} \mu(A_i) \mid \{A_i\}_{i \in \{1, \dots, n\}} \in \mathcal{S}[A]\}) & \end{cases}$$

where

$$\mathcal{S}[A] = \left\{ \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}_{\text{fin}}^n \mid \{ \emptyset \} \mid A \subseteq \bigcup_{i \in \mathbb{N}} A_i \right\}$$

then

$(\lambda^n)^*$ is a outer measure

$$\mathcal{L}[\mathbb{R}^n] = \{A \in \mathcal{P}[\mathbb{R}^n] \mid \forall B \in \mathcal{P}(\mathbb{R}^n) \text{ we have } (\lambda^n)^*(B) = (\lambda^n)^*(B \cap A) + (\lambda^n)^*(B \setminus A)\}$$

is a σ -algebra on $\mathbb{R}^n$ such that

$$\sigma[\mathcal{R}_{\text{fin}}^n \cup \{ \emptyset \}] \subseteq \mathcal{L}[\mathbb{R}^n]$$

and

$$\bar{\lambda}^n = ((\lambda^n)^*)|_{\mathcal{L}[\mathbb{R}^n]}: \mathcal{L}[\mathbb{R}^n] \rightarrow [0, \infty] \text{ is a measure on } \mathcal{L}[\mathbb{R}^n]$$

and

$$\lambda^n = ((\lambda^n)^*)|_{\sigma[\mathcal{R}_{\text{fin}}^n \cup \{ \emptyset \}]}: \sigma[\mathcal{R}_{\text{fin}}^n \cup \{ \emptyset \}] \rightarrow [0, \infty] \text{ is a measure on } \sigma[\mathcal{R}_{\text{fin}}^n \cup \{ \emptyset \}]$$

and

$$((\lambda^n)^*)|_{\mathcal{R}_{\text{fin}}^n \cup \{ \emptyset \}} = \text{vol}^n$$

Further if $\mu: \sigma[\mathcal{R}_{\text{fin}}^n \cup \{ \emptyset \}] \rightarrow [0, \infty]$ is another measure such that $\mu|_{\mathcal{R}_{\text{fin}}^n \cup \{ \emptyset \}} = \text{vol}^n$ then

$$\mu = \lambda^n$$

We have then

$$\langle \mathbb{R}^n, \mathcal{L}[\mathbb{R}^n], \bar{\lambda}^n \rangle \text{ is a measure space called the Lebesgue measure space on } \mathbb{R}^n$$

where

$$\mathcal{L}[\mathbb{R}^n] \text{ is called the set of Lebesgue measurable sets in } \mathbb{R}^n$$

and

$$\bar{\lambda}^n \text{ is called the Lebesgue measure on } \mathbb{R}^n$$

Note 21.201. As by [theorem: 21.189] $\mathcal{B}[\mathbb{R}^n] = \sigma[\mathcal{R}_{\text{fin}}^n \cup \{ \emptyset \}]$ we have also

$$\mathcal{B}[\mathbb{R}^n] \subseteq \mathcal{L}[\mathbb{R}^n]$$

and

$$\lambda^n: \mathcal{B}[\mathbb{R}^n] \rightarrow [0, \infty] \text{ is a measure on } \mathcal{B}[\mathbb{R}^n]$$

so that

$$\langle \mathbb{R}^n, \mathcal{B}[\mathbb{R}^n], \lambda^n \rangle \text{ is a measure space called the Borel measure space on } \mathbb{R}^n$$

and

$$\lambda^n \text{ is called the Borel measure on } \mathbb{R}^n$$

Proof. Using [theorem: 21.199] we have that

$$\text{vol}^n: \mathcal{R}_{\text{fin}}^n \cup \{ \emptyset \} \rightarrow [0, \infty] \text{ is a pre-measure on } \mathbb{R}^n \quad (21.347)$$

Define now $\{G_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}_{||}^n$ by $G_i = \prod_{j \in \{1, \dots, n\}} [-i, i[$. Then as $\forall i \in \mathbb{N} \ [-i, i[\subseteq [-(i+1), i+1[$ it follows from [theorem: 2.141] that $G_i \subseteq G_{i+1}$, hence we have

$$\forall i \in \mathbb{N} \text{ we have } G_i \subseteq G_{i+1} \text{ and as } \text{vol}^n \text{ is finite that } \text{vol}^n(G_i) < \infty \quad (21.348)$$

Let $x \in \mathbb{R}^n$ then $\forall i \in \{1, \dots, n\}$ we have by [theorem: 10.30] that there exists $n_i, m_i \in \mathbb{N}$ such that $-n_i < x_i < m_i$. Take $k = \max(\{n_i | i \in \mathbb{N}\} \cup \{m_i | i \in \mathbb{N}\}) \in \mathbb{N}$ then $\forall i \in \mathbb{N}$ we have $-k < n_i < x_i < m_i < k$ so that $x \in G_k \subseteq \bigcup_{i \in \mathbb{N}} G_i \subseteq \mathbb{R}^n$. Hence we have

$$\mathbb{R}^n = \bigcup_{i \in \mathbb{N}} G_i \quad (21.349)$$

The proof follows then from [eqs: 21.347, 21.348, 21.349] and [theorem: 21.141]. $\square$

21.3.5 Completeness of measures

Definition 21.202. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $B \in \mathcal{P}(X)$ is **μ -negligible** [sometimes also called μ -null] if there exist a $A \in \mathcal{S}$ with $\mu(A) = 0$ such that $B \subseteq A$. The set of all μ -negligible sets is noted as $\mathcal{N}_\mu$ hence

$$\mathcal{N}_\mu = \{A \in \mathcal{P}(X) | \exists B \in \mathcal{A} \text{ with } \mu(B) = 0 \text{ such that } A \subseteq B\}$$

Lemma 21.203. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measurable space, I a countable set [i.e. finite or denumerable] and $\{A_i\}_{i \in I} \subseteq \mathcal{A}$ a countable family of sets such that $\forall i \in I \ \mu(A_i) = 0$ then $\mu(\bigcup_{i \in I} A_i) = 0$

Note 21.204. [theorem: 21.36] ensures that $\bigcup_{i \in I} A_i \in \mathcal{A}$ so that $\mu(\bigcup_{i \in I} A_i)$ is well defined.

Proof. As I is countable we have either:

I is finite. Then there exist a $n \in \mathbb{N}$ and a bijection $\beta: \{1, \dots, n\} \rightarrow I$. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \begin{cases} A_{\beta(i)} & \text{if } i \in \{1, \dots, n\} \\ \emptyset & \text{if } i \in \mathbb{N} \setminus \{1, \dots, n\} \end{cases}$$

then we have

$$\forall i \in \mathbb{N} \text{ that } \mu(B_i) = 0$$

Let $x \in \bigcup_{i \in I} A_i$ then there exist a $i \in I$ such that $x \in A_i$. As β is a bijection there exist a $j \in \{1, \dots, n\}$ such that $i = \beta(j)$ hence $x \in A_{\beta(j)} = B_j \subseteq \bigcup_{j \in \mathbb{N}} B_j$ so that

$$\bigcup_{i \in I} A_i \subseteq \bigcup_{j \in \mathbb{N}} B_j$$

On the other hand if $x \in \bigcup_{j \in \mathbb{N}} B_j$ then $\exists j \in \mathbb{N}$ such that $x \in B_j$. We must have that $j \in \{1, \dots, n\}$ for if $j \in \mathbb{N} \setminus \{1, \dots, n\}$ then $B_j = \emptyset$, hence $x \in B_j = A_{\beta(j)} \subseteq \bigcup_{i \in I} A_i$ which proves that $\bigcup_{j \in \mathbb{N}} B_j \subseteq \bigcup_{i \in I} A_i$. Combining this result with the above gives

$$\bigcup_{i \in I} A_i = \bigcup_{i \in \mathbb{N}} B_i$$

Using the above we have

$$\begin{aligned} \mu\left(\bigcup_{i \in I} A_i\right) &= \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \\ &\stackrel{[\text{theorem: 21.95}]}{\leq} \sum_{i=1}^{\infty} \mu(B_i) \\ &= \sum_{i=1}^{\infty} 0 \\ &= 0 \end{aligned}$$

which proves, as $0 \leq \mu(\bigcup_{i \in I} A_i)$, that

$$\mu\left(\bigcup_{i \in I} A_i\right) = 0$$

I is denumerable. Then there exist a bijection $\beta: \mathbb{N} \rightarrow I$. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = A_{\beta(i)}$$

then

$$\forall i \in \mathbb{N} \text{ we have } \mu(B_i) = 0$$

Let $x \in \bigcup_{i \in I} A_i$ then there exist a $i \in I$ such that $x \in A_i$, as β is a bijection there exist a $j \in \mathbb{N}$ such that $i = \beta(j)$, hence $x \in A_{\beta(j)} = B_j \subseteq \bigcup_{j \in \mathbb{N}} B_j$ so that

$$\bigcup_{i \in I} A_i \subseteq \bigcup_{j \in \mathbb{N}} B_j$$

On the other hand if $x \in \bigcup_{j \in \mathbb{N}} B_j$ then there exist a $j \in \mathbb{N}$ such that $x \in B_j = A_{\beta(j)} \subseteq \bigcup_{i \in I} A_i$ which proves that $\bigcup_{j \in \mathbb{N}} B_j \subseteq \bigcup_{i \in I} A_i$. Combining this with the above proves that

$$\bigcup_{i \in I} A_i = \bigcup_{j \in \mathbb{N}} B_j$$

Using the above we have

$$\begin{aligned} \mu\left(\bigcup_{i \in I} A_i\right) &= \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \\ &\stackrel{[\text{theorem: 21.95}]}{\leq} \sum_{i \in \mathbb{N}} \mu(B_i) \\ &= \sum_{i \in \mathbb{N}} 0 \\ &= 0 \end{aligned}$$

which proves, as $0 \leq \mu(\bigcup_{i \in I} A_i)$, that

$$\mu\left(\bigcup_{i \in I} A_i\right) = 0$$

□

We have the following properties for μ -negligible sets.

Theorem 21.205. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measurable space then we have*

1. $\emptyset \in \mathcal{N}_\mu$
2. If $A \in \mathcal{N}_\mu$ then for every $B \subseteq A$ we have $B \in \mathcal{N}_\mu$
3. If I is countable, $\{A_i\}_{i \in I} \subseteq \mathcal{N}_\mu$ a countable family of μ -negligible sets then we have that
 - a. $\bigcup_{i \in \mathbb{N}} A_i \subseteq \mathcal{N}_\mu$
 - b. If $I \neq \emptyset$ then $\bigcap_{i \in \mathbb{N}} A_i \subseteq \mathcal{N}_\mu$

Proof.

1. This is trivial as $\emptyset \subseteq \emptyset \in \mathcal{A}$ and $\mu(\emptyset) = 0$.
2. Let $A \in \mathcal{N}_\mu$ and $B \subseteq A$. As $A \in \mathcal{N}_\mu$ there exists a $C \in \mathcal{A}$ with $\mu(C) = 0$ such that $A \subseteq C$ which as $B \subseteq A$ proves that $B \subseteq C$ so that $B \in \mathcal{N}_\mu$.
3. Assume that $\{A_i\}_{i \in I} \subseteq \mathcal{N}_\mu$ then there exists a $\{B_i\}_{i \in I} \subseteq \mathcal{A}$ such that $\forall i \in I$ $\mu(B_i) = 0$ and $A_i \subseteq B_i$. Hence $\bigcup_{i \in I} A_i \subseteq \bigcup_{i \in I} B_i$ and using [lemma: 21.203] we have that

$$\mu\left(\bigcup_{i \in I} B_i\right) = 0$$

which proves that

$$\bigcup_{i \in I} A_i \in \mathcal{N}_\mu$$

Finally if $I \neq \emptyset$ then there exist a $k \in I$ so that $\bigcap_{i \in I} A_i \subseteq A_k \in \mathcal{N}_\mu$ it follows from (2) that $\bigcap_{i \in I} A_i \in \mathcal{N}_\mu$. $\square$

Definition 21.206. (Complete Measures) Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then μ is **complete** if $\forall A \in \mathcal{A}$ with $\mu(A) = 0$ we have $\forall B \in \mathcal{P}(X)$ with $B \subseteq A$ that $B \in \mathcal{A}$. Every measure space with a complete measure is called a **complete measure space**.

Theorem 21.207. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then

$$\mu \text{ is complete} \Leftrightarrow \mathcal{N}_\mu \subseteq \mathcal{A}$$

Proof.

$\Rightarrow$. If $A \in \mathcal{N}_\mu$ then there exists a $B \in \mathcal{A}$ with $\mu(B) = 0$ such that $A \subseteq B$. As μ is complete, $B \in \mathcal{A}$, $\mu(B) = 0$ and $A \subseteq B$ it follows that $A \in \mathcal{A}$. Hence $\mathcal{N}_\mu \subseteq \mathcal{A}$

$\Leftarrow$. Let $A \in \mathcal{A}$ with $\mu(A) = 0$ then for $B \in \mathcal{P}(X)$ with $B \subseteq A$ we have by definition of $\mathcal{N}_\mu$ that $B \in \mathcal{N}_\mu$ hence, as $\mathcal{N}_\mu \subseteq \mathcal{A}$, it follows that $B \in \mathcal{A}$ which proves that μ is complete. $\square$

We prove now that every measure space constructed via the Carathéodory is a complete measure space.

Theorem 21.208. Let X be a set and $\mu^*: \mathcal{P}(X) \rightarrow [0, \infty]$ is a **outer measure** then the measure space

$$\langle X, \mathcal{M}[\mu^*], (\mu^*)|_{\mathcal{M}[\mu^*]} \rangle \text{ [see theorem: 21.116]}$$

where

$$\mathcal{M}[\mu^*] \stackrel{\text{[definition: 21.113]}}{=} \{A \in \mathcal{P}(X) | \forall B \in \mathcal{P}(X) \text{ we have } \mu^*(B) = \mu^*(B \cap A) + \mu^*(B \setminus A)\}$$

is a complete measure space.

Proof. If $A \in \mathcal{N}_{(\mu^*)|_{\mathcal{M}[\mu^*]}}$ then there exists a $B \in \mathcal{M}[\mu^*]$ with $\mu^*(B) = (\mu^*)|_{\mathcal{M}[\mu^*]}(B) = 0$ such that $A \subseteq B$. Hence by the definition of a outer measure [see definition: 21.111] we have that $\mu^*(A) \leq \mu^*(B) = 0$ which proves that $\mu^*(A) = 0$. Applying then [theorem: 21.115] proves that $A \in \mathcal{M}[\mu^*]$. Hence $\mathcal{N}_{(\mu^*)|_{\mathcal{M}[\mu^*]}} \subseteq \mathcal{M}[\mu^*]$ which by the previous theorem [theorem: 21.207] proves that $\langle X, \mathcal{M}[\mu^*], (\mu^*)|_{\mathcal{M}[\mu^*]} \rangle$ is a complete measure space. $\square$

Corollary 21.209. We have that

1. $\langle \mathbb{R}, \mathcal{L}[\mathbb{R}], \bar{\lambda} \rangle$ is a complete measure space.
2. Let $n \in \mathbb{N}$ then $\langle \mathbb{R}^n, \mathcal{L}[\mathbb{R}^n], \bar{\lambda}^n \rangle$ is a complete measure space

Proof.

1. This follows from the previous theorem [theorem: 21.177] and the definition of $\langle \mathbb{R}, \mathcal{L}[\mathbb{R}], \bar{\lambda} \rangle$ [see theorem: 21.177].
2. This follows from the previous theorem [theorem: 21.177] and the definition of $\langle \mathbb{R}^n, \mathcal{L}[\mathbb{R}^n], \bar{\lambda}^n \rangle$ [see theorem: 21.200]. $\square$

Sometimes we have to deal with arbitrary subsets of sets with measure zero, it is then desirable to that there exists a extension of measure space to a bigger measure space in which these sets are elements of the bigger σ -algebra. To do this we introduce the concept of the **completion** of a measure space.

Definition 21.210. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then the **completion** of $\mathcal{A}$ noted as $\mathcal{A}_\mu$ is defined by

$$\mathcal{A}_\mu = \{A \in \mathcal{P}(X) | \exists E, F \in \mathcal{A} \text{ such that } E \subseteq A \subseteq F \text{ and } \mu(F \setminus E) = 0\}$$

elements of $\mathcal{A}_\mu$ are called μ -measurable sets.

Note 21.211. As by [theorem: 21.33] a σ -algebra is a algebra if follows from [theorem: 21.28] that $\forall E, F \in \mathcal{A} \mu \setminus F \in \mathcal{A}$ so the above is well defined.

Next we define a set function of $\bar{\mu}: \mathcal{A}_\mu \rightarrow [0, \infty]$, first we need a little lemma needed for the existence of such a function.

Lemma 21.212. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space $A \in \mathcal{P}(X)$ and $E, F \in \mathcal{A}$ such that $E \subseteq A \subseteq F$ and $\mu(F \setminus E) = 0$ then

$$\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\} \neq \emptyset \text{ [so that } \sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\}) \text{ exists]}$$

and

$$\mu(F) = \mu(E) = \sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\})$$

Proof. As $E \in \mathcal{A} \in \mathcal{A}$ and $E \subseteq A$ it follows that $\mu(E) \in \{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\}$ hence

$$\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\} \neq \emptyset \quad (21.350)$$

and

$$\mu(E) \leq \sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\}) \quad (21.351)$$

As $E \subseteq A \subseteq F$ we have $E \subseteq F$ so that by [theorem: 1.35] $F = (F \setminus E) \sqcup E$ hence $\mu(F) = \mu(F \setminus E) + \mu(E) = 0 + \mu(E) = \mu(E)$ proving that

$$\mu(E) = \mu(F) \quad (21.352)$$

If $B \in \mathcal{A}$ with $B \subseteq A$ then $B \subseteq F$ so that by [theorem: 21.106] $\mu(B) \leq \mu(F) = \mu(E)$ hence

$$\sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\}) \leq \mu(E)$$

which combining with [eq: 21.351] proves that

$$\sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\}) \quad \square$$

Theorem 21.213. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then if we define

$$\bar{\mu}: \mathcal{A}_\mu \rightarrow [0, \infty] \text{ by } \bar{\mu}(A) = \sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\})$$

then we have

$$\forall A \in \mathcal{A}_\mu \text{ we have if } E, F \in \mathcal{A} \text{ satisfies } E \subseteq A \subseteq F \text{ and } \mu(F \setminus E) = 0 \text{ then } \mu(E) = \mu(F) = \bar{\mu}(A)$$

and

$$\langle X, \mathcal{A}_\mu, \bar{\mu} \rangle \text{ is a measure space}$$

and

$$\mathcal{A} \subseteq \mathcal{A}_\mu$$

and

$$\mu = (\bar{\mu})|_{\mathcal{A}}$$

In other words the measure space $\langle X, \mathcal{A}_\mu, \bar{\mu} \rangle$ is a extension of the measure space $\langle X, \mathcal{A}, \mu \rangle$. $\langle X, \mathcal{A}_\mu, \bar{\mu} \rangle$ is called the **completion of the measure space** $\langle X, \mathcal{A}, \mu \rangle$

Note 21.214. $\bar{\mu}$ is well defined because if $A \in \mathcal{A}_\mu$ then there exists $E, F \in \mathcal{A}$ with $E \subseteq A \subseteq F$ and $\mu(F \setminus E) = 0$ so that by [lemma: 21.212] $\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\} \neq \emptyset$.

Proof. Let $A \in \mathcal{A}_\mu$ then if $E, F \in \mathcal{A}$ is such that $E \subseteq A \subseteq F$ and $\mu(F \setminus E) = 0$ it follows from [lemma: 21.212] that

$$\mu(E) = \mu(F) = \sup(\{\mu(B) | B \in \mathcal{A} \text{ with } B \subseteq A\}) = \bar{\mu}(A) \quad (21.353)$$

Next we prove that $\mathcal{A}_\mu$ contains $\mathcal{A}$ and is a σ -algebra. Let $A \in \mathcal{A}$ and take $E = \emptyset \in \mathcal{A}$, $F = A \in \mathcal{A}$ then $E = \emptyset \subseteq A \subseteq F$ and $\mu(F \setminus E) = \mu(\emptyset) = 0$ so that $A \in \mathcal{A}_\mu$. Hence we have

$$\mathcal{A} \subseteq \mathcal{A}_\mu \quad (21.354)$$

As $\mathcal{A}$ is a σ -algebra $\emptyset \in \mathcal{A}$ hence using the above it follows that

$$\emptyset \in \mathcal{A}_\mu \quad (21.355)$$

Let $A \in \mathcal{A}_\mu$ then there exists $E, F \in \mathcal{A}$ such that $E \subseteq A \subseteq F$ and $\mu(F \setminus E) = 0$. As $\mathcal{A}$ is a σ -algebra we have that

$$X \setminus E, X \setminus F \in \mathcal{A} \quad (21.356)$$

further applying [theorem: 1.33] gives

$$X \setminus F \subseteq X \setminus A \subseteq X \setminus E \quad (21.357)$$

Next

$$\begin{aligned} x \in (X \setminus E) \setminus (X \setminus F) &\Leftrightarrow x \in X \setminus E \wedge x \notin X \setminus F \\ &\Leftrightarrow (x \in X \wedge x \notin E) \wedge \neg(x \in X \wedge x \notin F) \\ &\Leftrightarrow (x \in X \wedge x \notin E) \wedge (x \notin X \vee x \in F) \\ &\Leftrightarrow (x \in X \wedge x \notin E \wedge x \notin X) \vee (x \in X \wedge x \notin E \wedge x \in F) \\ &\Leftrightarrow x \in X \wedge x \notin E \wedge x \in F \\ &\stackrel{F \subseteq X}{\Leftrightarrow} x \notin E \wedge x \in F \\ &\Leftrightarrow F \setminus E \end{aligned}$$

so that $(X \setminus E) \setminus (X \setminus F) = F \setminus E$ hence

$$\mu((X \setminus E) \setminus (X \setminus F)) = \mu(F \setminus E) = 0 \quad (21.358)$$

From [eqs: 21.356, 21.357 and 21.358] it follows that $X \setminus A \in \mathcal{A}_\mu$ so that

$$\forall A \in \mathcal{A}_\mu \text{ we have } X \setminus A \in \mathcal{A}_\mu \quad (21.359)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_\mu$ then there exists $\{E_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$, $\{F_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ such that $\forall i \in \mathbb{N}$ $E_i \subseteq A_i \subseteq F_i$ and $\mu(F_i \setminus E_i) = 0$. Then we have

$$\bigcup_{i \in \mathbb{N}} E_i \subseteq \bigcup_{i \in \mathbb{N}} A_i \subseteq \bigcup_{i \in \mathbb{N}} F_i \text{ and, as } \mathcal{A} \text{ is a } \sigma\text{-algebra, } \bigcup_{i \in \mathbb{N}} E_i, \bigcup_{i \in \mathbb{N}} F_i \in \mathcal{A} \quad (21.360)$$

If $x \in (\bigcup_{i \in \mathbb{N}} F_i) \setminus (\bigcup_{i \in \mathbb{N}} E_i)$ then $x \in \bigcup_{i \in \mathbb{N}} F_i$ and $x \notin \bigcup_{i \in \mathbb{N}} E_i$, hence there exist a $i \in \mathbb{N}$ such that $x \in F_i$ and $\forall j \in \mathbb{N}$ $x \notin E_j$ in particular $x \notin E_i$, so $x \in F_i \setminus E_i$. So $(\bigcup_{i \in \mathbb{N}} F_i) \setminus (\bigcup_{i \in \mathbb{N}} E_i) \subseteq \bigcup_{i \in \mathbb{N}} (F_i \setminus E_i)$ where as $\mathcal{A}$ is a σ -algebra $F_i \setminus E_i \in \mathcal{A}$, hence

$$\mu\left(\left(\bigcup_{i \in \mathbb{N}} F_i\right) \setminus \left(\bigcup_{i \in \mathbb{N}} E_i\right)\right) \leq \mu\left(\bigcup_{i \in \mathbb{N}} (F_i \setminus E_i)\right) \stackrel{[\text{theorem: 21.95}]}{\leq} \sum_{i=1}^{\infty} \mu(F_i \setminus E_i) = 0 \quad (21.361)$$

From [eq: 21.360] and [eq: 21.361] it follows that $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}_\mu$ hence

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_\mu \text{ we have } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A}_\mu \quad (21.362)$$

From [eqs: 21.355, 21.359 and 21.362] it follows that

$$\mathcal{A}_\mu \text{ is a } \sigma\text{-algebra} \quad (21.363)$$

Now as $\emptyset \in \mathcal{A}$, $\emptyset \subseteq \emptyset \subseteq \emptyset$ and $\mu(\emptyset \setminus \emptyset) = 0$ it follows from [eq: 21.353] that

$$\bar{\mu}(\emptyset) = \mu(\emptyset) = 0 \quad (21.364)$$

If additional $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_\mu$ is pairwise disjoint then $\forall i \in \mathbb{N} \ E_i \subseteq A_i \subseteq F_i$ and $\mu(F_i \setminus E_i) = 0$. Let $i, j \in \mathbb{N}$ with $i \neq j$ then $E_i \cap E_j \subseteq A_i \cap A_j = \emptyset$ which proves that $\{E_i\}_{i \in \mathbb{N}}$ is pairwise disjoint. So

$$\begin{aligned} \bar{\mu}\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &\stackrel{[\text{eq: 21.360, 21.361, 21.353}]}{=} \mu\left(\bigsqcup_{i \in \mathbb{N}} E_i\right) \\ &\stackrel{\mu \text{ is a measure}}{=} \sum_{i=1}^{\infty} \mu(E_i) \\ &\stackrel{[\text{eq: 21.353}]}{=} \sum_{i=1}^{\infty} \bar{\mu}(A_i) \end{aligned}$$

The above together with [eq: 21.364] proves that

$$\bar{\mu} \text{ is a measure so that } \langle X, \mathcal{A}_\mu, \bar{\mu} \rangle \text{ is a measure space} \quad (21.365)$$

Let $A \in \mathcal{A}$ then as $A \subseteq A \subseteq A$ and $\mu(A \setminus A) = \mu(\emptyset) = 0$ we have by [eq: 21.353] that $\bar{\mu}(A) = \mu(A)$, hence

$$(\bar{\mu})|_A = \mu \quad (21.366)$$

Let $A \in \mathcal{N}_{\bar{\mu}}$ then there exist a $B \in \mathcal{A}_\mu$ with $\bar{\mu}(B) = 0$ such that $A \subseteq B$. As $B \in \mathcal{A}_\mu$ there exists $E, F \in \mathcal{A}$ with $E \subseteq B \subseteq F$ and $\mu(F \setminus E) = 0$, hence by [eq: 21.353] $\mu(F) = \bar{\mu}(B) = 0$. Next as $\emptyset \subseteq A \subseteq B \subseteq F$ and $\mu(F \setminus \emptyset) = \mu(F) = 0$ it follows that $A \in \mathcal{A}_\mu$. This proves that $\mathcal{N}_{\bar{\mu}} \subseteq \mathcal{A}_\mu$ so that by [theorem: 21.207]

$$\langle X, \mathcal{A}_\mu, \bar{\mu} \rangle \text{ is complete} \quad \square$$

21.4 Measurable Functions

21.4.1 Measurable function definition

We define now the functions that can be integrated.

Definition 21.215. (Measurable Function) Let $\langle X, \mathcal{A} \rangle, \langle Y, \mathcal{B} \rangle$ be two measurable spaces and $A \in \mathcal{A}$ then a function

$$f: X \rightarrow Y$$

is **$\mathcal{A}, \mathcal{B}$ -measurable** if $\forall B \in \mathcal{B}$ we have that $f^{-1}(B) \in \mathcal{A}$. The set of $\mathcal{A}, \mathcal{B}$ -measurable function graphs is noted as $\mathcal{M}[X, \mathcal{A}, Y, \mathcal{B}]$ hence

$$\mathcal{M}[X, \mathcal{A}, Y, \mathcal{B}] = \{f \in Y^X \mid f: X \rightarrow Y \text{ is } \mathcal{A}, \mathcal{B}\text{-measurable}\}$$

Note 21.216. A set can have many σ -algebras defined on it, so the same function can at the same time be measurable and not measurable, depending on the σ -algebras used.

Example 21.217. Let $\langle X, \mathcal{A} \rangle, \langle Y, \mathcal{B} \rangle$ be measurable spaces then $C_y: X \rightarrow Y$ defined by $C_y(x) = y$ [the constant function] is $\mathcal{A}, \mathcal{B}$ -measurable. In other words $C_y \in \mathcal{M}[X, \mathcal{A}, Y, \mathcal{B}]$.

Proof. Let $B \in \mathcal{B}$ then we have $C_y^{-1}(B) = X \in \mathcal{A}$ which proves that C_y is $\mathcal{A}, \mathcal{B}$ -measurable. $\square$

Theorem 21.218. Let $\langle X, \mathcal{A} \rangle, \langle Y, \mathcal{B} \rangle, \langle Z, \mathcal{C} \rangle$ be measurable spaces, $f: X \rightarrow Y$ a $\mathcal{A}, \mathcal{B}$ -measurable function and $g: Y \rightarrow Z$ a $\mathcal{B}, \mathcal{C}$ -measurable function then

$$g \circ f: X \rightarrow Z$$

is a $\mathcal{A}, \mathcal{C}$ measurable function.

Proof. Take $B \in \mathcal{C}$ then, as g is $\mathcal{B}, \mathcal{C}$ -measurable, $g^{-1}(B) \in \mathcal{B}$. As f is $\mathcal{A}, \mathcal{B}$ -measurable it follows that $f^{-1}(g^{-1}(B)) \in \mathcal{A}$. So, as $(g \circ f)^{-1}(B) \stackrel{[\text{theorem: 2.23}]}{=} f^{-1}(g^{-1}(B))$ it follows that $(g \circ f)^{-1}(B) \in \mathcal{A}$. Hence $g \circ f$ is $\mathcal{A}, \mathcal{C}$ -measurable. $\square$

The following theorem shows that a restriction measurable function is measurable.

Theorem 21.219. Let $\langle X, \mathcal{A} \rangle, \langle Y, \mathcal{B} \rangle$ be measurable spaces, $A \in \mathcal{A}$ and $f: X \rightarrow Y$ a $\mathcal{A}, \mathcal{B}$ -measurable function then $f|_A: A \rightarrow Y$ is $\mathcal{A}|_A, \mathcal{B}$ -measurable. In other words if $f \in \mathcal{M}[X, \mathcal{A}, Y, \mathcal{B}]$ then $f|_A \in \mathcal{M}[A, \mathcal{A}|_A, Y, \mathcal{B}]$.

Proof. Let $B \in \mathcal{B}$ then, as f is $\mathcal{A}, \mathcal{B}$ -measurable, we have that $f^{-1}(B) \in \mathcal{A}$ so that $A \cap f^{-1}(B) \in \{A \cap B | B \in \mathcal{A}\} = \mathcal{A}|_A$. So $(f|_A)^{-1}(B) \stackrel{[\text{theorem: 2.86}]}{=} A \cap f^{-1}(B) \in \mathcal{A}|_A$ which proves that $f|_A$ is $\mathcal{A}|_A, \mathcal{B}$ -measurable. $\square$

Theorem 21.220. Let $\langle X, \mathcal{A} \rangle, \langle Y, \mathcal{B} \rangle$ be measurable spaces, $A, B \in \mathcal{A}$ with $A \subseteq B$ and $f: B \rightarrow Y$ a $\mathcal{A}|_B, \mathcal{B}$ -measurable function then $f|_A: A \rightarrow Y$ is a $\mathcal{A}_A, \mathcal{B}$ -measurable function. In other words if $f \in \mathcal{M}[X, \mathcal{A}|_B, Y, \mathcal{B}]$ then $f|_A \in \mathcal{M}[X, \mathcal{A}|_A, Y, \mathcal{B}]$

Proof. As $f: B \rightarrow Y$ is $\mathcal{A}|_B, \mathcal{B}$ -measurable it follows from [theorem: 21.219] it follows that

$$f|_A: A \rightarrow Y \text{ is } (\mathcal{A}|_B)|_A, \mathcal{B}\text{-measurable} \quad (21.367)$$

Let $C \in (\mathcal{A}|_B)|_A \stackrel{\text{def}}{=} \{C \in \mathcal{A}|_B | C \subseteq A\}$ then $C \subseteq A$ and $C \in \mathcal{A}|_B = \{C \in \mathcal{A} | C \subseteq B\}$ so that $C \in \mathcal{A}$ and $C \subseteq A$ which proves that $C \in \mathcal{A}|_A$. Hence

$$(\mathcal{A}|_B)|_A \subseteq \mathcal{A}|_A \quad (21.368)$$

Let $C \in \mathcal{A}|_A = \{C \in \mathcal{A} | C \subseteq A\}$ then $C \subseteq A$ and $C \in \mathcal{A}$, as $A \subseteq B$ we have $C \subseteq B$ so that $C \in \mathcal{A}|_B$, which as $C \subseteq A$ proves that $C \in (\mathcal{A}|_B)|_A$. $\square$

Next we show the measurability of a extension of a function

Definition 21.221. Let X, Y be sets, $A \subseteq X$, $y \in Y$ and $f: A \rightarrow Y$ a function then we define

$$f_{A \uparrow yX}: X \rightarrow Y \text{ by } f_{A \uparrow yX}(x) = \begin{cases} f(x) & \text{if } x \in A \\ y & \text{if } x \in X \setminus A \end{cases}$$

Note 21.222. Let $x \in X$ then $f_{X \uparrow yX}(x) = f(x)$ so that $f_{X \uparrow yX} = f$

Note 21.223. Let $x \in A$ then $(f_{A \uparrow yX})|_A(x) = f_{A \uparrow yX}(x) \stackrel{x \in A}{=} f(x) \stackrel{x \in A}{=} f|_A(x)$ so that $(f_{A \uparrow yX})|_A = f|_A$

Theorem 21.224. Let $\langle X, \mathcal{A} \rangle, \langle Y, \mathcal{B} \rangle$ be measurable spaces, $A \in \mathcal{A}$ and $f: A \rightarrow Y$ a function then

$$f \text{ is } \mathcal{A}|_A, \mathcal{B}\text{-measurable} \Leftrightarrow f_{A \uparrow yX} \text{ is } \mathcal{A}, \mathcal{B}\text{-measurable}$$

In other words we have

$$f \in \mathcal{M}[A, \mathcal{A}|_A, Y, \mathcal{B}] \Leftrightarrow f_{A \uparrow yX} \in \mathcal{M}[X, \mathcal{A}, Y, \mathcal{B}]$$

Proof.

$\Rightarrow$. Let $B \in \mathcal{B}$ then we have either:

$y \in B$. Then for $t \in (f_{A \uparrow yX})^{-1}(B)$ we have either:

$t \in A$. Then $f(t) = f_{A \uparrow yX}(t) \in B$ so that $t \in f^{-1}(B)$ so that $t \in f^{-1}(B) \cup (X \setminus A)$

$t \in X \setminus A$. Then $t \in f^{-1}(B) \cup (X \setminus A)$

hence we have

$$(f_{A \uparrow yX})^{-1}(B) \subseteq f^{-1}(B) \cup (X \setminus A) \quad (21.369)$$

Let $t \in f^{-1}(B) \cup (X \setminus A)$ then we have either:

$t \in A$. Then as $t \notin X \setminus A$ we have $t \in f^{-1}(B)$ so that $f_{A \upharpoonright Y_X}(t) = f(t) \in B$ which proves that $t \in (f_{A \upharpoonright Y_X})^{-1}(B)$

$t \in X \setminus A$. Then $f_{A \upharpoonright Y_X}(t) = y \in B$ so that $t \in (f_{A \upharpoonright Y_X})^{-1}(B)$

Hence we have $f^{-1}(B) \cup (X \setminus A) \subseteq (f_{A \upharpoonright Y_X})^{-1}(B)$ which combined with [eq: 21.369] proves that

$$(f_{A \upharpoonright Y_X})^{-1}(B) = f^{-1}(B) \cup (X \setminus A)$$

As f is $\mathcal{A}_{|A}, \mathcal{B}$ -measurable $f^{-1}(B) \in \mathcal{A}$ and as $A \in \mathcal{A}$ we have $X \setminus A \in \mathcal{A}$ so that $f^{-1}(B) \cup (X \setminus A) \in \mathcal{A}$ which proves that

$$(f_{A \upharpoonright Y_X})^{-1}(B) \in \mathcal{A}$$

$y \in Y \setminus B$. Let $t \in (f_{A \upharpoonright Y_X})^{-1}(B)$. If $t \in X \setminus A$ then we have $y = f_{A \upharpoonright Y_X}(t) \in B$ contradicting $y \in Y \setminus B$ hence $t \in A$. Further $f(t) = f_{A \upharpoonright Y_X}(t) \in B \Rightarrow t \in f^{-1}(B)$ which proves that

$$(f_{A \upharpoonright Y_X})^{-1}(B) \subseteq A \cap f^{-1}(B) \quad (21.370)$$

Let $t \in A \cap f^{-1}(B)$ then $t \in A$ and $f(t) \in B$ so that $f_{A \upharpoonright Y_X}(t) \stackrel{t \in A}{=} f(t) \in B$ which proves that $t \in (f_{A \upharpoonright Y_X})^{-1}(B)$. Hence $A \cap f^{-1}(B) \subseteq (f_{A \upharpoonright Y_X})^{-1}(B)$ which combined with [eq: 21.370] proves that

$$(f_{A \upharpoonright Y_X})^{-1}(B) = A \cap f^{-1}(B)$$

As f is $\mathcal{A}_{|A}, \mathcal{B}$ -measurable we have that $f^{-1}(B) \in \mathcal{A}$ so that $A \cap f^{-1}(B) \in \mathcal{A}$ which proves that

$$(f_{A \upharpoonright Y_X})^{-1}(B) \in \mathcal{A}$$

Hence $\forall B \in \mathcal{B}$ we have $(f_{A \upharpoonright Y_X})^{-1}(B) \in \mathcal{A}$ which proves that

$$f_{A \upharpoonright Y_X} \text{ is } \mathcal{A}, \mathcal{B}\text{-measurable}$$

$\Leftarrow$. As $f_{A \upharpoonright Y_X}$ is $\mathcal{A}, \mathcal{B}$ -measurable it follows from using [theorem: 21.219] that $f \stackrel{[\text{definition: 21.221}]}{=} (f_{A \upharpoonright Y_X})|_A$ is $\mathcal{A}_{|A}, \mathcal{B}$ -measurable. $\square$

We have the following more specialized cases of measurable functions.

Definition 21.225. Let $\langle X, \mathcal{T}_X \rangle, \langle Y, \mathcal{T}_Y \rangle$ be two topological spaces then a $\mathcal{B}[X, \mathcal{T}_X], \mathcal{B}[Y, \mathcal{T}_Y]$ -measurable $f: X \rightarrow Y$ function is called a **Borel measurable function**.

Example 21.226. A $\mathcal{B}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$ -measurable function $f: X \rightarrow \overline{\mathbb{R}}$ is a Borel measurable function.

Example 21.227. A $\mathcal{B}[\mathbb{R}^n], \mathcal{B}[\overline{\mathbb{R}}]$ -measurable function $f: X \rightarrow \overline{\mathbb{R}}$ is a Borel measurable function.

For integration we are only interested in functions to $\overline{\mathbb{R}}$ so we use some simplified notations for these functions.

Definition 21.228. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then a

$$\mathcal{A}, \mathcal{B}[\overline{\mathbb{R}}]\text{-measurable function } f: X \rightarrow \overline{\mathbb{R}}$$

is called a **$\mathcal{A}$ -measurable function**. Further we define

$$\mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] = \{f \in \overline{\mathbb{R}}^X \mid f: X \rightarrow \overline{\mathbb{R}} \text{ is } \mathcal{A}\text{-measurable}\}$$

$$\mathcal{M}[X, \mathcal{A}, \mathbb{R}] = \{f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \mid f(X) \subseteq \mathbb{R}\} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

For non negative measurable functions we have the following definitions

Definition 21.229. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then we define

$$\mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] = \{f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \mid f(X) \subseteq [0, \infty]\}$$

$$\mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] = \{f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \mid f(X) \subseteq [0, \infty[\subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]\}$$

where $\mathcal{M}[X, \mathcal{A}, \mathbb{R}]$, $\mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ is defined in [definition: 21.228]

Note 21.230. As $[0, \infty[\subseteq \mathbb{R} \subseteq \overline{\mathbb{R}}$ and $[0, \infty[\subseteq [0, \infty] \subseteq \overline{\mathbb{R}}$ we have also

$$\mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

and

$$\mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Theorem 21.231. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then we have:

1. If $f: X \rightarrow \mathbb{R}$ is $\mathcal{A}, \mathcal{B}[\mathbb{R}]$ -measurable then $f: X \rightarrow \overline{\mathbb{R}}$ is $\mathcal{A}, \mathcal{B}[\overline{\mathbb{R}}]$ -measurable [in other words $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$].
2. If $f: X \rightarrow \overline{\mathbb{R}}$ is $\mathcal{A}, \mathcal{B}[\overline{\mathbb{R}}]$ -measurable and $f(X) \subseteq \mathbb{R}$ then $f: X \rightarrow \mathbb{R}$ is $\mathcal{A}, \mathcal{B}[\mathbb{R}]$ -measurable. In other words if $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $f: X \rightarrow \mathbb{R}$ is $\mathcal{A}, \mathcal{B}[\mathbb{R}]$ -measurable.

Proof.

1. Let $B \in \mathcal{B}[\overline{\mathbb{R}}]$ then by [theorem: 21.58] $B \cap \mathbb{R} \in \mathcal{B}[\mathbb{R}]$, hence, as f is $\mathcal{A}, \mathcal{B}[\mathbb{R}]$ -measurable, $f^{-1}(B \cap \mathbb{R}) \in \mathcal{A}$. Further

$$f^{-1}(B \cap \mathbb{R}) \stackrel{[\text{theorem: 2.95}]}{=} f^{-1}(B) \cap f^{-1}(\mathbb{R}) = f^{-1}(B) \cap X = f^{-1}(B)$$

so that $f^{-1}(B) \in \mathcal{A}$, which proves that $f: X \rightarrow \overline{\mathbb{R}}$ is $\mathcal{A}, \mathcal{B}[\overline{\mathbb{R}}]$ -measurable.

2. As $f(X) \subseteq \mathbb{R}$ it follows that $f: X \rightarrow \mathbb{R}$ is a well defined function. Let $B \in \mathcal{B}[\mathbb{R}] \Rightarrow B \subseteq \mathbb{R} \subseteq \overline{\mathbb{R}}$ then, as $B \cap \mathbb{R} = B$, we have by [theorem: 21.58] that $B \in \mathcal{B}[\overline{\mathbb{R}}]$, hence, as $f: X \rightarrow \overline{\mathbb{R}}$ is $\mathcal{A}, \mathcal{B}[\overline{\mathbb{R}}]$ -measurable, $f^{-1}(B) \in \mathcal{A}$ which proves that $f: A \rightarrow \mathbb{R}$ is $\mathcal{A}, \mathcal{B}[\mathbb{R}]$ -measurable. $\square$

Next we define Lebesgue measurable functions.

Definition 21.232. A $\mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$ -measurable function $f: \mathbb{R} \rightarrow \overline{\mathbb{R}}$ is called a Lebesgue measurable function and the set of $\mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$ -measurable function is noted as $\mathcal{L}$. So

$$\mathcal{L} = \{f \in \overline{\mathbb{R}}^{\mathbb{R}} \mid f: \mathbb{R} \rightarrow \overline{\mathbb{R}} \text{ is } \mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]\text{-measurable}\}$$

Definition 21.233. Let $n \in \mathbb{N}$ then a $\mathcal{L}[\mathbb{R}^n], \mathcal{B}[\overline{\mathbb{R}}]$ -measurable function $f: \mathbb{R}^n \rightarrow \overline{\mathbb{R}}$ is called a Lebesgue measurable function and the set of $\mathcal{L}[\mathbb{R}^n], \mathcal{B}[\overline{\mathbb{R}}]$ -measurable function is noted as $\mathcal{L}^n$. So

$$\mathcal{L}^n = \{f \in \overline{\mathbb{R}}^{\mathbb{R}^n} \mid f: \mathbb{R}^n \rightarrow \overline{\mathbb{R}} \text{ is } \mathcal{L}[\mathbb{R}^n], \mathcal{B}[\overline{\mathbb{R}}]\text{-measurable}\}$$

We show now how we can extend a measurable extended real valued function to a measurable function.

Definition 21.234. Let X, Y be sets, $A \subseteq X$ and $f: A \rightarrow Y$ a function then we define

$$f_{A \uparrow X}: X \rightarrow \overline{\mathbb{R}} \text{ by } f_{A \uparrow X} = f_{A \uparrow 0X} \text{ [see definition: 21.221]}$$

so that

$$\forall x \in X \text{ we have } f_{A \uparrow X}(x) = \begin{cases} f(x) & \text{if } x \in A \\ 0 & \text{if } x \in X \setminus A \end{cases}$$

Note 21.235. As $\forall x \in A$ we have $(f_{A \uparrow X})|_A(x) = f_{A \uparrow X}(x) \stackrel{=}{=} f(x)$ it follows that $(f_{A \uparrow X})|_A = f$

Theorem 21.236. Let X, Y be sets, $A \subseteq X$, $B \subseteq A$ and $f: A \rightarrow \overline{\mathbb{R}}$ a function then we have

$$\mathcal{X}_{X,B} \cdot f_{A \upharpoonright X} = (\mathcal{X}_{A,B} \cdot f)_{A \upharpoonright X}$$

Proof. Let $x \in X$ then we have either:

$x \in B$. Then, as $B \subseteq A$ we have that $x \in A$. Hence

$$\begin{aligned} (\mathcal{X}_{X,B} \cdot f_{A \upharpoonright X})(x) &= \mathcal{X}_{X,B}(x) \cdot f_{A \upharpoonright X}(x) \\ &\stackrel{x \in B}{=} f_{A \upharpoonright X}(x) \\ &\stackrel{x \in A}{=} f(x) \\ &\stackrel{x \in B}{=} \mathcal{X}_{A,B}(x) \cdot f(x) \\ &= (\mathcal{X}_{A,B} \cdot f)(x) \\ &\stackrel{x \in A}{=} (\mathcal{X}_{A,B} \cdot f)_{|A \upharpoonright X}(x) \end{aligned}$$

which proves that

$$\mathcal{X}_{X,B} \cdot f_{A \upharpoonright X} = (\mathcal{X}_{A,B} \cdot f)_{|A \upharpoonright X}$$

$x \in X \setminus B$. Then we have either

$x \in A$. Then

$$\begin{aligned} (\mathcal{X}_{A,B} \cdot f)_{A \upharpoonright X}(x) &= (\mathcal{X}_{A,B} \cdot f)(x) \\ &= \mathcal{X}_{A,B}(x) \cdot f(x) \\ &= 0 \\ &\stackrel{x \notin B}{=} \mathcal{X}_{X,B}(x) \cdot f_{A \upharpoonright X}(x) \\ &= (\mathcal{X}_{X,B} \cdot f_{A \upharpoonright X})(x) \end{aligned}$$

so that

$$\mathcal{X}_{X,B} \cdot f_{A \upharpoonright X} = (\mathcal{X}_{A,B} \cdot f)_{|A \upharpoonright X}$$

$x \in X \setminus A$. Then

$$\begin{aligned} (\mathcal{X}_{A,B} \cdot f)_{A \upharpoonright X}(x) &= 0 \\ &\stackrel{x \notin B}{=} \mathcal{X}_{X,B}(x) \cdot f_{A \upharpoonright X}(x) \\ &= (\mathcal{X}_{X,B} \cdot f_{A \upharpoonright X})(x) \end{aligned}$$

so that

$$\mathcal{X}_{X,B} \cdot f_{A \upharpoonright X} = (\mathcal{X}_{A,B} \cdot f)_{|A \upharpoonright X} \quad \square$$

Theorem 21.237. Let X be a set, $A \subseteq X$ and $f: A \rightarrow \overline{\mathbb{R}}$ a function then

$$\mathcal{X}_{X,A} \cdot f_{A \upharpoonright X} = f_{A \upharpoonright X}$$

Proof. Let $x \in X$ then we have either:

$x \in A$. Then $(\mathcal{X}_{X,A} \cdot f_{A \upharpoonright X})(x) = \mathcal{X}_{X,A}(x) \cdot f_{A \upharpoonright X}(x) = 1 \cdot f(x) = f(x) = f_{A \upharpoonright X}(x)$.

$x \in X \setminus A$. Then $(\mathcal{X}_{X,A} \cdot f_{A \upharpoonright X})(x) = \mathcal{X}_{X,A}(x) \cdot f_{A \upharpoonright X}(x) = 0 \cdot 0 = 0 = f_{A \upharpoonright X}(x)$.

proving that in all cases $(\mathcal{X}_{X,A} \cdot f_{A \upharpoonright X})(x) = f_{A \upharpoonright X}(x)$ from which it follows that

$$\mathcal{X}_{X,A} \cdot f_{A \upharpoonright X} = f_{A \upharpoonright X} \quad \square$$

Theorem 21.238. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $A \in \mathcal{A}$ and $f: A \rightarrow \overline{\mathbb{R}}$ a function then we have

$$f_{A \upharpoonright X} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \Leftrightarrow f \in \mathcal{M}[A, \mathcal{A}|_A, \overline{\mathbb{R}}]$$

Proof.

$\Rightarrow$. If $f_{A \uparrow X} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows that $f_{A \uparrow X} \stackrel{\text{def}}{=} f_{A \uparrow X}$ is $\mathcal{A}, \mathcal{B}[\overline{\mathbb{R}}]$ -measurable so that by [theorem: 21.224] f is $\mathcal{A}_{|A}, \mathcal{B}[\overline{\mathbb{R}}]$ -measurable, hence $f \in \mathcal{M}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$.

$\Leftarrow$. If $f \in \mathcal{M}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$ then f is $\mathcal{A}_{|A}, \mathcal{B}[\overline{\mathbb{R}}]$ -measurable so that by [theorem: 21.224] $f_{A \uparrow X} = f_{A \uparrow 0X}$ is $\mathcal{A}, \mathcal{B}[\overline{\mathbb{R}}]$ -measurable, hence $f_{A \uparrow X} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. $\square$

In the case of generated σ -algebras there is a easier way to check if a function is measurable.

Theorem 21.239. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, Y a set, $\mathcal{B} \subseteq \mathcal{P}(Y)$ so that $\langle Y, \sigma[\mathcal{B}] \rangle$ is a measurable space and $f: X \rightarrow Y$ a function then*

$$f \text{ is } \mathcal{A}, \sigma[\mathcal{B}]\text{-measurable} \Leftrightarrow \forall B \in \mathcal{B} \text{ we have } f^{-1}(B) \in \mathcal{A}$$

Proof.

$\Rightarrow$. Let $B \in \mathcal{B}$ then as $\mathcal{B} \subseteq \sigma[\mathcal{B}]$ we have that $B \in \sigma[\mathcal{B}]$. Hence, as f is $\mathcal{A}, \sigma[\mathcal{B}]$ -measurable, it follows that $f^{-1}(B) \in \mathcal{A}$.

$\Leftarrow$. First we prove that $\mathcal{H} = \{B \in \mathcal{P}(Y) | f^{-1}(B) \in \mathcal{A}\}$ is a σ -algebra containing $\mathcal{B}$. Let $B \in \mathcal{B}$ then by the hypothesis $f^{-1}(B) \in \mathcal{A}$ so that $B \in \mathcal{H}$, hence

$$\mathcal{B} \subseteq \mathcal{H} \tag{21.371}$$

As $f^{-1}(Y) = X \in \mathcal{A}$ we have also

$$Y \in \mathcal{H} \tag{21.372}$$

Let $B \in \mathcal{H}$ then $f^{-1}(B) \in \mathcal{A}$ so that $f^{-1}(Y \setminus B) \stackrel{[\text{theorem: 2.94(4)}]}{=} X \setminus f^{-1}(B) \in \mathcal{A}$. From this it follows that $Y \setminus B \in \mathcal{H}$. Hence

$$\forall B \in \mathcal{H} \text{ we have that } Y \setminus B \in \mathcal{H} \tag{21.373}$$

Let $\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{H}$ then $\forall i \in \mathbb{N} \ f^{-1}(B_i) \in \mathcal{A}$. As $f^{-1}(\bigcup_{i \in \mathbb{N}} B_i) \stackrel{[\text{theorem: 2.136}]}{=} \bigcup_{i \in \mathbb{N}} f^{-1}(B_i)$ and $\mathcal{A}$ is a σ -algebra it follows that $f^{-1}(\bigcup_{i \in \mathbb{N}} B_i) \in \mathcal{A}$ so that $\bigcup_{i \in \mathbb{N}} B_i \in \mathcal{H}$. Hence

$$\forall \{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{H} \text{ we have that } \bigcup_{i \in \mathbb{N}} B_i \in \mathcal{H} \tag{21.374}$$

From [eqs: 21.371, 21.372, 21.373 and 21.374] it follows that $\mathcal{H}$ is a σ -algebra containing $\mathcal{B}$ hence, using [theorem: 21.39], it follows that $\sigma[\mathcal{B}] \subseteq \mathcal{H}$. So $\forall B \in \sigma[\mathcal{B}]$ we have $B \in \mathcal{H}$ meaning that $f^{-1}(B) \in \mathcal{A}$ which proves that f is $\mathcal{A}, \sigma[\mathcal{B}]$ -measurable. $\square$

Most books on measure theory give a alternative definition for $\mathcal{A}$ -measurable functions based on the following definitions.

Definition 21.240. *Let X be a set then we define*

1. *If $f: X \rightarrow \overline{\mathbb{R}}, g: X \rightarrow \overline{\mathbb{R}}$ then given $x \in \overline{\mathbb{R}}$ we define*

$$\begin{aligned} \{f < x\} &\stackrel{\text{def}}{=} f^{-1}([-\infty, x[) = \{t \in X | f(t) < x\} \\ \{f \leq x\} &\stackrel{\text{def}}{=} f^{-1}([-\infty, x]) = \{t \in X | f(t) \leq x\} \\ \{f > x\} &\stackrel{\text{def}}{=} f^{-1}(]x, \infty]) = \{t \in X | x < f(t)\} \\ \{f \geq x\} &\stackrel{\text{def}}{=} f^{-1}([x, \infty]) = \{t \in X | x \leq f(t)\} \\ \{f = x\} &\stackrel{\text{def}}{=} f^{-1}(\{x\}) = \{t \in X | x = f(t)\} \\ \{f \leq g\} &\stackrel{\text{def}}{=} \{x \in X | f(x) \leq g(x)\} \\ \{f < g\} &\stackrel{\text{def}}{=} \{x \in X | f(x) < g(x)\} \\ \{f = g\} &\stackrel{\text{def}}{=} \{x \in X | f(x) = g(x)\} \end{aligned}$$

2. If $f: X \rightarrow \mathbb{R}$, $g: X \rightarrow \mathbb{R}$ then given $x \in \mathbb{R}$ we define

$$\begin{aligned} \{f < x\} &\stackrel{\text{def}}{=} f^{-1}([-\infty, x]) = \{t \in X \mid f(t) < x\} \\ \{f \leq x\} &\stackrel{\text{def}}{=} f^{-1}([-\infty, x]) = \{t \in X \mid f(t) \leq x\} \\ \{f > x\} &\stackrel{\text{def}}{=} f^{-1}([x, \infty]) = \{t \in X \mid x < f(t)\} \\ \{f \geq x\} &\stackrel{\text{def}}{=} f^{-1}([x, \infty]) = \{t \in X \mid x \leq f(t)\} \\ \{f = x\} &\stackrel{\text{def}}{=} f^{-1}(\{x\}) = \{t \in X \mid x = f(t)\} \\ \{f \leq g\} &\stackrel{\text{def}}{=} \{x \in X \mid f(x) \leq g(x)\} \\ \{f < g\} &\stackrel{\text{def}}{=} \{x \in X \mid f(x) < g(x)\} \\ \{f = g\} &\stackrel{\text{def}}{=} \{x \in X \mid f(x) = g(x)\} \end{aligned}$$

Lemma 21.241. Let X be a set, $f: X \rightarrow \overline{\mathbb{R}}$ and $x \in \mathbb{R}$ then

1. $\{f \geq x\} = \bigcap_{n \in \mathbb{N}} \{f > x - \frac{1}{n}\}$
2. $X \setminus \{f \geq x\} = \{f < x\}$
3. $\{f \leq x\} = \bigcap_{n \in \mathbb{N}} \{f < x + \frac{1}{n}\}$
4. $X \setminus \{f \leq x\} = \{f > x\}$

Proof.

1. Let $n \in \mathbb{N}$ then if $t \in \{f \geq x\}$ we have that $x \leq f(t) \xRightarrow{x \in \mathbb{R}} x - \frac{1}{n} < f(t) \Rightarrow t \in \{x - \frac{1}{n} < f\}$ proving

$$\{f \geq x\} \subseteq \bigcap_{n \in \mathbb{N}} \left\{ f > x - \frac{1}{n} \right\} \quad (21.375)$$

If $t \in \bigcap_{n \in \mathbb{N}} \{f > x - \frac{1}{n}\}$ then $\forall n \in \mathbb{N}$ we have $x - \frac{1}{n} < f(t)$. Assume that $f(t) < x$ then by [theorem: 10.30] there exists a $n \in \mathbb{N}$ such that $f(t) + \frac{1}{n} < x \xRightarrow{x \in \mathbb{R}} f(t) < x - \frac{1}{n}$ a contradiction, so we must have $x \leq f(t)$ or $t \in \{f \geq x\}$. So $\bigcap_{n \in \mathbb{N}} \{f > x - \frac{1}{n}\} \subseteq \{f \geq x\}$. Combining this with [eq: 21.375] proves

$$\{f \geq x\} = \bigcap_{n \in \mathbb{N}} \left\{ f > x - \frac{1}{n} \right\}$$

2.

$$\begin{aligned} X \setminus \{f \geq x\} &= X \setminus f^{-1}([x, \infty]) \\ &= f^{-1}(\overline{\mathbb{R}}) \setminus f^{-1}([x, \infty]) \\ &\stackrel{[\text{theorem: 2.94}]}{=} f^{-1}(\overline{\mathbb{R}} \setminus [x, \infty]) \\ &= f^{-1}([-\infty, x]) \\ &= \{f < x\} \end{aligned}$$

3. Let $n \in \mathbb{N}$ then if $t \in \{f \leq x\}$ we have that $f(t) \leq x \xRightarrow{x \in \mathbb{R}} f(t) < x + \frac{1}{n}$ or $t \in \{f < x + \frac{1}{n}\}$. So

$$\{f \leq x\} \subseteq \bigcap_{n \in \mathbb{N}} \left\{ f < x + \frac{1}{n} \right\} \quad (21.376)$$

Let $t \in \bigcap_{n \in \mathbb{N}} \{f < x + \frac{1}{n}\}$ then $\forall n \in \mathbb{N}$ we have $f(t) < x + \frac{1}{n}$. Assume that $f(t) > x$ then by [theorem: 10.30] there exists a $n \in \mathbb{N}$ such that $x + \frac{1}{n} < f(t)$ a contradiction hence $f(t) \leq x$ or $t \in \{f \leq x\}$. Combining this with [eq: 21.376] proves that

$$\{f \leq x\} = \bigcap_{n \in \mathbb{N}} \left\{ f < x + \frac{1}{n} \right\}$$

4.

$$\begin{aligned}
X \setminus \{f \leq x\} &= X \setminus f^{-1}([-\infty, x]) \\
&= f^{-1}(\overline{\mathbb{R}}) \setminus f^{-1}([-\infty, x]) \\
&\stackrel{[\text{theorem: 2.94}]}{=} f^{-1}(\overline{\mathbb{R}} \setminus [-\infty, x]) \\
&= f^{-1}(]x, \infty]) \\
&= \{x < f\}
\end{aligned}$$

□

We are now ready to state the following equivalences for $\mathcal{A}$ -measurability [which is used in many books about measure theory].

Theorem 21.242. *Let $\langle X, \mathcal{A} \rangle$ be a measurable set and $f: X \rightarrow \overline{\mathbb{R}}$ a function then we have the following equivalences:*

1. f is $\mathcal{A}$ -measurable [or equivalently $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$]
2. $\forall x \in \mathbb{R}$ we have $\{f > x\} \in \mathcal{A}$
3. $\forall x \in \mathbb{R}$ we have $\{f \geq x\} \in \mathcal{A}$
4. $\forall x \in \mathbb{R}$ we have $\{f < x\} \in \mathcal{A}$
5. $\forall x \in \mathbb{R}$ we have $\{f \leq x\} \in \mathcal{A}$

Proof.

$1 \Rightarrow 2$. Take $x \in \mathbb{R}$ then $]x, \infty] \in \sigma[\{]a, \infty[\mid a \in \mathbb{R}\}] \stackrel{[\text{theorem: 21.58}]}{=} \mathcal{B}[\overline{\mathbb{R}}]$ and we have, as f is $\mathcal{A}$ -measurable, that $\{f > x\} = f^{-1}(]x, \infty]) \in \mathcal{A}$

$2 \Rightarrow 1$. Let $B \in \{]a, \infty[\mid a \in \mathbb{R}\}$ then $B =]x, \infty]$ where $x \in \mathbb{R}$. hence

$$f^{-1}(B) = f^{-1}(]x, \infty]) = \{f > x\} \in \mathcal{A}.$$

So using [theorem: 21.239] together with $\sigma[\{]a, \infty[\mid a \in \mathbb{R}\}] \stackrel{[\text{theorem: 21.58}]}{=} \mathcal{B}[\overline{\mathbb{R}}]$ it follows that f is $\mathcal{A}, \mathcal{B}[\overline{\mathbb{R}}]$ -measurable or in other words $\mathcal{A}$ -measurable.

$2 \Rightarrow 3$. Let $x \in \mathbb{R}$ then using (2) we have $\forall n \in \mathbb{N}$ that $\{f > x - \frac{1}{n}\} \in \mathcal{A}$, hence by [theorem: 21.33] it follows that $\bigcap_{n \in \mathbb{N}} \{f > x - \frac{1}{n}\} \in \mathcal{A}$. Using [lemma: 21.241] $\{f \geq x\} = \bigcap_{n \in \mathbb{N}} \{f > x - \frac{1}{n}\}$ proving that $\{f \geq x\} \in \mathcal{A}$.

$3 \Rightarrow 4$. Let $x \in \mathbb{R}$ then $\{f < x\} \stackrel{[\text{lemma: 21.241}]}{=} X \setminus \{f \geq x\} \in \mathcal{A}$ [as $\{f \geq x\} \in \mathcal{A}$].

$4 \Rightarrow 5$. Let $x \in \mathbb{R}$ then by (4) we have that $\forall n \in \mathbb{N}$ that $\{f < x + \frac{1}{n}\} \in \mathcal{A}$, hence by [theorem: 21.33] it follows that $\bigcap_{n \in \mathbb{N}} \{f < x + \frac{1}{n}\} \in \mathcal{A}$. Using [lemma: 21.241] $\{f \leq x\} = \bigcap_{n \in \mathbb{N}_0} \{f < x + \frac{1}{n}\}$ proving that $\{f \leq x\} \in \mathcal{A}$.

$5 \Rightarrow 2$. Let $x \in \mathbb{R}$ then $\{f > x\} \stackrel{[\text{lemma: 21.241}]}{=} X \setminus \{f \leq x\} \in \mathcal{A}$. □

21.4.2 Measurable function properties

Theorem 21.243. *Let $\langle X, \mathcal{T}_X \rangle, \langle Y, \mathcal{T}_Y \rangle$ be topological spaces and $f: X \rightarrow Y$ a continuous function then f is $\mathcal{B}[X, \mathcal{T}_X], \mathcal{B}[Y, \mathcal{T}_Y]$ -measurable. In other words continuous functions are Borel measurable.*

Proof. If $U \in \mathcal{T}_Y$ then as f is continuous we have $f^{-1}(U) \in \mathcal{T}_X \subseteq \mathcal{B}[X, \mathcal{T}_X]$ so that by [theorem: 21.239] we have that f is $\mathcal{B}[X, \mathcal{T}_X], \mathcal{B}[Y, \mathcal{T}_Y]$ -measurable. □

Note that although the composition of measurable functions is measurable this is not the case for Lebesgue measurable functions. For example if $f: \mathbb{R} \rightarrow \overline{\mathbb{R}}$ and $g: \mathbb{R} \rightarrow \overline{\mathbb{R}}$ are Lebesgue measurable functions such that $f(\mathbb{R}) \subseteq \mathbb{R}$ then by [theorem: 21.231] $f: \mathbb{R} \rightarrow \mathbb{R}$ is $\mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$ -measurable and g is $\mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$ -measurable but not $\mathcal{B}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$ -measurable, so we can not apply the composition theorem. If however g is $\mathcal{B}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$ -measurable then $g \circ f$ is by the previous theorem $\mathcal{L}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$ -measurable hence Lebesgue measurable.

Theorem 21.244. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and let $f: X \rightarrow \overline{\mathbb{R}}$ and $g: X \rightarrow \overline{\mathbb{R}}$ be $\mathcal{A}$ -measurable functions then we have:

1. $\{f < g\} \in \mathcal{A}$
2. $\{f \leq g\} \in \mathcal{A}$
3. $\{f = g\} \in \mathcal{A}$
4. $\{f \neq g\} \in \mathcal{A}$
5. If $x \in \overline{\mathbb{R}}$ then $\{f = x\} \in \mathcal{A}$

Proof.

1. Let $t \in \{f < g\}$ then $f(t) < g(t)$. Using the density of the rational numbers in the extended real numbers [see theorem: 20.12] there exist a $q \in \mathbb{Q}$ such that $f(t) < q < g(t)$, so that $t \in \{f < q\}$ and $t \in \{g > q\}$, proving $t \in \{f < q\} \cap \{g > q\}$. Hence we have

$$\{f < g\} \subseteq \bigcup_{q \in \mathbb{Q}} (\{f < q\} \cap \{g > q\}) \quad (21.377)$$

If $t \in \bigcup_{q \in \mathbb{Q}} (\{f < q\} \cap \{g > q\})$ then there exist a $q \in \mathbb{Q}$ such that $t \in \{f < q\} \cap \{g > q\}$, hence $f(t) < q < g(t) \Rightarrow f(t) < g(t)$ proving that $t \in \{f < g\}$. Hence $\bigcup_{q \in \mathbb{Q}} (\{f < q\} \cap \{g > q\}) \subseteq \{f < g\}$ which combined with [eq: 21.377] proves that

$$\{f < g\} = \bigcup_{q \in \mathbb{Q}} (\{f < q\} \cap \{g > q\})$$

Using [theorem: 21.242] we have that $\forall q \in \mathbb{Q} \{f < q\}, \{g > q\} \in \mathcal{A} \Rightarrow \{f < q\} \cap \{g > q\} \in \mathcal{A}$. As $\mathbb{Q}$ is denumerable [see theorem: 10.5] it follows from [theorem: 21.36] that $\bigcup_{q \in \mathbb{Q}} (\{f < q\} \cap \{g > q\}) \in \mathcal{A}$ so that

$$\{f < g\} \in \mathcal{A}$$

2. We have

$$\begin{aligned} t \in (X \setminus \{g < f\}) &\Leftrightarrow t \in X \wedge \neg(g(t) < f(t)) \\ &\Leftrightarrow t \in X \wedge f(t) \leq g(t) \\ &\Leftrightarrow t \in \{f \leq g\} \end{aligned}$$

proving that $X \setminus \{g < f\} = \{f \leq g\}$. Using (1) we have $\{g < f\} \in \mathcal{A}$ hence $X \setminus \{g < f\} \in \mathcal{A}$ which proves that

$$\{f \leq g\} \in \mathcal{A}$$

3. We have

$$\begin{aligned} t \in (\{f \leq g\} \setminus \{f < g\}) &\Leftrightarrow t \in \{f \leq g\} \wedge t \notin \{f < g\} \\ &\Leftrightarrow t \in X \wedge f(t) \leq g(t) \wedge \neg(f(t) < g(t)) \\ &\Leftrightarrow t \in X \wedge f(t) \leq g(t) \wedge g(t) \leq f(t) \\ &\Leftrightarrow t \in X \wedge f(t) = g(t) \\ &\Leftrightarrow t \in \{f = g\} \end{aligned}$$

proving that $\{f = g\} = \{f \leq g\} \setminus \{f < g\} \in \mathcal{A}$ [using (1), (2) and [theorems: 21.29, 21.33]]

4. We have

$$\begin{aligned} t \in X \setminus \{f = g\} &\Leftrightarrow t \in X \wedge \neg(f(t) = g(t)) \\ &\Leftrightarrow t \in X \wedge f(t) \neq g(t) \\ &\Leftrightarrow t \in \{f \neq g\} \end{aligned}$$

proving that $\{f \neq g\} = X \setminus \{f = g\} \in \mathcal{A}$ [using (3)]

5. Let $x \in \overline{\mathbb{R}}$ then as $\{x\}$ is closed [see theorem: 20.51], we have by 21.44 that $\{x\} \in \mathcal{B}[\overline{\mathbb{R}}]$ which as f is $\mathcal{A}$ -measurable proves that $\{f = x\} = f^{-1}(\{x\}) \in \mathcal{A}$. $\square$

If the sum of two measurable functions is well defined then the sum is also measurable.

Theorem 21.245. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $f, g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ such that $\forall x \in X$ $(f(x), g(x)) \in (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ so that

$$f + g: X \rightarrow \overline{\mathbb{R}} \text{ defined by } (f + g)(x) = f(x) + g(x)$$

is well defined then

$$f + g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Note 21.246. If $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $\forall x \in X$

$$(f(x), g(x)) \in \mathbb{R} \times \mathbb{R} \subseteq (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty, \infty), (\infty, -\infty)\} \wedge (f + g)(x) \in \mathbb{R}$$

so that in this case we have

$$f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

Note 21.247. If $f, g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $\forall x \in X$

$$(f(x), g(x)) \in [0, \infty] \times [0, \infty] \subseteq (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty, \infty), (\infty, -\infty)\} \wedge (f + g)(x) \in [0, \infty]$$

so that in this case we have

$$f + g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Proof. As $\forall t \in X$ we have $(f(t), g(t)) \in (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ it follows that $f + g$ is well defined. Let $x \in \mathbb{R}$. If $t \in \{f + g < x\}$ we have $f(t) + g(t) < x$ so that by [theorem: 20.31] $f(t) < x - g(t)$. Using the density of $\mathbb{Q}$ in $\overline{\mathbb{R}}$ [see theorem: 20.12] there exists a $q \in \mathbb{Q}$ such that $f(t) < q < x - g(t)$, hence $f(t) < q \wedge q < x - g(t) \xRightarrow{[\text{theorem: 20.32}]} f(t) < q \wedge g(t) < x - q$ which proves

$$f(t) \in \{f < q\} \cap \{g < x - q\} \subseteq \bigcup_{q \in \mathbb{Q}} (\{f < q\} \cap \{g < x - q\})$$

which proves that

$$\{f + g < x\} \subseteq \bigcup_{q \in \mathbb{Q}} (\{f < q\} \cap \{g < x - q\}) \quad (21.378)$$

For the opposite inclusion. Let $t \in \bigcup_{q \in \mathbb{Q}} (\{f < q\} \cap \{g < x - q\})$ then there exist a $q \in \mathbb{Q}$ such that $t \in \{f < q\} \cap \{g < x - q\}$ from which it follows that $f(t) < q \wedge g(t) < x - q$. As $(f(t), g(t)) \in (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ and $f(t) < q < \infty \wedge g(t) < x - q < \infty$ we have the following possible cases for $f(t), g(t)$:

$f(t) = -\infty \wedge g(t) = -\infty$. Then $f(t) + g(t) = -\infty < x$.

$f(t) \in \mathbb{R} \wedge g(t) = -\infty$. Then $f(t) + g(t) = -\infty < x$.

$f(t) = -\infty \wedge g(t) \in \mathbb{R}$. Then $f(t) + g(t) = -\infty < x$.

$f(t) \in \mathbb{R} \wedge g(t) \in \mathbb{R}$. Then as $f(t) < q \wedge g(t) < x - q$ we have $f(t) + g(t) < q + (x - q) = x$

So in all cases we have $f(t) + g(t) < x$ from which it follows that $t \in \{f + g < x\}$. Hence we have $\bigcup_{q \in \mathbb{Q}} (\{f < q\} \cap \{g < x - q\}) \subseteq \{f + g < x\}$. Combining this [eq: 21.378] results in

$$\{f + g < x\} = \bigcup_{q \in \mathbb{Q}} (\{f < q\} \cap \{g < x - q\})$$

Let $q \in \mathbb{Q}$ then as f, g are $\mathcal{A}$ -measurable we have by [theorem: 21.242] that $\{f < q\}, \{g < x - q\} \in \mathcal{A}$ from which we conclude that $\{f < q\} \cap \{g < x - q\} \in \mathcal{A}$. Using [theorem: 21.36] and the fact that $\mathbb{Q}$ is countable [see theorem: 10.5] it follows that $\bigcup_{q \in \mathbb{Q}} (\{f < q\} \cap \{g < x - q\}) \in \mathcal{A}$ hence we have

$$\{f + g < x\} \in \mathcal{A}$$

As $x \in \mathbb{R}$ was chosen arbitrary it follows from the above and [theorem: 21.242] that $f + g$ is $\mathcal{A}$ -measurable. $\square$

Next we extend the above two theorems to finite sums of $\mathcal{A}$ -measurable functions.

Theorem 21.248. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $n \in \mathbb{N}$ and $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ such $\forall x \in X$ we have either $\forall i \in \{1, \dots, n\} f_i(x) \in \mathbb{R} \cup \{\infty, -\infty\}$ or $\forall i \in \{1, \dots, n\} f_i(x) \in \mathbb{R} \cup \{-\infty\}$ so that function

$$\sum_{i=1}^n f_i: X \rightarrow \overline{\mathbb{R}} \text{ is defined by } \left(\sum_{i=1}^n f_i \right)(x) = \sum_{i=1}^n f_i(x)$$

is well defined then

$$\sum_{i=1}^n f_i \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Proof. We use induction to prove this, so define

$$S = \left\{ n \in \mathbb{N} \mid \text{If } \{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ then } \sum_{i=1}^n f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \right\}$$

then we have:

$1 \in S$. If $\{f_i\}_{i \in \{1\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $\forall x \in X$ $(\sum_{i=1}^1 f_i)(x) = \sum_{i=1}^1 f_i(x) = f_1(x)$ which proves that $\sum_{i=1}^1 f = f_1 \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, hence $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $\forall x \in X$ we have

$$\left(\sum_{i=1}^{n+1} f_i \right)(x) = \sum_{i=1}^{n+1} f_i(x) = f_{n+1}(x) + \sum_{i=1}^n f_i(x) = \left(f_{n+1} + \sum_{i=1}^n f_i \right)(x)$$

so that

$$\sum_{i=1}^{n+1} f_i = f_{n+1} + \sum_{i=1}^n f_i \quad (21.379)$$

As $n \in S$ we have $\sum_{i=1}^n f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ which, as $f_{n+1} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, proves, using [theorem: 21.245], that

$$f_{n+1} + \sum_{i=1}^n f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Combining this with [eq: 21.379] proves that $\sum_{i=1}^{n+1} f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ so that $n+1 \in S$. $\square$

Having covered the case of sums of measurable functions we consider now the multiplication of a function by a scalar.

Theorem 21.249. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $\alpha \in \mathbb{R}$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ where $\alpha \cdot f$ is defined pointwise by $\alpha \cdot f: X \rightarrow \overline{\mathbb{R}}$ by $(\alpha \cdot f)(x) = \alpha \cdot f(x)$.

Note 21.250. If additional $f(X) \subseteq \mathbb{R}$ then $\forall x \in X$ we have $(\alpha \cdot f)(x) = \alpha \cdot f(x) \in \mathbb{R}$ so that $(\alpha \cdot f)(X) \subseteq \mathbb{R}$, hence $\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$. In other words if $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$.

Proof. For $\alpha \in \mathbb{R}$ we have 3 cases to consider.

$\alpha = 0$. Then $\forall x \in X$ $(\alpha \cdot f)(x) = 0 \cdot f(x) = 0$ so that $\alpha \cdot f = C_0$, hence using [theorem: 21.217] it follows that $\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

$0 < \alpha$. Let $x \in \mathbb{R}$ then

$$\begin{aligned} t \in \{\alpha \cdot f < x\} &\Leftrightarrow \alpha \cdot f(t) < x \\ &\Leftrightarrow f(t) < \frac{x}{\alpha} \\ &\Leftrightarrow t \in \left\{ f < \frac{x}{\alpha} \right\} \end{aligned}$$

proving that $\{\alpha \cdot f < x\} = \{f < \frac{x}{\alpha}\} \in \mathcal{A}$ [using theorem: 21.242]]. Using [theorem: 21.242] again we have then that $\alpha \cdot f$ is $\mathcal{A}$ -measurable.

$\alpha < 0$. Let $x \in \mathbb{R}$ then

$$\begin{aligned} t \in \{\alpha \cdot f < x\} &\Leftrightarrow \alpha \cdot f(t) < x \\ &\Leftrightarrow f(t) > \frac{x}{\alpha} \\ &\Leftrightarrow t \in \left\{f > \frac{x}{\alpha}\right\} \end{aligned}$$

proving that $\{\alpha \cdot f < x\} = \{f > \frac{x}{\alpha}\} \in \mathcal{A}$ [using [theorem: 21.242]]. Using [theorem: 21.242] again we have then that $\alpha \cdot f$ is $\mathcal{A}$ -measurable.

so in all cases we have that $\alpha \cdot f$ is $\mathcal{A}$ -measurable, hence

$$f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

□

Theorem 21.251. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space then we have*

1. *If $f, g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ is such that $\forall x \in X$ we have*

$$(f(x), -g(x)) \in (\overline{\mathbb{R}} \otimes \overline{\mathbb{R}}) \setminus \{(-\infty, \infty), (\infty, -\infty)\}$$

so that the following function is well defined

$$f - g: A \rightarrow \overline{\mathbb{R}} \text{ is defined by } (f - g)(x) = (f + (-1) \cdot g)(x)$$

then

$$f - g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

2. *If $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then*

$$f^2: A \rightarrow \overline{\mathbb{R}} \text{ defined by } f^2(x) = (f(x))^2$$

is $\mathcal{A}$ -measurable. In other words $f^2 \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$.

3. *If $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $f \cdot g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ where*

$$f \cdot g: X \rightarrow \overline{\mathbb{R}} \text{ defined by } (f \cdot g)(x) = f(x) \cdot g(x)$$

4. *If $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then we have that*

$$D = \{x \in X \mid g(x) \neq 0\} \in \mathcal{A}$$

and for

$$\frac{f}{g}: D \rightarrow \overline{\mathbb{R}} \text{ defined by } \frac{f}{g}(x) = \frac{f(x)}{g(x)}$$

we have that $\frac{f}{g} \in \mathcal{M}[D, \mathcal{A}|_D, \mathbb{R}]$.

Proof.

1. As $g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have by [theorem: 21.249] that $(-1) \cdot g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. Hence using [theorem: 21.245] it follows that
As $\forall x \in X$

$$(f + (-1) \cdot g)(x) = f(x) + ((-1) \cdot g)(x) = f(x) + (-1) \cdot g(x) = f(x) - g(x) = (f - g)(x)$$

we have that $f + (-1) \cdot g = f - g$. Using [theorem: 21.249]

$$(-1) \cdot g \in f \cdot g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \xrightarrow{(-1) \cdot g(X) \in \mathbb{R}} \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Hence, using [theorem: 21.245] $f - g = f + (-1) \cdot g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

2. Let $x \in \mathbb{R}$ then we have either:

$x \leq 0$. If $t \in \{f^2 < x\}$ we have $0 < (f(t))^2 = f^2(t) < x \leq 0$ leading to the contradiction $0 < 0$. Hence $\{f^2 < x\} = \emptyset \in \mathcal{A}$.

$0 < x$. Then

$$\begin{aligned} t \in \{f^2 < x\} &\Leftrightarrow f^2(t) < x \\ &\stackrel{[\text{theorem: 10.72}]}{\Leftrightarrow} -\sqrt{x} < f(t) < \sqrt{x} \\ &\Leftrightarrow t \in \{f > -\sqrt{x}\} \cap t \in \{f < \sqrt{x}\} \\ &\Leftrightarrow t \in \{f > -\sqrt{x}\} \cap \{f < \sqrt{x}\} \end{aligned}$$

proving that $\{f^2 < x\} = \{f > -\sqrt{x}\} \cap \{f < \sqrt{x}\}$. As $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ it follows from [theorem: 21.242] that $\{f > -\sqrt{x}\}, \{f < \sqrt{x}\} \in \mathcal{A} \Rightarrow \{f > -\sqrt{x}\} \cap \{f < \sqrt{x}\} \in \mathcal{A}$, hence $\{f^2 < x\} \in \mathcal{A}$.

As in all cases $\{f^2 < x\} \in \mathcal{A}$ we have by [theorem: 21.242] that f^2 is $\mathcal{A}$ -measurable.

3. As $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ we have by [theorem: 21.245] that $f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$. Applying (2) it follows that $f^2, g^2, (f + g)^2 \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$. Using (1) twice we have that $((f + g)^2 - f^2) - g^2 \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ so that by [theorem: 21.249]

$$\frac{1}{2} \cdot (((f + g)^2 - f^2) - g^2) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \quad (21.380)$$

Finally if $x \in X$ then

$$\begin{aligned} \left(\frac{1}{2} \cdot ((f + g)^2 - f^2 - g^2)\right)(x) &= \frac{1}{2} \cdot (((f(x) + g(x))^2 - f^2(x)) - g^2(x)) \\ &= \frac{1}{2} \cdot (f^2(x) + g^2(x) + 2 \cdot f(x) \cdot g(x) - f^2(x) - g^2(x)) \\ &= f(x) \cdot g(x) \\ &= (f \cdot g)(x) \end{aligned}$$

which proves that $f \cdot g = \frac{1}{2} \cdot (((f + g)^2 - f^2) - g^2)$ and by [eq: 21.380] that

$$f \cdot g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

4. Let $D = \{x \in X \mid g(x) \neq 0\}$ then

$$\begin{aligned} t \in D &\Leftrightarrow t \in \{x \in X \mid g(x) \neq 0\} \\ &\Leftrightarrow t \in X \wedge (g(t) < 0 \vee 0 < g(t)) \\ &\Leftrightarrow (t \in X \wedge g(t) < 0) \vee (t \in X \wedge 0 < g(t)) \\ &\Leftrightarrow t \in \{g < 0\} \vee t \in \{g > 0\} \\ &\Leftrightarrow t \in \{g < 0\} \cup \{g > 0\} \end{aligned}$$

so that $D = \{g < 0\} \cup \{g > 0\}$. As g is $\mathcal{A}$ -measurable we have by [theorem: 21.242] that $\{g < 0\}, \{g > 0\} \in \mathcal{A}$ proving that

$$D = \{x \in X \mid g(x) \neq 0\} = \{g < 0\} \cup \{g > 0\} \in \mathcal{A} \quad (21.381)$$

Let $x \in \mathbb{R}$.

$$t \in (\{t \in X \mid g(t) > 0\} \cap \{t \in X \mid f(t) < x \cdot g(t)\}) \cup (\{t \in X \mid g(t) < 0\} \cap \{t \in X \mid f(t) > x \cdot g(t)\})$$

then we have either:

$\{t \in X \mid g(t) > 0\} \cap \{t \in X \mid f(t) < x \cdot g(t)\}$. Then $x \in X \wedge g(t) > 0 \wedge f(t) < x \cdot g(t)$, so that $t \in X \wedge \frac{f(t)}{g(t)} < x$, proving as $g(t) \neq 0$, that $t \in \left\{t \in D \mid \frac{f(t)}{g(t)} < x\right\}$.

$\{t \in X \mid g(t) < 0\} \cap \{t \in X \mid f(t) > x \cdot g(t)\}$. then $t \in X \wedge g(t) < 0 \wedge f(t) > x \cdot g(t)$ so that $t \in X \wedge \frac{f(t)}{g(t)} < x$ proving as $g(t) \neq 0$, that $t \in \left\{t \in D \mid \frac{f(t)}{g(t)} < x\right\}$.

So we have

$$\begin{aligned} &(\{t \in X \mid g(t) > 0\} \cap \{t \in X \mid f(t) < x \cdot g(t)\}) \cup (\{t \in X \mid g(t) < 0\} \cap \{t \in X \mid f(t) > x \cdot g(t)\}) \subseteq \\ &\left\{t \in D \mid \frac{f(t)}{g(t)} < x\right\} \end{aligned} \quad (21.382)$$

For the opposite inclusion, let $t \in \left\{t \in D \mid \frac{f(t)}{g(t)} < x\right\}$ then $g(t) \neq 0$ and $\frac{f(t)}{g(t)} < x$ so we must consider the following cases for $g(t) \neq 0$:

$g(t) > 0$. then $f(t) < x \cdot g(t)$ or $t \in \{t \in X \mid g(t) > 0\} \cap \{t \in X \mid f(t) < x \cdot g(t)\}$

$g(t) < 0$. then $f(t) > x \cdot g(t)$ or $t \in \{t \in X \mid g(t) < 0\} \cap \{t \in X \mid f(t) > x \cdot g(t)\}$

proving that

$$\begin{aligned} \left\{t \in D \mid \frac{f(t)}{g(t)} < x\right\} &\subseteq (\{t \in X \mid g(t) > 0\} \cap \{t \in X \mid f(t) < x \cdot g(t)\}) \cup \\ &(\{t \in X \mid g(t) < 0\} \cap \{t \in X \mid f(t) > x \cdot g(t)\}) \end{aligned}$$

So combining this with 21.382 proves that

$$\begin{aligned} &(\{t \in X \mid g(t) > 0\} \cap \{t \in X \mid f(t) < x \cdot g(t)\}) \cup (\{t \in X \mid g(t) < 0\} \cap \{t \in X \mid f(t) > x \cdot g(t)\}) = \\ &\left\{t \in D \mid \frac{f(t)}{g(t)} < x\right\} \end{aligned} \quad (21.383)$$

Now as g is $\mathcal{A}$ -measurable it follows from 21.242] that $\{g > 0\} = \{t \in X \mid g(t) > 0\} \in \mathcal{A}$ and

$$\{g < 0\} = \{t \in X \mid g(t) < 0\} \in \mathcal{A}.$$

As f, g are $\mathcal{A}$ -measurable and $x \cdot g$ is $\mathcal{A}$ -measurable [using theorem: 21.249] it follows from 21.244] that

$$\{f > x \cdot g\} = \{t \in X \mid f(t) > x \cdot g(t)\} \in \mathcal{A}$$

$$\{f < x \cdot g\} = \{t \in X \mid f(t) < x \cdot g(t)\} \in \mathcal{A}$$

Using the above in [eq: 21.383] proves then that $\left\{t \in D \mid \frac{f(t)}{g(t)} < x\right\} \in \mathcal{A}$ and as $\left\{t \in D \mid \frac{f(t)}{g(t)} < x\right\} \subseteq D$ it follows that $\left\{t \in D \mid \frac{f(t)}{g(t)} < x\right\} \in \mathcal{A}_{|D}$. Finally using [theorem: 21.242] we get finally that

$$\frac{f}{g} \in \mathcal{M}[D, \mathcal{A}_{|D}, \overline{\mathbb{R}}] \quad \square$$

Theorem 21.252. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $f, g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then

1. $f \vee g: X \rightarrow [0, \infty]$ defined by $(f \vee g)(x) = \max(f(x), g(x))$ is a $\mathcal{A}$ -measurable function. In other words $f \vee g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.
2. $f \wedge g: X \rightarrow [0, \infty]$ defined by $(f \wedge g)(x) = \min(f(x), g(x))$ is a $\mathcal{A}$ -measurable function. In other words $f \wedge g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

Proof.

1. Let $x \in \mathbb{R}$ then

$$\begin{aligned} t \in \{(f \vee g) < x\} &\Leftrightarrow (f \vee g)(t) < x \\ &\Leftrightarrow \max(f(t), g(t)) < x \\ &\Leftrightarrow f(t) < x \wedge g(t) < x \\ &\Leftrightarrow t \in \{f < x\} \wedge t \in \{g < x\} \\ &\Leftrightarrow t \in \{f < x\} \cap \{g < x\} \end{aligned}$$

which proves that

$$\{(f \vee g) < x\} = \{f < x\} \cap \{g < x\}$$

Using [theorem: 21.242] and the fact that f, g are $\mathcal{A}$ -measurable it follows that $\{f < x\}, \{g < x\} \in \mathcal{A}$ from which it follows, using the above, that $\{(f \vee g) < x\} \in \mathcal{A}$. Applying [theorem: 21.242] again proves that $f \vee g$ is $\mathcal{A}$ -measurable.

2. Let $x \in \mathbb{R}$ then

$$\begin{aligned} t \in \{(f \wedge g) > x\} &\Leftrightarrow (f \wedge g)(t) > x \\ &\Leftrightarrow \min(f(t), g(t)) > x \\ &\Leftrightarrow f(t) > x \wedge g(t) > x \\ &\Leftrightarrow t \in \{f > x\} \cap \{g > x\} \\ &\Leftrightarrow t \in \{f > x\} \cap \{g > x\} \end{aligned}$$

which proves that

$$\{(f \vee g) > x\} = \{f > x\} \cup \{g > x\}$$

Using [theorem: 21.242] and the fact that f, g are $\mathcal{A}$ -measurable it follows that $\{f > x\}, \{g > x\} \in \mathcal{A}$ from which it follows, using the above, that $\{(f \vee g) > x\} \in \mathcal{A}$. Applying [theorem: 21.242] again proves that $f > g$ is $\mathcal{A}$ -measurable. $\square$

Using mathematical induction we can extend the above to a finite family of $\mathcal{A}$ -measurable functions.

Corollary 21.253. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $n \in \mathbb{N}$ and $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then

1. $\bigvee_{i=1}^n f_i: A \rightarrow \overline{\mathbb{R}}$ defined by $(\bigvee_{i=1}^n f_i)(x) = \max(\{f_i(x) | i \in \{1, \dots, n\}\})$ is $\mathcal{A}$ -measurable. In other words $\bigvee_{i=1}^n f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.
2. $\bigwedge_{i=1}^n f_i: A \rightarrow \overline{\mathbb{R}}$ defined by $(\bigwedge_{i=1}^n f_i)(x) = \min(\{f_i(x) | i \in \{1, \dots, n\}\})$ is $\mathcal{A}$ -measurable. In other words $\bigwedge_{i=1}^n f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

Proof. We use recursion to prove this.

1. Let

$$S = \left\{ n \in \mathbb{N} \mid \text{If } \{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ then } \bigvee_{i=1}^n f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \right\}$$

then we have:

$1 \in S$. If $\{f_i\}_{i \in \{1\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $(\bigvee_{i=1}^1 f_i)(x) = \max(\{f_1(x)\}) = f_1(x)$ so that $\bigvee_{i=1}^1 f_i = f_1 \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, hence $1 \in S$

$n \in S \Rightarrow n+1 \in S$. Let $\{f_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $\forall x \in X$ we have

$$\begin{aligned} \left(\bigvee_{i=1}^{n+1} f_i \right)(x) &= \max(\{f_i(x) | i \in \{1, \dots, n+1\}\}) \\ &\stackrel{[\text{corollary: 3.67}]}{=} \max(\max(\{f_i(x) | i \in \{1, \dots, n\}\}), f_{n+1}(x)) \\ &= \max\left(\left(\bigvee_{i=1}^n f_i\right)(x), f_{n+1}(x)\right) \\ &= \left(\left(\bigvee_{i=1}^n f_i\right) \vee f_{n+1}\right)(x) \end{aligned}$$

so that

$$\bigvee_{i=1}^{n+1} f_i = \left(\bigvee_{i=1}^n f_i\right) \vee f_{n+1}$$

As $n \in S$ we have that $\bigvee_{i=1}^n f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, hence, using [theorem: 21.252] it follows that $(\bigvee_{i=1}^{n+1} f_i) \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, proving $n+1 \in S$.

2. Let

$$S = \left\{ n \in \mathbb{N} \mid \text{If } \{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ then } \bigwedge_{i=1}^n f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \right\}$$

then we have:

$1 \in \mathcal{S}$. If $\{f_i\}_{i \in \{1\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $(\bigwedge_{i=1}^1 f)(x) = \min(\{f_1(x)\}) = f_1(x)$ so that $\bigwedge_{i=1}^1 f_i = f_1 \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, hence $1 \in \mathcal{S}$

$n \in \mathcal{S} \Rightarrow n+1 \in \mathcal{S}$. Let $\{f_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $\forall x \in X$ we have

$$\begin{aligned} \left(\bigwedge_{i=1}^{n+1} f_i \right)(x) &= \min(\{f_i(x) | i \in \{1, \dots, n+1\}\}) \\ &\stackrel{[\text{corollary: 3.67}]}{=} \min(\min(\{f_i(x) | i \in \{1, \dots, n+1\}\}), f_{n+1}(x)) \\ &= \min\left(\left(\bigwedge_{i=1}^n f_i\right)(x), f_{n+1}(x)\right) \\ &= \left(\left(\bigwedge_{i=1}^n f_i\right) \wedge f_{n+1}\right)(x) \end{aligned}$$

so that

$$\bigwedge_{i=1}^{n+1} f_i = \left(\bigwedge_{i=1}^n f_i\right) \wedge f_{n+1}$$

As $n \in \mathcal{S}$ we have that $\bigwedge_{i=1}^n f_i \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, hence, using [theorem: 21.252] it follows that $(\bigwedge_{i=1}^{n+1} f_i) \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, proving $n+1 \in \mathcal{S}$. $\square$

We now look at the measurability of the $\sup$, $\inf$, $\limsup$ and $\liminf$ and limit of a sequence of measurable functions.

Theorem 21.254. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $k \in \mathbb{N}$ and $\{f_i\}_{i \in \{k, \dots, \infty\}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ a sequence of $\mathcal{A}$ -measurable functions then we have:

1. The function

$$\sup_{n \in \{k, \dots, \infty\}} f_n: X \rightarrow \overline{\mathbb{R}} \text{ defined by } \left(\sup_{n \in \{k, \dots, \infty\}} f_n \right)(x) = \sup(\{f_n(x) | n \in \{k, \dots, \infty\}\})$$

is $\mathcal{A}$ -measurable. In other words $\sup_{n \rightarrow \infty} f_n \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

2. The function

$$\inf_{n \in \{k, \dots, \infty\}} f_n: X \rightarrow \overline{\mathbb{R}} \text{ defined by } \left(\inf_{n \in \{k, \dots, \infty\}} f_n \right)(x) = \inf(\{f_n(x) | n \in \{k, \dots, \infty\}\})$$

is $\mathcal{A}$ -measurable. In other words $\inf_{n \in \{k, \dots, \infty\}} f_n \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

3. The function

$$\liminf_{n \rightarrow \infty} f_n: X \rightarrow \overline{\mathbb{R}} \text{ defined by } \left(\liminf_{n \rightarrow \infty} f_n \right)(x) = \liminf_{n \rightarrow \infty} f_n(x)$$

is $\mathcal{A}$ -measurable. In other words $\liminf_{n \rightarrow \infty} f_n \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

4. The function

$$\limsup_{n \rightarrow \infty} f_n: X \rightarrow \overline{\mathbb{R}} \text{ defined by } \left(\limsup_{n \rightarrow \infty} f_n \right)(x) = \limsup_{n \rightarrow \infty} f_n(x)$$

is $\mathcal{A}$ -measurable. In other words $\limsup_{n \rightarrow \infty} f_n \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

5. Let $D = \left\{ x \in X \mid \left(\limsup_{n \rightarrow \infty} f_n \right)(x) = \left(\liminf_{n \rightarrow \infty} f_n \right)(x) \right\}$ [this is the set where by [definition: 20.71] limit $f_n(x)$ exist so $D = \left\{ x \in X \mid \lim_{n \rightarrow \infty} f_n(x) \text{ exist} \right\}$] then

$$D \in \mathcal{A}$$

and for the function

$$\lim_{n \rightarrow \infty} f_n: D \rightarrow \overline{\mathbb{R}} \text{ defined by } \left(\lim_{n \rightarrow \infty} f_n \right)(x) = \lim_{n \rightarrow \infty} f_n(x)$$

we have $\lim_{n \rightarrow \infty} f_n \in \mathcal{M}[D, \mathcal{A}_D, \overline{\mathbb{R}}]$.

6. If $\forall x \in X$ we have $\forall n \in \{k, \dots, \infty\}$ that $f_n(x) \leq f_{n+1}(x)$ then we have that

$$\lim_{n \rightarrow \infty} f_n: X \rightarrow \overline{\mathbb{R}} \text{ defined by } \left(\lim_{n \rightarrow \infty} f_n \right)(x) = \lim_{n \rightarrow \infty} f_n(x)$$

is well defined and

$$\lim_{n \rightarrow \infty} f_n = \sup_{n \in \{k, \dots, \infty\}} f_n \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Proof.

1. Let $x \in \mathbb{R}$. If $t \in \left\{ \left(\sup_{n \in \{k, \dots, \infty\}} f_n \right) \leq x \right\}$ then $\sup(\{f_n(t) | n \in \{k, \dots, \infty\}\}) \leq x$. So $\forall n \in \{k, \dots, \infty\}$ we have $f_n(t) \leq x \Rightarrow t \in \{f_n \leq x\}$. Hence

$$\left\{ \left(\sup_{n \in \{k, \dots, \infty\}} f_n \right) \leq x \right\} \subseteq \bigcap_{n \in \{k, \dots, \infty\}} \{f_n \leq x\} \quad (21.384)$$

If $t \in \bigcap_{n \in \{k, \dots, \infty\}} \{f_n \leq x\}$ then we have $\forall n \in \{k, \dots, \infty\}$ that $t \in \{f_n \leq x\} \Rightarrow f_n(t) \leq x$. So x is an upper bound for $\{f_n(t) | n \in \{k, \dots, \infty\}\}$ from which it follows that $\sup(\{f_n(t) | n \in \{k, \dots, \infty\}\}) \leq x$ or $t \in \left\{ \left(\sup_{n \in \{k, \dots, \infty\}} f_n \right) \leq x \right\}$ proving that

$\bigcap_{n \in \{k, \dots, \infty\}} \{f_n \leq x\} \subseteq \left\{ \left(\sup_{n \in \{k, \dots, \infty\}} f_n \right) \leq x \right\}$. Combining this with [eq: 21.384] gives

$$\left\{ \left(\sup_{n \in \{k, \dots, \infty\}} f_n \right) \leq x \right\} = \bigcap_{n \in \{k, \dots, \infty\}} \{f_n \leq x\} \quad (21.385)$$

As $\forall n \in \{k, \dots, n\}$ f_n is $\mathcal{A}$ -measurable it follows from [theorem: 21.242] that $\{f_n \leq x\} \in \mathcal{A}$. Using [theorem: 21.33] we have that $\bigcap_{n \in \{k, \dots, \infty\}} \{f_n \leq x\} \in \mathcal{A}$ or, using [eq: 21.385], that $\left\{ \left(\sup_{n \in \{k, \dots, \infty\}} f_n \right) \leq x \right\} \in \mathcal{A}$. Applying then [theorem: 21.242] proves that

$$\sup_{n \in \{k, \dots, \infty\}} f_n \text{ is } \mathcal{A}\text{-measurable}$$

2. Let $x \in \mathbb{R}$. If $t \in \left\{ \left(\inf_{n \in \{k, \dots, \infty\}} f_n \right) < x \right\}$ then $\inf(\{f_n(t) | n \in \{k, \dots, n\}\}) < x$. So $\exists n \in \{k, \dots, \infty\}$ such that $f_n(t) < x \Rightarrow t \in \{f_n < x\}$. Hence

$$\left\{ \left(\inf_{n \in \{k, \dots, \infty\}} f_n \right) < x \right\} \subseteq \bigcup_{n \in \{k, \dots, \infty\}} \{f_n < x\} \quad (21.386)$$

If $t \in \bigcup_{n \in \{k, \dots, \infty\}} \{f_n < x\}$ then $\exists n \in \{k, \dots, \infty\}$ such that $t \in \{f_n < x\} \Rightarrow f_n(t) < x$, hence $\inf(\{f_n(t) | n \in \{k, \dots, n\}\}) \leq f_n(t) < x$, proving that $t \in \left\{ \left(\inf_{n \in \{k, \dots, \infty\}} f_n \right) < x \right\}$. So $\bigcup_{n \in \{k, \dots, \infty\}} \{f_n < x\} \subseteq \left\{ \left(\inf_{n \in \{k, \dots, \infty\}} f_n \right) < x \right\}$ which by [eq: 21.386] gives

$$\left\{ \left(\inf_{n \in \{k, \dots, \infty\}} f_n \right) < x \right\} = \bigcup_{n \in \{k, \dots, \infty\}} \{f_n < x\} \quad (21.387)$$

As $\forall n \in \{k, \dots, n\}$ f_n is $\mathcal{A}$ -measurable it follows from [theorem: 21.242] that $\{f_n < x\} \in \mathcal{A}$, applying then [definition: 21.30] proves that $\bigcup_{n \in \{k, \dots, \infty\}} \{f_n < x\} \in \mathcal{A}$ or using [eq: 21.387] that $\left\{ \left(\inf_{n \in \{k, \dots, \infty\}} f_n \right) < x \right\} \in \mathcal{A}$. Using then [theorem: 21.242] it follows that

$$\inf_{n \in \{k, \dots, \infty\}} f_n \text{ is } \mathcal{A}\text{-measurable}$$

3. Let $x \in A$ then

$$\begin{aligned}
 \left(\liminf_{n \rightarrow \infty} f_n \right)(x) &= \liminf_{n \rightarrow \infty} f_n(x) \\
 &\stackrel{[\text{definition: 20.57}]}{=} \sup \left(\left\{ \inf \left(\{ f_i \mid i \in \{l, \dots, \infty\} \} \right) \mid l \in \{k, \dots, \infty\} \right\} \right) \\
 &= \sup \left(\left\{ \left(\inf_{i \in \{l, \dots, \infty\}} f_i \right)(x) \mid l \in \{k, \dots, \infty\} \right\} \right) \\
 &= \sup_{l \in \{k, \dots, \infty\}} \left(\left(\inf_{i \in \{l, \dots, \infty\}} f_i \right)(x) \right) \\
 &= \left(\sup_{l \in \{k, \dots, \infty\}} \left(\inf_{i \in \{l, \dots, \infty\}} f_i \right) \right)(x)
 \end{aligned}$$

which proves that

$$\liminf_{n \rightarrow \infty} f_n = \sup_{l \in \{k, \dots, \infty\}} \left(\inf_{i \in \{l, \dots, \infty\}} f_i \right) \quad (21.388)$$

Now $\forall l \in \{k, \dots, \infty\}$ we have by (2) that $\inf_{i \in \{l, \dots, \infty\}} f_i$ is $\mathcal{A}$ -measurable. So applying (1) it follows that $\sup_{l \in \{k, \dots, \infty\}} \left(\inf_{i \in \{l, \dots, \infty\}} f_i \right)$ is $\mathcal{A}$ -measurable. Hence using [eq: 21.388] it follows that $\liminf_{n \rightarrow \infty} f_n$ is $\mathcal{A}$ -measurable.

4. Let $x \in A$ then

$$\begin{aligned}
 \left(\limsup_{n \rightarrow \infty} f_n \right)(x) &= \limsup_{n \rightarrow \infty} f_n(x) \\
 &\stackrel{[\text{definition: 20.57}]}{=} \inf \left(\left\{ \sup \left(\{ f_i \mid i \in \{l, \dots, \infty\} \} \right) \mid l \in \{k, \dots, \infty\} \right\} \right) \\
 &= \inf \left(\left\{ \left(\sup_{i \in \{l, \dots, \infty\}} f_i \right)(x) \mid l \in \{k, \dots, \infty\} \right\} \right) \\
 &= \inf_{l \in \{k, \dots, \infty\}} \left(\left(\sup_{i \in \{l, \dots, \infty\}} f_i \right)(x) \right) \\
 &= \left(\inf_{l \in \{k, \dots, \infty\}} \left(\sup_{i \in \{l, \dots, \infty\}} f_i \right) \right)(x)
 \end{aligned}$$

which proves that

$$\limsup_{n \rightarrow \infty} f_n = \inf_{l \in \{k, \dots, \infty\}} \left(\sup_{i \in \{l, \dots, \infty\}} f_i \right) \quad (21.389)$$

Now $\forall l \in \{k, \dots, \infty\}$ we have by (1) that $\sup_{i \in \{l, \dots, \infty\}} f_i$ is $\mathcal{A}$ -measurable. So applying (2) it follows that $\inf_{l \in \{k, \dots, \infty\}} \left(\sup_{i \in \{l, \dots, \infty\}} f_i \right)$ is $\mathcal{A}$ -measurable. Hence using [eq: 21.388] it follows that $\limsup_{n \rightarrow \infty} f_n$ is $\mathcal{A}$ -measurable.

5. From (3),(4) it follows that $\liminf_{n \rightarrow \infty} f_n$ and $\limsup_{n \rightarrow \infty} f_n$ are $\mathcal{A}$ -measurable, combining this fact with [theorem: 21.244], proves that $\left\{ \limsup_{n \rightarrow \infty} f_n = \limsup_{n \rightarrow \infty} f_n \right\} \in \mathcal{A}$. As $D = \left\{ x \in A \mid \left(\limsup_{n \rightarrow \infty} f_n \right)(x) = \left(\limsup_{n \rightarrow \infty} f_n \right)(x) \right\} = \left\{ \limsup_{n \rightarrow \infty} f_n = \limsup_{n \rightarrow \infty} f_n \right\}$ it follows that

$$D \in \mathcal{A} \quad (21.390)$$

If $x \in D$ then by definition $\limsup_{n \rightarrow \infty} f_n(x) = \limsup_{n \rightarrow \infty} f_n(x)$ so that by [definition: 20.71] $\lim_{n \rightarrow \infty} f_n(x)$ exist and $\lim_{n \rightarrow \infty} f_n(x) = \limsup_{n \rightarrow \infty} f_n(x) = \limsup_{n \rightarrow \infty} f_n(x)$. This allows us to define the function

$$\lim_{n \rightarrow \infty} f_n: D \rightarrow [0, \infty] \text{ where } \left(\lim_{n \rightarrow \infty} f_n \right)(x) = \lim_{n \rightarrow \infty} f_n(x) = \limsup_{n \rightarrow \infty} f_n(x) = \limsup_{n \rightarrow \infty} f_n(x) \quad (21.391)$$

Let $x \in \overline{\mathbb{R}}$ then

$$\begin{aligned} t \in D \cap \left\{ \left(\limsup_{n \rightarrow \infty} f_n \right) \leq x \right\} &\Leftrightarrow t \in D \wedge \left(\limsup_{n \rightarrow \infty} f_n \right)(t) \leq x \\ &\stackrel{[\text{eq: 21.391}]}{\Leftrightarrow} t \in D \wedge \left(\lim_{n \rightarrow \infty} f_n \right)(t) \leq x \\ &\Leftrightarrow t \in \left\{ \left(\lim_{n \rightarrow \infty} f_n \right) \leq x \right\} \end{aligned}$$

which proves that $\left\{ \left(\lim_{n \rightarrow \infty} f_n \right) \leq x \right\} = D \cap \left\{ \left(\limsup_{n \rightarrow \infty} f_n \right) \leq x \right\} \in \mathcal{A}|_D$ [as $D \in \mathcal{A}$ and $\left\{ \left(\limsup_{n \rightarrow \infty} f_n \right) \leq x \right\} \in \mathcal{A}$]. Finally using [theorem: 21.242] it follows that

$$\lim_{n \rightarrow \infty} f_n: D \rightarrow \overline{\mathbb{R}} \text{ is } \mathcal{A}|_D\text{-measurable}$$

6. Let $x \in X$ then as $\forall n \in \{k, \dots, \infty\}$ $f_n(x) \leq f_{n+1}(x)$ we have by [theorem: 20.91] that

$$\lim_{n \rightarrow \infty} f_n(x) \text{ exist and } \lim_{n \rightarrow \infty} f_n(x) = \sup (\{f_n(x) | n \in \{k, \dots, \infty\}\})$$

so that

$$\lim_{n \rightarrow \infty} f_n: X \rightarrow \overline{\mathbb{R}} \text{ where } \left(\lim_{n \rightarrow \infty} f_n \right)(x) = \lim_{n \rightarrow \infty} f_n(x)$$

is a well defined function and

$$\lim_{n \rightarrow \infty} f_n = \sup_{n \in \{k, \dots, \infty\}} f_n$$

Finally by (1) we have that

$$\lim_{n \rightarrow \infty} f_n = \sup_{n \in \{k, \dots, \infty\}} f_n \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

□

Theorem 21.255. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\{f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ a sequence of $\mathcal{A}$ -measurable functions then for

$$f_\infty: X \rightarrow \overline{\mathbb{R}} \text{ defined by } f_\infty(x) = \begin{cases} \lim_{n \rightarrow \infty} f_n(x) & \text{if } x \in D \\ 0 & \text{if } x \in X \setminus D \end{cases}$$

where

$$D = \left\{ x \in X \mid \lim_{n \rightarrow \infty} f_n(x) \text{ exist} \right\} = \left\{ x \in X \mid \left(\limsup_{n \rightarrow \infty} f_n \right)(x) = \left(\liminf_{n \rightarrow \infty} f_n \right)(x) \right\}$$

we have that

$$f_\infty \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ or in other words } f_\infty \text{ is } \mathcal{A}\text{-measurable}$$

Proof. Using the previous theorem [theorem: 21.254] it follows that

$$D \in \mathcal{A} \text{ and for the function } \lim_{n \rightarrow \infty} f_n: D \rightarrow \overline{\mathbb{R}} \text{ defined by } \left(\lim_{n \rightarrow \infty} f_n \right)(x) = \lim_{n \rightarrow \infty} f_n(x)$$

we have $\lim_{n \rightarrow \infty} f_n \in \mathcal{M}[D, \mathcal{A}|_D, \overline{\mathbb{R}}]$. Further $\forall x \in X$ we have

$$\left(\lim_{n \rightarrow \infty} f_n \right)_{D \upharpoonright X}(x) = \begin{cases} \left(\lim_{n \rightarrow \infty} f_n \right)(x) & \text{if } x \in D \\ 0 & \text{if } x \in X \setminus D \end{cases} = \begin{cases} \lim_{n \rightarrow \infty} f_n(x) & \text{if } x \in D \\ 0 & \text{if } x \in X \setminus D \end{cases} = f_\infty(x)$$

which proves that $f_\infty = \left(\lim_{n \rightarrow \infty} f_n \right)_{D \upharpoonright X}$ so that by [theorem: 21.238]

$$f_\infty \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

□

A very usefull $\mathcal{A}$ -measurable function is the Charasteristic function.

Definition 21.256. Let X be a set, $A \in \mathcal{P}(X)$ then the Charasteristic function $\mathcal{X}_{X,A}$ is defined by

$$\mathcal{X}_{X,A}: X \rightarrow \overline{\mathbb{R}} \text{ where } \mathcal{X}_{X,A}(x) = \begin{cases} 1 & \text{if } x \in A \\ 0 & \text{if } x \in X \setminus A \end{cases}$$

If X is understood from the context then we use the notation $\mathcal{X}_A$ instead of $\mathcal{X}_{X,A}$

Theorem 21.257. Let X be a set and $A \subseteq X$, $B \subseteq X$ then

1. $\mathcal{X}_{X,A} \cdot \mathcal{X}_{X,B} = \mathcal{X}_{X,A \cap B}$ [where $\mathcal{X}_{X,A} \cdot \mathcal{X}_{X,B}$ is poinwise defined]
2. If $f: X \rightarrow \overline{\mathbb{R}}$ is a function then $(\mathcal{X}_{X,B} \cdot f)|_B = f|_B$ [where $\mathcal{X}_{X,A} \cdot f$ is poinwise defined]
3. If $f: X \rightarrow \overline{\mathbb{R}}$ is a function then $(\mathcal{X}_{X,B} \cdot f)|_A = \mathcal{X}_{A,B} \cdot f|_A$ [where $\mathcal{X}_{X,B} \cdot f$ is poinwise defined]

Proof.

1. Let $x \in X$ then we have either:

$x \in A \cap B$. Then $x \in A \wedge x \in B$ so that

$$(\mathcal{X}_{X,A} \cdot \mathcal{X}_{X,B})(x) = \mathcal{X}_{X,A}(x) \cdot \mathcal{X}_{X,B}(x) = 1 \cdot 1 = 1 = \mathcal{X}_{X,A \cap B}(x)$$

$x \in X \setminus (A \cap B)$. Then $x \notin A \vee x \in B$ so that

$$(\mathcal{X}_{X,A} \cdot \mathcal{X}_{X,B})(x) = \mathcal{X}_{X,A}(x) \cdot \mathcal{X}_{X,B}(x) = 0 \cdot \mathcal{X}_{X,B}(x) = 0 = \mathcal{X}_{X,A \cap B}(x)$$

which proves that $\mathcal{X}_{X,A} \cdot \mathcal{X}_{X,B} = \mathcal{X}_{X,A \cap B}$

2. Let $x \in B$ then we have $(\mathcal{X}_{X,B} \cdot f)|_B(x) = (\mathcal{X}_{X,B} \cdot f)(x) = 1 \cdot f(x) = f(x) = f|_B(x)$ which proves that $(\mathcal{X}_{X,B} \cdot f)|_B = f|_B$.
3. Let $x \in A$ then we have for x either:

$x \in B$. Then

$$(\mathcal{X}_{X,B} \cdot f)|_A(x) = (\mathcal{X}_{X,B} \cdot f)(x) = \mathcal{X}_{X,B}(x) \cdot f(x) = f(x) = f|_A(x) = \mathcal{X}_{A,B}(x) \cdot f|_A(x) = (\mathcal{X}_{A,B} \cdot f|_A)(x)$$

$x \notin B$. Then

$$(\mathcal{X}_{X,B} \cdot f)|_A(x) = (\mathcal{X}_{X,B} \cdot f)(x) = \mathcal{X}_{X,B}(x) \cdot f(x) = 0 \cdot f(x) = 0 = \mathcal{X}_{A,B}(x) \cdot f|_A(x) = (\mathcal{X}_{A,B} \cdot f|_A)(x)$$

so that

$$(\mathcal{X}_{X,B} \cdot f)|_A = \mathcal{X}_{A,B} \cdot f|_A \quad \square$$

Theorem 21.258. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $A \in \mathcal{A}$ then

$$\mathcal{X}_{X,A} \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$$

Proof. Let $x \in X$ then we have three possibilities:

$1 \leq x$. If $t \in \{\mathcal{X}_{X,A} > x\}$ then $1 \leq x < \mathcal{X}_{X,A}(t) = \begin{cases} 1 & \text{if } t \in A \\ 0 & \text{if } t \in X \setminus A \end{cases} \leq 1$ leading to the contradiction $1 < 1$ hence we have $\{\mathcal{X}_{X,A} > x\} = \emptyset \in \mathcal{A}$

$0 \leq x < 1$. Let $t \in \{\mathcal{X}_{X,A} > x\}$ then $0 \leq x < \mathcal{X}_{X,A}(t)$. If $t \notin A$ then $0 \leq x < \mathcal{X}_{X,A}(t) = 0$ laeding to the contradiction $0 < 0$ hence we must have that $t \in A$ which proves that

$$\{\mathcal{X}_{X,A} > x\} \subseteq A$$

If $t \in A$ then $\mathcal{X}_{X,A}(t) = 1 > x$ so that $t \in \{\mathcal{X}_{X,A} > x\}$ which proves that $A \subseteq \{\mathcal{X}_{X,A} > x\}$. Combining this with the above gives $\{\mathcal{X}_{X,A} > x\} = A \in \mathcal{A}$.

$x < 0$. If $t \in X$ then we have $\mathcal{X}_{X,A}(t) = \begin{cases} 1 & \text{if } t \in A \\ 0 & \text{if } t \in X \setminus A \end{cases} \geq 0 > x$ so that $X \subseteq \{\mathcal{X}_{X,A} > x\} \subseteq X$, hence $\{\mathcal{X}_{X,A} > x\} = X \in \mathcal{A}$.

As in all cases $\{\mathcal{X}_{X,A} > x\} \in \mathcal{A}$ it follows from [theorem: 21.242] that

$$\mathcal{X}_{X,A} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}].$$

Further, as $\forall t \in X \mathcal{X}_{X,A}(x) = \begin{cases} 1 \geq 0 & \text{if } t \in A \\ 0 \geq 0 & \text{if } t \in X \setminus A \end{cases} \geq 0$, it follows that $\mathcal{X}_{X,A}(X) \subseteq [0, \infty[$ so that we have also

$$\mathcal{X}_{X,A} \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \quad \square$$

Lemma 21.259. *Let $X, A \subseteq X$ be a set and $f: X \rightarrow \overline{\mathbb{R}}$ a function then for $B \subseteq \overline{\mathbb{R}}$ we have*

1. *If $0 \notin B$ then $(\mathcal{X}_{X,A} \cdot f)^{-1}(B) = A \cap f^{-1}(B)$*
2. *If $0 \in B$ then $(\mathcal{X}_{X,A} \cdot f)^{-1}(B) = (X \setminus A) \cup f^{-1}(B)$*

Proof.

1. Let $x \in (\mathcal{X}_{X,A} \cdot f)^{-1}(B)$ then $(\mathcal{X}_{X,A} \cdot f)(x) \in B$. Assume that $x \in X \setminus A$ then we would have $0 = \mathcal{X}_{X,A}(x) \cdot f(x) = (\mathcal{X}_{X,A} \cdot f)(x) \in B$ contradicting the hypothesis $0 \notin B$ so we must have that $x \in A$. Then $f(x) = \mathcal{X}_{X,A}(x) \cdot f(x) = (\mathcal{X}_{X,A} \cdot f)(x) \in B$ proving that $x \in A \cap f^{-1}(B)$. Hence

$$(\mathcal{X}_{X,A} \cdot f)^{-1}(B) \subseteq A \cap f^{-1}(B) \quad (21.392)$$

If $x \in A \cap f^{-1}(B)$ then $x \in A$ and $f(x) \in B$ so that $(\mathcal{X}_{X,A} \cdot f)(x) = \mathcal{X}_{X,A}(x) \cdot f(x) = f(x) \in B$ proving that $x \in (\mathcal{X}_{X,A} \cdot f)^{-1}(B)$. So $A \cap f^{-1}(B) \subseteq (\mathcal{X}_{X,A} \cdot f)^{-1}(B)$ which by [eq: 21.392] proves that

$$(\mathcal{X}_{X,A} \cdot f)^{-1}(B) = A \cap f^{-1}(B)$$

2. Let $x \in (\mathcal{X}_{X,A} \cdot f)^{-1}(B)$ then $(\mathcal{X}_{X,A} \cdot f)(x) \in B$, consider the following possible cases for x :
 $\mathbf{x} \in \mathbf{A}$. Then $f(x) = \mathcal{X}_{X,A}(x) \cdot f(x) = (\mathcal{X}_{X,A} \cdot f)(x) \in B$ proving that

$$x \in f^{-1}(B) \subseteq (X \setminus A) \cup f^{-1}(B)$$

$\mathbf{x} \in \mathbf{X} \setminus \mathbf{A}$. Then clearly $x \in (X \setminus A) \cup f^{-1}(B)$

Hence we have

$$(\mathcal{X}_{X,A} \cdot f)^{-1}(B) \subseteq (X \setminus A) \cup f^{-1}(B) \quad (21.393)$$

On the other hand if $x \in (X \setminus A) \cup f^{-1}(B)$ then we have either

$\mathbf{x} \in \mathbf{X} \setminus \mathbf{A}$. Then $(\mathcal{X}_{X,A} \cdot f)(x) = \mathcal{X}_{X,A}(x) \cdot f(x) = 0 \in B$ proving $x \in (\mathcal{X}_{X,A} \cdot f)^{-1}(B)$

$\mathbf{x} \in \mathbf{A}$. Then $x \in f^{-1}(B)$ so that $(\mathcal{X}_{X,A} \cdot f)(x) = \mathcal{X}_{X,A}(x) \cdot f(x) = f(x) \in B$ proving that $x \in (\mathcal{X}_{X,A} \cdot f)^{-1}(B)$.

Hence $(X \setminus A) \cup f^{-1}(B) \subseteq (\mathcal{X}_{X,A} \cdot f)^{-1}(B)$ which by [eq: 21.393] gives

$$(\mathcal{X}_{X,A} \cdot f)^{-1}(B) = (X \setminus A) \cup f^{-1}(B) \quad \square$$

Corollary 21.260. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $A \in \mathcal{A}$ and $f: X \rightarrow \overline{\mathbb{R}}$ a function then we have:*

1. *If $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$*
2. *If $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$*
3. *If $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$*
4. *If $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$*

Proof.

1. Let $B \in \mathcal{B}[\overline{\mathbb{R}}]$ then we have for B either:

$\mathbf{0} \notin \mathbf{B}$. Then by [lemma: 21.259] $(\mathcal{X}_{X,A} \cdot f)^{-1}(B) = A \cap f^{-1}(B)$, further $A \cap f^{-1}(B) \in \mathcal{A}$ [as $A \in \mathcal{A}$ and $f^{-1}(B) \in \mathcal{A}$ because f is $\mathcal{A}$ -measurable], so that $(\mathcal{X}_{X,A} \cdot f)^{-1}(B) \in \mathcal{A}$.

0 ∈ B. Then by [lemma: 21.259] $(\mathcal{X}_{X,A} \cdot f)^{-1}(B) = (X \setminus A) \cup f^{-1}(B)$, further $(X \setminus A) \cup f^{-1}(B) \in \mathcal{A}$ [as $A \in \mathcal{A} \Rightarrow X \setminus A \in \mathcal{A}$ and $f^{-1}(B) \in \mathcal{A}$ because f is $\mathcal{A}$ -measurable], so that $(\mathcal{X}_{X,A} \cdot f)^{-1}(B) \in \mathcal{A}$.

So $\forall B \in \mathcal{A}$ we have that $(\mathcal{X}_{X,A} \cdot f)^{-1}(B) \in \mathcal{A}$ which proves that $\mathcal{X}_{X,A} \cdot f$ is $\mathcal{A}$ -measurable, hence $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

2. If $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \xrightarrow{(1)} \mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $f(X) \subseteq \mathbb{R}$. Further $\forall x \in X$ we have $(\mathcal{X}_{X,A} \cdot f)(x) = \begin{cases} f(x) \in \mathbb{R} & \text{if } x \in A \\ 0 \in \mathbb{R} & \text{if } x \in X \setminus A \end{cases} \in \mathbb{R}$ so that $(\mathcal{X}_{X,A} \cdot f)(X) \subseteq \mathbb{R}$ which proves that $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$.
3. If $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \xrightarrow{(1)} \mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $f(X) \subseteq [0, \infty]$. Further $\forall x \in X$ we have $(\mathcal{X}_{X,A} \cdot f)(x) = \begin{cases} f(x) \in [0, \infty] & \text{if } x \in A \\ 0 \in [0, \infty] & \text{if } x \in X \setminus A \end{cases} \in [0, \infty]$ so that $(\mathcal{X}_{X,A} \cdot f)(X) \subseteq [0, \infty]$ which proves that $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$.
4. If $f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ then $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \xrightarrow{(1)} \mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $f(X) \subseteq [0, \infty[$. Further $\forall x \in X$ we have $(\mathcal{X}_{X,A} \cdot f)(x) = \begin{cases} f(x) \in [0, \infty[& \text{if } x \in A \\ 0 \in [0, \infty[& \text{if } x \in X \setminus A \end{cases} \in [0, \infty[$ so that $(\mathcal{X}_{X,A} \cdot f)(X) \subseteq [0, \infty[$ which proves that $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$. $\square$

Theorem 21.261. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $A \in \mathcal{A}$ and $\langle A, \mathcal{A}_{|A} \rangle$ the measurable space defined by $\mathcal{A}_{|A} = \{C \in \mathcal{A} \mid C \subseteq A\}$ [see theorem: 21.41] and $f: X \rightarrow \overline{\mathbb{R}}$ a function then we have

$$\mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \Leftrightarrow f|_A \in \mathcal{M}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$$

Proof.

$\Rightarrow$. Let $B \in \mathcal{B}[\overline{\mathbb{R}}]$ then as $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have

$$(\mathcal{X}_{X,A} \cdot f)^{-1}(B) \in \mathcal{A} \tag{21.394}$$

For B we must consider the following cases:

0 ∈ B. Then by [lemma: 21.259]

$$(X \setminus A) \cup f^{-1}(B) = (\mathcal{X}_{X,A} \cdot f)^{-1}(B) \underset{[\text{eq: 21.394}]}{\in} \mathcal{A} \tag{21.395}$$

Further

$$\begin{aligned} A \cap ((X \setminus A) \cup f^{-1}(B)) &= (A \cap (X \setminus A)) \cup (A \cap f^{-1}(B)) \\ &= \emptyset \cup (A \cap f^{-1}(B)) \\ &= A \cap f^{-1}(B) \\ &\underset{[\text{theorem: 2.86}]}{=} (f|_A)^{-1}(B) \end{aligned}$$

As $A \in \mathcal{A}$ and by [eq: 21.395] $(X \setminus A) \cup f^{-1}(B) \in \mathcal{A}$ it follows that $A \cap ((X \setminus A) \cup f^{-1}(B)) \in \mathcal{A}$ so that by the above $(f|_A)^{-1}(B) \in \mathcal{A}$.

0 ∉ B. Then $(f|_A)^{-1}(B) \underset{[\text{theorem: 2.86}]}{=} A \cap f^{-1}(B) \underset{[\text{lemma: 21.259}]}{=} (\mathcal{X}_{X,A} \cdot f)^{-1}(B) \underset{[\text{eq: 21.394}]}{\in} \mathcal{A}$ proving that $(f|_A)^{-1}(B) \in \mathcal{A}$.

So $\forall B \in \mathcal{B}[\overline{\mathbb{R}}]$ $(f|_A)^{-1}(B) \in \mathcal{A}$, hence as $(f|_A)^{-1}(B) \underset{[\text{theorem: 2.86}]}{=} A \cap f^{-1}(B) \subseteq A$ it follows that $(f|_A)^{-1}(B) \in \mathcal{A}_{|A}$. Which proves that

$$f|_A \in \mathcal{M}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$$

$\Leftarrow$. Let $B \in \mathcal{B}[\overline{\mathbb{R}}]$ then, as by the hypothesis $f|_A \in \mathcal{M}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$ we have that $(f|_A)^{-1}(B) \in \mathcal{A}_{|A}$ so that

$$A \cap f^{-1}(B) \underset{[\text{theorem: 2.86}]}{=} (f|_A)^{-1}(B) \in \mathcal{A}_{|A} = \{B \in \mathcal{A} \mid B \subseteq A\} \subseteq \mathcal{A} \tag{21.396}$$

Further

$$\begin{aligned}(X \setminus A) \cup (A \cap f^{-1}(B)) &= ((X \setminus A) \cup A) \cap ((X \setminus A) \cup f^{-1}(B)) \\ &= X \cap ((X \setminus A) \cup f^{-1}(B)) \\ &= (X \setminus A) \cup f^{-1}(B)\end{aligned}$$

As $A \cap (A \cap f^{-1}(B)) \in \mathcal{A}$ [see eq: 21.396] and $A \in \mathcal{A} \Rightarrow X \setminus A \in \mathcal{A}$ it follows that $(X \setminus A) \cup (A \cap f^{-1}(B)) \in \mathcal{A}$ so that by the above

$$(X \setminus A) \cup f^{-1}(B) \in \mathcal{A} \quad (21.397)$$

Now for B we have either:

$\mathbf{0} \in B$. Then by [lemma: 21.259] $(\mathcal{X}_A \cdot f)^{-1}(B) = (X \setminus A) \cup f^{-1}(B) \in \mathcal{A}$

$\mathbf{0} \notin B$. Then by [lemma: 21.259] $(\mathcal{X}_A \cdot f)^{-1}(B) = A \cap f^{-1}(B) \in \mathcal{A}$ [eq: 21.396]

So $\forall B \in \mathcal{B}[\overline{\mathbb{R}}]$ we have $(\mathcal{X}_A \cdot f)^{-1}(B) \in \mathcal{A}$ which proves that

$$\mathcal{X}_A \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \quad \square$$

Corollary 21.262. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $A \in \mathcal{A}$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then

$$f|_A \in \mathcal{M}[A, \mathcal{A}|_A, \overline{\mathbb{R}}]$$

Proof. As $A \in \mathcal{A}$ it follows from [theorem: 21.260] that $\mathcal{X}_A \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ so that by the previous theorem [theorem: 21.261] $f|_A \in \mathcal{M}[A, \mathcal{A}|_A, \overline{\mathbb{R}}]$. $\square$

21.4.3 Almost everywhere properties

Using the concept of μ -negligible sets [see definition: 21.202] we can introduce the term **almost everywhere**. A statement about elements in a set is said to be almost everywhere true if it is true for every element in the set except for a μ -negligible subset. The idea is that we can ignore the μ -negligible part because it will not influence the final result.

Definition 21.263. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $P(x)$ a predicator then $P(x)$ is **μ -a.e. true** if $\{x \in X \mid \neg P(x)\} \in \mathcal{N}_\mu$. In other words using the definition of $\mathcal{N}_\mu$ [see definition: 21.202]

$$P(x) \text{ is } \mu\text{-a.e. true or } P(x) \text{ holds } \mu\text{-a.e.}$$

if there exists a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$\{x \in X \mid \neg P(x)\} \subseteq N$$

Using the above we have the following examples that will be used in this text.

Definition 21.264. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then we define:

1. If $f: X \rightarrow \overline{\mathbb{R}}$ and $g: X \rightarrow \overline{\mathbb{R}}$ are functions then $\mathbf{f = g}$ **μ -a.e.** if there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X \mid f(x) \neq g(x)\} \subseteq N$.
2. If $f: X \rightarrow \overline{\mathbb{R}}$ and $g: X \rightarrow \overline{\mathbb{R}}$ are functions then $\mathbf{f \leq g}$ **μ -a.e.** if there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X \mid g(x) < f(x)\} \subseteq N$.
3. If $f: X \rightarrow \overline{\mathbb{R}}$ and $g: X \rightarrow \overline{\mathbb{R}}$ are functions then $\mathbf{f < g}$ **μ -a.e.** if there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X \mid g(x) \leq f(x)\} \subseteq N$.
4. If $f: X \rightarrow \overline{\mathbb{R}}$ then $\mathbf{f = 0}$ **μ -a.e.** if there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X \mid f(x) \neq 0\} \subseteq N$.
5. Let $\{f_n\}_{n \in \mathbb{N}} \subseteq \overline{\mathbb{R}}^X$ be a sequence of functions and $f: X \rightarrow \overline{\mathbb{R}}$ then $\lim_{n \rightarrow \infty} f_n = f$ **μ -a.e.** if there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$X \setminus \left\{x \in X \mid \lim_{n \rightarrow \infty} f_n(x) \text{ exist and } \lim_{n \rightarrow \infty} f_n(x) = f(x)\right\} \subseteq N$$

One way that almost everywhere equality is used is in masking undesirable points from the domain of a function using a characteristic function. For this the following theorem is useful.

Theorem 21.265. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $A \in \mathcal{N}_\mu$ [in other words there exist a $N \in \mathcal{S}$ with $\mu(N) = 0$ such that $A \subseteq N$] and $f: X \rightarrow \overline{\mathbb{R}}$ then for $\mathcal{X}_{X, X \setminus A} \cdot f: X \rightarrow \overline{\mathbb{R}}$ we have that*

$$\mathcal{X}_{X, X \setminus A} \cdot f = f \text{ } \mu\text{-a.e.}$$

Proof. Let $x \in \{x \in X | (\mathcal{X}_{X, X \setminus A} \cdot f)(x) \neq f(x)\}$ then $x \in X$ and $\mathcal{X}_{X, X \setminus A}(x) \cdot f(x) \neq f(x)$. Assume that $x \notin A$ then $x \in X \setminus A$ so that $f(x) \neq \mathcal{X}_{X, X \setminus A}(x) \cdot f(x) = 1 \cdot f(x) = f(x)$ which is a contradiction. Hence the assumption is false and we must have that $x \in A$, which proves that

$$\{x \in X | (\mathcal{X}_{X, X \setminus A} \cdot f)(x) \neq f(x)\} \subseteq A \subseteq N$$

So by definition

$$\mathcal{X}_{X \setminus A} \cdot f = f \text{ } \mu\text{-a.e.} \quad \square$$

Theorem 21.266. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space together with functions*

$$\begin{aligned} f: X &\rightarrow \overline{\mathbb{R}} \\ g: X &\rightarrow \overline{\mathbb{R}} \\ h: X &\rightarrow \overline{\mathbb{R}} \\ k: X &\rightarrow \overline{\mathbb{R}} \end{aligned}$$

then we have:

1. If $f = g$ μ -a.e. and $g = h$ μ -a.e. then $f = h$ μ -a.e.
2. If $f \leq g$ μ -a.e. and $g \leq h$ μ -a.e. then $f \leq h$ μ -a.e.
3. If $f \leq g$ μ -a.e. and $g \leq f$ μ -a.e. then $f = g$ μ -a.e.
4. If $\alpha \in \mathbb{R} \setminus \{0\}$ then if $f = g$ μ -a.e. it follows that $\alpha \cdot f = \alpha \cdot g$ μ -a.e.
5. If $\forall x \in X$ $(f(x), g(x)), (h(x), k(x)) \in \overline{\mathbb{R}} \setminus \{(\infty, -\infty), (-\infty, \infty)\}$ [in other words $\forall x \in X$ $f(x) + g(x)$ and $h(x) + k(x)$ is well defined], $f = h$ μ -a.e. and $g = k$ μ -a.e. then $f + g = h + k$ μ -a.e.

Proof.

1. As $f = g$ μ -a.e. and $g = h$ μ -a.e. there exist $N_1, N_2 \in \mathcal{A}$ with $\mu(N_1) = 0 = \mu(N_2)$ such that $\{x \in X | f(x) \neq g(x)\} \subseteq N_1$ and $\{x \in X | g(x) \neq h(x)\} \subseteq N_2$. Let $x \in \{x \in X | f(x) \neq h(x)\}$ then $f(x) \neq g(x) \vee g(x) \neq h(x)$ [for if $f(x) = g(x) \wedge g(x) = h(x)$ then $f(x) = h(x)$] so that $x \in \{x \in X | f(x) \neq g(x)\} \cup \{x \in X | g(x) \neq h(x)\}$ proving

$$\{x \in X | f(x) \neq h(x)\} \subseteq \{x \in X | f(x) \neq g(x)\} \cup \{x \in X | g(x) \neq h(x)\} \subseteq N_1 \cup N_2 \in \mathcal{A}$$

which, as $\mu(N_1 \cup N_2) \leq \mu(N_1) + \mu(N_2) = 0$, proves that

$$f = h \text{ } \mu\text{-a.e.}$$

2. As $f \leq g$ μ -a.e. and $g \leq h$ μ -a.e. there exist $N_1, N_2 \in \mathcal{A}$ with $\mu(N_1) = 0 = \mu(N_2)$ such that $\{x \in X | g(x) < f(x)\} \subseteq N_1$ and $\{x \in X | h(x) < g(x)\} \subseteq N_2$. Let $x \in \{x \in X | h(x) < f(x)\}$ then we have $g(x) < f(x) \vee h(x) < g(x)$ [for if $f(x) \leq g(x) \wedge g(x) \leq h(x)$ then we have $f(x) \leq h(x)$ contradicting $h(x) < f(x)$] so that $x \in \{x \in X | g(x) < f(x)\} \cup \{x \in X | h(x) < g(x)\}$ proving

$$\{x \in X | h(x) < f(x)\} \subseteq \{x \in X | g(x) < f(x)\} \cup \{x \in X | h(x) < g(x)\} \subseteq N_1 \cup N_2 \in \mathcal{A}$$

which, as $\mu(N_1 \cup N_2) \leq \mu(N_1) + \mu(N_2) = 0$, proves that

$$f \leq h \text{ } \mu\text{-a.e.}$$

3. As $f \leq g$ μ -a.e. and $g \leq f$ μ -a.e. there exist $N_1, N_2 \in \mathcal{A}$ with $\mu(N_1) = 0 = \mu(N_2)$ such that $\{x \in X | g(x) < f(x)\} \subseteq N_1$ and $\{x \in X | f(x) < g(x)\} \subseteq N_2$. Let $x \in \{x \in X | f(x) \neq g(x)\}$ then $f(x) \neq g(x)$ hence $f(x) < g(x) \vee g(x) < f(x)$ so that $x \in \{x \in X | g(x) < f(x)\} \cup \{x \in X | f(x) < g(x)\}$ proving that

$$\{x \in X | f(x) \neq g(x)\} \subseteq \{x \in X | g(x) < f(x)\} \cup \{x \in X | f(x) < g(x)\} \subseteq N_1 \cup N_2 \in \mathcal{A}$$

which as $\mu(N_1 \cup N_2) \leq \mu(N_1) + \mu(N_2) = 0$, proves that

$$f = g \text{ } \mu\text{-a.e.}$$

4. As $f = g$ μ -a.e. there exists a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X | f(x) \neq g(x)\} \subseteq N$. Let now $x \in \{x \in X | \alpha \cdot f(x) \neq \alpha \cdot g(x)\}$ then $\alpha \cdot f(x) \neq \alpha \cdot g(x) \xrightarrow{\alpha \neq 0} f(x) \neq g(x)$ proving that $\{x \in X | \alpha \cdot f(x) \neq \alpha \cdot g(x)\} \subseteq \{x \in X | f(x) \neq g(x)\} \subseteq N$. So

$$\alpha \cdot f \neq \alpha \cdot g \text{ } \mu\text{-a.e.}$$

5. As $f = h$ μ -a.e. and $g = k$ μ -a.e. there exists $N_1, N_2 \in \mathcal{A}$ with $\mu(N_1) = 0 = \mu(N_2)$ such that $\{x \in X | f(x) \neq h(x)\} \subseteq N_1$ and $\{x \in X | g(x) \neq k(x)\} \subseteq N_2$. Let $x \in \{x \in X | f(x) + g(x) \neq h(x) + k(x)\}$ then $f(x) \neq h(x) \vee g(x) \neq k(x)$ [for if $f(x) = h(x) \wedge g(x) = k(x) \Rightarrow f(x) + g(x) = h(x) + k(x)$] so that $x \in \{x \in X | f(x) \neq h(x)\} \cup \{x \in X | g(x) \neq k(x)\}$. Hence

$$\{x \in X | f(x) + g(x) \neq h(x) + k(x)\} \subseteq N_1 \cup N_2 \in \mathcal{A}$$

As $\mu(N_1 \cup N_2) \leq \mu(N_1) + \mu(N_2) = 0$ it follows that $f + g = h + k$ μ -a.e. $\square$

Theorem 21.267. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f: X \rightarrow \overline{\mathbb{R}}$ $g: X \rightarrow \overline{\mathbb{R}}$ with $f(X), g(X) \subseteq \mathbb{R}$ then

$$f = g \text{ } \mu\text{-a.e.} \Leftrightarrow f - g = 0 \text{ } \mu\text{-a.e.}$$

Note 21.268. $f(X), g(X) \subseteq \mathbb{R}$ is needed to ensure that $g - f$ is well defined.

Proof. Note that

$$\begin{aligned} x \in \{x \in X | f(x) \neq g(x)\} &\Leftrightarrow x \in X \wedge f(x) \neq g(x) \\ &\Leftrightarrow x \in X \wedge (f - g)(x) \neq 0 \\ &\Leftrightarrow x \in \{x \in X | (f - g)(x) \neq 0\} \end{aligned}$$

proving that $\{x \in X | f(x) \neq g(x)\} = \{x \in X | (f - g)(x) \neq 0\}$, from which we have trivially that

$$f = g \text{ } \mu\text{-a.e.} \Leftrightarrow f - g = 0 \text{ } \mu\text{-a.e.} \quad \square$$

The following theorem shows that for a complete measure space a function that is a.e. equal to a measurable function is also measurable.

Theorem 21.269. Let $\langle X, \mathcal{A}, \mu \rangle$ be a **complete** measure space [see theorem: 21.206], $f: X \rightarrow \overline{\mathbb{R}}$ a $\mathcal{A}$ -measurable function and $g: X \rightarrow \overline{\mathbb{R}}$ satisfies $f = g$ μ -a.e. then g is $\mathcal{A}$ -measurable.

Proof. As $f = g$ μ -a.e. there exists a $N \in \mathcal{A}$ with $\mu(N) = 0$ and $\{x \in X | f(x) \neq g(x)\} \subseteq N$. So

$$x \in X \setminus N \Rightarrow f(x) = g(x) \quad (21.398)$$

. Let $t \in \mathbb{R}$ then

$$\begin{aligned} x \in \{g \leq t\} &\Leftrightarrow x \in X \wedge g(x) \leq t \\ &\Leftrightarrow (x \in X \setminus N \vee x \in N) \wedge g(x) \leq t \\ &\Leftrightarrow (x \in X \setminus N \wedge g(x) \leq t) \vee (x \in N \wedge g(x) \leq t) \\ &\stackrel{[eq: 21.398]}{\Leftrightarrow} (x \in X \setminus N \wedge f(x) \leq t) \vee (x \in N \wedge g(x) \leq t) \\ &\Leftrightarrow x \in ((X \setminus N) \cap \{f \leq t\}) \vee x \in (N \cap \{g \leq t\}) \\ &\Leftrightarrow x \in ((X \setminus N) \cap \{f \leq t\}) \cup (N \cap \{g \leq t\}) \end{aligned}$$

which proves that

$$\{g \leq t\} = ((X \setminus N) \cap \{f \leq t\}) \cup (N \cap \{g \leq t\}) \quad (21.399)$$

Given that f is $\mathcal{A}$ -measurable we have by [theorem: 21.242] that $\{f \leq t\} \in \mathcal{A}$, further as $N \in \mathcal{A}$ we have also $X \setminus N \in \mathcal{A}$. Finally as $N \cap \{g \leq t\} \subseteq N$ and $\mu(N) = 0$ it follows from the fact μ is complete that $N \cap \{g \leq t\} \in \mathcal{A}$. So $(X \setminus N) \cap \{f \leq t\} \cup (N \cap \{g \leq t\}) \in \mathcal{A}$ which by [eq: 21.399] proves that $\{g \leq t\} \in \mathcal{A}$. Applying then [theorem: 21.242] results in

$$g \text{ is } \mathcal{A}\text{-measurable} \quad \square$$

Theorem 21.270. Let $\langle X, \mathcal{A}, \mu \rangle$ be a **complete measure space** and $\{f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ a sequence of $\mathcal{A}$ -measurable functions and $f: X \rightarrow \overline{\mathbb{R}}$ a function such that $\lim_{n \rightarrow \infty} f_n = f$ μ -a.e. then $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$.

Proof. Let $D = \left\{x \in X \mid \lim_{n \rightarrow \infty} f_n(x) \text{ exist}\right\}$ then we have by [theorem: 21.255] that

$$f_\infty: X \rightarrow \overline{\mathbb{R}} \text{ where } f_\infty(x) = \begin{cases} \lim_{n \rightarrow \infty} f_n(x) & \text{if } x \in D \\ 0 & \text{if } x \in X \setminus D \end{cases} \text{ is } \mathcal{A}\text{-measurable}$$

As $\lim_{n \rightarrow \infty} f_n = f$ μ -a.e. there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$X \setminus \left\{x \in X \mid \lim_{n \rightarrow \infty} f_n(x) \text{ exist and } \lim_{n \rightarrow \infty} f_n(x) = f(x)\right\} \subseteq N$$

If $x \in \left\{x \in X \mid \lim_{n \rightarrow \infty} f_n(x) \text{ exist and } \lim_{n \rightarrow \infty} f_n(x) = f(x)\right\}$ then $\lim_{n \rightarrow \infty} f_n(x)$ exists and $\lim_{n \rightarrow \infty} f_n(x) = f(x)$ so that $x \in D$ and $f(x) = \lim_{n \rightarrow \infty} f_n(x) = f_\infty(x)$ which proves that $x \in \{x \in X \mid f(x) = f_\infty(x)\}$. Hence

$$\left\{x \in X \mid \lim_{n \rightarrow \infty} f_n(x) \text{ exist and } \lim_{n \rightarrow \infty} f_n(x) = f(x)\right\} \subseteq \{x \in X \mid f(x) = f_\infty(x)\}$$

so that

$$X \setminus \{x \in X \mid f(x) = f_\infty(x)\} \subseteq X \setminus \left\{x \in X \mid \lim_{n \rightarrow \infty} f_n(x) \text{ exist and } \lim_{n \rightarrow \infty} f_n(x) = f(x)\right\} \subseteq N$$

from which it follows that $f = f_\infty$ μ -a.e.. Using then the previous theorem [theorem: 21.269] we must conclude that

$$f \text{ is } \mathcal{A}\text{-measurable.} \quad \square$$

21.5 The measure integral

We will build up the definition of the measure integral in fases:

1. We define a integral over measurable functions whose image is finite the so called **simple functions**.
2. Extend this integral to non negative measurable functions.
3. Extend the integral of non negative measurable function to general measurable functions.
4. Finally extend the integral to complex valued functions.

21.5.1 Integral of simple functions

Definition 21.271. Let X be a non empty set then a function $f: X \rightarrow \overline{\mathbb{R}}$ is a **simple function** if $f(X)$ is a **finite set** and $f(X) \subseteq \mathbb{R}$. The set of all simple function graphs is noted as $\mathcal{S}[X]$ so

$$\mathcal{S}[X] = \{f \in \overline{\mathbb{R}}^X \mid f(X) \subseteq \mathbb{R} \text{ and } f(X) \text{ is a finite set}\}$$

We have the following alternative definition of a simple function.

Theorem 21.272. *Let X be a non empty set then for a function $f: X \rightarrow \overline{\mathbb{R}}$ with $f(X) \subseteq \mathbb{R}$ we have the following equivalences:*

1. f is a simple function [in other words $f \in \mathcal{S}[X]$]
2. There exist a $n \in \mathbb{N}$ and a bijection $\beta: \{1, \dots, n\} \rightarrow f(X)$ such that for $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{P}(X)$ defined by $A_i = f^{-1}(\{\beta(i)\})$ we have:
 - a. $\{A_i\}_{i \in \{1, \dots, n\}}$ is pairwise disjoint
 - b. $X = \bigsqcup_{i \in \{1, \dots, n\}} A_i$
 - c. $f = \sum_{i=1}^n \beta(i) \cdot \mathcal{X}_{A_i}$
3. There exist a $n \in \mathbb{N}$ and a pairwise disjoint $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{P}(X)$ and $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}$ such that

$$f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{A_i}$$

Proof.

- 1 $\Rightarrow$ 2. As f is a simple function $f(X)$ is finite, further as $X \neq \emptyset$ $f(X) \neq \emptyset$, hence there exists a $n \in \mathbb{N}$ and a bijection

$$\beta: \{1, \dots, n\} \rightarrow f(X)$$

Define $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{P}(X)$ by $A_i = f^{-1}(\{\beta(i)\})$. Let $i, j \in \{1, \dots, n\}$ with $i \neq j$ then

$$\begin{aligned} A_i \cap A_j &= f^{-1}(\{\beta(i)\}) \cap f^{-1}(\{\beta(j)\}) \\ &\stackrel{[\text{theorem: 2.95}]}{=} f^{-1}(\{\beta(i)\} \cap \{\beta(j)\}) \\ &\stackrel{i \neq j \Rightarrow \beta(i) \neq \beta(j) \Rightarrow \{\beta(i)\} \cap \{\beta(j)\} = \emptyset}{=} f^{-1}(\emptyset) \\ &= \emptyset \end{aligned}$$

which proves that

$$\{A_i\}_{i \in \{1, \dots, n\}} \text{ is pairwise disjoint} \quad (21.400)$$

Let $x \in X$ then $f(x) \in f(X)$ so, using the surjectivity of β , there exist a $i \in \{1, \dots, n\}$ such that $f(x) = \beta(i)$. Hence $x \in f^{-1}(\{\beta(i)\}) = A_i \subseteq \bigsqcup_{i \in \{1, \dots, n\}} A_i$ which proves that $X \subseteq \bigsqcup_{i \in \{1, \dots, n\}} A_i \subseteq X$ or that

$$X = \bigsqcup_{i \in \{1, \dots, n\}} A_i \quad (21.401)$$

Let $x \in X$ then by [eqs: 21.400, 21.401] there exists a $i \in \{1, \dots, n\}$ such that $x \in A_i$ and $\forall j \in \{1, \dots, n\}$ $x \notin A_j$. Hence

$$\begin{aligned} \left(\sum_{k=1}^n f(\beta(k)) \cdot \mathcal{X}_{A_k} \right)(x) &= \sum_{k \in \{1, \dots, n\}} f(\beta(k)) \cdot \mathcal{X}_{A_k}(x) \\ &= \sum_{k \in \{i\}} f(\beta(k)) \cdot \mathcal{X}_{A_k}(x) + \sum_{k \in \{1, \dots, n\} \setminus \{i\}} f(\beta(k)) \cdot \mathcal{X}_{A_k}(x) \\ &= f(\beta(i)) \cdot \mathcal{X}_{A_i}(x) + \sum_{k \in \{1, \dots, n\} \setminus \{i\}} f(\beta(k)) \cdot 0 \\ &= f(\beta(i)) \\ &= f(x) \end{aligned}$$

proving that

$$f = \sum_{k=1}^n f(\beta(k)) \cdot \mathcal{X}_{A_k} \quad (21.402)$$

2 $\Rightarrow$ 3. By (2) there exists a $n \in \mathbb{N}$ and a bijection $\beta: \{1, \dots, n\} \rightarrow f(X) \subseteq \mathbb{R}$ such that for $\{A_i\}_{i \in \{1, \dots, n\}}$ defined by $A_i = \beta^{-1}(\{\beta(i)\})$ we have

$$\{A_i\}_{i \in \{1, \dots, n\}} \text{ is pairwise disjoint, } X = \bigsqcup_{i \in \{1, \dots, n\}} A_i \text{ and } f = \sum_{i=1}^n f(\beta(i)) \cdot \mathcal{X}_{X, A_i}$$

Define $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq f(X) \subseteq \mathbb{R}$ by $f_i = f(\beta(i)) \in \mathbb{R}$ then we have by the above also

$$f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{X, A_i}$$

which finish the proof of (3).

3 $\Rightarrow$ 1. By (3) there exists a $n \in \mathbb{N}$, $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{P}(X)$, $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}$ such that

$$\{A_i\}_{i \in \{1, \dots, n\}} \text{ is pairwise disjoint and } f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{X, A_i}$$

Let $y \in f(X)$ then there exists a $x \in X$ such that $y = f(x)$. Using the above there exist a $i \in \{1, \dots, n\}$ such that $x \in A_i$ and $\forall j \in \{1, \dots, n\} \setminus \{i\}$ $x \notin A_j$ hence

$$\begin{aligned} y &= f(x) \\ &= \left(\sum_{k=1}^n f_k \cdot \mathcal{X}_{A_k} \right)(x) \\ &= \sum_{k \in \{1, \dots, n\}} f_k \cdot \mathcal{X}_{A_k}(x) \\ &= \sum_{k \in \{i\}} f_k \cdot \mathcal{X}_{A_k}(x) + \sum_{k \in \{1, \dots, n\} \setminus \{i\}} f_k \cdot \mathcal{X}_{A_k}(x) \\ &= f_i \cdot \mathcal{X}_{A_i}(x) + \sum_{k \in \{1, \dots, n\} \setminus \{i\}} f_k \cdot 0 \\ &= f_i \\ &\in \{f_i | i \in \{1, \dots, n\}\} \end{aligned}$$

from which it follows that $f(X) \subseteq \{f_i | i \in \{1, \dots, n\}\}$ a finite set. As the subset of a finite set is finite [see theorem: 6.43] it follows that $f(X)$ is a finite set, hence f is a simple function by definition. $\square$

We have the following important result for functions of the form $f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{A_i}$ like simple functions.

Theorem 21.273. Let X be a non empty set, $n \in \mathbb{N}$, I finite, $\{A_i\}_{i \in I} \subseteq \mathcal{P}(X)$ pairwise disjoint and $\{f_i\}_{i \in I} \subseteq \mathbb{R}$ then for

$$f = \sum_{i \in I} f_i \cdot \mathcal{X}_{X, A_i}: X \rightarrow \overline{\mathbb{R}}$$

we have that:

1. $\forall i \in I$ we have $\forall x \in A_i$ that $f(x) = f_i$
2. $\forall x \in X \setminus (\bigsqcup_{i \in I} A_i)$ we have $f(x) = 0$

Proof.

1. Let $i \in I$ then for $x \in A_i$ we have, as $\{A_i\}_{i \in I}$ is pairwise disjoint, that $\forall j \in I \setminus \{i\}$ $x \notin A_j$. So

$$\begin{aligned} f(x) &= \sum_{k \in I} f_k \cdot \mathcal{X}_{X, A_k}(x) \\ &= \sum_{k \in \{i\}} f_k \cdot \mathcal{X}_{X, A_k}(x) + \sum_{k \in I \setminus \{i\}} f_k \cdot \mathcal{X}_{X, A_k}(x) \\ &= f_i \cdot \mathcal{X}_{X, A_i}(x) + \sum_{k \in I \setminus \{i\}} f_k \cdot 0 \\ &= f_i \end{aligned}$$

2. If $x \in X \setminus (\bigsqcup_{i \in I} A_i)$ then $\forall i \in I$ we have $x \notin A_i$ so that

$$f(x) = \sum_{i \in I} f_i \cdot \chi_{X, A_i}(x) = \sum_{i \in I} f_i \cdot 0 = 0 \quad \square$$

The set of simple functions is stable under pointwise sum and scalar product.

Theorem 21.274. *Let X be a set then we have*

1. $\forall f \in \mathcal{S}[X]$ and $\forall \alpha \in \mathbb{R}$ we have $\alpha \cdot f \in \mathcal{S}[X]$
2. $\forall f, g \in \mathcal{S}[X]$ we have $f + g \in \mathcal{S}[X]$

Proof.

1. We have to consider two cases for α

$\alpha = 0$. Then $(\alpha \cdot f)(X) = \{0\}$ which is finite and non empty

$\alpha \neq 0$. As f is a simple function there exists a $n \in \mathbb{N}$ and a bijection $\beta: \{1, \dots, n\} \rightarrow f(X)$.
Define now

$$\alpha_f: \{1, \dots, n\} \rightarrow (\alpha \cdot f)(X) \text{ by } \alpha_f(i) = \alpha \cdot \beta(i)$$

If $y \in (\alpha \cdot f)(X)$ then there exists a $x \in X$ such that

$$y = (\alpha \cdot f)(x) = \alpha \cdot f(x) \xrightarrow{\alpha \neq 0} f(x) = \frac{y}{\alpha}$$

As $f(x) \in f(X)$ there exists a $i \in \{1, \dots, n\}$ such that

$$\beta(i) = f(x) = \frac{y}{\alpha} \Rightarrow y = \alpha \cdot \beta(i) = \alpha_f(i)$$

proving that α_f is a surjection. So using [theorem: 6.44] we have that $(\alpha \cdot f)(X)$ is finite.

so in all cases $(\alpha \cdot f)(X)$ is finite proving that $\alpha \cdot f$ is a simple function.

2. As f and g are simple functions we have that $f(X)$ and $g(X)$ are finite. As the product of finite sets is finite [see theorem: 6.41] we have that

$$f(X) \times g(X) \text{ is finite}$$

Define now

$$s: f(X) \times g(X) \rightarrow \{x + y \mid (x, y) \in f(X) \times g(X)\} \text{ by } s(x, y) = x + y$$

Then if $z \in \{x + y \mid (x, y) \in f(X) \times g(X)\}$ there exists a $x \in f(X)$ and a $y \in g(X)$ such that $z = x + y = s(x, y)$ which proves that s is surjective. Applying then [theorem: 6.44] proves that

$$\{x + y \mid (x, y) \in f(X) \times g(X)\} \text{ is finite}$$

Let $y \in (f + g)(X)$ then there exists a $x \in X$ such that

$$y = f(x) + g(x) \in \{x + y \mid (x, y) \in f(X) \times g(X)\}.$$

Hence $(f + g)(X) \subseteq \{x + y \mid (x, y) \in f(X) \times g(X)\}$ which, as we have proved that $\{x + y \mid (x, y) \in f(X) \times g(X)\}$ is finite, proves using [theorem: 6.43] that $(f + g)(X)$ is finite..
This proves that $f + g$ is a simple function. $\square$

A example of a simple function $f: \mathbb{R} \rightarrow \overline{\mathbb{R}}$ of the form

$$f = f_1 \cdot \chi_{A_1} + f_2 \cdot \chi_{A_2} + f_3 \cdot \chi_{A_3} + f_4 \cdot \chi_{A_4} \text{ where } f(X) = \{f_1, f_2, f_3, f_4\}$$

is shown in the following figure:

Figure 21.5.

The area below the above function and the X -axis is intuitively equal to the sum

$$f_1 \cdot \text{size}(A_1) + f_2 \cdot \text{size}(A_2) + f_3 \cdot \text{size}(A_3) + f_4 \cdot \text{size}(A_4)$$

so the integral of f which calculates this size should be of the form

$$\int f = f_1 \cdot \text{size}(A_1) + f_2 \cdot \text{size}(A_2) + f_3 \cdot \text{size}(A_3) + f_4 \cdot \text{size}(A_4)$$

hence we need a way to calculate the sizes of A_1, A_2, A_3 and A_4 , in other words A_1, A_2, A_3 and A_4 must be measurable so that we can use the measure function to calculate the sizes. The integral becomes then

$$\int f = f_1 \cdot \mu(A_1) + f_2 \cdot \mu(A_2) + f_3 \cdot \mu(A_3) + f_4 \cdot \mu(A_4)$$

For this to work we must have $A_1, A_2, A_3, A_4 \in \mathcal{A}$ and as $\mu(A_i)$ can be ∞ f_1, f_2, f_3, f_4 must be non negative. This motivates the following definition.

Definition 21.275. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then the set of $\mathcal{A}$ -measurable real valued simple functions is noted as $\mathcal{S}[X, \mathcal{A}]$. Hence

$$\mathcal{S}[X, \mathcal{A}] = \{f \in \mathcal{S}[X] \mid f: X \rightarrow \overline{\mathbb{R}} \text{ is } \mathcal{A}\text{-measurable}\} \subseteq \mathcal{S}[X]$$

Note 21.276. If $f \in \mathcal{S}[X, \mathcal{A}]$ then $f \in \mathcal{S}[X] \xRightarrow{\text{definition: 21.271}} f(X) \subseteq \mathbb{R}$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. Hence we have that

$$\mathcal{S}[X, \mathcal{A}] = \mathcal{S}[X] \cap \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

We have a simpler alternative definition for $\mathcal{S}[X, \mathcal{A}]$

Lemma 21.277. Let X be a set, $n \in \mathbb{N}$ and $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{P}(X)$ pairwise disjoint then for

$$\{B_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{P}(X) \text{ defined by } B_i = \begin{cases} X \setminus (\bigcup_{i \in \{1, \dots, n\}} A_i) & \text{if } i = n+1 \\ A_i & \text{if } i \in \{1, \dots, n\} \end{cases}$$

we have that

$$\{B_i\}_{i \in \{1, \dots, n\}} \text{ is pairwise disjoint}$$

and

$$X = \bigsqcup_{i \in \{1, \dots, n+1\}} A_i$$

Proof. If $i, j \in \{1, \dots, n+1\}$ with $i \neq j$ then we have for i, j either:

$$i = n+1. \text{ Then } A_i \cap A_j = (X \setminus (\bigsqcup_{k \in \{1, \dots, n\}} A_k)) \cap A_j \subseteq (X \setminus A_j) \cap A_i = \emptyset.$$

$$j = n+1. \text{ Then } A_i \cap A_j = A_i \cap (X \setminus (\bigsqcup_{k \in \{1, \dots, n\}} A_k)) \subseteq A_i \cap (X \setminus A_i) = \emptyset.$$

$$i, j \in \{1, \dots, n\}. \text{ Then as } \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{P}(X) \text{ is pairwise disjoint we have that } A_i \cap A_j = \emptyset.$$

which proves that

$$\{B_i\}_{i \in \{1, \dots, n\}} \text{ is pairwise disjoint}$$

Further

$$\begin{aligned} \bigsqcup_{i \in \{1, \dots, n+1\}} B_i &\stackrel{[\text{theorem: 2.128}]}{=} \left(\bigsqcup_{i \in \{1, \dots, n\}} B_i \right) \cup \left(\bigcup_{i \in \{n+1\}} B_i \right) \\ &= \left(\bigsqcup_{i \in \{1, \dots, n\}} B_i \right) \cup B_{n+1} \\ &= \left(\bigsqcup_{i \in \{1, \dots, n\}} B_i \right) \cup \left(X \setminus \left(\bigsqcup_{i \in \{1, \dots, n\}} B_i \right) \right) \\ &= X \end{aligned}$$

hence

$$X = \bigsqcup_{i \in \{1, \dots, n+1\}} B_i$$

□

Theorem 21.278. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then we have the following equivalences:

1. $f \in \mathcal{S}[X, \mathcal{A}]$ [in other words $f \in \mathcal{S}[X]$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$
2. $f \in \mathcal{S}[X]$ and $\forall y \in f(X) \ f^{-1}(\{y\}) \in \mathcal{A}$
3. There exists a $n \in \mathbb{N}$, a pairwise disjoint family $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ of measurable sets and a family $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}$ of real numbers so that

$$f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{X, A_i}$$

Proof.

1 $\Rightarrow$ 2. As $f \in \mathcal{S}[X, \mathcal{A}] \Rightarrow f \in \mathcal{S}[X] \Rightarrow f(X) \subseteq \mathbb{R}$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. Let $y \in f(X)$ then, as $f(X) \subseteq \mathbb{R}$ it follows that $y \in \mathbb{R}$. Applying then [theorem: 21.244] it follows from the fact that f is $\mathcal{A}$ -measurable that $f^{-1}(\{y\}) \stackrel{[\text{definition: 21.240}]}{=} \{f = y\} \in \mathcal{A}$.

2 $\Rightarrow$ 3. As $f \in \mathcal{S}[X] \Rightarrow f(X) \subseteq \mathbb{R}$ we can use [theorem: 21.272] to get a $n \in \mathbb{N}$ and a bijection $\beta: \{1, \dots, n\} \rightarrow f(X)$ such that for $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{P}(X)$ defined by $A_i = f^{-1}(\beta(i))$ we have

$$f = \sum_{i=1}^n \beta(i) \cdot \mathcal{X}_{X, A_i} \text{ and } \{A_i\}_{i \in \{1, \dots, n\}} \text{ is pairwise disjoint}$$

Using (2) we have $\forall i \in \{1, \dots, n\} \ A_i = f^{-1}(\beta(i)) \in \mathcal{A}$ so that

$$\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$$

Finally, define $\{f_i\}_{i \in \{1, \dots, n\}}$ by $f_i = \beta(i) \in f(X) \subseteq \mathbb{R}$ then

$$\{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R} \text{ and } f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{A_i}$$

3 $\Rightarrow$ **1**. Define

$$\{B_i\}_{i \in \{1, \dots, n+1\}} \text{ by } B_i = \begin{cases} X \setminus (\bigcup_{i=1, \dots, n} A_i) & \text{if } i = n+1 \\ A_i & \text{if } i \in \{1, \dots, n\} \end{cases}$$

$$\{g_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathbb{R} \text{ by } g_i = \begin{cases} 0 & \text{if } i = n+1 \\ f_i & \text{if } i \in \{1, \dots, n\} \end{cases}$$

Then using [lemma: 21.277] we have that

$$\{g_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathbb{R}, \{B_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{A} \text{ is pairwise disjoint, } \bigcup_{i=1}^{n+1} B_i = X \quad (21.403)$$

Now $\forall x \in X$ we have, using the hypothesis that $\sum_{i=1}^n f_i \cdot \mathcal{X}_{X, A_i}(x) = f(x)$

$$\sum_{i=1}^{n+1} g_i \cdot \mathcal{X}_{X, B_i}(x) = g_{n+1} \cdot \mathcal{X}_{X, B_{n+1}}(x) + \sum_{i=1}^n g_i \cdot \mathcal{X}_{X, B_i}(x) = 0 + \sum_{i=1}^n f_i \cdot \mathcal{X}_{X, A_i}(x) = f(x)$$

so that

$$f = \sum_{i=1}^{n+1} g_i \cdot \mathcal{X}_{X, B_i} \quad (21.404)$$

Let $x \in X$ then there exist a $i \in \{1, \dots, n+1\}$ such that $x \in B_i$ hence $f(x) \stackrel{[\text{theorem: 21.273}]}{=} g_i \in \mathbb{R}$ which proves that

$$f(X) \subseteq \mathbb{R}$$

So by [theorem: 21.272] we have

$$f \in \mathcal{S}[X]$$

Define $\{I_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{P}(\{1, \dots, n+1\})$ by

$$I_i = \{j \in \{1, \dots, n+1\} \mid f(B_j) = \{g_i\}\} \subseteq \{1, \dots, n+1\}$$

then we prove that

$$\forall i \in \{1, \dots, n+1\} \text{ we have } f^{-1}(\{g_i\}) = \bigcup_{j \in I_i} B_j \stackrel{[\text{theorem: 21.36}]}{\in} \mathcal{A} \quad (21.405)$$

Proof. Given $i \in \{1, \dots, n+1\}$. Let $x \in f^{-1}(\{g_i\})$ then $f(x) = g_i$. As $x \in X = \bigcup_{k \in \{1, \dots, n+1\}} B_k$ there exist a $k \in \{1, \dots, n+1\}$ such that $x \in B_k$. Using [theorem: 21.273] it follows that $f(B_k) = \{g_k\}$ which, as $x \in B_k \wedge f(x) = g_i$, proves that $g_i = g_k$, hence $f(A_k) = \{g_i\}$ or $k \in I_i$. In other words $x \in B_k \subseteq \bigcup_{j \in I_i} B_j$, so that

$$f^{-1}(\{g_i\}) \subseteq \bigcup_{j \in I_i} B_j \quad (21.406)$$

Let $x \in \bigcup_{j \in I_i} B_j$ then there exist a $k \in I_i$ such that $x \in B_k$, as $k \in I_i$ $f(B_k) = \{g_i\}$, so that $f(x) = g_i$ or $x \in f^{-1}(\{g_i\})$. Hence $\bigcup_{j \in I_i} B_j \subseteq f^{-1}(\{g_i\})$ which combined with [eq: 21.406] proves $f^{-1}(\{g_i\}) = \bigcup_{j \in I_i} B_j$ and thus [eq: 21.405]. $\square$

Let $x \in X = \bigcup_{i \in \{1, \dots, n+1\}} B_i$ then there exist a $i \in \{1, \dots, n+1\}$ such that $x \in B_i$. Using [theorem: 21.273] again it follows that $f(x) = g_i$ so that $x \in f^{-1}(\{g_i\}) \subseteq \bigcup_{i \in \{1, \dots, n+1\}} f^{-1}(\{g_i\})$. Hence we have $X \subseteq \bigcup_{i \in \{1, \dots, n+1\}} f^{-1}(\{g_i\})$ and as trivially $\bigcup_{i \in \{1, \dots, n+1\}} f^{-1}(\{g_i\}) \subseteq X$ it follows that

$$X = \bigcup_{i \in \{1, \dots, n+1\}} f^{-1}(\{g_i\}) \quad (21.407)$$

We are now ready to prove that f is $\mathcal{A}$ -measurable. Let $B \in \mathcal{B}[\overline{\mathbb{R}}]$ then as $f^{-1}(B) \subseteq X$ we have

$$\begin{aligned}
 f^{-1}(B) &= f^{-1}(B) \cap X \\
 &\stackrel{[\text{eq: 21.407}]}{=} f^{-1}(B) \cap \left(\bigcup_{i \in \{1, \dots, n+1\}} f^{-1}(\{g_i\}) \right) \\
 &= \bigcup_{i \in \{1, \dots, n+1\}} (f^{-1}(B) \cap f^{-1}(\{g_i\})) \\
 &\stackrel{[\text{theorem: 2.95}]}{=} \bigcup_{i \in \{1, \dots, n+1\}} f^{-1}(B \cap \{g_i\}) \tag{21.408}
 \end{aligned}$$

Let $i \in \{1, \dots, n+1\}$ then for g_i we have either :

$g_i \in B$. Then $B \cap \{g_i\} = \{g_i\}$ so that $f^{-1}(B) \cap f^{-1}(\{g_i\}) = f^{-1}(\{g_i\}) \in \mathcal{A}$ [see eq: 21.405]

$g_i \notin B$. Then $f^{-1}(B \cap \{g_i\}) = f^{-1}(\emptyset) = \emptyset \in \mathcal{A}$

Hence $\forall i \in \{1, \dots, n+1\}$ $f^{-1}(B \cap \{g_i\}) \in \mathcal{A}$ so that $\bigcup_{i \in \{1, \dots, n+1\}} f^{-1}(B \cap \{g_i\}) \in \mathcal{A}$ which by [eq: 21.408] proves that $f^{-1}(B) \in \mathcal{A}$. As $B \in \mathcal{B}[\overline{\mathbb{R}}]$ was chosen arbitrary it follows by definition that

f is $\mathcal{A}$ -measurable $\square$

We show now that $\mathcal{S}[X, \mathcal{A}]$ is stable under the pointwise sum and product.

Theorem 21.279. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space then we have*

1. $\forall f \in \mathcal{S}[X, \mathcal{A}]$ and $\forall \alpha \in \mathbb{R}$ we have $\alpha \cdot f \in \mathcal{S}[X, \mathcal{A}]$
2. $\forall f, g \in \mathcal{S}[X, \mathcal{A}]$ we have $f + g \in \mathcal{S}[X, \mathcal{A}]$

Proof.

1. As $f \in \mathcal{S}[X, \mathcal{A}]$ we have that $f \in \mathcal{S}[X]$ and f is $\mathcal{A}$ -measurable. By [theorem: 21.274] we have $\alpha \cdot f \in \mathcal{S}[X]$ and by [theorem: 21.249] that $\alpha \cdot f$ is $\mathcal{A}$ -measurable. Hence $\alpha \cdot f \in \mathcal{S}[X, \mathcal{A}]$.
2. As $f, g \in \mathcal{S}[X, \mathcal{A}]$ we have that $f, g \in \mathcal{S}[X]$ and f, g are $\mathcal{A}$ -measurable. By [theorem: 21.274] we have $f + g \in \mathcal{S}[X]$. Further using [theorem: 21.245] it follows that $f + g$ is $\mathcal{A}$ -measurable. Hence $f + g \in \mathcal{S}[X, \mathcal{A}]$. $\square$

When defining integral we are only interested in non negative measurable simple functions hence the following definition.

Definition 21.280. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space then the set of non negative $\mathcal{A}$ -measurable real valued simple functions is noted as $\mathcal{S}^+[X, \mathcal{A}]$ hence*

$$\mathcal{S}^+[X, \mathcal{A}] = \{f \in \mathcal{S}[X, \mathcal{A}] \mid f(X) \subseteq [0, \infty[\}$$

Note 21.281. *As by [definition: 21.275] $\mathcal{S}[X, \mathcal{A}] \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows that*

$$\mathcal{S}^+[X, \mathcal{A}] \subseteq \mathcal{S}[X, \mathcal{A}] \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Note 21.282. *If $f \in \mathcal{S}^+[X, \mathcal{A}]$ then $f \in \mathcal{S}[X]$, $f(X) \subset [0, \infty[$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ so that $f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ which proves that*

$$\mathcal{S}^+[X, \mathcal{A}] \subseteq \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

A trivial example of a non negative measurable simple function is the constant function.

Example 21.283. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $a \in [0, \infty[$ then $C_a \in \mathcal{S}^+[X, \mathcal{A}]$ where

$$C_a: X \rightarrow \overline{\mathbb{R}} \text{ is defined by } C_a(x) = a$$

Proof. As $C_a(X) = \{a\}$, a finite set, we have that $C_a \in \mathcal{S}[X]$ and $C_a(X) \subseteq [0, \infty[$. Let $B \in \mathcal{B}[\mathbb{R}]$ then for a we have either:

$a \in B$. Then $(C_a)^{-1}(B) = \{x \in X \mid a = C_a(x) \in B\} = X \in \mathcal{A}$

$a \notin B$. Then $(C_a)^{-1}(B) = \{x \in X \mid a = C_a(x) \in B\} = \emptyset \in \mathcal{A}$

so that C_a is $\mathcal{A}$ -measurable. Hence it follows that $C_a \in \mathcal{S}^+[X, \mathcal{A}]$. $\square$

We have a simpler alternative definition for $\mathcal{S}^+[X, \mathcal{A}]$

Theorem 21.284. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space then we have the following equivalences:*

1. $f \in \mathcal{S}^+[X, \mathcal{A}]$ [in other words $f \in \mathcal{S}[X]$, $f(X) \subseteq [0, \infty[$ and f is $\mathcal{A}$ -measurable].
2. $f \in \mathcal{S}[X]$, $f(X) \subseteq [0, \infty[$ and $\forall y \in f(X)$ $f^{-1}(\{y\}) \in \mathcal{A}$
3. There exists a $n \in \mathbb{N}$, a pairwise disjoint family $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ of measurable sets and a family $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$ of real non negative numbers so that

$$f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{X, A_i}$$

Proof.

1 $\Rightarrow$ 2. As $f \in \mathcal{S}^+[X, \mathcal{A}]$ we have that $f \in \mathcal{S}[X, \mathcal{A}]$ and $f(X) \subseteq [0, \infty[$. Using [theorem: 21.278] it follows that $f \in \mathcal{S}[X]$ and $\forall y \in f(X)$ $f^{-1}(\{y\}) \in \mathcal{A}$.

2 $\Rightarrow$ 3. As $f \in \mathcal{S}[X]$ and $\forall y \in f(X)$ $f^{-1}(\{y\}) \in \mathcal{A}$ it follows from [theorem: 21.278] that there exist a $n \in \mathbb{N}$, a pairwise disjoint family $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ and a $\{f'_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}$ such that

$$f = \sum_{i=1}^n f'_i \cdot \mathcal{X}_{X, A_i}$$

Define

$$\{f_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[\text{ by } f_i = \max(0, f'_i)$$

Consider now

$$g = \sum_{i=1}^n f_i \cdot \mathcal{X}_{X, A_i}$$

Let $x \in X$ then we have either:

$x \in \bigcup_{i \in \{1, \dots, n\}} A_i$. Then there exist a $i \in \{1, \dots, n\}$ such that $x \in A_i$. Using [theorem: 21.273] we have that

$$f'_i = f(x) \wedge f_i = g(x)$$

Further as $f'_i = f(x) \subseteq f(X) \subseteq [0, \infty[$ it follows that $f'_i = \max(f'_i, 0) = f_i$ so that $f(x) = g(x)$.

$x \in X \setminus (\bigcup_{i \in \{1, \dots, n\}} A_i)$. Then using [theorem: 21.273] we have that $f(x) = 0 = g(x) = 0$

As in all cases we have $f(x) = g(x)$ it follows that $f = g$ hence we have that

$$f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{X, A_i} \text{ where } \{f_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[\text{ and } \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \text{ is pairwise disjoint}$$

3 $\Rightarrow$ 1. By the hypothesis we have that $f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{X, A_i}$ where $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ is pairwise disjoint and $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$. Using [theorem: 21.278] it follows that $f \in \mathcal{S}[X, \mathcal{A}]$. Let $x \in X$ then we have

$$f(x) \stackrel{[\text{theorem: 21.273}]}{=} \begin{cases} f_i \in [0, \infty[\text{ if } x \in \bigcup_{i \in \{1, \dots, n\}} A_i \\ 0 \in [0, \infty[\text{ if } x \in X \setminus \bigcup_{i \in \{1, \dots, n\}} A_i \end{cases} \in [0, \infty[$$

which proves that $f(X) \subseteq [0, \infty[$. Hence we have

$$f \in \mathcal{S}^+[X, \mathcal{A}]$$

$\square$

Example 21.285. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $A \in \mathcal{A}$, $a, b \in [0, \infty[$ then for the function

$$f: X \rightarrow \overline{\mathbb{R}} \text{ where } f(x) = \begin{cases} a & \text{if } x \in A \\ b & \text{if } x \in X \setminus A \end{cases}$$

we have that

$$f \in \mathcal{S}^+[X, \mathcal{A}]$$

Proof. As $f(X) = \{a, b\}$ a finite set it follows that $f \in \mathcal{S}[X]$ and $f(X) \subseteq [0, \infty[$. Further for a, b we have either:

$a = b$. Then $f^{-1}(\{a\}) = f^{-1}(\{b\}) = X \in \mathcal{A}$

$a \neq b$. Then as $\forall x \in A$ we have $f(x) = a \in \{a\}$ so that $A \subseteq f^{-1}(\{a\})$. If $x \in f^{-1}(\{a\})$ then $f(x) = a$ and we must have that $x \in A$ [if $x \in X \setminus A$ then $f(x) = b \neq a$] so that $f^{-1}(\{a\}) \subseteq A$. Hence we have

$$f^{-1}(\{a\}) = A \in \mathcal{A}$$

Likewise we have $\forall x \in X \setminus A$ that $f(x) = b \in \{b\}$ proving that $X \setminus A \subseteq f^{-1}(\{b\})$. If $x \in f^{-1}(\{b\})$ then $f(x) = b$ and we must have that $x \in X \setminus A$ [if $x \in A$ then $f(x) = a \neq b$] so that $f^{-1}(\{b\}) \subseteq X \setminus A$. Hence we have

$$f^{-1}(\{b\}) = X \setminus A \in \mathcal{A}$$

So in all cases we have that $f^{-1}(\{a\}), f^{-1}(\{b\}) \in \mathcal{A}$ which by [theorem: 21.284] proves that

$$f \in \mathcal{S}^+[X, \mathcal{A}]$$

□

Given a non negative measurable simple function $f = \sum_{i=1}^n \alpha_i \cdot \mathcal{X}_{X, A_i}$ we want to define the integral of f as $\int f = \sum_{i=1}^n f_i \cdot \mu(A_i)$. However the same function f can have another representation $f = \sum_{i=1}^m \beta_i \cdot \mathcal{X}_{X, B_i}$, so we must show that the integral is independent of the choosen representation of a simple function.

Theorem 21.286. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{S}^+[X, \mathcal{A}]$ then if $n, m \in \mathbb{N}$, $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$, $\{B_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{A}$, $\{a_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$ and $\{b_i\}_{i \in \{1, \dots, m\}} \subseteq [0, \infty[$ satisfies

$$\sum_{i=1}^n a_i \cdot \mathcal{X}_{X, A_i} = f = \sum_{i=1}^m b_i \cdot \mathcal{X}_{X, B_i}$$

then we have

$$\sum_{i=1}^n a_i \cdot \mu(A_i) = \sum_{i=1}^m b_i \cdot \mu(B_i)$$

Note 21.287. The condition that $f \in \mathcal{S}^+[X, \mathcal{A}]$ is needed because this ensures that $\{a_i\}_{i \in \{1, \dots, n\}}$, $\{b_i\}_{i \in \{1, \dots, m\}}$ are non negative so that $\sum_{i=1}^n a_i \cdot \mu(A_i)$ and $\sum_{i=1}^m b_i \cdot \mu(B_i)$ are well defined [as $\mu(A_i), \mu(B_i)$ can be ∞].

Proof. First we remove all the terms where $a_i \cdot \mu(A_i) = 0$ and $b_i \cdot \mu(B_i) = 0$, this will not change the sum. Define $I = \{i \in \{1, \dots, n\} | A_i \neq \emptyset \wedge a_i \neq 0\}$ and $J = \{i \in \{1, \dots, m\} | B_i \neq \emptyset \wedge b_i \neq 0\}$. Then $\forall i \in \{1, \dots, n\} \setminus I$ we have $a_i \cdot \mu(A_i) \stackrel{a_i=0 \vee A_i=\emptyset}{=} 0$ and $\forall i \in \{1, \dots, m\} \setminus J$ $b_i \cdot \mu(B_i) \stackrel{b_i=0 \vee B_i=\emptyset}{=} 0$ so that

$$\begin{aligned} \left(\sum_{i=1}^n a_i \cdot \mathcal{X}_{X, A_i} \right)(x) &= \sum_{i=1}^n a_i \cdot \mathcal{X}_{X, A_i}(x) \\ &= \sum_{i \in I} a_i \cdot \mathcal{X}_{X, A_i}(x) + \sum_{i \in \{1, \dots, n\} \setminus I} a_i \cdot \mathcal{X}_{X, A_i}(x) \\ &= \sum_{i \in I} a_i \cdot \mathcal{X}_{X, A_i}(x) + 0 \\ &= \sum_{i \in I} a_i \cdot \mathcal{X}_{X, A_i}(x) \end{aligned}$$

and

$$\begin{aligned}
 \left(\sum_{i=1}^m b_i \cdot \mathcal{X}_{X, B_i} \right)(x) &= \sum_{i=1}^m b_i \cdot \mathcal{X}_{X, B_i}(x) \\
 &= \sum_{i \in J} b_i \cdot \mathcal{X}_{X, B_i}(x) + \sum_{i \in \{1, \dots, m\} \setminus J} b_i \cdot \mathcal{X}_{X, B_i}(x) \\
 &= \sum_{i \in J} b_i \cdot \mathcal{X}_{X, B_i}(x) + 0 \\
 &= \sum_{i \in J} b_i \cdot \mathcal{X}_{X, B_i}(x)
 \end{aligned}$$

proving that

$$\sum_{i \in I} a_i \cdot \mathcal{X}_{X, A_i} = f = \sum_{i \in J} b_i \cdot \mathcal{X}_{X, B_i} \quad (21.409)$$

As $\{A_i\}_{i \in \{1, \dots, n\}}$ and $\{B_i\}_{i \in \{1, \dots, m\}}$ are pairwise disjoint we have

$$\{A_i\}_{i \in I} \subseteq \mathcal{A} \text{ and } \{B_i\}_{i \in J} \subseteq \mathcal{A} \text{ are pairwise disjoint} \quad (21.410)$$

Further if $x \in \bigsqcup_{i \in I} A_i$ then there exist a $i \in I$ such that $x \in A_i$, so that by [theorem: 21.273] $f(x) = a_i \neq 0$. Assume that $x \notin \bigsqcup_{i \in J} B_i$ then $f(x) = \sum_{i \in J} b_i \cdot \mathcal{X}_{X, B_i}(x) = \sum_{i \in J} b_i \cdot 0 = 0$ contradicting $f(x) \neq 0$. Hence the assumption is wrong and we must have that $x \in \bigsqcup_{i \in J} B_i$. So

$$\bigsqcup_{i \in I} A_i \subseteq \bigsqcup_{i \in J} B_i \quad (21.411)$$

Likewise if $x \in \bigsqcup_{i \in J} B_i$ then there exist a $i \in J$ such that $x \in B_i$, so that by [theorem: 21.273] $f(x) = b_i \neq 0$. Assume that $x \notin \bigsqcup_{i \in I} A_i$ then $f(x) = \sum_{i \in I} a_i \cdot \mathcal{X}_{X, A_i}(x) = \sum_{i \in I} a_i \cdot 0 = 0$ contradicting $f(x) \neq 0$. Hence the assumption is wrong and we must have that $x \in \bigsqcup_{i \in I} A_i$. So $\bigsqcup_{i \in J} B_i \subseteq \bigsqcup_{i \in I} A_i$, which combined with [eq: 21.411] gives

$$\bigsqcup_{i \in I} A_i = \bigsqcup_{i \in J} B_i \quad (21.412)$$

Let $i \in \{1, \dots, n\}$ then, as $\{B_j\}_{j \in J}$ are pairwise disjoint, $\{A_i \cap B_j\}_{j \in J}$ are pairwise disjoint and

$$A_i = A_i \cap \left(\bigsqcup_{j \in I} A_j \right) \stackrel{[\text{eq: 21.412}]}{=} A_i \cap \left(\bigsqcup_{j \in J} B_j \right) = \bigsqcup_{j \in J} (A_i \cap B_j) \quad (21.413)$$

Let $i \in \{1, \dots, m\}$ then, as $\{A_j\}_{j \in I}$ are pairwise disjoint $\{A_j \cap B_i\}_{j \in J}$ are pairwise disjoint and

$$B_i = B_i \cap \left(\bigsqcup_{j \in I} A_j \right) \stackrel{[\text{eq: 21.412}]}{=} B_i \cap \left(\bigsqcup_{j \in I} A_j \right) = \bigsqcup_{j \in I} (A_j \cap B_i) \quad (21.414)$$

Define $K = \{(i, j) \in \{1, \dots, n\} \times \{1, \dots, m\} \mid A_i \cap B_j \neq \emptyset\}$ then if $(i, j) \in K$ we have $A_i \cap B_j \neq \emptyset$ so there exist a $x \in A_i \cap B_j$ and

$$a_i \stackrel{[\text{theorem: 21.273}]}{=} f(x) \stackrel{[\text{theorem: 21.273}]}{=} b_j$$

In other words

$$\forall (i, j) \in K \text{ we have } a_i = b_j \quad (21.415)$$

Now

$$\begin{aligned}
\sum_{i=1}^n a_i \cdot \mu(A_i) &= \sum_{i \in I} a_i \cdot \mu(A_i) + \sum_{i \in \{1, \dots, n\} \setminus I} a_i \cdot \mu(A_i) \\
&= \sum_{i \in I} a_i \cdot \mu(A_i) + \sum_{i \in \{1, \dots, n\} \setminus I} 0 \cdot \mu(A_i) \\
&= \sum_{i \in I} a_i \cdot \mu(A_i) \\
&\stackrel{[\text{eq: 21.413}]}{=} \sum_{i \in I} a_i \cdot \mu\left(\bigsqcup_{j \in J} (A_i \cap B_j)\right) \\
&= \sum_{i \in I} \left(a_i \cdot \sum_{j \in J} \mu(A_i \cap B_j) \right) \\
&= \sum_{i \in I} \left(\sum_{j \in J} a_i \cdot \mu(A_i \cap B_j) \right) \\
&\stackrel{[\text{theorem: 11.45}]}{=} \sum_{(i,j) \in I \times J} a_i \cdot \mu(A_i \cap B_j) \\
&= \sum_{(i,j) \in K} a_i \cdot \mu(A_i \cap B_j) + \sum_{(i,j) \in (I \times J) \setminus K} a_i \cdot \mu(A_i \cap B_j) \\
&= \sum_{(i,j) \in K} a_i \cdot \mu(A_i \cap B_j) + \sum_{(i,j) \in (I \times J) \setminus K} a_i \cdot 0 \\
&= \sum_{(i,j) \in K} a_i \cdot \mu(A_i \cap B_j) \\
&\stackrel{[\text{eq: 21.415}]}{=} \sum_{(i,j) \in K} b_j \cdot \mu(A_i \cap B_j) \\
&= \sum_{(i,j) \in K} b_j \cdot \mu(A_i \cap B_j) + \sum_{(i,j) \in (I \times J) \setminus K} b_j \cdot 0 \\
&= \sum_{(i,j) \in K} b_j \cdot \mu(A_i \cap B_j) + \sum_{(i,j) \in (I \times J) \setminus K} b_j \cdot \mu(A_i \cap B_j) \\
&= \sum_{(i,j) \in I \times J} b_j \cdot \mu(A_i \cap B_j) \\
&\stackrel{[\text{theorem: 11.45}]}{=} \sum_{j \in J} \left(\sum_{i \in I} (b_j \cdot \mu(A_i \cap B_j)) \right) \\
&= \sum_{j \in J} \left(b_j \cdot \sum_{i \in I} \mu(A_i \cap B_j) \right) \\
&= \sum_{j \in J} b_j \cdot \mu\left(\bigsqcup_{i \in I} (A_i \cap B_j)\right) \\
&\stackrel{[\text{eq: 21.414}]}{=} \sum_{j \in J} b_j \cdot \mu(B_j) \\
&= \sum_{j \in J} b_j \cdot \mu(B_j) + \sum_{j \in \{1, \dots, m\} \setminus J} b_j \cdot \mu(B_j) \\
&= \sum_{j=1}^m b_j \cdot \mu(B_j)
\end{aligned}$$

Hence we have

$$\sum_{i=1}^n a_i \cdot \mu(A_i) = \sum_{j=1}^m b_j \cdot \mu(B_j)$$

□

Thanks to the two previous theorems [theorems: 21.284, 21.286] the following definition is well defined [existence and uniqueness].

Definition 21.288. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{S}^+[X, \mathcal{A}]$ then we define $\int^S f d\mu$ by

$$\int^S f d\mu = \sum_{i=1}^n a_i \cdot \mu(A_i) \in [0, \infty[$$

where

$$f = \sum_{i=1}^n a_i \cdot \chi_{X, A_i}, \quad n \in \mathbb{N}, \quad \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \text{ is pairwise disjoint and } \{a_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$$

is a representation of f .

Note 21.289. For the moment we use the special symbol $\int^S f d\mu$ to differentiate the integral of a simple function from the more general integral $\int f d\mu$ that will be based on the integral of simple functions.

Example 21.290. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $a \in [0, \infty[$ and $C_a: X \rightarrow \overline{\mathbb{R}}$ defined by $C_a(x) = a$ then $C_a \in \mathcal{S}[X, \mathcal{A}]$ and $\int^S C_a d\mu = a \cdot \mu(X)$.

Proof. Define $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{A}$ by $A_1 = X$ and $\{a_i\}_{i \in \{1\}} \subseteq [0, \infty[$ by $a_1 = a$ then $\forall x \in X$ we have $(\sum_{i=1}^1 a_i \cdot \chi_{X, A_i})(x) = \sum_{i=1}^1 a_i \cdot \chi_{X, A_i}(x) = a \cdot \chi_X(x) = a = C_a(x)$ so that $C_a = \sum_{i=1}^1 a_i \cdot \chi_{X, A_i}$. Hence by [theorem: 21.284]

$$C_a \in \mathcal{S}^+[X, \mathcal{A}]$$

and using [definition: 21.288]

$$\int^C C_a d\mu = \sum_{i=1}^1 a_i \cdot \mu(A_i) = a_1 \cdot \mu(A_1) = a \cdot \mu(X) \quad \square$$

The following lemma will be usefull if we have to compare or add simple functions.

Lemma 21.291. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $f, g \in \mathcal{S}^+[X, \mathcal{A}]$ then there exist a $n \in \mathbb{N}$, a pairwise disjoint family $\{C_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ of sets in $\mathcal{A}$, a family $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$ and a family $\{g_i\}_{i \in \{1, \dots, n\}}$ such that

$$X = \bigsqcup_{i \in \{1, \dots, n\}} C_i$$

$$f = \sum_{i=1}^n f_i \cdot \chi_{X, C_i} \text{ and } g = \sum_{i=1}^n g_i \cdot \chi_{X, C_i}$$

Proof. As $f, g \in \mathcal{S}^+[X, \mathcal{A}]$ we have by [theorem: 21.284] that there exists $n', m' \in \mathbb{N}$, $\{A'_i\}_{i \in \{1, \dots, n'\}} \subseteq \mathcal{A}$ pairwise disjoint, $\{B'_i\}_{i \in \{1, \dots, m'\}} \subseteq \mathcal{A}$ pairwise disjoint, $\{a'_i\}_{i \in \{1, \dots, n'\}} \subseteq [0, \infty[$ and $\{b'_i\}_{i \in \{1, \dots, m'\}}$ so that

$$f = \sum_{i=1}^{n'} a'_i \cdot \chi_{X, A'_i} \text{ and } g = \sum_{i=1}^{m'} b'_i \cdot \chi_{X, B'_i} \quad (21.416)$$

Define now

$$\{A_i\}_{i \in \{1, \dots, n'+1\}} \subseteq \mathcal{A} \text{ by } A_i = \begin{cases} X \setminus \bigcup_{i \in \{1, \dots, n'\}} A'_i & \text{if } i = n' + 1 \\ A'_i & \text{if } i \in \{1, \dots, n'\} \end{cases}$$

$$\{B_i\}_{i \in \{1, \dots, m'+1\}} \subseteq \mathcal{A} \text{ by } B_i = \begin{cases} X \setminus \bigcup_{i \in \{1, \dots, m'\}} B'_i & \text{if } i = m' + 1 \\ B'_i & \text{if } i \in \{1, \dots, m'\} \end{cases}$$

$$\{a_i\}_{i \in \{1, \dots, n'+1\}} \text{ by } a_i = \begin{cases} 0 & \text{if } i = n' + 1 \\ a'_i & \text{if } i \in \{1, \dots, n'\} \end{cases}$$

$$\{b_i\}_{i \in \{1, \dots, m'+1\}} \text{ by } b_i = \begin{cases} 0 & \text{if } i = m' + 1 \\ b'_i & \text{if } i \in \{1, \dots, m'\} \end{cases}$$

then by [lemma: 21.277] $\{A_i\}_{i \in \{1, \dots, n'+1\}}$, $\{B_i\}_{i \in \{1, \dots, m'+1\}}$ are pairwise disjoint and

$$X = \bigsqcup_{i \in \{1, \dots, n'+1\}} A_i = \bigsqcup_{i \in \{1, \dots, m'+1\}} B_i \quad (21.417)$$

Hence

$$\forall i \in \{1, \dots, n'+1\} \quad A_i = A_i \cap X = A_i \cap \left(\bigsqcup_{j \in \{1, \dots, m'+1\}} B_j \right) = \bigsqcup_{j \in \{1, \dots, m'+1\}} (A_i \cap B_j) \quad (21.418)$$

and

$$\forall i \in \{1, \dots, m'+1\} \quad B_i = B_i \cap X = B_i \cap \left(\bigsqcup_{j \in \{1, \dots, n'+1\}} A_j \right) = \bigsqcup_{j \in \{1, \dots, n'+1\}} (A_j \cap B_i) \quad (21.419)$$

so that

$$X = \bigsqcup_{i=1}^{n'+1} \left(\bigsqcup_{j=1}^{m'+1} (A_i \cap B_j) \right) = \bigsqcup_{i=1}^{m'+1} \left(\bigsqcup_{j=1}^{n'+1} (A_j \cap B_i) \right) \quad (21.420)$$

Using [theorem: 6.41] $\{1, \dots, n'+1\} \times \{1, \dots, m'+1\}$ is finite and there exists a bijection

$$\beta: \{1, \dots, n\} \rightarrow \{1, \dots, n'+1\} \times \{1, \dots, m'+1\} \text{ where } n = (n'+1) \cdot (m'+1)$$

Define now

$$\begin{aligned} \{C_i\}_{i \in \{1, \dots, n\}} \subseteq A \quad & \text{by } C_i = A_{\beta(i)_1} \cap B_{\beta(i)_2} \\ \{f_i\}_{i \in \{1, \dots, n\}} \quad & \text{by } f_i = a_{\beta(i)_1} \\ \{g_i\}_{i \in \{1, \dots, n\}} \quad & \text{by } g_i = b_{\beta(i)_2} \end{aligned}$$

Let $x \in X$ then by [eq: 21.420] there exists a $i \in \{1, \dots, n'+1\}$ such that $x \in \bigsqcup_{j \in \{1, \dots, m'+1\}} (A_i \cap B_j)$, hence there exist a $j \in \{1, \dots, m'+1\}$ such that $x \in A_i \cap B_j$. As β is a bijection there exist a $k \in \{1, \dots, n\}$ such that $\beta(k) = (i, j)$ hence $x \in A_{\beta(k)_1} \cap B_{\beta(k)_2} = C_k \subseteq \bigcup_{k \in \{1, \dots, n\}} C_k$. Hence $X \subseteq \bigcup_{k \in \{1, \dots, n\}} C_k$ and as trivially $\bigcup_{k \in \{1, \dots, n\}} C_k \subseteq X$ it follows that

$$X = \bigcup_{i \in \{1, \dots, n\}} C_i \quad (21.421)$$

Next we prove that $\{C_i\}_{i \in \{1, \dots, n\}}$ is pairwise disjoint. So let $i, j \in \{1, \dots, n\}$ with $i \neq j$ then as β is a bijection we have that $\beta(i) \neq \beta(j)$, for $\beta(i)_1, \beta(j)_1$ we have then either:

$\beta(i)_1 = \beta(j)_1$. Then we must have that $\beta(i)_2 \neq \beta(j)_2$ so that

$$C_i \cap C_j = (A_{\beta(i)_1} \cap B_{\beta(i)_2}) \cap (A_{\beta(j)_1} \cap B_{\beta(j)_2}) \subseteq B_{\beta(i)_2} \cap B_{\beta(j)_2} = \emptyset$$

$\beta(i)_1 \neq \beta(j)_1$. Then we have that

$$C_i \cap C_j = (A_{\beta(i)_1} \cap B_{\beta(i)_2}) \cap (A_{\beta(j)_1} \cap B_{\beta(j)_2}) \subseteq A_{\beta(i)_1} \cap A_{\beta(j)_1} = \emptyset$$

which proves that

$$\{C_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \text{ is pairwise disjoint and } X = \bigsqcup_{i \in \{1, \dots, n\}} C_i \quad (21.422)$$

Let $x \in X$ then by [eq: 21.422] there exist a $i \in \{1, \dots, n\}$ such that $x \in C_i = A_{\beta(i)_1} \cap B_{\beta(i)_2}$ hence $x \in A_{\beta(i)_1}$. For $\beta(i)_1$ we have the following possibilities:

$\beta(i)_1 = n' + 1$. Then $x \in A_{n'+1} = X \setminus (\bigsqcup_{i \in \{1, \dots, n'\}} A'_i)$ so that by [theorem: 21.273] and [eq: 21.416] $f(x) = 0$. Further using [theorem: 21.273] and [eq: 21.422] it follows also that

$$\left(\sum_{i=1}^n f_i \cdot \chi_{X, C_i} \right)(x) = f_i = a_{\beta(i)_1} = a_{n'+1} = 0 = f(x)$$

which proves that $f(x) = (\sum_{i=1}^n f_i \cdot \mathcal{X}_{C_i})(x)$.

$\beta(i)_1 \in \{1, \dots, n'\}$. Then $x \in A_{\beta(i)_1} = A'_{\beta(i)_1}$ so that by [theorem: 21.273] and [eq: 21.416] $f(x) = a'_{\beta(i)_1}$. Further using [theorem: 21.273] and [eq: 21.422] we have that

$$\left(\sum_{i=1}^n f_i \cdot \mathcal{X}_{X, C_i} \right)(x) = f_i = a_{\beta(i)_1} = a'_{\beta(i)_1} = f(x)$$

so that in this cases we have also that $f(x) = (\sum_{i=1}^n f_i \cdot \mathcal{X}_{X, C_i})(x)$.

To summarize we have proved that

$$f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{X, C_i}$$

We use now the same technic for g . Let $x \in X$ then by [eq: 21.422] there exist a $i \in \{1, \dots, n\}$ such that $x \in C_i = A_{\beta(i)_1} \cap B_{\beta(i)_2}$ hence $x \in B_{\beta(i)_2}$. For $\beta(i)_2$ we have the following possibilities:

$\beta(i)_2 = m' + 1$. Then $x \in B_{n'+1} = X \setminus (\bigcup_{i \in \{1, \dots, n'\}} B_i)$ so that by [theorem: 21.273] and [eq: 21.416] $g(x) = 0$. Further using [theorem: 21.273] and [eq: 21.422] it follows also that

$$\left(\sum_{i=1}^n g_i \cdot \mathcal{X}_{X, C_i} \right)(x) = g_i = b_{\beta(i)_2} = b_{m'+1} = 0 = g(x)$$

which proves that $g(x) = (\sum_{i=1}^n g_i \cdot \mathcal{X}_{X, C_i})(x)$.

$\beta(i)_2 \in \{1, \dots, m'\}$. Then $x \in B_{\beta(i)_2} = B'_{\beta(i)_2}$ so that by [theorem: 21.273] and [eq: 21.416] $g(x) = b'_{\beta(i)_2}$. Further using [theorem: 21.273] and [eq: 21.422] we have that

$$\left(\sum_{i=1}^n g_i \cdot \mathcal{X}_{X, C_i} \right)(x) = g_i = b_{\beta(i)_2} = b'_{\beta(i)_2} = g(x)$$

so that in this cases we have also that $g(x) = (\sum_{i=1}^n g_i \cdot \mathcal{X}_{X, C_i})(x)$.

To summarize we have proved that

$$g = \sum_{i=1}^n g_i \cdot \mathcal{X}_{X, C_i}$$

□

We prove now that the integral of non negativ.e measurable simple functions has the usual properties of integration.

Theorem 21.292. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then we have*

1. If $\alpha \in [0, \infty[$ and $f \in \mathcal{S}^+[X, \mathcal{A}]$ then $\alpha \cdot f \in \mathcal{S}^+[X, \mathcal{A}]$ and $\int^S (\alpha \cdot f) d\mu = \alpha \cdot \int^S f d\mu$.
2. If $f, g \in \mathcal{S}^+[X, \mathcal{A}]$ then
 - a. $f + g \in \mathcal{S}^+[X, \mathcal{A}]$ and $\int^S (f + g) d\mu = \int^S f d\mu + \int^S g d\mu$.
 - b. If $\forall x \in X f(x) \leq g(x)$ then $\int^S f d\mu \leq \int^S g d\mu$.
 - c. $f \wedge g \in \mathcal{S}^+[X, \mathcal{A}]$, $\int^S (f \wedge g) d\mu \leq \int^S f d\mu$ and $\int^S (f \wedge g) d\mu \leq \int^S g d\mu$.
 - d. $f \vee g \in \mathcal{S}^+[X, \mathcal{A}]$, $\int^S f d\mu \leq \int^S (f \vee g) d\mu$ and $\int^S g d\mu \leq \int^S (f \vee g) d\mu \leq \int^S f d\mu$.
3. If $f \in \mathcal{S}^+[X, \mathcal{A}]$ satisfies $f = 0$ μ -a.e. then $\int^S f d\mu = 0$.

Proof.

1. As $f \in \mathcal{S}^+[X, \mathcal{A}]$ there exists by [theorem: 21.284] a pairwise disjoint $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ and a $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$ such that $f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{A_i}$. Further we have by definition that

$$\int^S f d\mu = \sum_{i=1}^n f_i \cdot \mu(A_i)$$

Then $\{\alpha \cdot a_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$ and $\forall x \in X$ we have

$$\begin{aligned} (\alpha \cdot f)(x) &= \alpha \cdot f(x) \\ &= \alpha \cdot \sum_{i=1}^n a_i \cdot \mathcal{X}_{X, A_i}(x) \\ &= \sum_{i=1}^n (\alpha \cdot a_i) \cdot \mathcal{X}_{X, A_i}(x) \\ &= \left(\sum_{i=1}^n (\alpha \cdot a_i) \cdot \mathcal{X}_{X, A_i} \right)(x) \end{aligned}$$

proving that

$$\alpha \cdot f = \sum_{i=1}^n (\alpha \cdot a_i) \cdot \mathcal{X}_{X, A_i}$$

Using [theorem: 21.284] it follows that

$$\alpha \cdot f \in \mathcal{S}^+[X, \mathcal{A}]$$

Further we have

$$\begin{aligned} \int^S \alpha \cdot f d\mu &= \sum_{i=1}^n (\alpha \cdot f_i) \cdot \mu(A_i) \\ &= \alpha \cdot \sum_{i=1}^n f_i \cdot \mu(A_i) \\ &= \alpha \cdot \int^S f d\mu \end{aligned}$$

2. As $f, g \in \mathcal{S}^+[X, \mathcal{A}]$ there exists by [lemma: 21.291] $\{C_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ pairwise disjoint, $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$ and $\{g_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$ such that

$$X = \bigsqcup_{i \in \{1, \dots, n\}} A_i, \quad f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{X, C_i} \text{ and } g = \sum_{i=1}^n g_i \cdot \mathcal{X}_{X, C_i} \quad (21.423)$$

By the definition of $\int^S$ we have also

$$\int^S f d\mu = \sum_{i=1}^n f_i \cdot \mu(C_i) \text{ and } \int^S g d\mu = \sum_{i=1}^n g_i \cdot \mu(C_i) \quad (21.424)$$

Next we have:

- a. $\{f_i + g_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$ and

$$\begin{aligned} (f + g)(x) &= f(x) + g(x) \\ &= \sum_{i=1}^n f_i \cdot \mathcal{X}_{X, C_i}(x) + \sum_{i=1}^n g_i \cdot \mathcal{X}_{X, C_i}(x) \\ &= \sum_{i=1}^n (f_i \cdot \mathcal{X}_{X, C_i}(x) + g_i \cdot \mathcal{X}_{X, C_i}(x)) \\ &= \sum_{i=1}^n (f_i + g_i) \cdot \mathcal{X}_{X, C_i}(x) \\ &= \left(\sum_{i=1}^n (f_i + g_i) \cdot \mathcal{X}_{X, C_i} \right)(x) \end{aligned}$$

whic proves that

$$f + g = \sum_{i=1}^n (f_i + g_i) \cdot \mathcal{X}_{X, C_i}$$

So using [theorem: 21.284] it follows that

$$f + g \in \mathcal{S}^+[X, \mathcal{A}]$$

and using the definition of the integral

$$\begin{aligned} \int^S (f + g) d\mu &= \sum_{i=1}^n (f_i + g_i) \cdot \mu(C_i) \\ &= \sum_{i=1}^n f_i \cdot \mu(C_i) + \sum_{i=1}^n g_i \cdot \mu(C_i) \\ &\stackrel{[\text{eq: 21.424}]}{=} \int^S f d\mu + \int^S g d\mu \end{aligned}$$

b. Assume that $\forall x \in X \ f(x) \leq g(x)$. Define $I = \{i \in \{1, \dots, n\} \mid C_i \neq \emptyset\}$ then $\forall i \in I$ there exist a $C_i \neq \emptyset \Rightarrow \exists x \in C_i$ so that $f_i \stackrel{[\text{theorem: 21.273}]}{=} f(x) \leq g(x) \stackrel{[\text{theorem: 21.273}]}{=} g_i$. Hence we have

$$\forall i \in I \ f_i \leq g_i \tag{21.425}$$

Next

$$\begin{aligned} \int^S f d\mu &= \sum_{i=1}^n f_i \cdot \mu(C_i) \\ &= \sum_{i \in I} f_i \cdot \mu(C_i) + \sum_{i \in \{1, \dots, n\} \setminus I} f_i \cdot \mu(C_i) \\ &= \sum_{i \in I} f_i \cdot \mu(C_i) \\ &\leq \sum_{i \in I} g_i \cdot \mu(C_i) \\ &\stackrel{[\text{eq: 21.425}]}{=} \sum_{i \in I} g_i \cdot \mu(C_i) + \sum_{i \in \{1, \dots, n\} \setminus I} g_i \cdot \mu(C_i) \\ &= \sum_{i=1}^n g_i \cdot \mu(C_i) \\ &= \int^S g d\mu \end{aligned}$$

c. Let $x \in X$ then as $X \stackrel{[\text{eq: 21.423}]}{=} \bigsqcup_{i \in \{1, \dots, n\}} C_i$ there exists a $i \in \{1, \dots, n\}$ such that $x \in C_i$. Using [eq: 21.423] together with [theorem: 21.273] gives then $f(x) = f_i$ and $g(x) = g_i$. So

$$\begin{aligned} (f \wedge g)(x) &= \min(f(x), g(x)) \\ &= \min(f_i, g_i) \\ &\stackrel{[\text{theorem: 21.273}]}{=} \left(\sum_{i=1}^n \min(f_i, g_i) \cdot \mathcal{X}_{C_i} \right)(x) \end{aligned}$$

which proves that

$$(f \wedge g) = \sum_{i=1}^n \min(f_i, g_i) \cdot \mathcal{X}_{C_i}$$

and, as $\{\min(f_i, g_i)\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$, it follows from [theorem: 21.284] that

$$f \wedge g \in \mathcal{S}^+[X, \mathcal{A}]$$

Further as $\forall x \in X \ (f \wedge g)(x) = \min(f(x), g(x)) \leq f(x), g(x)$ it follows from (b) that

$$\int^S (f \wedge g) d\mu \leq \int^S f d\mu \text{ and } \int^S (f \wedge g) d\mu \leq \int^S g d\mu$$

- d. Let $x \in X$ then as $X \stackrel{[\text{eq: 21.423}]}{=} \bigsqcup_{i \in \{1, \dots, n\}} C_i$ there exists a $i \in \{1, \dots, n\}$ such that $x \in A_i$. Using [eq: 21.423] together with [theorem: 21.273] gives then $f(x) = f_i$ and $g(x) = g_i$. So

$$\begin{aligned} (f \vee g)(x) &= \max(f(x), g(x)) \\ &= \max(f_i, g_i) \\ &\stackrel{[\text{theorem: 21.273}]}{=} \left(\sum_{i=1}^n \max(f_i, g_i) \cdot \mathcal{X}_{X, C_i} \right)(x) \end{aligned}$$

which proves that

$$(f \vee g) = \sum_{i=1}^n \min(f_i, g_i) \cdot \mathcal{X}_{X, C_i}$$

and, as $\{\max(f_i, g_i)\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$ it follows from [theorem: 21.284] that

$$f \vee g \in \mathcal{S}^+[X, \mathcal{A}]$$

Further as $\forall x \in X f(x), g(x) \leq \max(f(x), g(x)) = f \vee g$ it follows from (b) that

$$\int^S f d\mu \leq \int^S (f \vee g) d\mu \text{ and } \int^S g d\mu \leq \int^S (f \vee g) d\mu$$

3. As $f = 0$ μ -a.e. there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$\{x \in X \mid 0 \neq f(x)\} \subseteq N \quad (21.426)$$

As $f \in \mathcal{S}^+[X, \mathcal{A}]$ there exists by [theorem: 21.284] a $n \in \mathbb{N}$, a pairwise disjoint family $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ and a $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$ such that $f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{X, A_i}$. Let $i \in \{1, \dots, n\}$ then for f_i we have either:

$f_i = 0$. Then $f_i \cdot \mu(A_i) = 0$

$0 < f_i$. Then $\forall x \in A_i$ we have $f(x) \stackrel{[\text{theorem: 21.273}]}{=} a_i \neq 0$ so that $x \in \{x \in X \mid 0 \neq f(x)\}$.

Hence $A_i \subseteq \{x \in X \mid 0 \neq f(x)\} \stackrel{[\text{eq: 21.426}]}{\subseteq} N$. So $\mu(A_i) \stackrel{[\text{theorem: 21.106}]}{\leq} \mu(N) = 0$ from which it follows that $f \cdot \mu(A_i) = 0$

So $\forall i \in \{1, \dots, n\}$ we have that $f_i \cdot \mu(A_i) = 0$ proving that

$$\int^S f d\mu = \sum_{i=1}^n f_i \cdot \mu(A_i) = 0 \quad \square$$

Using mathematical induction we have the following extension of the above theorem.

Corollary 21.293. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $n \in \mathbb{N}$ and $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ then we have that

1. $\bigwedge_{i \in \{1, \dots, n\}} f_i \in \mathcal{S}^+[X, \mathcal{A}]$
2. $\bigvee_{i \in \{1, \dots, n\}} f_i \in \mathcal{S}^+[X, \mathcal{A}]$

Proof.

1. Let

$$S = \left\{ n \in \mathbb{N} \mid \text{If } \{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}^+[X, \mathcal{A}] \text{ then } \bigwedge_{i=1}^n f_i \in \mathcal{S}^+[X, \mathcal{A}] \right\}$$

then we have:

$1 \in S$. If $\{f_i\}_{i \in \{1\}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ then $(\bigwedge_{i=1}^1 f)(x) = \min(\{f_1(x)\}) = f_1(x)$ so that $\bigwedge_{i=1}^1 f_i = f_1 \in \mathcal{S}^+[X, \mathcal{A}]$, hence $1 \in S$

$n \in S \Rightarrow n+1 \in S$. Let $\{f_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ then $\forall x \in A$ we have

$$\begin{aligned} \left(\bigwedge_{i=1}^{n+1} f_i \right)(x) &= \min(\{f_i(x) | i \in \{1, \dots, n+1\}\}) \\ &\stackrel{[\text{corollary: 3.67}]}{=} \min(\min(\{f_i(x) | i \in \{1, \dots, n+1\}\}), f_{n+1}(x)) \\ &= \min\left(\left(\bigwedge_{i=1}^n f_i\right)(x), f_{n+1}(x)\right) \\ &= \left(\left(\bigwedge_{i=1}^n f_i\right) \wedge f_{n+1}\right)(x) \end{aligned}$$

so that

$$\bigwedge_{i=1}^{n+1} f_i = \left(\bigwedge_{i=1}^n f_i\right) \wedge f_{n+1}$$

As $n \in S$ we have that $\bigwedge_{i=1}^n f_i \in \mathcal{S}^+[X, \mathcal{A}]$, hence, using [theorem: 21.292] it follows that $(\bigwedge_{i=1}^{n+1} f_i) \in \mathcal{S}^+[X, \mathcal{A}]$, proving $n+1 \in S$.

2. Let

$$S = \left\{ n \in \mathbb{N} \mid \text{If } \{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{S}^+[X, \mathcal{A}] \text{ then } \bigvee_{i=1}^n f_i \in \mathcal{S}^+[X, \mathcal{A}] \right\}$$

then we have:

$1 \in S$. If $\{f_i\}_{i \in \{1\}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ then $(\bigvee_{i=1}^1 f)(x) = \max(\{f_1(x)\}) = f_1(x)$ so that $\bigvee_{i=1}^1 f_i = f_1 \in \mathcal{S}^+[X, \mathcal{A}]$, hence $1 \in S$

$n \in S \Rightarrow n+1 \in S$. Let $\{f_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ then $\forall x \in A$ we have

$$\begin{aligned} \left(\bigvee_{i=1}^{n+1} f_i \right)(x) &= \max(\{f_i(x) | i \in \{1, \dots, n+1\}\}) \\ &\stackrel{[\text{corollary: 3.67}]}{=} \max(\max(\{f_i(x) | i \in \{1, \dots, n+1\}\}), f_{n+1}(x)) \\ &= \max\left(\left(\bigvee_{i=1}^n f_i\right)(x), f_{n+1}(x)\right) \\ &= \left(\left(\bigvee_{i=1}^n f_i\right) \vee f_{n+1}\right)(x) \end{aligned}$$

so that

$$\bigvee_{i=1}^{n+1} f_i = \left(\bigvee_{i=1}^n f_i\right) \vee f_{n+1}$$

As $n \in S$ we have that $\bigvee_{i=1}^n f_i \in \mathcal{S}^+[X, \mathcal{A}]$, hence, using [theorem: 21.292] it follows that $(\bigvee_{i=1}^{n+1} f_i) \in \mathcal{S}^+[X, \mathcal{A}]$, proving $n+1 \in S$. $\square$

The following theorem is the simple function variant of the monotone convergence theorem that is one of the central convergence theorems that sets the measure integral apart from the Riemann integral.

Theorem 21.294. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $\{f_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ such that

$$\forall x \in X \text{ we have } \forall k \in \mathbb{N} \text{ that } f_k(x) \leq f_{k+1}(x)$$

and for $\lim_{k \rightarrow \infty} f_k: X \rightarrow \overline{\mathbb{R}}$ defined by $\left(\lim_{k \rightarrow \infty} f_k\right)(x) = \lim_{k \rightarrow \infty} f_k(x)$ we have $\lim_{k \rightarrow \infty} f_k \in \mathcal{S}^+[X, \mathcal{A}]$ then

$$\lim_{k \rightarrow \infty} \int^S f_k d\mu \text{ exists}$$

and

$$\int^S \left(\lim_{k \rightarrow \infty} f_k\right) d\mu = \lim_{k \rightarrow \infty} \int^S f_k d\mu$$

Note 21.295. As $\forall x \in X$ we have $\forall k \in \mathbb{N}$ $f_k(x) \leq f_{k+1}(x)$ we have by [theorem: 20.91] that $\lim_{k \rightarrow \infty} f_k(x)$ exist, as is needed for the requirements of this theorem.

Proof. As $\forall x \in X$ we have $\forall k \in \mathbb{N}$ that $f_k(x) \leq f_{k+1}(x)$ it follows from [theorem: 21.292] that

$$\forall k \in \mathbb{N} \text{ we have } \int^S f_k d\mu \leq \int^S f_{k+1} d\mu \quad (21.427)$$

So using [theorem: 20.91] it follows that

$$\lim_{k \rightarrow \infty} \int^S f_k d\mu \text{ exists and } \lim_{k \rightarrow \infty} \int^S f_k d\mu = \sup \left(\left\{ \int^S f_k d\mu \mid k \in \mathbb{N} \right\} \right) \geq 0 \quad (21.428)$$

Further as $\forall x \in X$ we have $\forall k \in \mathbb{N}$ that $f_k(x) \leq f_{k+1}(x)$ we have by [theorem: 20.91] again that

$$\lim_{k \rightarrow \infty} f_k(x) \text{ exists and } \lim_{k \rightarrow \infty} f_k(x) = \sup \{ f_k(x) \mid k \in \mathbb{N} \} \quad (21.429)$$

so that

$$\forall x \in X \text{ we have } \forall k \in \mathbb{N} \text{ that } f_k(x) \leq \lim_{k \rightarrow \infty} f_k(x) \quad (21.430)$$

As $\lim_{k \rightarrow \infty} f_k \in \mathcal{S}^+[X, \mathcal{A}]$ we have that $\int^S \left(\lim_{k \rightarrow \infty} f_k\right) d\mu$ exist and using [theorem: 21.292] it follows then that $\forall k \in \mathbb{N}$ $\int^S f_k d\mu \leq \int^S \left(\lim_{i \rightarrow \infty} f_i\right) d\mu$ so that using [theorem: 20.84]

$$0 \leq \lim_{k \rightarrow \infty} \int^S f_k d\mu \leq \int^S \left(\lim_{i \rightarrow \infty} f_i\right) d\mu \quad (21.431)$$

Next we prove the opposite inequality. As $\lim_{k \rightarrow \infty} f_k \in \mathcal{S}^+[X, \mathcal{A}]$ there exists by [theorem: 21.284] a $n \in \mathbb{N}$, a pairwise disjoint family $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ and a family $\{a_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$ such that

$$\lim_{k \rightarrow \infty} f_k = \sum_{i=1}^n a_i \cdot \chi_{X, A_i} \quad (21.432)$$

For $\{a_i\}_{i \in \{1, \dots, n\}}$ we have two possible cases:

$\forall i \in \{1, \dots, n\}$ $a_i = 0$. Then $\int^S \left(\lim_{k \rightarrow \infty} f_k\right) d\mu \stackrel{[\text{eq: 21.432}]}{=} \sum_{i=1}^n a_i \cdot \mu(A_i) = \sum_{i=1}^n 0 \cdot \mu(A_i) = 0$ so that we have [using eq: 21.431]

$$0 \leq \lim_{k \rightarrow \infty} \int^S f_k d\mu \stackrel{[\text{eq: 21.429}]}{\leq} \int^S \left(\lim_{k \rightarrow \infty} f_k\right) d\mu = 0$$

which proves that in this case

$$\lim_{k \rightarrow \infty} \int^S f_k d\mu = 0 = \int^S \left(\lim_{k \rightarrow \infty} f_k\right) d\mu$$

$\exists i \in \{1, \dots, n\}$ $a_i \neq 0$. Then $I = \{i \in \{1, \dots, n\} | a_i \neq 0\} \neq \emptyset$ so that there exists a $m \in \mathbb{N}$ and a bijection $\beta: \{1, \dots, m\} \rightarrow I$. Let $x \in X$ then

$$\begin{aligned}
 \left(\lim_{k \rightarrow \infty} f_k \right)(x) & \stackrel{[\text{eq: 21.432}]}{=} \sum_{i \in \{1, \dots, n\}} a_i \cdot \mathcal{X}_{X, A_i}(x) \\
 & = \sum_{i \in \{1, \dots, n\} \setminus I} a_i \cdot \mathcal{X}_{X, A_i}(x) + \sum_{i \in I} a_i \cdot \mathcal{X}_{X, A_i}(x) \\
 & = \sum_{i \in I} a_i \cdot \mathcal{X}_{X, A_i}(x) \\
 & \stackrel{[\text{theorem: 11.36}]}{=} \sum_{i \in \{1, \dots, m\}} a_{\beta(i)} \cdot \mathcal{X}_{X, A_{\beta(i)}}(x) \\
 & = \left(\sum_{i=1}^m a_{\beta(i)} \cdot \mathcal{X}_{X, A_{\beta(i)}} \right)(x)
 \end{aligned}$$

proving, if we define $\{b_i\}_{i \in \{1, \dots, m\}}$ by $b_i = a_{\beta(i)}$ and $\{B_i\}_{i \in \{1, \dots, m\}}$ by $B_i = A_{\beta(i)} \in \mathcal{A}$, that

$$\{B_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{A} \text{ and } \lim_{k \rightarrow \infty} f_k = \sum_{i=1}^m b_i \cdot \mathcal{X}_{X, B_i} \text{ and } \forall i \in \{1, \dots, m\} \ b_i \in \mathbb{R}^+ \quad (21.433)$$

Further, if $i, j \in \{1, \dots, m\}$ with $i \neq j$ then $\beta(i) \neq \beta(j)$ so that $B_i \cap B_j = A_{\beta(i)} \cap A_{\beta(j)} = \emptyset$ which proves that

$$\{B_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{A} \text{ is pairwise disjoint} \quad (21.434)$$

Let $\varepsilon \in \mathbb{R}^+$ with $\varepsilon < 1$ then $0 < 1 - \varepsilon$. Let $i \in \{1, \dots, m\}$ and define

$$\{B_{i,j}\}_{j \in \mathbb{N}} \text{ by } B_{i,j} = \{x \in B_i | f_j(x) \geq (1 - \varepsilon) \cdot b_i\} \subseteq B_i \quad (21.435)$$

then as

$$\{x \in B_i | f_j(x) \geq (1 - \varepsilon) \cdot b_i\} = B_i \cap \{x \in X | f_j(x) \geq (1 - \varepsilon) \cdot b_i\} \stackrel{[\text{def: 21.240}]}{=} B_i \cap \{f_j \geq (1 - \varepsilon) \cdot b_i\}$$

and $B_i, \{f_j \geq (1 - \varepsilon) \cdot b_i\} \in \mathcal{A}$ [see: theorem: 21.242] it follows that

$$\forall i \in \{1, \dots, m\} \text{ we have } \{B_{i,j}\}_{j \in \mathbb{N}} \subseteq \mathcal{A} \quad (21.436)$$

If $x \in B_i$ then by [theorem: 21.273] and [eqs: 21.433, 21.434] we have $\left(\lim_{k \rightarrow \infty} f_k \right)(x) = b_i$. As by [eq: 21.433] $b_i \neq 0$ we have $(1 - \varepsilon) \cdot b_i < b_i = \left(\lim_{k \rightarrow \infty} f_k \right)(x) \stackrel{[\text{eq: 21.429}]}{=} \sup(\{f_i(x) | i \in \mathbb{N}\})$. Hence there exist a $k \in \mathbb{N}$ such that $(1 - \varepsilon) \cdot b_i < f_k(x)$ which proves that $x \in B_{i,k} \subseteq \bigcup_{j \in \mathbb{N}} B_{i,j}$. So that $B_i \subseteq \bigcup_{j \in \mathbb{N}} B_{i,j}$. As $\forall j \in \mathbb{N}$ we have $B_{i,j} \subseteq B_i \Rightarrow \bigcup_{j \in \mathbb{N}} B_{i,j} \subseteq B_i$ it follows that

$$\forall i \in \{1, \dots, m\} \ B_i = \bigcup_{j \in \mathbb{N}} B_{i,j} \quad (21.437)$$

Let $k \in \mathbb{N}$ then $\forall i, j \in \{1, \dots, m\}$ with $i \neq j$ we have $B_{i,k} \cap B_{j,k} \subseteq B_i \cap B_j = \emptyset$ which proves that

$$\forall k \in \mathbb{N} \text{ we have that } \{B_{i,k}\}_{i \in \{1, \dots, m\}} \text{ is pairwise disjoint} \quad (21.438)$$

Let $i \in \{1, \dots, m\}$ and $k \in \mathbb{N}$ then if $x \in B_{i,k}$ we have that $(1 - \varepsilon) \cdot b_i \leq f_k(x) \leq f_{k+1}(x)$, so $x \in B_{i,k+1}$, hence

$$\forall i \in \{1, \dots, m\} \text{ we have } \forall k \in \mathbb{N} \text{ that } B_{i,k} \subseteq B_{i,k+1} \quad (21.439)$$

Using now [theorem: 21.109 (1)] it follows that

$$\forall i \in \{1, \dots, m\} \ \mu(B_i) \stackrel{[\text{eq: 21.437}]}{=} \mu\left(\bigcup_{j \in \mathbb{N}} B_{i,j}\right) = \lim_{j \rightarrow \infty} \mu(B_{i,j}) = \sup(\{\mu(B_{i,j}) | j \in \mathbb{N}\}) \quad (21.440)$$

Define now

$$\{g_k\}_{k \in \mathbb{N}} \text{ by } g_k = \sum_{i=1}^m (1 - \varepsilon) \cdot b_i \cdot \mathcal{X}_{X, B_{i,k}} \quad (21.441)$$

then by [theorem: 21.284] together with [eqs: 21.441, 21.436, 21.438] we have that

$$\{g_k\}_{k \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}] \quad (21.442)$$

Let $x \in X$ and $k \in \mathbb{N}$ then for x we have either:

$x \in \bigcup_{i \in \{1, \dots, m\}} B_{i,k}$. Then there exist a $i \in \{1, \dots, m\}$ such that $x \in B_{i,k}$ so that $(1 - \varepsilon) \cdot b_i \leq f_k(x)$ which, as $g_k(x) \stackrel{[\text{theorem: 21.273}]}{=} (1 - \varepsilon) \cdot b_i \leq f_k(x)$, proves that

$$g_k(x) \leq f_k(x)$$

Further as $B_{i,k} \stackrel{[\text{eq: 21.439}]}{\subseteq} B_{i,k+1}$ we have that $x \in B_{i,k+1}$ so that

$$g_k(x) \stackrel{[\text{theorem: 21.273}]}{=} (1 - \varepsilon) \cdot b_{k+1} \stackrel{[\text{theorem: 21.273}]}{=} g_{k+1}(x)$$

proving, as equality implies inequality, that

$$g_k(x) \leq g_{k+1}(x)$$

$x \notin \bigcup_{i \in \{1, \dots, m\}} B_{i,k}$. Then $g_k(x) = \sum_{i=1}^m (1 - \varepsilon) \cdot b_i \cdot \chi_{X, B_{i,k}}(x) = \sum_{i=1}^m (1 - \varepsilon) \cdot b_i \cdot 0 = 0$ so that

$$g_k(x) = 0 \leq f_k(x)$$

and

$$g_k(x) = 0 \leq g_{k+1}(x)$$

So we must conclude that

$$\forall x \in X \text{ we have } \forall k \in \mathbb{N} \text{ that } g_k(x) \leq g_{k+1}(x) \text{ and } g_k(x) \leq f_k(x) \quad (21.443)$$

From the above we have using [theorem: 21.292] that $\forall k \in \mathbb{N} \int^S g_k d\mu \leq \int^S g_{k+1} d\mu$. So using [theorem: 20.91] $\lim_{k \rightarrow \infty} \int^S g_k d\mu$ exists. Lets calculate this limit. By [theorem: 20.84] and [eq: 21.440] we have that $\forall i \in \{1, \dots, m\} \lim_{k \rightarrow \infty} ((1 - \varepsilon) \cdot b_i \cdot \mu(B_{i,k}))$ exists and

$$\lim_{k \rightarrow \infty} ((1 - \varepsilon) \cdot b_i \cdot \mu(B_{i,k})) = (1 - \varepsilon) \cdot b_i \cdot \lim_{k \rightarrow \infty} \mu(B_{i,k}) = (1 - \varepsilon) \cdot b_i \cdot \mu(B_i)$$

Hence using [theorem: 20.87] on the above it follows that $\lim_{k \rightarrow \infty} (\sum_{i=1}^m (1 - \varepsilon) \cdot b_i \cdot \mu(B_{i,k}))$ exists and

$$\lim_{k \rightarrow \infty} \left(\sum_{i=1}^m (1 - \varepsilon) \cdot b_i \cdot \mu(B_{i,k}) \right) = (1 - \varepsilon) \cdot \sum_{i=1}^m b_i \cdot \mu(B_i) \quad (21.444)$$

so

$$\begin{aligned} \lim_{k \rightarrow \infty} \int^S g_k d\mu &\stackrel{[\text{eq: 21.441}]}{=} \lim_{k \rightarrow \infty} \left(\sum_{i=1}^m (1 - \varepsilon) \cdot b_i \cdot \mu(B_{i,k}) \right) \\ &\stackrel{[\text{eq: 21.444}]}{=} (1 - \varepsilon) \cdot \sum_{i=1}^m b_i \cdot \mu(B_i) \\ &\stackrel{[\text{eq: 21.433}]}{=} (1 - \varepsilon) \cdot \int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu \end{aligned}$$

Hence

$$\lim_{k \rightarrow \infty} \int^S g_k d\mu = (1 - \varepsilon) \cdot \int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu \quad (21.445)$$

By [eq: 21.443] we have $\forall x \in X$ that $\forall k \in \mathbb{N} g_k(x) \leq f_k(x)$, so it follows from [theorem: 21.292] that $\int^S g_k d\mu \leq \int^S f_k d\mu$. Using then [theorem: 20.84] we have that

$$\lim_{k \rightarrow \infty} \int^S g_k d\mu \leq \lim_{k \rightarrow \infty} \int^S f_k d\mu$$

If we combine this with [eq: 21.445] we get

$$(1 - \varepsilon) \cdot \int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu \leq \lim_{k \rightarrow \infty} \int^S f_k d\mu \leq \infty \quad (21.446)$$

Now for $\int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu$ we have either:

$\int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu = \infty$. Then as $0 < (1 - \varepsilon)$ we have $(1 - \varepsilon) \cdot \int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu = \infty$ so that
by [eq: 21.446] $\lim_{k \rightarrow \infty} \int^S f_k d\mu = \infty = \int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu$ so that

$$\int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu \leq \lim_{k \rightarrow \infty} \int^S f_k d\mu$$

$\int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu < \infty$. By [eq: 21.431] we have $0 \leq \lim_{k \rightarrow \infty} \int^S f_k d\mu \leq \int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu < \infty$
so that $\lim_{k \rightarrow \infty} \int^S f_k d\mu \in \mathbb{R} \wedge \int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu$. Hence by [eq: 21.446] we have that

$$\int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu \leq \lim_{k \rightarrow \infty} \int^S f_k d\mu + \varepsilon \cdot \int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu$$

As $\varepsilon \in \mathbb{R}^+$ with $\varepsilon < 1$ was chosen arbitrary it follows from [theorem: 10.31] that

$$\int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu \leq \lim_{k \rightarrow \infty} \int^S f_k d\mu$$

which proves that in all cases

$$\int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu \leq \lim_{k \rightarrow \infty} \int^S f_k d\mu$$

Combining this with [eq: 21.431] proves that

$$\int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu = \lim_{k \rightarrow \infty} \int^S f_k d\mu$$

So in all possible cases we have

$$\int^S \left(\lim_{k \rightarrow \infty} f_k \right) d\mu = \lim_{k \rightarrow \infty} \int^S f_k d\mu \quad \square$$

21.5.2 Integral of non negative functions

21.5.2.1 Definition of the integral of non negative functions

We extend now the integral $\int^S$ of measurable non negative simple functions to non negative measurable functions.

Definition 21.296. Let $\langle X, \mathcal{A}, \mu \rangle$ and $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then we define $\int^+ f d\mu$ by

$$\int^+ f d\mu = \sup \left(\left\{ \int^S g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leq f(x) \right\} \right)$$

Note 21.297. As by [example: 21.283] $C_0 \in \mathcal{S}^+[X, \mathcal{A}]$ and $\forall x \in X$ $C_0(x) = 0 \leq f(x)$ it follows that $\{\int^S g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leq f(x)\} \neq \emptyset$ so that

$$\sup \left(\left\{ \int^S g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leq f(x) \right\} \right)$$

exists. Hence the definition is well defined.

Note 21.298. In the definition of the integral $\int^+ f d\mu$ we don't use the $\mathcal{A}$ -measurability of f , $\sup(\{\int^S g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leq f(x)\})$ is also well defined for a non negative function. However the requirement that f is $\mathcal{A}$ -measurable will be useful later to construct an alternative definition based on a limiting process of simple functions.

We show now that $\int^+$ is actually an extension of $\int^S$.

Theorem 21.299. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measurable space and $f \in \mathcal{S}^+[X, \mathcal{A}]$ then $f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ and

$$\int^S f d\mu = \int^+ f d\mu$$

Proof. As $f \in \mathcal{S}^+[X, \mathcal{A}]$ we have by [definition: 21.280] that f is $\mathcal{A}$ -measurable, hence $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $f(X) \subseteq [0, \infty[$ so that

$$f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$$

Further, as trivially, $\forall x \in X \ f(x) \leq f(x)$ and $f \in \mathcal{S}^+[X, \mathcal{A}]$ it follows that

$$\int^S f d\mu \in \left\{ \int^S g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leq f(x) \right\}$$

so that

$$\int^S f d\mu \leq \sup \left(\left\{ \int^S g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leq f(x) \right\} \right) = \int^+ f d\mu \quad (21.447)$$

Let $g \in \mathcal{S}^+[X, \mathcal{A}]$ be such that $\forall x \in X$ we have $g(x) \leq f(x)$ then by [theorem: 21.292] we have that $\int^S g d\mu \leq \int^S f d\mu$. So it follows that $\int^S f d\mu$ is an upper bound of $\{\int^S g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leq f(x)\}$ which proves that

$$\sup \left(\left\{ \int^S g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \text{ we have } g(x) \leq f(x) \right\} \right) \leq \int^S f d\mu$$

Combining the above with [eq: 21.447] gives

$$\int^S f d\mu = \int^+ f d\mu \quad \square$$

Example 21.300. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $a \in [0, \infty]$ then $C_a \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ and

$$\int^+ C_a d\mu = a \cdot \mu(X)$$

Proof. Using [theorem: 21.283] $C_a \in \mathcal{S}^+[X, \mathcal{A}]$, hence using [theorem: 21.299] $C_a \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ and

$$\int^+ C_a d\mu = \int^S C_a d\mu \stackrel{[\text{theorem: 21.290}]}{=} a \cdot \mu(X) \quad \square$$

Example 21.301. $\langle X, \mathcal{A}, \mu \rangle$ be a measurable space, $A \in \mathcal{A}$ and $\alpha \in [0, \infty[$ then $\alpha \cdot \mathcal{X}_{X,A} \in \mathcal{S}^+[X, \mathcal{A}] \subseteq \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ and $\int^+(\alpha \cdot \mathcal{X}_{X,A}) d\mu = \int^S (\alpha \cdot \mathcal{X}_{X,A}) d\mu = \alpha \cdot \mu(A)$.

Proof. Take $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{A}$ by $A_1 = A$ and $\{a_i\}_{i \in \{1\}} = \alpha$ then

$$\forall x \in X \text{ we have } (\alpha \cdot \mathcal{X}_{X,A})(x) = \alpha \cdot \mathcal{X}_{X,A}(x) = \sum_{i=1}^1 a_i \cdot \mathcal{X}_{X,A_i}$$

proving that $\alpha \cdot \mathcal{X}_A = \sum_{i=1}^1 a_i \cdot \mathcal{X}_{A_i}$. From [theorem: 21.284] it follows then that

$$\alpha \cdot \mathcal{X}_A \in \mathcal{S}^+[X, \mathcal{A}]$$

Using the definition of $\int^S$ [see definition: 21.288] it follows that

$$\int^S (\alpha \cdot \mathcal{X}_{X,A}) d\mu = \sum_{i=1}^1 a_i \cdot \mu(A_i) = \alpha \cdot \mu(A)$$

Hence using [theorem: 21.299] $\alpha \cdot \mathcal{X}_{X,A} \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ and $\int^+ (\alpha \cdot \mathcal{X}_{X,A}) d\mu = \alpha \cdot \mu(A)$. $\square$

21.5.2.2 Integral of non negative measurable functions on a measurable subset

Next we define the integral on a measurable subset.

Definition 21.302. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $A \in \mathcal{A}$ and $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then

$$\int_A^+ f d\mu = \int^+ (\mathcal{X}_{A,X} \cdot f) d\mu$$

Note 21.303. Using [theorem: 21.260] $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ as is needed in this definition.

If $\langle X, \mathcal{A}, \mu \rangle$ is a measure space and $A \in \mathcal{A}$ then by [theorem: 21.41] we can construct the measure subspace $\langle A, \mathcal{A}|_A, \mu|_{\mathcal{A}|_A} \rangle$ where $\mathcal{A}|_A = \{B \in \mathcal{A} | B \subseteq A\}$ and $\mu|_{\mathcal{A}|_A}: \mathcal{A}|_A \rightarrow [0, \infty]$ is the restriction of μ to $\mathcal{A}|_A$. A natural question to ask is if there is a corollation between $\int_A^+ f d\mu$ and $\int_A^+ f d\mu|_{\mathcal{A}|_A}$. As the following theorem shows the answer is yes.

Theorem 21.304. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $A \in \mathcal{A}$ and $f: X \rightarrow \overline{\mathbb{R}}$ a function such that $\mathcal{X}_A \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then

$$f|_A \in \mathcal{M}^+[A, \mathcal{A}|_A, \overline{\mathbb{R}}]$$

and

$$\int_A^+ f d\mu \stackrel{[see\ definition:\ 21.302]}{=} \int^+ (\mathcal{X}_A \cdot f) d\mu = \int_A^+ f|_A d\mu|_{\mathcal{A}|_A}$$

where

$$\mathcal{A}|_A = \{B \in \mathcal{A} | B \subseteq A\} \text{ see [definition: 21.41]}$$

$$\mu|_{\mathcal{A}|_A} \text{ is the restriction of } \mu \text{ to } \mathcal{A}|_A$$

Proof. As $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows from [theorem: 21.261] it follows that

$$f|_A \in \mathcal{M}^+[A, \mathcal{A}|_A, \overline{\mathbb{R}}]$$

which proves the first part of the theorem. Now using the definition of $\int^+$ [see definition: 21.296] we have that

$$\int_A^+ f|_A d\mu|_{\mathcal{A}|_A} = \sup \left(\left\{ \int^S g d\mu|_{\mathcal{A}|_A} | g \in \mathcal{S}^+[A, \mathcal{A}|_A] \wedge \forall x \in A \text{ we have } g(x) \leq f|_A(x) \right\} \right) \quad (21.448)$$

$$\int^+ (\mathcal{X}_A \cdot f) d\mu = \sup \left(\left\{ \int^S g d\mu | g \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in X \text{ we have } g(x) \leq (\mathcal{X}_{X,A} \cdot f)(x) \right\} \right) \quad (21.449)$$

So to prove the theorem we have to prove that the above supremums are the same. Let $I \in \left\{ \int^S g d\mu|_{\mathcal{A}|_A} | g \in \mathcal{S}^+[A, \mathcal{A}|_A] \wedge \forall x \in A \text{ we have } g(x) \leq f|_A(x) \right\}$ then there exist a $g \in \mathcal{S}^+[A, \mathcal{A}|_A]$ with $\forall x \in A$ $g(x) \leq f|_A(x) = f(x)$ such that $I = \int^S g d\mu|_{\mathcal{A}|_A}$. Using the alternate definition of simple functions [see theorem: 21.284] there exist a $n \in \mathbb{N}$, a $\{C_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}|_A = \{B \in \mathcal{A} | B \subseteq A\} \subseteq \mathcal{A}$ pairwise disjoint and $\{\alpha_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$ such that

$$g = \sum_{i=1}^n \alpha_i \cdot \mathcal{X}_{A, C_i} \quad (21.450)$$

Define now

$$h = \sum_{i=1}^n \alpha_i \cdot \mathcal{X}_{X, C_i} \quad (21.451)$$

then by [theorem: 21.284] it follows that

$$h \in \mathcal{S}^+[X, \mathcal{A}] \quad (21.452)$$

Further if $x \in X$ then we have either:

$x \in \bigsqcup_{i \in \{1, \dots, n\}} C_i$. Then $\exists i \in \{1, \dots, n\}$ such that $x \in C_i \subseteq A$ so that

$$\begin{aligned} h(x) &= \left(\sum_{i=1}^n \alpha_i \cdot \mathcal{X}_{X, C_i} \right)(x) \\ &\stackrel{[\text{theorem: 21.273}]}{=} \alpha_i \\ &\stackrel{[\text{theorem: 21.273}]}{=} \left(\sum_{i=1}^n \alpha_i \cdot \mathcal{X}_{A, C_i} \right)(x) \\ &= g(x) \\ &\leq f|_A(x) \\ &= f(x) \\ &= \mathcal{X}_{X, A}(x) \cdot f(x) \\ &= (X_{X, A} \cdot f)(x) \end{aligned}$$

$x \in X \setminus \bigsqcup_{i \in \{1, \dots, n\}} C_i$. Then by [theorem: 21.273] $h(x) = 0 \leq (\mathcal{X}_{X, A} \cdot f)(x)$ [as f is non negative].

which proves that

$$\forall x \in X \text{ we have } h(x) \leq (\mathcal{X}_{X, A} \cdot f)(x) \quad (21.453)$$

Further we have

$$\begin{aligned} I &= \int^S g d\mu|_{\mathcal{A}|_A} \\ &\stackrel{[\text{eq:21.450}] \wedge [\text{definition: 21.288}]}{=} \sum_{i=1}^n \alpha_i \cdot \mu|_{\mathcal{A}|_A}(C_i) \\ &\stackrel{C_i \in \mathcal{A}}{=} \sum_{i=1}^n \alpha_i \cdot \mu(C_i) \\ &\stackrel{[\text{eq:21.451}] \wedge [\text{definition: 21.288}]}{=} \int^S h d\mu \end{aligned}$$

The above together with [eqs: 21.452 and 21.453] proves that

$$I \in \left\{ \int^S g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in X \text{ we have } g(x) \leq (\mathcal{X}_A \cdot f)(x) \right\}.$$

So we have proved that

$$\begin{aligned} &\left\{ \int^S g d\mu|_{\mathcal{A}|_A} \mid g \in \mathcal{S}^+[A, \mathcal{A}|_A] \wedge \forall x \in A \text{ we have } g(x) \leq f|_A(x) \right\} \subseteq \\ &\left\{ \int^S g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in X \text{ we have } g(x) \leq (\mathcal{X}_{X, A} \cdot f)(x) \right\} \end{aligned} \quad (21.454)$$

For the opposite inequality. Let $I \in \left\{ \int^S g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in X \text{ we have } g(x) \leq (\mathcal{X}_{X, A} \cdot f)(x) \right\}$ then there exist a $k \in \mathcal{S}^+[X, \mathcal{A}]$ with $\forall x \in X$ $k(x) \leq (\mathcal{X}_{X, A} \cdot f)(x)$ such that $I = \int^S k d\mu$. Now for $x \in X$ we have either:

$x \in A$. Then $k(x) = \mathcal{X}_{X, A}(x) \cdot k(x) = (\mathcal{X}_{X, A} \cdot k)(x)$

$x \in X \setminus A$. As $0 \leq k(x) \leq (\mathcal{X}_{X,A} \cdot f)(x) = \mathcal{X}_{X,A}(x) \cdot f(x) = 0$ so that

$$k(x) = 0 = \mathcal{X}_{X,A}(x) \cdot k(x) = (\mathcal{X}_{X,A} \cdot k)(x)$$

hence we have proved that

$$k = \mathcal{X}_{X,A} \cdot k \quad (21.455)$$

As $k \in \mathcal{S}^+[X, \mathcal{A}]$ there exist by [theorem: 21.284] a $m \in \mathbb{N}$, a $\{B_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{A}$ pairwise disjoint and a $\{\beta_i\}_{i \in \{1, \dots, m\}} \subseteq [0, \infty[$ such that

$$k = \sum_{i=1}^m \beta_i \cdot \mathcal{X}_{X, B_i} \quad (21.456)$$

Then we have

$$k_{[\text{eq: 21.455}]} = \mathcal{X}_{X,A} \cdot \sum_{i=1}^m \beta_i \cdot \mathcal{X}_{X, B_i} = \sum_{i=1}^m \beta_i \cdot \mathcal{X}_{X,A} \cdot \mathcal{X}_{B_i} \stackrel{[\text{theorem: 21.257}]}{=} \sum_{i=1}^m \beta_i \cdot \mathcal{X}_{X, A \cap B_i} \quad (21.457)$$

Define now

$$l = \sum_{i=1}^m \beta_i \cdot \mathcal{X}_{A, A \cap B_i} \quad (21.458)$$

As $\forall i \in \{1, \dots, m\} \ B_i \in \mathcal{A} \Rightarrow A \cap B_i \in \mathcal{A}$ and $A \cap B_i \subseteq A$ it follows that $\{A \cap B_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{A}|_A$ [pairwise disjoint]. So using [theorem: 21.284] we have that

$$l \in \mathcal{S}^+[A, \mathcal{A}|_A] \quad (21.459)$$

Further if $x \in A$ then we have either:

$x \in \bigcup_{i \in \{1, \dots, m\}} (A \cap B_i)$. Then $\exists i \in \{1, \dots, m\}$ such that $x \in A \cap B_i \subseteq B_i, A$ so that

$$\begin{aligned} l(x) &= \left(\sum_{i=1}^m \beta_i \cdot \mathcal{X}_{A, A \cap B_i} \right)(x) \\ &\stackrel{[\text{theorem: 21.273}]}{=} \beta_i \\ &\stackrel{[\text{theorem: 21.273}]}{=} \left(\sum_{i=1}^m \beta_i \cdot \mathcal{X}_{X, B_i} \right)(x) \\ &\stackrel{[\text{eq: 21.456}]}{=} k(x) \\ &\leq (\mathcal{X}_{X,A} \cdot f)(x) \\ &= \mathcal{X}_{X,A}(x) \cdot f(x) \\ &\stackrel{x \in A}{=} f(x) \\ &\stackrel{x \in A}{=} f|_A(x) \end{aligned}$$

$x \notin A \setminus \bigcup_{i \in \{1, \dots, m\}} (A \cap B_i)$. Then by [theorem: 21.273] $l(x) = 0 \leq f|_A(x)$ [as f is non negative]

which proves that

$$\forall x \in A \text{ we have } l(x) \leq f|_A(x) \quad (21.460)$$

Further

$$\begin{aligned} I &= \int^S k d\mu \\ &\stackrel{[\text{eq: 21.456}] \wedge [\text{definition: 21.288}]}{=} \sum_{i=1}^m \beta_i \cdot \mu(A \cap B_i) \\ &\stackrel{A \cap B_i \in \mathcal{A}|_A}{=} \sum_{i=1}^m \beta_i \cdot \mu|_{\mathcal{A}|_A}(A \cap B_i) \\ &\stackrel{[\text{eq: 21.458}] \wedge [\text{definition: 21.288}]}{=} \int^S l d\mu|_{\mathcal{A}|_A} \end{aligned}$$

Combining the above with [eqs: 21.459 and 21.460] proves that

$$I \in \left\{ \int^S g d\mu_{|A|A} \mid g \in \mathcal{S}^+[A, \mathcal{A}_{|A}] \wedge \forall x \in A \text{ we have } g(x) \leq f_{|A}(x) \right\}$$

hence

$$\begin{aligned} & \left\{ \int^S g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in X \text{ we have } g(x) \leq (\mathcal{X}_A \cdot f)(x) \right\} \subseteq \\ & \left\{ \int^S g d\mu_{|A|A} \mid g \in \mathcal{S}^+[A, \mathcal{A}_{|A}] \wedge \forall x \in A \text{ we have } g(x) \leq f_{|A}(x) \right\} \end{aligned}$$

which combined with [eq: 21.454] gives

$$\begin{aligned} & \left\{ \int^S g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in X \text{ we have } g(x) \leq (\mathcal{X}_A \cdot f)(x) \right\} = \\ & \left\{ \int^S g d\mu_{|A|A} \mid g \in \mathcal{S}^+[A, \mathcal{A}_{|A}] \wedge \forall x \in A \text{ we have } g(x) \leq f_{|A}(x) \right\} \end{aligned}$$

Finally substituting the above in [eqs: 21.448 and 21.449] proves that

$$\int^+ (\mathcal{X}_A \cdot f) d\mu = \int^+ f_{|A} d\mu_{|A|A} \quad \square$$

Corollary 21.305. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $\forall A \in \mathcal{A}$ we have*

$$f_{|A} \in \mathcal{M}^+[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$$

and

$$\int^+ (\mathcal{X}_{X,A} \cdot f) = \int_A^+ f d\mu = \int^+ f_{|A} d\mu_{|A|A}$$

Proof. Using [theorem: 21.260] and the fact that $(\mathcal{X}_{X,A} \cdot f)(X) \subseteq [0, \infty]$ that $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ so that by [theorem: 21.304] $f_{|A} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and

$$\int_A^+ f d\mu \stackrel{[\text{definition: 21.302}]}{=} \int^+ (\mathcal{X}_{X,A} \cdot f) = \int^+ f_{|A} d\mu_{|A|A} \quad \square$$

The previous theorem shows how we can calculate the integral of the restriction of a function to a measurable subset. The next theorem show how we can calculate the integral of the extension of a function on a measurable subset.

Theorem 21.306. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $A \in \mathcal{A}$ and $f \in \mathcal{M}^+[A, \mathcal{A}_A, \overline{\mathbb{R}}]$ then*

$$f_{A \uparrow X} \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

and

$$\int^+ f d\mu_{|A|A} = \int^+ f_{A \uparrow X} d\mu$$

where

$$\mathcal{A}_{|A} = \{B \in \mathcal{A} \mid B \subseteq A\} \text{ see [definition: 21.41]}$$

$\mu_{|A|A}$ is the restriction of μ to $\mathcal{A}_{|A}$

$$f_{A \uparrow X}: X \rightarrow \overline{\mathbb{R}} \text{ is defined by } f_{A \uparrow X}(x) = \begin{cases} f(x) & \text{if } x \in A \\ 0 & \text{if } x \in X \setminus A \end{cases} \text{ [see definition: 21.234]}$$

Proof. As $f \in \mathcal{M}^+[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}]$ it follows from [theorem: 21.238] that

$$f_{A \uparrow X} \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

which proves the first part of the lemma. Now for the second part note that $\forall x \in X$ we have either:

$$x \in A. \text{ Then } (\mathcal{X}_{X,A} \cdot f_{A \upharpoonright X})(x) = \mathcal{X}_{X \setminus A}(x) \cdot f_{A \upharpoonright X}(x) \underset{x \in A}{=} 1 \cdot f_{A \upharpoonright X}(x) = f_{A \upharpoonright X}(x)$$

$$x \in X \setminus A. \text{ Then } (\mathcal{X}_{X,A} \cdot f_{A \upharpoonright X})(x) = \mathcal{X}_{X \setminus A}(x) \cdot f_{A \upharpoonright X}(x) = 0 = f_{A \upharpoonright X}(x)$$

which prove that

$$\mathcal{X}_{X,A} \cdot f_{A \upharpoonright X} = f_{A \upharpoonright X}$$

so that

$$\begin{aligned} \int^+ f_{A \upharpoonright X} d\mu &\underset{[\text{definition: 21.234}]}{=} \int^+ (\mathcal{X}_A \cdot f_{A \upharpoonright X}) d\mu \\ &\underset{[\text{theorem: 21.304}]}{=} \int^+ (f_{A \upharpoonright X})|_A d\mu|_{\mathcal{A}|_A} \\ &\underset{[\text{definition: 21.234}]}{=} \int^+ f d\mu|_{\mathcal{A}|_A} \\ &\quad \square \end{aligned}$$

21.5.2.3 Integral of non negative measurable functions as a limit of the integral of simple functions

Every non negative measurable function can be written as a limit of increasing simple measurable functions. We will use this fact to write $\int^+$ in terms of a limit of $\int^S$ of simple functions.

Theorem 21.307. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ then there exists a sequence $\{f_k\}_{k \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ such that $\forall x \in X$ we have*

$$\forall n \in \mathbb{N} \text{ we have } f_n(x) \leq f_{n+1}(x)$$

and

$$\lim_{n \rightarrow \infty} f_n(x) \text{ exists and } f(x) = \lim_{n \rightarrow \infty} f_n(x) = \sup(\{f_n(x) | n \in \mathbb{N}\})$$

In other words we have that

$$f = \lim_{n \rightarrow \infty} f_n$$

Proof. The strategy of the proof is, given $n \in \mathbb{N}$, to divide $f(X) \cap [0, n[$ in $n \cdot 2^n$ intervals of the form $\left[\frac{k-1}{2^n}, \frac{k}{2^n}\right[$ and approximate f by f_n where

$$f_n(x) = \begin{cases} \frac{k-1}{2^n} & \text{if } x \in f(X) \cap [0, n[\text{ where } k \text{ satisfies } x \in f^{-1}\left(\left[\frac{k-1}{2^n}, \frac{k}{2^n}\right]\right) \\ n & \text{if } x \in X \setminus \left(\bigcup_{k \in I_n} A_{n,k}\right) \end{cases}$$

and prove that $f = \lim_{n \rightarrow \infty} f_n$. The following illustrates this for $n=2$ and $X = \mathbb{R}$ here

$x \in$	$f^{-1}([0, 1/4[)$	$\Rightarrow$	$f_2(x) = 0/4$
$x \in$	$f^{-1}([1/4, 2/4[)$	$\Rightarrow$	$f_2(x) = 1/4$
$x \in$	$f^{-1}([2/4, 3/4[)$	$\Rightarrow$	$f_2(x) = 2/4$
$x \in$	$f^{-1}([3/4, 4/4[)$	$\Rightarrow$	$f_2(x) = 3/4$
$x \in$	$f^{-1}([4/4, 5/4[)$	$\Rightarrow$	$f_2(x) = 4/4$
$x \in$	$f^{-1}([5/4, 6/4[)$	$\Rightarrow$	$f_2(x) = 5/4$
$x \in$	$f^{-1}([6/4, 7/4[)$	$\Rightarrow$	$f_2(x) = 6/4$
$x \in$	$f^{-1}([7/4, 8/4[)$	$\Rightarrow$	$f_2(x) = 7/4$
$x \in$	$f^{-1}([8/4, \infty[)$	$\Rightarrow$	$f_2(x) = 2$

so that

$$\begin{aligned} f_2 = & \mathcal{X}_{f^{-1}([0, 1/4[)} \cdot \frac{0}{4} + \mathcal{X}_{f^{-1}([1/4, 2/4[)} \cdot \frac{1}{4} + \mathcal{X}_{f^{-1}([2/4, 3/4[)} \cdot \frac{2}{4} + \mathcal{X}_{f^{-1}([3/4, 4/4[)} \cdot \frac{3}{4} + \mathcal{X}_{f^{-1}([4/4, 5/4[)} \cdot \frac{4}{4} + \\ & \mathcal{X}_{f^{-1}([5/4, 6/4[)} \cdot \frac{5}{4} + \mathcal{X}_{f^{-1}([6/4, 7/4[)} \cdot \frac{6}{4} + \mathcal{X}_{f^{-1}([7/4, 8/4[)} \cdot \frac{7}{4} + \mathcal{X}_{f^{-1}([8/4, \infty[)} \cdot \frac{8}{4} \end{aligned} \quad (21.461)$$

Figure 21.6. f approximated by f_2

Now for the details of the proof. Define

$$\{I_n\}_{n \in \mathbb{N}} \subseteq \mathcal{P}(\mathbb{N}) \text{ by } I_n = \{i \in \mathbb{N} | i \leq n \cdot 2^n\} = \{1, \dots, n \cdot 2^n\} \quad (21.462)$$

Let $n \in \mathbb{N}$. Define for $k \in I_n$

$$A_{n,k} = \left\{ x \in X \mid \frac{k-1}{2^n} \leq f(x) < \frac{k}{2^n} \right\} = f^{-1} \left(\left[\frac{k-1}{2^n}, \frac{k}{2^n} \right) \right) \quad (21.463)$$

Then we have

$$\begin{aligned} x \in A_{n,k} &\Leftrightarrow \frac{k-1}{2^n} \leq f(x) < \frac{k}{2^n} \\ &\Leftrightarrow x \in \left\{ f \geq \frac{k-1}{2^n} \right\} \wedge x \in \left\{ f < \frac{k}{2^n} \right\} \\ &\Leftrightarrow x \in \left\{ f \geq \frac{k-1}{2^n} \right\} \cap \left\{ f < \frac{k}{2^n} \right\} \end{aligned}$$

which proves that

$$A_{n,k} = \left\{ f \geq \frac{k-1}{2^n} \right\} \cap \left\{ f < \frac{k}{2^n} \right\} \quad (21.464)$$

As f is $\mathcal{A}$ -measurable it follows from [theorem: 21.242] that $\left\{ f \geq \frac{k-1}{2^n} \right\}, \left\{ f < \frac{k}{2^n} \right\} \in \mathcal{A}$ so that

$$\forall k \in I_n \text{ we have } A_{n,k} \in \mathcal{A} \quad (21.465)$$

As $I_n = \{1, \dots, n \cdot 2^n\}$ is finite hence countable it follows from [theorem: 21.36] that

$$\bigcup_{k \in I_n} A_{n,k} \in \mathcal{A} \quad (21.466)$$

Let $l, k \in I_n$ with $l \neq k$ then we may assume that $l < k \Rightarrow l \leq k-1$ [otherwise interchange l and k]. Assume that $x \in A_{n,k} \cap A_{n,l}$ then $\frac{l-1}{2^n} \leq f(x) < \frac{l}{2^n} \leq \frac{k-1}{2^n} \leq f(x) < \frac{k}{2^n}$ leading to the contradiction $f(x) < f(x)$, hence the assumption is wrong and we have that $A_{n,k} \cap A_{n,l} = \emptyset$. In other words we have proved that

$$\{A_{n,k}\}_{k \in I_n} \text{ is pairwise disjoint} \quad (21.467)$$

Given $n \in \mathbb{N}$ define

$$\{B_{n,k}\}_{k \in \{1, \dots, n \cdot 2^n + 1\}} \subseteq \mathcal{A} \text{ by } B_{n,k} = \begin{cases} A_{n,k} & \text{if } k \in \{1, \dots, n \cdot 2^n\} = I_n \\ X \setminus (\bigcup_{i \in I_n} A_{n,i}) & \text{if } k = n \cdot 2^n + 1 \end{cases} \stackrel{[\text{eq: 21.465, 21.466}]}{\in} \mathcal{A}$$

$$\{f_{n,k}\}_{k \in \{1, \dots, n \cdot 2^n + 1\}} \subseteq [0, \infty[\text{ by } f_{n,k} = \begin{cases} \frac{k-1}{2^n} & \text{if } k \in \{1, \dots, n \cdot 2^n\} = I_n \\ n & \text{if } k = n \cdot 2^n + 1 \end{cases}$$

Using [lemma: 21.277] together with [eq: 21.467] it follows then that

$$\{B_{n,k}\}_{k \in \{1, \dots, n \cdot 2^n + 1\}} \subseteq \mathcal{A} \text{ is pairwise disjoint and } \bigsqcup_{k \in \{1, \dots, n \cdot 2^n + 1\}} B_{n,k} = X \quad (21.468)$$

Define now

$$f_n: X \rightarrow \overline{\mathbb{R}} \text{ by } f_n = \sum_{i=1}^{n \cdot 2^n + 1} f_{n,i} \cdot \chi_{X, B_{n,i}} \quad (21.469)$$

Using then [theorem: 21.284] together with [eq: 21.468] proves that

$$\{f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}] \quad (21.470)$$

Let $x \in X$ then we have either:

$\exists k \in I_n$ with $x \in A_{n,k}$. Then as $A_{n,k} = B_{n,k}$ we have by [theorem: 21.273] and [eqs: 21.468, 21.469] that $f_n(x) = f_{n,k} = \frac{k-1}{2^n}$.

$\forall k \in I_n$ we have $x \notin A_{n,k}$. Then $x \in X \setminus (\bigcup_{k \in I_n} A_{n,k}) = B_{n, n \cdot 2^n + 1}$ so that by [theorem: 21.273] and [eqs: 21.468, 21.469] we have $f_n(x) = f_{n, n \cdot 2^n + 1} = n$.

To summarize we have

$$\forall x \in X \quad f_n(x) = \begin{cases} \frac{k-1}{2^n} & \text{if } \exists k \in I_n \text{ with } x \in A_{n,k} \\ n & \text{if } x \in X \setminus (\bigcup_{k \in I_n} A_{n,k}) \end{cases} \quad (21.471)$$

Let $n \in \mathbb{N}$ and take $x \in f^{-1}([0, n])$ then $0 \leq f(x) < n$. Define $B_x = \left\{k \in I_n \mid f(x) < \frac{k}{2^n}\right\} \subseteq I_n$ a finite set. As $n \cdot 2^n \in I_n$ and $f(x) < n = \frac{n \cdot 2^n}{2^n}$ we have that $n \cdot 2^n \in B_x$ so that $B_x \neq \emptyset$. Hence $l = \min(B_x)$ exist. There are two possible cases for l

$l = 1$. Then $\frac{1-1}{2^n} = 0 \leq f(x) < \frac{1}{2^n}$ so that $x \in A_{n,1} \subseteq \bigcup_{k \in I_n} A_{n,k}$

$1 < l$. Then $1 \leq l-1 < l \leq n \cdot 2^n$ so that $l-1 \in I_n$. As $l-1 < l = \min(B_x)$ we must have that $\frac{l-1}{2^n} \leq f(x) < \frac{l}{2^n}$ so that $x \in A_{n,l} \subseteq \bigcup_{k \in I_n} A_{n,k}$

So we have proved that $f^{-1}([0, n]) \subseteq \bigcup_{k \in I_n} A_{n,k}$. For the opposite inclusion, we have for $k \in I_n$ that $A_{n,k} = f^{-1}\left(\left[\frac{k-1}{2^n}, \frac{k}{2^n}\right]\right) \subseteq f^{-1}([0, 1]) \Rightarrow \bigcup_{k \in I_n} A_{n,k} \subseteq f^{-1}([0, 1])$. Summarized we have

$$\forall n \in \mathbb{N} \text{ we have } f^{-1}([0, n]) = \bigcup_{k \in I_n} A_{n,k} \quad (21.472)$$

Let $x \in X$ and $n \in \mathbb{N}$ then we have the following possible cases

$f(x) < n$. Then $x \in f^{-1}([0, n]) \stackrel{[\text{eq: 21.472}]}{=} \bigcup_{k \in I_n} A_{n,k}$ hence there exist a $k \in I_n$ [which is unique by [eq: 21.467]] such that $x \in A_{n,k}$, hence by [eq: 21.471] we have $f_n(x) = \frac{k-1}{2^n}$. As $x \in A_{n,k}$ we have also $\frac{k-1}{2^n} \leq f(x) < \frac{k}{2^n}$ so that

$$f_n(x) \leq f(x) \text{ and } f_n(x) = \frac{k-1}{2^n} \leq f(x) < \frac{k}{2^n}$$

$n \leq f(x)$. Then $x \notin f^{-1}([0, n])$ [eq: 21.472] $\bigcup_{k \in I_n} A_{n,k}$ so that $x \in X \setminus \bigcup_{k \in I_n} A_{n,k}$ and from [eq: 21.471] we have that

$$f_n(x) = n \leq f(x)$$

Summarizing the above we have three results

$$\forall x \in X \text{ we have } f_n(x) \leq f(x) \quad (21.473)$$

$$\forall x \in X, \forall n \in \mathbb{N} \text{ with } f(x) < n \text{ there exist a } k \in I_n \text{ with } f_n(x) = \frac{k-1}{2^n} \leq f(x) < \frac{k}{2} \quad (21.474)$$

$$\forall x \in X, \forall n \in \mathbb{N} \text{ with } n \leq f(x) \text{ we have } f_n(x) = n \quad (21.475)$$

Next we show that $\{f_n\}_{n \in \mathbb{N}}$ is increasing. Let $x \in X$ then we have for $n \in \mathbb{N}$ either:

$f(x) < n$. Then $f(x) < n, n+1$ so using [eq: 21.474] there exists $k \in I_n, l \in I_{n+1}$ such that

$$f_n(x) = \frac{k-1}{2^n} \leq f(x) < \frac{k}{2^n} \wedge f_{n+1}(x) = \frac{l-1}{2^{n+1}} \leq f(x) < \frac{l}{2^{n+1}}$$

From this it follows that

$$\begin{aligned} \frac{k-1}{2^n} < \frac{l}{2^{n+1}} &\Rightarrow \frac{2 \cdot k - 2}{2^{n+1}} < \frac{l}{2^{n+1}} \\ &\Rightarrow 2 \cdot k - 2 < l \\ &\Rightarrow 2 \cdot k - 2 \leq l - 1 \\ &\Rightarrow \frac{2 \cdot k - 2}{2^{n+1}} \leq \frac{l - 1}{2^{n+1}} \\ &\Rightarrow \frac{k - 1}{2^n} \leq \frac{l - 1}{2^{n+1}} \\ &\Rightarrow f_n(x) \leq f_{n+1}(x) \end{aligned}$$

proving

$$f_n(x) \leq f_{n+1}(x)$$

$n \leq f(x) < n+1$. Then by [eq: 21.475] $f_n(x) = n$ and by [eq: 21.474] there exist a $k \in I_{n+1}$ such that $f_{n+1}(x) = \frac{k-1}{2^{n+1}} \leq f(x) < \frac{k}{2^{n+1}}$. As $n \leq f(x)$ it follows that

$$\begin{aligned} n < \frac{k}{2^{n+1}} &\Rightarrow n \cdot 2^{n+1} < k \\ &\Rightarrow n \cdot 2^{n+1} \leq k - 1 \\ &\Rightarrow n \leq \frac{k - 1}{2^{n+1}} \\ &\Rightarrow f_n(x) \leq f_{n+1}(x) \end{aligned}$$

proving

$$f_n(x) \leq f_{n+1}(x)$$

$n+1 \leq f(x)$. Then $n, n+1 \leq f(x)$ so that by [eq: 21.475] $f_n(x) = n < n+1 = f_{n+1}(x)$ so that we have again

$$f_n(x) \leq f_{n+1}(x)$$

So we have proved that

$$\forall x \in X \text{ we have } \forall n \in \mathbb{N} \text{ that } f_n(x) \leq f_{n+1}(x) \quad (21.476)$$

Using then [theorem: 20.91] on the above it follows that

$$\forall x \in X \lim_{n \rightarrow \infty} f_n(x) \text{ exists and } \lim_{n \rightarrow \infty} f_n(x) = \sup(\{f_n(x) | n \in \mathbb{N}\}) \quad (21.477)$$

Let $x \in X$. Using [eq: 21.473] we have that $\forall n \in \mathbb{N} f_n(x) \leq f(x)$ so that

$$\sup(\{f_n(x) | n \in \mathbb{N}\}) \leq f(x) \quad (21.478)$$

For the opposite inclusion. Assume that $\sup(\{f_n(x)|n \in \mathbb{N}_0\}) < f(x)$ then

$$\sup(\{f_n(x)|n \in \mathbb{N}_0\}) \in \mathbb{R}$$

and for $f(x)$ we have either:

$f(x) = \infty$. By [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $\sup(\{f_n(x)|n \in \mathbb{N}_0\}) < n < \infty = f(x)$. Using then [eq: 21.475] we have $f_n(x) = n$ so that $n = f_n(x) \leq \sup(\{f_n(x)|n \in \mathbb{N}_0\}) < n$ leading to the contradiction $n < n$.

$f(x) < \infty$. As $\sup(\{f_n(x)|n \in \mathbb{N}\}) < f(x) \Rightarrow f(x) - \sup(\{f_n(x)|n \in \mathbb{N}\}) \in \mathbb{R}^+$ there exist by [theorem: 10.64] a $n_1 \in \mathbb{N}$ such that

$$\frac{1}{2^{n_1}} < f(x) - \sup(\{f_n(x)|n \in \mathbb{N}\})$$

Further using [theorem: 10.30] there exist a $n_2 \in \mathbb{N}$ such that $f(x) < n_2$. Let $n = \max(n_1, n_2)$ then $f(x) < n$ so that by [eq: 21.474] there exist a $k \in I_n$ such that

$$f_n(x) = \frac{k-1}{2^n} \leq f(x) < \frac{k}{2^n}.$$

Then

$$f(x) - f_n(x) < \frac{k}{2^n} - \frac{k-1}{2^n} = \frac{1}{2^n} < \frac{1}{2^{n_1}} < f(x) - \sup(\{f_n(x)|n \in \mathbb{N}\})$$

so that $\sup(\{f_n(x)|n \in \mathbb{N}\}) < f_n(x)$ which as $f_n(x) \leq \sup(\{f_n(x)|n \in \mathbb{N}\})$ is a contradiction.

As in all cases we reach a contradiction the assumption is invalid and we must have that $f(x) \leq \sup(\{f_n(x)|n \in \mathbb{N}\})$ which combined with [eq: 21.478] proves that $f(x) = \sup(\{f_n(x)|n \in \mathbb{N}\})$, hence using [eq: 21.477] we have

$$\forall x \in X \text{ we have } \lim_{n \rightarrow \infty} f_n(x) \text{ exist and } f(x) = \lim_{n \rightarrow \infty} f_n(x) = \sup(\{f_n(x)|n \in \mathbb{N}\}) \quad \square$$

We set out now to provide a alternative definition of f^+ . As we can approximate f by a sequence of simple functions $\{f_n\}_{n \in \mathbb{N}}$ we will approximate $\int^+ f d\mu$ by $\int^S f_n d\mu$. The following illustrates this for $n=2$ and $X = \mathbb{R}$ here

$x \in$	$f^{-1}([0, 1/4])$	$\Rightarrow$	$f_2(x) = 0/4$
$x \in$	$f^{-1}([1/4, 2/4])$	$\Rightarrow$	$f_2(x) = 1/4$
$x \in$	$f^{-1}([2/4, 3/4])$	$\Rightarrow$	$f_2(x) = 2/4$
$x \in$	$f^{-1}([3/4, 4/4])$	$\Rightarrow$	$f_2(x) = 3/4$
$x \in$	$f^{-1}([4/4, 5/4])$	$\Rightarrow$	$f_2(x) = 4/4$
$x \in$	$f^{-1}([5/4, 6/4])$	$\Rightarrow$	$f_2(x) = 5/4$
$x \in$	$f^{-1}([6/4, 7/4])$	$\Rightarrow$	$f_2(x) = 6/4$
$x \in$	$f^{-1}([7/4, 8/4])$	$\Rightarrow$	$f_2(x) = 7/4$
$x \in$	$f^{-1}([8/4, \infty])$	$\Rightarrow$	$f_2(x) = 2$

so that

$$\begin{aligned} f_2 = & \mathcal{X}_{f^{-1}([0, 1/4])} \cdot \frac{0}{4} + \mathcal{X}_{f^{-1}([1/4, 2/4])} \cdot \frac{1}{4} + \mathcal{X}_{f^{-1}([2/4, 3/4])} \cdot \frac{2}{4} + \mathcal{X}_{f^{-1}([3/4, 4/4])} \cdot \frac{3}{4} + \mathcal{X}_{f^{-1}([4/4, 5/4])} \cdot \frac{4}{4} + \\ & \mathcal{X}_{f^{-1}([5/4, 6/4])} \cdot \frac{5}{4} + \mathcal{X}_{f^{-1}([6/4, 7/4])} \cdot \frac{6}{4} + \mathcal{X}_{f^{-1}([7/4, 8/4])} \cdot \frac{7}{4} + \mathcal{X}_{f^{-1}([8/4, \infty])} \cdot \frac{8}{4} \end{aligned}$$

and the simple integral becomes

$$\begin{aligned} \int^S f_2 d\mu = & \frac{0}{4} \cdot \mu\left(f^{-1}\left(\left[0, \frac{1}{4}\right]\right)\right) + \frac{1}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{1}{4}, \frac{2}{4}\right]\right)\right) + \frac{2}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{2}{4}, \frac{3}{4}\right]\right)\right) + \\ & \frac{3}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{3}{4}, \frac{4}{4}\right]\right)\right) + \frac{4}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{4}{4}, \frac{5}{4}\right]\right)\right) + \frac{5}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{5}{4}, \frac{6}{4}\right]\right)\right) + \\ & \frac{6}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{6}{4}, \frac{7}{4}\right]\right)\right) + \frac{7}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{7}{4}, \frac{8}{4}\right]\right)\right) + \frac{8}{4} \cdot \mu\left(f^{-1}\left(\left[\frac{8}{4}, \infty\right]\right)\right) \end{aligned}$$

which is illustrated in the below figure

Note 21.308. For the integral $\int^S f_2 d\mu$ to make sense the sets $f^{-1}\left[\frac{k-1}{2^n}, \frac{k}{2^n}\right]$ must be measurable, which is the reason why we must require that f is measurable. The above figure suggest that the surface beneath f is aproximated from below by a increasing sequence $\int^S f_n d\mu$ this will provides us with a alternative definition for $\int^+ f d\mu$.

Figure 21.7. f apprimated by f_2

Theorem 21.309. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $\{f_k\}_{k \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ such that

$$\forall x \in X \text{ we have } f_k(x) \leq f_{k+1}(x)$$

and

$$\lim_{k \rightarrow \infty} f_k \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

then

$$\lim_{k \rightarrow \infty} \int^S f_k d\mu \text{ exist}$$

and

$$\int^+ \left(\lim_{k \rightarrow \infty} f_k \right) d\mu = \sup \left(\left\{ \int^S f_k d\mu \mid k \in \mathbb{N} \right\} \right) = \lim_{k \rightarrow \infty} \int^S f_k d\mu \quad [\text{theorem: 21.299}] = \lim_{n \rightarrow \infty} \int^+ f_n d\mu$$

Note 21.310. As $\forall x \in X$ we have $\forall k \in \mathbb{N} \ f_k(x) \leq f_{k+1}(x)$ we have by [theorem: 20.91] that $\lim_{k \rightarrow \infty} f_k(x)$ exist, as is needed for the requirements of this theorem.

Proof. As $\forall x \in X$ we have $\forall k \in \mathbb{N} \ f_k(x) \leq f_{k+1}(x)$ we have by [theorem: 20.91] that

$$\forall x \in X \ \lim_{k \rightarrow \infty} f_k(x) \text{ exists and } \lim_{k \rightarrow \infty} f_k(x) = \sup (\{f_k(x) \mid k \in \mathbb{N}\}) \quad (21.479)$$

so that

$$\forall x \in X \text{ we have } \forall k \in \mathbb{N} \text{ that } f_k(x) \leq \lim_{k \rightarrow \infty} f_k(x) \quad (21.480)$$

Further using [theorem: 21.292] we have that $\forall k \in \mathbb{N} \ \int^S f_k d\mu \leq \int^S f_{k+1} d\mu$ which by [theorem: 20.91] proves that

$$\lim_{k \rightarrow \infty} \int^S f_k d\mu \text{ exists and } \lim_{k \rightarrow \infty} \int^S f_k d\mu = \sup \left(\left\{ \int^S f_k d\mu \mid k \in \mathbb{N} \right\} \right) \quad (21.481)$$

So that

$$\forall k \in \mathbb{N} \text{ we have } \int^S f_k d\mu \leq \lim_{k \rightarrow \infty} \int^S f_k d\mu \quad (21.482)$$

Let $k \in \mathbb{N}$. As by [eq: 21.480] $\forall x \in X$ $f_k(x) \leq \lim_{k \rightarrow \infty} f_k(x) = \left(\lim_{k \rightarrow \infty} f_k \right)(x)$ and $f_k \in \mathcal{S}^+[X, \mathcal{A}]$ we have that $\int^S f_k d\mu \in \left\{ \int^S g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \ g(x) \leq \left(\lim_{k \rightarrow \infty} f_k \right)(x) \right\}$ so that

$$\int^S f_k d\mu \leq \sup \left(\left\{ \int^S g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \forall x \in X \ g(x) \leq \left(\lim_{k \rightarrow \infty} f_k \right)(x) \right\} \right)$$

hence we have by [definition: 21.296] that

$$\forall k \in \mathbb{N} \int^S f_k d\mu \leq \int^+ \left(\lim_{k \rightarrow \infty} f_k \right) d\mu \quad (21.483)$$

So $\int^+ \left(\lim_{k \rightarrow \infty} f_k \right) d\mu$ is a upper bound for $\{\int^S f_k d\mu \mid k \in \mathbb{N}\}$ from which it follows that $\sup(\{\int^S f_k d\mu \mid k \in \mathbb{N}\}) \leq \int^+ \left(\lim_{k \rightarrow \infty} f_k \right) d\mu$ which by [eq: 21.481] proves that

$$\lim_{k \rightarrow \infty} \int^S f_k d\mu \leq \int^+ \left(\lim_{k \rightarrow \infty} f_k \right) d\mu \quad (21.484)$$

For the opposite inequality. Let $g \in \mathcal{S}^+[X, \mathcal{A}]$ be such that $\forall x \in X$ $g(x) \leq \left(\lim_{k \rightarrow \infty} f_k \right)(x) = \lim_{k \rightarrow \infty} f_k(x)$. Then using [theorem: 21.292] it follows that

$$\forall k \in \mathbb{N} \ g \wedge f_k \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \int^S (g \wedge f_k) d\mu \leq \int^S f_k d\mu \quad (21.485)$$

Let $x \in X$ then given $k \in \mathbb{N}$ we have

$$(g \wedge f_k)(x) = \min(g(x), f_k(x)) \leq \min(g(x), f_{k+1}(x)) = (g \wedge f_{k+1})(x) \quad (21.486)$$

so that by [theorem: 20.91]

$$\lim_{k \rightarrow \infty} (g \wedge f_k)(x) \text{ exists and } \lim_{k \rightarrow \infty} (g \wedge f_k)(x) = \sup(\{(g \wedge f_k)(x) \mid k \in \mathbb{N}\}) \quad (21.487)$$

As $\forall k \in \mathbb{N} \ (g \wedge f_k)(x) = \min(g(x), f_k(x)) \leq g(x)$ we have that

$$\sup(\{(g \wedge f_k)(x) \mid k \in \mathbb{N}\}) \leq g(x) \quad (21.488)$$

As $g(x) \leq \left(\lim_{k \rightarrow \infty} f_k \right)(x)$ we have for $g(x)$ either:

$g(x) = \left(\lim_{k \rightarrow \infty} f_k \right)(x)$. Then $g(x) \stackrel{[\text{eq: 21.479}]}{=} \sup(\{f_k(x) \mid k \in \mathbb{N}\})$ so that $\forall k \in \mathbb{N}$ we have $f_k(x) \leq g(x)$ hence $(g \wedge f_k)(x) = \min(g(x), f_k(x)) = f_k(x)$ which proves that

$$\sup(\{(g \wedge f_n)(x) \mid k \in \mathbb{N}\}) = \sup(\{f_k(x) \mid k \in \mathbb{N}\}) \stackrel{[\text{eq: 21.479}]}{=} \left(\lim_{k \rightarrow \infty} f_k \right)(x) \stackrel{\text{hypothesis}}{=} g(x)$$

$g(x) < \left(\lim_{k \rightarrow \infty} f_k \right)(x)$. Then by [eq: 21.479] $g(x) < \sup(\{f_k(x) \mid k \in \mathbb{N}\})$ so that there exist a $k \in \mathbb{N}$ such that $g(x) < f_k(x)$ hence $(g \wedge f_k)(x) = \min(g(x), f_k(x)) = g(x)$. Hence $g(x) \in \{(g \wedge f_n)(x) \mid k \in \mathbb{N}\}$ so that $g(x) \leq \sup(\{(g \wedge f_n)(x) \mid k \in \mathbb{N}\})$ which by [eq: 21.488] proves that

$$g(x) = \sup(\{(g \wedge f_k)(x) \mid k \in \mathbb{N}\})$$

So in all cases $g(x) = \sup(\{(g \wedge f_k)(x) \mid k \in \mathbb{N}\})$ which by [eq: 21.487] proves $\lim_{k \rightarrow \infty} (g \wedge f_k)(x) = g(x)$ hence

$$\lim_{k \rightarrow \infty} (g \wedge f_k) = g \in \mathcal{S}^+[X, \mathcal{A}] \quad (21.489)$$

The above and [eq: 21.486] allows us to apply [theorem: 21.294] to get that

$$\lim_{k \rightarrow \infty} \int^S (g \wedge f_k) d\mu \text{ exists and } \lim_{k \rightarrow \infty} \int^S (g \wedge f_k) d\mu = \int^S \left(\lim_{k \rightarrow \infty} (g \wedge f_k) \right) d\mu = \int^S g d\mu \quad (21.490)$$

By [eq: 21.485] $\int^S (g \wedge f_k) d\mu \leq \int^S f_k d\mu$ so that by [theorem: 20.84] we have

$$\lim_{k \rightarrow \infty} \int^S (g \wedge f_k) d\mu \leq \lim_{k \rightarrow \infty} \int^S f_k d\mu$$

Combining this with [eq: 21.490] gives

$$\int^S g d\mu \leq \lim_{k \rightarrow \infty} \int^S f_k d\mu$$

So $\lim_{k \rightarrow \infty} \int^S f_k d\mu$ is an upper bound for $\left\{ \int^S g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \text{ with } g(x) \leq \left(\lim_{k \rightarrow \infty} f_k \right)(x) \right\}$ proving that

$$\sup \left(\left\{ \int^S g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \text{ with } g(x) \leq \left(\lim_{k \rightarrow \infty} f_k \right)(x) \right\} \right) \leq \lim_{k \rightarrow \infty} \int^S f_k d\mu$$

As $\int^+ \left(\lim_{k \rightarrow \infty} f_k \right) d\mu = \sup \left(\left\{ \int^S g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \text{ with } g(x) \leq \left(\lim_{k \rightarrow \infty} f_k \right)(x) \right\} \right)$ we have that

$$\int^+ \left(\lim_{k \rightarrow \infty} f_k \right) d\mu \leq \lim_{k \rightarrow \infty} \int^S f_k d\mu$$

Combining this with [eq: 21.484] proves that

$$\int^+ \left(\lim_{k \rightarrow \infty} f_k \right) d\mu = \lim_{k \rightarrow \infty} \int^S f_k d\mu \quad [\text{eq: 21.481}] \sup \left(\left\{ \int^S f_k d\mu \mid k \in \mathbb{N} \right\} \right) \quad \square$$

Next we state an alternative way to define the integral $\int^+$. The benefit of this alternative definition is that it is based on a limiting process making it easier to lift properties of $\int^S$ to $\int^+$. In this theorem the measurability of f is a requirement.

Theorem 21.311. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then there exist a sequence $\{f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ such that*

$$\forall x \in X \text{ we have } \forall n \in \mathbb{N} \text{ that } f_n(x) \leq f_{n+1}(x)$$

and

$$\forall x \in X \text{ we have } \lim_{n \rightarrow \infty} f_n(x) \text{ exists and } f(x) = \lim_{n \rightarrow \infty} f_n(x) = \sup (\{f_n(x) \mid n \in \mathbb{N}\})$$

and

$$\lim_{n \rightarrow \infty} \int^S f_n d\mu \text{ exist and } \int^+ f d\mu = \lim_{n \rightarrow \infty} \int^S f_n d\mu = \sup \left(\left\{ \int^S f_n d\mu \mid n \in \mathbb{N} \right\} \right)$$

Proof. Using [theorem: 21.307] there exists a $\{f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ such that $\forall x \in X$ we have $\forall n \in \mathbb{N}$ $f_n(x) \leq f_{n+1}(x)$ and $\lim_{n \rightarrow \infty} f_n(x) = f(x) = \sup (\{f_n(x) \mid n \in \mathbb{N}\}) \Rightarrow f = \lim_{n \rightarrow \infty} f_n$. Using this result together with the previous theorem [theorem: 21.309] proves that $\lim_{n \rightarrow \infty} \int^S f_n d\mu$ exists and

$$\int^+ f d\mu = \int^+ \left(\lim_{n \rightarrow \infty} f_n \right) d\mu = \lim_{n \rightarrow \infty} \int^S f_n d\mu \quad \square$$

21.5.2.4 Properties of the integral of non negative measurable functions

We prove now that $\int^+$ has similar properties as $\int^S$.

Theorem 21.312. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ such that $f = 0$ μ -a.e. then $\int^+ f d\mu = 0$.*

Proof. As $f = 0$ μ -a.e. there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$\{x \in X \mid 0 < f(x)\} \stackrel{f(X) \subseteq [0, \infty]}{=} \{x \in X \mid 0 \neq f(x)\} \subseteq N$$

Let $g \in \mathcal{S}^+[X, \mathcal{A}]$ be such that $\forall x \in X$ $g(x) \leq f(x)$. Then for

$$x \in \{x \in X \mid g(x) \neq 0\} \stackrel{g(X) \subseteq [0, \infty]}{=} \{x \in X \mid 0 < g(x)\}$$

we have $0 < g(x) \leq f(x)$ so that $x \in \{x \in X \mid 0 < f(x)\} \subseteq N$. Hence $\{x \in X \mid g(x) \neq 0\} \subseteq N$ which proves that $g = 0$ μ -a.e.. Applying then [theorem: 21.292 (5)] results in $\int^S g d\mu = 0$. So we have proved that

$$\left\{ \int^S g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \text{ with } \forall x \in X g(x) \leq f(x) \right\} = \{0\}$$

Hence

$$\int^+ f d\mu = \sup \left(\int g d\mu \mid g \in \mathcal{S}^+[X, \mathcal{A}] \text{ with } \forall x \in X g(x) \leq f(x) \right) = 0 \quad \square$$

Theorem 21.313. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f, g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then we have

1. $\forall \alpha \in [0, \infty[$ we have $\alpha \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $\int^+(\alpha \cdot f) d\mu = \alpha \cdot \int^+ f d\mu$.
2. $f + g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $\int^+(f + g) d\mu = \int^+ f d\mu + \int^+ g d\mu$.
3. If $\forall x \in X$ we have $f(x) \leq g(x)$ then $\int^+ f d\mu \leq \int^+ g d\mu$.
4. $\forall A \in \mathcal{A}$ we have that $\int_A^+ f d\mu \stackrel{\text{definition: 21.302}}{=} \int^+(\chi_{X,A} \cdot f) d\mu \leq \int^+ f d\mu$

Proof. First using [theorem: 21.311] there exists $\{f_n\}_{n \in \mathbb{N}}, \{g_n\}_{n \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ such that $\forall x \in X$ we have $\forall n \in \mathbb{N}$ that $f_n(x) \leq f_{n+1}(x)$, $g_n(x) \leq g_{n+1}(x)$ and

$$f = \lim_{n \rightarrow \infty} f_n, g = \lim_{n \rightarrow \infty} g_n, \int^+ f d\mu = \lim_{n \rightarrow \infty} \int^S f_n d\mu \text{ and } \int^+ g d\mu = \lim_{n \rightarrow \infty} \int^S g_n d\mu \quad (21.491)$$

then we have:

1. Using [theorems: 21.249, 21.292] and the fact that $0 < \alpha$ it follows that

$$\alpha \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \{\alpha \cdot f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$$

Given $x \in X$ we have

$$\forall n \in \mathbb{N} \text{ we have } (\alpha \cdot f_n)(x) = \alpha \cdot f_n(x) \underset{0 < \alpha}{\leq} \alpha \cdot f_{n+1}(x) = (\alpha \cdot f_{n+1})(x)$$

and

$$\begin{aligned} (\alpha \cdot f)(x) &= \alpha \cdot f(x) \\ &\stackrel{[\text{eq: 21.491}]}{=} \alpha \cdot \lim_{n \rightarrow \infty} f_n(x) \\ &\stackrel{[\text{theorem: 20.84}]}{=} \lim_{n \rightarrow \infty} (\alpha \cdot f_n(x)) \\ &= \lim_{n \rightarrow \infty} (\alpha \cdot f_n)(x) \end{aligned}$$

Hence using [theorem: 21.309] we have that $\lim_{n \rightarrow \infty} \int^S (\alpha \cdot f_n) d\mu$ exists and

$$\begin{aligned} \int^+(\alpha \cdot f) d\mu &= \lim_{n \rightarrow \infty} \int^S (\alpha \cdot f_n) d\mu \\ &\stackrel{[\text{theorem: 21.292}]}{=} \lim_{n \rightarrow \infty} \left(\alpha \cdot \int^S f_n d\mu \right) \\ &\stackrel{[\text{theorem: 20.84}]}{=} \alpha \cdot \lim_{n \rightarrow \infty} \int^S f_n d\mu \\ &\stackrel{[\text{eq: 21.491}]}{=} \alpha \cdot \int^+ f_n d\mu \end{aligned}$$

2. Using [theorems: 21.245, 21.292] it follows that

$$f + g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \{f_n + g_n\}_{n \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$$

Given $x \in X$ we have

$$\forall n \in \mathbb{N} \text{ we have } (f_n + g_n)(x) = f_n(x) + g_n(x) \leq f_{n+1}(x) + g_{n+1}(x) = (f_{n+1} + g_{n+1})(x)$$

and

$$\begin{aligned} (f + g)(x) &= f(x) + g(x) \\ &\stackrel{[\text{eq: 21.491}]}{=} \lim_{n \rightarrow \infty} f_n(x) + \lim_{n \rightarrow \infty} g_n(x) \\ &\stackrel{[\text{theorem: 20.84}]}{=} \lim_{n \rightarrow \infty} (f_n(x) + g_n(x)) \\ &= \lim_{n \rightarrow \infty} (f_n + g_n)(x) \end{aligned}$$

Hence using [theorem: 21.309] we have that $\lim_{n \rightarrow \infty} \int^S (f_n + g_n) d\mu$ exists and

$$\begin{aligned} \int^+ (f + g) d\mu &= \lim_{n \rightarrow \infty} \int^S (f_n + g_n) d\mu \\ &\stackrel{[\text{theorem: 21.292}]}{=} \lim_{n \rightarrow \infty} \left(\int^S f_n d\mu + \int^S g_n d\mu \right) \\ &\stackrel{[\text{theorem: 20.84}]}{=} \lim_{n \rightarrow \infty} \int^S f_n d\mu + \lim_{n \rightarrow \infty} \int^S g_n d\mu \\ &\stackrel{[\text{eq: 21.491}]}{=} \int^+ f_n d\mu + \int^+ g_n d\mu \end{aligned}$$

3. Assume that $\forall x \in X$ we have $f(x) \leq g(x)$. Let

$$y \in \left\{ \int^S h d\mu \mid h \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in X \text{ we have } h(x) \leq f(x) \right\}$$

then there exist a $h \in \mathcal{S}^+[X, \mathcal{A}]$ satisfying $\forall x \in X \ h(x) \leq f(x)$ such that $y = \int^S h d\mu$. As $\forall x \in X \ f(x) \leq g(x)$ we have also $h(x) \leq g(x)$ it follows that

$$y \in \left\{ \int^S h d\mu \mid h \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in X \text{ we have } h(x) \leq g(x) \right\}$$

Hence

$$\begin{aligned} &\left\{ \int^S h d\mu \mid h \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in X \text{ we have } h(x) \leq f(x) \right\} \subseteq \\ &\left\{ \int^S h d\mu \mid h \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in X \text{ we have } h(x) \leq g(x) \right\} \end{aligned}$$

So

$$\begin{aligned} \int^+ f d\mu &\stackrel{\text{def}}{=} \sup \left(\left\{ \int^S h d\mu \mid h \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in X \text{ we have } h(x) \leq f(x) \right\} \right) \\ &\stackrel{[\text{theorem: 3.77}]}{\leq} \sup \left(\left\{ \int^S h d\mu \mid h \in \mathcal{S}^+[X, \mathcal{A}] \wedge \forall x \in X \text{ we have } h(x) \leq g(x) \right\} \right) \\ &= \int^+ g d\mu \end{aligned}$$

4. Let $x \in X$ then $(\mathcal{X}_{X,A} \cdot f)(x) = \mathcal{X}_{X,A}(x) \cdot f(x) = \begin{cases} f(x) & \text{if } x \in A \\ 0 & \text{if } x \in X \setminus A \end{cases} \leq f(x)$ so that by (3)

$$\int^+ (\mathcal{X}_{X,A} \cdot f) d\mu \leq \int^+ f d\mu$$

□

Next we use induction to extend the last part of the previous theorem to a finite sum of measurable functions.

Theorem 21.314. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $n \in \mathbb{N}$ and $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then*

$$\sum_{i=1}^n f_i \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

and

$$\int^+ \left(\sum_{i=1}^n f_i \right) d\mu = \sum_{i=1}^n \int^+ f_i d\mu$$

Proof. We use induction to prove this, so let

$$\mathcal{S} = \left\{ n \in \mathbb{N}_0 \mid \text{If } \{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ then } \sum_{i=1}^n f_i \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ \left(\sum_{i=1}^n f_i \right) d\mu = \sum_{i=1}^n \int^+ f_i d\mu \right\}$$

then we have:

$1 \in \mathcal{S}$. Let $\{f_i\}_{i \in \{1, \dots, 1\}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $\sum_{i=1}^1 f_i = f_1 \in \mathcal{M}^+[X, \mathcal{A}]$ and

$$\int^+ \left(\sum_{i=1}^1 f_i \right) d\mu = \int^+ f_1 d\mu = \sum_{i=1}^1 \int^+ f_i d\mu$$

proving that $1 \in \mathcal{S}$.

$n \in \mathcal{S} \Rightarrow n+1 \in \mathcal{S}$. Let $\{f_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then as $n \in \mathcal{S}$ we have that $\sum_{i=1}^n f_i \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ hence

$$\sum_{i=1}^{n+1} f_i = \left(\sum_{i=1}^n f_i \right) + f_{n+1} \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad [\text{using [theorem: 21.313 (2)}]$$

Further we have

$$\begin{aligned} \int^+ \left(\sum_{i=1}^{n+1} f_i \right) d\mu &= \int^+ \left(\left(\sum_{i=1}^n f_i \right) + f_{n+1} \right) d\mu \\ &\stackrel{[\text{theorem: 21.313(2)}]}{=} \int^+ \left(\sum_{i=1}^n f_i \right) d\mu + \int^+ f_{n+1} d\mu \\ &\stackrel{n \in \mathcal{S}}{=} \left(\sum_{i=1}^n \int^+ f_i d\mu \right) + \int^+ f_{n+1} d\mu \\ &= \sum_{i=1}^{n+1} \int^+ f_i d\mu \end{aligned}$$

proving that $n+1 \in \mathcal{S}$. □

Theorem 21.315. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and let $f, g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ such that $f = g$ μ -a.e. then*

$$\int^+ f d\mu = \int^+ g d\mu$$

Proof. Define

$$H = \{x \in X \mid f(x) \neq g(x)\} = \{f \neq g\}$$

As f, g are $\mathcal{A}$ -measurable we have by [theorem: 21.244] that $H \in \mathcal{A}$. Further as $f = g$ μ -a.e. there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $H \subseteq N$ hence $\mu(H) \leq \mu(N) = 0$. Summarized we have

$$H \in \mathcal{A} \text{ and } \mu(H) = 0 \tag{21.492}$$

Define

$$h: X \rightarrow [0, \infty] \text{ by } h(x) = \begin{cases} \infty & \text{if } x \in H \\ 0 & \text{if } x \in X \setminus H \end{cases}$$

Let $x \in \mathbb{R}$ then we have either:

$0 \leq x$. Then if $t \in \{h > x\}$ we have $h(t) > x \geq 0$ so that $x \in H$ [otherwise $h(t) = 0 \not> 0$] so that $\{h > x\} \subseteq H$. If $t \in H$ then $h(t) = \infty > x$ so that $H \subseteq \{h > x\}$. Summarized we have

$$\{h > x\} = H \in \mathcal{A}$$

$x < 0$. Then if $t \in X$ we have either $t \in H$ so that $h(t) = \infty > x$ or $t \in X \setminus H$ giving $h(t) = 0 > x$, hence $X \subseteq \{h > x\} \subseteq X$ proving

$$\{h > x\} = X \in \mathcal{A}$$

So $\forall x \in \mathbb{R}$ we have $\{h > x\} \in \mathcal{A}$ from which it follows, using [theorem: 21.242] and the fact that $h(X) \in [0, \infty]$, that

$$h \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.493)$$

Let $n \in \mathbb{N}$ and define

$$h_n: X \rightarrow \overline{\mathbb{R}} \text{ by } h_n = n \cdot \mathcal{X}_{X, H}$$

then by [example: 21.301] we have

$$h_n = n \cdot \mathcal{X}_{X, H} \in \mathcal{S}^+[X, \mathcal{A}] \text{ and } \int^S h_n d\mu = n \cdot \mu(H) \underset{[\text{eq: 21.492}]}{=} 0 \quad (21.494)$$

Further we have

$$\forall n \in \mathbb{N}, \forall x \in X \text{ that } h_n(x) = \begin{cases} n & \text{if } x \in H \\ 0 & \text{if } x \in X \setminus H \end{cases} \leq \begin{cases} n+1 & \text{if } x \in H \\ 0 & \text{if } x \in X \setminus H \end{cases} = h_{n+1}(x) \quad (21.495)$$

Let $x \in X$ then we have either:

$$x \in H. \text{ Then } \lim_{n \rightarrow \infty} h_n(x) = \lim_{n \rightarrow \infty} n \underset{[\text{theorem: 20.81}]}{=} \infty = h(x).$$

$$x \in X \setminus H. \text{ Then } \lim_{n \rightarrow \infty} h_n(x) = \lim_{n \rightarrow \infty} 0 = 0 = h(x)$$

proving that $\lim_{n \rightarrow \infty} h_n(x) = h(x)$. This fact together with [eqs: 21.494 and 21.495] allows us to use [theorem: 21.309] giving

$$\lim_{n \rightarrow \infty} \int^S h_n d\mu \text{ exist and } \int^+ h d\mu = \lim_{n \rightarrow \infty} \int^S h_n d\mu \underset{[\text{eq: 21.494}]}{=} \lim_{n \rightarrow \infty} 0 = 0 \quad (21.496)$$

Further if we look again at the possibilities of $x \in X$ we have

$$x \in H. \text{ Then } h(x) = \infty \text{ so that } f(x) \leq \infty = g(x) + \infty = g(x) + h(x) \text{ and } g(x) \leq \infty = f(x) + \infty = f(x) + h(x) \text{ so that } f(x) \leq g(x) + h(x) \text{ and } g(x) \leq f(x) + h(x).$$

$$x \in X \setminus H. \text{ Then } f(x) = g(x) = g(x) + 0 = g(x) + f(x) \text{ and } g(x) = f(x) = f(x) + 0 = f(x) + h(x)$$

So in all cases we have $f(x) \leq g(x) + h(x) \wedge g(x) \leq f(x) + h(x)$. Using [theorem: 21.313] we have that

$$\int^+ f d\mu \leq \int^+ g d\mu + \int^+ h d\mu \underset{[\text{eq: 21.496}]}{=} \int^+ g d\mu$$

and

$$\int^+ g d\mu \leq \int^+ f d\mu + \int^+ h d\mu \underset{[\text{eq: 21.496}]}{=} \int^+ f d\mu$$

which proves that

$$\int^+ f d\mu = \int^+ f d\mu \quad \square$$

Next we prove that every non negative function with a finite integral is μ -a.e. finite. First we need a lemma.

Lemma 21.316. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measurable space, $t \in \mathbb{R}^+$ and $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then for

$$A_t = \{f \geq t\} \stackrel{\text{def}}{=} \{x \in X \mid f(x) \geq t\}$$

we have

$$\mu(A_t) \leq \frac{1}{t} \cdot \int_{A_t}^+ f d\mu \leq \frac{1}{t} \cdot \int^+ f d\mu$$

Note 21.317. Using [theorem: 21.242] $A_t \in \mathcal{A}$ as is required for the existence of $\int_{A_t}^+ f d\mu$ in this lemma.

Proof. Consider the function $t \cdot \chi_{X, A_t} = \sum_{i=1}^1 a_i \cdot \chi_{X, A_i}$ where $a_1 = t \in \mathbb{R}^+$ and $A_1 = A_t$ then as $A_t = \{f \geq t\} \in \mathcal{A}$ [as f is $\mathcal{A}$ -measurable] we have that

$$t \cdot \chi_{X, A_t} \stackrel{[\text{theorem: 21.284}]}{\in} \mathcal{S}^+[X, \mathcal{A}] \text{ and } \int^+ (t \cdot \chi_{X, A_t}) d\mu \stackrel{\text{def}}{=} \sum_{i=1}^1 a_i \mu(A_i) = t \cdot \mu(A_t) < \infty \quad (21.497)$$

Let $x \in X$ then we have either

$x \in A_t$. Then $0 < t \leq f(x)$ and as $\chi_{X, A_t}(x) = 1$ we have $0 \leq t \cdot \chi_{X, A_t} \leq f(x) \cdot \chi_{X, A_t} \leq f(x)$

$x \in X \setminus A_t$. Then $\chi_{X, A_t}(x) = 0$ so that trivially $0 \leq t \cdot \chi_{X, A_t}(x) \leq f(x) \cdot \chi_{X, A_t}(x) \leq f(x)$

hence in all cases we have $0 \leq t \cdot \chi_{X, A_t} \leq \chi_{X, A_t} \cdot f(x) \leq f(x)$ so that by [theorem: 21.313]

$$t \cdot \mu(A_t) \stackrel{[\text{eq: 21.497}]}{=} \int^+ (t \cdot \chi_{X, A_t}) d\mu \leq \int^+ (\chi_{X, A_t} \cdot f) d\mu \leq \int^+ f d\mu$$

proving that

$$\mu(A_t) \leq \frac{1}{t} \cdot \int_{A_t}^+ f d\mu \leq \frac{1}{t} \cdot \int^+ f d\mu \quad \square$$

Theorem 21.318. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ such that $\int^+ f d\mu < \infty$ then

$$\mu(\{x \in X : f(x) = \infty\}) = 0$$

proving that

$$f \neq \infty \text{ } \mu\text{-a.e.}$$

Note 21.319. Using [theorem: 21.244] we have that $\{x \in X \mid f(x) = \infty\} = \{f = \infty\} \in \mathcal{A}$ so that $\mu(\{x \in X \mid f(x) = \infty\})$ is well defined.

Proof. Let $n \in \mathbb{N}_0$ then $\frac{1}{n} \in \mathbb{R}^+$ so using the above lemma [lemma: 21.316] we have that

$$\mu(\{x \in X \mid f(x) \geq n\}) \leq \frac{1}{n} \cdot \int^+ f d\mu$$

Now if $x \in \{x \in X \mid f(x) = \infty\}$ we have $n \leq \infty = f(x)$ so that $x \in \{x \in X \mid f(x) \geq n\}$ proving that

$$\{f = \infty\} = \{x \in X \mid f(x) = \infty\} \subseteq \{x \in X \mid f(x) \geq n\}$$

As $\{f = \infty\} \in \mathcal{A}$ [see theorem: 21.244] we have

$$\mu(\{x \in X \mid f(x) = \infty\}) \leq \mu(\{x \in X \mid f(x) \geq n\}) \leq \frac{1}{n} \cdot \int^+ f d\mu$$

As n is chosen arbitrary and $0 \leq \int^+ f d\mu < \infty \Rightarrow$ we have by [theorem: 10.31] that

$$\mu(\{x \in X \mid f(x) = \infty\}) = 0$$

proving that

$$f \neq \infty \text{ } \mu\text{-a.e.} \quad \square$$

21.5.3 Measure integral

21.5.3.1 Definition of the measure integral

We extend now the integral $\int^+$ of non negative measurable functions to the measure integral $\int$ of measurable functions. To do this we write a measurable function f as the difference of two non negative measurable functions f^+ and f^- , so $f = f^+ - f^-$ and define $\int f d\mu$ as $\int f d\mu = \int^+ f^+ d\mu - \int^+ f^- d\mu$. Of course this only works if $\int^+ f^+ d\mu - \int^+ f^- d\mu$ is well defined, so we require that $\int^+ f^+ d\mu, \int^+ f^- d\mu$ are finite. First we define f^+, f^- .

Definition 21.320. Let X be a set and $f: X \rightarrow \overline{\mathbb{R}}$ a function then we define:

1. $f^+: X \rightarrow \overline{\mathbb{R}}$ by $f^+(x) = \max(f(x), 0) \in [0, \infty]$
2. $f^-: X \rightarrow \overline{\mathbb{R}}$ by $f^-(x) = -\min(-f(x), 0) \in [0, \infty]$
3. $|f|: X \rightarrow \overline{\mathbb{R}}$ by $|f|(x) = |f(x)|$

Note 21.321. From the definition it follows that $f^+(X) \subseteq [0, \infty]$, $f^-(X) \subseteq [0, \infty]$ and $|f|(X) \subseteq [0, \infty]$.

We have the following alternative definition for f^+, f^- and $|f|$.

Theorem 21.322. Let X be a set and $f: X \rightarrow \overline{\mathbb{R}}$ a function then we have

1. $f^+ = f \vee C_0$
 2. $f^- = -(f \wedge C_0)$
 3. $|f| = f^+ + f^-$
 4. $\forall x \in X (f^+(x), f^-(x)) \in \overline{\mathbb{R}} \times \overline{\mathbb{R}} \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ so that $f^+ - f^-$ is well defined and
- $$f = f^+ - f^-$$

Proof.

1. Let $x \in X$ then $f^+(x) = \max(f(x), 0) = \max(f(x), C_0(x)) = (f \vee C_0)(x)$. proving that

$$f^+ = f \vee C_0$$

2. Let $x \in X$ then $f^-(x) = -\min(f(x), 0) = -\min(f(x), C_0(x)) = -(f \wedge C_0)(x) = -(f \wedge C_0)(x)$ proving that

$$f^- = -(f \wedge C_0)$$

3. Let $x \in X$ then for $f(x)$ we have either:

$0 \leq f(x)$. Then

$$\begin{aligned} (f^+ + f^-)(x) &= f^+(x) + f^-(x) \\ &= \max(f(x), 0) + (-\min(f(x), 0)) \\ &= f(x) + (-0) \\ &= f(x) \\ &= |f(x)| \\ &= |f|(x) \end{aligned}$$

$f(x) < 0$. Then

$$\begin{aligned} (f^+ + f^-)(x) &= f^+(x) + f^-(x) \\ &= \max(f(x), 0) + (-\min(f(x), 0)) \\ &= 0 + (-f(x)) \\ &= -f(x) \\ &= |f(x)| \\ &= |f|(x) \end{aligned}$$

which proves that

$$|f| = f^+ + f^-$$

4. Let $x \in X$ then we have the following cases for $f(x)$

$f(x) = \infty$. Then

$$f^+(x) = \max(f(x), 0) = \max(\infty, 0) = \infty = f(x)$$

and

$$f^-(x) = -\min(f(x), 0) = -\min(\infty, 0) = 0$$

so that $(f^+(x), f^-(x)) = (\infty, 0) \in \overline{\mathbb{R}} \times \overline{\mathbb{R}} \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ and

$$(f^+ - f^-)(x) = f^+(x) - f^-(x) = f(x) - 0 = f(x)$$

$f(x) = -\infty$. Then

$$f^+(x) = \max(f(x), 0) = \max(-\infty, 0) = 0$$

and

$$f^-(x) = -\min(f(x), 0) = -\min(-\infty, 0) = \infty$$

so that $(f^+(x), f^-(x)) = (0, \infty) \in \overline{\mathbb{R}} \times \overline{\mathbb{R}} \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ and

$$(f^+ - f^-)(x) = f^+(x) - f^-(x) = 0 - \infty = -\infty = f(x)$$

$f(x) \in \mathbb{R}$. Then for $f(x)$ we have either:

$f(x) < 0$. Then we have

$$f^+(x) = \max(f(x), 0) = 0$$

and

$$f^-(x) = -\min(f(x), 0) = -f(x)$$

so that $(f^+(x), f^-(x)) = (0, -f(x)) \in \overline{\mathbb{R}} \times \overline{\mathbb{R}} \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ and

$$(f^+ - f^-)(x) = f^+(x) - f^-(x) = 0 - (-f(x)) = f(x)$$

$0 \leq f(x)$. Then we have

$$f^+(x) = \max(f(x), 0) = f(x)$$

and

$$f^-(x) = -\min(f(x), 0) = -0 = 0$$

so that $(f^+(x), f^-(x)) = (f(x), 0) \in \overline{\mathbb{R}} \times \overline{\mathbb{R}} \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ and

$$(f^+ - f^-)(x) = f^+(x) - f^-(x) = f(x) - 0 = f(x)$$

So in all cases we have have $(f^+(x), f^-(x)) = (f(x), 0) \in \overline{\mathbb{R}} \times \overline{\mathbb{R}} \setminus \{(-\infty, \infty), (\infty, -\infty)\}$ and $(f^+ - f^-)(x) = f(x)$. Hence

$$f = f^+ - f^- \quad \square$$

Theorem 21.323. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $f: X \rightarrow \overline{\mathbb{R}}$ then we have:

1. $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \Leftrightarrow f^+ \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $f^- \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$
2. If $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then $|f| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$

Note 21.324. If $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $f(X) \subseteq \mathbb{R} \Rightarrow \forall x \in X \ f(x) \in \mathbb{R} \Rightarrow f^+(x) = \max(f(x), 0) \in \mathbb{R} \wedge f^-(x) = -\min(f(x), 0) \in \mathbb{R} \wedge |f(x)| \in \mathbb{R}$ so that $f^+(X), f^-(X), |f|(X) \subseteq \mathbb{R}$ hence $f^+, f^-, |f| \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$.

Proof.

1.

$\Rightarrow$. As $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $C_0 \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ [see example: 21.217] it follows from [theorems: 21.252, 21.249 and 21.322] that

$$f^+ = f \vee C_0 \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } f^- = -(f \wedge C_0) \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

which as $\forall x \in X \ 0 \leq f^+(x), f^-(x)$ proves that

$$f^+, f^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

$\Leftarrow$. As $f^+, f^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and the fact $f \stackrel{[\text{theorem: 21.322}]}{=} f^+ - f^-$ it follows from [theorem: 21.251] that

$$f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

2. As $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows from (1) that $f^+, f^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ so that by [theorem: 21.245] $|f| \stackrel{[\text{theorem: 21.322}]}{=} f^+ + f^- \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. As $\forall x \in X \ 0 \leq |f|(x)$ it follows that

$$|f| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad \square$$

Theorem 21.325. *Let X be a set and $f: X \rightarrow \overline{\mathbb{R}}, g: X \rightarrow \overline{\mathbb{R}}$ be functions then we have:*

1. If $\alpha \in [0, \infty[$ then $(\alpha \cdot f)^+ = \alpha \cdot f^+$ and $(\alpha \cdot f)^- = \alpha \cdot f^-$
2. If $\alpha \in]-\infty, 0]$ then $(\alpha \cdot f)^+ = -\alpha \cdot f^-$ and $(\alpha \cdot f)^- = -\alpha \cdot f^+$
3. If $f(X) \subseteq \mathbb{R} \wedge g(X) \subseteq \mathbb{R}$ then we have $\forall x \in X$ that
 - a. $(f + g)^+(x) \leq f^+(x) + g^+(x) \leq (f^+ + g^+)(x)$
 - b. $(f + g)^-(x) \leq f^-(x) + g^-(x) \leq (f^- + g^-)(x)$
4. $\forall x \in X$ we have $f^+(x) \leq |f(x)|$ and $f^-(x) \leq |f(x)|$
5. If $A \subseteq X$ then $(f|_A)^+ = (f^+)|_A$ and $(f|_A)^- = (f^-)|_A$
6. If $A \subseteq X$ then $(f_{A \uparrow Y})^+ = (f^+)_{A \uparrow Y}$ and $(f_{A \uparrow X})^- = (f^-)_{A \uparrow X}$ [see definition: 21.234]
7. If $f(X) \subseteq [0, \infty]$ then $f = f^+$ and $f^- = C_0$
8. If $f(X) \subseteq [0, \infty]$ then $(f \cdot g)^+ = f \cdot g^+$ and $(f \cdot g)^- = f \cdot g^-$

Proof.

1. Let $x \in X$ then we have either:

$$f(x) \leq 0. \text{ then } \alpha \cdot f(x) \leq 0$$

$$\begin{aligned} (\alpha \cdot f)^+(x) &= (\alpha \cdot f)^+(x) \\ &= \max(\alpha \cdot f(x), 0) \\ &= 0 \\ &= \alpha \cdot 0 \\ &= \alpha \cdot \max(f(x), 0) \\ &= \alpha \cdot f^+(x) \end{aligned}$$

and

$$\begin{aligned} (\alpha \cdot f)^-(x) &= -\min(\alpha \cdot f(x), 0) \\ &= -\alpha \cdot f(x) \\ &= \alpha \cdot (-f(x)) \\ &= \alpha \cdot (-\min(f(x), 0)) \\ &= \alpha \cdot f^-(x) \end{aligned}$$

$0 < f(x)$. then $0 < \alpha \cdot f(x)$

$$\begin{aligned} (\alpha \cdot f)^+(x) &= \max(\alpha \cdot f(x), 0) \\ &= \alpha \cdot f(x) \\ &= \alpha \cdot \max(f(x), 0) \\ &= \alpha \cdot f^+(x) \end{aligned}$$

and

$$\begin{aligned} (\alpha \cdot f)^-(x) &= -\min(\alpha \cdot f(x), 0) \\ &= 0 \\ &= \alpha \cdot 0 \\ &= \alpha \cdot (-\min(f(x), 0)) \\ &= \alpha \cdot f^-(x) \end{aligned}$$

2. Let $x \in X$ then for x we have either:

$f(x) \leq 0$. then $0 \leq \alpha \cdot f(x)$

$$\begin{aligned} (\alpha \cdot f)^+(x) &= \max(\alpha \cdot f(x), 0) \\ &= \alpha \cdot f(x) \\ &= \alpha \cdot \min(f(x), 0) \\ &= -\alpha \cdot f^-(x) \end{aligned}$$

and

$$\begin{aligned} (\alpha \cdot f)^-(x) &= -\min(\alpha \cdot f(x), 0) \\ &= 0 \\ &= -\alpha \cdot 0 \\ &= -\alpha \cdot \max(f(x), 0) \\ &= -\alpha \cdot f^+(x) \end{aligned}$$

$0 < f(x)$. then $\alpha \cdot f(x) < 0$

$$\begin{aligned} (\alpha \cdot f)^+(x) &= \max(\alpha \cdot f(x), 0) \\ &= 0 \\ &= \alpha \cdot 0 \\ &= \alpha \cdot (\min(f(x), 0)) \\ &= -\alpha \cdot f^-(x) \end{aligned}$$

and

$$\begin{aligned} (\alpha \cdot f)^-(x) &= -\min(\alpha \cdot f(x), 0) \\ &= -\alpha \cdot f(x) \\ &= -\alpha \cdot \max(f(x), 0) \\ &= -\alpha \cdot f^+(x) \end{aligned}$$

3. Let $x \in X$ then

a. As $f(x) \leq \max(f(x), 0) = f^+(x)$ and $g(x) \leq \max(g(x), 0) = g^+(x)$ we have

$$\begin{aligned} (f+g)(x) &= f(x) + g(x) \\ &\leq f^+(x) + g^+(x) \end{aligned}$$

which as $0 \leq f^+(x) + g^+(x)$ proves that $\max((f+g)(x), 0) \leq f^+(x) + g^+(x)$ so that

$$\begin{aligned} (f+g)^+(x) &= \max((f+g)(x), 0) \\ &\leq f^+(x) + g^+(x) \end{aligned}$$

b. Then $-f^-(x) = \min(f(x), 0) \leq f(x)$ and $-g^-(x) = \min(g(x), 0) \leq g(x)$ so that

$$\begin{aligned} -f^-(x) - g^-(x) &\leq f(x) + g(x) \\ &\leq (f+g)(x) \end{aligned}$$

which as $-f^-(x) - g^-(x) \leq 0$ proves that $-f^-(x) - g^-(x) \leq \min((f+g)(x), 0)$ so that

$$\begin{aligned} (f+g)^-(x) &= -\min((f+g)(x), 0) \\ &\leq f^-(x) + g^-(x) \end{aligned}$$

4. Let $x \in X$ then $f(x) \leq |f(x)|$ and $0 \leq |f(x)|$ so that

$$f^+(x) = \max(f(x), 0) \leq |f(x)|$$

Further $-f(x) \leq |f(x)| \Rightarrow -|f(x)| \leq f(x)$ and $-|f(x)| \leq 0$ so that $-|f(x)| \leq \min(f(x), 0)$, hence

$$f^-(x) = -\min(f(x), 0) \leq |f(x)|$$

5. Let $x \in A \subseteq X$ then $(f|_A)^+(x) = \max(f|_A(x), 0) \stackrel{x \in A}{=} \max(f(x), 0) = f^+(x) \stackrel{x \in A}{=} (f^+)|_A(x)$ and $(f|_A)^-(x) = -\min(f|_A(x), 0) \stackrel{x \in A}{=} -\min(f(x), 0) = f^-(x) \stackrel{x \in A}{=} (f^-)|_A(x)$ proving that

$$(f|_A)^+ = (f^+)|_A \text{ and } (f|_A)^- = (f^-)|_A$$

6. Let $x \in A \subseteq X$ then we must consider two cases:

$x \in \mathbf{A}$. Then

$$\begin{aligned} (f_{A \uparrow X})^+(x) &= \max((f_{A \uparrow X})(x), 0) \\ &= \max(f(x), 0) \\ &= f^+(x) \\ &= (f^+)_{A \uparrow X}(x) \\ (f_{A \uparrow X})^-(x) &= -\min((f_{A \uparrow X})(x), 0) \\ &= -\min(f(x), 0) \\ &= f^-(x) \\ &= (f^-)_{A \uparrow X}(x) \end{aligned}$$

hence we have

$$(f_{A \uparrow X})^+ = (f^+)_{A \uparrow X} \text{ and } (f_{A \uparrow X})^- = (f^-)_{A \uparrow X}$$

$x \in X \setminus \mathbf{A}$. Then

$$\begin{aligned} (f_{A \uparrow X})^+(x) &= \max(f_{A \uparrow X}(x), 0) \\ &= \max(0, 0) \\ &= 0 \\ &= (f^+)_{A \uparrow X}(x) \\ (f_{A \uparrow X})^-(x) &= -\min(f_{A \uparrow X}(x), 0) \\ &= -\min(0, 0) \\ &= 0 \\ &= (f^-)_{A \uparrow X}(x) \end{aligned}$$

hence we have

$$(f_{A \uparrow X})^+ = (f^+)_{A \uparrow X} \text{ and } (f_{A \uparrow X})^- = (f^-)_{A \uparrow X}$$

7. Let $x \in X$ then we have, as $f(X) \subseteq [0, \infty]$, that $0 \leq f(x)$ hence

$$f^+(x) = \max(f(x), 0) = f(x) \text{ and } f^-(x) = -\min(f(x), 0) = 0 = C_0(x)$$

which proves that

$$f = f^+ \text{ and } f^- = C_0$$

8. Let $x \in X$ then for $g(x)$ we have either:

$0 \leq g(x)$. Then as $0 \leq f(x)$ we have $0 \leq f(x) \cdot g(x) = (f \cdot g)(x)$ so that

$$\begin{aligned} (f \cdot g)^+(x) &= \max((f \cdot g)(x), 0) \\ &= (f \cdot g)(x) \\ &= f(x) \cdot g(x) \\ &= f(x) \cdot \max(g(x), 0) \\ &= f(x) \cdot g^+(x) \\ &= (f \cdot g^+)(x) \\ (f \cdot g)^-(x) &= -\min((f \cdot g)(x), 0) \\ &= 0 \\ &= f(x) \cdot 0 \\ &= f(x) \cdot (-\min(g(x), 0)) \\ &= f(x) \cdot g^-(x) \\ &= (f \cdot g^-)(x) \end{aligned}$$

hence

$$(f \cdot g)^+ = f \cdot g^+ \text{ and } (f \cdot g)^- = f \cdot g^-$$

$g(x) < 0$. Then as $0 \leq f(x)$ we have $(f \cdot g)(x) = f(x) \cdot g(x) < 0$ so that

$$\begin{aligned} (f \cdot g)^+(x) &= \max((f \cdot g)(x), 0) \\ &= 0 \\ &= f(x) \cdot 0 \\ &= f(x) \cdot \max(g(x), 0) \\ &= f(x) \cdot g^+(x) \\ &= (f \cdot g^+)(x) \\ (f \cdot g)^-(x) &= -\min((f \cdot g)(x), 0) \\ &= -(f \cdot g)(x) \\ &= f(x) \cdot (-g(x)) \\ &= f(x) \cdot (-\min(g(x), 0)) \\ &= f(x) \cdot g^-(x) \\ &= (f \cdot g^-)(x) \end{aligned}$$

hence

$$(f \cdot g)^+ = f \cdot g^+ \text{ and } (f \cdot g)^- = f \cdot g^-$$

□

We are ready now to define the μ -measure integral and μ -integrable functions [the functions for which the μ -measure integral is defined].

Definition 21.326. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $f: X \rightarrow \overline{\mathbb{R}}$ is **μ -integrable** if

$$f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ f^+ d\mu \in [0, \infty[\text{ and } \int^- f^- d\mu \in [0, \infty[$$

The set of all μ -integrable function graphs is noted as $\mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ hence

$$\mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] = \left\{ f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge \int^+ f^+ d\mu \in [0, \infty[\wedge \int^- f^- d\mu \in [0, \infty[\right\} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

and the set of all real valued μ -integrable function graphs is noted as $\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ hence

$$\begin{aligned}\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] &= \left\{ f \in \mathcal{M}[X, \mathcal{A}, \mu, \mathbb{R}] \wedge \int^+ f^+ d\mu \in [0, \infty[\wedge \int^- f^- d\mu \in [0, \infty[\right\} \\ &= \{ f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] | f(X) \subseteq \mathbb{R} \} \\ &\subseteq \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]\end{aligned}$$

If $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then the measure integral $\int f d\mu$ is defined by

$$\int f d\mu = \int^+ f^+ d\mu - \int^+ f^- d\mu \in [0, \infty[$$

Note 21.327. As $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows from [theorem: 21.323] that $f^+, f^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$. Hence $\int^+ f^+ d\mu, \int^- f^- d\mu$ are well defined. Finally the condition $\int^+ f^+ d\mu, \int^+ f^- d\mu \in [0, \infty[$ ensures that $\int^+ f^+ d\mu - \int^+ f^- d\mu$ is well defined.

Note 21.328. For the measure space $\langle \mathbb{R}, \mathcal{L}, \lambda \rangle$ and $\langle \mathbb{R}^n, \mathcal{L}^n, \lambda^n \rangle$ the measure integral is named the Lebesgue integral.

Example 21.329. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $C_0 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ and $\int C_0 d\mu = 0$

Proof. Let $x \in X$ then we have that $(C_0)^+(x) = \max(C_0(x), 0) = 0 = C_0(x)$ and also $(C_0)^-(x) = -\min(C_0(x), 0) = 0 = C_0(x)$ so that

$$(C_0)^+ = C_0 = (C_0)^-$$

Hence we have $\int^+(C_0)^+ d\mu = \int^+ C_0 d\mu \stackrel{[\text{example: 21.312}]}{=} 0 \stackrel{[\text{example: 21.312}]}{=} \int^+ C_0 d\mu = \int^+(C_0)^- d\mu = 0$. As further $C_0 \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ [see theorem: 21.217] it follows that

$$C_0 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ and } \int C_0 d\mu = 0$$

□

The following alternative definition will be a usefull alternative for the definition of the measure integral.

Theorem 21.330. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then for $f: X \rightarrow \overline{\mathbb{R}}$ we have

$$\begin{aligned}f &\in \mathcal{L}[X, \mathcal{A}, \mu] \\ &\Updownarrow \\ \exists f_1, f_2 &\in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ with } \int^+ f_1 d\mu < \infty \wedge \int^+ f_2 d\mu \text{ such that } f = f_1 - f_2\end{aligned}$$

Further if $\exists f_1, f_2 \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ with $\int^+ f_1 d\mu < \infty \wedge \int^+ f_2 d\mu$ such that $f = f_1 - f_2$ then

$$\int f d\mu = \int^+ f_1 d\mu - \int^+ f_2 d\mu$$

Note 21.331. The condition $f = f_1 - f_2$ is equivalent with $\forall x \in X$ we have

$$(f_1(x), f_2(x)) \in (\overline{\mathbb{R}} \times \overline{\mathbb{R}}) \setminus \{(-\infty, \infty), (\infty, -\infty)\} \text{ and } f(x) = f_1(x) - f_2(x)$$

Proof.

$\Rightarrow$. If $f \in \mathcal{L}[X, \mathcal{A}, \mu]$ then by [definition: 21.326] and [theorem: 21.322] we have that for $f_1 = f^+$ and $f_2 = f^-$ that $f = f_1 - f_2$ and $\int^+ f_1 d\mu < \infty \wedge \int^+ f_2 d\mu$.

$\Leftarrow$. As $f_1, f_2 \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ with $f = f_1 - f_2$ it follows from [theorem: 21.251] that

$$f \in \mathcal{M}[X, \mathcal{A}, \mu] \tag{21.498}$$

and using [theorem: 21.323] that

$$f^+, f^- \in \mathcal{M}[X, \mathcal{A}, \mu] \quad (21.499)$$

Let $x \in X$ then we have either:

$0 \leq f(x)$. Then

$$f^+(x) = \max(f(x), 0) = f(x) = f_1(x) - f_2(x) \underset{0 \leq f_2(x) \wedge [\text{theorem: 20.27}]}{\leq} f_1(x)$$

and

$$f^-(x) = -\min(f(x), 0) = 0 \underset{0 \leq f_2(x)}{\leq} f_2(x)$$

so that

$$f^+(x) \leq f_1(x) \text{ and } f^-(x) \leq f_2(x)$$

$f(x) < 0$. Then

$$f^+(x) = \max(f(x), 0) = 0 \underset{0 \leq f_1(x)}{\leq} f_1(x)$$

and

$$f^-(x) = -\min(f(x), 0) = -f(x) = f_2(x) - f_1(x) \underset{0 \leq f_1(x) \wedge [\text{theorem: 20.27}]}{\leq} f_2(x)$$

so that

$$f^+(x) \leq f_1(x) \text{ and } f^-(x) \leq f_2(x)$$

Using then the above and [eq: 21.499] allows us to apply [theorem: 21.313] giving

$$\int^+ f^+ d\mu \leq \int^+ f_1 d\mu < \infty \text{ and } \int^+ f^- d\mu \leq \int^+ f_2 d\mu < \infty \quad (21.500)$$

Combing the above with [eq: 21.498] it follows by definition that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu]$$

Now for the last part of the theorem. As $\int^+ f_1 d\mu < \infty$ and $\int^+ f_2 d\mu < \infty$ it follows from [theorem: 21.318] that

$$N_1 = \{x \in X \mid f_1(x) = \infty\} \in \mathcal{A} \text{ and } \mu(N_1) = 0$$

$$N_2 = \{x \in X \mid f_2(x) = \infty\} \in \mathcal{A} \text{ and } \mu(N_2) = 0$$

Take

$$N = N_1 \cup N_2 \in \mathcal{A}$$

then we have $\mu(N) = \mu(N_1 \cup N_2) \leq \mu(N_1) + \mu(N_2) = 0 + 0$ so that

$$\mu(N) = 0$$

Hence if $x \in X \setminus N \Rightarrow x \notin N_1 \wedge x \notin N_2$ then $f_1(x), f_2(x) \in \mathbb{R}$ so that $f(x) = f_1(x) - f_2(x) \in \mathbb{R}$, by [theorem: 21.322] $f(x) = f^+(x) - f^-(x)$ from which it follows that $f^+(x), f^-(x) \in \mathbb{R}$. To summarize we have

$$\forall x \in X \setminus N \quad f(x), f^+(x), f^-(x), f_1(x), f_2(x) \in \mathbb{R}$$

From the above and $f^+(x) - f^-(x) = f(x) = f_1(x) - f_2(x)$ it follows that

$$\forall x \in X \setminus N \text{ we have } f^+(x) + f_2(x) = f^-(x) + f_1(x)$$

So that $\forall x \in X$ we have

$$\begin{aligned} (\mathcal{X}_{X, X \setminus N} \cdot f^+ + \mathcal{X}_{X, X \setminus N} \cdot f_2)(x) &= \begin{cases} f^+(x) + f_2(x) & \text{if } x \in X \setminus N \\ 0 & \text{if } x \in N \end{cases} \\ &= \begin{cases} f^-(x) + f_1(x) & \text{if } x \in X \setminus N \\ 0 & \text{if } x \in N \end{cases} \\ &= (\mathcal{X}_{X, X \setminus N} \cdot f^- + \mathcal{X}_{X, X \setminus N} \cdot f_1)(x) \end{aligned}$$

which proves that

$$\mathcal{X}_{X,X \setminus N} \cdot f^+ + \mathcal{X}_{X,X \setminus N} \cdot f_2 = \mathcal{X}_{X,N} \cdot f^- + \mathcal{X}_{X,N} \cdot f_1$$

As by [theorem: 21.260] $\mathcal{X}_{X,X \setminus N} \cdot f^+$, $\mathcal{X}_{X,X \setminus N} \cdot f_2$, $\mathcal{X}_{X,X \setminus N} \cdot f^-$, $\mathcal{X}_{X,X \setminus N} \cdot f_1 \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have by [theorem 21.245] that

$$\int^+ (\mathcal{X}_{X,N} \cdot f^+) d\mu + \int^+ (\mathcal{X}_{X,N} \cdot f_2) d\mu = \int^+ (\mathcal{X}_{X,N} \cdot f^-) d\mu + \int^+ (\mathcal{X}_{X,N} \cdot f_1) d\mu$$

Combining this with [theorems: 21.265, 21.315] gives

$$\int^+ f^+ d\mu + \int^+ f_2 d\mu = \int^+ f^- d\mu + \int^+ f_1 d\mu$$

As by [eq: 21.500] all the integrals are finite we finally have that

$$\int f d\mu \underset{\text{definitions}}{=} \int^+ f^+ d\mu - \int^+ f^- d\mu = \int^+ f_1 d\mu - \int^+ f_2 d\mu \quad \square$$

We show now that $\int$ is a extension of $\int^S$ and almost a extension of $\int^+$ [we need a extra condition].

Theorem 21.332. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then we have:*

1. *If $f \in \mathcal{S}^+[X, \mathcal{A}]$ then*

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ and } \int f d\mu = \int^S f d\mu$$

2. *If $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ satisfies $\int^+ f d\mu < \infty$ then*

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \text{ and } \int f d\mu = \int^+ f d\mu$$

3. *If $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ and $f(X) \subseteq [0, \infty]$ then $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$, $\int^+ f d\mu < \infty$ and $\int f d\mu = \int^+ f d\mu$*

Proof.

1. As $f \in \mathcal{S}^+[X, \mathcal{A}]$ we have that $f(X) \subseteq [0, \infty[$ and f is $\mathcal{A}$ -measurable, hence $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ further by [definition: 21.288]

$$\int^S f d\mu \in [0, \infty[$$

From [theorem: 21.325] it follows that

$$f^+ = f \in \mathcal{S}^+[X, \mathcal{A}] \underset{[\text{theorem: 21.299}]}{\subseteq} \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \text{ and } f^- = C_0$$

then $\int^+ f^+ d\mu \underset{[\text{theorem: 21.299}]}{=} \int^S f^+ d\mu = \int^S f d\mu \in [0, \infty[$ and $\int^+ f^- d\mu \underset{[\text{theorem: 21.300}]}{=} 0 \cdot \mu(X) = 0 \in [0, \infty[$. So we have proved that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ and } \int f d\mu = \int^+ f^+ d\mu - \int^+ f^- d\mu = \int^S f^+ d\mu - 0 \underset{f^+ = f}{=} \int^S f d\mu$$

2. As $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have $f(X) \subset [0, \infty]$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. Further by [theorem: 21.325]

$$f^+ = f \text{ and } f^- = C_0$$

As $\int^+ f d\mu \in [0, \infty[$ and $\int^+ f^- d\mu = \int^+ C_0 d\mu \underset{[\text{theorem: 21.300}]}{=} 0 \cdot \mu(X) = 0 \in [0, \infty[$ it follows that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu] \text{ and } \int f d\mu = \int^+ f^+ d\mu - \int^+ f^- d\mu = \int^+ f d\mu - 0 = \int^+ f d\mu$$

3. As $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $f(X) \subseteq [0, \infty]$ we have by definition that $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$, further from $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ we have also that $\int^+ f^+ d\mu < \infty$. So the conditions for (2) are satisfied from which it follows that $\int f d\mu = \int^+ f d\mu$. $\square$

21.5.3.2 Integration on measurable subspaces

Definition 21.333. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $A \in \mathcal{A}$ then $f: X \rightarrow \overline{\mathbb{R}}$ is **μ -integrable over A** if $\mathcal{X}_A \cdot f$ is **μ -integrable** or equivalently

$$\mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ (\mathcal{X}_{X,A} \cdot f)^+ d\mu \in [0, \infty[, \int^+ (\mathcal{X}_A \cdot f)^- d\mu \in [0, \infty[$$

The set of all μ -integrable function graphs is noted as $\mathcal{L}_A[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ hence

$$\begin{aligned} & \mathcal{L}_A[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \\ &= \\ & \{f \in \overline{\mathbb{R}}^X | \mathcal{X}_{X,A} \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]\} \\ &= \\ & \left\{ f \in \overline{\mathbb{R}}^X | \mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge \int^+ (\mathcal{X}_{X,A} \cdot f)^+ d\mu \in [0, \infty[\wedge \int^+ (\mathcal{X}_{X,A} \cdot f)^- d\mu \in [0, \infty[\right\} \end{aligned}$$

If $f \in \mathcal{L}_A[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then the measure integral $\int_A f d\mu$ is defined by

$$\begin{aligned} \int_A f d\mu &= \int^+ (\mathcal{X}_{X,A} \cdot f)^+ d\mu - \int^+ (\mathcal{X}_{X,A} \cdot f)^- d\mu \\ &= \int (\mathcal{X}_{X,A} \cdot f) d\mu \end{aligned}$$

Note 21.334. As $\forall x \in X (\mathcal{X}_{X,X} \cdot f)(x) = \mathcal{X}_{X,X}(x) \cdot f(x) = 1 \cdot f(x) = f(x)$ it follows that $\mathcal{X}_{X,X} \cdot f = f$. So that

$$\begin{aligned} & \mathcal{L}_X[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] = \\ & \left\{ \mathcal{X}_{X,X} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge \int^+ (\mathcal{X}_{X,X} \cdot f)^+ d\mu \in [0, \infty[\wedge \int^+ (\mathcal{X}_{X,X} \cdot f)^- d\mu \in [0, \infty[\right\} = \\ & \left\{ f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge \int^+ f^+ d\mu \in [0, \infty[\wedge \int^+ f^- d\mu \in [0, \infty[\right\} = \\ & \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \end{aligned}$$

which proves that

$$\mathcal{L}_X[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] = \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \text{ and } \int_X f d\mu = \int (\mathcal{X}_{X,X} \cdot f) d\mu = \int f d\mu$$

Theorem 21.335. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $A \in \mathcal{A}$ then

$$\mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \subseteq \mathcal{L}_A[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

Proof. Let $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $\int^+ f^+ d\mu, \int^+ f^- d\mu \in [0, \infty[$. As $A \in \mathcal{A}$ we have by [theorem: 21.260] that

$$\mathcal{X}_A \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.501)$$

Let $x \in X$ then we have either:

$x \in A$. Then

$$\begin{aligned} (\mathcal{X}_{X,A} \cdot f)^+(x) & \stackrel{[\text{theorem: 21.325(8)}]}{=} (\mathcal{X}_{X,A} \cdot f^+)(x) = \mathcal{X}_{X,A}(x) \cdot f^+(x) = 1 \cdot f^+(x) = f^+(x) \\ (\mathcal{X}_A \cdot f)^-(x) & \stackrel{[\text{theorem: 21.325(8)}]}{=} (\mathcal{X}_{X,A} \cdot f^-)(x) = \mathcal{X}_{X,A}(x) \cdot f^-(x) = 1 \cdot f^-(x) = f^-(x) \end{aligned}$$

so that

$$(\mathcal{X}_{X,A} \cdot f)^+(x) \leq f^+(x) \wedge (\mathcal{X}_{X,A} \cdot f)^-(x) \leq f^-(x)$$

$x \in X \setminus A$. Then

$$(\mathcal{X}_{X,A} \cdot f)^+(x) \stackrel{[\text{theorem: 21.325(8)}]}{=} (\mathcal{X}_{X,A} \cdot f^+)(x) = \mathcal{X}_{X,A}(x) \cdot f^+(x) = 0 \cdot f^+(x) = 0 \leq f^+(x)$$

$$(\mathcal{X}_{X,A} \cdot f)^-(x) \stackrel{[\text{theorem: 21.325(8)}]}{=} (\mathcal{X}_{X,A} \cdot f^-)(x) = \mathcal{X}_{X,A}(x) \cdot f^-(x) = 0 \cdot f^-(x) = 0 \leq f^-(x)$$

so that

$$(\mathcal{X}_{X,A} \cdot f)^+(x) \leq f^+(x) \wedge (\mathcal{X}_{X,A} \cdot f)^-(x) \leq f^-(x)$$

hence in all cases we have

$$(\mathcal{X}_{X,A} \cdot f)^+(x) \leq f^+(x) \wedge (\mathcal{X}_{X,A} \cdot f)^-(x) \leq f^-(x)$$

Applying then [theorem: 21.313] we have that

$$\int^+ (\mathcal{X}_A \cdot f)^+ d\mu \leq \int^+ f^+ d\mu < \infty \text{ and } 0 \leq \int^+ (\mathcal{X}_A \cdot f)^- d\mu \leq \int^+ f^- d\mu < \infty \quad (21.502)$$

By [eq: 21.501, 21.502] it follows from [definition: 21.326] that $\mathcal{X}_{X,A} \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ so that by [definition: 21.333]

$$f \in \mathcal{L}_A[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \quad \square$$

Theorem 21.336. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $A \in \mathcal{A}$ and $\langle A, \mathcal{A}|_A, \mu|_{\mathcal{A}|_A} \rangle$ a measure subspace of $\langle X, \mathcal{A}, \mu \rangle$ [see theorem: 21.104] then we have for $f: X \rightarrow \overline{\mathbb{R}}$

1. Then the following are equivalent

a. $f \in \mathcal{L}_A[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ [meaning $(\mathcal{X}_{X,A} \cdot f) \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ or equivalently f is μ -integrable over A]

b. $f|_A \in \mathcal{L}[A, \mathcal{A}|_A, \mu|_{\mathcal{A}|_A}, \overline{\mathbb{R}}]$ [meaning $f|_A$ is $\mu|_{\mathcal{A}|_A}$ -integrable]

Further in case of (a) [and thus also case (b)] we have

$$\int_A f d\mu = \int f|_A d\mu|_{\mathcal{A}|_A}$$

2. The following are equivalent

a. $f \in \mathcal{L}[A, \mathcal{A}, \mu|_{\mathcal{A}|_A}, \overline{\mathbb{R}}]$

b. $f_{A \uparrow X} \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$

Further in case of (a) [and thus also of (b)] we have

$$\int f_{A \uparrow X} d\mu = \int f d\mu|_{\mathcal{A}|_A}$$

Proof.

1.

a $\Rightarrow$ b. As $f \in \mathcal{L}_A[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ we have that $\mathcal{X}_{X,A} \cdot f$ is μ -integrable, which by definition means that

$$\mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \stackrel{[\text{theor: 21.323}]}{\Rightarrow} (\mathcal{X}_{X,A} \cdot f)^+, (\mathcal{X}_{X,A} \cdot f)^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.503)$$

and

$$\int^+ (\mathcal{X}_{X,A} \cdot f)^+ d\mu < \infty \wedge \int^+ (\mathcal{X}_{X,A} \cdot f)^- d\mu < \infty \quad (21.504)$$

By [theorem: 21.325(8)] we have $(\mathcal{X}_{X,A}f)^+ = \mathcal{X}_{X,A} \cdot f^+$ and $(\mathcal{X}_{X,A}f)^- = \mathcal{X}_{X,A} \cdot f^-$ which after substituting this result in [eq: 21.503, 21.504] gives

$$\mathcal{X}_{X,A} \cdot f^+, \mathcal{X}_{X,A} \cdot f^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.505)$$

$$\int^+ \mathcal{X}_{X,A} \cdot f^+ d\mu = \int^+ (\mathcal{X}_{X,A} \cdot f)^+ d\mu < \infty \quad (21.506)$$

$$\int^- \mathcal{X}_{X,A} \cdot f^- d\mu = \int^+ (\mathcal{X}_{X,A} \cdot f)^- d\mu < \infty \quad (21.507)$$

Using then [theorem: 21.304] on the above three equations gives

$$(f^+)_{|A}, (f^-)_{|A} \in \mathcal{M}^+[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}] \quad (21.508)$$

$$\int^+ (f^+)_{|A} d\mu_{|A|A} = \int^+ \mathcal{X}_{X,A} \cdot f^+ d\mu < \infty \quad (21.509)$$

$$\int^+ (f^-)_{|A} d\mu_{|A|A} = \int^+ \mathcal{X}_{X,A} \cdot f^- d\mu < \infty \quad (21.510)$$

Using [theorem: 21.325(5)] we have that $(f^+)_{|A} = (f_{|A})^+ \wedge (f^-)_{|A} = (f_{|A})^{-1}$ which after substituting this result in the previous three equations gives

$$(f_{|A})^+, (f_{|A})^- \in \mathcal{M}^+[A, \mathcal{A}_{|A}, \mu_{|A|A}] \quad (21.511)$$

$$\int^+ (f_{|A})^+ d\mu_{|A|A} = \int^+ (f^+)_{|A} d\mu_{|A|A} < \infty \quad (21.512)$$

$$\int^+ (f_{|A})^- d\mu_{|A|A} = \int^+ (f^-)_{|A} d\mu_{|A|A} < \infty \quad (21.513)$$

Hence we have by definition that

$$f_{|A} \in \mathcal{L}[A, \mathcal{A}_{|A}, \mu_{|A|A}, \overline{\mathbb{R}}]$$

and

$$\begin{aligned} \int f_{|A} d\mu_{|A|A} &\stackrel{\text{def}}{=} \int^+ (f_{|A})^+ d\mu_{|A|A} - \int^+ (f_{|A})^- d\mu_{|A|A} \\ &\stackrel{[\text{eqs: 21.512, 21.513}]}{=} \int^+ (f^+)_{|A} d\mu_{|A|A} - \int^+ (f^-)_{|A} d\mu_{|A|A} \\ &\stackrel{[\text{eqs: 21.509, 21.510}]}{=} \int^+ \mathcal{X}_{X,A} \cdot f^+ d\mu - \int^+ \mathcal{X}_{X,A} \cdot f^- d\mu \\ &\stackrel{[\text{eqs: 21.506, 21.507}]}{=} \int^+ (\mathcal{X}_{X,A} \cdot f)^+ d\mu - \int^+ (\mathcal{X}_{X,A} \cdot f)^- d\mu \\ &\stackrel{\text{def}}{=} \int (\mathcal{X}_{X,A} \cdot f) d\mu \\ &\stackrel{\text{def}}{=} \int_A f d\mu \end{aligned}$$

giving

$$\int_A f d\mu = \int f_{|A} d\mu_{|A|A}$$

b $\Rightarrow$ a. Because $f_{|A}$ is $\mu_{|A|A}$ -integrable we have by definition that

$$f_{|A} \in \mathcal{M}[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}] \stackrel{[\text{theorem: 21.323}]}{\Rightarrow} (f_{|A})^+, (f_{|A})^- \in \mathcal{M}^+[A, \mathcal{A}_{|A}, \overline{\mathbb{R}}] \quad (21.514)$$

$$\int^+ (f_{|A})^+ d\mu_{|A|A} < \infty \text{ and } \int^+ (f_{|A})^- d\mu_{|A|A} < \infty \quad (21.515)$$

Using [theorem: 21.325(5)] it follows that $(f|_A)^+ = (f^+)|_A$ and $(f|_A)^- = (f^-)|_A$ which after substituting this result in [eq: 21.514] gives

$$f|_A \in \mathcal{M}[A, \mathcal{A}|_A, \overline{\mathbb{R}}] \text{ and } (f^+)|_A, (f^-)|_A \in \mathcal{M}^+[A, \mathcal{A}|_A, \overline{\mathbb{R}}]$$

Using then [theorem: 21.261] on the above results in

$$\mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \mathcal{X}_A \cdot f^+, \mathcal{X}_A \cdot f^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.516)$$

Using [theorem: 21.304] on the above gives

$$\begin{aligned} \int^+ (\mathcal{X}_A \cdot f^+) d\mu &= \int^+ (f^+)|_A d\mu|_{\mathcal{A}|_A} \stackrel{[\text{theorem: 21.325(5)}]}{=} \int^+ (f|_A)^+ d\mu|_{\mathcal{A}|_A} \stackrel{[\text{eq: 21.515}]}{<} \infty \\ \int^+ (\mathcal{X}_A \cdot f^-) d\mu &= \int^+ (f^-)|_A d\mu|_{\mathcal{A}|_A} \stackrel{[\text{theorem: 21.325(5)}]}{=} \int^+ (f|_A)^- d\mu|_{\mathcal{A}|_A} \stackrel{[\text{eq: 21.515}]}{<} \infty \end{aligned}$$

Finally as by [theorem: 21.325(8)] $\mathcal{X}_A \cdot f^+ = (\mathcal{X}_A \cdot f)^+ \wedge \mathcal{X}_A \cdot f^- = (\mathcal{X}_A \cdot f)^-$ it follows from the above that

$$\int^+ (\mathcal{X}_A \cdot f)^+ d\mu < \infty \wedge \int^+ (\mathcal{X}_A \cdot f)^- d\mu < \infty$$

which together with $\mathcal{X}_A \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ [see eq: 21.516] proves $\mathcal{X}_A \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$. Hence by [definition: 21.333]

$$f \in \mathcal{L}_A[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

2.

a $\Rightarrow$ b. As f is $\mu|_{\mathcal{A}|_A}$ -integrable we have that

$$f \in \mathcal{M}[A, \mathcal{A}|_A, \overline{\mathbb{R}}] \stackrel{[\text{theorem: 21.323}]}{\Rightarrow} f^+, f^- \in \mathcal{M}^+[A, \mathcal{A}|_A, \overline{\mathbb{R}}] \quad (21.517)$$

$$\int^+ f^+ d\mu|_{\mathcal{A}|_A} < \infty \text{ and } \int^+ f^- d\mu|_{\mathcal{A}|_A} < \infty \quad (21.518)$$

Using [theorem: 21.306] it follows that

$$(f^+)_{A \uparrow X} \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ (f^+)_{A \uparrow X} d\mu = \int^+ f^+ d\mu|_{\mathcal{A}|_A} < \infty$$

$$(f^-)_{A \uparrow X} \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ (f^-)_{A \uparrow X} d\mu = \int^+ f^- d\mu|_{\mathcal{A}|_A} < \infty$$

As by [theorem: 21.325(6)] $(f^+)_{A \uparrow X} = (f_{A \uparrow X})^+$ and $(f^-)_{A \uparrow X} = (f_{A \uparrow X})^-$ the above becomes:

$$(f_{A \uparrow X})^+ \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ (f_{A \uparrow X})^+ d\mu = \int^+ f^+ d\mu|_{\mathcal{A}|_A} < \infty \quad (21.519)$$

$$(f_{A \uparrow X})^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ (f_{A \uparrow X})^- d\mu = \int^+ f^- d\mu|_{\mathcal{A}|_A} < \infty \quad (21.520)$$

Using the above and the fact that $f \in \mathcal{M}[A, \mathcal{A}|_A, \overline{\mathbb{R}}] \stackrel{[\text{theorem: 21.306}]}{\Rightarrow} f_{A \uparrow X} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ proves that

$$f_{A \uparrow X} \text{ is } \mu\text{-integrable}$$

Further we have that

$$\begin{aligned} \int f_{A \uparrow X} d\mu &\stackrel{\text{def}}{=} \int^+ (f_{A \uparrow X})^+ d\mu - \int^+ (f_{A \uparrow X})^- d\mu \\ &\stackrel{[\text{eqs: 21.519, 21.520}]}{=} \int^+ f^+ d\mu|_{\mathcal{A}|_A} - \int^+ f^- d\mu|_{\mathcal{A}|_A} \\ &\stackrel{\text{def}}{=} \int f d\mu|_{\mathcal{A}|_A} \end{aligned}$$

b $\Rightarrow$ **a**. As $f_{A \uparrow X}$ is μ -integrable we have by definition that

$$f_{A \uparrow X} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \xrightarrow{[\text{theorem: 21.323}]} (f_{A \uparrow X})^+, (f_{A \uparrow X})^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

$$\int^+ (f_{A \uparrow X})^+ d\mu < \infty \wedge \int^+ (f_{A \uparrow X})^- d\mu < \infty$$

Inserting $(f_{A \uparrow X})^+ \xrightarrow{[\text{theorem: 21.325(5)}]} (f^+)_{A \uparrow X}$ and $(f_{A \uparrow X})^- \xrightarrow{[\text{theorem: 21.325(5)}]} (f^-)_{A \uparrow X}$ in the above gives

$$f_{A \uparrow X} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } (f^+)_{A \uparrow X}, (f^-)_{A \uparrow X} \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.521)$$

$$\int^+ (f^+)_{A \uparrow X} d\mu < \infty \wedge \int^+ (f^-)_{A \uparrow X} d\mu < \infty \quad (21.522)$$

Using [theorem: 21.238] on [eq: 21.521] gives

$$f \in \mathcal{M}[A, \mathcal{A}|_A, \overline{\mathbb{R}}] \text{ and } f^+, f^- \in \mathcal{M}^+[A, \mathcal{A}|_A, \overline{\mathbb{R}}]$$

Using [theorem: 21.306] on the above we have

$$\int^+ f^+ d\mu|_{\mathcal{A}|_A} = \int^+ (f^+)_{A \uparrow X} d\mu \underset{[\text{eq: 21.522}]}{<} \infty \wedge \int^+ f^- d\mu|_{\mathcal{A}|_A} = \int^+ (f^-)_{A \uparrow X} d\mu \underset{[\text{eq: 21.522}]}{<} \infty$$

From the two equations above it follows by definition that

$$f \in \mathcal{L}[A, \mathcal{A}|_A, \mu|_{\mathcal{A}|_A}, \overline{\mathbb{R}}] \quad \square$$

21.5.3.3 Properties of the measure integral

Theorem 21.337. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ such that $f = 0$ μ -a.e. then $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ and $\int f d\mu = 0$

Proof. As $f = 0$ μ -a.e. there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$\{x \in X | f(x) \neq 0\} \subseteq N$$

Let $x \in \{x \in X | f^+(x) \neq 0\}$ then $\max(f(x), 0) \neq 0$ so that $f(x) \neq 0$ or $x \in \{x \in X | f(x) \neq 0\} \subseteq N$, hence $\{x \in X | f^+(x) \neq 0\} \subseteq N$ which proves that $f^+ = 0$ is μ -a.e.. Applying then [theorem: 21.312] proves that

$$\int^+ f^+ d\mu = 0 < \infty$$

If $x \in \{x \in X | f^-(x) \neq 0\}$ then $-\min(f(x), 0) \neq 0$ so that $f(x) \neq 0$ or $x \in \{x \in X | f(x) \neq 0\} \subseteq N$, hence $\{x \in X | f^-(x) \neq 0\} \subseteq N$ which proves that f^- is μ -a.e.. Applying then [theorem: 21.312] proves that

$$\int^+ f^- d\mu = 0 < \infty$$

As $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $\int^+ f^+ d\mu, \int^+ f^- d\mu \in [0, \infty[$ it follows that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

and

$$\int f d\mu \stackrel{\text{def}}{=} \int^+ f^+ d\mu - \int^+ f^- d\mu = 0 - 0 = 0 \quad \square$$

Theorem 21.338. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f_1, g_1, f_2, g_2 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ [so that $f_1(X), g_1(X), f_2(X), g_2(X) \subseteq [0, \infty[$] and $f_1 - f_2 = g_1 - g_2$ then

$$\int^+ f_1 d\mu - \int^+ f_2 d\mu = \int f_1 d\mu - \int f_2 d\mu = \int g_1 d\mu - \int g_2 d\mu = \int^+ g_1 d\mu - \int^+ g_2 d\mu$$

Proof. Let $x \in X$ then from $f_1 - f_2 = g_1 - g_2$ we have

$$\begin{aligned} (f_1 - f_2)(x) &= (g_1 - g_2)(x) &\Rightarrow & f_1(x) - f_2(x) = g_1(x) - g_2(x) \\ & &\Rightarrow & f_1(x) + g_2(x) = f_2(x) + g_1(x) \\ & &\Rightarrow & (f_1 + g_2)(x) = (f_2 + g_1)(x) \end{aligned}$$

proving that

$$f_1 + g_2 = f_2 + g_1 \quad (21.523)$$

As $f_1, f_2, g_1, g_2 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ so that $f_1(X), g_1(X), f_2(X), g_2(X) \subseteq [0, \infty[$ we have

$$f_1, g_1, f_2, g_2 \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$$

and

$$\int f_1 d\mu \stackrel{[\text{theorem: 21.332 (3)}]}{=} \int^+ f_1 d\mu < \infty \quad (21.524)$$

$$\int f_2 d\mu \stackrel{[\text{theorem: 21.332 (3)}]}{=} \int^+ f_2 d\mu < \infty \quad (21.525)$$

$$\int g_1 d\mu \stackrel{[\text{theorem: 21.332 (3)}]}{=} \int^+ g_1 d\mu < \infty \quad (21.526)$$

$$\int g_2 d\mu \stackrel{[\text{theorem: 21.332 (3)}]}{=} \int^+ g_2 d\mu < \infty \quad (21.527)$$

Using [theorem: 21.313] we have that

$$\int^+ f_1 d\mu + \int^+ g_2 d\mu = \int^+ (f_1 + g_2) d\mu \stackrel{[\text{eq: 21.523}]}{=} \int^+ (f_2 + g_1) d\mu = \int^+ f_2 d\mu + \int^+ g_1 d\mu$$

So we have as the integrals are finite that

$$\int^+ f_1 d\mu - \int^+ f_2 d\mu = \int^+ g_1 d\mu - \int^+ g_2 d\mu$$

which combined with [eqs: 21.524, 21.227, 21.526 and 21.527] proves that

$$\int f_1 d\mu - \int f_2 d\mu = \int g_1 d\mu - \int g_2 d\mu \quad \square$$

Theorem 21.339. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $f, g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ then we have:

1. $\forall \alpha \in \mathbb{R} \ \alpha \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ and $\int (\alpha \cdot f) d\mu = \alpha \cdot \int f d\mu$.
2. $f + g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ and $\int (f + g) d\mu = \int f d\mu + \int g d\mu$
3. $\forall x \in X \ f(x) \leq g(x)$ then $\int f d\mu \leq \int g d\mu$

Note 21.340. As $f, g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ we have that $f(X), g(X) \subseteq \mathbb{R}$ which is needed to ensure that $f + g$ is well defined.

Proof.

1. As $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ we have that $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ and $\int^+ f^+ d\mu, \int^+ f^- d\mu \in [0, \infty[$. Using [theorem: 21.249] we have that

$$\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \quad (21.528)$$

Consider the following cases for α

$\alpha = 0$. Then $\alpha \cdot f = C_0$ so that by [note: 21.329] $\int (\alpha \cdot f) d\mu = 0 = \alpha \cdot \int f d\mu$.

$0 < \alpha$. Then we have that

$$(\alpha \cdot f)^+ \stackrel{[\text{theorem: 21.325}]}{=} \alpha \cdot f^+ \text{ and } (\alpha \cdot f)^- \stackrel{[\text{theorem: 21.325}]}{=} \alpha \cdot f^- \quad (21.529)$$

so

$$\begin{aligned} \int^+ (\alpha \cdot f)^+ d\mu &= \int^+ (\alpha \cdot f^+) d\mu \\ &\stackrel{[\text{theorem: 21.313}]}{=} \alpha \cdot \int^+ f^+ d\mu < \infty \end{aligned} \quad (21.530)$$

$$\begin{aligned} \int^+ (\alpha \cdot f)^- d\mu &= \int^+ (\alpha \cdot f^-) d\mu \\ &\stackrel{[\text{theorem: 21.313}]}{=} \alpha \cdot \int^+ f^- d\mu < \infty \end{aligned} \quad (21.531)$$

Using [eqs: 21.528, 21.530 and 21.531] it follows that

$\alpha \cdot f$ is μ -integrable

and

$$\begin{aligned} \int (\alpha \cdot f) d\mu &= \int^+ (\alpha \cdot f)^+ d\mu - \int^+ (\alpha \cdot f)^- d\mu \\ &\stackrel{[\text{eqs: 21.530, 21.531}]}{=} \alpha \cdot \int^+ f^+ d\mu - \alpha \cdot \int^+ f^- d\mu \\ &= \alpha \cdot \left(\int^+ f^+ d\mu - \int^+ f^- d\mu \right) \\ &= \alpha \cdot \int f d\mu \end{aligned}$$

$\alpha < 0$. Then we have that $-\alpha \in [0, \infty[$ and

$$(\alpha \cdot f)^+ \stackrel{[\text{theorem: 21.325}]}{=} -\alpha \cdot f^- \text{ and } (\alpha \cdot f)^- \stackrel{[\text{theorem: 21.325}]}{=} -\alpha \cdot f^+ \quad (21.532)$$

so

$$\begin{aligned} \int^+ (\alpha \cdot f)^+ d\mu &= \int^+ (-\alpha \cdot f^-) d\mu \\ &\stackrel{[\text{theorem: 21.313}]}{=} (-\alpha) \cdot \int^+ f^- d\mu < \infty \end{aligned} \quad (21.533)$$

$$\begin{aligned} \int^+ (\alpha \cdot f)^- d\mu &= \int^+ (-\alpha \cdot f^+) d\mu \\ &\stackrel{[\text{theorem: 21.313}]}{=} (-\alpha) \cdot \int^+ f^+ d\mu < \infty \end{aligned} \quad (21.534)$$

Using [eqs: 21.528, 21.533 and 21.534] it follows that

$\alpha \cdot f$ is μ -integrable

and

$$\begin{aligned} \int (\alpha \cdot f) d\mu &= \int^+ (\alpha \cdot f)^+ d\mu - \int^+ (\alpha \cdot f)^- d\mu \\ &\stackrel{[\text{eqs: 21.533, 21.534}]}{=} (-\alpha) \cdot \int^+ f^- d\mu - (-\alpha) \cdot \int^+ f^+ d\mu \\ &= \alpha \cdot \left(\int^+ f^+ d\mu - \int^+ f^- d\mu \right) \\ &= \alpha \cdot \int f d\mu \end{aligned}$$

2. As $f, g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ $f(X), g(X) \subseteq \mathbb{R}$ we have that

$f + g$ is well defined, $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ and $\int^+ f^+ d\mu, \int^+ f^- d\mu, \int^+ g^+ d\mu, \int^+ g^- d\mu < \infty$

Using [theorem: 21.245] it follows that

$$f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

and by [theorem: 21.323] we have that

$$f^+, g^+, f^-, (f+g)^+, (f+g)^- \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$$

Further using [theorem: 21.245] we have also

$$f^+ + g^+, f^- + g^- \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$$

Further we have by [theorem: 21.325] that

$$\forall x \in X \quad (f+g)^+(x) \leq f^+(x) + g^+(x) \text{ and } (f+g)^-(x) \leq f^-(x) + g^-(x)$$

so that we can apply [theorem: 21.313] giving

$$\begin{aligned} \int^+ (f+g)^+ d\mu &\leq \int^+ (f^+ + g^+) d\mu \stackrel{[\text{theorem: 21.313}]}{=} \int^+ f^+ d\mu + \int^+ g^+ d\mu < \infty \\ \int^+ (f+g)^- d\mu &\leq \int^+ (f^- + g^-) d\mu \stackrel{[\text{theorem: 21.313}]}{=} \int^+ f^- d\mu + \int^+ g^- d\mu < \infty \end{aligned}$$

which proves that

$$f+g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

Next we have that

$$\begin{aligned} (f+g)^+ - (f+g)^- &\stackrel{[\text{theorem: 21.322}]}{=} f+g \\ &\stackrel{[\text{theorem: 21.322}]}{=} (f^+ - f^-) + (g^+ - g^-) \\ &= (f^+ + g^+) - (f^- + g^-) \end{aligned} \quad (21.535)$$

Finally

$$\begin{aligned} \int (f+g) d\mu &\stackrel{\text{def}}{=} \int^+ (f+g)^+ d\mu - \int^+ (f+g)^- d\mu \\ &\stackrel{[\text{theorem: 21.338}], [\text{eq: 21.535}]}{=} \int^+ (f^+ + g^+) d\mu - \int^+ (f^- + g^-) d\mu \\ &\stackrel{[\text{theorem: 21.313}]}{=} \int^+ f^+ d\mu + \int^+ g^+ d\mu - \left(\int^+ f^- d\mu + \int^+ g^- d\mu \right) \\ &= \left(\int^+ f^+ d\mu - \int^+ f^- d\mu \right) + \left(\int^+ g^+ d\mu - \int^+ g^- d\mu \right) \\ &= \int f d\mu + \int g d\mu \end{aligned}$$

3. As $f, g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$, $f(X), g(X) \subseteq \mathbb{R}$ and $-1 \in \mathbb{R}$ we have by (1) that $(-1) \cdot g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$, hence by (2) it follows that

$$f - g = f + (-1) \cdot g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \quad (21.536)$$

As $\forall x \in X \quad f(x) \leq g(x) \Rightarrow (g-f)(x) = g(x) - f(x) \in [0, \infty[$ it follows from [theorem: 21.332] that

$$\int (g-f) d\mu = \int^+ (g-f) \geq 0 \quad (21.537)$$

Further we have

$$\begin{aligned} \int g d\mu - \int f d\mu &= \int g d\mu + (-1) \cdot \int f d\mu \\ &\stackrel{(1)}{=} \int g d\mu + \int ((-1) \cdot f) d\mu \\ &\stackrel{(2)}{=} \int (g + (-1) \cdot f) d\mu \\ &= \int (g-f) d\mu \\ &\stackrel{[\text{theorem 21.537}]}{\geq} 0 \end{aligned}$$

which proves that

$$\int f d\mu \leq \int g d\mu \quad \square$$

We have now the following alternative definition for integrability.

Theorem 21.341. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then we have*

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \Rightarrow |f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \wedge |f| \in \mathcal{M}^+[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \wedge \int^+ |f| d\mu < \infty$$

$$f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ |f| d\mu < \infty \Rightarrow f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

$$f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } |f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \text{ then } f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

Further if $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then

$$\left| \int f d\mu \right| \leq \int |f| d\mu$$

Proof. We prove this in 4 steps:

1. Assume that $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then by definition

$$f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ f^+ d\mu < \infty \wedge \int^+ f^- d\mu < \infty \quad (21.538)$$

Using [theorem: 21.323] it follows then that

$$f^+, f^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.539)$$

Using [theorem: 21.313] we have that

$$f^+ + f^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ (f^+ + f^-) d\mu = \int^+ f^+ d\mu + \int^+ f^- d\mu \underset{\text{eq: 21.538}}{<} \infty$$

As $|f| \underset{\text{theorem: 21.322}}{=} f^+ + f^-$ we have

$$|f| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ |f| d\mu < \infty$$

Hence using [theorem: 21.332] it follows that

$$|f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

To summarize we have proved that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \Rightarrow |f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

2. Assume that $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $\int^+ |f| d\mu < \infty$ then using [theorem: 21.323] it follows that

$$|f| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Let $x \in X$ then by [theorem: 21.325] $f^+(x) \leq |f(x)| = |f|(x)$ and $f^-(x) \leq |f(x)| = |f|(x)$ so that by [theorem: 21.313] we have that $\int^+ f^+ d\mu \leq \int^+ |f| d\mu < \infty$ and $\int^+ f^- d\mu \leq \int^+ |f| d\mu < \infty$. Hence as we assumed that $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have by definition that $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$. Summarized we have

$$f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ |f| d\mu < \infty \Rightarrow f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

3. Let $f \in \mathcal{M}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ and $|f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then by definition we have that

$$\int^+ |f| d\mu \underset{\text{theorem: 21.325}}{=} \int^+ |f|^+ d\mu \underset{|f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]}{<} \infty$$

which by (2) proves that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

4. Finally

$$\begin{aligned} \left| \int f d\mu \right| &= \left| \int^+ f^+ d\mu - \int^+ f^- d\mu \right| \\ &\leq \left| \int^+ f^+ d\mu \right| + \left| \int^+ f^- d\mu \right| \\ &= \int^+ f^+ d\mu + \int^+ f^- d\mu \\ &\stackrel{[\text{theorem: 21.313}]}{=} \int^+ (f^+ + g^-) d\mu \\ &\stackrel{[\text{theorem: 21.322}]}{=} \int^+ |f| d\mu \\ &\stackrel{[\text{theorem: 21.332}]}{=} \int |f| d\mu \end{aligned}$$

□

Theorem 21.342. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and let $f, g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ such that $f = g$ μ -a.e.. If $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then $g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ [in other words if f is μ -integrable then g is μ -integrable].

$$\int f d\mu = \int g d\mu.$$

Proof. Define

$$H = \{x \in X \mid f(x) \neq g(x)\} = \{f \neq g\}$$

As $f, g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, hence f, g are $\mathcal{A}$ -measurable, we have by [theorem: 21.244] that $H \in \mathcal{A}$. Further as $f = g$ μ -a.e. there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $H \subseteq N$, hence $\mu(H) \leq \mu(N) = 0$. To summarize

$$H \in \mathcal{A} \text{ and } \mu(H) = 0 \quad (21.540)$$

As $f, g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have by [theorem: 21.323] that $f^+, f^-, g^+, g^- \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. Let $x \in X$ then

$$\text{If } f^+(x) \neq g^+(x) \Rightarrow \max(f(x), 0) \neq \max(g(x), 0) \Rightarrow f(x) \neq g(x)$$

$$\text{If } f^-(x) \neq g^-(x) \Rightarrow -\min(f(x), 0) \neq -\min(g(x), 0) \Rightarrow f(x) \neq g(x)$$

which proves that

$$\{x \in A \mid f^+(x) \neq g^+(x)\} \subseteq H \text{ and } \{x \in A \mid f^-(x) \neq g^-(x)\} \subseteq H$$

As $\mu(H) \stackrel{[\text{eq: 21.540}]}{=} 0$ we have by definition that

$$f^+ = g^+ \text{ } \mu\text{-a.e. and } f^- = g^- \text{ } \mu\text{-a.e.}$$

Using [theorem: 21.315] we have then

$$\int^+ g^+ d\mu = \int^+ f^+ d\mu \underset{f \text{ is } \mu\text{-integrable}}{<} \infty \text{ and } \int^+ g^- d\mu = \int^+ f^- d\mu \underset{f \text{ is } \mu\text{-integrable}}{<} \infty$$

which, as $g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$, proves that

$$g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \text{ and } \int f d\mu = \int^+ f^+ d\mu - \int^+ f^- d\mu = \int^+ g^+ d\mu - \int^+ g^- d\mu = \int g d\mu \quad \square$$

Theorem 21.343. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ with $g(X) \subseteq [0, \infty[$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ such that $|f| \leq g$ μ -a.e. then $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ and $\int f d\mu \leq \int g d\mu$.

Note 21.344. If $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $f(X) \subseteq \mathbb{R}$ so that $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$.

Proof. We prove this theorem in two stages:

1. Assume that $\forall x \in X$ we have $|f(x)| \leq g(x)$. As $g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ and $g(X) \subseteq [0, \infty[$ it follows from [theorem: 21.332 (3)] that

$$g \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \text{ and } \int g d\mu = \int^+ g d\mu < \infty$$

As $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows from [theorem: 21.323] that

$$f^+, f^- \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Let $x \in X$ then $f^+(x) \leq |f(x)| \leq g(x)$ and $f^-(x) \leq |f(x)| \leq g(x)$ so that by [theorem: 21.313]

$$\int^+ f^+ d\mu \leq \int^+ g d\mu < \infty \text{ and } \int^+ f^- d\mu \leq \int^+ g d\mu < \infty$$

From the above it follows that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

As $\forall x \in X$ $f(x) \leq |f(x)| \leq g(x) \underset{g(X) \subseteq [0, \infty[}{\leq} \infty$ we have $f(X) \subseteq \mathbb{R}$ and using [theorem: 21.339] that

$$\int f d\mu \leq \int g d\mu$$

2. Assume that $|f| \leq g$ μ -a.e. Then there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$\{x \in X \mid \neg(|f(x)| \leq g(x))\} \subseteq N$$

so that

$$\forall x \in X \setminus N \text{ we have } |f(x)| \leq g(x)$$

Let $x \in X$ then we have either:

$$\mathbf{x \in N.} \text{ Then } |(\mathcal{X}_{X, X \setminus N} \cdot f)|(x) = |\mathcal{X}_{X, X \setminus N}(x) \cdot f(x)| = |0 \cdot f(x)| = 0 \leq g(x)$$

$$\mathbf{x \in X \setminus N.} \text{ Then } |(\mathcal{X}_{X, X \setminus N} \cdot f)|(x) = |\mathcal{X}_{X, X \setminus N}(x) \cdot f(x)| = |1 \cdot f(x)| = |f(x)| \leq g(x)$$

hence we have that

$$\forall x \in X \text{ that } |\mathcal{X}_{X \setminus N} \cdot f| \leq g(x)$$

Further as $N \in \mathcal{A} \Rightarrow X \setminus N \in \mathcal{A}$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows from [theorem: 21.260] that

$$\mathcal{X}_{X, X \setminus N} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

So all the conditions for (1) are satisfied and we have that

$$\mathcal{X}_{X, X \setminus N} \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \text{ and } \int (\mathcal{X}_{X, X \setminus N} \cdot f) d\mu \leq \int g d\mu$$

Now as $\mu(N) = 0$ it follows from [theorem: 21.265] that $\mathcal{X}_{X, X \setminus N} \cdot f = f$ μ -a.e., using then [theorem: 21.342] it follows that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \text{ and } \int f d\mu = \int (\mathcal{X}_{X \setminus N} \cdot f) d\mu \leq \int g d\mu \quad \square$$

Theorem 21.345. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then $\{x \in X \mid f(x) \neq 0\}$ is μ -finite under μ . [see definition: 21.97].

Proof. Let $n \in \mathbb{N}$ and define

$$A_n = \left\{ x \in X \mid |f|(x) \geq \frac{1}{n} \right\} = \left\{ |f| \geq \frac{1}{n} \right\}$$

As $f \in \mathcal{L}[X, \mathcal{A}, \mu]$ we have by [theorem: 21.341] that $|f| \in \mathcal{L}[X, \mathcal{A}, \mu]$ hence $|f| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ so that by [theorem: 21.242]

$$A_n = \left\{ |f| \geq \frac{1}{n} \right\} \in \mathcal{A}$$

As $|f| \in \mathcal{L}[X, \mathcal{A}, \mu]$ we have that

$$\int^+ |f| d\mu \underset{[\text{theorem: 21.325}]}{=} \int^+ |f|^+ d\mu < \infty$$

Using [lemma: 21.316] we have then that

$$\mu(A_n) = \mu\left(\left\{|f| \geq \frac{1}{n}\right\}\right) \leq \frac{1}{\frac{1}{n}} \cdot \int^+ |f| d\mu = n \cdot \int^+ |f| d\mu < \infty$$

To summarize

$$\{A_n\}_{n \in \mathbb{N}} \subseteq \mathcal{A} \text{ and } \forall n \in \mathbb{N} \text{ we have } \mu(A_n) < \infty \quad (21.541)$$

Let $x \in \{x \in X \mid f(x) \neq 0\}$ then $0 < |f(x)|$ so that by [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $0 < \frac{1}{n} < |f(x)|$, hence $x \in A_n$. This proves that

$$\{x \in X \mid f(x) \neq 0\} \subseteq A_n \subseteq \bigcup_{n \in \mathbb{N}} A_n \quad (21.542)$$

Further if $x \in \bigcup_{n \in \mathbb{N}} A_n$ then there exist a $n \in \mathbb{N}$ such that $x \in A_n$. Then $0 < \frac{1}{n} \leq |f(x)| \Rightarrow f(x) \neq 0$ so that $x \in \{x \in X \mid f(x) \neq 0\}$. So it follows that $\bigcup_{n \in \mathbb{N}} A_n \subseteq \{x \in X \mid f(x) \neq 0\}$ which combined with [eq: 21.542] proves that

$$\{x \in X \mid f(x) \neq 0\} = \bigcup_{n \in \mathbb{N}} A_n$$

Hence $\{x \in X \mid f(x) \neq 0\}$ is μ -finite under μ . □

Theorem 21.346. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ [so that by [theorem: 21.323] $|f| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$] then we have:

1. If $\int^+ |f| d\mu = 0$ then $f = 0$ μ -a.e.
2. If $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ with $\int |f| d\mu = 0$ then $f = 0$ μ -a.e.

Proof.

1. For the first part. Let $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ with $\int^+ |f| d\mu = 0$ then by [theorem: 21.323] $|f| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$. Hence using [lemma: 21.316] we have for $n \in \mathbb{N}$ that

$$\mu\left(\left\{x \in X \mid |f(x)| \geq \frac{1}{n}\right\}\right) \leq n \cdot \int^+ |f| d\mu = 0 \quad (21.543)$$

Let $x \in \{x \in X \mid f(x) \neq 0\}$ then $0 < |f(x)|$ so that by [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $0 < \frac{1}{n} < |f(x)| \Rightarrow x \in \{x \in X \mid |f(x)| \geq \frac{1}{n}\} \subseteq \bigcup_{n \in \mathbb{N}} \{x \in X \mid |f(x)| \geq \frac{1}{n}\}$. Likewise if $x \in \bigcup_{n \in \mathbb{N}} \{x \in X \mid |f(x)| \geq \frac{1}{n}\}$ then there exist a $n \in \mathbb{N}$ such that $x \in \{x \in X \mid |f(x)| \geq \frac{1}{n}\} \Rightarrow |f(x)| \geq \frac{1}{n} > 0 \Rightarrow f(x) \neq 0$ proving that $x \in \{x \in X \mid f(x) \neq 0\}$. So we have proved that

$$\bigcup_{n \in \mathbb{N}} \left\{x \in X \mid |f(x)| \geq \frac{1}{n}\right\} = \{x \in X \mid f(x) \neq 0\} \quad (21.544)$$

As $|f| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have by [theorem: 21.242] that

$$\left\{x \in X \mid |f(x)| \geq \frac{1}{n}\right\}_{n \in \mathbb{N}} \subseteq \mathcal{A} \text{ so that } \bigcup_{n \in \mathbb{N}} \left\{x \in X \mid |f(x)| \geq \frac{1}{n}\right\} \in \mathcal{A} \quad (21.545)$$

Hence

$$\begin{aligned} \mu(\{x \in X \mid f(x) \neq 0\}) &\stackrel{[\text{eq: 21.544}]}{=} \mu\left(\bigcup_{n \in \mathbb{N}} \left\{x \in X \mid |f(x)| \geq \frac{1}{n}\right\}\right) \\ &\stackrel{[\text{eq: 21.545}] \wedge [\text{theorem: 21.95}]}{\leq} \sum_{n=1}^{\infty} \mu\left(\left\{x \in X \mid |f(x)| \geq \frac{1}{n}\right\}\right) \\ &\stackrel{[\text{eq: 21.543}]}{=} 0 \end{aligned}$$

which proves that

$$f = 0 \text{ } \mu\text{-a.e.}$$

2. As $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows from [theorem: 21.341] that $|f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ hence $\int |f|^+ d\mu < \infty$ and we have from [theorem: 21.332(3)] that $\int^+ |f| d\mu = \int |f| d\mu = 0$. Hence by (1) $f = 0 \text{ } \mu\text{-a.e.}$ $\square$

Theorem 21.347. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ such that $\forall A \in \mathcal{A}$ we have $0 \leq \int_A f d\mu$ then $f \geq 0 \text{ } \mu\text{-a.e.}$

Note 21.348. Using [theorem: 21.335] we have that $\mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \subseteq \mathcal{L}_A[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ so that $\int_A f d\mu$ is well defined.

Proof. Let $A = \{x \in X \mid 0 \not\leq f(x)\} = \{x \in X \mid f(x) < 0\} = \{f < 0\}$. Now as $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have by [theorem: 21.242] that

$$A \in \mathcal{A}$$

If $x \in X$ then we have either:

$x \in A$. Then $f(x) < 0$ and $\mathcal{X}_{X,A}(x) = 1$ so that $(\mathcal{X}_A \cdot f)(x) = f(x) < 0$ hence

$$(\mathcal{X}_{X,A} \cdot f)^+(x) = \max((\mathcal{X}_{X,A} \cdot f)(x), 0) = 0$$

$x \in X \setminus A$. Then $\mathcal{X}_{X,A}(x) = 0$ so that $(\mathcal{X}_{X,A} \cdot f)(x) = 0$ hence

$$(\mathcal{X}_{X,A} \cdot f)^+(x) = \max((\mathcal{X}_A \cdot f)(x), 0) = \max(0, 0) = 0$$

so we have proved that $(\mathcal{X}_{X,A} \cdot f)^+ = C_0$. Hence using [example: 21.300] we have that

$$\int^+ (\mathcal{X}_{X,A} \cdot f)^+ d\mu = 0 \tag{21.546}$$

So we have

$$0 \leq \int_A f d\mu = \int (\mathcal{X}_{X,A} \cdot f) d\mu = \int^+ (\mathcal{X}_{X,A} \cdot f)^+ d\mu - \int^+ (\mathcal{X}_{X,A} \cdot f)^- d\mu = - \int^+ (\mathcal{X}_{X,A} \cdot f)^- d\mu \leq 0$$

which proves that

$$\int^+ (\mathcal{X}_{X,A} \cdot f)^- d\mu = 0 \tag{21.547}$$

Hence

$$\begin{aligned} \int^+ |\mathcal{X}_{X,A} \cdot f| d\mu &\stackrel{[\text{theorem: 21.322}]}{=} \int^+ ((\mathcal{X}_{X,A} \cdot f)^+ + (\mathcal{X}_{X,A} \cdot f)^-) d\mu \\ &\stackrel{[\text{theorem: 21.313}]}{=} \int^+ (\mathcal{X}_{X,A} \cdot f)^+ d\mu + \int (\mathcal{X}_{X,A} \cdot f)^- d\mu \\ &\stackrel{[\text{eqs: 21.546, 21.547}]}{=} 0 \end{aligned}$$

Using [theorem: 21.346(1)] on the above it follows that $\mathcal{X}_{X,A} \cdot f = 0 \text{ } \mu\text{-a.e.}$ Hence there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$\{x \in X \mid (\mathcal{X}_{X,A} \cdot f) \neq 0\} \subseteq N$$

If $x \in \{x \in X \mid f(x) \not\geq 0\} = \{f < 0\}$ then $f(x) < 0$ and $\mathcal{X}_{X,A}(x) = 1$ proving that $(\mathcal{X}_A \cdot f)(x) < 0 \Rightarrow (\mathcal{X}_A \cdot f)(x) \neq 0$, hence $x \in \{x \in X \mid (\mathcal{X}_A \cdot f) \neq 0\} \subseteq N$. So

$$\{x \in X \mid f(x) \not\geq 0\} \subseteq N \text{ with } \mu(N) = 0$$

from which it follows that

$$f \geq 0 \text{ } \mu\text{-a.e.} \quad \square$$

Theorem 21.349. *Let $\langle X, \mathcal{A}, \mu \rangle$ and $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then*

$$\{x \in X \mid |f(x)| = \infty\} \in \mathcal{A} \text{ and } \mu(\{x \in X \mid |f(x)| = \infty\}) = 0$$

In other words $|f| < \infty$ μ -a.e..

Proof. As $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ we have by [theorem: 21.341] that $|f| \in \mathcal{L}[X, \mathcal{A}, \mu]$. Hence by [theorem: 21.332] we have that $|f| \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $\int^+ |f| d\mu$. Using [theorem: 21.318] it follows then that $\{x \in X \mid |f(x)| = \infty\} \in \mathcal{A}$ and $\mu(\{x \in X \mid |f(x)| = \infty\}) = 0$. $\square$

We have now a weaker version of μ -integrable functions.

Theorem 21.350. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ then*

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \Leftrightarrow \exists g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \text{ with } g(X) \subseteq \mathbb{R} \text{ such that } f = g \text{ } \mu\text{-a.e.}$$

Proof. We have

$\Rightarrow$. As $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ then we must create a function $g: X \rightarrow \overline{\mathbb{R}}$ with $g(X) \subseteq \mathbb{R}$ such that $f = g$ μ -a.e.. To do this define the set A of all elements of X where $f(x)$ is either $+\infty$ or $-\infty$.

$$A = \{x \in X \mid |f(x)| = \infty\} = \{|f| = \infty\}$$

By [theorem: 21.341] $|f| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ so that, using [theorem: 21.244(5)], $A \in \mathcal{A}$ and thus also $X \setminus A \in \mathcal{A}$, further by [theorem: 21.349] $\mu(A) = 0$. Summarized we have

$$A \in \mathcal{A}, X \setminus A \in \mathcal{A} \text{ and } \mu(A) = 0 \quad (21.548)$$

Define now

$$g = \mathcal{X}_{X, X \setminus A} \cdot f: X \rightarrow \overline{\mathbb{R}}$$

then using [theorem: 21.260] we have that

$$g = \mathcal{X}_{X, X \setminus A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Further if $x \in X$ then either $x \in A$ giving $g(x) \stackrel{x \notin X \setminus A}{=} 0 \in \mathbb{R}$ or $x \in X \setminus A$ then $|g(x)| = |f(x)| \neq \infty$ so that $g(x) \in \mathbb{R}$ hence

$$g(X) \subseteq \mathbb{R}$$

As $\mu(A) = 0$ it follows from [theorem: 21.265] that $\mathcal{X}_{X, X \setminus A} \cdot f = f$ μ -a.e. hence

$$g = f \text{ } \mu\text{-a.e.}$$

Using [theorem: 21.342] together with the above proves that

$$g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

$\Leftarrow$. Let $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. As there exist a function $g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ such that $f = g$ μ -a.e. we have by [theorem: 21.342] $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$. $\square$

21.5.4 Limit theorems

One benefit that the measure integral has over the Riemann integral are the limit theorems which are the prime reason for the invention of the measure integral.

Theorem 21.351. (Monotone Convergence Theorem (1)) *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $\{f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ such that $\forall x \in X$*

$$\forall n \in \mathbb{N} \quad f_n(x) \leq f_{n+1}(x)$$

then we have for the function

$$f = \lim_{n \rightarrow \infty} f_n: X \rightarrow \overline{\mathbb{R}} \text{ defined by } f(x) = \left(\lim_{n \rightarrow \infty} f_n \right)(x) = \lim_{n \rightarrow \infty} f_n(x)$$

that f is well defined and

$$f = \lim_{n \rightarrow \infty} f_n = \sup_{n \in \mathbb{N}} f_n \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

$$\lim_{n \rightarrow \infty} \int^+ f_n d\mu \text{ exists and } \int^+ f d\mu = \lim_{n \rightarrow \infty} \int^+ f_n d\mu = \sup \left(\left\{ \int^+ f_n d\mu \mid n \in \mathbb{N} \right\} \right)$$

Note 21.352. As $\forall n \in \mathbb{N} \ f_n(x) \leq f_{n+1}(x)$ it follows from [theorem: 20.91] that $\lim_{n \rightarrow \infty} f_n(x)$ exist and $\lim_{n \rightarrow \infty} f_n(x) = \sup (\{f_n(x) \mid n \in \mathbb{N}\})$

Note 21.353. We do not require that f is μ -integrable hence $\int^+ f d\mu = \infty$ is possible. This also the reason why we use $\int^+$ instead of $\int$.

Proof. Using [theorem: 21.254(6)] it follows that

$$f = \lim_{n \rightarrow \infty} f_n: X \rightarrow \overline{\mathbb{R}} \text{ defined by } f(x) = \left(\lim_{n \rightarrow \infty} f_n \right)(x) = \lim_{n \rightarrow \infty} f_n(x)$$

is well defined and

$$f = \lim_{n \rightarrow \infty} f_n = \sup_{n \in \mathbb{N}} f_n \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Further as $\forall n \in \mathbb{N} \ f_n \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \Rightarrow \forall x \in X \ 0 \leq f_n(x)$ it follows also that

$$f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Let $x \in X$ then as $\forall n \in \mathbb{N} \ f_n(x) \leq f_{n+1}(x)$ we have by [theorem: 21.313] that $\int^+ f_n d\mu \leq \int^+ f_{n+1} d\mu$ so that by [theorem: 20.91]

$$\lim_{n \rightarrow \infty} \int^+ f_n d\mu \text{ exist and } \lim_{n \rightarrow \infty} \int^+ f_n d\mu = \sup \left(\left\{ \int^+ f_n d\mu \mid n \in \mathbb{N} \right\} \right) \quad (21.549)$$

As $\forall n \in \mathbb{N}$ we have $f_n(x) \leq \sup (\{f_n(x) \mid n \in \mathbb{N}\}) = \lim_{n \rightarrow \infty} f_n(x) = f(x)$ we have by [theorem: 21.313] that $\int^+ f_n d\mu \leq \int^+ f d\mu$. Hence we have that $\int^+ f d\mu$ is an upper bound for $\{\int^+ f_n d\mu \mid n \in \mathbb{N}\}$ so that

$$\lim_{n \rightarrow \infty} \int^+ f_n d\mu = \sup \left(\left\{ \int^+ f_n d\mu \mid n \in \mathbb{N} \right\} \right) \leq \int^+ f d\mu \quad (21.550)$$

So it remains to prove that $\int^+ f d\mu \leq \lim_{n \rightarrow \infty} \int^+ f_n d\mu$. Let $x \in X$ and $n \in \mathbb{N}$ then as $f_n \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have by [theorem: 21.311] that there exist a $\{g_{n,i}\}_{i \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ such that

$$\forall i \in \mathbb{N} \text{ we have } g_{n,i}(x) \leq g_{n,i+1}(x) \quad (21.551)$$

$$f_n(x) = \lim_{i \rightarrow \infty} g_{n,i} = \sup (\{g_{n,i}(x) \mid i \in \mathbb{N}\}) \quad (21.552)$$

$$\lim_{i \rightarrow \infty} \int^S g_{n,i} d\mu \text{ exist and } \int^+ f_n d\mu = \lim_{i \rightarrow \infty} \int^S g_{n,i} d\mu \quad (21.553)$$

Define now

$$\{h_n\}_{n \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}] \text{ by } h_n = \left(\bigvee_{i \in \{1, \dots, n\}} g_{i,n} \right) \underset{[\text{theorem: 21.293}]}{\in} \mathcal{S}^+[X, \mathcal{A}] \quad (21.554)$$

Let $x \in X$ and $n \in \mathbb{N}$ then $\forall i \in \{1, \dots, n\}$ we have

$$\begin{aligned} g_{i,n}(x) &\leq g_{i,n+1}(x) \\ &\leq \max (\{g_{i,n+1}(x) \mid i \in \{1, \dots, n+1\}\}) \\ &= \left(\bigvee_{i \in \{1, \dots, n+1\}} g_{i,n+1} \right)(x) \\ &= h_{n+1}(x) \end{aligned} \quad (21.555)$$

hence $h_n(x) = \left(\bigvee_{i \in \{1, \dots, n\}} g_{i,n} \right)(x) = \max(\{g_{i,n}(x) | i \in \{1, \dots, n\}\}) \underset{[\text{eq: 21.555}]}{\leq} h_{n+1}(x)$. So we have that

$$\forall x \in X \text{ we have } \forall n \in \mathbb{N} \text{ that } h_n(x) \leq h_{n+1}(x) \quad (21.556)$$

Further as $\forall i \in \{1, \dots, n\} \ g_{i,n}(x) \leq \sup(\{g_{i,j}(x) | j \in \mathbb{N}\}) \underset{[\text{eq: 21.552}]}{=} f_i(x) \underset{i \leq n \Rightarrow f_i(x) \leq f_n(x)}{\leq} f_n(x)$ we have that

$$\forall n \in \mathbb{N} \ h_n(x) = \left(\bigvee_{i \in \{1, \dots, n\}} g_{i,n} \right)(x) = \max(\{g_{i,n}(x) | i \in \{1, \dots, n\}\}) \leq f_n(x) \quad (21.557)$$

As $\forall n \in \mathbb{N}$ we have $f_n(x) \leq \sup(\{f_n(x) | n \in \mathbb{N}\}) = \lim_{n \rightarrow \infty} f_n(x) = f(x)$ it follows that

$$\forall n \in \mathbb{N} \text{ we have } h_n(x) \leq f(x) \quad (21.558)$$

Using [eq: 21.556] together with [theorem: 20.91] proves that

$$\lim_{n \rightarrow \infty} h_n(x) \text{ exist and } \lim_{n \rightarrow \infty} h_n(x) = \sup(\{h_n(x) | n \in \mathbb{N}\}) \underset{[\text{eq: 21.558}]}{\leq} f(x) \quad (21.559)$$

We prove now by contradiction that $f(x) \leq \sup(\{h_n(x) | n \in \mathbb{N}\})$. So assume that $\sup(\{h_n(x) | n \in \mathbb{N}\}) < f(x)$. Then as $f(x) = \sup(\{f_n(x) | n \in \mathbb{N}\})$ there exist a $n \in \mathbb{N}$ such that

$$\sup(\{h_n(x) | n \in \mathbb{N}\}) < f_n(x)$$

As by [eq: 21.552] $f_n(x) = \sup(\{g_{n,i}(x) | i \in \mathbb{N}\})$ there exist a $k \in \mathbb{N}$ such that

$$\sup(\{h_n(x) | n \in \mathbb{N}\}) < g_{n,k}(x) \underset{k \leq \max(h,k)}{\leq} g_{n,\max(n,k)}(x)$$

now

$$\begin{aligned} g_{n,\max(n,k)}(x) &\underset{n \in \{1, \dots, \max(n,k)\}}{\leq} \max(\{g_{i,\max(n,k)}(x) | i \in \{1, \dots, \max(n,k)\}\}) \\ &= \left(\bigvee_{i \in \{1, \dots, \max(n,k)\}} g_{i,\max(n,k)} \right)(x) \\ &= h_{\max(n,k)}(x) \end{aligned}$$

which leads to the contradiction $h_{\max(n,k)}(x) \leq \sup(\{h_n(x) | n \in \mathbb{N}\}) < h_{\max(n,k)}(x)$. So the assumption is wrong and we have that $f(x) \leq \sup(\{h_n(x) | n \in \mathbb{N}\})$ which combined with [eq: 21.559] gives $f(x) = \sup(\{h_n(x) | n \in \mathbb{N}\})$. As $x \in X$ was chosen arbitrary we have

$$\forall x \in X \text{ we have } f(x) = \sup(\{h_n(x) | n \in \mathbb{N}\}) = \lim_{n \rightarrow \infty} h_n(x)$$

or

$$\lim_{n \rightarrow \infty} h_n = f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.560)$$

Next

$$\begin{aligned} \int^+ f d\mu &\underset{[\text{eq: 21.560}]}{=} \int^+ \left(\lim_{n \rightarrow \infty} h_n(x) \right) d\mu \\ &\underset{[\text{theorem: 21.309}]}{=} \lim_{n \rightarrow \infty} \int^S h_n d\mu \\ &\underset{[\text{theorem: 21.299}]}{=} \lim_{n \rightarrow \infty} \int^+ h_n d\mu \\ &\underset{[\text{eq: 21.557}] \wedge [\text{theorems: 20.84, 21.313}]}{\leq} \lim_{n \rightarrow \infty} \int^+ f_n d\mu \end{aligned}$$

which together with [eq: 21.550] proves that

$$\int^+ f d\mu = \lim_{n \rightarrow \infty} \int^+ f_n d\mu = \sup \left(\left\{ \int^+ f_n d\mu | n \in \mathbb{N} \right\} \right) \quad \square$$

If we weaken the requirements $\forall n \in \mathbb{N} \ f_n(x) \leq f_{n+1}(x)$ and $f(x) = \lim_{n \rightarrow \infty} f_n(x)$ to be hold almost everywhere we get the Monotone Convergence Theorem.

Theorem 21.354. (Monotone Convergence Theorem (2)) *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ and $\{f_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$. If there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that*

$$\left\{x \in X \mid \neg \left(\forall n \in \mathbb{N} \ f_n(x) \leq f_{n+1}(x) \wedge \lim_{n \rightarrow \infty} f_n(x) = f(x) \right) \right\} \subseteq N$$

then we have

$$\int^+ f d\mu = \lim_{n \rightarrow \infty} \int^+ f_n d\mu$$

In other words if $\forall n \in \mathbb{N} \ f_n(x) \leq f_{n+1}(x) \wedge \lim_{n \rightarrow \infty} f_n(x) = f(x)$ is μ -a.e. true then

$$\int^+ f d\mu = \lim_{n \rightarrow \infty} \int^+ f_n d\mu$$

Proof. Let

$$A = \left\{x \in X \mid \neg \left(\forall n \in \mathbb{N} \ f_n(x) \leq f_{n+1}(x) \wedge \lim_{n \rightarrow \infty} f_n(x) = f(x) \right) \right\}$$

then by the hypothesis there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$A \subseteq N \Rightarrow X \setminus N \subseteq X \setminus A$$

then we have for x either:

$x \in N$. Then $\forall n \in \mathbb{N}$

$$(\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) = 0 \cdot f_n(x) = 0 = 0 \cdot f_{n+1}(x) = \mathcal{X}_{X, X \setminus N}(x) \cdot f_{n+1}(x) = (\mathcal{X}_{X, X \setminus N} \cdot f_{n+1})(x)$$

and

$$\begin{aligned} (\mathcal{X}_{X, X \setminus N} \cdot f)(x) &= 0 \cdot f(x) \\ &= 0 \\ &= \lim_{n \rightarrow \infty} (0 \cdot f_n(x)) \\ &= \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N}(x) \cdot f_n(x)) \\ &= \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \end{aligned}$$

$x \in X \setminus N$. Then

$$\forall n \in \mathbb{N} \ (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) = 1 \cdot f_n(x) \leq_{x \in X \setminus N \Rightarrow x \notin A} f_{n+1}(x) = 1 \cdot f_{n+1}(x) = (\mathcal{X}_{X, X \setminus N} \cdot f_{n+1})(x)$$

and

$$\begin{aligned} (\mathcal{X}_{X, X \setminus N} \cdot f)(x) &= \mathcal{X}_{X, X \setminus N}(x) \cdot f(x) \\ &= f(x) \\ &\stackrel{x \in X \setminus N \Rightarrow x \notin A}{=} \lim_{n \rightarrow \infty} f_n(x) \\ &= \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N}(x) \cdot f_n(x)) \\ &= \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \end{aligned}$$

So we have $\forall x \in X$ that

$$\forall n \in \mathbb{N} \text{ we have } (\mathcal{X}_{X \setminus N} \cdot f_n)(x) \leq (\mathcal{X}_{X \setminus N} \cdot f_{n+1})(x) \text{ and } (\mathcal{X}_N \cdot f)(x) = \lim_{n \rightarrow \infty} (\mathcal{X}_{X \setminus N} \cdot f)(x)$$

As $N \in \mathcal{A} \Rightarrow X \setminus N \in \mathcal{A}$ it follows from [theorem: 21.260] that $\mathcal{X}_{X \setminus N} \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ and $\{\mathcal{X}_{X \setminus N} \cdot f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{A}$. So the conditions for [theorem: 21.351] are satisfied and we have that

$$\lim_{n \rightarrow \infty} \int^+ (\mathcal{X}_{X \setminus N} \cdot f_n) d\mu \text{ exist and } \lim_{n \rightarrow \infty} \int^+ (\mathcal{X}_{X \setminus N} \cdot f_n) d\mu = \int^+ (\mathcal{X}_{X \setminus N} \cdot f) d\mu \quad (21.561)$$

Further using [theorem: 21.265] we have that

$$f = (\mathcal{X}_{X \setminus N} \cdot f) \text{ } \mu\text{-a.e. and } \forall n \in \mathbb{N} \text{ we have } f_n = (\mathcal{X}_{X \setminus N} \cdot f_n) \text{ } \mu\text{-a.e.}$$

Hence using [theorem: 21.315] we have that

$$\int^+ f d\mu \underset{[\text{theorem: 21.315}]}{=} \int^+ (\mathcal{X}_{X \setminus N} \cdot f) d\mu \underset{[\text{eq: 21.561}]}{=} \lim_{n \rightarrow \infty} \int^+ (\mathcal{X}_{X \setminus N} \cdot f_n) d\mu \underset{[\text{theorem: 21.315}]}{=} \lim_{n \rightarrow \infty} \int^+ f_n d\mu$$

proving that

$$\int^+ f d\mu = \lim_{n \rightarrow \infty} \int^+ f_n d\mu \quad \square$$

A consequence of the above theorem is the Beppo Levi's theorem.

Theorem 21.355. (Beppo Levi's Theorem) *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $\{f_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then we have that*

$$\sum_{i=1}^{\infty} f_i \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ \left(\sum_{i=1}^{\infty} f_i \right) d\mu = \sum_{i=1}^{\infty} \int^+ f_i d\mu$$

where

$$\sum_{i=1}^{\infty} f_i : X \rightarrow \overline{\mathbb{R}} \text{ is defined by } \left(\sum_{i=1}^{\infty} f_i \right)(x) = \sum_{i=1}^{\infty} f_i(x)$$

Note 21.356. *As $\{f_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have $\{f_i(x)\}_{i \in \mathbb{N}} \subseteq [0, \infty]$ so that by [definition: 20.94] $\sum_{i=1}^{\infty} f_i(x)$ is well defined, similar as $\{\int^+ f_i d\mu\}_{i \in \mathbb{N}} \subseteq [0, \infty]$ we have that $\sum_{i=1}^{\infty} \int^+ f_i d\mu$.*

Proof. Let $n \in \mathbb{N}$ then by [theorem: 21.314]

$$\sum_{i=1}^n f_i \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ and } \int^+ \left(\sum_{i=1}^n f_i \right) d\mu = \sum_{i=1}^n \left(\int^+ f_i d\mu \right) \quad (21.562)$$

so that

$$\left\{ \sum_{i=1}^n f_i \right\}_{n \in \mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Let $x \in X$ then by [definition: 20.94] $\lim_{n \rightarrow \infty} \sum_{i=1}^n f_i(x)$ exist and $\lim_{n \rightarrow \infty} \sum_{i=1}^n f_i(x) = \sum_{i=1}^{\infty} f_i(x) \in [0, \infty]$. Hence using [theorem: 21.254] we have that

$$\lim_{n \rightarrow \infty} \left(\sum_{i=1}^n f_i \right) \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Using now the Monotone Convergence Theorem [theorem: 21.351] we have that

$$\lim_{n \rightarrow \infty} \int^+ \left(\sum_{i=1}^n f_i \right) d\mu \text{ exists and } \int^+ \left(\lim_{n \rightarrow \infty} \left(\sum_{i=1}^n f_i \right) \right) d\mu = \lim_{n \rightarrow \infty} \int^+ \left(\sum_{i=1}^n f_i \right) d\mu \quad (21.563)$$

As $\left(\lim_{n \rightarrow \infty} \left(\sum_{i=1}^n f_i \right) \right)(x) = \lim_{n \rightarrow \infty} \left(\left(\sum_{i=1}^n f_i \right)(x) \right) = \lim_{n \rightarrow \infty} \left(\sum_{i=1}^n f_i(x) \right) \underset{\text{def}}{=} \sum_{i=1}^{\infty} f_i(x) \underset{\text{def}}{=} \left(\sum_{i=1}^{\infty} f_i \right)(x)$ we have

$$\lim_{n \rightarrow \infty} \left(\sum_{i=1}^n f_i \right) = \sum_{i=1}^{\infty} f_i$$

Substituting this in [eq: 21.563] gives finally

$$\int^+ \left(\sum_{i=1}^{\infty} f_i \right) d\mu \underset{[\text{eq: 21.563}]}{=} \lim_{n \rightarrow \infty} \int^+ \left(\sum_{i=1}^n f_i \right) d\mu \underset{[\text{eq: 21.562}]}{=} \lim_{n \rightarrow \infty} \left(\sum_{i=1}^n \left(\int^+ f_i d\mu \right) \right) \underset{\text{def}}{=} \sum_{i=1}^{\infty} \left(\int^+ f_i d\mu \right) \quad \square$$

A application of the Beppo Levi's Theorem is a way of defining a new measure on a measure space based on a non negative measurable function.

Theorem 21.357. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $f \in \mathcal{M}^+[X, \mathcal{A}, \bar{\mathbb{R}}]$ then if we define

$$\nu: \mathcal{A} \rightarrow [0, \infty] \text{ by } \nu(A) = \int_A^+ f d\mu$$

we have that ν is a measure on $\langle X, \mathcal{A} \rangle$. Further we have

$$\nu \text{ is finite} \Leftrightarrow f \text{ is } \mu\text{-integrable}$$

Proof. Let $x \in X$ then $(\mathcal{X}_{X, \emptyset} \cdot f)(x) = \mathcal{X}_{X, \emptyset}(x) \cdot f(x) = 0 \cdot f(x) = C_0$ which proves that

$$\nu(\emptyset) = \int_{\emptyset}^+ (\mathcal{X}_{X, \emptyset} \cdot f) d\mu = \int_A^+ C_0 d\mu \stackrel{[\text{example: 21.300}]}{=} 0 \quad (21.564)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be pairwise disjoint family. Define

$$\{f_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{M}^+[X, \mathcal{A}, \bar{\mathbb{R}}] \text{ by } f_i = \mathcal{X}_{X, A_i} \cdot f \stackrel{[\text{theorem: 21.260}]}{\in} \mathcal{M}^+[X, \mathcal{A}, \bar{\mathbb{R}}]$$

Let $A = \bigsqcup_{i \in \mathbb{N}} A_i$. Take $x \in X$ then for $f(x)$ we have the following cases to consider:

$f(x) = \infty$. then for x and $n \in \mathbb{N}$ we have either:

$x \in X \setminus A$. Then $(\mathcal{X}_{X, A} \cdot f)(x) = 0$ and $(\sum_{i=1}^n f_i)(x) = \sum_{i=1}^n (\mathcal{X}_{X, A_i}(x) \cdot f(x)) = \sum_{i=1}^n 0 = 0$ so that

$$\lim_{n \rightarrow \infty} \sum_{i=1}^n f_i(x) = 0 = (\mathcal{X}_{X, A} \cdot f)(x)$$

$x \in A$. Then $(f \cdot \mathcal{X}_{X, A})(x) = \infty$ and $(\sum_{i=1}^n f_i)(x) = \sum_{i=1}^n (\mathcal{X}_{X, A_i}(x) \cdot f(x)) = \sum_{i=1}^n \infty = \infty$ proving that

$$\lim_{n \rightarrow \infty} \sum_{i=1}^n f_i(x) = (\mathcal{X}_{X, A} \cdot f)(x)$$

$f(x) < \infty$. Then for x and $n \in \mathbb{N}$ we have either:

$x \in X \setminus A$. then $(\mathcal{X}_{X, A} \cdot f)(x) = 0$ and $(\sum_{i=1}^n f_i)(x) = \sum_{i=1}^n (\mathcal{X}_{X, A_i}(x) \cdot f(x)) = \sum_{i=1}^n 0 = 0$ so that

$$\lim_{n \rightarrow \infty} \sum_{i=1}^n f_i(x) = (\mathcal{X}_{X, A} \cdot f)(x)$$

$x \in A$. Let $\varepsilon > 0$, as $x \in A = \bigsqcup_{i \in \mathbb{N}} A_i$ there exists a unique $M \in \mathbb{N}_0$ such that $x \in A_M$ and $\forall i \in \mathbb{N} \setminus \{M\}$ $x \notin A_i$. If $n \in \{M, \dots, \infty\}$ then we have

$$\begin{aligned} \left| (f \cdot \mathcal{X}_{X, A})(x) - \sum_{i=1}^n f_i(x) \right| &= \\ \left| f(x) - \sum_{i=1}^n (\mathcal{X}_{X, A_i}(x) \cdot f(x)) \right| &= \\ \left| f(x) - \sum_{i \in \{M\}} (\mathcal{X}_{X, A_i}(x) \cdot f(x)) - \sum_{i \in \mathbb{N} \setminus \{M\}} (\mathcal{X}_{X, A_i}(x) \cdot f(x)) \right| &= \\ |f(x) - \mathcal{X}_{X, A_M}(x) \cdot f(x)| &= \\ |f(x) - f(x)| &= \\ 0 &< \\ \varepsilon \end{aligned}$$

proving that

$$\lim_{n \rightarrow \infty} \sum_{i=1}^n f_i(x) = (\mathcal{X}_{X, A} \cdot f)(x)$$

this proves that in all cases

$$\sum_{i=1}^{\infty} f_i(x) = (\mathcal{X}_{X,A} \cdot f)(x)$$

Applying then Beppo Levi [see 21.355] gives

$$\begin{aligned} \nu\left(\bigsqcup_{i \in \mathbb{N}_0} A_i\right) &= \nu(A) \\ &= \int^+ (\mathcal{X}_A \cdot f) d\mu \\ &= \int^+ \left(\sum_{i=1}^{\infty} f_i\right) d\mu \\ &\stackrel{21.355}{=} \sum_{i=1}^{\infty} \int^+ f_i d\mu \\ &= \sum_{i=1}^{\infty} \int^+ (\mathcal{X}_{A_i} \cdot f) d\mu \\ &= \sum_{i=1}^{\infty} \nu(A_i) \end{aligned}$$

which together with [eq: 21.564] proves that

$$\nu \text{ is a measure on the measurable space } \langle X, \mathcal{A} \rangle$$

For the last part of the theorem:

- $\Rightarrow$. If ν is finite then as $f = \mathcal{X}_{X,X} \cdot f$ we have that $\int^+ f d\mu = \int^+ (\mathcal{X}_{X,X} \cdot f) d\mu = \nu(X) < \infty$ which proves using [theorem: 21.332] that f is μ -integrable.
- $\Leftarrow$. Let $A \in \mathcal{A}$ and $x \in X$ then $(f \cdot \mathcal{X}_{X,A})(x) = f(x) \cdot \mathcal{X}_A(x) = \begin{cases} f(x) & \text{if } x \in A \\ 0 \leq f(x) & \text{if } x \in X \setminus A \end{cases} \leq f(x)$. Hence using [theorem: 21.313] we have that $\nu(A) = \int_A^+ f d\mu = \int^+ (\mathcal{X}_A \cdot f) d\mu \leq \int^+ f d\mu < \infty$ which proves that ν is a finite measure. $\square$

Lemma 21.358. (Fatou's lemma) Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $\{f_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then

$$\int^+ \left(\liminf_{n \rightarrow \infty} f_n \right) d\mu \leq \liminf_{n \rightarrow \infty} \int^+ f_n d\mu$$

Note 21.359. Using [theorem: 21.254] we have that $\liminf_{n \rightarrow \infty} f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ so that $\int^+ \left(\liminf_{n \rightarrow \infty} f_n \right) d\mu$ is well defined.

Note 21.360. We can not assume that $\lim_{n \rightarrow \infty} \int^+ f_n d\mu$ exists which is the reason $\liminf_{n \rightarrow \infty} \int^+ f_n d\mu$ is used instead.

Proof. Define

$$\{g_n\}_{n \in \mathbb{N}_0} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \text{ by } g_n(x) = \inf(\{f_i(x) | i \in \{n, \dots, \infty\}\}) \stackrel{[\text{theorem: 21.254}]}{\in} \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.565)$$

Let $x \in X$ and $n \in \mathbb{N}$ then $\{f_i(x) | i \in \{n+1, \dots, \infty\}\} \subseteq \{f_i(x) | i \in \{n, \dots, \infty\}\}$ so that by [theorem: 3.77] we have

$$\inf(\{f_i(x) | i \in \{n, \dots, \infty\}\}) \leq \inf(\{f_i(x) | i \in \{n+1, \dots, \infty\}\})$$

which as also

$$\inf(\{f_i(x) | i \in \{n, \dots, \infty\}\}) \leq f_n(x)$$

proves that

$$\forall n \in \mathbb{N} \quad g_n(x) \leq f_n(x) \text{ and } g_n(x) \leq g_{n+1}(x) \quad (21.566)$$

So we have by [theorem: 20.91] that $\lim_{n \rightarrow \infty} g_n(x)$ exist and

$$\begin{aligned} \lim_{n \rightarrow \infty} g_n(x) &\stackrel{[\text{theorem: 20.91}]}{=} \sup(\{g_n(x) | n \in \mathbb{N}\}) \\ &= \sup(\{\inf(\{f_i(x) | i \in \{n, \dots, \infty\}\}) | n \in \mathbb{N}\}) \\ &\stackrel{\text{def}}{=} \liminf_{n \rightarrow \infty} f_i(x) \end{aligned}$$

We can now apply the Monotone Convergence Theorem [see theorem: 21.351] giving

$$\begin{aligned} \int^+ \left(\liminf_{n \rightarrow \infty} f_i \right) d\mu &= \int^+ \left(\lim_{n \rightarrow \infty} g_n \right) d\mu \\ &\stackrel{[\text{theorem: 21.351}]}{=} \lim_{n \rightarrow \infty} \int^+ g_n d\mu \\ &\stackrel{\text{def}}{=} \liminf_{n \rightarrow \infty} \int^+ g_n d\mu \end{aligned} \quad (21.567)$$

Using [eq: 21.566] with [theorem: 21.313] we have $\forall n \in \mathbb{N}_0$ that $\int^+ g_n d\mu \leq \int^+ f_n d\mu$. So we have using [theorem: 20.61] that $\liminf_{n \rightarrow \infty} \int^+ g_n d\mu \leq \liminf_{n \rightarrow \infty} \int^+ f_n d\mu$. Substituting this in [eq: 21.567] gives finally

$$\int^+ \left(\liminf_{n \rightarrow \infty} f_i \right) d\mu \leq \liminf_{n \rightarrow \infty} \int^+ f_n d\mu \quad \square$$

Theorem 21.361. (Lebesgue's Dominated Convergence Theorem) *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ with $g(X) \subseteq [0, \infty]$, $\{f_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ such that*

$$(f = \lim_{n \rightarrow \infty} f_n \text{ and } \forall n \in \mathbb{N} \text{ we have } |f_n| \leq g) \text{ holds } \mu.a.e.$$

In other words there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that

$$\left\{ x \in X \mid \neg \left(\lim_{n \rightarrow \infty} f_n(x) \text{ exists with } f(x) = \lim_{n \rightarrow \infty} f_n(x) \text{ and } \forall n \in \mathbb{N} \text{ we have } |f_n(x)| \leq g(x) \right) \right\}$$

then we have:

1. $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$
2. $\{f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$
3. $\int f d\mu = \lim_{n \rightarrow \infty} \int f_n d\mu$

Proof. As $g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$ it follows from [theorem: 21.349] that

$$N_1 = \{x \in X \mid g(x) = \infty\} \in \mathcal{A} \text{ and } \mu(N_1) = 0 \quad (21.568)$$

By the hypothesis there exist a $N_2 \in \mathcal{A}$ with $\mu(N_2) = 0$ such that

$$\left\{ x \in X \mid \neg \left(\lim_{n \rightarrow \infty} f_n(x) \text{ exists with } f(x) = \lim_{n \rightarrow \infty} f_n(x) \text{ and } \forall n \in \mathbb{N} \text{ we have } |f_n(x)| \leq g(x) \right) \right\} \subseteq N_2$$

Take $N = N_1 \cup N_2$ then we have $\forall x \in X \setminus N$ that

$$g(x) \neq \infty \wedge \lim_{n \rightarrow \infty} f_n(x) \text{ exists with } f(x) = \lim_{n \rightarrow \infty} f_n(x) \text{ and } \forall n \in \mathbb{N} \text{ we have } |f_n(x)| \leq g(x) \quad (21.569)$$

and

$$N \in \mathcal{A} \text{ and } \mu(N) \leq \mu(N_1) + \mu(N_2) = 0 \Rightarrow \mu(N) = 0 \quad (21.570)$$

So using [theorems: 21.260, 21.323] we have that

$$\mathcal{X}_{X, X \setminus N} \cdot f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge \mathcal{X}_{X, X \setminus N} \cdot f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge \mathcal{X}_{X, X \setminus N} \cdot g \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \quad (21.571)$$

$$\forall n \in \mathbb{N} \text{ we have } \mathcal{X}_{X, X \setminus N} \cdot f_n \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge \mathcal{X}_{X, X \setminus N} \cdot f_n \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.572)$$

Let $x \in X$ then we have either:

$x \in N$. Then we have

$$(\mathcal{X}_{X, X \setminus N} \cdot g)(x) = 0 \Rightarrow 0 \leq (\mathcal{X}_{X, X \setminus N} \cdot g)(x) < \infty$$

$$\forall n \in \mathbb{N} \quad |\mathcal{X}_{X, X \setminus N} \cdot f_n|(x) = 0 = (\mathcal{X}_{X, X \setminus N} \cdot g)(x) \Rightarrow |\mathcal{X}_{X, X \setminus N} \cdot f_n|(x) \leq (\mathcal{X}_{X, X \setminus N} \cdot g)(x)$$

$$\lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \text{ exist and } \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) = \lim_{n \rightarrow \infty} 0 = 0 = (\mathcal{X}_{X, X \setminus N} \cdot f)(x)$$

so that

$$\lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \text{ exist and } \lim_{n \rightarrow \infty} |\mathcal{X}_{X, X \setminus N} \cdot f_n|(x) = (\mathcal{X}_{X, X \setminus N} \cdot f)(x)$$

$x \in X \setminus N$. Then

$$(\mathcal{X}_{X, X \setminus N} \cdot g)(x) = g(x) \neq \infty \Rightarrow 0 \leq (\mathcal{X}_{X, X \setminus N} \cdot g)(x) < \infty$$

[eq: 21.569]

$$\forall n \in \mathbb{N} \quad |\mathcal{X}_{X, X \setminus N} \cdot f_n|(x) = |f_n(x)| \leq g_n(x) = (\mathcal{X}_{X, X \setminus N} \cdot g)(x) \Rightarrow |\mathcal{X}_{X, X \setminus N} \cdot f_n|(x) \leq (\mathcal{X}_{X, X \setminus N} \cdot g)(x)$$

[eq: 21.569]

$$\lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) = \lim_{n \rightarrow \infty} f_n(x) \text{ exist and } \lim_{n \rightarrow \infty} f_n(x) \stackrel{[eq: 21.569]}{=} f(x) = (\mathcal{X}_{X, X \setminus N} \cdot f)(x)$$

so that

$$\lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \text{ exist and } \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) = (\mathcal{X}_{X, X \setminus N} \cdot f)(x)$$

Hence we have in all cases that

$$\forall x \in X \text{ we have } 0 \leq (\mathcal{X}_{X, X \setminus N} \cdot g)(x) < \infty \quad (21.573)$$

$$\forall x \in X \text{ we have } \forall n \in \mathbb{N} \text{ that } |\mathcal{X}_{X, X \setminus N} \cdot f_n|(x) \leq (\mathcal{X}_{X, X \setminus N} \cdot g)(x) < \infty \quad (21.574)$$

$$\forall x \in X \quad \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \text{ exists and } \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) = (\mathcal{X}_{X, X \setminus N} \cdot f)(x) \quad (21.575)$$

Applying [corollary: 20.80] on the above we have also

$$\forall x \in X \quad \lim_{n \rightarrow \infty} |\mathcal{X}_{X \setminus N} \cdot f_n|(x) \text{ exist and } \lim_{n \rightarrow \infty} |\mathcal{X}_{X \setminus N} \cdot f_n|(x) = |\mathcal{X}_{X \setminus N} \cdot f|(x) \quad (21.576)$$

Using [theorem: 21.265] together with [eq: 21.570] proves also

$$g = \mathcal{X}_{X, X \setminus N} \cdot g \text{ } \mu\text{-a.e.}, \quad f = \mathcal{X}_{X, X \setminus N} \cdot f \text{ } \mu\text{-a.e.} \text{ and } \forall n \in \mathbb{N} \text{ we have } f_n = \mathcal{X}_{X, X \setminus N} \cdot f_n \text{ } \mu\text{-a.e.} \quad (21.577)$$

So that using [theorem: 21.342] we have, as g is μ -integrable and, that

$$\mathcal{X}_{X, X \setminus N} \cdot g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \stackrel{[eq: 21.573]}{\Rightarrow} g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ and } \int (\mathcal{X}_{X, X \setminus N} \cdot g) d\mu = \int g d\mu < \infty \quad (21.578)$$

Next we prove that every $f_n \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ and $\int f_n d\mu = \int (\mathcal{X}_{X, X \setminus N} \cdot f_n)$. Let $n \in \mathbb{N}$. Using [eqs: 21.571, 21.572] and [eq: 21.574] allows us to use [theorem: 21.313] to get

$$\int^+ |\mathcal{X}_{X, X \setminus N} \cdot f_n| d\mu \leq \int^+ (\mathcal{X}_{X, X \setminus N} \cdot g) d\mu \stackrel{[eq: 21.578][theorem: 21.332]}{=} \int (\mathcal{X}_{X, X \setminus N} \cdot g) d\mu \stackrel{[eq: 21.578]}{<} \infty$$

So using [eq: 21.572] and [theorem: 21.332] it follows that $|\mathcal{X}_{X \setminus N} \cdot f_n| \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$. Applying then [theorem: 21.341] together with [eq: 21.574] it follows that $\mathcal{X}_{X \setminus N} \cdot f_n \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. Using then [theorem: 21.342] together with [eq: 21.577] proves that

$$\forall n \in \mathbb{N} \text{ we have } f_n \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ and } \int f_n d\mu = \int (\mathcal{X}_{X, X \setminus N} \cdot f_n) d\mu \quad (21.579)$$

Next we prove that $f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$. Let $x \in X$ then we have

$$\begin{aligned} |\mathcal{X}_{X, X \setminus N} \cdot f(x)|(x) & \stackrel{[\text{eq: 21.576}]}{=} \lim_{n \rightarrow \infty} |\mathcal{X}_{X, X \setminus N} \cdot f_n|(x) \\ & \leq (\mathcal{X}_{X, X \setminus N} \cdot g)(x) \\ & \stackrel{[\text{theorem: 20.84}] \wedge [\text{eq: 21.574}]}{<} \infty \\ & \stackrel{[\text{eq: 21.573}]}{<} \infty \end{aligned}$$

which proves that

$$|\mathcal{X}_{X, X \setminus N} \cdot f(x)|(x) \leq (\mathcal{X}_{X, X \setminus N} \cdot g)(x) < \infty \quad (21.580)$$

Using the above and [eq: 21.571] allows us to use [theorem: 21.313] to get

$$\int^+ |\mathcal{X}_{X, X \setminus N} \cdot f| d\mu \leq \int^+ (\mathcal{X}_{X, X \setminus N} \cdot g) d\mu \stackrel{[\text{eq: 21.578}]}{<} \infty$$

Hence using [eq: 21.571] and [theorem: 21.341] it follows that $\mathcal{X}_{X, X \setminus N} \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$. Using then [theorem: 21.342] together with [eq: 21.577] proves that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \text{ and } \int f d\mu = \int (\mathcal{X}_{X, X \setminus N} \cdot f) d\mu \quad (21.581)$$

Further using [eq: 21.574] and [eq: 21.580] it follows that

$$(\mathcal{X}_{X, X \setminus N} \cdot f)(X) \subseteq \mathbb{R}, (\mathcal{X}_{X, X \setminus N} \cdot g)(X) \subseteq \mathbb{R} \text{ and } \forall n \in \mathbb{N} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(X) \subseteq \mathbb{R} \quad (21.582)$$

Given $x \in X$ and $n \in \mathbb{N}$ then as $|\mathcal{X}_{X, X \setminus N} \cdot f_n(x)|(x) \leq (\mathcal{X}_{X, X \setminus N} \cdot g)(x)$ [see eq: 21.574] we have

$$\begin{aligned} (\mathcal{X}_{X, X \setminus N} \cdot f_n(x))(x) & \leq (\mathcal{X}_{X, X \setminus N} \cdot g)(x) \\ -(\mathcal{X}_{X, X \setminus N} \cdot f_n(x))(x) & \leq (\mathcal{X}_{X, X \setminus N} \cdot g)(x) \end{aligned}$$

so taking in account [eq: 21.582] we have that

$$0 \leq (\mathcal{X}_{X, X \setminus N} \cdot g)(x) - (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \quad (21.583)$$

$$0 \leq (\mathcal{X}_{X, X \setminus N} \cdot g)(x) + (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \quad (21.584)$$

Using the above, [eq: 21.571, 21.572] and [theorem: 21.245, 21.251] we have

$$\{\mathcal{X}_{X, X \setminus N} \cdot g - \mathcal{X}_{X, X \setminus N} \cdot f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.585)$$

$$\{\mathcal{X}_{X, X \setminus N} \cdot g + \mathcal{X}_{X, X \setminus N} \cdot f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.586)$$

Using the above we have

$$\begin{aligned} (\mathcal{X}_{X, X \setminus N} \cdot g)(x) + (\mathcal{X}_{X, X \setminus N} \cdot f)(x) & \stackrel{[\text{eq: 21.575}]}{=} (\mathcal{X}_{X, X \setminus N} \cdot g)(x) + \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \\ & \stackrel{[\text{example: 20.73}]}{=} \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot g)(x) + \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \\ & \stackrel{[\text{theorem: 20.84}]}{=} \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot g + \mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \\ & \stackrel{\text{def}}{=} \liminf_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot g + \mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \\ (\mathcal{X}_{X, X \setminus N} \cdot g)(x) - (\mathcal{X}_{X, X \setminus N} \cdot f)(x) & \stackrel{[\text{eq: 21.575}]}{=} (\mathcal{X}_{X, X \setminus N} \cdot g)(x) - \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \\ & \stackrel{[\text{example: 20.73}]}{=} \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot g)(x) - \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \\ & \stackrel{[\text{theorem: 20.84}]}{=} \lim_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot g - \mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \\ & \stackrel{\text{def}}{=} \liminf_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot g - \mathcal{X}_{X, X \setminus N} \cdot f_n)(x) \end{aligned}$$

so that

$$(\mathcal{X}_{X \setminus N} \cdot g) + (\mathcal{X}_{X \setminus N} \cdot f) = \liminf_{n \rightarrow \infty} (\mathcal{X}_{X \setminus N} \cdot g + \mathcal{X}_{X \setminus N} \cdot f_n) \quad (21.587)$$

$$(\mathcal{X}_{X \setminus N} \cdot g) - (\mathcal{X}_{X \setminus N} \cdot f) = \liminf_{n \rightarrow \infty} (\mathcal{X}_{X \setminus N} \cdot g - \mathcal{X}_{X \setminus N} \cdot f_n) \quad (21.588)$$

Next we have, taking in account that $\mathcal{X}_{X, X \setminus N} g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ and $\forall n \in \mathbb{N}$ $\mathcal{X}_{X, X \setminus N} \cdot f_n \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ [see eqs: 21.578, 21.579], that

$$\begin{aligned} & \int (\mathcal{X}_{X, X \setminus N} \cdot g) d\mu + \int (\mathcal{X}_{X, X \setminus N} \cdot f) d\mu \quad [\text{theorem: 21.339}] \\ & \quad = \int (\mathcal{X}_{X, X \setminus N} \cdot g + \mathcal{X}_{X, X \setminus N} \cdot f) d\mu \quad [\text{eq: 21.587}] \\ & \quad \leq \int \liminf_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot g + \mathcal{X}_{X, X \setminus N} \cdot f_n) d\mu \quad [\text{theorem: 21.358}] \wedge [\text{eq: 21.584}] \\ & \quad = \liminf_{n \rightarrow \infty} \left(\int (\mathcal{X}_{X, X \setminus N} \cdot g + \mathcal{X}_{X, X \setminus N} \cdot f_n) d\mu \right) \quad [\text{theorem: 21.339}] \\ & \quad = \liminf_{n \rightarrow \infty} \left(\int (\mathcal{X}_{X, X \setminus N} \cdot g) d\mu + \int (\mathcal{X}_{X, X \setminus N} \cdot f_n) d\mu \right) \quad [\text{theorem: 20.64}] \\ & \quad = \int (\mathcal{X}_{X, X \setminus N} \cdot g) d\mu + \liminf_{n \rightarrow \infty} \int (\mathcal{X}_{X, X \setminus N} \cdot f_n) d\mu \end{aligned}$$

hence as the integrals are real numbers we have that

$$\int (\mathcal{X}_{X, X \setminus N} \cdot f) d\mu \leq \liminf_{n \rightarrow \infty} \int (\mathcal{X}_{X, X \setminus N} \cdot f_n) d\mu \quad (21.589)$$

Similar we have

$$\begin{aligned} & \int (\mathcal{X}_{X, X \setminus N} \cdot g) d\mu - \int (\mathcal{X}_{X, X \setminus N} \cdot f) d\mu \quad [\text{theorem: 21.339}] \\ & \quad = \int (\mathcal{X}_{X, X \setminus N} \cdot g - \mathcal{X}_{X, X \setminus N} \cdot f) d\mu \quad [\text{eq: 21.588}] \\ & \quad \leq \int \liminf_{n \rightarrow \infty} (\mathcal{X}_{X, X \setminus N} \cdot g - \mathcal{X}_{X, X \setminus N} \cdot f_n) d\mu \quad [\text{theorem: 21.358}] \wedge [\text{eq: 21.583}] \\ & \quad = \liminf_{n \rightarrow \infty} \left(\int (\mathcal{X}_{X, X \setminus N} \cdot g + \mathcal{X}_{X, X \setminus N} \cdot f_n) d\mu \right) \quad [\text{theorem: 21.339}] \\ & \quad = \liminf_{n \rightarrow \infty} \left(\int (\mathcal{X}_{X, X \setminus N} \cdot g) d\mu + \left(- \int (\mathcal{X}_{X, X \setminus N} \cdot f_n) d\mu \right) \right) \quad [\text{theorem: 20.64}] \\ & \quad = \int (\mathcal{X}_{X, X \setminus N} \cdot g) d\mu + \liminf_{n \rightarrow \infty} \left(- \int (\mathcal{X}_{X, X \setminus N} \cdot f_n) d\mu \right) \quad [\text{theorem: 20.66}] \\ & \quad = \int (\mathcal{X}_{X, X \setminus N} \cdot g) d\mu - \limsup_{n \rightarrow \infty} \int (\mathcal{X}_{X, X \setminus N} \cdot f_n) d\mu \end{aligned}$$

which as the integrals are real numbers gives

$$\limsup_{n \rightarrow \infty} \int (\mathcal{X}_{X, X \setminus N} \cdot f_n) d\mu \leq \int (\mathcal{X}_{X, X \setminus N} \cdot f) d\mu \quad (21.590)$$

Hence we have

$$\begin{aligned} \int (\mathcal{X}_{X, X \setminus N} \cdot f) d\mu & \quad \leq \quad \liminf_{n \rightarrow \infty} \int (\mathcal{X}_{X, X \setminus N} \cdot f_n) d\mu \\ & \quad \leq \quad \limsup_{n \rightarrow \infty} \int (\mathcal{X}_{X, X \setminus N} \cdot f) d\mu \\ & \quad \leq \quad \int (\mathcal{X}_{X, X \setminus N} \cdot f) d\mu \end{aligned}$$

[eq: 21.589] [theorem: 20.69] [eq: 21.590]

so that

$$\liminf_{n \rightarrow \infty} \int (\mathcal{X}_{X, X \setminus N} \cdot f_n) d\mu = \limsup_{n \rightarrow \infty} \int (\mathcal{X}_{X, X \setminus N} \cdot f) d\mu = \int (\mathcal{X}_{X, X \setminus N} \cdot f) d\mu$$

This proves that $\lim_{n \rightarrow \infty} \int (\mathcal{X}_{X \setminus N} \cdot f_n) d\mu$ exist and $\int (\mathcal{X}_{X \setminus N} \cdot f) d\mu = \lim_{n \rightarrow \infty} \int (\mathcal{X}_{X \setminus N} \cdot f_n) d\mu$. Using then [eq: 21.579] and [eq: 21.581] gives

$$\lim_{n \rightarrow \infty} \int f_n d\mu \text{ exist and } \int f d\mu = \lim_{n \rightarrow \infty} \int f_n d\mu \quad \square$$

21.5.5 Complex integration

21.5.5.1 Measurability of complex valued functions

If we want to develop a theory of integration of complex valued functions we need first to replace the measure space $(\mathbb{R}, \mathcal{B}[\mathbb{R}], \lambda)$ with a measure space based on $\mathbb{C}$ instead of $\mathbb{R}$. To do this we make use of the fact that $\mathbb{C}$ is actually defined as $\mathbb{C} = \mathbb{R}^2$ [see definition: 10.1] where $z = x + i \cdot y$ is actually equivalent with $(x, y) = x + i \cdot y$ [see theorem: 10.77]. Further the topology on $\mathbb{C} = \mathbb{R}^2$ based on the absolute value $||: \mathbb{C} \rightarrow [0, \infty[$ where $|(x, y)| = \sqrt{x^2 + y^2}$ is by [theorem: 14.117] is equivalent with the norm $||_2: \mathbb{C} \rightarrow [0, \infty[$ defined by $|(x, y)|_2 = \max(|x|, |y|)$ so that by [theorem: 14.113] the topology $\mathcal{T}_{||}$ [the canonical topology on $\mathbb{C}$] is equal to the topology $\mathcal{T}_{||_2}$. Hence the following definition makes sense.

Definition 21.362. *The measurable space for the complex numbers noted as $\langle \mathbb{C}, \mathcal{B}[\mathbb{C}] \rangle$ is defined by*

$$\mathbb{C} = \mathbb{R}^2 \text{ and } \mathcal{B}[\mathbb{C}] = \mathcal{B}[\mathbb{C}, \mathcal{T}_{||}] = \mathcal{B}[\mathbb{R}^2, \mathcal{T}_{||_2}] = \sigma[\mathcal{T}_{||_2}] \stackrel{[\text{theorem: 21.59}]}{=} \mathcal{B}[\mathbb{R}^2]$$

In other words

$$\langle \mathbb{C}, \mathcal{B}[\mathbb{C}] \rangle = \langle \mathbb{R}^2, \mathcal{B}[\mathbb{R}^2] \rangle$$

Once we have defined the measurable space we can define the set of all measurable functions to $\mathbb{C}$.

Definition 21.363. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $A \in \mathcal{A}$ then the set of all $\mathcal{A}, \mathcal{B}[\mathbb{C}]$ -measurable functions is noted as $\mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ so*

$$\mathcal{M}[A, \mathcal{A}, \mathbb{C}] = \{f \in \mathbb{C}^A \mid f: X \rightarrow \mathbb{C} \text{ is } \mathcal{A}, \mathcal{B}[\mathbb{C}]\text{-measurable}\}$$

Note 21.364. *Sometimes we want to talk about $\mathcal{M}[A, \mathcal{A}, \mathbb{R}]$ and $\mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ at the same time. In this case we use the notation $\mathcal{M}[A, \mathcal{A}, \mathbb{K}]$ where $\mathcal{M}[A, \mathcal{A}, \mathbb{K}]$ stands for either $\mathcal{M}[A, \mathcal{A}, \mathbb{R}]$ or $\mathcal{M}[A, \mathcal{A}, \mathbb{C}]$. Just like $\mathbb{K}$ stands for either $\mathbb{R}$ or $\mathbb{C}$.*

The following general theorem will be usefull for a alternative definition of $\mathcal{M}[X, \mathcal{A}, \mathbb{C}]$.

Theorem 21.365. *Let $n \in \mathbb{N}$, $\langle X, \mathcal{A} \rangle$, $A \in \mathcal{A}$ be a measurable space and $f: A \rightarrow \mathbb{R}^n$ a function then*

$$f \text{ is } \mathcal{A}, \mathcal{B}[\mathbb{R}^n]\text{-measurable} \Leftrightarrow \forall i \in \{1, \dots, n\} \ f_i = \pi_i \circ f: A \rightarrow \mathbb{R} \text{ is } \mathcal{A}\text{-measurable}$$

Proof.

$\Rightarrow$. Given $i \in \{1, \dots, n\}$ we have by [theorems: 14.94, 14.141] that $\pi_i: \mathbb{R}^n \rightarrow \mathbb{R}$ is continuous using the topologies $\mathcal{T}, \mathcal{T}_{||_n}$. So using [theorem: 21.243] it follows that π_i is $\mathcal{B}[\mathbb{R}^n], \mathcal{B}[\mathbb{R}]$ -measurable. As f is $\mathcal{A}, \mathcal{B}[\mathbb{R}^n]$ -measurable it follows from [theorem: 21.218] that $f_i = \pi_i \circ f$ is $\mathcal{A}, \mathcal{B}[\mathbb{R}]$ -measurable, hence by definition we have that f_i is $\mathcal{A}$ -measurable.

$\Leftarrow$. Using [theorem: 21.86] we have that

$$\mathcal{B}[\mathbb{R}^n] = \sigma(\mathcal{H}^n) \text{ where } \mathcal{H}^n = \{]-\infty, a[i \mid i \in \{1, \dots, n\} \wedge a \in \mathbb{R}\} \text{ and }]-\infty, a[i = \{x \in \mathbb{R}^n \mid x_i < a\}$$

Let $A \in \mathcal{H}^n$ then there exists a $i \in \{1, \dots, n\}$ and a $x \in \mathbb{R}$ such that $A =]-\infty, x[_i$ then we have

$$\begin{aligned} y \in f^{-1}(A) &\Leftrightarrow f(y) \in]-\infty, x[_i \\ &\Leftrightarrow (f(y))_i < x \\ &\Leftrightarrow \pi_i(f(y)) < x \\ &\Leftrightarrow (\pi_i \circ f)_i(y) < x \\ &\Leftrightarrow f_i(y) < x \\ &\Leftrightarrow y \in \{f_i < x\} \end{aligned}$$

which proves that

$$f^{-1}(A) = \{f_i < x\} \underset{f_i \text{ is } \mathcal{A}\text{-measurable}}{\in} \mathcal{A}$$

Hence we have by [theorem: 21.239] that f is $\mathcal{A}, \mathcal{B}[\mathbb{R}^n]$ -measurable. $\square$

Applying the above theorem to $\mathbb{R}^2$ yields a simple way to check if $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$.

Definition 21.366. Let X be a set and $f: X \rightarrow \mathbb{C}$ then we define

$$\text{Re}(f): X \rightarrow \mathbb{R} \text{ by } \text{Re}(f)(x) = \text{Re}(f(x))$$

$$\text{Im}(f): X \rightarrow \mathbb{R} \text{ by } \text{Im}(f)(x) = \text{Im}(f(x))$$

Theorem 21.367. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $f: X \rightarrow \mathbb{C}$ and $g: X \rightarrow \mathbb{C}$ then

$$f = g \text{ } \mu\text{-a.e.} \Leftrightarrow \text{Re}(f) = \text{Re}(g) \text{ } \mu\text{-a.e. and } \text{Im}(f) = \text{Im}(g) \text{ } \mu\text{-a.e.}$$

Proof.

$\Rightarrow$. As $f = g$ μ -a.e. there exists a $N \in \mathcal{A}$ such that $\mu(N) = 0$ and $\{x \in X | f(x) \neq g(x)\} \subseteq N$. Assume that $x \in \{x \in X | \text{Re}(f)(x) \neq \text{Re}(g)(x)\}$ then $\text{Re}(f(x)) \neq \text{Re}(g(x)) \Rightarrow f(x) \neq g(x)$ proving that $\{x \in X | \text{Re}(f)(x) \neq \text{Re}(g)(x)\} \subseteq \{x \in X | f(x) \neq g(x)\} \subseteq N$. So we have that

$$\text{Re}(f) = \text{Re}(g) \text{ } \mu\text{-a.e.}$$

If $x \in \{x \in X | \text{Im}(f)(x) \neq \text{Im}(g)(x)\}$ then $\text{Im}(f(x)) \neq \text{Im}(g(x)) \Rightarrow f(x) \neq g(x)$ proving that $\{x \in X | \text{Im}(f)(x) \neq \text{Im}(g)(x)\} \subseteq \{x \in X | f(x) \neq g(x)\} \subseteq N$. Hence

$$\text{Im}(f) = \text{Im}(g) \text{ } \mu\text{-a.e.}$$

$\Leftarrow$. As $\text{Re}(f) = \text{Re}(g)$ μ -a.e. and $\text{Im}(f) = \text{Im}(g)$ μ -a.e. there exists $N_1, N_2 \in \mathcal{A}$ such that $\mu(N_1) = 0 = \mu(N_2)$, $\{x \in X | \text{Re}(f)(x) \neq \text{Re}(g)(x)\} \subseteq N_1$ and $\{x \in X | \text{Im}(f)(x) \neq \text{Im}(g)(x)\} \subseteq N_2$. Let $x \in \{x \in X | f(x) \neq g(x)\}$ then $f(x) \neq g(x)$ so that either $\text{Re}(f(x)) \neq \text{Re}(g(x))$ or $\text{Im}(f(x)) \neq \text{Im}(g(x))$, hence

$$x \in \{x \in X | \text{Re}(f)(x) \neq \text{Re}(g)(x)\} \cup \{x \in X | \text{Im}(f)(x) \neq \text{Im}(g)(x)\} \subseteq N_1 \cup N_2$$

proving that $\{x \in X | f(x) \neq g(x)\} \subseteq N_1 \cup N_2$. As $\mu(N_1 \cup N_2) = \mu(N_1) + \mu(N_2) = 0$ it follows that

$$f = g \text{ } \mu\text{-a.e.} \quad \square$$

Theorem 21.368. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $A \in \mathcal{A}$ and $f: A \rightarrow \mathbb{C}$ a function then we have

$$f \text{ is } \mathcal{A}, \mathcal{B}[\mathbb{C}]\text{-measurable} \Leftrightarrow \text{Re}(f) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \text{ and } \text{Im}(f) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

Proof. This follows from the previous theorem [see theorem: 21.365], $\text{Re}(f), \text{Im}(f) \subseteq \mathbb{R}$ and the fact that $\mathbb{C} = \mathbb{R}^2$, $\text{Re}(f) = \pi_1 \circ f$ and $\text{Im}(f) = \pi_2 \circ f$. $\square$

We have now similar properties for $\mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ as for $\mathcal{M}[X, \mathcal{A}]$. First we define some pointwise definitions:

Definition 21.369. Let X be a set then we define

1. If $\alpha \in \mathbb{C}$ and $f: X \rightarrow \mathbb{C}$ a function then $\alpha \cdot f: X \rightarrow \mathbb{C}$ is defined by $(\alpha \cdot f)(x) = \alpha \cdot f(x)$
2. If $f: X \rightarrow \mathbb{C}$ is a function then $|f|: X \rightarrow \mathbb{R}$ is defined by $|f|(x) = |f(x)|$.
3. If $f: X \rightarrow \mathbb{C}$ and $g: X \rightarrow \mathbb{C}$ are functions then we define:
 - a. $f + g: X \rightarrow \mathbb{C}$ by $(f + g)(x) = f(x) + g(x)$
 - b. $f \cdot g: X \rightarrow \mathbb{C}$ by $(f \cdot g)(x) = f(x) \cdot g(x)$
4. If $n \in \mathbb{N}$, $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{C}^X$ then $\sum_{i=1}^n f_i: X \rightarrow \mathbb{C}$ is defined by $(\sum_{i=1}^n f_i)(x) = \sum_{i=1}^n f_i(x)$
5. If $\{f_i\}_{i \in \mathbb{N}} \subseteq \mathbb{C}^X$ then

$$\lim_{i \rightarrow \infty} f_i: \left\{x \in X \mid \lim_{i \rightarrow \infty} f_i(x) \text{ exist}\right\} \rightarrow \mathbb{C} \text{ is defined by } \left(\lim_{i \rightarrow \infty} f_i\right)(x) = \lim_{i \rightarrow \infty} f_i(x)$$

Theorem 21.370. Let $\langle X, \mathcal{A} \rangle$, $A \in \mathcal{A}$ be a measurable space then we have

1. $\forall f, g \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ we have that $f + g \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$.
2. If $n \in \mathbb{N}$, $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ then $\sum_{i=1}^n f_i \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$.
3. $\forall \alpha \in \mathbb{C}$ and $f \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ we have that $\alpha \cdot f \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$.
4. $\forall f, g \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ we have $f \cdot g \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$.
5. If $A \in \mathcal{A}$ and $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ then $\mathcal{X}_{X,A} \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$.
6. If $\{f_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ and $D = \left\{x \in X \mid \lim_{i \rightarrow \infty} f_i(x) \text{ exist}\right\}$ then $D \in \mathcal{A}$ and $\lim_{i \rightarrow \infty} f_i \in \mathcal{M}[D, \mathcal{A}, \mathbb{C}]$.

Proof.

1. As $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ we have by the previous theorem [theorem: 21.368] that

$$\operatorname{Re}(f), \operatorname{Im}(f), \operatorname{Re}(g), \operatorname{Im}(g) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \quad (21.591)$$

Let $x \in X$ then

$$\begin{aligned} (f + g)(x) &= f(x) + g(x) \\ &= \operatorname{Re}(f(x)) + i \cdot \operatorname{Im}(f(x)) + \operatorname{Re}(g(x)) + i \cdot \operatorname{Im}(g(x)) \\ &= (\operatorname{Re}(f(x)) + \operatorname{Re}(g(x))) + i \cdot (\operatorname{Im}(f(x)) + \operatorname{Im}(g(x))) \\ &= (\operatorname{Re}(f) + \operatorname{Re}(g))(x) + i \cdot (\operatorname{Im}(f) + \operatorname{Im}(g))(x) \end{aligned}$$

proving that

$$\operatorname{Re}(f + g) = \operatorname{Re}(f) + \operatorname{Re}(g) \text{ and } \operatorname{Im}(f + g) = \operatorname{Im}(f) + \operatorname{Im}(g)$$

Using the above, [eq: 21.591] and [theorem: 21.245] we have that $\operatorname{Re}(f + g), \operatorname{Im}(f + g) \in \mathcal{M}[A, \mathcal{A}]$ so that by the previous theorem [see theorem: 21.368] we have that

$$f + g \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$$

2. This is easily proved by induction. So let

$$\mathcal{S} = \left\{n \in \mathbb{N}_0 \mid \text{If } \{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{M}[A, \mathcal{A}, \mathbb{C}] \text{ then } \sum_{i=1}^n f_i \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]\right\}$$

then we have:

$1 \in \mathcal{S}$. If $\{f_i\}_{i \in \{1\}} \subseteq \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ then $\sum_{i=1}^1 f_i = f_1 \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ which proves that $1 \in \mathcal{S}$.

$n \in \mathcal{S} \Rightarrow n + 1 \in \mathcal{S}$. then if $\{f_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ we have as $\sum_{i=1}^{n+1} f_i = f_{n+1} + \sum_{i=1}^n f_i \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ [as $f_{n+1} \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$, $n \in \mathcal{S}$ and (1)]. So $n + 1 \in \mathcal{S}$

induction proves then (2).

3. As $f \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ we have by the previous theorem [theorem: 21.368] that

$$\operatorname{Re}(f), \operatorname{Im}(f) \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}] \quad (21.592)$$

Let $x \in X$ then

$$\begin{aligned} (\alpha \cdot f)(x) &= \\ \alpha \cdot f(x) &= \\ (\operatorname{Re}(\alpha) + i \cdot \operatorname{Im}(\alpha)) \cdot (\operatorname{Re}(f(x)) + i \cdot \operatorname{Im}(f(x))) &= \\ (\operatorname{Re}(\alpha) \cdot \operatorname{Re}(f(x)) - \operatorname{Im}(\alpha) \cdot \operatorname{Im}(f(x))) + i \cdot (\operatorname{Re}(\alpha) \cdot \operatorname{Im}(f(x)) + \operatorname{Im}(\alpha) \cdot \operatorname{Re}(f(x))) &= \\ (\operatorname{Re}(\alpha) \cdot \operatorname{Re}(f) - \operatorname{Im}(\alpha) \cdot \operatorname{Im}(f))(x) + i \cdot (\operatorname{Re}(\alpha) \cdot \operatorname{Im}(f) + \operatorname{Im}(\alpha) \cdot \operatorname{Re}(f))(x) \end{aligned}$$

proving that

$$\operatorname{Re}(\alpha \cdot f) = \operatorname{Re}(\alpha) \cdot \operatorname{Re}(f) - \operatorname{Im}(\alpha) \cdot \operatorname{Im}(f) \wedge \operatorname{Im}(\alpha \cdot f) = \operatorname{Re}(\alpha) \cdot \operatorname{Im}(f) + \operatorname{Im}(\alpha) \cdot \operatorname{Re}(f)$$

Using the above, [eq: 21.592 and [theorems: 21.249 and 21.245] we have that

$$\operatorname{Re}(\alpha \cdot f), \operatorname{Im}(\alpha \cdot f) \in \mathcal{M}[A, \mathcal{A}, \mathbb{R}]$$

which by [theorem: 21.368] proves

$$\alpha \cdot f \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$$

4. As $f, g \in \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ we have by [theorem: 21.368] that $\operatorname{Re}(f), \operatorname{Re}(g), \operatorname{Im}(f), \operatorname{Im}(g) \in \mathcal{M}[A, \mathcal{A}, \mathbb{R}]$. Further for $x \in X$ we have

$$\begin{aligned} (f \cdot g)(x) &= \\ f(x) \cdot g(x) &= \\ (\operatorname{Re}(f(x)) + i \cdot \operatorname{Im}(f(x))) \cdot (\operatorname{Re}(g(x)) + i \cdot \operatorname{Im}(g(x))) &= \\ \operatorname{Re}(f(x)) \cdot \operatorname{Re}(g(x)) - \operatorname{Im}(f(x)) \cdot \operatorname{Im}(g(x)) + i \cdot (\operatorname{Re}(f(x)) \cdot \operatorname{Im}(g(x)) + \operatorname{Im}(f(x)) \cdot \operatorname{Re}(g(x))) &= \\ \operatorname{Re}(g(x)) &= \\ (\operatorname{Re}(f) \cdot \operatorname{Re}(g) - \operatorname{Im}(f) \cdot \operatorname{Im}(g))(x) + i \cdot (\operatorname{Re}(f) \cdot \operatorname{Im}(g) + \operatorname{Im}(f) \cdot \operatorname{Re}(g))(x) \end{aligned}$$

proving that

$$\begin{aligned} \operatorname{Re}(f \cdot g) &= \operatorname{Re}(f) \cdot \operatorname{Re}(g) - \operatorname{Im}(f) \cdot \operatorname{Im}(g) \\ \operatorname{Im}(f \cdot g) &= \operatorname{Re}(f) \cdot \operatorname{Im}(g) + \operatorname{Im}(f) \cdot \operatorname{Re}(g) \end{aligned}$$

Using then [theorems: 21.251, 21.245] it follows that

$$\operatorname{Re}(f \cdot g), \operatorname{Im}(f \cdot g) \in \mathcal{M}[A, \mathcal{A}, \mathbb{R}]$$

which by [theorem: 21.368] proves that $f \cdot g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$.

5. As $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ we have by [theorem: 21.368] that

$$\operatorname{Re}(f), \operatorname{Im}(f) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

Further we have for $x \in X$

$$\begin{aligned} \operatorname{Re}(\mathcal{X}_{X,A} \cdot f)(x) &= \operatorname{Re}(\mathcal{X}_{X,A}(x) \cdot f(x)) \stackrel{\mathcal{X}_{X,A}(x) \in \mathbb{R}}{=} \mathcal{X}_{X,A}(x) \cdot \operatorname{Re}(f(x)) = (\mathcal{X}_{X,A} \cdot \operatorname{Re}(f))(x) \\ \operatorname{Im}(\mathcal{X}_{X,A} \cdot f)(x) &= \operatorname{Im}(\mathcal{X}_{X,A}(x) \cdot f(x)) \stackrel{\mathcal{X}_{X,A}(x) \in \mathbb{R}}{=} \mathcal{X}_{X,A}(x) \cdot \operatorname{Im}(f(x)) = (\mathcal{X}_{X,A} \cdot \operatorname{Im}(f))(x) \end{aligned}$$

proving that

$$\operatorname{Re}(\mathcal{X}_{X,A} \cdot f) = \mathcal{X}_{X,A} \cdot \operatorname{Re}(f) \wedge \operatorname{Im}(\mathcal{X}_{X,A} \cdot f) = \mathcal{X}_{X,A} \cdot \operatorname{Im}(f)$$

so that by [theorem: 21.260]

$$\operatorname{Re}(\mathcal{X}_A \cdot f), \operatorname{Im}(\mathcal{X}_A \cdot f) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

hence using [theorem: 21.368] we have that $\mathcal{X}_A \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$.

6. As $\{f_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{M}[A, \mathcal{A}, \mathbb{C}]$ we have by [theorem: 21.368] that

$$\forall i \in \mathbb{N} \operatorname{Re}(f_i), \operatorname{Im}(f_i) \in \mathcal{M}[A, \mathcal{A}, \mathbb{R}]$$

Further using [theorem: 14.304] we have that $\lim_{i \rightarrow \infty} f_i(x)$ exists if and only if $\lim_{i \rightarrow \infty} \operatorname{Re}(f_i(x))$ and $\lim_{i \rightarrow \infty} \operatorname{Im}(f_i(x))$ exists. So if $D_1 = \left\{x \in A \mid \lim_{i \rightarrow \infty} \operatorname{Re}(f_i(x)) \text{ exists} \right\}$ and $D_2 = \left\{x \in A \mid \lim_{i \rightarrow \infty} \operatorname{Im}(f_i(x)) \text{ exists} \right\}$ then we have

$$D = \left\{x \in A \mid \lim_{i \rightarrow \infty} f_i(x) \text{ exists} \right\} = D_1 \cap D_2$$

From [theorem: 21.254] we have that $D_1 \in \mathcal{A}, D_2 \in \mathcal{A}$ proving that

$$D = D_1 \cap D_2 \in \mathcal{A}$$

Further using [theorem: 21.254] again and $\operatorname{Re}(f_i)(X), \operatorname{Im}(f_i)(X) \subseteq \mathbb{R}$ we have that $\lim_{i \rightarrow \infty} \operatorname{Re}(f_i) \in \mathcal{M}[D_1, \mathcal{A}|_{D_1}, \mathbb{R}]$ and $\lim_{i \rightarrow \infty} \operatorname{Im}(f_i) \in \mathcal{M}[D_2, \mathcal{A}|_{D_2}, \mathbb{R}]$ which as $D \subseteq D_1, D_2$ proves by [theorem: 21.220] that

$$\left(\lim_{i \rightarrow \infty} \operatorname{Re}(f_i)\right)_{|D}, \left(\lim_{i \rightarrow \infty} \operatorname{Im}(f_i)\right)_{|D} \in \mathcal{M}[D, \mathcal{A}|_D, \mathbb{C}].$$

Further $\forall x \in D$ we have by [theorem: 14.304]

$$\begin{aligned} & \left(\left(\lim_{n \rightarrow \infty} \operatorname{Re}(f_n)\right)_{|D} + i \cdot \left(\lim_{n \rightarrow \infty} \operatorname{Im}(f_n)\right)_{|D}\right)(x) = \\ & \left(\lim_{n \rightarrow \infty} \operatorname{Re}(f_n)\right)_{|D}(x) + i \cdot \left(\lim_{n \rightarrow \infty} \operatorname{Im}(f_n)\right)_{|D}(x) = \\ & \left(\lim_{n \rightarrow \infty} \operatorname{Re}(f_n)\right)(x) + i \cdot \left(\lim_{n \rightarrow \infty} \operatorname{Im}(f_n)\right)(x) \\ & \lim_{n \rightarrow \infty} \operatorname{Re}(f_n(x)) + i \cdot \lim_{n \rightarrow \infty} \operatorname{Im}(f_n(x)) \stackrel{[\text{theorem: 14.304}]}{=} \\ & \lim_{n \rightarrow \infty} (\operatorname{Re}(f_n(x)) + i \cdot \operatorname{Im}(f_n(x))) = \\ & \lim_{n \rightarrow \infty} f_n(x) \end{aligned}$$

proving that $\lim_{n \rightarrow \infty} f_n = \left(\lim_{n \rightarrow \infty} \operatorname{Re}(f_n)\right)_{|D} + i \cdot \left(\lim_{n \rightarrow \infty} \operatorname{Im}(f_n)\right)_{|D}$. Using [theorem: 21.368] we finally have that

$$\lim_{n \rightarrow \infty} f_n \in \mathcal{M}[D, \mathcal{A}, \mathbb{C}] \quad \square$$

Theorem 21.371. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $A \in \mathcal{A}$ and $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ then

$$|f| \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$$

Proof. As $||: \mathbb{C} \rightarrow \mathbb{R}$ is continuous [see theorem: 14.157] we have by [theorem: 21.243] that the function $||$ is $\mathcal{B}[\mathbb{C}], \mathcal{B}[\mathbb{R}]$ -measurable. As $\forall x \in A$ we have $(|| \circ f)(x) = ||(f(x)) = |f(x)| = |f|(x)$ it follows that $|f| = || \circ f$. So using [theorem: 21.218] it follows that $|f|$ is $\mathcal{A}, \mathcal{B}[\mathbb{R}]$ -measurable or as $|f|(X) \subseteq \mathbb{R}$ that

$$|f| \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \quad \square$$

21.5.5.2 Complex Measure Integral

We can now define the integral of complex valued functions based on the integrals of its real and imaginair components of these functions.

Definition 21.372. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f: X \rightarrow \mathbb{C}$ a function then

$$f \text{ is } \mu\text{-complex integrable if } \operatorname{Re}(f) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \wedge \operatorname{Im}(f) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

and the complex integral of f noted as $\int^{\mathbb{C}} f d\mu$ is defined by

$$\int^{\mathbb{C}} f d\mu = \int \operatorname{Re}(f) d\mu + i \cdot \int \operatorname{Im}(f) d\mu$$

The set of all complex integrable functions is noted as $\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ hence

$$\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}] = \{f \in \mathbb{C}^X \mid f: X \rightarrow \mathbb{C} \text{ is } \mu\text{-complex integrable}\}$$

Example 21.373. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $C_0 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ and $\int^{\mathbb{C}} C_0 d\mu = 0$ where $C_0: X \rightarrow \mathbb{C}$ is defined by $C_0(x)$.

Proof. Let $x \in X$ then $\operatorname{Re}(C_0)(x) = \operatorname{Re}(C_0(x)) = \operatorname{Re}(0) = 0 = C_0(x)$ and $\operatorname{Im}(C_0)(x) = \operatorname{Im}(C_0(x)) = \operatorname{Im}(0) = 0 = C_0(x)$. This proves that $\operatorname{Re}(C_0) = C_0 \underset{[\text{note: 21.329}]}{\in} \mathcal{L}(X, \mathcal{A}, \mu, \mathbb{R})$ and $\operatorname{Im}(C_0) = C_0 \underset{[\text{note: 21.329}]}{\in} \mathcal{L}(X, \mathcal{A}, \mu, \mathbb{R})$. Hence we have by definition that $C_0 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$. Further we have

$$\int^{\mathbb{C}} C_0 d\mu = \int \operatorname{Re}(C_0) d\mu + i \cdot \int \operatorname{Im}(C_0) d\mu = \int C_0 d\mu + i \cdot \int C_0 d\mu \underset{[\text{note: 21.329}]}{=} 0$$

□

Theorem 21.374. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $A \in \mathcal{A}$ and $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ then

$$\operatorname{Re}(\mathcal{X}_{X,A} \cdot f) = \mathcal{X}_{X,A} \cdot \operatorname{Re}(f) \text{ and } \operatorname{Im}(\mathcal{X}_{X,A} \cdot f) = \mathcal{X}_{X,A} \cdot \operatorname{Im}(f)$$

$$\mathcal{X}_{X,A} \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$$

Proof. If $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ then $\operatorname{Re}(f), \operatorname{Im}(f) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ so that by [theorem: 21.335] $\mathcal{X}_{X,A} \cdot \operatorname{Re}(f), \mathcal{X}_{X,A} \cdot \operatorname{Im}(f) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. Let $x \in X$ then

$$\operatorname{Re}(\mathcal{X}_{X,A} \cdot f)(x) = \operatorname{Re}(\mathcal{X}_{X \setminus A}(x) \cdot f(x)) = \mathcal{X}_{X,A} \cdot \operatorname{Re}(f)(x) = (\mathcal{X}_{X,A} \cdot \operatorname{Re}(f))(x)$$

$$\operatorname{Im}(\mathcal{X}_{X,A} \cdot f)(x) = \operatorname{Im}(\mathcal{X}_{X \setminus A}(x) \cdot f(x)) = \mathcal{X}_{X,A} \cdot \operatorname{Im}(f)(x) = (\mathcal{X}_{X,A} \cdot \operatorname{Im}(f))(x)$$

which proves that $\operatorname{Re}(\mathcal{X}_{X,A} \cdot f) = \mathcal{X}_{X,A} \cdot \operatorname{Re}(f)$ and $\operatorname{Im}(\mathcal{X}_{X,A} \cdot f) = \mathcal{X}_{X,A} \cdot \operatorname{Im}(f)$. Hence

$$\mathcal{X}_{X,A} \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$$

□

The above theorem allows us to define the integral over a measurable function.

Definition 21.375. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $A \in \mathcal{A}$ and $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ then we define $\int_A^{\mathbb{C}} f d\mu$ by

$$\int_A^{\mathbb{C}} f d\mu = \int^{\mathbb{C}} (\mathcal{X}_{X,A} \cdot f) d\mu$$

Note 21.376. As

$$\begin{aligned} \int_A^{\mathbb{C}} f d\mu &= \int^{\mathbb{C}} (\mathcal{X}_{X,A} \cdot f) d\mu \\ &\stackrel{\text{def}}{=} \int \operatorname{Re}(\mathcal{X}_{X,A} \cdot f) d\mu + i \cdot \int \operatorname{Im}(\mathcal{X}_{X,A} \cdot f) d\mu \\ &\stackrel{[\text{theorem: 21.374}]}{=} \int (\mathcal{X}_{X,A} \cdot \operatorname{Re}(f)) d\mu + i \cdot \int (\mathcal{X}_{X,A} \cdot \operatorname{Im}(f)) d\mu \\ &= \int_A \operatorname{Re}(f) d\mu + i \cdot \int_A \operatorname{Im}(f) d\mu \end{aligned}$$

we have that

$$\int_A^{\mathbb{C}} f d\mu = \int_A \operatorname{Re}(f) d\mu + i \cdot \int_A \operatorname{Im}(f) d\mu$$

The following shows that the complex integral is an extension of the measure integral.

Theorem 21.377. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then

$$\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \subseteq \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$$

and

$$\forall f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ we have that } \int^{\mathbb{C}} f d\mu = \int f d\mu$$

Proof. Let $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ then $f(X) \subseteq \mathbb{R}$. Now for the function $f: X \rightarrow \mathbb{C}$ we have as $f(X) \subseteq \mathbb{R}$ that $\forall x \in X$ $\text{Re}(f)(x) = \text{Re}(f(x)) = f(x)$ and $\text{Im}(f)(x) = \text{Im}(f(x)) = 0 = C_0(x)$. Hence we have

$$\text{Re}(f) = f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ and } \text{Im}(f) = C_0 \underset{[\text{theorem: 21.337}]}{\in} \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \quad (21.593)$$

which proves that $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$. So

$$\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \subseteq \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$$

Further

$$\int^{\mathbb{C}} f d\mu = \int \text{Re}(f) d\mu + i \cdot \int \text{Im}(f) d\mu \underset{[\text{eq: 21.593}]}{=} \int f d\mu + i \cdot \int C_0 d\mu \underset{[\text{theorem: 21.337}]}{=} \int f d\mu \quad \square$$

Theorem 21.378. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then we have

1. $\forall f, g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that $f + g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ and

$$\int^{\mathbb{C}} (f + g) d\mu = \int^{\mathbb{C}} f d\mu + \int^{\mathbb{C}} g d\mu$$

2. $\forall \alpha \in \mathbb{C}$ and $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that $\alpha \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ and

$$\int^{\mathbb{C}} (\alpha \cdot f) d\mu = \alpha \cdot \int^{\mathbb{C}} f d\mu$$

Proof.

1. As $f, g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ we have by definition that

$$\text{Re}(f), \text{Re}(g), \text{Im}(f), \text{Im}(g) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

Let $x \in X$ then

$$\text{Re}(f + g)(x) = \text{Re}(f(x) + g(x)) = \text{Re}(f(x)) + \text{Re}(g(x)) = (\text{Re}(f) + \text{Re}(g))(x)$$

$$\text{Im}(f + g)(x) = \text{Im}(f(x) + g(x)) = \text{Im}(f(x)) + \text{Im}(g(x)) = (\text{Im}(f) + \text{Im}(g))(x)$$

so that

$$\text{Re}(f + g) = \text{Re}(f) + \text{Re}(g) \text{ and } \text{Im}(f + g) = \text{Im}(f) + \text{Im}(g)$$

Hence using now [theorem: 21.339] it follows that

$$\text{Re}(f + g), \text{Im}(f + g) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

which proves that

$$f + g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$$

Further

$$\begin{aligned} \int^{\mathbb{C}} (f + g) d\mu &= \int \text{Re}(f + g) d\mu + i \cdot \int \text{Im}(f + g) d\mu \\ &= \int (\text{Re}(f) + \text{Re}(g)) d\mu + i \cdot \int (\text{Im}(f) + \text{Im}(g)) d\mu \\ &\underset{[\text{theorem: 21.339}]}{=} \int \text{Re}(f) d\mu + \int \text{Re}(g) d\mu + i \cdot \int \text{Im}(f) d\mu + i \cdot \int \text{Im}(g) d\mu \\ &= \int^{\mathbb{C}} f d\mu + \int^{\mathbb{C}} g d\mu \end{aligned}$$

2. As $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ we have by definition that

$$\operatorname{Re}(f), \operatorname{Im}(f) \in \mathcal{L}(X, \mathcal{A}, \mu, \mathbb{R}) \text{ and } \int^{\mathbb{C}} f d\mu = \int \operatorname{Re}(f) d\mu + i \cdot \int \operatorname{Im}(f) d\mu$$

Let $x \in X$ then

$$\begin{aligned} (\alpha \cdot f)(x) &= \\ \alpha \cdot f(x) &= \\ (\operatorname{Re}(\alpha) + i \cdot \operatorname{Im}(\alpha)) \cdot (\operatorname{Re}(f(x)) + i \operatorname{Im}(f(x))) &= \\ \operatorname{Re}(\alpha) \cdot \operatorname{Re}(f(x)) - \operatorname{Im}(\alpha) \cdot \operatorname{Re}(f(x)) + i \cdot (\operatorname{Re}(\alpha) \cdot \operatorname{Im}(f(x)) + \operatorname{Im}(\alpha) \cdot \operatorname{Re}(f(x))) &= \\ ((\operatorname{Re}(\alpha) \cdot \operatorname{Re}(f) - \operatorname{Im}(\alpha) \cdot \operatorname{Im}(f)) + i \cdot (\operatorname{Re}(\alpha) \cdot \operatorname{Im}(f) + \operatorname{Im}(\alpha) \cdot \operatorname{Re}(f)))(x) \end{aligned}$$

which proves that

$$\operatorname{Re}(\alpha \cdot f) = \operatorname{Re}(\alpha) \cdot \operatorname{Re}(f) - \operatorname{Im}(\alpha) \cdot \operatorname{Im}(f) \wedge \operatorname{Im}(\alpha \cdot f) = \operatorname{Re}(\alpha) \cdot \operatorname{Im}(f) + \operatorname{Im}(\alpha) \cdot \operatorname{Re}(f)$$

Using [theorem: 21.339] on the above we have that $\operatorname{Re}(\alpha \cdot f), \operatorname{Im}(\alpha \cdot f) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ so that by definition

$$\alpha \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$$

Further

$$\begin{aligned} \int^{\mathbb{C}} (\alpha \cdot f) d\mu &= \\ \int (\operatorname{Re}(\alpha) \cdot \operatorname{Re}(f) - \operatorname{Im}(\alpha) \cdot \operatorname{Im}(f)) d\mu + i \cdot \int (\operatorname{Re}(\alpha) \cdot \operatorname{Im}(f) + \operatorname{Im}(\alpha) \cdot \operatorname{Re}(f)) d\mu &= \\ \operatorname{Re}(\alpha) \cdot \int \operatorname{Re}(f) d\mu - \operatorname{Im}(\alpha) \cdot \int \operatorname{Im}(f) d\mu + i \cdot \operatorname{Re}(\alpha) \cdot \int \operatorname{Im}(f) d\mu + & \\ i \cdot \operatorname{Im}(\alpha) \cdot \int \operatorname{Re}(f) d\mu &= \\ \operatorname{Re}(\alpha) \cdot \left(\int \operatorname{Re}(f) d\mu + i \cdot \int \operatorname{Im}(f) d\mu \right) + i \cdot \operatorname{Im}(\alpha) \cdot \left(\int \operatorname{Re}(f) d\mu + \int \operatorname{Im}(f) d\mu \right) &= \\ \operatorname{Re}(\alpha) \cdot \int^{\mathbb{C}} f d\mu + i \cdot \operatorname{Im}(\alpha) \cdot \int^{\mathbb{C}} f d\mu &= \\ (\operatorname{Re}(\alpha) + i \cdot \operatorname{Im}(\alpha)) \cdot \int^{\mathbb{C}} f d\mu &= \\ \alpha \cdot \int^{\mathbb{C}} f d\mu \end{aligned}$$

□

We have the following equivalent definition of μ -complex integrable functions:

Theorem 21.379. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f: X \rightarrow \mathbb{C}$ a complex valued function then

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}] \Leftrightarrow f \in \mathcal{M}[X, \mathcal{A}, \mu, \mathbb{C}] \text{ and } |f| \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

Further if $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ then we have

$$\left| \int^{\mathbb{C}} f d\mu \right| \leq \int |f| d\mu$$

Proof.

$\Rightarrow$. As $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that $\operatorname{Re}(f), \operatorname{Im}(f) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ so that $\operatorname{Re}(f), \operatorname{Im}(f) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$. Using then [theorem: 21.368] it follows that

$$f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}] \quad (21.594)$$

and using [theorem: 21.371]

$$|f| \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \quad (21.595)$$

Further as $\operatorname{Re}(f), \operatorname{Im}(g) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ we have by [theorem: 21.341] that

$$|\operatorname{Re}(f)|, |\operatorname{Im}(f)| \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

so that

$$\int^+ |\operatorname{Re}(f)| d\mu \stackrel{[\text{theorem: 21.325}]}{=} \int^+ |\operatorname{Re}(f)|^+ d\mu < \infty$$

$$\int^+ |\operatorname{Im}(f)| d\mu \stackrel{[\text{theorem: 21.325}]}{=} \int^+ |\operatorname{Im}(f)|^+ d\mu < \infty$$

Let $x \in X$ then

$$|f|(x) = |f(x)| \stackrel{[\text{theorem: 10.85(8)}]}{\leq} |\operatorname{Re}(f(x))| + |\operatorname{Im}(f(x))| = (|\operatorname{Re}(f)| + |\operatorname{Im}(f)|)(x)$$

So that by [theorem: 21.313]

$$\int^+ |f| d\mu \leq \int^+ (|\operatorname{Re}(f)| + |\operatorname{Im}(f)|) d\mu \stackrel{[\text{theorem: 21.313}]}{=} \int^+ |\operatorname{Re}(f)| d\mu + \int^+ |\operatorname{Im}(f)| d\mu < \infty$$

which together with [eq: 21.595] proves by [theorem: 21.332] that

$$|f| \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

$\Leftarrow$. As $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ we have using [theorem: 21.368] that

$$\operatorname{Re}(f), \operatorname{Im}(f) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

Let $x \in X$ then

$$|\operatorname{Re}(f)|(x) = |\operatorname{Re}(f(x))| \stackrel{[\text{theorem: 10.85(3)}]}{\leq} |f(x)| = |f|(x)$$

$$|\operatorname{Im}(f)|(x) = |\operatorname{Im}(f(x))| \stackrel{[\text{theorem: 10.85(3)}]}{\leq} |f(x)| = |f|(x)$$

Using then [theorem: 21.343] it follows that $\operatorname{Re}(f), \operatorname{Im}(f) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ hence we have by definition that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$$

For the last part define

$$w(f) = \begin{cases} 1 & \text{if } \left| \int^{\mathbb{C}} f d\mu \right| = 0 \\ \frac{\int^{\mathbb{C}} f d\mu}{\left| \int^{\mathbb{C}} f d\mu \right|} & \text{if } \left| \int^{\mathbb{C}} f d\mu \right| \neq 0 \end{cases} \quad \text{so that } |w(f)| = 1$$

then for $\int^{\mathbb{C}} f d\mu$ we have either:

$$\int f^{\mathbb{C}} d\mu = 0. \quad \text{Then } \left| \int f d\mu \right| = 0 \text{ and } w(f) = 1 \text{ so that } w \cdot \left| \int^{\mathbb{C}} f d\mu \right| = \int^{\mathbb{C}} f d\mu$$

$$\int f^{\mathbb{C}} d\mu \neq 0. \quad \text{Then } \left| \int^{\mathbb{C}} f d\mu \right| \neq 0 \text{ and } w = \frac{\int^{\mathbb{C}} f d\mu}{\left| \int^{\mathbb{C}} f d\mu \right|} \text{ so that } w \cdot \left| \int^{\mathbb{C}} f d\mu \right| = \int^{\mathbb{C}} f d\mu$$

Summarized we have

$$\int^{\mathbb{C}} f d\mu = w(f) \cdot \left| \int^{\mathbb{C}} f d\mu \right| \text{ and } |w(f)| = 1$$

Then we have

$$\begin{aligned} \left| \int^{\mathbb{C}} f d\mu \right| &= \frac{1}{w(f)} \cdot \int^{\mathbb{C}} f d\mu \\ &\stackrel{[\text{theorem: 21.378}]}{=} \int^{\mathbb{C}} \left(\frac{1}{w(f)} \cdot f \right) d\mu \\ &\stackrel{\text{def}}{=} \int \operatorname{Re} \left(\frac{1}{w(f)} \cdot f \right) d\mu + i \cdot \int \operatorname{Im} \left(\frac{1}{w(f)} \cdot f \right) d\mu \\ &\stackrel{[\text{theorem: 21.378}]}{=} \int \operatorname{Re} \left(\frac{1}{w(f)} \cdot f \right) d\mu, \int \operatorname{Im} \left(\frac{1}{w(f)} \cdot f \right) d\mu, \left| \int^{\mathbb{C}} f d\mu \right| \in \mathbb{R} \end{aligned} \quad (21.596)$$

Let $x \in X$ then using [theorem: 10.85] we have that

$$\operatorname{Re}\left(\frac{1}{w(f)} \cdot f(x)\right) \leq \left|\frac{1}{w(f)} \cdot f(x)\right| = \left|\frac{1}{w(f)}\right| \cdot |f(x)|_{|w(f)|=1} |f(x)| = |f|(x)$$

Hence using [theorem: 21.339] we have that $\int \operatorname{Re}\left(\frac{1}{w(f)} \cdot f(x)\right) d\mu \leq \int |f| d\mu$ which combined with [eq: 21.596] proves that

$$\left|\int^{\mathbb{C}} f d\mu\right| \leq \int |f| d\mu \quad \square$$

21.5.6 The spaces $\mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ and $L^p[X, \mathcal{A}, \mu, \mathbb{K}]$

21.5.6.1 Definition of $\mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ and $L^p[X, \mathcal{A}, \mu, \mathbb{K}]$

In this section we introduce infinite Banach spaces that play a very important role in physics and functional analyses. Be carefull, in the following we use the same symbol $\|\cdot\|$ for the norm on $\mathbb{R}$ and on $\mathbb{C}$ [see examples: 14.97, 14.96], context will indicate which norm is used.

Definition 21.380. Let $p \in [1, \infty[$ then we define

$$\| \cdot \|^p = (*)^p \circ \| : \mathbb{R} \rightarrow \overline{\mathbb{R}} \text{ so that } (\| \cdot \|^p)(x) = |x|^p$$

$$\| \cdot \|^p = (*)^p \circ \| : \mathbb{C} \rightarrow \overline{\mathbb{R}} \text{ so that } (\| \cdot \|^p)(x) = |x|^p$$

If X is a set and $f: X \rightarrow \mathbb{R}$ then we define

$$|f|^p = \| \cdot \|^p \circ f: X \rightarrow \overline{\mathbb{R}} \text{ so that } |f|^p(x) = |f(x)|^p$$

If X is a set and $f: X \rightarrow \mathbb{C}$ then we define

$$|f|^p = \| \cdot \|^p \circ f: X \rightarrow \overline{\mathbb{R}} \text{ so that } |f|^p(x) = |f(x)|^p$$

Note 21.381. Using [theorem: 19.42 (2)] we have that $\forall x \in [0, \infty[$ $x^p \in [0, \infty[$ so that

$$\| (X) \subseteq [0, \infty[\wedge \| \cdot \|^p(X) \subseteq [0, \infty[\wedge |f|^p(X) \subseteq [0, \infty[$$

Definition 21.382. Let $p \in [1, \infty[$ and $\langle X, \mathcal{A}, \mu \rangle$ a measures space, $\mathbb{K} = \mathbb{C}$ or $\mathbb{R}$ then we define $\mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ as follows

1. If $\mathbb{K} = \mathbb{R}$ then $\mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}] = \{f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] | f(X) \subseteq \mathbb{R} \wedge |f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]\}$
2. If $\mathbb{K} = \mathbb{C}$ then $\mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}] = \{f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}] | |f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]\}$

We prove now that $\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}]$ is the special case of $\mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$.

Theorem 21.383. Let $p \in [1, \infty[$ and $\langle X, \mathcal{A}, \mu \rangle$ a measure space then

$$\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}] = \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$$

in other words we have

1. $\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] = \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{R}]$
2. $\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}] = \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{C}]$

Proof. First as $\forall x \in X$ we have $|f|^1(x) = |f(x)|^1 \stackrel{[\text{theorem: 19.42(4)}]}{=} |f(x)| = |f|(x)$ we have that

$$|f| = |f|^1$$

1. Let $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ then $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ and by [theorem: 21.341] $|f|^1 = |f| \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ so that

$$\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \subseteq \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{R}] \quad (21.597)$$

Further if $f \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{R}]$ then $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ and $|f| = |f|^1 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. Hence $\int^+ |f| d\mu = \int^+ |f|^1 d\mu < \infty$ so that by [theorem: 21.341] $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ which proves that $\mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{R}] \subseteq \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$, combining this with [eq: 21.597] gives

$$\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] = \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{R}]$$

2. Let $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ then we have by definition that $\operatorname{Re}(f), \operatorname{Im}(f) \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$, hence $\operatorname{Re}(f), \operatorname{Im}(f) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$. Using [theorem: 21.368] it follows then that $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ and using [theorem: 21.379] it follows that $|f|^1 = |f| \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$, hence $f \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{C}]$ which proves that

$$\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}] \subseteq \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{C}] \quad (21.598)$$

If $f \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{C}]$ then $f \in \mathcal{M}[X, \mathcal{A}, \mu, \mathbb{C}]$ and $|f| = |f|^1 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ which by [theorem: 21.379] proves that $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$, hence $\mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{C}] \subseteq \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$. Combining this result with [eq: 21.598] proves that

$$\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}] = \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{C}] \quad \square$$

Example 21.384. Let $p \in [1, \infty[$ then for $C_0: X \rightarrow \mathbb{K}$ defined by $C_0(x) = 0$ we have that

$$C_0 \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

Proof. First using [theorem: 21.217] it follows that

$$C_0 \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$$

Further we have $\forall x \in X$ that $|C_0|^p(x) = |C_0(x)|^p = |0|^p \stackrel{\text{[definition: 19.39]} \wedge p \neq 0}{=} 0 = C_0(x)$ which proves that $|C_0|^p = C_0$. As by [example: 21.329] $C_0 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ it follows that

$$C_0 \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \quad \square$$

Next we want to prove that $\langle \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}], +, \cdot \rangle$ is a vector space over $\mathbb{R}$ and that $\langle \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}], +, \cdot \rangle$ is a vector space over $\mathbb{C}$. To do this we need the following three lemma's.

Lemma 21.385. Let $p \in [1, \infty[$ then we have that:

1. $\| \cdot \|^p \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$.
2. If $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ then $|f|^p \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$.
3. $\| \cdot \|^p \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{C}]$.
4. If $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ then $|f|^p \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$.

Proof.

1. Using [theorem: 14.157] $\| \cdot \|: \mathbb{R} \rightarrow \mathbb{R}$ is a continuous function [using the canonical topologies on $\mathbb{R}$]. By [theorem: 14.134] it follows then that

$$\| \cdot \|: \mathbb{R} \rightarrow [0, \infty[\text{ is continuous using the topologies } \mathcal{T}_{\|}, (\mathcal{T}_{\|})_{|[0, \infty[}$$

Further using [theorem: 19.51] we have that

$$(*)^p: [0, \infty[\rightarrow \mathbb{R} \text{ is continuous}$$

Hence as $\| \cdot \|^p = (*)^p \circ \| \cdot \|$ we have by [theorem: 14.140] that

$$\| \cdot \|^p: \mathbb{R} \rightarrow \mathbb{R} \text{ is continuous using the topologies } \mathcal{T}_{\|}, \mathcal{T}_{\|}$$

By [theorem: 21.243] $\| \cdot \|^p$ is $\mathcal{B}[\mathbb{R}], \mathcal{B}[\mathbb{R}]$ -measurable, using then [theorem: 21.231] it follows that $\| \cdot \|^p: \mathbb{R} \rightarrow \overline{\mathbb{R}}$ is $\mathcal{B}[\mathbb{R}], \mathcal{B}[\overline{\mathbb{R}}]$ -measurable. Finally as $\| \cdot \|^p(X) \subseteq [0, \infty[$ it follows that

$$\| \cdot \|^p \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$$

2. Let $x \in X$ then $|f|^p = |^p \circ f$. Hence using [theorem: 21.218] (1) and the fact that f is $\mathcal{A}$, $\mathcal{B}[\mathbb{R}]$ -measurable it follows that $|f|^p$ is $\mathcal{A}$, $\mathcal{B}[\mathbb{R}]$ -measurable. Finally as $|^p(f(X)) \subseteq [0, \infty[$ we have that

$$|f|^p \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$$

3. Using [theorem: 14.157] $||: \mathbb{C} \rightarrow \mathbb{R}$ is a continuous function [using the canonical topologies on $\mathbb{C}$ and $\mathbb{R}$. By [theorem: 14.134] it follows then that

$$||: \mathbb{R} \rightarrow [0, \infty[\text{ is continuous using the topologies } \mathcal{T}_{||}, (\mathcal{T}_{||})_{|[0, \infty[}$$

Further using [theorem: 19.51] we have that

$$(*)^p: [0, \infty[\rightarrow \mathbb{R} \text{ is continuous}$$

Hence as $|^p = (*)^p \circ ||$ we have by [theorem: 14.140] that

$$|^p: \mathbb{C} \rightarrow \mathbb{R} \text{ is continuous using the topologies } \mathcal{T}_{||}, \mathcal{T}_{||}$$

Hence $|^p$ is $\mathcal{B}[\mathbb{C}]$, $\mathcal{B}[\mathbb{R}]$ -measurable [see theorem: 21.243], using then [theorem: 21.231] it follows that $|^p: \mathbb{C} \rightarrow \mathbb{R}$ is $\mathcal{B}[\mathbb{C}]$, $\mathcal{B}[\mathbb{R}]$ -measurable. Finally as $|^p(X) \subseteq [0, \infty[$ it follows that

$$|^p \in \mathcal{M}^+[\mathbb{C}, \mathcal{A}, \mathbb{R}]$$

4. Let $x \in X$ then $|f|^p = |^p \circ f$. Hence using [theorem: 21.218] (3) and the fact that f is $\mathcal{A}$, $\mathcal{B}[\mathbb{R}]$ -measurable it follows that $|f|^p$ is $\mathcal{A}$, $\mathcal{B}[\mathbb{R}]$ -measurable. Finally as $|^p(f(X)) \subseteq [0, \infty[$ we have that

$$|f|^p \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \quad \square$$

Lemma 21.386. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $p \in [1, \infty[$, $g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ and $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ such that $\forall x \in X$ we have $|f(x)| \leq |g(x)|$ then $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$.

Proof. As $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ we have by [lemma: 21.385] that

$$|f|^p \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$$

Let $x \in X$ then by the hypothesis $|f(x)| \leq |g(x)|$ so that by the fact that the power function is monotone [see theorem: 19.42(15)] we have $|f(x)|^p \leq |g(x)|^p$, summarized

$$\forall x \in X \text{ we have } ||f(x)|^p| \leq |g(x)|^p$$

Further as $g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ we have that

$$|g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ so that } |g|^p(X) \subseteq [0, \infty[$$

Hence the conditions for [theorem: 21.343] are satisfied so that

$$|f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

which as $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ proves that

$$f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \quad \square$$

Lemma 21.387. Let $p \in]0, \infty[$ and $z_1, z_2 \in \mathbb{K}$ then $|z_1 + z_2|^p \leq 2^p \cdot (|z_1|^p + |z_2|^p)$

Proof. For $|z_1|, |z_2|$ we have the following possible cases:

$|z_1| \leq |z_2|$. Then

$$|z_1 + z_2| \leq |z_1| + |z_2| \leq 2 \cdot |z_2|$$

So that

$$\begin{aligned} |z_1 + z_2|^p &\leq (2 \cdot |z_2|)^p \\ &\stackrel{[\text{theorem: 19.42(15)}]}{=} 2^p \cdot |z_2|^p \\ &\stackrel{[\text{theorem: 19.42(12)}]}{\leq} 2^p \cdot |z_1|^p + 2^p \cdot |z_2|^p \\ &\leq 2^p \cdot (|z_1|^p + |z_2|^p) \end{aligned}$$

$|z_2| < |z_1|$. Then

$$|z_1 + z_2| < |z_1| + |z_2| \leq 2 \cdot |z_1|$$

So that

$$\begin{aligned} |z_1 + z_2|^p &\stackrel{[\text{theorem: 19.42(15)}]}{<} (2 \cdot |z_1|)^p \\ &\stackrel{[\text{theorem: 19.42(12)}]}{=} 2^p \cdot |z_1|^p \\ &\leq 2^p \cdot |z_1|^p + 2^p \cdot |z_2|^p \\ &\leq 2^p \cdot (|z_1|^p + |z_2|^p) \end{aligned}$$

So in all cases we have

$$|z_1 + z_2|^p \leq 2^p \cdot (|z_1|^p + |z_2|^p) \quad \square$$

Theorem 21.388. Let $p \in [1, \infty[$ and $\langle X, \mathcal{A}, \mu \rangle$ a measure space then we have:

1. $\forall f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ we have $f + g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$.
2. $\forall \alpha \in \mathbb{R}$ and $\forall f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ we have that $\alpha \cdot f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$.
3. $\forall f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}]$ we have $f + g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}]$.
4. $\forall \alpha \in \mathbb{R}$ and $\forall f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that $\alpha \cdot f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}]$.

Note 21.389. If we use the convention then $\mathbb{K} = \mathbb{R}$ or $\mathbb{C}$ then we can rephrase the theorem as follows

$$\begin{aligned} &\forall f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ we have } f + g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \\ &\forall f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ and } \alpha \in \mathbb{C} \text{ we have } \alpha \cdot f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \end{aligned}$$

Proof.

1. As $f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ we have that

$$f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \text{ and } |f|^p, |g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \stackrel{[\text{theorem: 21.332}]}{\Rightarrow} |f|^p, |g|^p \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$$

From [theorem: 21.245] it follows that

$$f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \quad (21.599)$$

so that using [lemma: 21.385]

$$|f + g|^p \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \quad (21.600)$$

Let $x \in X$ then

$$|f + g|^p(x) = |f(x) + g(x)|^p \stackrel{[\text{lemma: 21.387}]}{\leq} 2^p \cdot (|f(x)|^p + |g(x)|^p) = (2^p \cdot (|f|^p + |g|^p))(x)$$

applying then [theorem: 21.313] we have

$$\int^+ |f + g|^p d\mu \leq 2^p \cdot \left(\int^+ |f|^p d\mu + \int^+ |g|^p d\mu \right) \quad (21.601)$$

As $|f|^p, |g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ we have by [theorem: 21.332] that $\int^+ |f|^p d\mu < \infty, \int^+ |g|^p d\mu < \infty$. So from the above [eq: 21.600] we have that $\int^+ |f + g|^p d\mu < \infty$. Combining this with [eq: 21.600] allows us to use [theorem: 21.332] to prove that $|f + g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. As $f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ [see eq: 21.599] we have that

$$f + g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$$

2. As $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ we have that

$$f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \text{ and } |f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

From [theorem: 21.249] it follows then that

$$\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

Further for $x \in X$ we have

$$|\alpha \cdot f|^p(x) = |\alpha \cdot f(x)|^p = (|\alpha| \cdot |f(x)|)^p \stackrel{[\text{theorem: 19.42}]}{=} |\alpha|^p \cdot |f(x)|^p = (|\alpha|^p \cdot |f|^p)(x)$$

which proves that

$$|\alpha \cdot f|^p = |\alpha|^p \cdot |f|^p$$

As $|f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ it follows from [theorem: 21.339] that $|\alpha|^p \cdot |f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ so that $|\alpha \cdot f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$, which combined with $\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ proves that

$$\alpha \cdot f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$$

3. As $f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that

$$f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}] \text{ and } |f|^p, |g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \stackrel{[\text{theorem: 21.332}]}{\Rightarrow} |f|^p, |g|^p \in \mathcal{M}^+[X, \mathcal{A}, \mu]$$

From [theorem: 21.370] it follows that

$$f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}] \tag{21.602}$$

so that using [lemma: 21.385]

$$|f + g|^p \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \tag{21.603}$$

Let $x \in X$ then

$$|f + g|^p(x) = |f(x) + g(x)|^p \stackrel{[\text{lemma: 21.387}]}{\leq} 2^p \cdot (|f(x)|^p + |g(x)|^p) = (2^p \cdot (|f|^p + |g|^p))(x)$$

applying then [theorem: 21.313] we have

$$\int^+ |f + g|^p d\mu \leq 2^p \cdot \left(\int^+ |f|^p d\mu + \int^+ |g|^p d\mu \right) \tag{21.604}$$

As $|f|^p, |g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ we have by [theorem: 21.339] that $\int^+ |f|^p d\mu < \infty, \int^+ |g|^p d\mu < \infty$. So from the above [eq: 21.604] we have that $\int^+ |f + g|^p d\mu < \infty$. Combining this with [eq: 21.603] allows us to use [theorem: 21.332] to prove that $|f + g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. As $f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ [see eq: 21.602] we have that

$$|f + g|^p \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$$

4. As $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that

$$f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}] \text{ and } |f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

From [theorem: 21.370] it follows then that

$$\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$$

Further for $x \in X$ we have

$$|\alpha \cdot f|^p(x) = |\alpha \cdot f(x)|^p = (|\alpha| \cdot |f(x)|)^p \stackrel{[\text{theorem: 19.42}]}{=} |\alpha|^p \cdot |f(x)|^p = (|\alpha|^p \cdot |f|^p)(x)$$

which proves that

$$|\alpha \cdot f|^p = |\alpha|^p \cdot |f|^p$$

As $|f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ it follows from [theorem: 21.339] that $|\alpha|^p \cdot |f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ so that $|\alpha \cdot f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$, which combined with $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ proves that

$$\alpha \cdot f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{C}] \quad \square$$

We extend now $\mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ where $p \in [1, \infty[$ to the case where $p = \infty$.

Definition 21.390. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $\mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ where $\mathbb{K} = \mathbb{R}$ or $\mathbb{C}$ is defined by

1. If $\mathbb{K} = \mathbb{R}$ then $\mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}] = \{f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \mid \exists M \in \mathbb{R}^+ \text{ such that } \forall x \in X \ |f(x)| \leq M\}$
2. If $\mathbb{K} = \mathbb{C}$ then $\mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}] = \{f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}] \mid \exists M \in \mathbb{R}^+ \text{ such that } \forall x \in X \ |f(x)| \leq M\}$

In essence $\mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ is the set of bounded measurable functions.

Theorem 21.391. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then

1. $\forall f, g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ we have $f + g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$
2. $\forall f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ and $\alpha \in \mathbb{R}$ we have that $\alpha \cdot f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$
3. $\forall f, g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}]$ we have $f + g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}]$
4. $\forall f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}]$ and $\alpha \in \mathbb{C}$ we have that $\alpha \cdot f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}]$

In other words using the notation $\mathbb{K} = \mathbb{R}$ or $\mathbb{C}$ we have that

$$\begin{aligned} \forall f, g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \text{ we have } f + g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \\ \forall f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \text{ we have } \forall \alpha \in \mathbb{K} \text{ that } \alpha \cdot f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \end{aligned}$$

Proof.

1. As $f, g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ we have that $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$, hence by [theorem: 21.245] $f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$. Further there exists $M_1, M_2 \in \mathbb{R}^+$ such that $\forall x \in X$ we have $|f(x)| \leq M_1$, $|g(x)| \leq M_2$. If we take $M = M_1 + M_2$ then $\forall x \in X$ we have

$$|(f + g)(x)| = |f(x) + g(x)| \leq |f(x)| + |g(x)| \leq M_1 + M_2 = M$$

which proves that

$$f + g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$$

2. As $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ we have that $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$, hence by [theorem: 21.249] $\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$. Further there exists a $M' \in \mathbb{R}^+$ such that $\forall x \in X \ |f(x)| \leq M'$. Take $M = |\alpha| \cdot M' + 1 \in \mathbb{R}^+$ then given $x \in X$ we have

$$|(\alpha \cdot f)(x)| = |\alpha \cdot f(x)| = |\alpha| \cdot |f(x)| \leq |\alpha| \cdot M' < |\alpha| \cdot M' + 1 = M$$

So we have

$$\alpha \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

3. As $f, g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$, hence by [theorem: 21.378] $f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$, and a M_1, M_2 such that $\forall x \in X$ we have $|f(x)| \leq M_1$, $|g(x)| \leq M_2$. If $M = M_1 + M_2$ then $\forall x \in X$ we have

$$|(f + g)(x)| = |f(x) + g(x)| \leq |f(x)| + |g(x)| \leq M_1 + M_2 = M.$$

So we have that

$$f + g \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}]$$

4. As $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{C}]$ we have that $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$, hence by [theorem: 21.378] $\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ and there exists a $M' \in \mathbb{R}^+$ such that $\forall x \in X \ |f(x)| \leq M'$. Take $M = |\alpha| \cdot M' + 1 \in \mathbb{R}^+$ then given $x \in X$ we have

$$|(\alpha \cdot f)(x)| = |\alpha \cdot f(x)| = |\alpha| \cdot |f(x)| \leq |\alpha| \cdot M' < |\alpha| \cdot M' + 1 = M.$$

So we have

$$\alpha \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$$

□

We are now ready to prove that $\mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ is a vector space.

Theorem 21.392. *Let $p \in [1, \infty]$, $\mathbb{K} = \mathbb{R}$ or $\mathbb{C}$ and $\langle X, \mathcal{A}, \mu \rangle$ a measure space then if we define*

$$f + g: X \rightarrow \mathbb{K} \text{ by } (f + g)(x) = f(x) + g(x) \text{ and } (\alpha \cdot f): X \rightarrow \mathbb{K} \text{ by } (\alpha \cdot f)(x) = \alpha \cdot f(x)$$

we have that

$$\langle \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot \rangle \text{ is a vector space over the field } \mathbb{K} \text{ with neutral element } C_0$$

Proof. By [example: 21.384] $C_0 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}]$ so that

$$\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}] \neq \emptyset$$

As further $\mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \subseteq \mathbb{K}^X$ it follows from [theorem: 11.67] and [theorem: 11.60] together with [theorems: 21.388, 21.391] that

$$\langle \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot \rangle \text{ is a vector space over the field } \mathbb{K} \text{ with neutral element } C_0 \quad \square$$

Theorem 21.393. *Let $p \in [1, \infty]$ and $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then $|f| \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$*

Proof. For $p \in [1, \infty]$ we have two possible cases to consider:

$p = \infty$. As $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ we have by definition that

$$f \in \mathcal{M}[X, \mathcal{A}, \mu, \mathbb{K}] \text{ and } \exists M \in \mathbb{R}^+ \text{ such that } \forall x \in X \text{ we have } |f(x)| \leq M < \infty$$

Using [theorems: 21.323, 21.371] and $|f|(X) \subseteq \mathbb{R}$ it follows that $|f| \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$, further $\forall x \in X$ we have $||f(x)|| = |f(x)| \leq M$. Hence we have by definition that

$$|f| \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$$

$p \in [1, \infty[$. As $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ we have by definition that

$$f \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \Rightarrow f(X) \subseteq \mathbb{K} \text{ and } |f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

Using [theorems: 21.323, 21.371] it follows that $|f| \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$, further as $||f||^p = |f|^p$ it follows that $||f||^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. Hence

$$|f| \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}] \quad \square$$

Next we define what later will become a pseudo norm on $\mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$. We start with the case where $p \in [1, \infty[$.

Definition 21.394. *Let $p \in [1, \infty[$ and $\langle X, \mathcal{A}, \mu \rangle$ a measure space then we define*

$$||| \cdot |||_p: \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \rightarrow [0, \infty[\text{ by } ||f||_p = \left(\int |f|^p d\mu \right)^{\frac{1}{p}}$$

Theorem 21.395. *Let $p \in [1, \infty[$, $\langle X, \mathcal{A}, \mu \rangle$ a measure space and $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ such that $||f||_p = 0$ then we have that $|f|^p = 0$ μ -a.e. and $f = 0$ μ -a.e.*

Proof. Let $x \in X$ then as $|f(x)| \in [0, \infty[$ we have by [definition: 19.39] that $|f(x)|^p \in [0, \infty[$, hence we have $||f|^p|(x) = |f|^p(x) = |f|^p(x)$ so that $||f|^p| = |f|^p$. As $||f||_p = 0$ we have that $(\int |f|^p d\mu)^{\frac{1}{p}} = 0$ so that by [theorem: 19.42] $\int |f|^p d\mu = \int |f|^p d\mu = 0$. Using then [theorem: 21.346] it follows that $|f|^p = 0$ μ -a.e. So there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X | |f(x)|^p \neq 0\} \subseteq N$. Let $x \in \{x \in X | f(x) \neq 0\}$ then $f(x) \neq 0 \Rightarrow |f(x)| \neq 0 \xRightarrow{[\text{theorem: 19.42}]} |f(x)|^p \neq 0$ so that $x \in \{x \in X | |f(x)|^p \neq 0\} \subseteq N$, hence $\{x \in X | f(x) \neq 0\} \subseteq N$ which proves that

$$f = 0 \text{ } \mu\text{-a.e.} \quad \square$$

To define $\|\cdot\|_\infty$ we need first to first introduce the concept of locally μ -null sets.

Definition 21.396. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then N is **locally μ -null** if $\forall A \in \mathcal{A}$ with $\mu(A) < \infty$ we have that $A \cap N \in \mathcal{N}_\mu$ [see definition: 21.202].

A trivial example is of a locally μ -null set is the empty set.

Example 21.397. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $\emptyset$ is locally μ -null.

Proof. Let $A \in \mathcal{A}$ then $A \cap \emptyset = \emptyset \in \mathcal{A}$ with $\mu(\emptyset) = 0$ proving that $\emptyset$ is locally μ -null. $\square$

We have the following properties for μ -null sets.

Theorem 21.398. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measurable space then

1. Every negligible set is locally μ -null. In otherwords $\forall N \in \mathcal{N}_\mu$ we have that N is locally μ -null.
2. If B is locally μ -null and $A \subseteq B$ then A is locally μ -null.
3. If I is a countable set [finite or denumerable] and $\{A_i\}_{i \in I} \subseteq \mathcal{P}(X)$ a countable family of locally μ -null sets then $\bigcup_{i \in I} A_i$ is locally μ -null.

Proof.

1. Let $N \in \mathcal{N}_\mu$ then there exist a $A \in \mathcal{A}$ with $\mu(A) = 0$ such that $N \subseteq A$. Let $B \in \mathcal{A}$ with $\mu(B) < \infty$ then $N \cap B \subseteq N \subseteq A$ so that $N \cap B \in \mathcal{N}_\mu$. So we have by definition that N is locally μ -null.
2. Let $D \in \mathcal{A}$ with $\mu(D) < \infty$ then as B is locally μ -null we have that $B \cap D \in \mathcal{N}_\mu$. Hence there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $B \cap D \subseteq N$. As $A \subseteq B$ we have that $A \cap D \subseteq B \cap D \subseteq N$ which proves that $A \cap D \in \mathcal{N}_\mu$. Hence A is locally μ -null.
3. Let $\{A_i\}_{i \in I} \subseteq \mathcal{P}(X)$ be a countable family of locally μ -null sets. Let $A \in \mathcal{A}$ with $\mu(A) < \infty$. Given $i \in I$ we have, as A_i is locally μ -null, that $A \cap A_i \in \mathcal{N}_\mu$, so by [theorem: 21.205] we have that $\bigcup_{i \in I} (A \cap A_i) \in \mathcal{N}_\mu$. So that

$$A \cap \left(\bigcup_{i \in I} A_i \right) = \bigcup_{i \in I} (A \cap A_i) \in \mathcal{N}_\mu$$

which proves that

$$\bigcup_{i \in I} A_i \text{ is locally } \mu\text{-null}$$

$\square$

We are now ready to define $\|\cdot\|_\infty$

Definition 21.399. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then we define

$$\|\cdot\|_\infty: \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \rightarrow [0, \infty[\text{ by } \|f\|_\infty = \inf(\{M \in [0, \infty[\mid \{x \in X \mid |f(x)| > M\} \text{ is locally } \mu\text{-null}\})$$

Proof. Of course for this definition to make sense the inf must exist and be finite. Let $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ then $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ and there exist a $M \in \mathbb{R}^+$ such that $\forall x \in X$ we have $|f(x)| \leq M$. From this it follows that $\{x \in X \mid |f(x)| > M\} = \emptyset$ a locally μ -null set [see example: 21.397]. So we have proved that

$$M \in \{M \in [0, \infty[\mid \{x \in X \mid |f(x)| > M\} \text{ is locally } \mu\text{-null}\}$$

from which it follows that

$$\inf(\{M \in [0, \infty[\mid \{x \in X \mid |f(x)| > M\} \text{ is locally } \mu\text{-null}\}) \text{ exist}$$

and

$$0 \leq \inf(\{M \in [0, \infty[\mid \{x \in X \mid |f(x)| > M\} \text{ is locally } \mu\text{-null}\}) \leq M$$

which proves, as $M < \infty$, that

$$\inf(\{M \in [0, \infty[\mid \{x \in X \mid |f(x)| > M\} \text{ is locally } \mu\text{-null}\}) \in [0, \infty[. \quad \square$$

We set out now to prove that $\|\cdot\|_p$ is a norm on the vector space $\langle \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot \rangle$.

Lemma 21.400. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measurable space and $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ then*

$$\{x \in X \mid |f(x)| > \|f\|_\infty\} \text{ is locally } \mu\text{-null}$$

Proof. Let $n \in \mathbb{N}$ then as $\|f\|_\infty \in \mathbb{R}$ we ave

$$\inf(\{M \in [0, \infty[\mid \{x \in X \mid |f(x)| > M\} \text{ is locally } \mu\text{-null}\}) = \|f\|_\infty < \|f\|_\infty + \frac{1}{n}$$

there exist a M_n such that $\{x \in X \mid |f(x)| > M_n\}$ is locally μ -null and $\|f\|_\infty \leq M_n < \|f\|_\infty + \frac{1}{n}$. So we have by [theorem: 3.107] a $\{M_n\}_{n \in \mathbb{N}} \subseteq [0, \infty[$ such that

$$\forall n \in \mathbb{N} \quad \{x \in X \mid |f(x)| > M_n\} \text{ is local } \mu\text{-null and } \|f\|_\infty \leq M_n < \|f\|_\infty + \frac{1}{n} \quad (21.605)$$

If $x \in \{x \in X \mid |f(x)| > \|f\|_\infty\}$ then $\|f\|_\infty < |f(x)|$ so that using [theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $\|f\|_\infty < \|f\|_\infty + \frac{1}{n} < |f(x)|$, so $M_n \stackrel{[\text{eq: 21.605}]}{<} \|f\|_\infty + \frac{1}{n} < |f(x)|$ from which we deduce that $x \in \{x \in X \mid |f(x)| > M_n\} \subseteq \bigcup_{n \in \mathbb{N}} \{x \in X \mid |f(x)| > M_n\}$. Hence we have

$$\{x \in X \mid |f(x)| > \|f\|_\infty\} \subseteq \bigcup_{n \in \mathbb{N}} \{x \in X \mid |f(x)| > M_n\} \quad (21.606)$$

If $x \in \bigcup_{n \in \mathbb{N}} \{x \in X \mid |f(x)| > M_n\}$ then there exist a $n \in \mathbb{N}$ such that $x \in \{x \in X \mid |f(x)| > M_n\} \Rightarrow M_n < |f(x)|$, hence by [eq: 21.605] $\|f\|_\infty \leq M_n < |f(x)|$ so that $x \in \{x \in X \mid |f(x)| > \|f\|_\infty\}$ which proves that $\bigcup_{n \in \mathbb{N}} \{x \in X \mid |f(x)| > M_n\} \subseteq \{x \in X \mid |f(x)| > \|f\|_\infty\}$. Combining this with [eq: 21.606] proves

$$\{x \in X \mid |f(x)| > \|f\|_\infty\} = \bigcup_{n \in \mathbb{N}} \{x \in X \mid |f(x)| > M_n\}$$

As by [eq: 21.605] we have $\forall n \in \mathbb{N}$ that $\{x \in X \mid |f(x)| > M_n\}$ is locally μ -null it follows from [theorem: 21.398] that $\bigcup_{n \in \mathbb{N}} \{x \in X \mid |f(x)| > M_n\}$ is locally μ -finite, hence we have that

$$\{x \in X \mid |f(x)| > \|f\|_\infty\} \text{ is locally } \mu\text{-finite} \quad \square$$

The following theorem will be crucial for the properties of $\|\cdot\|_p$.

Theorem 21.401. (Holder's Inequality) *Let $p, q \in [1, \infty]$ be such that $\frac{1}{p} + \frac{1}{q} = 1$, $\langle X, \mathcal{A}, \mu \rangle$ a measure space and $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$, $g \in \mathcal{L}^q[X, \mathcal{A}, \mu, \mathbb{K}]$ then $f \cdot g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$ and*

$$\int |f \cdot g| d\mu \leq \|f\|_p \cdot \|g\|_q$$

Proof. For p, q we must consider the following cases:

$p = \infty$. Then as $1 = \frac{1}{p} + \frac{1}{q} \stackrel{[\text{definition: 20.21}]}{=} 0 + \frac{1}{q} = \frac{1}{q}$ we have that $q = 1$ [if $q = -\infty, \infty$ then $\frac{1}{q} = 0 \neq 1$ so we must have that $q = (1)^{-1} = 1$], so $g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$. By [theorem: 21.345] it follows that $\{x \in X \mid |g(x)| \neq 0\}$ is μ -finite, so there exist a $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N} \quad \mu(A_i) < \infty$ such that

$$A = \{x \in X \mid |g(x)| \neq 0\} \subseteq \bigcup_{i \in \mathbb{N}} A_i \quad (21.607)$$

Further as $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ we have by [lemma: 21.400] that

$$B = \{x \in X \mid |f(x)| > \|f\|_\infty\} \text{ is locally } \mu\text{-null} \quad (21.608)$$

Using the definitions of A and B we have

$$\begin{aligned} A \cap B &\stackrel{[\text{eq: 21.607}]}{\subseteq} \left(\bigcup_{i \in \mathbb{N}} A_i \right) \cap B \\ &= \bigcup_{i \in \mathbb{N}} (A_i \cap B) \\ &= \bigcup_{i \in \mathbb{N}} (A_i \cap \{x \in X \mid |f(x)| > \|f\|_\infty\}) \end{aligned} \quad (21.609)$$

As $B = \{x \in X \mid |f(x)| > \|f\|_\infty\}$ is locally μ -null and $\mu(A_i) < \infty$ we have that $A_i \cap \{x \in X \mid |f(x)| > \|f\|_\infty\} \in \mathcal{N}_\mu$. So there exist a $N_i \in \mathcal{A}$ with $\mu(N_i) = 0$ such that $A_i \cap \{x \in X \mid |f(x)| > \|f\|_\infty\} \subseteq N_i$. Substituting this in [eq: 21.609] gives

$$A \cap B = \{x \in X \mid |g(x)| \neq 0\} \cap \{x \in X \mid |f(x)| > \|f\|_\infty\} \subseteq \bigcup_{i \in \mathbb{N}} N_i \quad (21.610)$$

and

$$\mu\left(\bigcup_{i \in \mathbb{N}} N_i\right) \stackrel{[\text{theorem: 21.203}]}{=} 0 \quad (21.611)$$

If $x \in \{x \in X \mid |f \cdot g|(x) > \|f\|_\infty \cdot |g(x)|\}$ then $|f(x)| \cdot |g(x)| > \|f\|_\infty \cdot |g(x)|$ and we must have that $|g(x)| \neq 0$ [otherwise we have $0 = |f(x)| \cdot |g(x)| > \|f\|_\infty \cdot |g(x)| = 0$ leading to the contradiction $0 > 0$], hence by dividing the inequality by $|g(x)|$ we have $|f(x)| > \|f\|_\infty$. So $x \in \{x \in X \mid |g(x)| \neq 0\} \cap \{x \in X \mid |f(x)| > \|f\|_\infty\}$ proving that

$$\{x \in X \mid |f \cdot g|(x) > \|f\|_\infty \cdot |g(x)|\} \subseteq \{x \in X \mid |g(x)| \neq 0\} \cap \{x \in X \mid |f(x)| > \|f\|_\infty\}$$

Using [eq: 21.610] it follows that

$$\{x \in X \mid |f \cdot g|(x) > \|f\|_\infty \cdot |g(x)|\} \subseteq \bigcup_{i \in \mathbb{N}} N_i$$

which as $\mu(\bigcup_{i \in \mathbb{N}} N_i) = 0$ proves that

$$|f \cdot g| \leq \|f\|_\infty \cdot |g| \text{ } \mu\text{-a.e.} \quad (21.612)$$

As $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ and $g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$ we have that $f, g \in \mathcal{M}[X, \mathcal{A}, \mu, \mathbb{K}]$, using then [theorems: 21.251, 21.370] and [lemma: 21.385] we have that

$$|f \cdot g| \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \quad (21.613)$$

Further from $g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$ it follows that $|g| = |g|^1 \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ so that by [theorems: 21.249, 21.378] $\|f\|_\infty \cdot |g| \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. Using then [eq: 21.612] together with [theorem: 21.343] and the fact that by [eq: 21.613] $|f \cdot g|(X) \subseteq \mathbb{R}$ proves that

$$|f \cdot g| \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ and } \int |f \cdot g| d\mu \leq \int \|f\|_\infty \cdot |g| d\mu = \|f\|_\infty \cdot \int |g| d\mu \quad (21.614)$$

Hence we have by definition that

$$f \cdot g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$$

As $\|g\|_q \stackrel{q=1}{=} \|g\|_1 = (\int |g|^1 d\mu)^{\frac{1}{1}} = \int |g| d\mu$ it follows from [eq: 21.614] that

$$\int |f \cdot g| d\mu \leq \|f\|_\infty \cdot \|g\|_q = \|f\|_p \cdot \|g\|_q$$

$q = \infty$. This reduces to the case $p = \infty$ if we switch p with q and f with g .

$p \neq \infty \wedge q \neq \infty$. Let $x \in X$ then we have either:

$$f(x) = 0 \vee g(x) = 0. \text{ Then } |f(x) \cdot g(x)| = 0 \leq \frac{|f(x)|^p}{p} + \frac{|g(x)|^q}{q}$$

$f(x) \neq 0 \wedge g(x) \neq 0$. Using Young's inequality [see 19.53] we have that

$$|f(x) \cdot g(x)| = |f(x)| \cdot |g(x)| \leq \frac{|f(x)|^p}{p} + \frac{|g(x)|^q}{q}$$

from which it follows that

$$\forall x \in X \quad |f(x) \cdot g(x)| \leq \frac{|f(x)|^p}{p} + \frac{|g(x)|^q}{q} \quad (21.615)$$

As $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$, $g \in \mathcal{L}^q[X, \mathcal{A}, \mu, \mathbb{K}]$ it follows that $|f|^p, |g|^q \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. Hence using [theorem: 21.339] we have that $\frac{|f|^p}{p} + \frac{|g|^q}{q} \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. Further as $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ [see definition: 21.382] we have by [theorems: 21.251, 21.323, 21.370, 21.371] that $|f \cdot g| \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{K}]$ [so that $|f \cdot g|(X) \subseteq [0, 1] \subseteq \mathbb{R}$]. Using then [eq: 21.615] together with [theorem: 21.343] proves that

$$|f \cdot g| \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ so that by definition } f \cdot g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}] \quad (21.616)$$

and

$$\int |f \cdot g| d\mu \leq \int \left(\frac{|f|^p}{p} + \frac{|g|^q}{q} \right) d\mu = \frac{1}{p} \cdot \int |f|^p d\mu + \frac{1}{q} \cdot \int |g|^q d\mu \quad (21.617)$$

We examine now the case where $\|f\|_p = 1 = \|g\|_q$. In this case we have that

$$\begin{aligned} 1_{[\text{theorem: 19.42}]}^p &= (\|f\|_p)^p = \left(\left(\int |f|^p d\mu \right)^{\frac{1}{p}} \right)^p \stackrel{[\text{theorem: 19.42}]}{=} \int |f|^p d\mu \\ 1_{[\text{theorem: 19.42}]}^q &= (\|g\|_q)^q = \left(\left(\int |g|^q d\mu \right)^{\frac{1}{q}} \right)^q \stackrel{[\text{theorem: 19.42}]}{=} \int |g|^q d\mu \end{aligned}$$

Substituting this in [eq: 21.617] gives

$$\int |f \cdot g| d\mu \leq \frac{1}{p} + \frac{1}{q} = 1$$

To summarize we have

If $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$, $g \in \mathcal{L}^q[X, \mathcal{A}, \mu, \mathbb{K}]$ with $\|f\|_p = 1 = \|g\|_q$ then $f \cdot g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}]$ and

$$\int |f \cdot g| d\mu \leq 1 = \|f\|_p \cdot \|g\|_q \quad (21.618)$$

proving the theorem in this special case. Now for the general case we have for $\|f\|_p, \|g\|_q$ the following possible cases:

$\|f\|_p \neq 0 \wedge \|g\|_q \neq 0$. Take then $f' = \frac{f}{\|f\|_p}$ and $g' = \frac{g}{\|g\|_q}$ so that by [theorem: 21.388] $f' \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$, $g' \in \mathcal{L}^q[X, \mathcal{A}, \mu, \mathbb{K}]$. Further we have $\forall x \in X$ that

$$\begin{aligned} \left| \frac{f}{\|f\|_p} \right|^p(x) &= \left(\frac{|f(x)|}{\|f\|_p} \right)^p \stackrel{[\text{theorem: 19.42}]}{=} \left(\frac{|f(x)|^p}{(\|f\|_p)^p} \right) = \left(\frac{|f|^p}{(\|f\|_p)^p} \right)(x) \\ \left| \frac{g}{\|g\|_q} \right|^q(x) &= \left(\frac{|g(x)|}{\|g\|_q} \right)^q \stackrel{[\text{theorem: 19.42}]}{=} \left(\frac{|g(x)|^q}{(\|g\|_q)^q} \right) = \left(\frac{|g|^q}{(\|g\|_q)^q} \right)(x) \end{aligned}$$

which proves that

$$\left| \frac{f}{\|f\|_p} \right|^p = \frac{|f|^p}{(\|f\|_p)^p} \wedge \left| \frac{g}{\|g\|_q} \right|^q = \frac{|g|^q}{(\|g\|_q)^q}$$

so that

$$\begin{aligned}
 \|f'\|_p &= \left(\int \left| \frac{f}{\|f\|_p} \right|^p d\mu \right)^{\frac{1}{p}} \\
 &= \left(\int \frac{|f|^p}{(\|f\|_p)^p} d\mu \right)^{\frac{1}{p}} \\
 &= \left(\left(\frac{1}{\|f\|_p} \right)^p \cdot \int |f|^p d\mu \right)^{\frac{1}{p}} \\
 &\stackrel{[\text{theorem: 19.42}]}{=} \frac{1}{\|f\|_p} \cdot \left(\int |f|^p d\mu \right)^{\frac{1}{p}} \\
 &= \frac{1}{\|f\|_p} \cdot \|f\|_p \\
 &= 1 \\
 \|g'\|_q &= \left(\int \left| \frac{g}{\|g\|_q} \right|^q d\mu \right)^{\frac{1}{q}} \\
 &= \left(\int \frac{|g|^q}{(\|g\|_q)^q} d\mu \right)^{\frac{1}{q}} \\
 &= \left(\left(\frac{1}{\|g\|_q} \right)^q \cdot \int |g|^q d\mu \right)^{\frac{1}{q}} \\
 &\stackrel{[\text{theorem: 19.42}]}{=} \frac{1}{\|g\|_q} \cdot \left(\int |g|^q d\mu \right)^{\frac{1}{q}} \\
 &= \frac{1}{\|g\|_q} \cdot \|g\|_q \\
 &= 1
 \end{aligned}$$

So we can apply [eq: 21.618] giving

$$f' \cdot g' \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}] \text{ and } \int |f' \cdot g'| d\mu \leq 1 \quad (21.619)$$

Using [theorem: 21.388] we have $f \cdot g = (\|f\|_p \cdot \|g\|_q) \cdot (f' \cdot g') \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$ and

$$\int (f \cdot g) d\mu = \|f\|_p \cdot \|g\|_q \cdot \int (f' \cdot g') d\mu \stackrel{[\text{eq: 21.619}]}{\leq} \|f\|_p \cdot \|g\|_q \cdot 1$$

in other words

$$f \cdot g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}] \text{ and } \int (f \cdot g) d\mu \leq \|f\|_p \cdot \|g\|_q$$

$\|f\|_p = 0$. Then by [theorem: 21.395] we have $f = 0$ μ -a.e so there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X \mid f(x) \neq 0\} \subseteq N$. If $x \in \{x \in X \mid f \cdot g(x) \neq 0\}$ then $f(x) \neq 0$ [otherwise $|f \cdot g|(x) = |f(x) \cdot g(x)| = |0| = 0$] so that $x \in \{x \in X \mid f(x) \neq 0\} \subseteq N$. Hence $\{x \in X \mid f \cdot g(x) \neq 0\} \subseteq N$ which proves that $|f \cdot g| = 0$ μ -a.e.. Using [theorem: 21.337] it follows that

$$\int |f \cdot g| d\mu = 0 \leq \|f\|_p \cdot \|g\|_q$$

$\|g\|_q = 0$. Then by [theorem: 21.395] we have $g = 0$ μ -a.e so there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X \mid g(x) \neq 0\} \subseteq N$. If $x \in \{x \in X \mid f \cdot g(x) \neq 0\}$ then $g(x) \neq 0$ [otherwise $|f \cdot g|(x) = |f(x) \cdot g(x)| = |0| = 0$] so that $x \in \{x \in X \mid g(x) \neq 0\} \subseteq N$. Hence $\{x \in X \mid f \cdot g(x) \neq 0\} \subseteq N$ which proves that $|f \cdot g| = 0$ μ -a.e.. Using [theorem: 21.337] it follows that

$$\int |f \cdot g| d\mu = 0 \leq \|f\|_p \cdot \|g\|_q$$

So in all cases we have that

$$\int |f \cdot g| d\mu \leq \|f\|_p \cdot \|g\|_q \text{ and by [eq: 21.616] } f \cdot g \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}]$$

which proves the theorem for the case where $p, q \in [1, \infty[$. $\square$

Theorem 21.402. (Minkowski's Inequality) *Let $p \in [1, \infty]$, $\langle X, \mathcal{A}, \mu \rangle$ a measure space then we have $\forall f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ that $\|f + g\|_p \leq \|f\|_p + \|g\|_p$*

Note 21.403. *Using [theorem: 21.392] $f + g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ so that $\|f + g\|_p$ is well defined.*

Proof. As $f + g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ we have by definition that

$$f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \text{ and } |f + g|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}] \quad (21.620)$$

For $p \in [1, \infty]$ we have the following possible cases:

$p = \infty$. Define $F = \{x \in X \mid |f(x)| > \|f\|_\infty\}$ and $G = \{x \in X \mid |g(x)| \geq \|g\|_\infty\}$ then using [lemma: 21.400] we have that F is locally μ -null and G is locally μ -null so that by [theorem: 21.398]

$$F \bigcup G \text{ is locally } \mu\text{-null} \quad (21.621)$$

Let $x \in \{x \in X \mid |(f + g)(x)| > \|f\|_\infty + \|g\|_\infty\}$ then

$$\|f\|_\infty + \|g\|_\infty < |(f + g)(x)| \leq |f(x)| + |g(x)|$$

Assume that $|f(x)| \leq \|f\|_\infty \wedge |g(x)| \leq \|g\|_\infty$ then we would have $|f(x)| + |g(x)| \leq \|f\|_\infty + \|g\|_\infty < |f(x)| + |g(x)|$ a contradiction. Hence the assumption is wrong and we must have $\|f\|_\infty < |f(x)| \vee \|g\|_\infty < |g(x)|$ so that $x \in F \bigcup G$. Thus it is proved that

$$\{x \in X \mid |(f + g)(x)| > \|f\|_\infty + \|g\|_\infty\} \subseteq F \bigcup G$$

Using the above, [eq: 21.621] together with [theorem: 21.398] proves that

$$\{x \in X \mid |(f + g)(x)| > \|f\|_\infty + \|g\|_\infty\} \text{ is locally } \mu\text{-null}$$

As by [definition: 21.399] $\|f\|_\infty + \|g\|_\infty \in [0, \infty[$ it follows that

$$\|f\|_\infty + \|g\|_\infty \in \{M \in [0, \infty[\mid \{x \in X \mid |(f + g)(x)| > M\} \text{ is locally } \mu\text{-null}\}$$

so that

$$\begin{aligned} \|f + g\|_\infty &\stackrel{[\text{definition: 21.399}]}{=} \inf(\{M \in [0, \infty[\mid \{x \in X \mid |(f + g)(x)| > M\} \text{ is locally } \mu\text{-null}\}) \\ &\leq \|f\|_\infty + \|g\|_\infty \end{aligned}$$

Hence we have proved that

$$\|f + g\|_p \leq \|f\|_p + \|g\|_p$$

$p = 1$. Given $x \in X$ we have that $|f + g|(x) = |f(x) + g(x)| \leq |f(x)| + |g(x)|$ so that by [theorem: 21.339] we have $\int |f + g| d\mu \leq \int |f| d\mu + \int |g| d\mu$. Hence we have

$$\begin{aligned} \|f + g\|_1 &= \left(\int |f + g|^1 d\mu \right)^{\frac{1}{1}} \\ &= \int |f + g| d\mu \\ &\leq \int |f| d\mu + \int |g| d\mu \\ &= \left(\int |f|^1 d\mu \right)^{\frac{1}{1}} + \left(\int |g|^1 d\mu \right)^{\frac{1}{1}} \\ &= \|f\|_1 + \|g\|_1 \end{aligned}$$

proving that

$$\|f + g\|_p \leq \|f\|_p$$

$p \in]1, \infty[$. Let $q = \frac{p}{p-1}$ then $\frac{1}{p} + \frac{1}{q} = \frac{1}{p} + \frac{p-1}{p} = \frac{p}{p} = 1$ and

$$(p-1) \cdot q = p \quad (21.622)$$

So it follows that $(|f + g|^{p-1})^q \stackrel{[\text{theorem: 19.42}]}{=} |f + g|^{(p-1) \cdot q} = |f + g|^p$. So using [eq: 21.620] it follows that $(|f + g|^{p-1})^q \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}]$ so that

$$|f + g|^{p-1} \in \mathcal{L}^q[X, \mathcal{A}, \mu, \mathbb{K}] \quad (21.623)$$

Now as $f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$, $\frac{1}{p} + \frac{1}{q} = 1$ we have using the Holder's inequality [see theorem: 21.401] together with the above that

$$f \cdot |f + g|^{p-1} \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}] \wedge g \cdot |f + g|^{p-1} \in \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{K}] \quad (21.624)$$

$$\int |f \cdot |f + g|^{p-1}| d\mu \leq \|f\|_p \cdot \| |f + g|^{p-1} \|_q \quad (21.625)$$

$$\int |g \cdot |f + g|^{p-1}| d\mu \leq \|g\|_p \cdot \| |f + g|^{p-1} \|_q \quad (21.626)$$

Further we have $\forall x \in X$ that

$$\begin{aligned} |f + g|^p(x) &= |f(x) + g(x)|^p \\ &\stackrel{[\text{theorem: 19.42}]}{=} |f(x) + g(x)| \cdot |f(x) + g(x)|^{p-1} \\ &\leq (|f(x)| + |g(x)|) \cdot |f(x) + g(x)|^{p-1} \\ &= |f(x)| \cdot |f(x) + g(x)|^{p-1} + |g(x)| \cdot |f(x) + g(x)|^{p-1} \\ &= (|f| \cdot |f + g|^{p-1} + |g| \cdot |f + g|^{p-1})(x) \end{aligned}$$

Using [theorem: 21.339] we have then

$$\begin{aligned} \int |f + g|^p d\mu &\leq \int (|f| \cdot |f + g|^{p-1} + |g| \cdot |f + g|^{p-1}) d\mu \\ &\stackrel{[\text{theorem: 21.339}]}{=} \int (|f| \cdot |f + g|^{p-1}) d\mu + \int (|g| \cdot |f + g|^{p-1}) d\mu \\ &\stackrel{[\text{eqs: 21.625, 21.626}]}{\leq} \|f\|_p \cdot \| |f + g|^{p-1} \|_q + \|g\|_p \cdot \| |f + g|^{p-1} \|_q \\ &= (\|f\|_p + \|g\|_p) \cdot \| |f + g|^{p-1} \|_q \\ &= (\|f\|_p + \|g\|_p) \cdot \left(\int (|f + g|^{p-1})^q d\mu \right)^{\frac{1}{q}} \\ &\stackrel{[\text{theorem: 19.42}]}{=} (\|f\|_p + \|g\|_p) \cdot \left(\int |f + g|^{(p-1) \cdot q} d\mu \right)^{\frac{1}{q}} \\ &\stackrel{[\text{eq: 21.622}]}{=} (\|f\|_p + \|g\|_p) \cdot \left(\int |f + g|^p d\mu \right)^{\frac{1}{q}} \end{aligned}$$

so that

$$\int |f + g|^p d\mu \leq (\|f\|_p + \|g\|_p) \cdot \left(\int |f + g|^p d\mu \right)^{\frac{1}{q}} \quad (21.627)$$

For $\int |f + g|^p d\mu$ we have either:

$\int |f + g|^p d\mu = 0$. Then we have

$$\|f + g\|_p = \left(\int |f + g|^p d\mu \right)^{\frac{1}{p}} = 0^{\frac{1}{p}} \stackrel{[\text{eq: 19.42}]}{=} 0 \leq \|f\|_p + \|g\|_p$$

so that

$$\|f + g\|_p \leq \|f\|_p + \|g\|_p$$

$\int |f + g|^p d\mu \neq 0$. Then by [theorem: 19.39] we have $(\int |f + g|^p d\mu)^{\frac{1}{q}} \neq 0$ so that using [eq: 21.627] we have

$$\begin{aligned} \|f\|_p + \|g\|_p &\geq \frac{\int |f + g|^p d\mu}{(\int |f + g|^p d\mu)^{\frac{1}{q}}} \\ &\stackrel{[\text{eq: 19.42}]}{=} \left(\int |f + g|^p d\mu \right)^{1 - \frac{1}{q}} \\ &= \left(\int |f + g|^p d\mu \right)^{\frac{1}{p}} \\ &= \|f + g\|_p \end{aligned}$$

hence

$$\|f + g\|_p \leq \|f\|_p + \|g\|_p$$

So in all cases we have

$$\|f + g\|_p \leq \|f\|_p + \|g\|_p \quad \square$$

Theorem 21.404. Let $p \in [1, \infty]$, $n \in \mathbb{N}$ and $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then $\sum_{i=1}^n f_i \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ and $\|\sum_{i=1}^n f_i\|_p \leq \sum_{i=1}^n \|f_i\|_p$.

Proof. This is easily proved by mathematical induction. So let

$$\mathcal{S} = \left\{ n \in \mathbb{N} \mid \text{If } \{f_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ then } \sum_{i=1}^n f_i \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ and } \left\| \sum_{i=1}^n f_i \right\|_p \leq \sum_{i=1}^n \|f_i\|_p \right\}$$

then we have:

$1 \in \mathcal{S}$. If $\{f_i\}_{i \in \{1\}} \subseteq \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then $\sum_{i=1}^1 f_i = f_1 \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ and

$$\left\| \sum_{i=1}^1 f_i \right\|_p = \|f_1\|_p = \sum_{i=1}^1 \|f_i\|_p$$

proving that $1 \in \mathcal{S}$.

$n \in \mathcal{S} \Rightarrow n+1 \in \mathcal{S}$. Let $\{f_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then we have, as $n \in \mathcal{S}$, that $\sum_{i=1}^n f_i \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$. Hence using [theorem: 21.392] it follows that

$$\sum_{i=1}^{n+1} f_i = \sum_{i=1}^n f_i + f_{n+1} \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

and

$$\begin{aligned} \left\| \sum_{i=1}^{n+1} f_i \right\|_p &= \left\| \sum_{i=1}^n f_i + f_{n+1} \right\|_p \\ &\stackrel{[\text{theorem: 21.402}]}{\leq} \left\| \sum_{i=1}^n f_i \right\|_p + \|f_{n+1}\|_p \\ &\leq_{n \in \mathcal{S}} \sum_{i=1}^n \|f_i\|_p + \|f_{n+1}\|_p \\ &= \sum_{i=1}^{n+1} \|f_i\|_p \end{aligned}$$

proving that $n+1 \in \mathcal{S}$. $\square$

We are now ready to prove that $\langle \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}], \|\cdot\|_p \rangle$ is a pseudo normed space.

Theorem 21.405. *Let $p \in [1, \dots, \infty]$ and $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $\langle \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}], \|\cdot\|_p \rangle$ is a pseudo normed vectorspace over $\mathbb{K}$.*

Note 21.406. *Using [theorem: 21.392] we have that $\langle \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot \rangle$ is a vector space.*

Note 21.407. *If $A \in \mathcal{A}$ such that $\mu(A) = 0$ and $A \neq \emptyset$. As $A \neq \emptyset$ there exist a $a \in A$ so that $\mathcal{X}_{X,A}(a) \neq C_0(a)$ which proves that in this case $\mathcal{X}_{X,A} \neq C_0$. Further using [example: 21.301] we have $0 = \mu(A) = \int^+ \mathcal{X}_{X,A} d\mu = \int \mathcal{X}_{X,A} d\mu = (\int (\mathcal{X}_{X,A})^1 d\mu)^{\frac{1}{1}} = \|\mathcal{X}_{X,A}\|_1$. Hence it follows that in this case $\|\cdot\|_1$ is only a pseudo norm not a norm.*

Proof. By [definitions: 21.394, 21.399] we have that

$$\|\cdot\|_p: \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \rightarrow [0, \infty[\quad (21.628)$$

Further we have using the Minkowski's Inequality [see theorem: 21.402] that

$$\forall f, g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}] \quad \|f + g\|_p \leq \|f\|_p + \|g\|_p \quad (21.629)$$

Let $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}]$ and $\alpha \in \mathbb{K}$. For $p \in [1, \infty]$ we have either:

$p \in [1, \infty[$. Then

$$\begin{aligned} \|\alpha \cdot f\|_p &= \left(\int |\alpha \cdot f|^p d\mu \right)^{\frac{1}{p}} \\ &= \left(\int (|\alpha| \cdot |f|)^p d\mu \right)^{\frac{1}{p}} \\ &\stackrel{[\text{theorem: 19.42}]}{=} \left(\int (|\alpha|^p \cdot |f|^p) d\mu \right)^{\frac{1}{p}} \\ &\stackrel{[\text{theorem: 21.339}]}{=} \left(|\alpha|^p \cdot \int |f|^p d\mu \right)^{\frac{1}{p}} \\ &\stackrel{[\text{theorem: 19.42}]}{=} (|\alpha|^p)^{\frac{1}{p}} \cdot \left(\int |f|^p d\mu \right)^{\frac{1}{p}} \\ &\stackrel{[\text{theorem: 19.42}]}{=} |\alpha| \cdot \left(\int |f|^p d\mu \right)^{\frac{1}{p}} \\ &= |\alpha| \cdot \|f\|_p \end{aligned}$$

proving that

$$\|\alpha \cdot f\|_p = |\alpha| \cdot \|f\|_p$$

$p = \infty$. For $\alpha \in \mathbb{K}$ we have either:

$\alpha = 0$. As $\{x \in X \mid |\alpha \cdot f|(x) > 0\} = \emptyset$ [for if $|\alpha \cdot f|(x) > M$ then we have $0 = |\alpha \cdot f(x)| = |\alpha \cdot f|(x) > M \geq 0$ a contradiction] we have by [example: 21.397] that

$\{x \in X \mid |\alpha \cdot f|(x) > 0\}$ is locally μ -null

So that $0 \in \{M \in [0, \infty[\mid \{x \in X \mid |\alpha \cdot f|(x) > 0\} \text{ is locally } \mu\text{-null}\}$ hence

$$0 \leq \|\alpha \cdot f\|_\infty = \inf(\{M \in [0, \infty[\mid \{x \in X \mid |\alpha \cdot f|(x) > 0\} \text{ is locally } \mu\text{-null}\}) \leq 0$$

which proves that

$$\|\alpha \cdot f\|_\infty = 0 = |\alpha| \cdot \|f\|_\infty$$

$\alpha \neq 0$. Let $M \in [0, \infty[$ then we have

$$\begin{aligned} x \in \{x \in X \mid |(\alpha \cdot f)(x)| > M\} &\Leftrightarrow |\alpha \cdot f(x)| > M \\ &\Leftrightarrow |\alpha| \cdot |f(x)| > M \\ &\stackrel{|\alpha| \neq 0}{\Leftrightarrow} |f(x)| > \frac{M}{|\alpha|} \\ &\Leftrightarrow x \in \left\{x \in X \mid |f(x)| > \frac{M}{|\alpha|}\right\} \end{aligned}$$

proving that

$$\{x \in X \mid |(\alpha \cdot f)(x)| > M\} = \left\{x \in X \mid |f(x)| > \frac{M}{|\alpha|}\right\} \quad (21.630)$$

Define

$$\begin{aligned} A &= \{M \in [0, \infty[\mid \{x \in X \mid |\alpha \cdot f(x)| > M\} \text{ is locally } \mu\text{-null}\} \\ B &= \{M \in [0, \infty[\mid \{x \in X \mid |f(x)| > M\} \text{ is locally } \mu\text{-null}\} \end{aligned}$$

If $M \in A$ then $\{x \in X \mid |\alpha \cdot f(x)| > M\}$ is locally μ -null and using [eq: 21.630] we have that $\left\{x \in X \mid |f(x)| > \frac{M}{|\alpha|}\right\}$ is locally μ -null. Hence $M' = \frac{M}{|\alpha|} \in B$ or $M \in \{|\alpha| \cdot M' \mid M' \in B\}$ giving

$$A \subseteq \{|\alpha| \cdot M' \mid M' \in B\} \quad (21.631)$$

On the other side, if $M \in \{|\alpha| \cdot M' \mid M' \in B\}$ there exists a $M' \in B$ such that $M = |\alpha| \cdot M'$ or $\frac{M}{|\alpha|} = M' \in B$ hence $\left\{x \in X \mid |f(x)| > \frac{M}{|\alpha|}\right\}$ is locally μ -null. Using [eq: 21.630] we have then that $\{x \in X \mid |(\alpha \cdot f)(x)| > M\}$ is locally μ -null or $M \in A$, proving that $\{|\alpha| \cdot M' \mid M' \in B\} \subseteq A$. Combining this with [eq: 21.631] proves that

$$A = \{|\alpha| \cdot M' \mid M' \in B\} \quad (21.632)$$

As $\|\alpha \cdot f\|_\infty \stackrel{\text{def}}{=} \inf(A)$ we have by [eq: 21.632] that $\forall M \in B$ $\|\alpha \cdot f\|_\infty \leq |\alpha| \cdot M$ so that $\frac{\|\alpha \cdot f\|_\infty}{|\alpha|} \leq M$ hence $\frac{\|\alpha \cdot f\|_\infty}{|\alpha|} \leq \inf(B) = \|f\|_\infty$ or

$$\|\alpha \cdot f\|_\infty \leq |\alpha| \cdot \|f\|_\infty \quad (21.633)$$

Further if $M \in \{|\alpha| \cdot M' \mid M' \in B\}$ then $M = |\alpha| \cdot M'$ where $M' \in B$ so that $\frac{M}{|\alpha|} = M' \in B$ hence $\|f\|_\infty = \inf(B) \leq \frac{M}{|\alpha|}$ or $|\alpha| \cdot \|f\|_\infty \leq M$ so that

$$|\alpha| \cdot \|f\|_\infty \leq \inf(\{|\alpha| \cdot M' \mid M' \in B\}) \stackrel{[\text{eq: 21.632}]}{=} \inf(A) = \|\alpha \cdot f\|_\infty$$

which combined with [eq: 21.633] proves that

$$\|\alpha \cdot f\|_p = \|\alpha \cdot f\|_\infty = |\alpha| \cdot \|f\|_\infty = |\alpha| \cdot \|f\|_p \quad \square$$

It would be nice that $\|\cdot\|_p$ is actually a norm. To do this we consider first the sub space of $\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}]$ consisted of functions f with $\|f\|_p = 0$ and use this sub space to construct the factor space [see theorem: 11.76]. This will allows us to define a norm on this factor space based on the pseudo norm.

Definition 21.408. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $p \in [1, \infty]$ then we define the **p -null set** $\mathcal{N}^p$ by

$$\mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}] = \{f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \mid \|f\|_p = 0\}$$

We have the following equivalences of p -null sets.

Theorem 21.409. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then we have

1. If $p \in [1, \infty[$ then

$$f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}] \Leftrightarrow f \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \text{ and } f = 0 \text{ } \mu\text{-a.e.}$$

2. If $p = \infty$ then

$$f \in \mathcal{N}^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \Leftrightarrow f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \text{ and } \{x \in X \mid f(x) \neq 0\} \text{ is locally } \mu\text{-null}$$

Proof.

1. First if $p \in [1, \infty[$ then

$$\begin{aligned} x \in \{x \in X \mid f(x) \neq 0\} &\Leftrightarrow f(x) \neq 0 \\ &\Leftrightarrow |f(x)| \neq 0 \\ &\stackrel{|| \text{ is a norm}}{\Leftrightarrow} |f(x)|^p \neq 0 \\ &\stackrel{[\text{theorem: 19.42}]}{\Leftrightarrow} x \in \{x \in X \mid |f(x)|^p \neq 0\} \end{aligned}$$

which proves that

$$\forall p \in [1, \infty[\text{ we have } \{x \in X \mid f(x) \neq 0\} = \{x \in X \mid |f(x)|^p \neq 0\} \quad (21.634)$$

$\Rightarrow$. As $f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ we have that $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ and $\|f\|_p = 0$. Hence $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ and by [theorem: 21.395] $f = 0$ μ -a.e..

$\Leftarrow$. If $f = 0$ μ -a.e. then there exist a $N \in \mathcal{A}$ with $\mu(N) = 0$ such that $\{x \in X \mid f(x) \neq 0\} \subseteq N$, using [eq: 21.634] we have $\{x \in X \mid |f(x)|^p \neq 0\} \subseteq N$ so that

$$|f|^p = 0 \text{ } \mu\text{-a.e.}$$

As $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ we have by the above, $f(X) \subseteq \mathbb{K} \Rightarrow |f|^p(X) \subseteq \mathbb{R}$ and [theorem: 21.337] that

$$|f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ and } \int |f|^p d\mu = 0 \Rightarrow \|f\|_p = \left(\int |f|^p d\mu \right)^{\frac{1}{p}} \stackrel{[\text{theorem: 19.42}]}{=} 0$$

so that $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ and $\|f\|_p = 0$ which proves that

$$f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

2. First we have

$$\begin{aligned} x \in \{x \in X \mid |f(x)| \neq 0\} &\Leftrightarrow |f(x)| \neq 0 \\ &\stackrel{0 \leq |f(x)|}{\Leftrightarrow} |f(x)| > 0 \\ &\Leftrightarrow \{x \in X \mid |f(x)| > 0\} \end{aligned}$$

so that

$$\{x \in X \mid |f(x)| \neq 0\} = \{x \in X \mid |f(x)| > 0\} \quad (21.635)$$

$\Rightarrow$. As $f \in \mathcal{N}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ we have that

$$f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$$

and $\|f\|_\infty = 0$. Using [lemma: 21.400] it follows that $\{x \in X \mid |f(x)| > \|f\|_\infty\}$ is locally μ -null. As $\|f\|_\infty = 0$ it follows then that $\{x \in X \mid |f(x)| > 0\}$ is locally μ -null or as $\{x \in X \mid |f(x)| \neq 0\} \stackrel{[\text{eq: 21.635}]}{=} \{x \in X \mid |f(x)| > 0\}$ it follows that

$$\{x \in X \mid |f(x)| > 0\} \text{ is locally } \mu\text{-null}$$

$\Leftarrow$. As $\{x \in X \mid f(x) \neq 0\}$ is locally μ -null we have by [eq: 21.635] $\{x \in X \mid |f(x)| > 0\}$ is locally μ -null. Hence

$$0 \in \{M \in [0, \infty[\mid \{x \in X \mid |f(x)| > M\} \text{ is locally } \mu\text{-null}\}$$

so that $0 \leq \|f\|_\infty = \inf(\{M \in [0, \infty[\mid \{x \in X \mid |f(x)| > M\} \text{ is locally } \mu\text{-null}\}) \leq 0$ which proves that

$$\|f\|_\infty = 0$$

As by the hypothesis $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ it follows from the above that

$$f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

□

We prove now that $\mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ is a sub-space of $\mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}]$.

Theorem 21.410. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $p \in [0, \infty]$ then $\langle \mathcal{N}[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot \rangle$ is a sub-space of $\langle \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot \rangle$*

Proof. As $C_0 \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$, C_0 is the neutral element [see theorem: 21.392] and by [theorem: 21.405] $\| \cdot \|_p$ is a pseudo norm it follows that $\|C_0\|_p = 0$ hence

$$C_0 \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}] \Rightarrow \mathcal{N}[X, \mathcal{A}, \mu, \mathbb{K}] \neq \emptyset$$

If $f, g \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then $\|f\|_p = 0 = \|g\|_p$ so that $\|f + g\|_p \leq \|f\|_p + \|g\|_p = 0$ hence $\|f + g\|_p = 0$. So we have:

$$\forall f, g \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ we have } f + g \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

Further if $\alpha \in \mathbb{K}$, $f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then $\|f\|_p = 0$ so that $\|\alpha \cdot f\|_p = |\alpha| \cdot \|f\|_p = 0$ proving that

$$\forall f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}], \forall \alpha \in \mathbb{K} \text{ we have } \alpha \cdot f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

This concludes the proof that $\langle \mathcal{N}[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot \rangle$ is a sub-space of $\langle \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot \rangle$. $\square$

We use now [theorem: 11.76] to define $L^p[X, \mathcal{A}, \mu, \mathbb{K}]$.

Definition 21.411. *Let $p \in [1, \infty]$ and $\langle X, \mathcal{A}, \mu \rangle$ a measure space then by [theorems: 21.410 and 11.75]*

$$\sim_p \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \times \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ where } f \sim_p g \text{ if } f - g \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

is a equivalence relation. For every $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ we can then define the equivalence class $[f]_p$ by

$$[f]_p = \{g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] | g \sim_p f\} = \{g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] | f - g \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]\}$$

The set $L^p[X, \mathcal{A}, \mu, \mathbb{K}]$ is then defined as the factor space $\mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] / \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ so that by [theorem: 11.76] we have

$$L^p[X, \mathcal{A}, \mu, \mathbb{K}] = \{[x]_p | x \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]\}$$

Using [theorem: 11.76] the following operators are well defined

$$+ : L^p[X, \mathcal{A}, \mu, \mathbb{K}] \times L^p[X, \mathcal{A}, \mu, \mathbb{K}] \rightarrow L^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ by } [f]_p + [g]_p = [f + g]_p$$

$$\cdot : \mathbb{K} \times L^p[X, \mathcal{A}, \mu, \mathbb{K}] \rightarrow L^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ by } \alpha \cdot [f]_p = [\alpha \cdot f]_p$$

and

$$\langle L^p[X, \mathcal{A}, \mu, \mathbb{K}], +, \cdot \rangle \text{ forms a vector space with neutral element } [C_0]_p$$

Next we show that we can define a norm on $L^p[X, \mathcal{A}, \mu, \mathbb{K}]$.

Theorem 21.412. *Let $p \in [0, \infty]$ and $\langle X, \mathcal{A}, \mu \rangle$ a measure space then*

$$\| \cdot \|_{L^p} : L(X, \mathcal{A}, \mu, \mathbb{K}) \rightarrow [0, \infty[\text{ defined by } \|x\|_{L^p} = \|f\| \text{ where } x = [f]_p$$

is a well defined function that defines a norm on $L(X, \mathcal{A}, \mu, \mathbb{K})$ making

$$\langle L^p(X, \mathcal{A}, \mu, \mathbb{K}), \| \cdot \|_{L^p} \rangle \text{ a normed space}$$

Proof. First we must prove that $\| \cdot \|_{L^p}$ is well defined. Let $f \in L^p(X, \mathcal{A}, \mu, \mathbb{K})$ then there exist a $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ such that $x = [f]_p$. Assume that there exist another $g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ such that $x = [g]_p$ then $[f]_p = [g]_p$ so that $f - g \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$. Hence we have that $\|f - g\|_p = 0$ so that

$$\| \|f\|_p - \|g\|_p \| \underset{\text{theorem: 14.87}}{\leq} \|f - g\|_p = 0$$

so that $\|f\|_p = \|g\|_p$. Hence it follows that

$$\| \cdot \|_{L^p} : L(X, \mathcal{A}, \mu, \mathbb{K}) \rightarrow [0, \infty[\text{ defined by } \|x\|_{L^p} = \|f\| \text{ where } x = [f]_p \text{ is well defined} \quad (21.636)$$

Next let $x, y \in L^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then there exist $f, g \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ such that $x = [f]_p$ and $y = [g]_p$ then

$$\begin{aligned} \|x + y\|_{L^p} &= \|[f]_p + [g]_p\|_{L^p} \\ &= \|[f + g]_p\|_{L^p} \\ &= \|f + g\|_p \\ &\leq \|f\|_p + \|g\|_p \\ &= \|[f]_p\|_{L^p} + \|[g]_p\|_{L^p} \\ &= \|x\|_{L^p} + \|y\|_{L^p} \end{aligned}$$

So we have proved that

$$\forall x, y \in L^p[X, \mathcal{A}, \mu, \mathbb{K}] \quad \|x + y\|_{L^p} \leq \|x\|_{L^p} + \|y\|_{L^p} \quad (21.637)$$

Further if $\alpha \in \mathbb{K}$ and $x \in L^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then there exist a $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ such that $x = [f]_p$ so that

$$\begin{aligned} \|\alpha \cdot x\|_{L^p} &= \|\alpha \cdot [f]_p\|_{L^p} \\ &= \|[\alpha \cdot f]_p\|_{L^p} \\ &= \|\alpha \cdot f\|_p \\ &= |\alpha| \cdot \|f\|_p \\ &= |\alpha| \cdot \|[f]_p\|_{L^p} \\ &= |\alpha| \cdot \|x\|_{L^p} \end{aligned}$$

hence we have

$$\forall \alpha \in \mathbb{K}, \forall x \in L^p[X, \mathcal{A}, \mu, \mathbb{K}] \quad \|\alpha \cdot x\|_{L^p} = |\alpha| \cdot \|x\|_{L^p} \quad (21.638)$$

Finally if $x \in L[X, \mathcal{A}, \mu, \mathbb{K}]$ is such that $\|x\|_{L^p} = 0$ then there exist a $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ such that $x = [f]_p$. As $\|f\|_p = \|[f]_p\|_{L^p} = \|x\|_{L^p} = 0$ it follows that $f \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$. As further $C_0 \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ we have that $f - C_0 \in \mathcal{N}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ so that $x = [f]_p = [C_0]_p$ the neutral element in $L^p[X, \mathcal{A}, \mu, \mathbb{K}]$. In other words we have

$$\forall x \in L^p[X, \mathcal{A}, \mu, \mathbb{K}] \text{ with } \|x\|_{L^p} = 0 \text{ we have } x = [C_0]_p \quad (21.639)$$

So by [eqs: 21.636, 21.637, 21.638 and 21.639] it follows that $\|\cdot\|_{L^p}$ is a norm. $\square$

21.5.6.2 The Banach space $\langle L^p[X, \mathcal{A}, \mu, \mathbb{K}], \|\cdot\|_{L^p} \rangle$

We will prove now that the norm $\|\cdot\|_p$ is complete. First we need some lemmas.

Lemma 21.413. *Let $p \in [0, \infty[$ and $\{x_i\}_{i \in \mathbb{N}} \subseteq [0, \infty[$ such that $\lim_{i \rightarrow \infty} x_i$ exist and $\lim_{i \rightarrow \infty} x_i \in \mathbb{R}$ then*

$$\begin{aligned} \lim_{i \rightarrow \infty} (x_i)^p \text{ exists and } \lim_{i \rightarrow \infty} (x_i)^p &= \left(\lim_{i \rightarrow \infty} x_i \right)^p \\ \lim_{i \rightarrow \infty} |x_i|^p \text{ exist and } \lim_{i \rightarrow \infty} |x_i|^p &= \left| \lim_{i \rightarrow \infty} x_i \right|^p \end{aligned}$$

Proof. As $[*]^p: [0, \infty[\rightarrow \mathbb{R}$ defined by $[*]^p(x) = x^p$ is continuous on $[0, \infty[$ [see theorem: 19.51] we have by [theorem: 14.313] that $\lim_{i \rightarrow \infty} (x_i)^p = \lim_{i \rightarrow \infty} (*)^p(x)$ exist and $\lim_{i \rightarrow \infty} (x_i)^p = \lim_{i \rightarrow \infty} (*)^p(x) = (*)^p\left(\lim_{i \rightarrow \infty} x_i\right) = \left(\lim_{i \rightarrow \infty} x_i\right)^p$. In other words

$$\forall \{x_i\}_{i \in \mathbb{N}} \subseteq [0, \infty[\text{ we have } \lim_{i \rightarrow \infty} (x_i)^p \text{ exists and } \lim_{i \rightarrow \infty} (x_i)^p = \left(\lim_{i \rightarrow \infty} x_i\right)^p \quad (21.640)$$

Further as $\lim_{i \rightarrow \infty} x_i$ exist and $\lim_{i \rightarrow \infty} x_i \in \mathbb{R}$ it follows from [theorem: 14.316] that for $\{|x_i|\}_{i \in \mathbb{N}} \subseteq [0, \infty[$ $\lim_{i \rightarrow \infty} |x_i|$ exist and $\lim_{i \rightarrow \infty} |x_i| = \left| \lim_{i \rightarrow \infty} x_i \right|$. Using then [eq: 21.640] it follows that

$$\lim_{i \rightarrow \infty} |x_i|^p \text{ exist and } \lim_{i \rightarrow \infty} |x_i|^p = \left(\left| \lim_{i \rightarrow \infty} x_i \right| \right)^p = \left| \lim_{i \rightarrow \infty} x_i \right|^p \quad \square$$

We extend now the above lemma to limits that can be finite or infinite. First we need to extend the power function to the infinite case.

Definition 21.414. Let $p \in \mathbb{R}$ then we define for $x \in [0, \infty]$ $x^{[p]} \in [0, \infty]$ by

$$x^{[p]} = \begin{cases} x^p & \text{if } x \in [0, \infty[\\ \infty & \text{if } x = \infty \end{cases}$$

We show now this extension is monotone.

Lemma 21.415. Let $p \in [1, \infty[$ then for $x, y \in [0, \infty]$ with $x \leq y$ we have that $x^{[p]} \leq y^{[p]}$

Proof. Let $x, y \in [0, \infty]$ with $x \leq y$ then for x we have either:

$x \in [0, \infty[$. Then we have for y either

$y \in [0, \infty[$. Then by [theorem: 19.42] we have that $x^{[p]} = x^p \leq y^p = y^{[p]}$.

$y = \infty$. Then $x^{[p]} \leq \infty = \infty^{[p]} = y^{[p]}$.

$x = \infty$. Then we must have that $y = \infty$ from which it follows that $x^{[p]} = \infty^{[p]} = y^{[p]}$

So in all cases we have

$$x^{[p]} \leq y^{[p]} \quad \square$$

Lemma 21.416. Let $p \in [1, \infty[$ and $\{x_i\}_{i \in \mathbb{N}} \subseteq [0, \infty[$ be such that $\forall i \in \mathbb{N}$ we have $x_i \leq x_{i+1}$ then we have

$$\lim_{i \rightarrow \infty} x_i \text{ and } \lim_{i \rightarrow \infty} (x_i)^{[p]} \text{ exists where } \lim_{i \rightarrow \infty} x_i, \lim_{i \rightarrow \infty} (x_i)^{[p]} \in [0, \infty]$$

and

$$\sup(\{(x_i)^{[p]} | i \in \mathbb{N}_0\}) = \lim_{i \rightarrow \infty} (x_i)^{[p]} = \left(\lim_{i \rightarrow \infty} x_i \right)^{[p]} = (\sup(\{x_i | i \in \mathbb{N}_0\}))^{[p]}$$

Proof. As $\forall i \in \mathbb{N}$ we have $0 \leq x_i \leq x_{i+1}$ it follow from [lemma: 21.415] that $0 \leq (x_i)^{[p]} \leq (x_{i+1})^{[p]}$. Using then [theorems: 20.91, 20.84] it follows that

$$\lim_{i \rightarrow \infty} x_i \text{ and } \lim_{i \rightarrow \infty} (x_i)^p \text{ exists} \quad (21.641)$$

$$0 \leq \lim_{i \rightarrow \infty} x_i = \sup(\{x_i | i \in \mathbb{N}\}) \wedge 0 \leq \lim_{i \rightarrow \infty} (x_i)^{[p]} = \sup(\{(x_i)^{[p]} | i \in \mathbb{N}\}) \quad (21.642)$$

Let $i \in \mathbb{N}$ then for $\lim_{i \rightarrow \infty} x_i \in [0, \infty]$ we have either:

$\lim_{i \rightarrow \infty} x_i = \infty$. Then $(x_i)^{[p]} \leq \infty = \infty^{[p]} = \left(\lim_{i \rightarrow \infty} x_i \right)^{[p]}$ so that $(x_i)^{[p]} \leq \left(\lim_{i \rightarrow \infty} x_i \right)^{[p]}$

$\lim_{i \rightarrow \infty} x_i < \infty$. Then $x_i, \lim_{i \rightarrow \infty} x_i \in [0, \infty[$ and $x_i \leq \sup(\{x_i | i \in \mathbb{N}\}) = \lim_{i \rightarrow \infty} x_i$ so that by [theorem: 19.42] $(x_i)^{[p]} = (x_i)^p \leq \left(\lim_{i \rightarrow \infty} x_i \right)^p = \left(\lim_{i \rightarrow \infty} x_i \right)^{[p]}$

so that $\left(\lim_{i \rightarrow \infty} x_i \right)^{[p]}$ is a upper bound of $\{(x_i)^{[p]} | i \in \mathbb{N}\}$. Hence we have that

$$\lim_{i \rightarrow \infty} (x_i)^{[p]} \stackrel{[\text{eq: 21.642}]}{=} \sup(\{(x_i)^{[p]} | i \in \mathbb{N}\}) \leq \left(\lim_{i \rightarrow \infty} x_i \right)^{[p]} \quad (21.643)$$

Now for the opposite equation. For $\lim_{i \rightarrow \infty} (x_i)^{[p]} \in$ we have either:

$\lim_{i \rightarrow \infty} (x_i)^{[p]} = \infty$. Then $\infty = \lim_{i \rightarrow \infty} (x_i)^{[p]} \stackrel{[\text{eq: 21.643}]}{\leq} \left(\lim_{i \rightarrow \infty} x_i \right)^{[p]} \leq \infty$ so that

$$\lim_{i \rightarrow \infty} (x_i)^{[p]} = \left(\lim_{i \rightarrow \infty} x_i \right)^{[p]}$$

$\lim_{i \rightarrow \infty} (x_i)^{[p]} \neq \infty$. Let $i \in \mathbb{N}$ then we have $(x_i)^{[p]} \stackrel{[\text{definition: 19.39}]}{=} x_i^p \in [0, \infty[$ and

$$(x_i)^{[p]} \leq \sup(\{(x_i)^{[p]} | i \in \mathbb{N}\}) = \lim_{i \rightarrow \infty} (x_i)^{[p]} \in [0, \infty[$$

it follows from [theorem: 19.42] that $x_i = ((x_i)^p)^{\frac{1}{p}} \leq \left(\lim_{i \rightarrow \infty} (x_i)^{[p]} \right)^{\frac{1}{p}}$. Hence $\left(\lim_{i \rightarrow \infty} (x_i)^{[p]} \right)^{\frac{1}{p}}$ is an upper bound for $\{x_i | i \in \mathbb{N}\}$. So that $\lim_{i \rightarrow \infty} x_i \stackrel{[\text{eq: 21.642}]}{=} \sup(\{x_i | i \in \mathbb{N}\}) \leq \left(\lim_{i \rightarrow \infty} (x_i)^{[p]} \right)^{\frac{1}{p}} < \infty$. Hence using [theorem: 19.39] again we have that

$$\left(\lim_{i \rightarrow \infty} x_i \right)^p \leq \left(\left(\lim_{i \rightarrow \infty} (x_i)^{[p]} \right)^{\frac{1}{p}} \right)^p \stackrel{[\text{theorem: 19.42}]}{=} \lim_{i \rightarrow \infty} (x_i)^{[p]}$$

which combined with [eq: 21.643] gives

$$\lim_{i \rightarrow \infty} (x_i)^{[p]} = \left(\lim_{i \rightarrow \infty} x_i \right)^{[p]}$$

So in all cases we have

$$\sup(\{(x_i)^{[p]} | i \in \mathbb{N}\}) \stackrel{[\text{eq: 21.642}]}{=} \lim_{i \rightarrow \infty} (x_i)^{[p]} = \left(\lim_{i \rightarrow \infty} x_i \right)^{[p]} = (\sup(\{x_i | i \in \mathbb{N}\}))^{[p]} \quad \square$$

Lemma 21.417. Let $p \in [1, \infty]$, $\langle X, \mathcal{A}, \mu \rangle$ be measure space and $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ then we have $\|f\|_p = \| |f| \|_p$

Note 21.418. Using [theorem: 21.393] $|f| \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ as is required in this lemma.

Proof. For p we have either

$p = \infty$. then as $|f| = |(|f|)|$ we have that

$$\begin{aligned} \|f\|_\infty &= \inf(\{M \in [0, \infty] | \{x \in X | |f(x)| > M\} \text{ is locally } \mu\text{-null}\}) \\ &= \inf(\{M \in [0, \infty] | \{x \in X | |(|f|)(x)| > M\} \text{ is locally } \mu\text{-null}\}) \\ &= \|(|f|)\|_\infty \end{aligned}$$

$p \in]1, \infty[$. then as $|f| = |(|f|)|$ we have that

$$\begin{aligned} \|f\|_p &= \left(\int |f|^p \right)^{\frac{1}{p}} \\ &= \left(\int |(|f|)|^p \right)^{\frac{1}{p}} \\ &= \|(|f|)\|_p \end{aligned} \quad \square$$

Lemma 21.419. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $\langle L^\infty[X, \mathcal{A}, \mu, \mathbb{K}], \| \cdot \|_{L^\infty} \rangle$ is a Banach space

Proof. Using [theorem: 21.412] it follows that

$$\langle L^\infty[X, \mathcal{A}, \mu, \mathbb{K}], \| \cdot \|_{L^\infty} \rangle \text{ is a normed space}$$

So the only thing left to prove is that this space is complete. Let $\{f_i\}_{i \in \mathbb{N}} \subseteq L^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ be a Cauchy sequence then there exist a $\{F_i\}_{i \in \mathbb{N}} \subset \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ such that $\forall i \in \mathbb{N} \ f_i = [F_i]_p$. Let $\varepsilon \in \mathbb{R}^+$ then as $\{f_i\}_{i \in \mathbb{N}}$ is Cauchy there exist a $N_\varepsilon \in \mathbb{N}$ such that $\forall n, m \in \{N_\varepsilon, \dots, \infty\}$ we have $\|f_n - f_m\|_{L^\infty} < \varepsilon$. So $\|F_n - F_m\|_\infty = \|[F_n - F_m]\|_{L^\infty} = \|[F_n]_\infty - [F_m]_\infty\|_{L^\infty} = \|f_n - f_m\|_{L^\infty} < \varepsilon$ hence we have proved that

$$\forall \varepsilon \in \mathbb{R}^+ \ \exists N_\varepsilon \in \mathbb{N} \text{ such that } \forall n, m \in \{N_\varepsilon, \dots, \infty\} \text{ we have } \|F_n - F_m\|_\infty < \varepsilon \quad (21.644)$$

Let $n, m \in \mathbb{N}$ then as $F_n, F_m \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ a vector space we have that $F_n - F_m \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ so that by [lemma: 21.400]

$$A_{n,m} = \{x \in X | |F_n(x) - F_m(x)| > \|F_n - F_m\|_\infty\} \text{ is locally } \mu\text{-null} \quad (21.645)$$

Using [theorem: 21.398] it follow that

$$A = \bigcup_{(i,j) \in \mathbb{N} \times \mathbb{N}} A_{i,j} \text{ is locally } \mu\text{-null} \quad (21.646)$$

As $F_n - F_m \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ we have by [definition: 21.390] that $F_n - F_m \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ so that by [theorem: 21.385] $|F_n - F_m| \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ hence $|F_n - F_m|$ is $\mathcal{A}$ -measurable so that by [theorem: 21.242] $A_{n,m} = \{|F_n - F_m| > \|F_n - F_m\|\} \in \mathcal{A}$. As $\mathcal{A}$ is a σ -algebra it follows then that

$$\forall n, m \in \mathbb{N} \quad A_{n,m} \in \mathcal{A} \wedge A = \bigcup_{(i,j) \in \mathbb{N} \times \mathbb{N}} A_{i,j} \in \mathcal{A} \wedge X \setminus A \in \mathcal{A} \quad (21.647)$$

Now

$$\begin{aligned} x \in X \setminus A &\Leftrightarrow \forall n, m \in \mathbb{N} \quad x \notin A_{n,m} = \{x \in X \mid |F_n(x) - F_m(x)| > \|F_n - F_m\|_\infty\} \\ &\Leftrightarrow \forall n, m \in \mathbb{N} \quad |F_n(x) - F_m(x)| \leq \|F_n - F_m\|_\infty \\ &\Leftrightarrow x \in \{x \in X \mid \forall n, m \in \mathbb{N} \text{ we have } |F_n(x) - F_m(x)| \leq \|F_n - F_m\|_\infty\} \end{aligned}$$

so that

$$X \setminus A = \{x \in X \mid \forall n, m \in \mathbb{N} \text{ we have } |F_n(x) - F_m(x)| \leq \|F_n - F_m\|_\infty\} \quad (21.648)$$

Let $x \in X \setminus A$ and take $\varepsilon \in \mathbb{R}^+$ then by [eq: 21.644] there exist a $N_\varepsilon \in \mathbb{N}$ such that $\forall n, m \in \{N_\varepsilon, \dots, \infty\}$ we have $|F_n(x) - F_m(x)| \leq \|F_n - F_m\|_\infty < \varepsilon$ which proves that

$$\forall x \in X \setminus A \quad \{F_n(x)\}_{n \in \mathbb{N}} \subseteq \mathbb{K} \text{ is a Cauchy sequence in } \langle \mathbb{K}, \|\cdot\| \rangle$$

As $\langle \mathbb{K}, \|\cdot\| \rangle$ is complete [see examples: 14.336, 14.339] it follows that

$$\forall x \in X \setminus A \quad \lim_{i \rightarrow \infty} F_i(x) \text{ exist} \quad (21.649)$$

Define

$$F: X \rightarrow \mathbb{K} \text{ by } F(x) = \begin{cases} \lim_{i \rightarrow \infty} F_i(x) & \text{if } x \in X \setminus A \\ 0 & \text{if } x \in A \end{cases} \quad (21.650)$$

As $\forall i \in \mathbb{N} \quad F_i \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}]$ it follows that $F_i \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$, hence using [theorem: 21.260, 21.370] it follows that $\{\mathcal{X}_{X \setminus A} \cdot F_i\}_{i \in \mathbb{N}} \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ hence

$$\{\mathcal{X}_{X \setminus A} \cdot F_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \quad (21.651)$$

Let $x \in X$ then we either:

$$x \in A. \text{ Then } \lim_{i \rightarrow \infty} (\mathcal{X}_{X \setminus A} \cdot f_i)(x) = \lim_{i \rightarrow \infty} 0 = 0 = F(x)$$

$$x \in X \setminus A. \text{ Then } \lim_{i \rightarrow \infty} (\mathcal{X}_{X \setminus A} \cdot f_i)(x) = \lim_{i \rightarrow \infty} f_i(x) = F(x)$$

hence $\forall x \in X$ we have that $\lim_{i \rightarrow \infty} (\mathcal{X}_{X \setminus A} \cdot f)(x)$ exist and $\lim_{i \rightarrow \infty} (\mathcal{X}_{X \setminus A} \cdot f)(x) = F(x)$. Using then [theorems: 21.254, 21.370] together with [eq: 21.651] proves that

$$F \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \quad (21.652)$$

Let $\varepsilon \in \mathbb{R}^+$ and take $x \in X \setminus A$. Let $n \in \{N_\varepsilon, \dots, \infty\}$ [see eq: 21.644 for the definition of N_ε] then by [eq: 21.650] there exist a $N_x \in \mathbb{N}$ such that $\forall m \in [N_x, \dots, \infty]$ we have $|F(x) - F_m(x)| < \frac{\varepsilon}{2}$. Take $N = \max(N_\varepsilon, N_x)$ then we have

$$\begin{aligned} |F(x) - F_n(x)| &= |F(x) - F_N(x) + F_N(x) - F_n(x)| \\ &\leq |F(x) - F_N(x)| + |F_N(x) - F_n(x)| \\ &< \frac{\varepsilon}{2} + |F_N(x) - F_n(x)| \\ &\stackrel{[\text{eq: 21.644}]}{<} \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \\ &= \varepsilon \end{aligned}$$

which proves, if we take $M_\varepsilon = N_\varepsilon$, that

$$\forall \varepsilon \in \mathbb{R}^+ \quad \exists M_\varepsilon \in \mathbb{N} \text{ such that } \forall n \in \{M_\varepsilon, \dots, \infty\} \text{ we have } \forall x \in X \setminus A \text{ that } |F(x) - F_n(x)| < \varepsilon \quad (21.653)$$

As $1 \in \mathbb{R}^+$ we have by the above that $\exists M_1 \in \mathbb{N}$ such that $\forall x \in X \setminus A$ we have $|F(x) - F_{M_1}(x)| < 1$. As $F_{M_1} \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}]$ it follows from [definition: 21.390] that there exist a $M \in \mathbb{R}^+$ such that $\forall x \in X \quad |F_{M_1}(x)| \leq M$. Let $x \in X$ then we have either:

$$x \in X \setminus A. \text{ Then } |F(x)| = |F(x) - F_{M_1}(x) + F_{M_1}(x)| \leq |F(x) - F_{M_1}(x)| + |F_{M_1}(x)| < 1 + M.$$

$x \in A$. Then $|F(x)| = 0 \leq 1 + M$

Hence F is bounded so that by [definition: 21.390] and [eq: 21.652] it follows that

$$F \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \text{ so that } f = [F]_\infty \in L^\infty[X, \mathcal{A}, \mu, \mathbb{K}] \quad (21.654)$$

Let $\varepsilon \in \mathbb{R}^+$. If $n \in \{M_{\varepsilon/2}, \dots, \infty\}$ then $\{x \in X \mid |F(x) - F_n(x)| > \frac{\varepsilon}{2}\} \subseteq A$ [for if $x \in X \setminus A$ we have by [eq: 21.653] that $|F(x) - F_n(x)| < \frac{\varepsilon}{2}$]. As A is locally μ -null [see eq: 21.646] it follows from [theorem: 21.398] that $\{x \in X \mid |F(x) - F_n(x)| > \frac{\varepsilon}{2}\}$ is locally μ -null. So

$$\frac{\varepsilon}{2} \in \{M \in [0, \infty[\mid \{F(x) - F_n(x) > M\} \text{ is locally } \mu\text{-null}\}$$

Hence

$$\|F - F_n\|_\infty = \inf(\{M \in [0, \infty[\mid \{F(x) - F_n(x) > M\} \text{ is locally } \mu\text{-null}\}) \leq \frac{\varepsilon}{2} < \varepsilon$$

Hence we have proved that

$$\forall \varepsilon \in \mathbb{R}^+ \text{ there exist a } N \in \mathbb{N} \text{ such that } \forall n \in \{N, \dots, \infty\} \text{ we have } \|F - F_n\|_\infty < \varepsilon \quad (21.655)$$

Let $n \in \mathbb{N}$ then we have

$$\begin{aligned} \|f - f_n\|_{L^\infty} &\stackrel{[\text{eq: 21.654}]}{=} \|[F]_\infty - [F_n]_\infty\|_{L^\infty} \\ &= \|[F - F_n]_\infty\|_{L^\infty} \\ &= \|F - F_n\|_\infty \end{aligned}$$

which combined with [eq: 21.655] proves that

$$\forall \varepsilon \in \mathbb{R}^+ \exists N \in \mathbb{N} \text{ such that } \forall n \in \{N, \dots, \infty\} \text{ we have } \|f - f_n\|_{L^\infty} < \varepsilon$$

which proves that

$$\lim_{i \rightarrow \infty} f_i \text{ converges in } \langle L^\infty[X, \mathcal{A}, \mu, \mathbb{K}], \|\cdot\|_{L^\infty} \rangle$$

so that

$$\langle L^\infty[X, \mathcal{A}, \mu, \mathbb{K}], \|\cdot\|_{L^\infty} \rangle \text{ is complete} \quad \square$$

Lemma 21.420. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $p \in [1, \infty[$ then $\langle L^p[X, \mathcal{A}, \mu, \mathbb{K}], \|\cdot\|_{L^p} \rangle$ is a Banach space.

Proof. Using [theorem: 21.412] it follows that

$$\langle L^p[X, \mathcal{A}, \mu, \mathbb{K}], \|\cdot\|_{L^p} \rangle \text{ is a normed space}$$

So it remains to prove that $\langle L^p[X, \mathcal{A}, \mu, \mathbb{K}], \|\cdot\|_{L^p} \rangle$ is a Banach space. We use [theorem: 14.382] stating that a normed space is complete if and only if every absolute convergent series is convergent. So let $\{f_i\}_{i \in \mathbb{N}} \subseteq L^p[X, \mathcal{A}, \mu, \mathbb{K}]$ be a absolute convergent series. Then by definition

$$\sum_{i=1}^{\infty} \|f_i\|_{L^p} \text{ converges to a element in } [0, \infty[\subseteq \mathbb{R} \quad (21.656)$$

As $\{f_i\}_{i \in \mathbb{N}} \subseteq L^p[X, \mathcal{A}, \mu, \mathbb{K}]$ there exist a $\{F_i\}_{i \in \mathbb{N}} \subseteq \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ such that

$$\forall i \in \mathbb{N} \quad f_i = [F_i]_p \quad (21.657)$$

As $\{F_i\}_{i \in \mathbb{N}} \subseteq \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ we have using [theorem: 21.393] $\{|F_i|\}_{i \in \mathbb{N}} \subseteq \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$, hence using [theorem: 21.404] that

$$\left\{ \sum_{i=1}^n |F_i| \right\}_{n \in \mathbb{N}} \subseteq \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \quad (21.658)$$

So using the definition of $\mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ [see definition: 21.382] we have that

$$\forall n \in \mathbb{N} \quad \left(\sum_{i=1}^n |F_i| \right)^p = \left| \sum_{i=1}^n |F_i| \right|^p \subseteq \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \quad (21.659)$$

Using [theorem: 21.332] we have that

$$\forall n \in \mathbb{N} \left(\sum_{i=1}^n |F_i| \right)^p \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \wedge \int \left(\sum_{i=1}^n |F_i| \right)^p d\mu = \int^+ \left(\sum_{i=1}^n |F_i| \right)^p d\mu < \infty \quad (21.660)$$

Given $n \in \mathbb{N}$ and $x \in X$ we have that $\sum_{i=1}^n |F_i(x)| \leq \sum_{i=1}^n |F_i(x)| + |F_{n+1}(x)| = \sum_{i=1}^{n+1} |F_i(x)|$ which together with the monotonicity of the power function [see theorem: 19.42] proves that

$$\forall x \in X \text{ we have } \forall n \in \mathbb{N} \text{ that } \sum_{i=1}^n |F_i(x)| \leq \sum_{i=1}^{n+1} |F_i(x)| \wedge \left(\sum_{i=1}^n |F_i(x)| \right)^p \leq \left(\sum_{i=1}^{n+1} |F_i(x)| \right)^p \quad (21.661)$$

Hence using [theorem: 21.416] it follows that $g(x) \stackrel{\text{def}}{=} \left(\lim_{n \rightarrow \infty} \sum_{i=1}^n |F_i(x)| \right)^p = (\sum_{i=1}^{\infty} |F_i(x)|)^p$ is well defined and

$$\forall x \in X g(x) = \left(\sum_{i=1}^{\infty} |F_i(x)| \right)^p = \left(\lim_{n \rightarrow \infty} \sum_{i=1}^n |F_i(x)| \right)^p \stackrel{[\text{lemma: 21.413}]}{=} \lim_{n \rightarrow \infty} \left(\sum_{i=1}^n |F_i(x)| \right)^p \quad (21.662)$$

Using the above together with [eq: 21.660] allows us to use [theorem: 21.254] giving

$$g = \lim_{n \rightarrow \infty} \left(\sum_{i=1}^n |F_i| \right)^p \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.663)$$

The conditions for the Monotone Convergence Theorem [see theorem: 21.351] are now satisfied by [eq: 21.660, 21.661, 21.663], hence we have that

$$\lim_{n \rightarrow \infty} \int^+ \left(\sum_{i=1}^n |F_i| \right)^p d\mu \text{ exist and } \int^+ g d\mu = \lim_{n \rightarrow \infty} \int^+ \left(\sum_{i=1}^n |F_i| \right)^p d\mu \quad (21.664)$$

Further, using the monotonicity of the integral [see theorem: 21.313] on [eq: 21.661] we have

$$\forall n \in \mathbb{N} \int^+ \left(\sum_{i=1}^n |F_i| \right)^p d\mu \leq \int^+ \left(\sum_{i=1}^{n+1} |F_i| \right)^p d\mu \quad (21.665)$$

so that by [theorem: 20.91]

$$\lim_{n \rightarrow \infty} \int^+ \left(\sum_{i=1}^n |F_i| \right)^p d\mu = \sup \left(\left\{ \left(\sum_{i=1}^n |F_i| \right)^p \mid n \in \mathbb{N} \right\} \right) \quad (21.666)$$

Next

$$\begin{aligned} \int^+ \left(\sum_{i=1}^n |F_i| \right)^p d\mu &\stackrel{[\text{eq: 21.660}]}{=} \int \left(\sum_{i=1}^n |F_i| \right)^p d\mu \\ &= \left(\left\| \sum_{i=1}^n |F_i| \right\|_p \right)^p \\ &\stackrel{[\text{theorem: 19.42}], \|\cdot\|_p \text{ is a norm}}{\leq} \left(\sum_{i=1}^n \| |F_i| \|_p \right)^p \\ &\stackrel{[\text{lemma: 21.417}]}{=} \left(\sum_{i=1}^n \| F_i \|_p \right)^p \\ &\stackrel{[\text{theorem: 19.42}]}{\leq} \left(\sup \left(\left\{ \sum_{i=1}^n \| F_i \|_p \mid n \in \mathbb{N} \right\} \right) \right)^p \\ &\stackrel{[\text{definition: 20.94}]}{=} \left(\sum_{i=1}^{\infty} \| F_i \|_p \right)^p \end{aligned}$$

hence

$$\int^+ \left(\sum_{i=1}^n |F_i| \right)^p d\mu \leq \left(\sum_{i=1}^{\infty} \|F_i\|_p \right)^p \quad (21.667)$$

Next

$$\begin{aligned} \int^+ g d\mu & \underset{[\text{eq: 21.664}]}{=} \lim_{n \rightarrow \infty} \int^+ \left(\sum_{i=1}^n |F_i| \right)^p d\mu \\ & \underset{[\text{eq: 21.666}]}{=} \sup \left(\left\{ \int^+ \left(\sum_{i=1}^n |F_i| \right)^p d\mu \mid n \in \mathbb{N} \right\} \right) \\ & \underset{[\text{eq: 21.667}]}{\leq} \left(\sum_{i=1}^{\infty} \|F_i\|_p \right)^p \\ & \underset{[\text{eq: 21.656}]}{<} \infty \end{aligned}$$

which, as also $g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$, proves by [theorem: 21.332] that

$$g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \quad (21.668)$$

Using [theorem: 21.349] it follows from the above that

$$N = \{x \in X \mid |g(x)| = \infty\} \in \mathcal{A} \text{ and } \mu(N) = \mu(\{x \in X \mid |g(x)| = \infty\}) = 0 \quad (21.669)$$

As $g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ [see eq: 21.663] it follows from [theorem: 21.260, 21.370] that $\mathcal{X}_{X \setminus N} \cdot g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$, from the above we have by [theorem: 21.265] that $\mathcal{X}_{X \setminus N} \cdot g = g$ μ -a.e. Finally, as by [eq: 21.668] $g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$, it follows from [theorem: 21.342] that

$$\mathcal{X}_{X \setminus N} \cdot g \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}]$$

Further if $x \in X$ then $(\mathcal{X}_{X \setminus N} \cdot g)(x) = \begin{cases} g(x) \in \mathbb{R} & \text{if } x \in X \setminus N \\ 0 \in \mathbb{R} & \text{if } x \in N \end{cases} \in \mathbb{R}$ so that

$$\mathcal{X}_{X \setminus N} \cdot g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] = \{f \in \mathcal{L}[X, \mathcal{A}, \mu, \overline{\mathbb{R}}] \mid f(X) \subseteq \mathbb{R}\} \quad (21.670)$$

Let $x \in X \setminus N$ then $(\sum_{i=1}^{\infty} |F_i(x)|)^p \underset{[\text{eq: 21.662}]}{=} g(x) \underset{[\text{eq: 21.669}]}{<} \infty$, hence $\sum_{i=1}^{\infty} |F_i(x)| < \infty$ [otherwise we have $(\sum_{i=1}^{\infty} |F_i(x)|)^p = \infty^p \underset{\text{def}}{=} \infty$]. To summarize we have proved that

$$\forall x \in X \setminus N \text{ we have } \sum_{i=1}^{\infty} |F_i(x)| < \infty \quad (21.671)$$

Using Dominant Convergence [see theorem: 14.378] on the above for the Banach space $(\mathbb{C}, \|\cdot\|)$ proves that

$$\forall x \in X \setminus N \sum_{i=1}^{\infty} F_i(x) = \lim_{n \rightarrow \infty} \sum_{i=1}^n F_i(x) \in \mathbb{K} \text{ exist} \quad (21.672)$$

Define now

$$F: X \rightarrow \mathbb{K} \text{ by } F(x) = \begin{cases} \lim_{n \rightarrow \infty} \sum_{i=1}^n F_i(x) & \text{if } x \in X \setminus N \\ 0 & \text{if } x \in N \end{cases} \quad (21.673)$$

As $\{F_i\}_{i \in \mathbb{N}} \subseteq \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \underset{[\text{definition: 21.382}]}{\Rightarrow} \{F_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$, further, using [theorems: 21.260, 21.370], it follows that $\{\mathcal{X}_{X \setminus N} \cdot F_i\}_{i \in \mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$. Hence using [theorems: 21.245, 21.370] it follows that

$$\left\{ \sum_{i=1}^n F_i \right\}_{n \in \mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \text{ and } \left\{ \sum_{i=1}^n (\mathcal{X}_{X \setminus N} \cdot F_i) \right\} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \quad (21.674)$$

If $x \in X$ then

$$\lim_{n \rightarrow \infty} \left(\sum_{i=1}^n (\mathcal{X}_{X \setminus N} \cdot F_i)(x) \right) = \begin{cases} \lim_{n \rightarrow \infty} \sum_{i=1}^n F_i(x) & \text{if } x \in X \setminus N \\ \lim_{i \rightarrow} 0 & \text{if } x \in N \end{cases} = F(x) \quad (21.675)$$

So using [theorems: 21.254, 21.370] on the above it follows that

$$F \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \text{ and by [lemma: 21.385] that } |F|^p \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}] \quad (21.676)$$

Let $n \in \mathbb{N}$ then for $x \in X$ we have either:

$x \in X \setminus N$. Then

$$\begin{aligned} \left| \sum_{i=1}^n F_i(x) \right|^p & \underset{[\text{theorem: 19.42}]}{\leq} \left(\sum_{i=1}^n |F_i(x)| \right)^p \\ & \underset{[\text{theorem: 19.42}]}{\leq} \left(\sup \left(\left\{ \sum_{i=1}^n |F_i(x)| \mid n \in \mathbb{N} \right\} \right) \right)^p \\ & \underset{[\text{definition: 20.94}]}{=} \left(\sum_{i=1}^{\infty} |F_i(x)| \right)^p \\ & \underset{[\text{eq: 21.662}]}{=} g(x) \end{aligned}$$

Next

$$\begin{aligned} |F(x)|^p & \underset{[\text{eq: 21.675}]}{=} \left| \lim_{n \rightarrow \infty} \sum_{i=1}^n F_i(x) \right|^p \\ & \underset{[\text{lemma: 21.413}]}{=} \lim_{n \rightarrow \infty} \left| \sum_{i=1}^n F_i(x) \right|^p \\ & \underset{[\text{theorem: 14.306}]}{\leq} g(x) \\ & = (\mathcal{X}_{X \setminus N} \cdot g)(x) \end{aligned}$$

$$x \in N. \text{ Then } |F(x)|^p \underset{[\text{eq: 21.673}]}{=} 0 \leq 0 = (\mathcal{X}_{X \setminus N} \cdot g)(x)$$

So we have that

$$\forall x \in X \text{ we have } 0 \leq |F(x)|^p \leq (\mathcal{X}_{X \setminus N} \cdot g)(x) \quad (21.677)$$

As $\mathcal{X}_{X \setminus N} \cdot g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ [see eq: 21.670], $|F|^p \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ [see eq: 21.676] it follows from the above and [theorem: 21.343] that

$$|F|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \quad (21.678)$$

which as $F \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ [see eq: 21.676] proves that

$$F \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}] \quad (21.679)$$

Let $x \in X \setminus N$ then given $\varepsilon \in \mathbb{R}^+$ we have, as $F(x) \underset{[\text{eq: 21.673}]}{=} \lim_{n \rightarrow \infty} \sum_{i=1}^n F_i(x)$, that by [theorem: 14.295] $\lim_{n \rightarrow \infty} |F(x) - \sum_{i=1}^n F_i(x)| = 0$. So using [lemma: 21.413]

$$\lim_{n \rightarrow \infty} \left| F(x) - \sum_{i=1}^n F_i(x) \right|^p = \left| \lim_{n \rightarrow \infty} \left(F(x) - \sum_{i=1}^n F_i(x) \right) \right|^p = 0^p \underset{p \neq 1}{=} 0.$$

As $\mu(N) = 0$ it follows

$$\lim_{n \rightarrow \infty} \left| F - \sum_{i=1}^n F_i \right|^p = C_0 \text{ } \mu\text{-a.e.} \quad (21.680)$$

Further, as $F, \sum_{i=1}^n F_i \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$ [see eqs: 21.674, 21.676] it follows from [theorems: 21.251, 21.370] that $\{F - \sum_{i=1}^n F_i\}_{n \in \mathbb{N}} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$, applying then [theorem: 21.385] gives

$$\left\{ \left| F - \sum_{i=1}^n F_i \right|^p \right\}_{n \in \mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \quad (21.681)$$

If $x \in X \setminus N$ then given $n \in \mathbb{N}$ we have

$$\begin{aligned} \left| F(x) - \sum_{i=1}^n F_i(x) \right| & \stackrel{[\text{eq: 21.673}]}{=} \left| \sum_{i=1}^{\infty} F_i(x) - \sum_{i=1}^n F_i(x) \right| \\ & \stackrel{[\text{theorem: 14.358}]}{=} \left| \sum_{i=n+1}^{\infty} F_i(x) \right| \\ & \stackrel{[\text{eq: 21.671}] \wedge [\text{theorem: 14.380}]}{\leq} \sum_{i=n+1}^{\infty} |F_i(x)| \\ & \leq \sum_{i=1}^{\infty} |F_i(x)| \end{aligned}$$

Hence using [theorem: 19.42] $|F(x) - \sum_{i=1}^n F_i(x)|^p \leq (\sum_{i=1}^{\infty} |F_i(x)|)^p \stackrel{[\text{eq: 21.662}]}{=} g(x)$. As $\mu(N) = 0$ it follows that

$$\forall n \in \mathbb{N} \text{ we have } \left| F - \sum_{i=1}^n F_i \right|^p \leq g \text{ } \mu\text{-a.e.} \quad (21.682)$$

So all the conditions for the Lebesgue Dominant Convergence Theorem [see theorem: 21.361] are satisfied [see eqs: 21.668, 21.663, 21.681, 21.680 and 21.682], hence we have that

$$\lim_{n \rightarrow \infty} \int \left| F - \sum_{i=1}^n F_i \right|^p d\mu = \int \left(\lim_{n \rightarrow \infty} \left| F - \sum_{i=1}^n F_i \right|^p \right) d\mu \stackrel{[\text{eq: 21.680}]}{=} \int C_0 d\mu \stackrel{[\text{example: 21.329}]}{=} 0$$

proving

$$\lim_{n \rightarrow \infty} \left(\left\| F - \sum_{i=1}^n F_i \right\|_p \right)^p = 0$$

Using [lemma: 21.413] it follows then that

$$\lim_{n \rightarrow \infty} \left(\left(\left\| F - \sum_{i=1}^n F_i \right\|_p \right)^p \right)^{1/p} \text{ exist and } \lim_{n \rightarrow \infty} \left(\left(\left\| F - \sum_{i=1}^n F_i \right\|_p \right)^p \right)^{1/p} = 0^{1/p} = 0$$

which proves that

$$\lim_{n \rightarrow \infty} \left\| F - \sum_{i=1}^n F_i \right\|_p = 0 \quad (21.683)$$

As $F \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{K}]$ [see 21.679] we have $[F]_p \in L^p[X, \mathcal{A}, \mu, \mathbb{K}]$. Let $n \in \mathbb{N}$ then we have

$$\begin{aligned} \left\| [F]_p - \sum_{i=1}^n f_i \right\|_{L^p} &= \left\| [F]_p - \sum_{i=1}^n [F_i]_p \right\|_{L^p} \\ &= \left\| \left[F - \sum_{i=1}^n F_i \right]_p \right\|_{L^p} \\ &= \left\| F - \sum_{i=1}^n F_i \right\|_p \end{aligned}$$

so that by [eq: 21.683] we have that $\lim_{n \rightarrow \infty} \|[F]_p - \sum_{i=1}^n f_i\|_{L^p} = 0$. Hence using [theorem: 14.295] it follows that

$$\sum_{i=1}^{\infty} f_i \text{ converges and } \sum_{i=1}^n f_i = [F]_p \in L^p[X, \mathcal{A}, \mu, \mathbb{K}]$$

In other words we have proved that every absolute convergent series converges which by [theorem: 14.382] proves that

$$\langle L^p[X, \mathcal{A}, \mu, \mathbb{K}], \|\cdot\|_p \rangle \text{ is a Banach space} \quad \square$$

Summarizing the previous lemma's we have

Theorem 21.421. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $p \in [1, \infty]$ then $\langle L^p[X, \mathcal{A}, \mu, \mathbb{K}], \|\cdot\|_{L^p} \rangle$ is a Banach space.*

Proof. This follows from [lemma: 21.419] and [lemma: 21.420]. $\square$

21.5.6.3 Density

We show now that $\mathcal{S}[X, \mathcal{A}]$ is dense in $\mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ [see theorem: 14.111]. First we prove this for the case where $p \in [1, \infty[$.

Theorem 21.422. *Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $p \in [1, \infty[$ and $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ then $\forall \varepsilon \in \mathbb{R}^+$ there exist $g \in \mathcal{S}[X, \mathcal{A}] \cap \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ such that $\|f - g\|_p < \varepsilon$.*

Proof. If $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ then $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ so that using [theorem: 21.323] we have $f^+, f^- \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$. Using [theorem: 21.307] there exists $\{h_n\}_{n \in \mathbb{N}}, \{g_n\}_{n \in \mathbb{N}} \subseteq \mathcal{S}^+[X, \mathcal{A}]$ such that

$$\forall x \in X \text{ we have } \forall n \in \mathbb{N} \text{ that } h_n(x) \leq h_{n+1}(x) \wedge g_n(x) \leq g_{n+1}(x) \quad (21.684)$$

and

$$f^+ = \lim_{n \rightarrow \infty} h_n \underset{\text{[theorem: 20.91]}}{=} \sup(\{h_n | n \in \mathbb{N}\}) \wedge f^- = \lim_{n \rightarrow \infty} g_n \underset{\text{[theorem: 20.91]}}{=} \sup(\{g_n | n \in \mathbb{N}\}) \quad (21.685)$$

Define now

$$\{f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{S}[X, \mathcal{A}] \underset{\text{[definition: 21.275]}}{\subseteq} \mathcal{M}[X, \mathcal{A}, \mathbb{R}] \text{ by } f_n = h_n - g_n \underset{\text{[theorem: 21.279]}}{\in} \mathcal{S}[X, \mathcal{A}]$$

Given $x \in X$ we have $\forall n \in \mathbb{N}$

$$\begin{aligned} |f_n(x)| &\leq |(h_n - g_n)(x)| \\ &\leq |h_n(x)| + |g_n(x)| \\ &\underset{0 \leq h_n(x), g_n(x)}{=} h_n(x) + g_n(x) \\ &\underset{\text{[eq: 21.685]}}{\leq} f^+(x) + f^-(x) \\ &\underset{\text{[theorem: 21.322]}}{=} |f(x)| \end{aligned}$$

So we can use [lemma: 21.386] giving

$$f_n \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}] \underset{f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]}{\Rightarrow} f_n - f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}] \quad (21.686)$$

Hence we have by definition

$$\forall n \in \mathbb{N} \quad |f_n - f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \Rightarrow |f_n - f|^p \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \quad (21.687)$$

Further we have

$$\begin{aligned} |f_n(x) - f(x)| &= |h_n(x) - g_n(x) - f(x)| \\ &\underset{\text{[eq: 21.322]}}{=} |h_n(x) - g_n(x) - (f^+(x) - f^-(x))| \\ &\leq |h_n(x) - f^+(x)| + |g_n(x) - f^-(x)| \\ &\underset{\text{[eq: 21.685]}}{=} f^+(x) - h_n(x) + f^-(x) - g_n(x) \\ &\underset{0 \leq h_n(x), g_n(x)}{\leq} f^+(x) + f^-(x) \\ &\underset{\text{[theorem: 21.322]}}{=} |f(x)| \end{aligned}$$

which, as the power function is monotone [see theorem: 19.42], results in

$$\forall x \in X \text{ we have } \forall n \in \mathbb{N} \text{ that } |(f_n - f)(x)|^p \leq |f(x)|^p \quad (21.688)$$

Let $x \in X$ then as $f(x) \in \mathbb{R}$ we have that $f^+(x), f^-(x) \in \mathbb{R}$ so that by [eq: 21.685] $\lim_{n \rightarrow \infty} h_n(x) \in \mathbb{R}$ and $\lim_{n \rightarrow \infty} g_n(x) \in \mathbb{R}$ so that

$$\begin{aligned} \lim_{n \rightarrow \infty} f_n(x) &= \lim_{n \rightarrow \infty} (h_n(x) - g_n(x)) \\ &\stackrel{[\text{theorems: 14.303, 14.302}]}{=} \lim_{n \rightarrow \infty} h_n(x) - \lim_{n \rightarrow \infty} g_n(x) \\ &\stackrel{[\text{eq: 21.685}]}{=} f^+(x) - f^-(x) \\ &= f(x) \end{aligned}$$

which, using [theorem: 14.295] proves that $\lim_{n \rightarrow \infty} |f_n(x) - f(x)| = 0$. Using [lemma: 21.413] we have

$$\lim_{n \rightarrow \infty} |(f_n - f)(x)|^p = 0 = C_0(x) \text{ or } \lim_{n \rightarrow \infty} |f_n - f|^p = C_0 \quad (21.689)$$

As $f \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ we have by definition that

$$|f|^p \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \quad (21.690)$$

The conditions for the Lebesgue Dominant Convergence Theorem [theorem: 21.361] are now satisfied by the fact that $C_0 \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ [see example: 21.217] and [eqs: 21.687, 21.688, 21.690]. Hence by applying this theorem we get

$$\lim_{n \rightarrow \infty} \int |f_n - f|^p d\mu = \int \left(\lim_{n \rightarrow \infty} |f_n - f|^p \right) d\mu \stackrel{[\text{eq: 21.689}]}{=} \int C_0 d\mu = 0$$

proving

$$\lim_{n \rightarrow \infty} (\|f_n - f\|_p)^p = 0$$

So given $\varepsilon \in \mathbb{R}^+$ there exist a $N \in \mathbb{N}$ such that $(\|f_N - f\|_p)^p < \varepsilon^p$. Hence using [theorem: 19.42] we have that $\|f_N - f\|_p = ((\|f_N - f\|_p)^p)^{1/p} < (\varepsilon^p)^{1/p} = \varepsilon$. Further we have $f_N \in \mathcal{S}[X, \mathcal{A}]$ and by [eq: 21.686] $f_N \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$. Hence we have proved by taking $g = f_N$ that

$$\forall \varepsilon \in \mathbb{R}^+ \text{ there exist a } g \in \mathcal{S}[X, \mathcal{A}] \cap \mathcal{L}^p(X, \mathcal{A}, \mu, \mathbb{R}) \text{ such that } \|g - f\|_p < \varepsilon \quad \square$$

We have a similar theorem for $p = \infty$, first we need a little lemma.

Lemma 21.423. *Let $a, b \in \mathbb{R}$ with $a \leq b$ then given $\varepsilon \in \mathbb{R}^+$ there exists a $n \in \{2, \dots, \infty\}$ and $\{a_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}$ such that $[a, b] \subseteq \bigcup_{i \in \{1, \dots, n-1\}} [a_i, a_{i+1}[$, $\forall i \in \{1, \dots, n-1\}$ $a_i < a_{i+1}$ and $a_{i+1} - a_i < \varepsilon$.*

Proof. Take $l = b - a$. As $\varepsilon > 0$ we have by [theorem: 10.30] that there exists a $N \in \mathbb{N}$ such that $\frac{2 \cdot l}{\varepsilon} < N$ or $l < N \cdot \frac{\varepsilon}{2}$. Define now $n = N + 1$, so that $n \in \{2, \dots, \infty\}$ and $\forall i \in \{1, \dots, n\}$ $a_i = a + (i-1) \cdot \frac{\varepsilon}{2}$. Then $\forall i \in \{1, \dots, n-1\}$ we have

$$a_i = a + (i-1) \cdot \frac{\varepsilon}{2} < a + i \cdot \frac{\varepsilon}{2} = a_{i+1}$$

and

$$a_{i+1} - a_i = a + i \cdot \frac{\varepsilon}{2} - a - (i-1) \cdot \frac{\varepsilon}{2} = \frac{\varepsilon}{2} < \varepsilon$$

Further $a_1 = a$ and $a_n = a + (n-1) \cdot \frac{\varepsilon}{2} = a + N \cdot \frac{\varepsilon}{2} > a + l = b$ so that

$$b < a_n$$

Given $x \in [a, b]$ then $a \leq x \leq b$, define $I_x = \{i \in \{1, \dots, n-1\} | a_i \leq x\}$. Then as $a_1 = a \leq x$ we have that the finite set I_x is not empty so that $m = \max(I_x)$ is well defined. We have now two cases to consider:

$m = n - 1$. Then $a_{n-1} \leq x$ and as $x \leq b < a_n$ it follows that $x \in [a_{n-1}, a_n[= [a_m, a_{m+1}[$

$m < n - 1$. Then $a_m \leq x$ and as $m + 1 \leq n - 1$ we must have $x < a_{m+1}$ proving that $x \in [a_m, a_{m+1}[$. So we conclude that $x \in \bigcup_{i \in \{1, \dots, n-1\}} [a_i, a_{i+1}[$ or that

$$[a, b] \subseteq \bigcup_{i \in \{1, \dots, n-1\}} [a_i, a_{i+1}[\quad \square$$

Theorem 21.424. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ then $\forall \varepsilon \in \mathbb{R}^+$ there exist a $g \in \mathcal{S}[X, \mathcal{A}]$ such that $\|f - g\| < \varepsilon$.

Proof. Let $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ and take $\varepsilon \in \mathbb{R}^+$. Using [lemma: 21.423] there exists a $n \in \{2, \dots, \infty\}$ and a family $\{a_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}$ with

$$]-\|f\|_\infty, \|f\|_\infty] \subseteq \bigcup_{i \in \{1, \dots, n-1\}} [a_i, a_{i+1}[\text{ and } \forall i \in \{1, \dots, n-1\} \ a_i < a_{i+1} \wedge a_{i+1} - a_i < \frac{\varepsilon}{2} \quad (21.691)$$

Let $i \in \{1, \dots, n-1\}$ then we have that $[a_i, a_{i+1}[\in \mathcal{I} \subseteq \sigma[\mathcal{I}] \stackrel{[\text{theorem: 21.52}]}{=} \mathcal{B}[\mathbb{R}] \stackrel{[\text{theorem: 21.58}]}{\subseteq} \mathcal{B}[\overline{\mathbb{R}}]$. As $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ so that $f^{-1}([a_i, a_{i+1}[) \in \mathcal{A}$. Hence we can define

$$\{A_i\}_{i \in \{1, \dots, n-1\}} \subseteq \mathcal{A} \text{ by } A_i = f^{-1}([a_i, a_{i+1}[) \quad (21.692)$$

Next

$$\begin{aligned} f^{-1}(-\|f\|_\infty, \|f\|_\infty) &\stackrel{[\text{eq: 21.691}]}{\subseteq} f^{-1}\left(\bigcup_{i \in \{1, \dots, n-1\}} [a_i, a_{i+1}[\right) \\ &= \bigcup_{i \in \{1, \dots, n-1\}} f^{-1}([a_i, a_{i+1}[) \\ &\stackrel{[\text{eq: 21.692}]}{=} \bigcup_{i \in \{1, \dots, n-1\}} A_i \end{aligned}$$

proving that

$$f^{-1}(-\|f\|_\infty, \|f\|_\infty) \subseteq \bigcup_{i \in \{1, \dots, n-1\}} A_i \in \mathcal{A} \quad (21.693)$$

Let $i, j \in \{1, \dots, n-1\}$ with $i \neq j$ then we may assume without loss of generality that $i < j$ [otherwise switch i and j]. Assume that $x \in A_i \cap A_j$ then $f(x) \in [a_i, a_{i+1}[\cap [a_j, a_{j+1}[$ so that $a_i \leq f(x) < a_{i+1} \leq a_j \leq f(x) < a_{j+1}$ leading to the contradiction $f(x) < f(x)$. Hence the assumption is wrong and we must have that $A_i \cap A_j = \emptyset$. So its proved that

$$\{A_i\}_{i \in \{1, \dots, n-1\}} \text{ is pairwise disjoint} \quad (21.694)$$

Using then [theorem: 21.278] we have that

$$g = \sum_{i=1}^{n-1} a_i \cdot \chi_{A_i} \in \mathcal{S}[X, \mathcal{A}] \quad (21.695)$$

If $x \in \bigcup_{i \in \{1, \dots, n-1\}} A_i$ then by [eq: 21.694] there exist a unique $i \in \{1, \dots, n-1\}$ such that $x \in A_i$ from which it follows that $f(x) \in [a_i, a_{i+1}[\Rightarrow a_i \leq f(x) < a_{i+1}$ so that $0 \leq f(x) - a_i \leq a_{i+1} - a_i = \frac{\varepsilon}{2}$. As $g(x) \stackrel{[\text{theorem: 21.273}]}{=} a_i$ it follows that $|f(x) - g(x)| < \frac{\varepsilon}{2}$. Hence

$$\forall x \in \bigcup_{i \in \{1, \dots, n-1\}} A_i \text{ we have } |f(x) - g(x)| < \frac{\varepsilon}{2} \quad (21.696)$$

If $x \in \{x \in X \mid |f(x) - g(x)| > \frac{\varepsilon}{2}\}$ then using the above we must have that $x \in X \setminus \bigcup_{i \in \{1, \dots, n-1\}} A_i$. Using [eq: 21.693] it follows that $x \notin f^{-1}(-\|f\|_\infty, \|f\|_\infty)$ so that $f(x) \notin [-\|f\|_\infty, \|f\|_\infty]$ hence $f(x) < -\|f\|_\infty \vee \|f\|_\infty < f(x)$ from which we conclude that $\|f\|_\infty < |f(x)|$. So that

$$\left\{x \in X \mid |f(x) - g(x)| > \frac{\varepsilon}{2}\right\} \subseteq \{x \in X \mid |f(x)| > \|f\|_\infty\} \quad (21.697)$$

As $f \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ we have by [lemma: 21.400] that $\{x \in X \mid |f(x)| > \|f\|_\infty\}$ is locally μ -null so that by [theorem: 21.398] $\{x \in X \mid |f(x) - g(x)| > \frac{\varepsilon}{2}\}$ is locally μ -null. So we have that $\frac{\varepsilon}{2} \in \{M \in [0, \infty \mid \{x \in X \mid |(f - g)(x)| > M\} \text{ is locally } \mu\text{-null}\}$ so that

$$\|f - g\|_\infty = \inf(\{M \in [0, \infty \mid \{x \in X \mid |(f - g)(x)| > M\} \text{ is locally } \mu\text{-null}\}) \leq \frac{\varepsilon}{2} < \varepsilon$$

In other words

$$\forall \varepsilon \in \mathbb{R}^+ \text{ there exist a } g \in \mathcal{S}[X, \mathcal{A}] \text{ such that } \|f - g\|_\infty < \varepsilon \quad \square$$

The two previous theorem motivates the following definition

Definition 21.425. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $p \in [1, \infty]$ then we define

$$\mathcal{S}^p[X, \mathcal{A}, \mu, \mathbb{R}] = \begin{cases} \{[f]_\infty \mid f \in \mathcal{S}[X, \mathcal{A}] \text{ if } p = \infty\} \\ \{[f]_p \mid f \in \mathcal{S}[X, \mathcal{A}] \cap \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]\} \text{ if } p \in [1, \infty[\end{cases} \subseteq L^p[X, \mathcal{A}, \mu, \mathbb{R}]$$

Note 21.426. If $f \in \mathcal{S}[X, \mathcal{A}]$ then f is $\mathcal{A}$ -measurable and $f(X)$ is finite and non empty [as $X \neq \emptyset$], hence f is bounded above by $M = \max(\{|y| \mid y \in f(X)\})$ proving that $\mathcal{S}[X, \mathcal{A}] \subseteq \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$.

Using this definition we can summarize the two previous theorems.

Theorem 21.427. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space, $p \in [1, \infty]$ and $f \in L^p[X, \mathcal{A}, \mu, \mathbb{R}]$ then $\forall \varepsilon \in \mathbb{R}^+$ there exist a $g \in \mathcal{S}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ such that $\|f - g\|_{L^p} < \varepsilon$

Note 21.428. Using the topological space $\langle L^p[X, \mathcal{A}, \mu, \mathbb{R}], \|\cdot\|_{L^p} \rangle$ we have by [theorem: 14.111] that $\mathcal{S}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ is dense in $L^p[X, \mathcal{A}, \mu, \mathbb{R}]$. So that by definition of dense subsets [see definition: 14.49] we have

$$\overline{\mathcal{S}^p[X, \mathcal{A}, \mu, \mathbb{R}]} = L^p[X, \mathcal{A}, \mu, \mathbb{R}]$$

Proof. Let $p \in [1, \dots, \infty]$ then we have either:

$p = \infty$. As $f \in L^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ there exists a $F \in \mathcal{L}^\infty[X, \mathcal{A}, \mu, \mathbb{R}]$ such that $f = [F]_\infty$. Using [theorem: 21.424] there exists a $G \in \mathcal{S}[X, \mathcal{A}]$ such that $\|F - G\|_\infty < \varepsilon$. Take $g = [G]_\infty \in \mathcal{S}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ then we have

$$\|f - g\|_{L^\infty} = \|[F]_\infty - [G]_\infty\|_{L^\infty} = \|[F - G]_\infty\|_{L^\infty} = \|F - G\|_\infty < \varepsilon$$

$p \in [1, \infty[$. As $f \in L^p[X, \mathcal{A}, \mu, \mathbb{R}]$ there exists a $F \in \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ such that $f = [F]_p$. Using [theorem: 21.422] there exists a $G \in \mathcal{S}[X, \mathcal{A}] \cap \mathcal{L}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ such that $\|F - G\|_p < \varepsilon$. Take $g = [G]_p \in \mathcal{S}^p[X, \mathcal{A}, \mu, \mathbb{R}]$ then we have

$$\|f - g\|_{L^p} = \|[F]_p - [G]_p\|_{L^p} = \|[F - G]_p\|_{L^p} = \|F - G\|_p < \varepsilon \quad \square$$

21.6 Signed and complex measures

Up to now a measure μ is defined to be a non negative real valued function. In this section we extend this to measures that are real or complex.

21.6.1 Signed measures

21.6.1.1 Definition and properties

First we must extend the concept of finite sums in $\overline{\mathbb{R}}$ and ensure that they are always well defined. The problem is that $-\infty + \infty$ and $\infty + (-\infty)$ is not defined in $\overline{\mathbb{R}}$. To avoid this we restrict ourselves to the subsets $\mathbb{R} \cup \{\infty\}$ or $\mathbb{R} \cup \{-\infty\}$.

Definition 21.429. We define

$$\mathbb{R}_\infty = \mathbb{R} \cup \{\infty\}$$

$$\mathbb{R}_{-\infty} = \mathbb{R} \cup \{-\infty\}$$

Theorem 21.430. Using the definition of $+$ in $\bar{\mathbb{R}}$ restricted to $\mathbb{R}_\infty, \mathbb{R}_{-\infty}$ we have the following

1. $\langle \mathbb{R}_\infty, + \rangle$ is a Abelian semigroup
2. $\langle \mathbb{R}_{-\infty}, + \rangle$ is a Abelian semigroup

Proof.

1. We must prove the axioms of a Abelian semi group:

associativity. Let $x, y, z \in \mathbb{R}_\infty$ then we have for $x, y, z \in \mathbb{R}_\infty$ either:

$x \in \mathbb{R} \wedge y \in \mathbb{R} \wedge z \in \mathbb{R}$. then using the properties of $+$ in $\mathbb{R}$ we have

$$(x + y) + z = x + (y + z)$$

$x \in \mathbb{R} \wedge y \in \mathbb{R} \wedge z = \infty$. Then

$$\begin{aligned} (x + y) + z &= (x + y) + \infty \\ &= \infty \\ &= x + \infty \\ &= x + (y + \infty) \\ &= x + (y + z) \end{aligned}$$

$x \in \mathbb{R} \wedge y = \infty \wedge z \in \mathbb{R}$. Then

$$\begin{aligned} (x + y) + z &= (x + \infty) + z \\ &= \infty + z \\ &= \infty \\ &= x + \infty \\ &= x + (\infty + z) \\ &= x + (y + z) \end{aligned}$$

$x \in \mathbb{R} \wedge y = \infty \wedge z = \infty$. Then

$$\begin{aligned} (x + y) + z &= (x + \infty) + \infty \\ &= \infty \\ &= x + \infty \\ &= x + (\infty + \infty) \\ &= x + (y + z) \end{aligned}$$

$x = \infty \wedge y \in \mathbb{R} \wedge z \in \mathbb{R}$. Then

$$\begin{aligned} (x + y) + z &= (\infty + y) + z \\ &= \infty + z \\ &= \infty \\ &= \infty + (y + z) \\ &= x + (y + z) \end{aligned}$$

$x = \infty \wedge y \in \mathbb{R} \wedge z = \infty$. Then

$$\begin{aligned} (x + y) + z &= (\infty + y) + \infty \\ &= \infty \\ &= \infty + (y + z) \\ &= x + (y + z) \end{aligned}$$

$x = \infty \wedge y = \infty \wedge z \in \mathbb{R}$. Then

$$\begin{aligned}(x + y) + z &= (\infty + \infty) + z \\ &= \infty + z \\ &= \infty \\ &= \infty + (y + z) \\ &= x + (y + z)\end{aligned}$$

$x = \infty \wedge y = \infty \wedge z = \infty$. Then

$$\begin{aligned}(x + y) + z &= (\infty + \infty) + \infty \\ &= \infty \\ &= \infty + (y + z) \\ &= x + (y + z)\end{aligned}$$

neutral element. Then we have for $x \in \mathbb{R}_\infty$ either

$x \in \mathbb{R}$. then using the properties of $+$ in the real numbers we have

$$x + 0 = x = 0 + x$$

$x = \infty$. then

$$x + 0 = \infty + 0 = \infty = 0 + \infty = 0 + x$$

commutativity. Then we have for $x, y \in \mathbb{R}_\infty$ either

$x \in \mathbb{R} \wedge y \in \mathbb{R}$. Then using the properties of $+$ in $\mathbb{R}$ we have

$$x + y = y + x$$

$x \in \mathbb{R} \wedge y = \infty$. Then

$$x + y = x + \infty = \infty = \infty + x = y + x$$

$x = \infty \wedge y \in \mathbb{R}$. Then

$$x + y = \infty + y = \infty = y + \infty = y + x$$

$x = \infty \wedge y = \infty$. Then

$$x + y = \infty + \infty = \infty = \infty + \infty = y + x$$

2. We must prove the axioms of a Abelian semi group:

associativity. Let $x, y, z \in \mathbb{R}_{-\infty}$ then we have vor $x, y, z \in \mathbb{R}_{-\infty}$ either:

$x \in \mathbb{R} \wedge y \in \mathbb{R} \wedge z \in \mathbb{R}$. Then using the properties of $+$ in $\mathbb{R}$ we have

$$(x + y) + z = x + (y + z)$$

$x \in \mathbb{R} \wedge y \in \mathbb{R} \wedge z = -\infty$. Then

$$\begin{aligned}(x + y) + z &= (x + y) + (-\infty) \\ &= -\infty \\ &= x + (-\infty) \\ &= x + (y + (-\infty)) \\ &= x + (y + z)\end{aligned}$$

$x \in \mathbb{R} \wedge y = -\infty \wedge z \in \mathbb{R}$. Then

$$\begin{aligned}(x + y) + z &= (x + (-\infty)) + z \\ &= -\infty + z \\ &= -\infty \\ &= x + (-\infty) \\ &= x + ((-\infty) + y) \\ &= x + (y + z)\end{aligned}$$

$x \in \mathbb{R} \wedge y = -\infty \wedge z = -\infty$. Then

$$\begin{aligned}(x + y) + z &= (x + (-\infty)) + (-\infty) \\ &= -\infty \\ &= x + (-\infty) \\ &= x + (-\infty + (-\infty)) \\ &= x + (y + z)\end{aligned}$$

$x = -\infty \wedge y \in \mathbb{R} \wedge z \in \mathbb{R}$. Then

$$\begin{aligned}(x + y) + z &= (-\infty + y) + z \\ &= -\infty + z \\ &= -\infty \\ &= -\infty + (y + z) \\ &= x + (y + z)\end{aligned}$$

$x = -\infty \wedge y \in \mathbb{R} \wedge z = -\infty$. Then

$$\begin{aligned}(x + y) + z &= (-\infty + y) + (-\infty) \\ &= -\infty \\ &= -\infty + (y + z) \\ &= x + (y + z)\end{aligned}$$

$x = -\infty \wedge y = -\infty \wedge z \in \mathbb{R}$. Then

$$\begin{aligned}(x + y) + z &= (-\infty + (-\infty)) + z \\ &= -\infty + z \\ &= -\infty \\ &= -\infty + (y + z) \\ &= x + (y + z)\end{aligned}$$

$x = -\infty \wedge y = -\infty \wedge z = -\infty$. Then

$$\begin{aligned}(x + y) + z &= (-\infty + (-\infty)) + (-\infty) \\ &= -\infty \\ &= -\infty + (y + z) \\ &= x + (y + z)\end{aligned}$$

netural element. Then we have for $x \in \mathbb{R}_{-\infty}$ either

$x \in \mathbb{R}$. Then using the properties of $+$ in the real numbers we have

$$x + 0 = x = 0 + x$$

$x = -\infty$. Then

$$x + 0 = -\infty + 0 = -\infty = 0 + (-\infty) = 0 + x$$

commutativity. Then we have for $x, y \in \mathbb{R}_{\infty}$ either

$x \in \mathbb{R} \wedge y \in \mathbb{R}$. Then using the properties of $+$ in $\mathbb{R}$ we have

$$x + y = y + x$$

$x \in \mathbb{R} \wedge y = -\infty$. Then

$$x + y = x + (-\infty) = -\infty = -\infty + x = y + x$$

$x = -\infty \wedge y \in \mathbb{R}$. Then

$$x + y = -\infty + y = -\infty = y + (-\infty) = y + x$$

$x = -\infty \wedge y = -\infty$. Then

$$x + y = -\infty + (-\infty) = -\infty = -\infty + (-\infty) = y + x \quad \square$$

As $\langle \mathbb{R}_\infty, + \rangle$ and $\langle \mathbb{R}_\infty, + \rangle$ are semi groups we can now use [section: 11.1] to work with finite sums in these semi-groups.

Theorem 21.431. *Let $n \in \mathbb{N}$, $\alpha \in \mathbb{R}$ then we have $\forall \{x_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}_\infty$ [or $\mathbb{R}_{-\infty}$]*

1. $\forall \{x_i\}_{i \in \mathbb{N}} \subseteq \mathbb{R}_\infty$ we have $\alpha \cdot \sum_{i=1}^n x_i = \sum_{i=1}^n (\alpha \cdot x_i)$
2. $\forall \{x_i\}_{i \in \mathbb{N}} \subseteq \mathbb{R}_{-\infty}$ we have $\alpha \cdot \sum_{i=1}^n x_i = \sum_{i=1}^n (\alpha \cdot x_i)$

Note 21.432. $\langle \mathbb{R}_\infty, +, \cdot \rangle$ is not a ring so we can not use [theorem: 11.8] in this proof

Proof. We use induction to prove this, so define

$$S = \left\{ n \in \mathbb{N} \mid \text{If } \{x_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}_\infty \text{ [or } \mathbb{R}_{-\infty}] \text{ then } \alpha \cdot \sum_{i=1}^n x_i = \sum_{i=1}^n (\alpha \cdot x_i) \right\}$$

then we have:

$1 \in S$. Let $\{x_i\}_{i \in \{1\}} \subseteq \mathbb{R}_\infty$ [or $\mathbb{R}_{-\infty}$] then $\alpha \cdot \sum_{i=1}^1 x_i = \alpha \cdot x_1 = \sum_{i=1}^1 (\alpha \cdot x_i)$ which proves that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Let $\{x_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathbb{R}_+$ [or $\mathbb{R}_{-\infty}$] then we have that

$$\begin{aligned} \sum_{i=1}^{n+1} (\alpha \cdot x_i) &= (\alpha \cdot x_{n+1}) + \sum_{i=1}^n (\alpha \cdot x_i) \\ &\stackrel{n \in S}{=} (\alpha \cdot x_{n+1}) + \alpha \cdot \sum_{i=1}^n x_i \\ &\stackrel{[\text{theorem: 20.41}]}{=} \alpha \cdot \left(x_{n+1} + \sum_{i=1}^n x_i \right) \\ &= \alpha \cdot \sum_{i=1}^{n+1} x_i \end{aligned}$$

which proves that $n+1 \in S$. $\square$

Next we extend the definition of infinite sums of non negative numbers in $\overline{\mathbb{R}}$ [see definition: 20.94] to infinite sums of elements in $\mathbb{R}_\infty$ or $\mathbb{R}_-$. Unfortunately this comes at a cost, in contrast to the sum of non negative extended real numbers the infinite sum of elements in $\mathbb{R}_\infty$ or $\mathbb{R}_{-\infty}$ is not guaranteed to exist.

Definition 21.433. *Let $\{x_i\}_{i \in \mathbb{N}} \subseteq \mathbb{R}_\infty \subseteq \overline{\mathbb{R}}$ then we say that $\sum_{i=1}^\infty x_i$ exist if $\lim_{n \rightarrow \infty} \sum_{i=1}^n x_i$ exist and in this case we define $\sum_{i=1}^\infty x_i$ by $\sum_{i=1}^\infty x_i = \lim_{n \rightarrow \infty} \sum_{i=1}^n x_i$. Likewise if $\{x_i\}_{i \in \mathbb{N}} \subseteq \mathbb{R}_{-\infty} \subseteq \overline{\mathbb{R}}$ then $\sum_{i=1}^\infty x_i$ exist if $\lim_{n \rightarrow \infty} x_i$ exist and $\sum_{i=1}^\infty x_i$ is defined by $\sum_{i=1}^\infty x_i = \lim_{n \rightarrow \infty} \sum_{i=1}^n x_i$.*

Note 21.434. $\lim_{n \rightarrow \infty} x_i$ is defined in [definition: 20.71]

We are now ready to define a signed measure on a measurable space.

Definition 21.435. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space then $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ is a **signed measure** on $\mathcal{A}$ if*

1. $\mu(\emptyset) = 0$

2. $\{\mu(A)|A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$ or $\{\mu(A)|A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$
3. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ pairwise disjoint we have that $\sum_{i=1}^\infty \mu(A_i)$ exist and

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^\infty \mu(A_i)$$

Note 21.436. One difference between signed measures and measures is that for measures $\sum_{i=1}^\infty \mu(A_i)$ is always defined and equal to $\sup\{\{\sum_{i=1}^k \mu(A_i) | k \in \mathbb{N}_0\}\}$. For signed measures it is not guaranteed that $\sum_{i=1}^\infty \mu(A_i) = \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i)$ exists. So the existence must either be stated in a definition [as above] or proved.

Definition 21.437. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then a signed measure $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ is finite if

$$\forall A \in \mathcal{A} \text{ we have } \mu(A) \in \mathbb{R}$$

Given two measures where one is finite we can create a signed measure as the difference of these measures.

Theorem 21.438. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu_1: \mathcal{A} \rightarrow [0, \infty]$, $\mu_2: \mathcal{A} \rightarrow [0, \infty]$ two measures on $\mathcal{A}$ where μ_2 is finite or μ_1 is finite so that

$$\mu_1 - \mu_2: \mathcal{A} \rightarrow \overline{\mathbb{R}} \text{ defined by } (\mu_1 - \mu_2)(A)$$

is well defined then we have that

1. $\mu_1 - \mu_2: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ is a signed measure on $\mathcal{A}$
2. If $\forall A \in \mathcal{A}$ we have $\mu_2(A) \leq \mu_1(A)$ then $\mu_1 - \mu_2: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ is a measure on $\mathcal{A}$

Proof.

1. We have

$$\forall A \in \mathcal{A} \text{ that } (\mu_1 - \mu_2)(A) = \mu_1(A) - \mu_2(A) = 0 - 0 = 0 \quad (21.698)$$

For finiteness we have two possible cases:

μ_1 is finite. Then for $A \in \mathcal{A}$ we have either:

$$\mu_2(A) = \infty. \text{ Then } (\mu_1 - \mu_2)(A) = \mu_1(A) - \mu_2(A) = \mu_1(A) - \infty = -\infty$$

$$\mu_2(A) \in \mathbb{R}. \text{ Then } (\mu_1 - \mu_2)(A) = \mu_1(A) - \mu_2(A) \in \mathbb{R}$$

Hence we have

$$\{(\mu_1 - \mu_2)(A) | A \in \mathcal{A}\} \in \mathbb{R}_{-\infty}$$

μ_2 is finite. Then for $A \in \mathcal{A}$ we have either:

$$\mu_1(A) = \infty. \text{ Then } (\mu_1 - \mu_2)(A) = \mu_1(A) - \mu_2(A) = \infty - \mu_2(A) = \infty$$

$$\mu_1(A) \in \mathbb{R}. \text{ Then } (\mu_1 - \mu_2)(A) = \mu_1(A) - \mu_2(A) \in \mathbb{R}$$

Hence we have

$$\{(\mu_1 - \mu_2)(A) | A \in \mathcal{A}\} \in \mathbb{R}_\infty$$

So it follows that

$$\{(\mu_1 - \mu_2)(A) | A \in \mathcal{A}\} \in \mathbb{R}_\infty \text{ or } \{(\mu_1 - \mu_2)(A) | A \in \mathcal{A}\} \in \mathbb{R}_{-\infty} \quad (21.699)$$

Next we use induction to prove

$$\forall n \in \mathbb{N} \text{ we have } \forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \quad \sum_{i=1}^n (\mu_1 - \mu_2)(A_i) = \sum_{i=1}^n \mu_1(A_i) - \sum_{i=1}^n \mu_2(A_i) \quad (21.700)$$

Proof. Let

$$S = \left\{ n \in \mathbb{N} \mid \forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \text{ we have } \sum_{i=1}^n (\mu_1 - \mu_2)(A_i) = \sum_{i=1}^n \mu_1(A_i) - \sum_{i=1}^n \mu_2(A_i) \right\}$$

then we have:

$1 \in S$. Then for $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{A}$ we have

$$\sum_{i=1}^1 (\mu_1 - \mu_2)(A_i) = \mu_1(A_1) - \mu_2(A_1) = \sum_{i=1}^1 \mu_1(A_i) - \sum_{i=1}^1 \mu_2(A_i)$$

which proves that $1 \in S$.

$n \in S \Rightarrow n+1 \in S$. Then for $\{A_i\}_{i \in \{1, \dots, n+1\}} \subseteq \mathcal{A}$ that

$$\begin{aligned} \sum_{i=1}^{n+1} (\mu_1 - \mu_2)(A_i) &= (\mu_1 - \mu_2)(A_{n+1}) + \sum_{i=1}^n (\mu_1 - \mu_2)(A_i) \\ &\stackrel{n \in S}{=} (\mu_1 - \mu_2)(A_{n+1}) + \sum_{i=1}^n \mu_1(A_i) - \sum_{i=1}^n \mu_2(A_i) \\ &= \mu_1(A_{n+1}) + \sum_{i=1}^n \mu_1(A_i) - \mu_2(A_{n+1}) - \sum_{i=1}^n \mu_2(A_i) \\ &= \sum_{i=1}^{n+1} \mu_1(A_i) - \sum_{i=1}^{n+1} \mu_2(A_i) \end{aligned}$$

which proves that $n+1 \in S$.

Mathematical induction proves [eq: 21.700] □

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be pairwise disjoint then we have, as μ_1, μ_2 are measures, that

$$\mu_1\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \mu_1(A_i) = \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu_1(A_i) \text{ and } \mu_2\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \mu_2(A_i) = \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu_2(A_i)$$

Then using [theorem: 20.84(3,5)] we have that $\lim_{n \rightarrow \infty} (\sum_{i=1}^n \mu_1(A_i) - \sum_{i=1}^n \mu_2(A_i))$ exist and

$$\lim_{n \rightarrow \infty} \left(\sum_{i=1}^n \mu_1(A_i) - \sum_{i=1}^n \mu_2(A_i) \right) = \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu_1(A_i) - \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu_2(A_i) \quad (21.701)$$

Hence

$$\begin{aligned} \lim_{n \rightarrow \infty} \sum_{i=1}^n (\mu_1 - \mu_2)(A_i) &\stackrel{[\text{eq: 21.700}]}{=} \lim_{n \rightarrow \infty} \left(\sum_{i=1}^n \mu_1(A_i) - \sum_{i=1}^n \mu_2(A_i) \right) \\ &\stackrel{[\text{eq: 21.701}]}{=} \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu_1(A_i) - \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu_2(A_i) \\ &= \mu_1\left(\bigcup_{i \in \mathbb{N}} A_i\right) - \mu_2\left(\bigcup_{i \in \mathbb{N}} A_i\right) \\ &= (\mu_1 - \mu_2)\left(\bigcup_{i \in \mathbb{N}} A_i\right) \end{aligned}$$

As $\sum_{i=1}^{\infty} (\mu_1 - \mu_2)(A_i) = \lim_{n \rightarrow \infty} \sum_{i=1}^n (\mu_1 - \mu_2)(A_i)$ it follows that

$$\sum_{i=1}^{\infty} (\mu_1 - \mu_2)(A_i) \text{ exist and } \sum_{i=1}^{\infty} (\mu_1 - \mu_2)(A_i) = (\mu_1 - \mu_2)\left(\bigcup_{i \in \mathbb{N}} A_i\right) \quad (21.702)$$

From [eqs: 21.698, 21.699 and 21.702] it follows that $\mu_1 - \mu_2$ is a signed measure on $\mathcal{A}$.

2. Assume that $\forall A \in \mathcal{A}$ we have $\mu_1(A) \leq \mu_2(A)$. For μ_1, μ_2 we have either:

μ_1 is finite. Then as $\mu_1(A) \leq \mu_2(A)$ we have for $\mu_2(A)$ either:

$\mu_2(A) \in \mathbb{R}$. Then $0 \leq \mu_2(A) - \mu_1(A)$ so that $(\mu_2 - \mu_1)(A) \in [0, \infty]$

$\mu_2(A) = \infty$. Then $\mu_2(A) - \mu_1(A) = \infty - \mu_1(A) = \infty$ so that $(\mu_2 - \mu_1)(A) \in [0, \infty]$

μ_2 is finite. Then $0 \leq \mu_1(A) \leq \mu_2(A) < \infty$ so that $\mu_1(A), \mu_2(A) \in \mathbb{R}$ hence $0 \leq \mu_2(A) - \mu_1(A)$ which proves that $(\mu_2 - \mu_1)(A) \in [0, \infty]$.

From the above we conclude that

$$\mu_2 - \mu_1: \mathcal{A} \rightarrow [0, \infty]$$

is a well defined function which together with [eqs: 21.698 and 21.702] proves that

$$\mu_2 - \mu_1: \mathcal{A} \rightarrow [0, \infty] \text{ is a measure on } \mathcal{A} \quad \square$$

Theorem 21.439. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$ and $\alpha \in \mathbb{R}$ then $\alpha \cdot \mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ defined by $(\alpha \cdot \mu)(A) = \alpha \cdot \mu(A)$ is a signed measure.

Proof. We have

$$(\alpha \cdot \mu)(\emptyset) \underset{\mu \text{ is a signed measure}}{=} \alpha \cdot \mu(\emptyset) = \alpha \cdot 0 = 0 \quad (21.703)$$

As μ is a signed measure we have either:

$\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$. For $\alpha \in \mathbb{R}$ we have either:

$0 \leq \alpha$. Then if $x \in \{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\}$ there exist a $A \in \mathcal{A}$ such that $x = (\alpha \cdot \mu)(A) = \alpha \cdot \mu(A)$. For $\mu(A) \in \mathbb{R}_\infty$ we have either:

$\mu(A) \in \mathbb{R}$. Then $x = \alpha \cdot \mu(A) \in \mathbb{R}$ so that $x \in \mathbb{R}_\infty$

$\mu(A) = \infty$. Then $x = \alpha \cdot \infty = \infty$ so that $x \in \mathbb{R}_\infty$

So that

$$\{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$$

$\alpha < 0$. Then if $x \in \{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\}$ there exist a $A \in \mathcal{A}$ such that $x = (\alpha \cdot \mu)(A) = \alpha \cdot \mu(A)$. For $\mu(A) \in \mathbb{R}_\infty$ we have either:

$\mu(A) \in \mathbb{R}$. Then $x = \alpha \cdot \mu(A) \in \mathbb{R}$ so that $x \in \mathbb{R}_{-\infty}$

$\mu(A) = \infty$. Then $x = \alpha \cdot \infty = -\infty$ so that $x \in \mathbb{R}_{-\infty}$

So that

$$\{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$$

$\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$. For $\alpha \in \mathbb{R}$ we have either:

$0 \leq \alpha$. Then if $x \in \{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\}$ there exist a $A \in \mathcal{A}$ such that $x = (\alpha \cdot \mu)(A) = \alpha \cdot \mu(A)$. For $\mu(A) \in \mathbb{R}_{-\infty}$ we have either:

$\mu(A) \in \mathbb{R}$. Then $x = \alpha \cdot \mu(A) \in \mathbb{R}$ so that $x \in \mathbb{R}_{-\infty}$

$\mu(A) = -\infty$. Then $x = \alpha \cdot (-\infty) = -\infty$ so that $x \in \mathbb{R}_{-\infty}$

So that

$$\{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$$

$\alpha < 0$. Then if $x \in \{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\}$ there exist a $A \in \mathcal{A}$ such that $x = (\alpha \cdot \mu)(A) = \alpha \cdot \mu(A)$. For $\mu(A) \in \mathbb{R}_{-\infty}$ we have either:

$\mu(A) \in \mathbb{R}$. Then $x = \alpha \cdot \mu(A) \in \mathbb{R}$ so that $x \in \mathbb{R}_\infty$

$\mu(A) = -\infty$. Then $x = \alpha \cdot (-\infty) = \infty$ so that $x \in \mathbb{R}_\infty$

So that

$$\{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$$

Hence we have proved that

$$\{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_+ \text{ or } \{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty} \quad (21.704)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be a pairwise family of measurable sets. Then as μ is a signed measure we have that

$$\sum_{i=1}^{\infty} \mu(A_i) = \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i) \text{ exist and } \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \mu(A_i) \quad (21.705)$$

Using [theorem: 20.84(3)] we have that

$$\lim_{n \rightarrow \infty} \left(\alpha \cdot \sum_{i=1}^n \mu(A_i) \right) \text{ exist and } \lim_{n \rightarrow \infty} \left(\alpha \cdot \sum_{i=1}^n \mu(A_i) \right) = \alpha \cdot \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i) \quad (21.706)$$

As $\forall n \in \mathbb{N}$ we have $\alpha \cdot \sum_{i=1}^n \mu(A_i) \stackrel{[\text{theorem: 21.431}]}{=} \sum_{i=1}^n (\alpha \cdot \mu(A_i)) = \sum_{i=1}^n (\alpha \cdot \mu)(A_i)$ it follows that

$$\begin{aligned} \sum_{i=1}^{\infty} (\alpha \cdot \mu)(A_i) &= \lim_{n \rightarrow \infty} \sum_{i=1}^n (\alpha \cdot \mu(A_i)) \\ &= \lim_{n \rightarrow \infty} \left(\alpha \cdot \sum_{i=1}^n \mu(A_i) \right) \\ &\stackrel{[\text{eq: 21.706}]}{=} \alpha \cdot \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i) \\ &\stackrel{[\text{eq: 21.704}]}{=} \alpha \cdot \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \\ &= (\alpha \cdot \mu)\left(\bigcup_{i \in \mathbb{N}} A_i\right) \end{aligned}$$

In other words

$$\sum_{i=1}^{\infty} (\alpha \cdot \mu)(A_i) \text{ exist and } \sum_{i=1}^{\infty} (\alpha \cdot \mu)(A_i) = (\alpha \cdot \mu)\left(\bigcup_{i \in \mathbb{N}} A_i\right) \quad \square$$

Theorem 21.440. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $n \in \mathbb{N}$ and $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ be a signed measure on $\mathcal{A}$ then $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ pairwise disjoint we have that

$$\mu\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^n \mu(A_i)$$

In other words μ is finite additive.

Proof. Let $n \in \mathbb{N}$, $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ be pairwise disjoint. Define now

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \begin{cases} A_i & \text{if } i \in \{1, \dots, n\} \\ \emptyset & \text{if } i \in \mathbb{N} \setminus \{1, \dots, n\} \end{cases}$$

If $k, l \in \mathbb{N}$ with $k \neq l$ then we have either

$$k, l \in \{1, \dots, n\}. \text{ then } B_k \cap B_l = A_k \cap A_l = \emptyset$$

$$k \notin \{1, \dots, n\}. \text{ then } B_k \cap B_l = \emptyset \cap B_l = \emptyset$$

$$l \notin \{1, \dots, n\}. \text{ then } B_k \cap B_l = B_k \cap \emptyset = \emptyset$$

which proves that

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ is pairwise disjoint}$$

So we have by the definition of a signed measure that $\sum_{i=1}^{\infty} \mu(B_i) = \lim_{k \rightarrow \infty} \sum_{i=1}^k \mu(B_i)$ exists and

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \sum_{i=1}^{\infty} \mu(B_i) = \lim_{k \rightarrow \infty} \sum_{i=1}^k \mu(B_i) \quad (21.707)$$

Now if $n < k$ we have that

$$\begin{aligned} \sum_{i=1}^k \mu(B_i) &= \sum_{i \in \{1, \dots, k\}} \mu(B_i) \\ &\stackrel{[\text{theorem: 11.44}]}{=} \sum_{i \in \{1, \dots, n\}} \mu(B_i) + \sum_{i \in \{n+1, \dots, k\}} \mu(B_i) \\ &= \sum_{i \in \{1, \dots, n\}} \mu(B_i) + \sum_{i \in \{n+1, \dots, k\}} \mu(\emptyset) \\ &= \sum_{i \in \{1, \dots, n\}} \mu(B_i) \\ &= \sum_{i \in \{1, \dots, n\}} \mu(A_i) \\ &= \sum_{i=1}^n \mu(A_i) \end{aligned} \quad (21.708)$$

Further

$$\begin{aligned} \lim_{k \rightarrow \infty} \sum_{i=1}^k \mu(B_i) &\stackrel{[\text{theorem: 20.83}]}{=} \lim_{k \rightarrow \infty} \sum_{i=1}^{n+k+1} \mu(B_i) \\ &\stackrel{[\text{eq: 21.708}]}{=} \lim_{k \rightarrow \infty} \sum_{i=1}^n \mu(A_i) \\ &= \sum_{i=1}^{\infty} \mu(A_i) \end{aligned} \quad (21.709)$$

As

$$\bigcup_{i \in \mathbb{N}} B_i = \left(\bigcup_{i \in \{1, \dots, n\}} B_i \right) \cup \left(\bigcup_{i \in \{n+1, \dots, \infty\}} B_i \right) = \bigcup_{i \in \{1, \dots, n\}} A_i$$

we have using the above and [eqs: 21.707 and 21.709] that

$$\mu\left(\bigcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^n \mu(A_i) \quad \square$$

Signed measures have many of the same properties as normal measures.

Theorem 21.441. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$ then we have:*

1. *If $A \in \mathcal{A}$ satisfies $\mu(A) \in \mathbb{R}$ then we have $\forall B \in \mathcal{A}$ with $B \subseteq A$ that $\mu(B) \in \mathbb{R}$*
2. *If $A, B \in \mathcal{A}$ with $B \subseteq A$ and $\mu(B) \in \mathbb{R}$ then $\mu(A \setminus B) = \mu(A) - \mu(B)$*

Proof. If $B \subseteq A$ then $A = (A \setminus B) \cup B$ and $(A \setminus B) \cap B = \emptyset$ so that by [theorem: 21.440] we have

$$\mu(A) = \mu(A \setminus B) + \mu(B) \quad (21.710)$$

1. Assume that $\mu(A) \in \mathbb{R}$ and $B \subseteq A$. For μ we have either:

$\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{\infty}$. If $\mu(B) = \infty$ then $\mu(A) \stackrel{[\text{eq: 21.710}]}{=} \mu(A \setminus B) + \infty = \infty$ contradicting $\mu(A) \in \mathbb{R}$ hence we must have that $\mu(B) \in \mathbb{R}$.

$\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$. If $\mu(B) = -\infty$ then $\mu(A) \stackrel{[\text{eq: 21.710}]}{=} \mu(A \setminus B) + (-\infty) = -\infty$ contradicting $\mu(A) \in \mathbb{R}$ hence we must have that $\mu(B) \in \mathbb{R}$.

2. If $B \subseteq A$ and $\mu(B) \in \mathbb{R}$ then for μ we have either:

$\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$. Then for $\mu(A)$ we have either:

$\mu(A) \in \mathbb{R}$. If $\mu(A \setminus B) = \infty$ then from [eq: 21.710] we have that $\mu(A) = \infty + \mu(B) = \infty$ contradicting $\mu(A) \in \mathbb{R}$. Hence we have $\mu(B), \mu(A), \mu(A \setminus B) \in \mathbb{R}$ so that from [eq: 21.710] it follows that $\mu(A \setminus B) = \mu(A) - \mu(B)$.

$\mu(A) = \infty$. If $\mu(A \setminus B) \in \mathbb{R}$ then by [eq: 21.710] $\mu(A) = \mu(A \setminus B) + \mu(B) \in \mathbb{R}$ contradicting $\mu(A) = \infty$. Hence we must have that $\mu(A \setminus B) = \infty$ so that $\mu(A \setminus B) = \infty = \infty - \mu(B) = \mu(A) - \mu(B)$.

$\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$. Then for $\mu(A)$ we have either:

$\mu(A) \in \mathbb{R}$. If $\mu(A \setminus B) = -\infty$ then from [eq: 21.710] we have that $\mu(A) = -\infty + \mu(B) = -\infty$ contradicting $\mu(A) \in \mathbb{R}$. Hence we have $\mu(B), \mu(A), \mu(A \setminus B) \in \mathbb{R}$ so that from [eq: 21.710] it follows that $\mu(A \setminus B) = \mu(A) - \mu(B)$.

$\mu(A) = -\infty$. If $\mu(A \setminus B) \in \mathbb{R}$ then by [eq: 21.710] $\mu(A) = \mu(A \setminus B) + \mu(B) \in \mathbb{R}$ contradicting $\mu(A) = -\infty$. Hence we must have that $\mu(A \setminus B) = -\infty$ so that $\mu(A \setminus B) = -\infty = -\infty - \mu(B) = \mu(A) - \mu(B)$. $\square$

Theorem 21.442. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and let $\mu: \mathcal{A} \rightarrow \mathbb{R}$ be a signed measure on $\langle X, \mathcal{A} \rangle$. Then we have

1. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N} A_i \subseteq A_{i+1}$ we have that $\lim_{i \rightarrow \infty} \mu(A_i)$ exists and

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \lim_{i \rightarrow \infty} \mu(A_i)$$

2. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N} A_{i+1} \subseteq A_i$ such that $\exists k \in \mathbb{N}$ with $\mu(A_k) \in \mathbb{R}$ we have that $\lim_{i \rightarrow \infty} \mu(A_i)$ exists and

$$\mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) = \lim_{i \rightarrow \infty} \mu(A_i)$$

Proof.

1. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \begin{cases} A_i & \text{if } i = 1 \\ A_i \setminus A_{i-1} & \text{if } i \in \{2, \dots, \infty\} \end{cases} \in \mathcal{A}$$

Let $i, j \in \mathbb{N}$ with $i \neq j$ then we may always assume that $i < j$ [otherwise exchange i and j] then for i we have either:

$i = 1$. Then $1 < j$ so that $1 \leq j - 1$ from which it follows that $A_1 \subseteq A_{j-1} \Rightarrow A_j \setminus A_{j-1} \subseteq A_j \setminus A_1$ hence $B_i \cap B_j = A_1 \cap (A_j \setminus A_{j-1}) \subseteq A_1 \cap (A_j \setminus A_1) = \emptyset$ so that $B_i \cap B_j = \emptyset$

$i \in \{2, \dots, \infty\}$. Then as $i < j$ we have $i \leq j - 1$ so that $A_i \subseteq A_{j-1}$ from which it follows that $A_j \setminus A_{j-1} \subseteq A_j \setminus A_i$. So

$$B_i \cap B_j = (A_i \setminus A_{i-1}) \cap (A_j \setminus A_{j-1}) \subseteq (A_i \setminus A_{j-1}) \cap (A_j \setminus A_i) = \emptyset$$

or $B_i \cap B_j = \emptyset$.

Hence

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ is pairwise disjoint} \quad (21.711)$$

Let $n \in \mathbb{N}$ then $\forall i \in \{1, \dots, n\}$ we have that $B_i = \begin{cases} A_1 \subseteq A_i & \text{if } i = 1 \\ A_i \setminus A_{i-1} \subseteq A_i & \text{if } i \in \{2, \dots, \infty\} \end{cases} \subseteq A_i \subseteq A_n$ so that $\bigcup_{i \in \{1, \dots, n\}} B_i \subseteq A_n$ and $B_n \subseteq A_n \Rightarrow \bigcup_{n \in \mathbb{N}} B_n \subseteq \bigcup_{n \in \mathbb{N}} A_n$. Summarized we have

$$\forall n \in \mathbb{N} \text{ we have } \bigcup_{i \in \{1, \dots, n\}} B_i \subseteq A_n \text{ and } \bigcup_{i \in \mathbb{N}} B_i \subseteq \bigcup_{i \in \mathbb{N}} A_i \quad (21.712)$$

Let $n \in \mathbb{N}$ then for $x \in A_n$ we have that $n \in \{i \in \{1, \dots, n\} | x \in A_i\}$ a finite set so that $m = \min(\{i \in \{1, \dots, n\} | x \in A_i\})$ exist. For m we have either:

$m = 1$. Then $x \in A_1 = B_1 \subseteq \bigcup_{i \in \{1, \dots, n\}} B_i$

$1 < m$. Then $x \notin A_{m-1}$ and $x \in A_m$ so that $x \in A_m \setminus A_{m-1} = B_m \subseteq \bigcup_{i \in \{1, \dots, n\}} B_i$

So we have that $A_n \subseteq \bigcup_{i \in \{1, \dots, n\}} B_i \subseteq \bigcup_{i \in \mathbb{N}} B_i$ which combined with [eq: 21.712] gives

$$\forall n \in \mathbb{N} \text{ we have } A_n = \bigcup_{i \in \{1, \dots, n\}} B_i \text{ and } \bigcup_{i \in \mathbb{N}} B_i = \bigcup_{i \in \mathbb{N}} A_i \quad (21.713)$$

By the definition of a signed measure we have that

$$\sum_{i=1}^{\infty} \mu(B_i) = \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(B_i) \text{ exist and } \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \sum_{i=1}^{\infty} \mu(B_i) \quad (21.714)$$

Finally

$$\begin{aligned} \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) & \stackrel{[\text{eq: 21.713}]}{=} \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \\ & \stackrel{[\text{eq: 21.714}]}{=} \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(B_i) \\ & \stackrel{[\text{theorem: 21.440}]}{=} \lim_{n \rightarrow \infty} \mu\left(\bigcup_{i \in \{1, \dots, n\}} B_i\right) \\ & \stackrel{[\text{eq: 21.713}]}{=} \lim_{n \rightarrow \infty} \mu(A_n) \end{aligned}$$

hence

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \lim_{n \rightarrow \infty} \mu(A_n)$$

2. First we consider the case where $k = 1$. So let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be such that $\mu(A_1) \in \mathbb{R}$ and $\forall i \in \mathbb{N}$ we have $A_{i+1} \subseteq A_i$. Then $\forall i \in \mathbb{N}$ we have $A_i \subseteq A_1$ so that by [theorem: 21.441] we have

$$\forall i \in \mathbb{N} \text{ we have } \mu(A_i) \in \mathbb{R} \quad (21.715)$$

Define now

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = A_1 \setminus A_i \in \mathcal{A}$$

If $i \in \mathbb{N}$ then we have $B_i = A_1 \setminus A_i \subseteq A_1 \setminus A_{i+1} = B_{i+1}$ so that

$$\forall i \in \mathbb{N} \text{ we have } B_i \subseteq B_{i+1}$$

Using (1) it follows that

$$\lim_{i \rightarrow \infty} \mu(B_i) \text{ exist and } \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) = \lim_{i \rightarrow \infty} \mu(B_i) \quad (21.716)$$

Now

$$\begin{aligned} A_1 \setminus \left(\bigcup_{i \in \mathbb{N}} B_i\right) & \stackrel{[\text{theorem: 2.132}]}{=} \bigcap_{i \in \mathbb{N}} (A_1 \setminus B_i) \\ & = \bigcap_{i \in \mathbb{N}} (A_1 \setminus (A_1 \setminus A_i)) \\ & \stackrel{[\text{theorem: 1.33}]}{=} \bigcap_{i \in \mathbb{N}} A_i \end{aligned}$$

so that

$$A_1 \setminus \left(\bigcup_{i \in \mathbb{N}} B_i\right) = \bigcap_{i \in \mathbb{N}} A_i \quad (21.717)$$

As $\forall i \in \mathbb{N} \ B_i = A_1 \setminus A_i \subseteq A_1$ we have $\bigcup_{i \in \mathbb{N}} B_i \subseteq A_1$ hence as $\mu(A_1) \in \mathbb{R}$ it follows from [theorem: 21.441] that

$$\mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \in \mathbb{R}, \bigcup_{i \in \mathbb{N}} B_i \subseteq A_1 \text{ and } \forall i \in \mathbb{N} \ \mu(B_i) \in \mathbb{R} \quad (21.718)$$

Next

$$\begin{aligned} \mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) & \stackrel{[\text{eq: 21.717}]}{=} \mu\left(A_1 \setminus \left(\bigcup_{i \in \mathbb{N}} B_i\right)\right) \\ & \stackrel{[\text{eq: 21.718}] \wedge [\text{theorem: 21.441}]}{=} \mu(A_1) - \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \\ & \stackrel{[\text{eq: 21.716}]}{=} \mu(A_1) - \lim_{i \rightarrow \infty} \mu(B_i) \\ & \stackrel{B_i = A_1 \setminus A_i, [\text{theorem: 21.441}], [\text{eq: 21.718}]}{=} \mu(A_1) - \lim_{i \rightarrow \infty} (\mu(A_1) - \mu(A_i)) \\ & \stackrel{[\text{theorem: 20.84}]}{=} \mu(A_1) - \mu(A_1) + \lim_{i \rightarrow \infty} \mu(A_i) \\ & = \lim_{i \rightarrow \infty} \mu(A_i) \end{aligned}$$

To summarize we have

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ with } \mu(A_1) \in \mathbb{R} \text{ and } \forall i \in \mathbb{N} \ A_{i+1} \subseteq A_i \quad \mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) = \lim_{i \rightarrow \infty} \mu(A_i) \quad (21.719)$$

We consider now the general cases where $1 \leq k$. So let $\{C_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be such that $\exists k \in \mathbb{N}$ with $\mu(C_k) \in \mathbb{R}$ and $\forall i \in \mathbb{N} \ C_{i+1} \subseteq C_i$. Define

$$\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } A_i = C_{i+(k-1)} \in \mathcal{A}$$

Then $\mu(A_1) = C_{1+(k-1)} = C_k \in \mathbb{R}$ and $\forall i \in \mathbb{N}$ we have $A_{i+1} = C_{(i+1)+(k-1)} \subseteq C_{i+(k-1)} = A_i$. So we can apply [eq: 21.719] giving

$$\mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) = \lim_{i \rightarrow \infty} \mu(A_i) = \lim_{i \rightarrow \infty} \mu(C_{i+(k-1)}) \stackrel{[\text{theorem: 20.83}]}{=} \lim_{i \rightarrow \infty} \mu(C_i) \quad (21.720)$$

If $x \in \bigcap_{i \in \mathbb{N}} C_i$ then $\forall i \in \mathbb{N}$ we have, as $i + (k-1) \in \mathbb{N}$, that $x \in C_{i+(k-1)} = A_i$ proving that

$$\bigcap_{i \in \mathbb{N}} C_i \subseteq \bigcap_{i \in \mathbb{N}} A_i \quad (21.721)$$

If $x \in \bigcap_{i \in \mathbb{N}} A_i$ then $\forall i \in \mathbb{N}$ we have $x \in A_i$. Let $j \in \mathbb{N}$ then we have either:

$j \in \{k, \dots, \infty\}$. Then $j - (k-1) \in \mathbb{N}$ so that $x \in A_{j-(k-1)} = C_{j-(k-1)+(k-1)} = C_j$

$j \in \{1, \dots, k-1\}$. Then $j < k$ so that $C_k \subseteq C_j$, as $x \in A_1 = C_{1+(k-1)} = C_k$ we have $x \in C_j$.

From the above it follows that $\forall j \in \mathbb{N}$ we have $x \in C_j$ so that $x \in \bigcap_{j \in \mathbb{N}} C_j$ which proves that $\bigcap_{i \in \mathbb{N}} A_i \subseteq \bigcap_{i \in \mathbb{N}} C_i$. Combining this with [eq: 21.721] we have

$$\bigcap_{i \in \mathbb{N}} C_i = \bigcap_{i \in \mathbb{N}} A_i$$

Substituting this in [eq: 21.720] gives finally

$$\mu\left(\bigcap_{i \in \mathbb{N}} C_i\right) = \lim_{i \rightarrow \infty} \mu(C_i) \quad \square$$

For the opposite of the previous theorem we have:

Theorem 21.443. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ a extended real function such that

- a) $\mu(\emptyset) = 0$
- b) $\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$ or $\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$
- c) If $n \in \mathbb{N}$ and $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ is pairwise disjoint we have $\mu(\bigcup_{i \in \{1, \dots, n\}} A_i) = \sum_{i=1}^n \mu(A_i)$

then

- 1. If $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N} A_i \subseteq A_{i+1}$ we have that $\lim_{i \rightarrow \infty} \mu(A_i)$ exists and

$$\mu\left(\bigcup_{i \in \mathbb{N}_0} A_i\right) = \lim_{n \rightarrow \infty} \mu(A_n)$$

then μ is a signed measure on $\mathcal{A}$.

- 2. If $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N} A_{i+1} \subseteq A_i$ and $\bigcap_{i \in \mathbb{N}} A_i = \emptyset$ we have that $\lim_{i \rightarrow \infty} \mu(A_i)$ exists and $\lim_{i \rightarrow \infty} \mu(A_i) = 0$ then μ is a signed measure on $\mathcal{A}$.

Proof.

- 1. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be pairwise disjoint. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \bigsqcup_{j \in \{1, \dots, i\}} A_j \in \mathcal{A}$$

Then using [lemma: 21.6] we have that

$$\bigsqcup_{i \in \mathbb{N}} A_i = \bigcup_{i \in \mathbb{N}} B_i \text{ and } \forall i \in \mathbb{N} B_i \subseteq B_{i+1} \quad (21.722)$$

Next

$$\begin{aligned} \mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &= \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \\ &\stackrel{\text{assumption}}{=} \lim_{i \rightarrow \infty} \mu(B_i) \\ &= \lim_{i \rightarrow \infty} \mu\left(\bigsqcup_{j \in \{1, \dots, i\}} A_j\right) \\ &\stackrel{(c)}{=} \lim_{i \rightarrow \infty} \sum_{j=1}^i \mu(A_j) \end{aligned}$$

which together with (a) and (b) proves that μ is a signed measure on $\mathcal{A}$.

- 2. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be pairwise disjoint. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \bigcup_{j \in \{i, \dots, \infty\}} A_j \in \mathcal{A}$$

Let $i \in \mathbb{N}$ then $B_{i+1} = \bigcup_{j \in \{i+1, \dots, \infty\}} A_j \stackrel{[\text{theorem: 2.128}]}{\subseteq} \bigcup_{j \in \{i, \dots, \infty\}} A_j = B_i$ so that

$$\forall i \in \mathbb{N} \text{ we have } B_{i+1} \subseteq B_i \quad (21.723)$$

Assume that $x \in \bigcap_{i \in \mathbb{N}} B_i$ then $x \in B_1 = \bigcup_{j \in \mathbb{N}} A_j$ so that there exist a $j \in \mathbb{N}$ such that $x \in A_j$. Now $\forall k \in \{j+1, \dots, \infty\}$ we have as $j \neq k$ that $A_j \cap A_k = \emptyset$ so that it follows that $x \notin A_k$ so that $x \notin \bigcup_{j \in \{j+1, \dots, \infty\}} A_j = B_{j+1}$ which contradicts $x \in \bigcap_{i \in \mathbb{N}} B_i$. Hence the assumption is wrong and we must have

$$\bigcap_{i \in \mathbb{N}} B_i = \emptyset \quad (21.724)$$

Using the hypothesis we have that $\lim_{i \rightarrow \infty} \mu(B_i)$ exist and $\lim_{i \rightarrow \infty} \mu(B_i) = 0$. Using [theorem: 20.83] it follows then that

$$\lim_{i \rightarrow \infty} \mu(B_{i+1}) \text{ exist and } \lim_{i \rightarrow \infty} \mu(B_{i+1}) = 0 \quad (21.725)$$

Let $k \in \mathbb{N}$. If $x \in (\bigcup_{i \in \{1, \dots, k\}} A_i) \cap (\bigcup_{i \in \{k+1, \dots, \infty\}} A_i)$ then there exist a $i \in \{1, \dots, k\}$ and a $j \in \{k+1, \dots, \infty\}$ such that $x \in A_i \wedge x \in A_j \Rightarrow x \in A_i \cap A_j$. However as $i \in \{1, \dots, k\} \wedge j \in \{k+1, \dots, \infty\}$ we have $i \leq k < k+1 < j \Rightarrow i \neq j$ so that $A_i \cap A_j = \emptyset$ and we reach a contradiction. Hence we have

$$\forall k \in \mathbb{N} \quad \left(\bigcup_{i \in \{1, \dots, k\}} A_i \right) \cap \left(\bigcup_{i \in \{k+1, \dots, \infty\}} A_i \right) = \emptyset$$

and using [theorem: 2.128]

$$\bigcup_{i \in \mathbb{N}} A_i = \left(\bigcup_{i \in \{1, \dots, k\}} A_i \right) \cup \left(\bigcup_{i \in \{k+1, \dots, \infty\}} A_i \right)$$

By (c) [finite additivity] we have

$$\begin{aligned} \mu \left(\bigcup_{i \in \mathbb{N}} A_i \right) &= \mu \left(\left(\bigcup_{i \in \{1, \dots, k\}} A_i \right) \cup \left(\bigcup_{i \in \{k+1, \dots, \infty\}} A_i \right) \right) \\ &= \mu \left(\bigcup_{i \in \{1, \dots, k\}} A_i \right) + \mu \left(\bigcup_{i \in \{k+1, \dots, \infty\}} A_i \right) \\ &= \mu \left(\bigcup_{i \in \{1, \dots, k\}} A_i \right) + \mu(B_{k+1}) \\ &\stackrel{(c)}{=} \mu \left(\sum_{i=1}^k \mu(A_i) \right) + \mu(B_{k+1}) \end{aligned}$$

which proves that

$$\forall k \in \mathbb{N} \text{ we have } \mu \left(\bigcup_{i \in \mathbb{N}} A_i \right) = \mu \left(\sum_{i=1}^k \mu(A_i) \right) + \mu(B_{k+1}) \quad (21.726)$$

For μ we have now either:

$\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$. Then for $\mu(\bigcup_{i \in \mathbb{N}} A_i)$ we have either:

$\mu(\bigcup_{i \in \mathbb{N}} A_i) \in \mathbb{R}$. Then from [eq: 21.726] it follows that $\sum_{i=1}^k \mu(A_i), \mu(B_{k+1}) \in \mathbb{R}$ so that

$$\forall k \in \mathbb{N} \text{ we have } \left| \sum_{i=1}^k \mu(A_i) - \mu \left(\bigcup_{i \in \mathbb{N}} A_i \right) \right| = |\mu(B_{k+1})|$$

Let $\varepsilon \in \mathbb{R}^+$ then as $\lim_{i \rightarrow \infty} \mu(B_{k+1}) \stackrel{[\text{eq: 21.725}]}{=} 0$ there exist a $N \in \mathbb{N}$ such that

$\forall k \in \{N, \dots, \infty\} |\mu(B_{k+1})| < \varepsilon \Rightarrow |\sum_{i=1}^k \mu(A_i) - \mu(\bigcup_{i \in \mathbb{N}} A_i)| < \varepsilon$. This proves that

$$\lim_{k \rightarrow \infty} \sum_{i=1}^k \mu(A_i) \text{ exist and } \sum_{i=1}^{\infty} \mu(A_i) = \lim_{k \rightarrow \infty} \sum_{i=1}^k \mu(A_i) = \mu \left(\bigcup_{i \in \mathbb{N}} A_i \right)$$

$\mu(\bigcup_{i \in \mathbb{N}} A_i) = \infty$. As $\lim_{i \rightarrow \infty} \mu(B_{k+1}) \stackrel{[\text{eq: 21.725}]}{=} 0$ there exist a $N \in \mathbb{N}$ such that

$\forall n \in \{N, \dots, \infty\} |\mu(B_{n+1})| < 1$. So we have $\forall n \in \{N, \dots, \infty\}$ that $\mu(B_{n+1}) \in \mathbb{R}$ which combined with [eq: 21.726] proves that $\forall n \in \{N, \dots, \infty\} \sum_{i=1}^n \mu(A_i) = \infty$. Hence if $C \in \mathbb{R}^+$ we have that $\forall n \in \{N, \dots, \infty\} C < \sum_{i=1}^n \mu(A_i)$ which proves by [theorem: 20.78] that $\lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i)$ exist and $\lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i) = \infty$. So that

$$\sum_{i=1}^{\infty} \mu(A_i) = \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i) = \infty = \mu \left(\bigcup_{i \in \mathbb{N}} A_i \right)$$

$\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$. For $\mu(\bigcup_{i \in \mathbb{N}} A_i)$ we have either:

$\mu(\bigcup_{i \in \mathbb{N}} A_i) \in \mathbb{R}$. Then from [eq: 21.726] it follows that $\sum_{i=1}^k \mu(A_i), \mu(B_{k+1}) \in \mathbb{R}$ so that

$$\forall k \in \mathbb{N} \text{ we have } \left| \sum_{i=1}^k \mu(A_i) - \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \right| = |\mu(B_{k+1})|$$

Let $\varepsilon \in \mathbb{R}^+$ then as $\lim_{i \rightarrow \infty} \mu(B_{k+1}) \stackrel{[\text{eq: 21.725}]}{=} 0$ there exist a $N \in \mathbb{N}$ such that $\forall k \in \{N, \dots, \infty\} |\mu(B_{k+1})| < \varepsilon \Rightarrow \left| \sum_{i=1}^k \mu(A_i) - \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) \right| < \varepsilon$. This proves that

$$\lim_{k \rightarrow \infty} \sum_{i=1}^k \mu(A_i) \text{ exist and } \sum_{i=1}^{\infty} \mu(A_i) = \lim_{k \rightarrow \infty} \sum_{i=1}^k \mu(A_i) = \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right)$$

$\mu(\bigcup_{i \in \mathbb{N}} A_i) = -\infty$. As $\lim_{i \rightarrow \infty} \mu(B_{k+1}) \stackrel{[\text{eq: 21.725}]}{=} 0$ there exist a $N \in \mathbb{N}$ such that $\forall n \in \{N, \dots, \infty\} |\mu(B_{n+1})| < 1$. So we have $\forall n \in \{N, \dots, \infty\}$ that $\mu(B_{n+1}) \in \mathbb{R}$ which combined with [eq: 21.726] proves that $\forall n \in \{N, \dots, \infty\} \sum_{i=1}^n \mu(A_i) = -\infty$. Hence if $C \in \mathbb{R}^+$ we have that $\forall n \in \{N, \dots, \infty\} \sum_{i=1}^n \mu(A_i) < -C$ which proves by [theorem: 20.78] that $\lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i)$ exist and $\lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i) = -\infty$. So that

$$\sum_{i=1}^{\infty} \mu(A_i) = \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i) = -\infty = \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right)$$

So in all cases we have that

$$\sum_{i=1}^{\infty} \mu(A_i) \text{ exist and } \sum_{i=1}^{\infty} \mu(A_i) = \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right)$$

This together with (a) and (b) proves that μ is signed measure. $\square$

21.6.1.2 Hahn and Jordan decomposition

In [theorem: 21.438] we have showed that for two measures, where one of them is finite, the difference of these measures is a signed measure. In this section we want to show that every signed measure can be written as the difference of two measures.

Definition 21.444. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$ then for $A \subseteq X$ we say that

1. A is a **positive set for μ** if $A \in \mathcal{A}$ and $\forall B \in \mathcal{A}$ with $B \subseteq A$ we have $0 \leq \mu(B)$.
2. A is a **negative set for μ** if $A \in \mathcal{A}$ and $\forall B \in \mathcal{A}$ with $B \subseteq A$ we have $\mu(B) \leq 0$.

Example 21.445. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$ then $\emptyset$ is a positive set for μ and $\emptyset$ is a negative set for μ .

Proof. First $\emptyset \in \mathcal{A}$, second if $E \subseteq \emptyset$ then $E = \emptyset$ and $\mu(E) = \mu(\emptyset) = 0$ hence $\emptyset$ is a positive and negative set for μ . $\square$

Lemma 21.446. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$ then we have for the signed measure $-\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ defined by $(-\mu)(A) = -\mu(A) = (-1) \cdot \mu(A)$ [see theorem: 21.439]

1. If A is a positive set for $\mu \Leftrightarrow A$ is a negative set for $-\mu$
2. If A is a negative set for $\mu \Leftrightarrow A$ is a positive set for $-\mu$

Proof.

1.

$\Rightarrow$. If A is a positive set for μ then we have for $B \in \mathcal{A}$ with $B \subseteq A$ that $0 \leq \mu(B)$ hence $(-\mu)(B) = -\mu(B) \leq 0$ which proves that A is a negative set for $-\mu$.

$\Leftarrow$. If A is a negative set for $-\mu$ then we have for $B \in \mathcal{A}$ with $B \subseteq A$ that $(-\mu)(B) \leq 0$ hence $-\mu(B) \leq 0$ so that $0 \leq \mu(B)$ which proves that μ is a positive set for μ .

2.

$\Rightarrow$. If A is a negative set for μ then we have for $B \in \mathcal{A}$ with $B \subseteq A$ that $\mu(B) \leq 0$ hence $(-\mu)(B) = -\mu(B) \geq 0$ which proves that A is a positive set for $-\mu$.

$\Leftarrow$. If A is a positive set for $-\mu$ then we have for $B \in \mathcal{A}$ with $B \subseteq A$ that $0 \leq (-\mu)(B)$ hence $0 \leq -\mu(B)$ so that $\mu(B) \leq 0$ which proves that μ is a negative set for μ . $\square$

Lemma 21.447. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$ then we have

1. If A is a positive set for μ then $\forall B \in \mathcal{A}$ with $B \subseteq A$ we have $\mu(B) \leq \mu(A)$
2. If A is a negative set for μ then $\forall B \in \mathcal{A}$ with $B \subseteq A$ we have $\mu(A) \leq \mu(B)$

Proof.

1. As A is a positive set for μ and $A, B, A \setminus B \in \mathcal{A}$ with $A \subseteq A, B \subseteq A, A \setminus B \subseteq A$ we have that

$$0 \leq \mu(A) \wedge 0 \leq \mu(B) \wedge 0 \leq \mu(A \setminus B)$$

Now as $B \subseteq A$ we have $A = (A \setminus B) \sqcup B$, hence

$$\mu(A) = \mu(A \setminus B) + \mu(B)$$

For $\mu(A)$ we have now as $0 \leq \mu(A)$ either

$\mu(A) = \infty$. then $\mu(B) \leq \mu(A)$.

$\mu(A) < \infty$. then we have by [theorem: 21.441] that $\mu(A \setminus B) \in \mathbb{R}$ and $\mu(B) \in \mathbb{R}$ so that $\mu(B) = \mu(A) - \mu(A \setminus B)$ giving $\mu(B) \leq \mu(A)$.

So in all cases we have $\mu(B) \leq \mu(A)$

2. As A is a negative set for μ and $A, B, A \setminus B \in \mathcal{A}$ with $A \subseteq A, B \subseteq A, A \setminus B \subseteq A$ we have that

$$\mu(A) \leq 0 \wedge \mu(B) \leq 0 \wedge \mu(A \setminus B) \leq 0$$

Now as $B \subseteq A$ we have $A = (A \setminus B) \sqcup B$, hence

$$\mu(A) = \mu(A \setminus B) + \mu(B)$$

For $\mu(A) \leq 0$ we have now as $\mu(A) \leq 0$ either

$\mu(A) = -\infty$. then $\mu(A) \leq \mu(B)$

$-\infty < \mu(A)$. then by [theorem: 21.441] $\mu(A \setminus B) \in \mathbb{R}$ and $\mu(B) \in \mathbb{R}$ so that, as $\mu(A \setminus B) \leq 0$, that $\mu(A) = \mu(A \setminus B) + \mu(B) \leq \mu(B)$.

So in all cases we have $\mu(A) \leq \mu(B)$. $\square$

Lemma 21.448. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ be a signed measure on $\mathcal{A}$. Let $A \in \mathcal{A}$ be such that $-\infty < \mu(A) < 0$ then there exist a **negative set** B such that $B \subseteq A$ and $\mu(B) \leq \mu(A)$.

Proof. Consider the set $\{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}$ then as $\mu(\emptyset) = 0, \emptyset \in \mathcal{A}$ and $\emptyset \subseteq A$ we have that $0 \in \{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\} \Rightarrow \{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\} \neq \emptyset$ so that

$$\delta_1 = \sup(\{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}) \text{ exist and } 0 \leq \delta_1 \in \overline{\mathbb{R}} \quad (21.727)$$

For δ_1 we have now two possible cases:

$$\delta_1 = \infty. \text{ Then } 0 \leq \min\left(\frac{\delta_1}{2}, 1\right) = 1 < \infty = \delta_1$$

$$\delta_1 < \infty. \text{ Then } 0 \leq \min\left(\frac{\delta_1}{2}, 1\right) < \frac{\delta_1}{2} < \delta_1$$

Hence we have

$$0 \leq \min\left(\frac{\delta_1}{2}, 1\right) < \delta_1$$

so that there exist $A_1 \in \{B \in \mathcal{B} | B \subseteq A\}$ with $\min\left(\frac{\delta_1}{2}, 1\right) < \mu(A_1) \leq \delta_1$. Define now

$$\{(\rho_n, B_n)\}_{n \in \mathbb{N}}$$

recursively by:

$n = 1$. Then we define (ρ_1, B_1) by $\rho_1 = \delta_1$ and $B_1 = A_1$ so that

$$B_1 \in \mathcal{A} \wedge B_1 \subseteq A \text{ and } 0 \leq \min\left(\frac{\rho_1}{2}, 1\right) < \mu(A_1) \leq \rho_1$$

$n \in \{2, \dots, \infty\}$. Then $\emptyset \subseteq A \setminus (\bigcup_{i=1}^{n-1} B_i)$, $\emptyset \in \mathcal{A}$ and $0 = \mu(\emptyset)$. So that

$$0 \in \left\{ \mu(B) | B \in \mathcal{A} \wedge B \subseteq A \setminus \left(\bigcup_{i=1}^{n-1} B_i \right) \right\}$$

hence

$$\rho_n = \sup \left(\left\{ \mu(B) | B \in \mathcal{A} \wedge B \subseteq A \setminus \left(\bigcup_{i=1}^{n-1} B_i \right) \right\} \right) \text{ exist and } 0 \leq \rho_n$$

For ρ_n we have either:

$$\rho_n = \infty. \text{ Then } 0 \leq \min\left(\frac{\rho_n}{2}, 1\right) = 1 < \infty = \rho_n$$

$$\rho_n < \infty. \text{ Then } 0 \leq \min\left(\frac{\rho_n}{2}, 1\right) \leq \frac{\rho_n}{2} < \rho_n$$

so that

$$0 \leq \min\left(\frac{\rho_n}{2}, 1\right) < \rho_n$$

Hence there exist a $B_n \in \{B \in \mathcal{A} | B \subseteq A \setminus (\bigcup_{i \in \{1, \dots, n-1\}} B_i)\}$ such that $\min\left(\frac{\rho_n}{2}, 1\right) < \mu(B_n) \leq \rho_n$ so that

$$B_n \in \mathcal{A} \wedge B_n \subseteq A \setminus \left(\bigcup_{i \in \{1, \dots, n-1\}} B_i \right) \text{ and } 0 \leq \min\left(\frac{\rho_n}{2}, 1\right) < \mu(B_n) \leq \rho_n$$

So we have constructed a sequence $\{(\rho_n, B_n)\}_{n \in \mathbb{N}}$ such that $\forall n \in \mathbb{N}$

$$\rho_n = \begin{cases} \sup(\{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}) & \text{if } n = 1 \\ \sup(\{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A \setminus (\bigcup_{k \in \{1, \dots, n-1\}} B_k)\}) & \text{if } n \in \{2, \dots, \infty\} \end{cases} \quad (21.728)$$

$$B_n = \begin{cases} \{B \in \mathcal{A} | B \subseteq A\} & \text{if } n = 1 \\ \{B \in \mathcal{A} | B \subseteq A \setminus (\bigcup_{i \in \{1, \dots, n-1\}} B_i)\} & \text{if } n \in \{2, \dots, \infty\} \end{cases} \quad (21.729)$$

$$0 \leq \min\left(\frac{\rho_n}{2}, 1\right) < \mu(B_n) \leq \rho_n \quad (21.730)$$

Let $i, j \in \mathbb{N}$ with $i \neq j$ then we may always assume that $i < j$ [otherwise exchange i and j]. Then as $i \leq j - 1$ we have that $B_j \subseteq A \setminus (\bigcup_{k \in \{1, \dots, j-1\}} B_k) \subseteq A \subseteq A \setminus B_i$ so that $B_j \cap B_i \subseteq (A \setminus B_i) \cap B_i = \emptyset$ which proves that

$$\{B_n\}_{n \in \mathbb{N}} \subseteq \mathcal{A} \text{ is pairwise disjoint} \quad (21.731)$$

Define

$$B_\infty = \bigcup_{n \in \mathbb{N}} B_n \in \mathcal{A} \text{ and } B = A \setminus B_\infty \in \mathcal{A} \text{ then } B \subseteq A \quad (21.732)$$

We will prove now that B is the required negative set. As $\forall n \in \mathbb{N}$ we have from [eq: 21.730] that

$$0 \leq \min\left(\frac{\delta_1}{2}, 1\right) < \mu(B_1) \leq \sum_{i=1}^n \mu(B_i) \leq \sup\left(\left\{\sum_{i=1}^n \mu(B_i) \mid n \in \mathbb{N}\right\}\right) = \sum_{i=1}^{\infty} \mu(B_i)$$

so that $0 < \sum_{i=1}^{\infty} \mu(B_i)$. As further μ is a signed measure we have

$$0 < \sum_{i=1}^{\infty} \mu(B_i) \underset{[\text{eq: 21.731}]}{=} \mu\left(\bigcup_{n \in \mathbb{N}} B_n\right) \underset{[\text{eq: 21.732}]}{=} \mu(B_\infty)$$

so that

$$0 < \sum_{i=1}^{\infty} \mu(B_i) = \mu(B_\infty) \quad (21.733)$$

Using [eq: 21.729] we have $\forall i \in \mathbb{N}$ that $B_i \subseteq A$ so that $B_\infty \subseteq A$ hence $A = (A \setminus B_\infty) \sqcup B_\infty = B \sqcup B_\infty$ so that by [theorem: 21.440]

$$\mu(A) = \mu(B) + \mu(B_\infty) \quad (21.734)$$

As $0 < \mu(B_\infty)$ we have by [theorem: 20.29] that $\mu(B) = \mu(B) + 0 \leq \mu(B) + \mu(B_\infty) = \mu(A)$ so that

$$B \in \mathcal{A} \text{ and } \mu(B) \leq \mu(A) \quad (21.735)$$

This proves the last part of the lemma, the only thing that still must be proved is that B is a negative set for μ .

As by [eq: 21.729] $\forall n \in \mathbb{N}$ $B_n \subseteq A$ it follows that $B_\infty = \bigcup_{n \in \mathbb{N}} B_n \subseteq A$, further by the hypothesis $\mu(A) \in \mathbb{R}$, so using [theorem: 21.441] we have $\sum_{i=1}^{\infty} \mu(B_i) = \mu(B_\infty) \in \mathbb{R}$, applying then [theorem: 14.355] proves that

$$\lim_{i \rightarrow \infty} \mu(B_i) = 0$$

Let $\varepsilon \in \mathbb{R}^+$ then, using the above, there exist a $N \in \mathbb{N}$ such that $\forall n \in \{N, \dots, \infty\}$

$$\mu(B_n) \underset{[21.730]}{=} |\mu(B_n) - 0| < \min\left(\frac{\varepsilon}{2}, \frac{1}{2}\right).$$

Using [eq: 21.730] $\min\left(\frac{\rho_n}{2}, 1\right) \leq \mu(B_n)$ so that $\min\left(\frac{\rho_n}{2}, 1\right) \leq \min\left(\frac{\varepsilon}{2}, \frac{1}{2}\right)$. Assume that $1 < \frac{\rho_n}{2}$ then $\min\left(\frac{\rho_n}{2}, 1\right) = 1 < \min\left(\frac{\varepsilon}{2}, \frac{1}{2}\right) \leq \frac{1}{2}$ giving the contradiction $1 \leq \frac{1}{2}$. Hence must have $\frac{\rho_n}{2} \leq 1$ so that $\frac{\rho_n}{2} = \min\left(\frac{\rho_n}{2}, 1\right) < \min\left(\frac{\varepsilon}{2}, \frac{1}{2}\right) \leq \frac{\varepsilon}{2}$ from which it follows that $|\rho_n - 0| = \rho_n < \varepsilon$. This proves that

$$\lim_{i \rightarrow \infty} \rho_n = 0 \quad (21.736)$$

Let $E \in \mathcal{A}$ with $E \subseteq B$. For $n \in \mathbb{N}$ we have either:

$n = 1$. Then as $B_1 \subseteq \bigcup_{i \in \mathbb{N}} B_i = B_\infty$ we have that $B = A \setminus B_\infty \subseteq A \setminus B_1 \subseteq A$ so that $E \subseteq A$ which proves that $E \in \{B \in \mathcal{A} \mid B \subseteq A\}$. From this it follows that

$$\mu(E) \leq \sup\left(\{\mu(B) \mid B \in \mathcal{A} \wedge B \subseteq A\}\right) \underset{[\text{eq: 21.728}]}{=} \rho_1$$

$n \in \{2, \dots, \infty\}$. Then as $\bigcup_{i \in \{1, \dots, n-1\}} B_i \subseteq \bigcup_{i \in \mathbb{N}} B_i = B_\infty$ we have that

$$E \subseteq B = A \setminus B_\infty \subseteq A \setminus \left(\bigcup_{i \in \{1, \dots, n-1\}} B_i\right)$$

so that $E \in \{B \in \mathcal{A} \mid B \subseteq \setminus (\bigcup_{i \in \{1, \dots, n-1\}} B_i)\}$. Hence

$$\mu(E) \leq \sup \left(\left\{ \mu(B) \mid B \in \mathcal{A} \wedge B \subseteq \setminus \left(\bigcup_{i \in \{1, \dots, n-1\}} B_i \right) \right\} \right) = \rho_n$$

So we have proved that

$$\forall n \in \mathbb{N} \text{ we have } \mu(E) \leq \rho_n \quad (21.737)$$

Assume that $0 < \mu(E)$ then as $\lim_{n \rightarrow \infty} \rho_n \stackrel{[\text{eq: 21.736}]}{=} 0$ there exist a $N \in \mathbb{N}$ such that $\rho_n = |\rho_n - 0| < \mu(E)$ contradicting [eq: 21.737]. Hence we must have that $\mu(E) \leq 0$. So the assumption is false and we must have that $\mu(E) \leq 0$. In other words we have proved that

$$\forall E \in \mathcal{A} \text{ with } E \subseteq B \text{ we have } \mu(E) \leq 0$$

which proves that

$$B \text{ is a negative set for } \mu$$

The above combined with [eq: 21.735] proves the lemma. $\square$

Lemma 21.449. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$. If A and B are negative sets for μ such that $A \cap B = \emptyset$ then $A \cup B$ is a negative set for μ .

Proof. Let $C \in \mathcal{A}$ be such that $C \subseteq A \cup B$. Then $C = C \cap (A \cup B) = (C \cap A) \cup (C \cap B)$ and $(C \cap A) \cap (C \cap B) = C \cap (A \cap B) = \emptyset$. So

$$\mu(C) = \mu(C \cap A) + \mu(C \cap B)$$

As A, B are negative sets for μ , $C \cap A, C \cap B \in \mathcal{A}$ and $C \cap A \subseteq A$, $C \cap B \subseteq B$, we have $\mu(C \cap A) \leq 0$ and $\mu(C \cap B) \leq 0$. So we have that

$$\mu(C) = \mu(C \cap A) + \mu(C \cap B) \leq 0$$

Hence $A \cup B$ is a negative set. $\square$

Definition 21.450. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$. Then (P, N) is a **Hahn Decomposition of μ** if

$$\begin{aligned} X &= P \cup N \text{ and } P \cap N = \emptyset \\ P &\text{ is a positive set for } \mu \\ N &\text{ is a negative set for } \mu \end{aligned}$$

It is possible that there are two Hahn Decompositions of a measure but then there is a relation between the positive and negative sets.

Theorem 21.451. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$ and $(P_1, N_1), (P_2, N_2)$ be two Hahn decompositions of μ then $\mu(P_1 \cap N_2) = 0 = \mu(P_2 \cap N_1)$.

Proof. As $P_1 \cap N_2 \in \mathcal{A}$, $P_1 \cap N_2 \subseteq P_1, P_1 \cap N_2 \subseteq N_2$, P_1 a positive set for μ and N_2 a negative set for μ , we have $0 \leq \mu(P_1 \cap N_2) \leq 0$ proving that

$$\mu(P_1 \cap N_2) = 0$$

Likewise, as $P_2 \cap N_1 \in \mathcal{A}$, $P_2 \cap N_1 \subseteq P_2, P_2 \cap N_1 \subseteq N_1$, P_2 a positive set for μ and N_1 a negative set for μ , we have $0 \leq \mu(P_2 \cap N_1) \leq 0$ proving that

$$\mu(P_2 \cap N_1) = 0 \quad \square$$

Theorem 21.452. (Hahn Decomposition Theorem) Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \rightarrow \mathbb{R}$ a signed measure on $\langle X, \mathcal{A} \rangle$. Then there exists a Hahn decomposition of μ . In other words there exists subsets $P, N \subseteq X$ such that

$$\begin{aligned} X &= P \cup N \text{ and } P \cap N = \emptyset \\ P &\text{ is a positive set for } \mu \\ N &\text{ is a negative set for } \mu \end{aligned}$$

Proof. For μ we have two cases to consider:

$\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$. As $\emptyset$ is a negative set for μ [see example: 21.445] and $\mu(\emptyset) = 0$ it follows that $0 \in \{\mu(A) | A \text{ is a negative set for } \mu\}$ so that

$$L = \inf(\{\mu(A) | A \text{ is a negative set for } \mu\}) \text{ exist and } L \leq 0 \quad (21.738)$$

Using [theorem: 20.82] there exist a sequence $\{x_i\}_{i \in \mathbb{N}} \subseteq \{\mu(A) | A \text{ is a negative set for } \mu\}$ such that $\lim_{n \rightarrow \infty} x_n$ exist and $\lim_{n \rightarrow \infty} x_n = L$. Hence there exist a sequence $\{A_n\}_{n \in \mathbb{N}}$ of negative sets for μ such that $\forall n \in \mathbb{N}$ we have $\mu(A_n) = x_n$ so that

$$\lim_{n \rightarrow \infty} \mu(A_n) \text{ exist and } \lim_{n \rightarrow \infty} \mu(A_n) = L \quad (21.739)$$

By the definition of a negative set we have $\{A_n\}_{n \in \mathbb{N}} \subseteq \mathcal{A}$ so that

$$N = \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{A} \quad (21.740)$$

We prove now that N is a negative set for μ . Using [theorem: 21.94] there exist a sequence $\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ such that

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ is pairwise disjoint, } N = \bigcup_{i \in \mathbb{N}} B_i \text{ and } \forall i \in \mathbb{N} \text{ we have } B_i \subseteq A_i \quad (21.741)$$

Let $E \in \mathcal{A}$ with $E \subseteq N$ then

$$\begin{aligned} \mu(E) &= \mu(E \cap N) \\ &= \mu\left(E \cap \left(\bigcup_{i \in \mathbb{N}} B_i\right)\right) \\ &= \mu\left(\bigcup_{i \in \mathbb{N}} (E \cap B_i)\right) \\ &= \sum_{i=1}^{\infty} \mu(E \cap B_i) \end{aligned} \quad (21.742)$$

Given $i \in \mathbb{N}$ we have by [eq: 21.741] $E \cap B_i \in \mathcal{A}$ and $E \cap B_i \subseteq B_i \subseteq A_i$. As A_i is a negative set for μ it follows that $\mu(E \cap B_i) \leq 0$. Hence

$$\mu(E) \stackrel{[\text{eq: 21.742}]}{=} \sum_{i=1}^{\infty} \mu(E \cap B_i) = \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(E \cap B_i) \stackrel{[\text{eq: 20.84}]}{\leq} 0$$

So $\forall E \in \mathcal{A}$ with $E \subseteq N$ we have $\mu(E) \leq 0$ which proves that

$$N \text{ is a negative set for } \mu \quad (21.743)$$

From the above it follows that $\mu(N) \in \{\mu(A) | A \text{ is a negative set for } \mu\}$ so that

$$L = \inf(\{\mu(A) | A \text{ is a negative set for } \mu\}) \leq \mu(N) \quad (21.744)$$

Further given $n \in \mathbb{N}$ $A_n \in \mathcal{A}$, $A_n \subseteq \bigcup_{i \in \mathbb{N}} A_i = N$ and N is a negative set. So it follows from [theorem: 21.447] $\mu(N) \leq \mu(A_n)$. Using [theorem: 20.84] it follows then that $\mu(N) \leq \lim_{n \rightarrow \infty} \mu(A_n) \stackrel{[\text{eq: 21.739}]}{=} L$ which combined with [eq: 21.744]

$$L = \mu(N) \quad (21.745)$$

As $L \leq 0$ we have from the above that $\mu(N) \leq 0 < \infty$ so that $\mu(N) \neq \infty$, further as $\mu(N) \in \{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_+$ we have that $\mu(N) \neq -\infty$. Hence we have

$$\mu(N) \in \mathbb{R} \quad (21.746)$$

Let $P = X \setminus N$ then we prove that P is a positive set for μ . As $N \in \mathcal{A}$ we have that $P \in \mathcal{A}$. Assume that there exist a $C \in \mathcal{A}$ with $C \subseteq P$ such that $\mu(C) < 0$. As $\mu(C) \in \{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$ we have $\mu(C) \neq -\infty$ so that $-\infty < \mu(C) < 0$. Using then [lemma: 21.448] it follows that there exist a negative set B for μ such that

$$B \subseteq C \text{ and } \mu(B) \leq \mu(C) < 0 \quad (21.747)$$

Also we have $N \cap B \subseteq N \cap C \subseteq N \cap P = N \cap (X \setminus N) = \emptyset$ so that

$$N \cap B = \emptyset \quad (21.748)$$

As N, B are negative sets for μ we have by the above and [lemma: 21.449] that

$$N \cup B \text{ is a negative set for } \mu \quad (21.749)$$

Now as $\mu(N) \in \mathbb{R}$ and $\mu(B) < 0$ [see eq: 21.746, 21.747] we have that $\mu(N) + \mu(B) < \mu(N) = L$. So

$$\begin{aligned} \mu(N \cup B) & \stackrel{N \cap B = \emptyset}{=} \mu(N) + \mu(B) \\ & < L \\ & = \inf(\{\mu(A) | A \text{ is a negative set for } \mu\}) \\ & \leq \mu(N \cup B) \end{aligned} \quad \text{[eq: 21.749]}$$

leading to the contradiction $\mu(N \cup B) < \mu(N \cup B)$. So the assumption is wrong and we must have that $\forall C \in \mathcal{A}$ with $C \subseteq P$ we have $0 \leq \mu(C)$ which proves that

$$P \text{ is a positive set for } \mu \quad (21.750)$$

To summarize

$$N \text{ is a negative set for } \mu, P \text{ is a positive set for } \mu, \emptyset = P \cap N \text{ and } X = P \cup N$$

$\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$. Using [lemma: 21.446] we have that $\nu = (-\mu): \mathcal{A} \rightarrow \overline{\mathbb{R}}$ is a signed measure on $\mathcal{A}$. Further if $x \in \{\nu(A) | A \in \mathcal{A}\}$ then there exist a $A \in \mathcal{A}$ such that $x = \nu(A) = -\mu(A)$. As we have either $\mu(A) \in \mathbb{R} \Rightarrow -\mu(A) \in \mathbb{R}$ or $\mu(A) = -\infty \Rightarrow -\mu(A) = \infty$ it follows that $\{\nu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_\infty$. Using then the previous case [see eq: 21.750] for ν there exist a positive set N for ν and a negative set P for ν such that $P \cap N = \emptyset$ and $X = P \cup N$. Using [lemma: 21.446] it follows that P is a positive set for $-\nu = -(-\mu) = \mu$ and N is a negative set for $-\nu = -(-\mu) = \mu$. $\square$

The Hahn Decompositions allows us to write every signed measure as the difference of two measures.

Theorem 21.453. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ a signed measure on $\mathcal{A}$ and (P, N) a Hahn decomposition of μ then we have:*

$$\forall A \in \mathcal{A} \quad \mu(A \cap P) \in [0, \infty] \wedge -\mu(A \cap N) \in [0, \infty]$$

$$\mu^+: \mathcal{A} \rightarrow [0, \infty] \text{ defined by } \mu^+(A) = \mu(A \cap P) \text{ is a measure on } \mathcal{A}$$

$$\mu^-: \mathcal{A} \rightarrow [0, \infty] \text{ defined by } \mu^-(A) = -\mu(A \cap N) \text{ is a measure on } \mathcal{A}$$

$$\mu^+ \text{ or } \mu^- \text{ is finite}$$

$$\forall A \in \mathcal{A} \text{ we have } \mu(A) = \mu^+(A) - \mu^-(A)$$

Further we have that

$$\forall A \in \mathcal{A} \quad \mu^+(A) = \sup(\{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}) \text{ and } \mu^-(A) = \sup(\{-\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\})$$

Proof. Let $A \in \mathcal{A}$. As P is a positive set for μ and N is a negative set for μ we have that $N, P \in \mathcal{A}$ so that $A \cap P, A \cap N \in \mathcal{A}$. As also $A \cap P \subseteq P, A \cap N \subseteq N$ it follows that $0 \leq \mu(A \cap P)$ and $\mu(A \cap N) \leq 0$ so that

$$\forall A \in \mathcal{A} \text{ we have } \mu(A \cap P) \in [0, \infty] \wedge -\mu(A \cap N) \in [0, \infty] \quad (21.751)$$

Further we have

$$\mu^+(\emptyset) = \mu(\emptyset \cap P) = \mu(\emptyset) = 0 \text{ and } \mu^-(\emptyset) = -\mu(\emptyset \cap N) = -\mu(\emptyset) = 0$$

and for every $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ pairwise disjoint that

$$\begin{aligned} \mu^+\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &= \mu\left(\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) \cap P\right) \\ &= \mu\left(\bigsqcup_{i \in \mathbb{N}} (A_i \cap P)\right) \\ &= \sum_{i=1}^{\infty} \mu(A_i \cap P) \\ &= \sum_{i=1}^{\infty} \mu^+(A_i) \\ \mu^-\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &= -\mu\left(\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) \cap N\right) \\ &= -\mu\left(\bigsqcup_{i \in \mathbb{N}} (A_i \cap N)\right) \\ &= (-1) \cdot \sum_{i=1}^{\infty} \mu(A_i \cap N) \\ &= (-1) \cdot \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i \cap N) \\ &\stackrel{[\text{theorem: 20.84}]}{=} \lim_{n \rightarrow \infty} \sum_{i=1}^n (-\mu(A_i \cap N)) \\ &= \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu^-(A_i) \\ &= \sum_{i=1}^{\infty} \mu^-(A_i) \end{aligned}$$

Which proves that

$$\mu^+: \mathcal{A} \rightarrow [0, \infty] \text{ and } \mu^-: \mathcal{A} \rightarrow [0, \infty] \text{ are measures} \quad (21.752)$$

For μ we have either:

$\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{\infty}$. Suppose that there exist a $A \in \mathcal{A}$ such that $\mu^-(A) = \infty$ then $\infty = -\mu(A \cap N) \Rightarrow \mu(A \cap N) = -\infty$ contradicting $\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{\infty}$. Hence we have that $\forall A \in \mathcal{A} \quad \mu^-(A) \in [0, \infty[$, in other words μ^- is finite.

$\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$. Suppose that there exist a $A \in \mathcal{A}$ such that $\mu^+(A) = \infty$ then $\mu(A \cap N) = \infty$ contradicting $\{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}_{-\infty}$. Hence we have that $\forall A \in \mathcal{A} \quad \mu^+(A) \in [0, \infty[$, in other words μ^+ is finite.

Hence we have that

$$\mu^+ \text{ is finite or } \mu^- \text{ is finite} \quad (21.753)$$

Let $A \in \mathcal{A}$ then as $X = P \sqcup N$ and $P \cap N = \emptyset$ we have

$$\begin{aligned} \mu(A) &= \mu(A \cap X) \\ &= \mu(A \cap (P \sqcup N)) \\ &= \mu((A \cap P) \cup (A \cap N)) \\ &\stackrel{P \cap N = \emptyset}{=} \mu(A \cap P) + \mu(A \cap N) \\ &= \mu^+(A) - \mu^-(A) \end{aligned}$$

Hence we have

$$\forall A \in \mathcal{A} \text{ we have } \mu(A) = \mu^+(A) - \mu^-(A) \quad (21.754)$$

So the only thing left to prove is that we can define μ^+ and μ^- in terms of the supremums. Let $A \in \mathcal{A}$ then if $B \in \mathcal{A}$ with $B \subseteq A$ we have

$$\mu(B) \stackrel{[\text{eq: 21.754}]}{=} \mu^+(B) - \mu^-(B) \stackrel{[\text{eq: 21.753}] \wedge [\text{theorem: 20.27}]}{\leq} \mu^+(B) \stackrel{[\text{theorem: 21.106}]}{\leq} \mu^+(A)$$

so that

$$\sup \{ \mu(B) | B \in \mathcal{A} \wedge B \subseteq A \} \leq \mu^+(A) \quad (21.755)$$

Further, as $A \cap P \in \mathcal{A}$, $A \cap P \subseteq A$ and $\mu^+(A) = \mu(A \cap P)$, we have $\mu^+(A) \in \{ \mu(B) | B \in \mathcal{A} \wedge B \subseteq A \}$ so that $\mu^+(A) \leq \sup \{ \mu(B) | B \in \mathcal{A} \wedge B \subseteq A \}$. Combining this with [eq: 21.755] proves that $\mu^+(A) = \sup \{ \mu(B) | B \in \mathcal{A} \wedge B \subseteq A \}$. Hence

$$\forall A \in \mathcal{A} \text{ we have } \mu^+(A) = \sup \{ \mu(B) | B \in \mathcal{A} \wedge B \subseteq A \} \quad (21.756)$$

Similar, let $A \in \mathcal{A}$ then if $B \in \mathcal{A}$ with $B \subseteq A$ we have

$$-\mu(B) \stackrel{[\text{eq: 21.754}]}{=} \mu^-(B) - \mu^+(B) \stackrel{[\text{eq: 21.753}] \wedge [\text{theorem: 20.27}]}{\leq} \mu^-(B) \stackrel{[\text{theorem: 21.106}]}{\leq} \mu^-(A)$$

so that

$$\sup \{ -\mu(B) | B \in \mathcal{A} \wedge B \subseteq A \} \leq \mu^-(A) \quad (21.757)$$

Further as $A \cap N \in \mathcal{A}$, $A \cap N \subseteq A$ and $\mu^-(A) = -\mu(A \cap N)$, we have that $\mu^-(A) \in \{ -\mu(B) | B \in \mathcal{A} \wedge B \subseteq A \}$ so that $\mu^-(A) \leq \sup \{ -\mu(B) | B \in \mathcal{A} \wedge B \subseteq A \}$. Combining this with [eq: 21.757] proves that $\mu^-(A) = \sup \{ -\mu(B) | B \in \mathcal{A} \wedge B \subseteq A \}$. Hence

$$\forall A \in \mathcal{A} \text{ we have } \mu^-(A) = \sup \{ -\mu(B) | B \in \mathcal{A} \wedge B \subseteq A \} \quad (21.758) \quad \square$$

Theorem 21.454. (Jordan Decomposition) Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ a signed measure then

$\forall A \in \mathcal{A}$ we have $\sup \{ \mu(B) | B \in \mathcal{A} \wedge B \subseteq A \} \in [0, \infty]$ and $\sup \{ -\mu(B) | B \in \mathcal{A} \wedge B \subseteq A \} \in [0, \infty]$

$\mu^+: \mathcal{A} \rightarrow [0, \infty]$ defined by $\mu^+(A) = \sup \{ \mu(B) | B \in \mathcal{A} \wedge B \subseteq A \}$ is a measure on $\mathcal{A}$

$\mu^-: \mathcal{A} \rightarrow [0, \infty]$ defined by $\mu^-(A) = \sup \{ -\mu(B) | B \in \mathcal{A} \wedge B \subseteq A \}$ is a measure on $\mathcal{A}$

μ^+ or μ^- are finite

If μ is finite then μ^+ and μ^- are finite

$$\mu = \mu^+ - \mu^-$$

Further there exist a Hahn Decomposition (P, N) of μ such that

$$\forall A \in \mathcal{A} \text{ we have } \mu^+(A) = \mu(A \cap P) \text{ and } \mu^-(A) = -\mu(A \cap N)$$

The function

$$|\mu| = \mu^+ + \mu^-: \mathcal{A} \rightarrow [0, \infty] \text{ is a measure and } \forall A \in \mathcal{A} \text{ we have } |\mu(A)| \leq |\mu|(A)$$

For every Hahn Decomposition (P', N') of μ we have that

$$\forall A \in \mathcal{A} \quad \mu^+(A) = \mu(A \cap P') \wedge \mu^-(A) = -\mu(A \cap N')$$

Further if there exists a measure ν on $\langle X, \mathcal{A} \rangle$ such that $\forall A \in \mathcal{A} \quad |\mu(A)| \leq \nu(A)$ then $\forall A \in \mathcal{A}$ we have that $|\mu|(A) \leq \nu(A)$. In other words $|\mu|$ is the smallest positive measure such that $\forall A \in \mathcal{A} \quad |\mu(A)| < \nu(A)$. The pair (μ^+, μ^-) is called a **Jordan Decomposition** of μ . μ^+ is called the **positive part of μ** and μ^- is called the **negative part of μ** . The function $|\mu|$ is called the **variation of μ** . the **total variation** of the signed measure μ noted as $\|\mu\|$ is defined to be

$$\|\mu\| = |\mu|(X) = \mu^+(X) + \mu^-(X)$$

Proof. Using the Hahn Decomposition Theorem [see theorem: 21.452] there exist a Hahn Decomposition (P, N) of μ . Using the previous theorem [theorem: 21.453] we have that

$$\forall A \in \mathcal{A} \text{ we have } \mu(A \cap P) \subset [0, \infty] \wedge -\mu(A \cap N) \subset [0, \infty] \quad (21.759)$$

$$\mu^+: \mathcal{A} \rightarrow [0, \infty] \text{ defined by } \mu^+(A) = \mu(A \cap P) \text{ is a measure on } \mathcal{A} \quad (21.760)$$

$$\mu^-: \mathcal{A} \rightarrow [0, \infty] \text{ defined by } \mu^-(A) = -\mu(A \cap N) \text{ is a measure on } \mathcal{A} \quad (21.761)$$

$$\mu^+ \text{ or } \mu^- \text{ is finite} \quad (21.762)$$

$$\forall A \in \mathcal{A} \text{ we have } \mu(A) = \mu^+(A) - \mu^-(A) \quad (21.763)$$

$$\forall A \in \mathcal{A} \quad \mu^+(A) = \sup(\{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}) \text{ and } \mu^-(A) = \sup(\{-\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}) \quad (21.764)$$

Applying [eq: 21.764] on [eqs: 21.759, 21.760, 21.761, 21.762 and 21.763] we have that

$$\forall A \in \mathcal{A} \quad \sup(\{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}) \subset [0, \infty] \text{ and } \sup(\{-\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}) \subset [0, \infty]$$

$$\mu^+: \mathcal{A} \rightarrow [0, \infty] \text{ defined by } \mu^+(A) = \sup(\{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}) = \mu(A \cap P) \text{ is a measure on } \mathcal{A}$$

$$\mu^-: \mathcal{A} \rightarrow [0, \infty] \text{ defined by } \mu^-(A) = \sup(\{-\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}) = -\mu(A \cap N) \text{ is a measure on } \mathcal{A}$$

$$\mu^+ \text{ or } \mu^- \text{ is finite}$$

$$\forall A \in \mathcal{A} \text{ we have } \mu(A) = \mu^+(A) - \mu^-(A)$$

As μ^+, μ^- are measures on $\mathcal{A}$ we have by [theorem: 21.101] that

$$|\mu| = \mu^+ + \mu^-: \mathcal{A} \rightarrow [0, \infty] \text{ is a measure on } \mathcal{A}$$

If μ is finite then $\forall A \in \mathcal{A}$ we have $\mu^+(A) = \mu(A \cap P) \in \mathbb{R} \wedge \mu^-(A) = \mu(A \cap N) \in \mathbb{R}$ so that we have

$$\text{If } \mu \text{ is finite then } \mu^+ \text{ and } \mu^- \text{ are finite}$$

Let $A \in \mathcal{A}$ then

$$|\mu(A)| = |\mu^+(A) - \mu^-(A)| \leq |\mu^+(A)| + |\mu^-(A)| \underset{0 \leq \mu^+(A), \mu^-(A)}{=} \mu^+(A) + \mu^-(A) = |\mu|(A)$$

which proves that

$$\forall A \in \mathcal{A} \text{ we have } |\mu(A)| \leq |\mu|(A)$$

Further if (P', N') is any Hahn Decomposition of μ we have by [theorem: 21.453] that

$$\mu^+(A) = \sup(\{\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}) = \mu(A \cap P')$$

$$\mu^-(A) = \sup(\{-\mu(B) | B \in \mathcal{A} \wedge B \subseteq A\}) = \mu(A \cap N')$$

Let ν be a measure on $\langle X, \mathcal{A} \rangle$ such that $\forall A \in \mathcal{A}$ we have $|\mu(A)| < \nu(A)$. If $A \in \mathcal{A}$ then we have

$$\begin{aligned} \mu^+(A) &\stackrel{[\text{eq: 21.760}]}{=} \mu(A \cap P) \\ &\stackrel{[\text{eq: 21.759}]}{=} |\mu(A \cap P)| \\ &\leq \nu(A \cap P) \\ \mu^-(A) &\stackrel{[\text{eq: 21.761}]}{=} -\mu(A \cap N) \\ &\stackrel{[\text{eq: 21.759}]}{=} |\mu(A \cap N)| \\ &\leq \nu(A \cap N) \end{aligned}$$

So

$$\begin{aligned} |\mu|(A) &= \mu^+(A) + \mu^-(A) \\ &\stackrel{[\text{eqs: 21.760, 21.761}]}{=} \mu(A \cap P) + \mu(A \cap N) \\ &\leq \nu(A \cap P) + \nu(A \cap N) \\ &\stackrel{(A \cap P) \cap (A \cap N) = \emptyset}{=} \nu((A \cap P) \sqcup (A \cap N)) \\ &= \nu(A \cap (P \sqcup N)) \\ &= \nu(A \cap X) \\ &= \nu(A) \end{aligned}$$

which proves that

$$\forall A \in \mathcal{A} \text{ we have } |\mu|(A) \leq \nu(A)$$

□

21.6.2 Complex Measure

21.6.2.1 Definition and properties

Just as we defined signed measures it is possible to define complex measures.

Definition 21.455. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then a function $\mu: \mathcal{A} \rightarrow \mathbb{C}$ is a **complex measure** if

1. $\mu(\emptyset) = 0$
2. $\forall \{A_i\}_{i \in \mathbb{N}_0} \subseteq \mathcal{A}$ pairwise disjoint we have

$$\sum_{i=1}^{\infty} \mu(A_i) = \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i) \text{ exists}$$

and

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \mu(A_i)$$

Note 21.456. As $\forall A \in \mathcal{A}$ we have that $\mu(A) \in \mathbb{C}$ it follows that $\text{Im}(\mu(A)), \text{Re}(\mu(A)) \in \mathbb{R}$, or the real and imaginary parts are finite.

Theorem 21.457. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: X \rightarrow \mathbb{C}$ a complex measure then

$\text{Re}(\mu): X \rightarrow \overline{\mathbb{R}}$ defined by $\text{Re}(\mu)(A) = \text{Re}(\mu(A))$ is a finite signed measure on $\mathcal{A}$

$\text{Im}(\mu): X \rightarrow \overline{\mathbb{R}}$ defined by $\text{Im}(\mu)(A) = \text{Im}(\mu(A))$ is a finite signed measure on $\mathcal{A}$

Note 21.458. As $\forall A \in \mathcal{A}$ we have

$$\mu(A) = \text{Re}(\mu(A)) + i \cdot \text{Im}(\mu(A)) = \text{Re}(\mu)(A) + \text{Im}(\mu)(A) = (\text{Re}(\mu) + i \cdot \text{Im}(\mu))(A)$$

we have that

$$\mu = \operatorname{Re}(\mu) + i \cdot \operatorname{Im}(\mu)$$

Proof. First we have that

$$\operatorname{Re}(\mu)(\emptyset) = \operatorname{Re}(\mu(\emptyset)) = \operatorname{Re}(\emptyset) = 0 \text{ and } \operatorname{Im}(\mu)(\emptyset) = \operatorname{Im}(\mu(\emptyset)) = \operatorname{Im}(\emptyset) = 0 \quad (21.765)$$

$$\forall A \in \mathcal{A} \operatorname{Re}(\mu)(A) = \operatorname{Re}(\mu(A)) \in \mathbb{R} \text{ and } \operatorname{Im}(\mu)(A) = \operatorname{Im}(\mu(A)) \in \mathbb{R} \quad (21.766)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be pairwise disjoint then $\sum_{i=1}^{\infty} \mu(A_i)$ exist and $\sum_{i=1}^{\infty} \mu(A_i) = \mu(\bigcup_{i \in \mathbb{N}} A_i)$. Using [theorem: 14.361] it follows that

$$\sum_{i \rightarrow \infty} \operatorname{Re}(\mu(A_i)) \text{ exist with } \sum_{i \rightarrow \infty} \operatorname{Re}(\mu(A_i)) = \operatorname{Re}\left(\sum_{i=1}^{\infty} \mu(A_i)\right) \quad (21.767)$$

$$\sum_{i \rightarrow \infty} \operatorname{Im}(\mu(A_i)) \text{ exist with } \sum_{i \rightarrow \infty} \operatorname{Im}(\mu(A_i)) = \operatorname{Im}\left(\sum_{i=1}^{\infty} \mu(A_i)\right) \quad (21.768)$$

Hence we have, as $\forall i \in \mathbb{N} \operatorname{Re}(\mu)(A_i) = \operatorname{Re}(\mu(A_i))$ and $\operatorname{Im}(\mu)(A_i) = \operatorname{Im}(\mu(A_i))$, that

$$\begin{aligned} \sum_{i=1}^{\infty} \operatorname{Re}(\mu)(A_i) &\text{ exist and } \sum_{i=1}^{\infty} \operatorname{Im}(\mu)(A_i) \text{ exist} \\ \sum_{i=1}^{\infty} \operatorname{Re}(\mu)(A_i) &= \operatorname{Re}\left(\sum_{i=1}^{\infty} \mu(A_i)\right) \Big|_{\text{eq: 21.767}} \operatorname{Re}\left(\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right)\right) = \operatorname{Re}(\mu)\left(\bigcup_{i \in \mathbb{N}} A_i\right) \\ \sum_{i=1}^{\infty} \operatorname{Im}(\mu)(A_i) &= \operatorname{Im}\left(\sum_{i=1}^{\infty} \mu(A_i)\right) \Big|_{\text{eq: 21.768}} \operatorname{Im}\left(\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right)\right) = \operatorname{Im}(\mu)\left(\bigcup_{i \in \mathbb{N}} A_i\right) \end{aligned}$$

The above together with [eqs: 21.765, 21.766] proves that

$$\operatorname{Re}(\mu) \text{ and } \operatorname{Im}(\mu) \text{ are finite signed measures}$$

□

Complex measures are evidently finite additive

Theorem 21.459. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $n \in \mathbb{N}$ and $\mu: \mathcal{A} \rightarrow \mathbb{C}$ a complex measure on $\mathcal{A}$ then

1. $\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ pairwise disjoint we have that

$$\mu\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^n \mu(A_i)$$

2. $\forall A, B \in \mathcal{A}$ with $B \subseteq A$ we have $\mu(A \setminus B) = \mu(A) - \mu(B)$

In other words μ is finite additive.

Proof.

1. Using the previous theorem [theorem: 21.457] we have that $\operatorname{Re}(\mu)$ and $\operatorname{Im}(\mu)$ are signed measures, hence by [theorem: 21.440] we have that

$$\operatorname{Re}(\mu)\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^n \operatorname{Re}(\mu(A_i)) \text{ and } \operatorname{Im}(\mu)\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^n \operatorname{Im}(\mu(A_i))$$

So that

$$\begin{aligned}
 \mu\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) &= \operatorname{Re}\left(\mu\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right)\right) + i \cdot \operatorname{Img}\left(\mu\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right)\right) \\
 &= \operatorname{Re}(\mu)\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) + i \cdot \operatorname{Img}(\mu)\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) \\
 &= \sum_{i=1}^n \operatorname{Re}(\mu)(A_i) + i \cdot \sum_{i=1}^n \operatorname{Img}(\mu)(A_i) \\
 &= \sum_{i=1}^n (\operatorname{Re}(\mu)(A_i) + i \cdot \operatorname{Img}(\mu)(A_i)) \\
 &= \sum_{i=1}^n (\operatorname{Re}(\mu(A_i)) + i \cdot \operatorname{Img}(\mu(A_i))) \\
 &= \sum_{i=1}^n \mu(A_i)
 \end{aligned}$$

2. As $B \subseteq A$ we have $A = (A \setminus B) \cup B$ with $(A \setminus B) \cap B = \emptyset$ so that $\mu(A) \stackrel{(1)}{=} \mu(A \setminus B) + \mu(B)$ so that $\mu(A \setminus B) = \mu(A) - \mu(B)$. $\square$

We have now similar theorems as [theorems: 21.442, 21.443] for complex measures.

Theorem 21.460. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: \mathcal{A} \rightarrow \mathbb{C}$ a complex measure on $\mathcal{A}$ then we have:*

1. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N}_0 \ A_i \subseteq A_{i+1}$ we have that $\lim_{i \rightarrow \infty} \mu(A_i)$ exists and

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \lim_{i \rightarrow \infty} \mu(A_i)$$

2. $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N}_0 \ A_{i+1} \subseteq A_i$ we have that $\lim_{i \rightarrow \infty} \mu(A_i)$ exists and

$$\mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) = \lim_{i \rightarrow \infty} \mu(A_i)$$

Proof.

1. As $\operatorname{Re}(\mu)$, $\operatorname{Img}(\mu)$ are finite signed measures [see theorem: 21.457] it follows from [theorem: 21.442] that

$$\lim_{i \rightarrow \infty} \operatorname{Re}(\mu)(A_i) \text{ exist and } \lim_{i \rightarrow \infty} \operatorname{Img}(\mu)(A_i) \text{ exist}$$

and

$$\lim_{i \rightarrow \infty} \operatorname{Re}(\mu)(A_i) = \operatorname{Re}(\mu)\left(\bigcup_{i \in \mathbb{N}} A_i\right) \text{ and } \lim_{i \rightarrow \infty} \operatorname{Img}(\mu)(A_i) = \operatorname{Img}(\mu)\left(\bigcup_{i \in \mathbb{N}} A_i\right)$$

Using [theorem: 14.304] on the above we have then that

$$\lim_{i \rightarrow \infty} \mu(A_i) \stackrel{[\text{theorem: 21.457}]}{=} \lim_{i \rightarrow \infty} (\operatorname{Re}(\mu)(A_i) + i \cdot \operatorname{Img}(\mu)(A_i)) \text{ exist}$$

and

$$\begin{aligned}
 \lim_{i \rightarrow \infty} \mu(A_i) &\stackrel{[\text{theorem: 21.457}]}{=} \lim_{i \rightarrow \infty} (\operatorname{Re}(\mu)(A_i) + i \cdot \operatorname{Img}(\mu)(A_i)) \\
 &\stackrel{[\text{theorem: 14.304}]}{=} \lim_{i \rightarrow \infty} \operatorname{Re}(\mu)(A_i) + i \cdot \lim_{i \rightarrow \infty} \operatorname{Img}(\mu)(A_i) \\
 &= \operatorname{Re}(\mu)\left(\bigcup_{i \in \mathbb{N}} A_i\right) + i \cdot \operatorname{Img}\left(\bigcup_{i \in \mathbb{N}} A_i\right) \\
 &= \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right)
 \end{aligned}$$

Summarized

$$\lim_{i \rightarrow \infty} \mu(A_i) \text{ exist and } \lim_{i \rightarrow \infty} \mu(A_i) = \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right)$$

2. As $\text{Re}(\mu)$, $\text{Im}(\mu)$ are **finite** signed measures [see theorem: 21.457] it follows from [theorem: 21.442] that

$$\lim_{i \rightarrow \infty} \text{Re}(\mu)(A_i) \text{ exist and } \lim_{i \rightarrow \infty} \text{Im}(\mu)(A_i) \text{ exist}$$

and

$$\lim_{i \rightarrow \infty} \text{Re}(\mu)(A_i) = \text{Re}(\mu)\left(\bigcap_{i \in \mathbb{N}} A_i\right) \text{ and } \lim_{i \rightarrow \infty} \text{Im}(\mu)(A_i) = \text{Im}(\mu)\left(\bigcap_{i \in \mathbb{N}} A_i\right)$$

Using [theorem: 14.304] on the above we have then that

$$\lim_{i \rightarrow \infty} \mu(A_i) \stackrel{[\text{theorem: 21.457}]}{=} \lim_{i \rightarrow \infty} (\text{Re}(\mu)(A_i) + i \cdot \text{Im}(\mu)(A_i)) \text{ exist}$$

and

$$\begin{aligned} \lim_{i \rightarrow \infty} \mu(A_i) &\stackrel{[\text{theorem: 21.457}]}{=} \lim_{i \rightarrow \infty} (\text{Re}(\mu)(A_i) + i \cdot \text{Im}(\mu)(A_i)) \\ &\stackrel{[\text{theorem: 14.304}]}{=} \lim_{i \rightarrow \infty} \text{Re}(\mu)(A_i) + i \cdot \lim_{i \rightarrow \infty} \text{Im}(\mu)(A_i) \\ &= \text{Re}(\mu)\left(\bigcap_{i \in \mathbb{N}} A_i\right) + i \cdot \text{Im}\left(\bigcap_{i \in \mathbb{N}} A_i\right) \\ &= \mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) \end{aligned}$$

Summarized

$$\lim_{i \rightarrow \infty} \mu(A_i) \text{ exist and } \lim_{i \rightarrow \infty} \mu(A_i) = \mu\left(\bigcap_{i \in \mathbb{N}} A_i\right) \quad \square$$

Theorem 21.461. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and let $\mu: X \rightarrow \mathbb{C}$ be a complex function such that

- a) $\mu(\emptyset) = 0$
- b) For all finite pairwise disjoint measurable sets $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$, $n \in \mathbb{N}$ we have $\mu\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^n \mu(A_i)$

then we have

1. If $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N} A_i \subseteq A_{i+1}$ we have that $\lim_{i \rightarrow \infty} \mu(A_i)$ exists and $\mu\left(\bigcup_{i \in \mathbb{N}_0} A_i\right) = \lim_{n \rightarrow \infty} \mu(A_n)$ then μ is a complex measure on $\mathcal{A}$.
2. If $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N} A_{i+1} \subseteq A_i$ and $\bigcap_{i \in \mathbb{N}} A_i = \emptyset$ we have that $\lim_{i \rightarrow \infty} \mu(A_i)$ exists and $\lim_{i \rightarrow \infty} \mu(A_i) = 0$ then μ is a complex measure on $\mathcal{A}$.

Proof.

1. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be a pairwise disjoint sequence of measurable sets. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_n = \bigsqcup_{i \in \{1, \dots, n\}} A_i$$

Then using [lemma: 21.6] we have that

$$\bigcup_{i \in \mathbb{N}} B_i = \bigsqcup_{i \in \mathbb{N}} A_i \text{ and } \forall i \in \mathbb{N} \text{ we have } B_i \subseteq B_{i+1}$$

Hence we have

$$\begin{aligned}
 \mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &= \mu\left(\bigcup_{i \in \mathbb{N}} B_i\right) \\
 &\stackrel{\text{hypothesis}}{=} \lim_{i \rightarrow \infty} \mu(B_i) \text{ [where the limit exist]} \\
 &= \lim_{i \rightarrow \infty} \mu\left(\bigsqcup_{j \in \{1, \dots, i\}} A_j\right) \\
 &\stackrel{(a)}{=} \lim_{i \rightarrow \infty} \sum_{j=1}^i \mu(A_j) \\
 &= \sum_{j=1}^{\infty} \mu(A_j)
 \end{aligned}$$

which together with (a) proves that μ is a complex measure.

2. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be a pairwise disjoint sequence of measureable sets. Define

$$\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_i = \bigsqcup_{j \in \{i, \dots, \infty\}} A_j$$

Then $\forall i \in \mathbb{N}$ we have $B_{i+1} = \bigsqcup_{j \in \{i+1, \dots, \infty\}} A_j \stackrel{[\text{theorem: 2.128}]}{\subseteq} \bigsqcup_{j \in \{i, \dots, \infty\}} A_j = B_i$ proving that

$$\forall i \in \mathbb{N} \text{ we have } B_{i+1} \subseteq B_i \quad (21.769)$$

Assume that $x \in \bigcap_{i \in \mathbb{N}} B_i$ then $x \in B_1$ so there exist a $k \in \{1, \dots, \infty\}$ such that $x \in A_k$. From $x \in \bigcap_{i \in \mathbb{N}} B_i$ we have $x \in B_{k+1}$ so there exist a $j \in \{k+1, \dots, \infty\}$ such that $x \in A_j$ hence $x \in A_k \cap A_j \stackrel{k \neq j}{=} \emptyset$ giving the contradiction $x \in \emptyset$. So the assumption is false and we must have

$$\bigcap_{i \in \mathbb{N}} B_i = \emptyset$$

Using the hypothesis it follows that $\lim_{i \rightarrow \infty} \mu(B_i)$ exist and $\lim_{i \rightarrow \infty} \mu(B_i) = 0$. Using then [theorem: 14.291] it follows that

$$\lim_{i \rightarrow \infty} \mu(B_{i+1}) = 0 \quad (21.770)$$

Let $k \in \mathbb{N}$. If $x \in \left(\bigcup_{i \in \{1, \dots, k\}} A_i\right) \cap \left(\bigcup_{i \in \{k+1, \dots, \infty\}} A_i\right)$ then $\exists i \in \{1, \dots, k\}$ and a $j \in \{k+1, \dots, \infty\}$ such that $x \in A_i \cap A_j$. As $i \leq k < k+1 \leq j$ we have that $A_i \cap A_j = \emptyset$ contradicting $x \in A_i \cap A_j$ so we have

$$\left(\bigcup_{i \in \{1, \dots, k\}} A_i\right) \cap \left(\bigcup_{i \in \{k+1, \dots, \infty\}} A_i\right) = \emptyset$$

and

$$\bigcup_{i \in \mathbb{N}} A_i = \left(\bigcup_{i \in \{1, \dots, k\}} A_i\right) \cup \left(\bigcup_{i \in \{k+1, \dots, \infty\}} A_i\right)$$

So that

$$\begin{aligned}
 \mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &\stackrel{(b)}{=} \mu\left(\bigcup_{i \in \{1, \dots, k\}} A_i\right) + \mu\left(\bigcup_{i \in \{k+1, \dots, \infty\}} A_i\right) \\
 &= \mu\left(\bigcup_{i \in \{1, \dots, k\}} A_i\right) + \mu(B_{k+1}) \\
 &\stackrel{(b)}{=} \sum_{i=1}^k \mu(A_i) + \mu(B_{k+1})
 \end{aligned}$$

Hence we have that

$$\mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^k \mu(A_i) + \mu(B_{k+1})$$

so that

$$\forall k \in \mathbb{N} \text{ we have } \left| \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) - \sum_{i=1}^k \mu(A_i) \right| = |\mu(B_{k+1})| \quad (21.771)$$

Let $\varepsilon \in \mathbb{R}^+$. Then by [eq: 21.770] there exist a $N \in \mathbb{N}$ such that $\forall k \in \{N, \dots, \infty\}$

$$|\mu(B_{k+1})| < \varepsilon \xRightarrow{\text{[eq: 21.771]}} \left| \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) - \sum_{i=1}^k \mu(A_i) \right| < \varepsilon$$

which proves that

$$\sum_{i=1}^{\infty} \mu(A_i) = \lim_{k \rightarrow \infty} \sum_{i=1}^k \mu(A_i) \text{ exist and } \sum_{i=1}^{\infty} \mu(A_i) = \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right)$$

This together with (a) proves that

$$\mu \text{ is a complex measure}$$

□

21.6.2.2 Jordan decomposition of a complex measure

As every complex measure μ can be written as $\mu = \text{Re}(\mu) + i \cdot \text{Im}(\mu)$, we can do a Jordan Decomposition of the real and imaginair part of μ . This lead to the following definition.

Theorem 21.462. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and $\mu: X \rightarrow \mathbb{C}$ a complex measure then*

$\mu_r^+: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ defined by $\mu_r^+(A) = \sup(\{\text{Re}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\})$ is a finite measure on $\mathcal{A}$

$\mu_r^-: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ defined by $\mu_r^-(A) = \sup(\{-\text{Re}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\})$ is a finite measure on $\mathcal{A}$

$\mu_c^+: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ defined by $\mu_c^+(A) = \sup(\{\text{Im}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\})$ is a finite measure on $\mathcal{A}$

$\mu_c^-: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ defined by $\mu_c^-(A) = \sup(\{-\text{Im}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\})$ is a finite measure on $\mathcal{A}$

and

$$\mu = \mu_r^+ - \mu_r^- + i \cdot (\mu_c^+ - \mu_c^-)$$

The quadruple is called the Jordan Decomposition of μ

Proof. Using [theorem: 21.457] it follows that $\text{Re}(\mu)$ and $\text{Im}(\mu)$ are finite signed measures such that

$$\mu = \text{Re}(\mu) + i \text{Im}(\mu)$$

Using [theorem: 21.454] we have that

$(\text{Re}(\mu))^+: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ by $(\text{Re}(\mu))^+(A) = \sup(\{\text{Re}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\})$ is a measure on $\mathcal{A}$

$(\text{Re}(\mu))^-: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ by $(\text{Re}(\mu))^-(A) = \sup(\{-\text{Re}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\})$ is a measure on $\mathcal{A}$

$(\text{Im}(\mu))^+: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ by $(\text{Im}(\mu))^+(A) = \sup(\{\text{Im}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\})$ is a measure on $\mathcal{A}$

$(\text{Im}(\mu))^-: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ by $(\text{Im}(\mu))^-(A) = \sup(\{-\text{Im}(\mu)(B) | B \in \mathcal{A} \wedge B \subseteq A\})$ is a measure on $\mathcal{A}$

and

$$\text{Re}(\mu) = (\text{Re}(\mu))^+ - (\text{Re}(\mu))^- \text{ and } \text{Im}(\mu) = (\text{Im}(\mu))^+ - (\text{Im}(\mu))^-$$

As $\text{Re}(\mu), \text{Im}(\mu)$ are finite we have by [theorem: 21.454] that

$$(\text{Re}(\mu))^+, (\text{Re}(\mu))^-, (\text{Im}(\mu))^+, (\text{Im}(\mu))^- \text{ are finite measures}$$

Further

$$\mu = (\text{Re}(\mu))^+ + (\text{Re}(\mu))^- + i \cdot ((\text{Im}(\mu))^+ - (\text{Im}(\mu))^-)$$

The theorem is then proved by taking $\mu_r^+ = (\operatorname{Re}(\mu))^+$, $\mu_r^- = (\operatorname{Re}(\mu))^-$, $\mu_c^+ = (\operatorname{Im}(\mu))^+$ and $\mu_c^- = (\operatorname{Im}(\mu))^-$. $\square$

Definition 21.463. (Variation of a Complex Measure) Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $\mu: \mathcal{A} \rightarrow \mathbb{C}$ a complex measure then the **variation** of μ noted by $|\mu|$ is defined by

$$|\mu|: \mathcal{A} \rightarrow [0, \infty] \text{ where } |\mu|(A) = \sup \left(\left\{ \sum_{i=1}^n |\mu(A_i)| \mid n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i \in \{1, \dots, n\}} A_i \right\} \right)$$

In the above definition we use $A = \bigsqcup_{i \in \{1, \dots, n\}} A_i$ to indicate that $\{A_i\}_{i \in \{1, \dots, n\}}$ is pairwise disjoint and $A = \bigcup_{i \in \{1, \dots, n\}} A_i$. The **total variation** of μ noted by $\|\mu\|$ is defined by

$$\|\mu\| = |\mu|(X)$$

Note 21.464. As $A = \bigsqcup_{i \in \{1\}} A_i$ where $A_1 = A$ we have that

$$\left\{ \sum_{i=1}^n |\mu(A_i)| \mid n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i \in \{1, \dots, n\}} A_i \right\} \neq \emptyset$$

so that $\sup \left(\left\{ \sum_{i=1}^n |\mu(A_i)| \mid n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i \in \{1, \dots, n\}} A_i \right\} \right)$ is well defined.

Theorem 21.465. Let $\langle X, \mathcal{A} \rangle$ and $\mu: \mathcal{A} \rightarrow \mathbb{C}$ a complex measure then the variation

$$|\mu|: \mathcal{A} \rightarrow [0, \infty]$$

is a finite measure. Further we have that

$$\forall A \in \mathcal{A} \text{ we have that } |\mu(A)| \leq |\mu|(A)$$

Proof. First we prove that $|\mu|$ is finite. Use [theorem: 21.462] to get a Jordan decomposition of **finite measures** $(\mu_r^+, \mu_r^-, \mu_c^+, \mu_c^-)$ of μ . Let $A \in \mathcal{A}$ and take $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ pairwise disjoint with $A = \bigsqcup_{i=1}^n A_i$ then we have

$$\begin{aligned} \sum_{i=1}^n |\mu(A_i)| &= \\ \sum_{i=1}^n |\mu_r^+(A_i) + \mu_r^-(A_i) + i \cdot (\mu_c^+(A_i) - \mu_c^-(A_i))| &\leq \\ \sum_{i=1}^n (|\mu_r^+(A_i)| + |\mu_r^-(A_i)| + |\mu_c^+(A_i)| + |\mu_c^-(A_i)|) &= \\ \sum_{i=1}^n |\mu_r^+(A_i)| + \sum_{i=1}^n |\mu_r^-(A_i)| + \sum_{i=1}^n |\mu_c^+(A_i)| + \sum_{i=1}^n |\mu_c^-(A_i)| &\stackrel{\text{measures are nonnegative}}{=} \\ \sum_{i=1}^n \mu_r^+(A_i) + \sum_{i=1}^n \mu_r^-(A_i) + \sum_{i=1}^n \mu_c^+(A_i) + \sum_{i=1}^n \mu_c^-(A_i) &= \\ \mu_r^+\left(\bigsqcup_{i=1}^n A_i\right) + \mu_r^-\left(\bigsqcup_{i=1}^n A_i\right) + \mu_c^+\left(\bigsqcup_{i=1}^n A_i\right) + \mu_c^-\left(\bigsqcup_{i=1}^n A_i\right) &= \\ \mu_r^+(A) + \mu_r^-(A) + \mu_c^+(A) + \mu_c^-(A) \end{aligned}$$

which proves that $\mu_r^+(A) + \mu_r^-(A) + \mu_c^+(A) + \mu_c^-(A)$ is a real upper bound of

$$\left\{ \sum_{i=1}^n |\mu(A_i)| \mid n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i \in \{1, \dots, n\}} A_i \right\}$$

So that by [theorems: 10.18, 20.13] we have that $\forall A \in \mathcal{A}$

$$\begin{aligned} |\mu|(A) &= \sup \left(\left\{ \sum_{i=1}^n |\mu(A_i)| \mid n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i \in \{1, \dots, n\}} A_i \right\} \right) \\ &\leq \mu_r^+(A) + \mu_r^-(A) + \mu_c^+(A) + \mu_c^-(A) \in \mathbb{R} \end{aligned}$$

which proves that

$$\forall A \in \mathcal{A} \text{ we have } |\mu|(A) \in \mathbb{R} \text{ and } |\mu|(A) \leq \mu_r^+(A) + \mu_r^-(A) + \mu_c^+(A) + \mu_c^-(A) \in \mathbb{R} \quad (21.772)$$

Next we use [theorem: 21.110] to prove that $|\mu|$ is a measure. Let $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ be a pairwise disjoint sequence of measurable sets such that $\emptyset = \bigsqcup_{i \in \mathbb{N}} A_i$ then we have $\forall i \in \mathbb{N}$ that $A_i = \emptyset \Rightarrow |\mu(A_i)| = |\emptyset| = 0$. Hence $\sum_{i=1}^n |\mu(A_i)| = 0$ so that

$$|\mu|(\emptyset) = \sup \left(\left\{ \sum_{i=1}^n |\mu(A_i)| \mid n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge \emptyset = \bigsqcup_{i \in \{1, \dots, n\}} A_i \right\} \right) = \sup(\{0\}) = 0$$

proving that

$$|\mu|(\emptyset) = 0 \quad (21.773)$$

Let $A, B \in \mathcal{A}$ with $A \cap B = \emptyset$. Let $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ be pairwise disjoint such that $A \cup B = \bigsqcup_{i \in \{1, \dots, n\}} A_i$. Then given $i \in \{1, \dots, n\}$ we have $A_i = A_i \cap (A \cup B) = (A_i \cap A) \sqcup (A_i \cap B)$ so that $|\mu(A_i)| \stackrel{[\text{theorem: 21.459}]}{=} |\mu(A_i \cap A) + \mu(A_i \cap B)| \leq |\mu(A_i \cap A)| + |\mu(A_i \cap B)|$. Hence we have that

$$\begin{aligned} \sum_{i=1}^n |\mu(A_i)| &\leq \sum_{i=1}^n (|\mu(A_i \cap A)| + |\mu(A_i \cap B)|) \\ &= \sum_{i=1}^n |\mu(A_i \cap A)| + \sum_{i=1}^n |\mu(A_i \cap B)| \end{aligned} \quad (21.774)$$

Further

$$A = A \cap (A \cup B) = A \cap \left(\bigsqcup_{i \in \{1, \dots, n\}} A_i \right) = \bigsqcup_{i \in \{1, \dots, n\}} (A_i \cap A)$$

and

$$B = B \cap (A \cup B) = B \cap \left(\bigsqcup_{i \in \{1, \dots, n\}} A_i \right) = \bigsqcup_{i \in \{1, \dots, n\}} (A_i \cap B)$$

Hence

$$\begin{aligned} \sum_{i=1}^n |\mu(A_i \cap A)| &\leq \sup \left(\left\{ \sum_{i=1}^n |\mu(B_i)| \mid n \in \mathbb{N} \wedge \{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i=1}^n B_i \right\} \right) \\ &= |\mu|(A) \\ \sum_{i=1}^n |\mu(A_i \cap B)| &\leq \sup \left(\left\{ \sum_{i=1}^n |\mu(B_i)| \mid n \in \mathbb{N} \wedge \{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge B = \bigsqcup_{i=1}^n B_i \right\} \right) \\ &= |\mu|(B) \end{aligned}$$

which combined by [eq: 21.774] proves that

$$\sum_{i=1}^n |\mu(A_i)| \leq |\mu|(A) + |\mu|(B)$$

Hence $|\mu|(A) + |\mu|(B)$ is a upper bound for

$$\left\{ \sum_{i=1}^n |\mu(B_i)| \mid n \in \mathbb{N} \wedge \{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge A \cup B = \bigsqcup_{i=1}^n B_i \right\}$$

so that

$$\begin{aligned} |\mu|(A \cup B) &= \sup \left(\left\{ \sum_{i=1}^n |\mu(B_i)| \mid n \in \mathbb{N} \wedge \{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge A \cup B = \bigsqcup_{i=1}^n B_i \right\} \right) \\ &\leq |\mu|(A) + |\mu|(B) \end{aligned}$$

which proves that

$$|\mu|(A \sqcup B) \leq |\mu|(A) + |\mu|(B) \quad (21.775)$$

For the opposite inequality. Let $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$, $\{B_i\}_{i \in \{1, \dots, m\}} \subseteq \mathcal{A}$ be pairwise disjoint such that $A = \bigsqcup_{i=1}^n A_i$, $B = \bigsqcup_{i=1}^m B_i$. Define

$$\{C_i\}_{i \in \{1, \dots, n+m\}} \text{ by } \begin{cases} C_i = A_i & \text{if } i \in \{1, \dots, n\} \\ C_i = B_{i-n} & \text{if } i \in \{n+1, \dots, n+m\} \end{cases}$$

then

$$\begin{aligned} x \in A \sqcup B &\Leftrightarrow x \in A \vee x \in B \\ &\Leftrightarrow (\exists i \in \{1, \dots, n\} x \in A_i) \vee (\exists j \in \{1, \dots, m\} x \in B_j) \\ &\Leftrightarrow (\exists i \in \{1, \dots, n\} x \in C_i) \vee (\exists j \in \{1, \dots, m\} x \in C_{j+n}) \\ &\Leftrightarrow (\exists i \in \{1, \dots, n\} x \in C_i) \vee (\exists j \in \{n+1, \dots, n+m\} x \in C_j) \\ &\Leftrightarrow \exists i \in \{1, \dots, n+m\} x \in C_i \\ &\Leftrightarrow \bigcup_{i \in \{1, \dots, n+m\}} C_i \end{aligned}$$

proving that

$$A \sqcup B = \bigcup_{i=1}^{n+m} C_i \quad (21.776)$$

Further If $i, j \in \{1, \dots, n+m\}$ with $i \neq j$ then we have either

$$\begin{aligned} i \in \{1, \dots, n\} \wedge j \in \{1, \dots, n\}. & \text{ Then } C_i \cap C_j = A_i \cap A_j = \emptyset \\ i, j \in \{1, \dots, n\} \wedge j \in \{n+1, \dots, n+m\}. & \text{ Then } C_i \cap C_j = A_i \cap B_{j-n} \subseteq A \cap B = \emptyset \\ i \in \{n+1, \dots, n+m\} \wedge j \in \{1, \dots, n\}. & \text{ Then } C_i \cap C_j = B_{i-n} \cap A_j \subseteq B \cap A = \emptyset \\ i \in \{n+1, \dots, n+m\} \wedge j \in \{n+1, \dots, n+m\}. & \text{ Then } C_i \cap C_j = B_{i-n} \cap B_{j-n} = \emptyset \end{aligned}$$

hence we have that

$$\{C_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \text{ is pairwise disjoint} \quad (21.777)$$

So

$$\begin{aligned} \sum_{i=1}^n |\mu(A_i)| + \sum_{i=1}^m |\mu(B_i)| &= \sum_{i=1}^n |\mu(C_i)| + \sum_{i=1}^m |\mu(C_{i+n})| \\ &= \sum_{i=1}^n |\mu(C_i)| + \sum_{i=n+1}^{n+m} |\mu(C_i)| \\ &= \sum_{i=1}^{n+m} |\mu(C_i)| \\ &\leq \sup \left(\left\{ \sum_{i=1}^n |\mu(C_i)| \mid n \in \mathbb{N} \wedge \{C_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge \bigsqcup_{i=1}^n C_i = A \sqcup B \right\} \right) \\ &= |\mu|(A \sqcup B) \end{aligned} \quad (21.778)$$

Then as $\sum_{i=1}^m |\mu(B_i)| \in \mathbb{R}$ we have that $\sum_{i=1}^n |\mu(A_i)| \leq |\mu|(A \sqcup B) - \sum_{i=1}^m |\mu(B_i)|$ so that $|\mu|(A \sqcup B) - \sum_{i=1}^m |\mu(B_i)|$ is an upper bound for

$$\left\{ \sum_{i=1}^n |\mu(B_i)| \mid n \in \mathbb{N} \wedge \{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i=1}^n B_i \right\}$$

so that

$$|\mu|(A) = \sup \left(\left\{ \sum_{i=1}^n |\mu(B_i)| \mid n \in \mathbb{N} \wedge \{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i=1}^n B_i \right\} \right) \leq |\mu|(A \sqcup B) - \sum_{i=1}^m |\mu(B_i)|$$

As by [eq: 21.772] $|\mu|(A) \in \mathbb{R}$, $|\mu|(A \sqcup B) \in \mathbb{R}$, $\sum_{i=1}^m |\mu(B_i)| \in \mathbb{R}$ we have that

$$\sum_{i=1}^m |\mu(B_i)| \leq |\mu|(A \sqcup B) - |\mu|(A)$$

Hence $|\mu|(A \sqcup B) - |\mu|(A)$ is an upper bound for

$$\left\{ \sum_{i=1}^n |\mu(B_i)| \mid n \in \mathbb{N} \wedge \{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge B = \bigsqcup_{i=1}^n B_i \right\}$$

so that

$$|\mu|(B) = \sup \left(\left\{ \sum_{i=1}^n |\mu(B_i)| \mid n \in \mathbb{N} \wedge \{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge B = \bigsqcup_{i=1}^n B_i \right\} \right) \leq |\mu|(A \sqcup B) - |\mu|(A)$$

which proves that $|\mu|(A) + |\mu|(B) \leq |\mu|(A \sqcup B)$. Combining this with [eq: 21.775] proves that $|\mu|(A \sqcup B) = |\mu|(A) + |\mu|(B)$. Using then [theorem: 21.8] we have that

$$\forall \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \text{ pairwise disjoint we have } |\mu|\left(\bigsqcup_{i \in \{1, \dots, n\}} A_i\right) = \sum_{i=1}^n |\mu|(A_i) \quad (21.779)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N} \ A_{i+1} \subseteq A_i$ such that $\bigcap_{i \in \mathbb{N}} A_i = \emptyset$. Then as $\mu_r^+, \mu_r^-, \mu_c^+, \mu_c^-$ are finite measures we have by [theorem: 21.109]

$$\lim_{i \rightarrow \infty} \mu_r^+(A_i) = \mu_r^+\left(\bigcap_{i \in \mathbb{N}} A_i\right) = \mu_r^+(\emptyset) = 0$$

$$\lim_{i \rightarrow \infty} \mu_r^-(A_i) = \mu_r^-\left(\bigcap_{i \in \mathbb{N}} A_i\right) = \mu_r^-(\emptyset) = 0$$

$$\lim_{i \rightarrow \infty} \mu_c^+(A_i) = \mu_c^+\left(\bigcap_{i \in \mathbb{N}} A_i\right) = \mu_c^+(\emptyset) = 0$$

$$\lim_{i \rightarrow \infty} \mu_c^-(A_i) = \mu_c^-\left(\bigcap_{i \in \mathbb{N}} A_i\right) = \mu_c^-(\emptyset) = 0$$

Let $\varepsilon \in \mathbb{R}^+$ then there exists $N_r^+ \in \mathbb{N}, N_r^- \in \mathbb{N}, N_c^+ \in \mathbb{N}, N_c^- \in \mathbb{N}$ such that

$$\forall n \in \{N_r^+, \dots, \infty\} \quad \mu_r^+(A_i) = |\mu_r^+(A_i) - 0| < \frac{\varepsilon}{4}$$

$$\forall n \in \{N_r^-, \dots, \infty\} \quad \mu_r^-(A_i) = |\mu_r^-(A_i) - 0| < \frac{\varepsilon}{4}$$

$$\forall n \in \{N_c^+, \dots, \infty\} \quad \mu_c^+(A_i) = |\mu_c^+(A_i) - 0| < \frac{\varepsilon}{4}$$

$$\forall n \in \{N_c^-, \dots, \infty\} \quad \mu_c^-(A_i) = |\mu_c^-(A_i) - 0| < \frac{\varepsilon}{4}$$

Take $N = \max(N_r^+, N_r^-, N_c^+, N_c^-)$ then we have $\forall i \in \{N, \dots, \infty\}$ we have

$$||\mu|(A_i) - 0| = |\mu|(A_i) \underset{[\text{eq: 21.772}]}{\leq} \mu_r^+(A_i) + \mu_r^-(A_i) + \mu_c^+(A_i) + \mu_c^-(A_i) < \varepsilon$$

which proves that $\lim_{i \rightarrow \infty} |\mu|(A_i) = 0$. Hence we have proved that

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ with } \forall i \in \mathbb{N} \ A_{i+1} \subseteq A_i \text{ and } \bigcap_{i \in \mathbb{N}} A_i = \emptyset \text{ we have } \lim_{i \rightarrow \infty} \mu(A_i) = 0 \quad (21.780)$$

So the conditions for [theorem: 21.110] are satisfied by [eqs: 21.770, 21.779 and 21.780] proves that $|\mu|$ is a measure on $\mathcal{A}$. This together with [eq: 21.772] proves that

$$|\mu|: \mathcal{A} \rightarrow [0, \infty] \text{ is a finite measure on } \mathcal{A}$$

Finally let $A \in \mathcal{A}$. Take

$$\{A_i\}_{i \in \{1\}} \subseteq \mathcal{A} \text{ by } A_1 = A$$

then we have that $\{A_i\}_{i \in \{1\}} \subseteq \mathcal{A}$ is pairwise disjoint and $A = \bigcup_{i \in \{1\}} A_i$ so that

$$|\mu(A)| = |\mu(A_1)| = \sum_{i=1}^1 |\mu(A_i)| \in \left\{ \sum_{i=1}^n |\mu(A_i)| \mid n \in \mathbb{N}_0 \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i \in \{1, \dots, n\}} A_i \right\}$$

so that $|\mu(A)| \leq \sup \left(\left\{ \sum_{i=1}^n |\mu(A_i)| \mid n \in \mathbb{N}_0 \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i \in \{1, \dots, n\}} A_i \right\} \right) = |\mu|(A)$.
Hence we have

$$\forall A \in \mathcal{A} \text{ we have } |\mu(A)| \leq |\mu|(A) \quad \square$$

21.6.3 Banach space of signed (complex) measures

We show now that the collection of finite signed measures [or complex measures] is a Banach space.

Definition 21.466. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then we define $M(X, \mathcal{A}, \mathbb{K})$ where $\mathbb{K} = \mathbb{R}$ or $\mathbb{K} = \mathbb{C}$ by

$$M(X, \mathcal{A}, \mathbb{R}) = \{\mu \in \mathbb{R}^{\mathcal{A}} \mid \mu: \mathcal{A} \rightarrow \overline{\mathbb{R}} \text{ is a **finite** signed measure on } \mathcal{A}\}$$

$$M(X, \mathcal{A}, \mathbb{C}) = \{\mu \in \mathbb{C}^{\mathcal{A}} \mid \mu: \mathcal{A} \rightarrow \mathbb{C} \text{ is a complex measure on } \mathcal{A}\}$$

Theorem 21.467. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then

$$\forall \mu \in M(X, \mathcal{A}, \mathbb{K}) \text{ we have } \forall A \in \mathcal{A} \text{ that } |\mu|(A) \in [0, \infty[$$

More specific we have for the total variation $\|\mu\|$ that

$$\|\mu\|_{\text{definitions: } \overline{21.454}, 21.463} = |\mu|(X) \in [0, \infty[$$

Proof. We must consider the following cases for $M(X, \mathcal{A}, \mathbb{K})$:

$\mathbb{K} = \mathbb{R}$. If $\mu \in M[X, \mathcal{A}, \mathbb{K}] = M[X, \mathcal{A}, \mathbb{R}]$ then μ is a finite signed measure. Using [theorem: 21.454] we have that $\mu = \mu^+ - \mu^-$ where μ^+, μ^- are finite measures on $\mathcal{A}$ and $|\mu| = \mu^+ + \mu^-$.
Hence we have

$$\forall A \in \mathcal{A} \text{ we have } |\mu|(A) = \mu^+(A) + \mu^-(A) \in [0, \infty[.$$

$\mathbb{K} = \mathbb{C}$. If $\mu \in M[X, \mathcal{A}, \mathbb{K}] = M[X, \mathcal{A}, \mathbb{C}]$ then μ is a complex measure. Hence using [theorem: 21.465] $|\mu|$ is a finite measure so that

$$\forall A \in \mathcal{A} \text{ we have } |\mu|(A) \in \mathbb{R} \quad \square$$

We construct now on $M[X, \mathcal{A}, \mathbb{K}]$ a addition $+$ and scalar product $\cdot$ operation making $\langle M[X, \mathcal{A}, \mathbb{K}] \rangle$ a vector space.

Theorem 21.468. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then $\langle M[X, \mathcal{A}, \mathbb{K}], +, \cdot \rangle$ is a vector space over $\mathbb{K}$ where

$$+: M[X, \mathcal{A}, \mathbb{K}] \times M[X, \mathcal{A}, \mathbb{K}] \rightarrow M[X, \mathcal{A}, \mathbb{K}] \text{ is defined by } (\mu + \nu)(A) = \mu(A) + \nu(A)$$

$$\cdot: \mathbb{K} \times M[X, \mathcal{A}, \mathbb{K}] \rightarrow M[X, \mathcal{A}, \mathbb{K}] \text{ is defined by } (\alpha \cdot \mu)(A) = \alpha \cdot \mu(A)$$

$$C_0 \in M[X, \mathcal{A}, \mathbb{K}] \text{ defined by } C_0(A) = 0 \text{ is the neutral element}$$

Proof. We have for $\mathbb{K}$ either:

$\mathbb{K} = \mathbb{R}$. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be pairwise disjoint then

$$C_0 \left(\bigsqcup_{i \in \mathbb{N}} A_i \right) = 0 = \sum_{i=1}^{\infty} 0 = \sum_{i=1}^{\infty} \mu(A_i),$$

$$\{C_0(A) \mid A \in \mathcal{A}\} = \{0\} \subseteq \mathbb{R} \subseteq \mathbb{R}_{\infty}$$

$$C_0(\emptyset) = 0$$

so that $C_0: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ is a finite signed measure. Hence

$$C_0 \in M(X, \mathcal{A}, \mathbb{R}) \Rightarrow M(X, \mathcal{A}, \mathbb{R}) \neq \emptyset \quad (21.781)$$

Let $\mu, \nu \in M[X, \mathcal{A}, \mathbb{R}]$. Then

$$(\mu + \nu)(\emptyset) = \mu(\emptyset) + \nu(\emptyset) = 0 + 0 = 0$$

$$\{(\mu + \nu)(A) | A \in \mathcal{A}\} = \{\mu(A) + \nu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R} \subseteq \mathbb{R}_\infty$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ pairwise disjoint then $\sum_{i=1}^\infty \mu(A_i), \sum_{i=1}^\infty \nu(A_i)$ exists and $\sum_{i=1}^\infty \mu(A_i) = \mu(\bigcup_{i \in \mathbb{N}} A_i)$, $\sum_{i=1}^\infty \nu(A_i) = \nu(\bigcup_{i \in \mathbb{N}} A_i)$. By [theorem: 20.98] we have that $\sum_{i=1}^\infty (\mu(A_i) + \nu(A_i))$ exist and

$$\begin{aligned} \sum_{i=1}^\infty (\mu + \nu)(A_i) &= \sum_{i=1}^\infty (\mu(A_i) + \nu(A_i)) = \sum_{i=1}^\infty \mu(A_i) + \sum_{i=1}^\infty \nu(A_i) = \mu\left(\bigcup_{i \in \mathbb{N}} A_i\right) + \nu\left(\bigcup_{i \in \mathbb{N}} A_i\right) = \\ &(\mu + \nu)\left(\bigcup_{i \in \mathbb{N}} A_i\right) \end{aligned}$$

which proves that $\mu + \nu$ is a finite signed measure. Hence

$$\forall \mu, \nu \in M[X, \mathcal{A}, \mathbb{R}] \text{ we have that } \mu + \nu \in M[X, \mathcal{A}, \mathbb{R}] \quad (21.782)$$

Let $\alpha \in \mathbb{R}$, $\mu \in M[X, \mathcal{A}, \mathbb{R}]$ then by [theorem: 21.439] $\alpha \cdot \mu$ is a signed measure, as also $\{(\alpha \cdot \mu)(A) | A \in \mathcal{A}\} = \{\alpha \cdot \mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R}$ it follows that

$$\forall \mu \in M(X, \mathcal{A}, \mathbb{R}) \text{ we have } \forall \alpha \in \mathbb{R} \text{ that } \alpha \cdot \mu \in M(X, \mathcal{A}, \mathbb{R}) \quad (21.783)$$

Using [eqs: 21.781, 21.782 and 21.783] together with [theorems: 11.67, 11.60] it follows that

$$\langle M(X, \mathcal{A}, \mathbb{R}), +, \cdot \rangle \text{ is a vector space over } \mathbb{R}$$

$\mathbb{K} = \mathbb{C}$. Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be pairwise disjoint then

$$\begin{aligned} C_0\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) &= 0 = \sum_{i=1}^\infty 0 = \sum_{i=1}^\infty \mu(A_i), \\ C_0(\emptyset) &= 0 \end{aligned}$$

so that $C_0: \mathcal{A} \rightarrow \overline{\mathbb{R}}$ is a complex measure. Hence

$$C_0 \in M(X, \mathcal{A}, \mathbb{C}) \Rightarrow M(X, \mathcal{A}, \mathbb{C}) \neq \emptyset \quad (21.784)$$

Let $\mu, \nu \in M(X, \mathcal{A}, \mathbb{C})$ then we have

$$(\mu + \nu)(\emptyset) = \mu(\emptyset) + \nu(\emptyset) = 0 + 0 = 0 \quad (21.785)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be pairwise disjoint then $\sum_{i=1}^\infty \mu(A_i), \sum_{i=1}^\infty \nu(A_i)$ exists and $\sum_{i=1}^\infty \mu(A_i) = \mu(\bigcup_{i \in \mathbb{N}} A_i)$, $\sum_{i=1}^\infty \nu(A_i) = \nu(\bigcup_{i \in \mathbb{N}} A_i)$. By [theorem: 14.360] we have that $\sum_{i=1}^\infty (\mu(A_i) + \nu(A_i))$ exist and

$$\begin{aligned} \sum_{i=1}^\infty (\mu + \nu)(A_i) &= \sum_{i=1}^\infty (\mu(A_i) + \nu(A_i)) = \sum_{i=1}^\infty \mu(A_i) + \sum_{i=1}^\infty \nu(A_i) = \mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) + \nu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) = \\ &(\mu + \nu)\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) \end{aligned}$$

which proves that $\mu + \nu$ is a complex measure. Hence

$$\forall \mu, \nu \in M[X, \mathcal{A}, \mathbb{R}] \text{ we have that } \mu + \nu \in M[X, \mathcal{A}, \mathbb{R}] \quad (21.786)$$

Let $\mu \in M(X, \mathcal{A}, \mathbb{C})$ and $\alpha \in \mathbb{C}$ then we have

$$(\alpha \cdot \nu)(\emptyset) = \alpha \cdot \nu(\emptyset) = \alpha \cdot 0 = 0$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ be pairwise disjoint then $\sum_{i=1}^{\infty} \mu(A_i)$ exist and $\sum_{i=1}^{\infty} \mu(A_i) = \mu(\bigcup_{i \in \mathbb{N}} A_i)$ so that by [theorem: 14.360] $\sum_{i=1}^{\infty} \alpha \cdot \mu(A_i)$ exist and

$$\sum_{i=1}^{\infty} (\alpha \cdot \mu)(A_i) = \sum_{i=1}^{\infty} \alpha \cdot \mu(A_i) = \alpha \cdot \sum_{i=1}^{\infty} \mu(A_i) = \alpha \cdot \mu\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) = (\alpha \cdot \mu)\left(\bigsqcup_{i \in \mathbb{N}} A_i\right)$$

which proves that $\alpha \cdot \mu \in M[X, \mathcal{A}, \mathbb{C}]$. Hence

$$\forall u \in M(X, \mathcal{A}, \mathbb{C}) \text{ we have } \forall \alpha \in \mathbb{C} \text{ we have } \alpha \cdot \mu \in M[X, \mathcal{A}, \mathbb{C}] \quad (21.787)$$

Using [eqs: 21.785, 21.786 and 21.787] together with [theorems: 11.67, 11.60] it follows that

$$\langle M[X, \mathcal{A}, \mathbb{C}], +, \cdot \rangle \text{ is a vector space over } \mathbb{C} \quad \square$$

Next we prove that $\langle M[X, \mathcal{A}, \mathbb{K}], ||| \rangle$ is a normed space.

Theorem 21.469. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space then $\langle M[X, \mathcal{A}, \mathbb{R}], ||| \rangle$ is a normed space*

Proof. Let $\mu \in M[X, \mathcal{A}, \mathbb{R}]$ and let (μ^+, μ^-) be the Jordan Decomposition of μ and $((\alpha \cdot \mu)^+, (\alpha \cdot \mu)^-)$ be the Jordan Decomposition of $\alpha \cdot \mu$ [see theorem: 21.454 for the existence]. Let further (P, N) be a Hahn Decomposition of μ [see theorem: 21.452]. For $\alpha \in \mathbb{R}$ we have either:

$0 \leq \alpha$. Let $A \in \mathcal{A}$ with $A \subseteq P$ [a positive set for μ] then we have $0 \leq \mu(A)$ so that $0 \leq \alpha \cdot \mu(A) = (\alpha \cdot \mu)(A)$ which proves by [definition: 21.444] that P is a positive set for $\alpha \cdot \mu$. Let $A \in \mathcal{A}$ with $A \subseteq N$ [a negative set for μ] then we have $\mu(A) \leq 0$ so that $(\alpha \cdot \mu)(A) = \alpha \cdot \mu(A) \leq 0$ which proves that N is a negative set for $\alpha \cdot \mu$. Hence we have that

$$(P, N) \text{ is a Hahn Decomposition of } \alpha \cdot \mu$$

Then we have

$$\begin{aligned} \|\alpha \cdot \mu\| &= |\alpha \cdot \mu|(X) \\ &= (\alpha \cdot \mu)^+(X) + (\alpha \cdot \mu)^-(X) \\ &\stackrel{[\text{theorem: 21.454}]}{=} (\alpha \cdot \mu)(X \cap P) - (\alpha \cdot \mu)(X \cap N) \\ &= \alpha \cdot \mu(X \cap P) - \alpha \cdot \mu(X \cap N) \\ &= \alpha \cdot (\mu(X \cap P) - \mu(X \cap N)) \\ &= \alpha \cdot (\mu^+(X) + \mu^-(X)) \\ &= \alpha \cdot |\mu|(X) \\ &= \alpha \cdot \|\mu\| \\ &\stackrel{0 \leq \alpha}{=} |\alpha| \cdot \|\mu\| \end{aligned}$$

$\alpha < 0$. Then if $A \in \mathcal{A}$ with $A \subseteq P$ [a positive set for μ] then $0 \leq \mu(A)$ so that $(\alpha \cdot \mu)(A) = \alpha \cdot \mu(A) \leq 0$ which proves that P is a negative set for $\alpha \cdot \mu$. Likewise if $A \in \mathcal{A}$ with $A \subseteq N$ [a negative set for μ] then $\mu(A) \leq 0$ so that $0 \leq \alpha \cdot \mu(A) = (\alpha \cdot \mu)(A)$ which proves that N is a positive set for $\alpha \cdot \mu$. Hence

$$(N, P) \text{ is a Hahn Decomposition of } \alpha \cdot \mu$$

Then we have

$$\begin{aligned} \|\alpha \cdot \mu\| &= |\alpha \cdot \mu|(X) \\ &= (\alpha \cdot \mu)^+(X) + (\alpha \cdot \mu)^-(X) \\ &= (\alpha \cdot \mu)(X \cap N) - (\alpha \cdot \mu)(X \cap P) \\ &= \alpha \cdot \mu(X \cap N) - \alpha \cdot \mu(X \cap P) \\ &= -\alpha \cdot (\mu(X \cap P) - \mu(X \cap N)) \\ &\stackrel{\alpha < 0}{=} |\alpha| \cdot (\mu(X \cap P) - \mu(X \cap N)) \\ &= |\alpha| \cdot (\mu^+(X) + \mu^-(X)) \\ &= |\alpha| \cdot \|\mu\| \end{aligned}$$

So we have proved that

$$\forall \mu \in M[X, \mathcal{A}, \mathbb{R}] \text{ we have } \forall \alpha \in \mathbb{R} \text{ that } \|\alpha \cdot \mu\| = |\alpha| \cdot \|\mu\| \quad (21.788)$$

Let $\mu_1, \mu_2 \in M[X, \mathcal{A}, \mathbb{R}]$ then μ_1, μ_2 are finite and $\mu_1 + \mu_2 \in M[X, \mathcal{A}, \mathbb{R}]$. By the Hahn Decomposition Theorem [see theorem: 21.452] there exists Hahn decompositions $(P_1, N_1), (P_2, N_2), (P_{12}, N_{12})$ of $\mu_1, \mu_2, \mu_1 + \mu_2$ respectively. Then we have

$$\begin{aligned} \mu_1(P_{12}) & \stackrel{[\text{theorem: 21.454}]}{=} (\mu_1)^+(P_{12}) - (\mu_1)^-(P_{12}) \\ & = \mu_1(P_{12} \cap P_1) + \mu_1(P_{12} \cap N_1) \\ & \leq \mu_1(P_{12} \cap P_1) \\ & \stackrel{P_{12} \cap N_1 \subseteq N_1 \Rightarrow \mu_1(P_{12} \cap N_1) \leq 0 \wedge \mu_1 \text{ is finite}}{\leq} \mu_1(P_1) \\ & \stackrel{[\text{lemma: 21.447}]}{\leq} \mu_1(P_1) \end{aligned} \quad (21.789)$$

$$\begin{aligned} \mu_1(N_{12}) & \stackrel{[\text{theorem: 21.454}]}{=} (\mu_1)^+(N_{12}) - (\mu_1)^-(N_{12}) \\ & = \mu_1(N_{12} \cap P_1) + \mu_1(N_{12} \cap N_1) \\ & \geq \mu_1(N_{12} \cap P_1) \\ & \stackrel{N_{12} \cap P_1 \subseteq P_1 \Rightarrow \mu_1(N_{12} \cap P_1) \geq 0 \wedge \mu_1 \text{ is finite}}{\geq} \mu_1(N_1) \\ & \stackrel{[\text{lemma: 21.447}]}{\geq} \mu_1(N_1) \end{aligned} \quad (21.790)$$

$$\begin{aligned} \mu_2(P_{12}) & \stackrel{[\text{theorem: 21.454}]}{=} (\mu_2)^+(P_{12}) - (\mu_2)^-(P_{12}) \\ & = \mu_2(P_{12} \cap P_2) + \mu_2(P_{12} \cap N_2) \\ & \leq \mu_2(P_{12} \cap P_2) \\ & \stackrel{P_{12} \cap N_2 \subseteq N_2 \Rightarrow \mu_2(P_{12} \cap N_2) \leq 0 \wedge \mu_2 \text{ is finite}}{\leq} \mu_2(P_2) \\ & \stackrel{[\text{lemma: 21.447}]}{\leq} \mu_2(P_2) \end{aligned} \quad (21.791)$$

$$\begin{aligned} \mu_2(N_{12}) & \stackrel{[\text{theorem: 21.454}]}{=} (\mu_2)^+(N_{12}) - (\mu_2)^-(N_{12}) \\ & = \mu_2(N_{12} \cap P_2) + \mu_2(N_{12} \cap N_2) \\ & \geq \mu_2(N_{12} \cap P_2) \\ & \stackrel{N_{12} \cap P_2 \subseteq P_2 \Rightarrow \mu_2(N_{12} \cap P_2) \geq 0 \wedge \mu_2 \text{ is finite}}{\geq} \mu_2(N_2) \\ & \stackrel{[\text{lemma: 21.447}]}{\geq} \mu_2(N_2) \end{aligned} \quad (21.792)$$

Now

$$\begin{aligned} \|\mu_1 + \mu_2\| & = |\mu_1 + \mu_2|(X) \\ & = (\mu_1 + \mu_2)^+(X) + (\mu_1 + \mu_2)^-(X) \\ & = (\mu_1 + \mu_2)(X \cap P_{12}) - (\mu_1 + \mu_2)(X \cap N_{12}) \\ & = (\mu_1 + \mu_2)(P_{12}) - (\mu_1 + \mu_2)(N_{12}) \\ & = \mu_1(P_{12}) + \mu_2(P_{12}) - \mu_1(N_{12}) - \mu_2(N_{12}) \\ & \leq \mu_1(P_{12}) + \mu_2(P_{12}) - \mu_1(N_1) - \mu_2(N_2) \\ & \stackrel{[\text{eqs: 21.790, 21.792}]}{\leq} \mu_1(P_1) - \mu_1(N_1) + \mu_2(P_2) - \mu_2(N_2) \\ & \stackrel{[\text{eqs: 21.789, 21.791}]}{\leq} \mu_1(P_1) - \mu_1(N_1) + \mu_2(P_2) - \mu_2(N_2) \\ & = \mu_1(X \cap P_1) - \mu_1(X \cap N_1) + \mu_2(X \cap P_2) - \mu_2(X \cap N_2) \\ & = (\mu_1)^+(X) + (\mu_1)^-(X) + (\mu_2)^+(X) + (\mu_2)^-(X) \\ & = |\mu_1|(X) + |\mu_2|(X) \\ & = \|\mu_1\| + \|\mu_2\| \end{aligned}$$

Hence we have proved the triangular inequality

$$\forall \mu_1, \mu_2 \in M[X, \mathcal{A}, \mathbb{R}] \text{ we have } \|\mu_1 + \mu_2\| \leq \|\mu_1\| + \|\mu_2\| \quad (21.793)$$

Let $\mu \in M[X, \mathcal{A}, \mathbb{R}]$ be such that $\|\mu\| = 0$ then we have $\forall A \in \mathcal{A}$ that

$$|\mu(A)| \underset{[\text{theorem: 21.454}]}{\leq} |\mu|(A) \underset{[\text{theorem: 21.106}] \wedge |\mu| \text{ is a measure}}{\leq} |\mu|(X) = \|\mu\| = 0 = C_0(A)$$

So that

$$\text{If } \|\mu\| = 0 \text{ then } \mu = C_0 \text{ the neutral element in } M[X, \mathcal{A}, \mathbb{R}] \quad (21.794)$$

As $\mu \in M[X, \mathcal{A}, \mathbb{R}]$ μ is a **finite** signed measure so that by [theorem: 21.454] $|\mu|$ is a finite measure. Hence $\|\mu\| = |\mu|(X) \in [0, \infty[$, this together with [eqs: 21.788, 21.793 and 21.794] proves that

$$\|\cdot\| \text{ is a norm on } M[X, \mathcal{A}, \mathbb{R}] \quad \square$$

Next we prove the same for the vector space $\langle M[X, \mathcal{A}, \mathbb{C}], +, \cdot \rangle$

Theorem 21.470. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space then $\langle M[X, \mathcal{A}, \mathbb{C}], \|\cdot\| \rangle$ is a normed space.*

Proof. Let $\mu \in M[X, \mathcal{A}, \mathbb{C}]$ then by [theorem: 21.465] it follows that $|\mu|$ is a finite measure, hence we have that $\|\mu\| = |\mu|(X) \in [0, \infty[$. In other words

$$\forall \mu \in M[X, \mathcal{A}, \mathbb{C}] \text{ we have } \|\mu\| \in [0, \infty[\quad (21.795)$$

Let $\mu \in M[X, \mathcal{A}, \mathbb{C}]$ and $\alpha \in \mathbb{C}$ then by [theorem: 21.465] $|\mu|$ is a finite measure so that

$$|\sup \left(\left(\left\{ \sum_{i=1}^n |\mu(A_i)| \mid n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i=\{1, \dots, n\}} A_i \right\} \right) \right) \in \mathbb{R} \text{ exist} \quad (21.796)$$

Further we have

$$\begin{aligned} & \frac{\|\alpha \cdot \mu\|}{|\alpha \cdot \mu|(X)} \underset{[\text{definition: 21.463}]}{=} \\ & \sup \left(\left(\left\{ \sum_{i=1}^n |(\alpha \cdot \mu)(A_i)| \mid n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i=\{1, \dots, n\}} A_i \right\} \right) \right) = \\ & \sup \left(\left(\left\{ |\alpha| \cdot \sum_{i=1}^n |\mu(A_i)| \mid n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i=\{1, \dots, n\}} A_i \right\} \right) \right) \underset{[\text{theorem: 10.22}] \wedge [\text{eq: 21.796}]}{=} \\ & |\alpha| \cdot \sup \left(\left(\left\{ \sum_{i=1}^n |\mu(A_i)| \mid n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i=\{1, \dots, n\}} A_i \right\} \right) \right) = \\ & \frac{|\alpha| \cdot |\mu|(X)}{|\alpha| \cdot \|\mu\|} = \end{aligned}$$

which proves that

$$\forall \mu \in M[X, \mathcal{A}, \mathbb{C}] \text{ we have } \forall \alpha \in \mathbb{C} \text{ that } \|\alpha \cdot \mu\| = |\alpha| \cdot \|\mu\| \quad (21.797)$$

Let $\mu_1, \mu_2 \in M[X, \mathcal{A}, \mathbb{C}]$ and

$$x \in \left\{ \sum_{i=1}^n |(\mu_1 + \mu_2)(A_i)| \mid n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i=\{1, \dots, n\}} A_i \right\}$$

then $\exists \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ pairwise disjoint with $X = \bigsqcup_{i \in \{1, \dots, n\}} A_i$ such that

$$\begin{aligned}
 x &= \sum_{i=1}^n |(\mu_1 + \mu_2)(A_i)| \\
 &= \sum_{i=1}^n |\mu_1(A_i) + \mu_2(A_i)| \\
 &\leq \sum_{i=1}^n (|\mu_1(A_i)| + |\mu_2(A_i)|) \\
 &= \sum_{i=1}^n |\mu_1(A_i)| + \sum_{i=1}^n |\mu_2(A_i)| \\
 &\leq \sup \left(\left\{ \sum_{i=1}^n |\mu_1(A_i)| \mid m \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i \in \{1, \dots, n\}} A_i \right\} \right) + \\
 &\quad \sup \left(\left\{ \sum_{i=1}^n |\mu_2(A_i)| \mid m \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i \in \{1, \dots, n\}} A_i \right\} \right) \\
 &= \|\mu_1\| + \|\mu_2\|
 \end{aligned}$$

Hence $\|\mu_1\| + \|\mu_2\|$ is an upper bound for the set

$$\left\{ \sum_{i=1}^n |(\mu_1 + \mu_2)(A_i)| \mid n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i \in \{1, \dots, n\}} A_i \right\}$$

so that

$$\begin{aligned}
 \|\mu_1 + \mu_2\| &= \sup \left(\left\{ \sum_{i=1}^n |(\mu_1 + \mu_2)(A_i)| \mid n \in \mathbb{N} \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i \in \{1, \dots, n\}} A_i \right\} \right) \leq \\
 &\|\mu_1\| + \|\mu_2\|
 \end{aligned}$$

which proves that

$$\forall \mu_1, \mu_2 \in M[X, \mathcal{A}, \mathbb{C}] \text{ we have } \|\mu_1 + \mu_2\| \leq \|\mu_1\| + \|\mu_2\| \quad (21.798)$$

Further if $\mu \in M[X, \mathcal{A}, \mathbb{C}]$ is such that $\|\mu\| = 0$ then we have for $A \in \mathcal{A}$ that

$$|\mu(A)| \underset{[\text{theorem: 21.465}]}{\leq} |\mu|(A) \underset{[\text{theorem: 21.106}] \wedge |\mu| \text{ is a measure}}{\leq} |\mu|(X) = \|\mu\| = 0 = C_0(A)$$

it follows that

$$\text{If } \|\mu\| = 0 \text{ then } \mu = C_0 \text{ the neutral element in } M[X, \mathcal{A}, \mathbb{R}] \quad (21.799)$$

From [eqs: 21.795, 21.797, 21.798 and 21.799] it follows that

$$\|\cdot\| \text{ is a norm on } M(X, \mathcal{A}, \mathbb{C}) \quad \square$$

Next we prove that $\langle M[X, \mathcal{A}, \mathbb{K}], \|\cdot\| \rangle$ is not only a normed space but also a Banach space.

Theorem 21.471. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space then $\langle M[X, \mathcal{A}, \mathbb{K}], \|\cdot\| \rangle$ is a Banach space*

Proof. Using [theorems: 21.469, 21.470] it follows that

$$\langle M[X, \mathcal{A}, \mathbb{K}], \|\cdot\| \rangle \text{ is a normed space}$$

So to prove that $\langle M[X, \mathcal{A}, \mathbb{K}], \|\cdot\| \rangle$ is a Banach space we must prove that every Cauchy sequence in $M[X, \mathcal{A}, \mathbb{K}]$ is a convergent series in $M[X, \mathcal{A}, \mathbb{K}]$. So let $\{\mu_i\}_{i \in \mathbb{N}} \subseteq M[X, \mathcal{A}, \mathbb{K}]$ be a Cauchy sequence then we have that

$$\forall \varepsilon \in \mathbb{R}^+ \text{ there exist a } N_\varepsilon \in \mathbb{N} \text{ with } \forall n, m \in \{N_\varepsilon, \dots, \infty\} \quad |\mu_n - \mu_m|(X) = \|\mu_n - \mu_m\| < \varepsilon \quad (21.800)$$

Let $\varepsilon \in \mathbb{R}^+$ then we have, as $\forall n, m \in \{N_\varepsilon, \dots, \infty\}$ $|\mu_n - \mu_m|$ is a finite measure [see theorems: 21.468, 21.454, 21.465], that $\forall A \in \mathcal{A}$

$$\begin{aligned} |\mu_n(A) - \mu_m(A)| &= |(\mu_n - \mu_m)(A)| \\ &\leq |\mu_n - \mu_m|(A) \\ &\quad [\text{theorems: 21.454, 21.465}] \\ &\leq |\mu_n - \mu_m|(X) \\ &\quad [\text{theorem: 21.106}] \\ &= \|\mu_n - \mu_m\| \\ &\quad [\text{eq: 21.800}] \\ &< \varepsilon \end{aligned}$$

In other words

$$\forall \varepsilon > 0 \quad \exists N_\varepsilon \in \mathbb{N} \text{ such that } \forall n, m \in \{N_\varepsilon, \dots, \infty\} \text{ and } \forall A \in \mathcal{A} \text{ we have } |\mu_n(A) - \mu_m(A)| < \varepsilon \quad (21.801)$$

Hence we have that $\forall A \in \mathcal{A}$ $\{\mu_n(A)\}_{n \in \mathbb{N}} \subseteq \mathbb{K}$ is a Cauchy sequence in $\langle \mathbb{K}, \|\cdot\| \rangle$. As by [examples: 14.336, 14.339] $\langle \mathbb{K}, \|\cdot\| \rangle$ is a Banach space it follows that

$$\forall A \in \mathcal{A} \quad \lim_{n \rightarrow \infty} \mu_n(A) \in \mathbb{K}$$

Hence we can define the following function

$$\mu: \mathcal{A} \rightarrow \mathbb{K} \text{ where } \mu(A) = \lim_{n \rightarrow \infty} \mu_n(A) \in \mathbb{K} \quad (21.802)$$

From which it follows that

$$\text{If } \mathbb{K} = \mathbb{R} \text{ then } \{\mu(A) | A \in \mathcal{A}\} \subseteq \mathbb{R} \subseteq \mathbb{R}_\infty \quad (21.803)$$

Take $\varepsilon \in \mathbb{R}^+$ and let $n \in \{N_{\frac{\varepsilon}{2}}, \dots, \infty\}$ then given an arbitrary $A \in \mathcal{A}$ we have as $\mu(A) = \lim_{n \rightarrow \infty} \mu_n(A)$ that there exist a M_ε such that $\forall n \in \{M_\varepsilon, \dots, \infty\}$ we have $|\mu_n(A) - \mu(A)| < \frac{\varepsilon}{2}$. Let $M = \max(N_{\frac{\varepsilon}{2}}, M_\varepsilon)$ then we have

$$\begin{aligned} |\mu_n(A) - \mu(A)| &= |\mu_n(A) - \mu_M(A) + \mu_M(A) - \mu(A)| \\ &\leq |\mu_n(A) - \mu_M(A)| + |\mu_M(A) - \mu(A)| \\ &< \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \\ &= \varepsilon \end{aligned}$$

which proves, if we take $K_\varepsilon = N_{\frac{\varepsilon}{2}}$, that

$$\forall \varepsilon \in \mathbb{R}^+ \quad \exists K_\varepsilon \in \mathbb{N} \text{ such that } \forall n \in \{K_\varepsilon, \dots, \infty\} \text{ we have } \forall A \in \mathcal{A} \quad |\mu_n(A) - \mu(A)| < \varepsilon \quad (21.804)$$

Now we prove that $\mu \in M[X, \mathcal{A}, \mathbb{K}]$. In this proof we will use [theorems: 21.443, 21.461], so our first task is to prove that the conditions for these theorems are satisfied. First we have

$$\mu(\emptyset) = \lim_{n \rightarrow \infty} \mu_n(\emptyset) = \lim_{n \rightarrow \infty} 0 = 0 \quad (21.805)$$

Let $\{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$, $n \in \mathbb{N}$ be a finite pairwise disjoint family of measurable sets. Let $\varepsilon \in \mathbb{R}^+$ then $\forall i \in \{1, \dots, n\}$ we have, as $\mu(B_i) \stackrel{[\text{eq: 21.802}]}{=} \lim_{k \rightarrow \infty} \mu_k(B_i)$, that there exist a $N_i \in \mathbb{N}$ such that $\forall k \in \{N_i, \dots, \infty\}$ we have $|\mu_k(B_i) - \mu(B_i)| < \frac{\varepsilon}{n}$. Take $N = \max(\{N_i | i \in \{1, \dots, n\}\})$ then we have $\forall k \in \{N, \dots, \infty\}$ that

$$\begin{aligned} \left| \sum_{i=1}^n \mu_k(B_i) - \sum_{i=1}^n \mu(B_i) \right| &= \left| \sum_{i=1}^n (\mu_k(B_i) - \mu(B_i)) \right| \\ &\leq \sum_{i=1}^n |\mu_k(B_i) - \mu(B_i)| \\ &\stackrel{N_i \leq N}{\leq} \sum_{i=1}^n \frac{\varepsilon}{n} \\ &= \varepsilon \end{aligned}$$

so that

$$\lim_{k \rightarrow \infty} \sum_{i=1}^n \mu_k(B_i) = \sum_{i=1}^n \mu(B_i) \quad (21.806)$$

Further we have

$$\begin{aligned} \mu\left(\bigsqcup_{i \in \{1, \dots, n\}} B_i\right) &\stackrel{[\text{eq: 21.802}]}{=} \lim_{k \rightarrow \infty} \mu_k\left(\bigsqcup_{i \in \{1, \dots, n\}} B_i\right) \\ &\stackrel{\mu_k \in M[X, \mathcal{A}, \mathbb{K}]}{=} \lim_{k \rightarrow \infty} \sum_{i=1}^n \mu_k(B_i) \\ &\stackrel{[\text{eq: 21.806}]}{=} \sum_{i=1}^n \mu(B_i) \end{aligned}$$

proving finite additivity. To summarize

$$\forall \{B_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \text{ pairwise disjoint we have that } \mu\left(\bigsqcup_{i=1}^n B_i\right) = \sum_{i=1}^n \mu(B_i) \quad (21.807)$$

Let now $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ with $\forall i \in \mathbb{N} \ A_{i+1} \subseteq A_i$ such that $\bigcap_{i \in \mathbb{N}} A_i = \emptyset$. For $\mathbb{K}$ we have then two slightly different cases to consider:

$\mathbb{K} = \mathbb{R}$. Let $i \in \mathbb{N}$ then $\mu_i \in M(X, \mathcal{A}, \mathbb{R}) \Rightarrow \mu_i$ is a finite signed measure, hence using [theorem: 21.442] it follows that $\lim_{k \rightarrow \infty} \mu_i(A_k) = \mu_i(\bigcap_{k \in \mathbb{N}} A_k) = \mu_i(\emptyset) = 0$.

$\mathbb{K} = \mathbb{C}$. Let $i \in \mathbb{N}$ then $\mu_i \in M[X, \mathcal{A}, \mathbb{C}] \Rightarrow \mu_i$ is a complex measure so that using [theorem: 21.460] we have that $\lim_{k \rightarrow \infty} \mu_i(A_k) = \mu_i(\bigcap_{k \in \mathbb{N}} A_k) = \mu_i(\emptyset) = 0$.

So in all cases we have

$$\forall i \in \mathbb{N} \text{ that } \lim_{k \rightarrow \infty} \mu_i(A_k) = 0 \quad (21.808)$$

Let $\varepsilon \in \mathbb{R}^+$ then by [eq: 21.804] there exist a $N \in \mathbb{N}$ such that $\forall A \in \mathcal{A} \ |\mu_N(A) - \mu(A)| < \frac{\varepsilon}{2}$. From [eq: 21.808] it follows that there exist a $K \in \mathbb{N}$ such that $\forall n \in \{K, \dots, \infty\}$ we have $|\mu_N(A_n)| < \frac{\varepsilon}{2}$. Let $n \in \{K, \dots, \infty\}$ then we have

$$|\mu(A_n)| \leq |\mu(A_n) - \mu_N(A_n) + \mu_N(A_n)| \leq |\mu(A_n) - \mu_N(A_n)| + |\mu_N(A_n)| < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$$

which proves that $\lim_{n \rightarrow \infty} \mu(A_n) = 0$. To summarize we have proved that

$$\forall \{A_k\}_{k \in \mathbb{N}} \subseteq \mathcal{A} \text{ with } A_{k+1} \subseteq A_k \text{ such that } \bigcap_{k \in \mathbb{N}} A_k = \emptyset \text{ we have } \lim_{k \rightarrow \infty} \mu(A_k) = 0 \quad (21.809)$$

Again we look at the the two cases for $\mathbb{K}$

$\mathbb{K} = \mathbb{R}$. Then [eqs: 21.805, 21.803, 21.807 and 21.809] allows us to use [them: 21.443] to prove that μ is a signed measure. As by [eq: 21.803] μ is finite it follows that

$$\mu \in M[X, \mathcal{A}, \mathbb{R}]$$

$\mathbb{K} = \mathbb{C}$. Then [eqs: 21.805, 21.807 and 21.809] allows us to use [theorem: 21.461] to prove that μ is a complex measure. Hence

$$\mu \in M[X, \mathcal{A}, \mathbb{C}]$$

So we have proved that for $\mathbb{K} = \mathbb{R}$ or $\mathbb{K} = \mathbb{C}$

$$\mu \in M[X, \mathcal{A}, \mathbb{K}] \quad (21.810)$$

Next we must prove that $\lim_{n \rightarrow \infty} \mu_n$ converges using the norm $|||$. Consider for $\mathbb{K}$ either:

$\mathbb{K} = \mathbb{R}$. Let $\varepsilon \in \mathbb{R}^+$ then for $n \in \{K_{\frac{\varepsilon}{4}}, \dots, \infty\}$ we have by [eq: 21.804] that $\forall A \in \mathcal{A}$

$$(\mu_n - \mu)(A) = \mu_n(A) - \mu(A) \leq |\mu_n(A) - \mu(A)| < \frac{\varepsilon}{4}$$

$$-(\mu_n - \mu)(A) = -(\mu_n(A) - \mu(A)) \leq |\mu_n(A) - \mu(A)| < \frac{\varepsilon}{4}$$

so that $\frac{\varepsilon}{4}$ is a upper bound for

$$\{(\mu_n - \mu)(A) | A \in \mathcal{A} \wedge A \subseteq X\} \text{ and } \{-(\mu_n - \mu)(A) | A \in \mathcal{A} \wedge A \subseteq X\}$$

Hence we have that

$$(\mu_n - \mu)^+(X) \stackrel{[\text{theorem: 21.454}]}{=} \sup \{(\mu_n - \mu)(A) | A \in \mathcal{A} \wedge A \subseteq X\} < \frac{\varepsilon}{4}$$

$$(\mu_n - \mu)^-(X) \stackrel{[\text{theorem: 21.454}]}{=} \sup \{-(\mu_n - \mu)(A) | A \in \mathcal{A} \wedge A \subseteq X\} < \frac{\varepsilon}{4}$$

so that

$$\|\mu_n - \mu\| = (\mu_n - \mu)^+ + (\mu_n - \mu)^- = \frac{\varepsilon}{4} + \frac{\varepsilon}{4} = \frac{\varepsilon}{2} < \varepsilon$$

which proves that

$$\mu = \lim_{n \rightarrow \infty} \mu_n$$

$\mathbb{K} = \mathbb{C}$. Let $\varepsilon \in \mathbb{R}^+$. As $\{\mu_n\}_{n \in \mathbb{N}}$ is Cauchy there exist a $N \in \mathbb{N}$ such that $\forall n, m \in \{N, \dots, \infty\}$ we have $\|\mu_n - \mu_m\| < \frac{\varepsilon}{4}$. Hence using [definition: 21.463] we have that

$$\sup \left(\left\{ \sum_{i=1}^k |(\mu_n - \mu_m)(A_i)| \mid \{A_i\}_{i \in \{1, \dots, k\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i \in \{1, \dots, k\}} A_i \right\} \right) < \frac{\varepsilon}{4} \quad (21.811)$$

Take $\{A_i\}_{i \in \{1, \dots, k\}} \subseteq \mathcal{A}$ pairwise disjoint such that $X = \bigsqcup_{i \in \{1, \dots, k\}} A_i$. Using [eq: 21.804] there exist a $K \in \mathbb{N}$ such that $\forall l \in \{K, \dots, \infty\}$ we have $\forall i \in \{1, \dots, k\}$ that $|(\mu_l - \mu)(A_i)| < \frac{\varepsilon}{4 \cdot k}$. So that

$$\sum_{i=1}^k |\mu_l - \mu| < \sum_{i=1}^k \frac{\varepsilon}{4 \cdot k} = \frac{\varepsilon}{4} \quad (21.812)$$

Take now $n \in \{N, \dots, \infty\}$ and $M = \max(N, K)$ then we have

$$\begin{aligned} \sum_{i=1}^k |(\mu_n - \mu)(A_i)| &= \\ \sum_{i=1}^k |\mu_n(A_i) - \mu(A_i)| &= \\ \sum_{i=1}^k |\mu_n(A_i) - \mu_M(A_i) + \mu_M(A_i) - \mu(A_i)| &\leq \\ \sum_{i=1}^k |\mu_n(A_i) - \mu_M(A_i)| + \sum_{i=1}^k |\mu_M(A_i) - \mu(A_i)| &\stackrel{[\text{eq: 21.812}]}{<} \\ \sum_{i=1}^k |\mu_n(A_i) - \mu_M(A_i)| + \frac{\varepsilon}{4} &\leq \\ \sup \left(\left\{ \sum_{i=1}^k |(\mu_n - \mu_M)(A_i)| \mid \{A_i\}_{i \in \{1, \dots, k\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i \in \{1, \dots, k\}} A_i \right\} \right) + \frac{\varepsilon}{4} &\stackrel{[\text{eq: 21.811}]}{<} \\ \frac{\varepsilon}{4} + \frac{\varepsilon}{4} &= \\ \frac{\varepsilon}{2} & \end{aligned}$$

So $\frac{\varepsilon}{2}$ is a upper bound for $\{\sum_{i=1}^k |(\mu_n - \mu)(A_i)| \mid \{A_i\}_{i \in \{1, \dots, k\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i \in \{1, \dots, k\}} A_i\}$ which proves that

$$\|\mu_n - \mu\| \stackrel{\text{def}}{=} \sup \left(\sum_{i=1}^k |(\mu_n - \mu)(A_i)| \mid \{A_i\}_{i \in \{1, \dots, k\}} \subseteq \mathcal{A} \wedge X = \bigsqcup_{i \in \{1, \dots, k\}} A_i \right) \leq \frac{\varepsilon}{2} < \varepsilon$$

Hence we have that

$$\mu = \lim_{n \rightarrow \infty} \mu_n$$

In conclusion we have proved that for every Cauchy sequence $\{\mu_n\}_{n \in \mathbb{N}} \subseteq M[X, \mathcal{A}, \mathbb{K}]$ $\mu = \lim_{n \rightarrow \infty} \mu_k$ exist in $\langle M[X, \mathcal{A}, \mathbb{K}], ||| \rangle$ or in other words that

$$\langle M[X, \mathcal{A}, \mathbb{K}], ||| \rangle \text{ is a Banach space} \quad \square$$

21.6.3.1 Integrals based on signed or complex measures.

As a signed measure μ can be written as $\mu = \mu^+ - \mu^-$ where (μ^+, μ^-) is the Jordan decomposition of μ it make sense to define $\int f d\mu$ as $\int f d\mu = \int f d\mu^+ - \int f d\mu^-$. Likewise as a complex measure can be written as $\mu = \mu_r^+ - \mu_r^- + i \cdot (\mu_c^+ - \mu_c^-)$ where $(\mu_r^+, \mu_r^-, \mu_c^+, \mu_c^-)$ is the Jordan decomposition of μ it make sense to define $\int f d\mu$ as $\int f d\mu = \int f d\mu_r^+ - \int f d\mu_r^- + i \cdot (\int f d\mu_c^+ - \int f d\mu_c^-)$ but this works only if the integrals on the left side are finite. Hence as with the definition of μ -integrable functions we need a extra condition on the measurable functions. This is provided in the following definition.

Definition 21.472. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then the set of **bounded measurable functions** $B[X, \mathcal{A}, \mathbb{K}]$ is defined by

$$B[X, \mathcal{A}, \mathbb{K}] = \{f \in \mathcal{M}[X, \mathcal{A}, \mathbb{K}] | \exists M \in [0, \infty[\text{ such that } \forall x \in X \text{ we have } |f(x)| \leq M\} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{K}]$$

more specific we have

$$B[X, \mathcal{A}, \mathbb{R}] = \{f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}] | \exists M \in [0, \infty[\text{ such that } \forall x \in X \text{ we have } |f(x)| \leq M\} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

$$B[X, \mathcal{A}, \mathbb{C}] = \{f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}] | \exists M \in [0, \infty[\text{ such that } \forall x \in X \text{ we have } |f(x)| \leq M\} \subseteq \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$$

We show now that that $B[X, \mathcal{A}, \mathbb{K}]$ is actually a normed vector space.

Theorem 21.473. Let $\langle X, \mathcal{A} \rangle$ be a measurable space then we have

1. $\langle B[X, \mathcal{A}, \mathbb{R}], +, \cdot \rangle$ is a vector space [where $+$ and $\cdot$ are pointwise defined] and C_0 defined by $C_0(x) = 0$ is the neutral element.
2. $\langle B[X, \mathcal{A}, \mathbb{C}], +, \cdot \rangle$ is a vector space [where $+$ and $\cdot$ are pointwise defined] and C_0 defined by $C_0(x) = 0$ is the neutral element.
3. If we define

$$\|f\|_\infty: B[X, \mathcal{A}, \mathbb{K}] \rightarrow [0, \infty[\text{ by } \|f\|_\infty = \sup(\{|f(x)| | x \in X\})$$

then $\langle B[X, \mathcal{A}, \mathbb{K}], |||_\infty \rangle$ is a normed space.

Proof.

1. As $C_0 \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ [see example: 21.217] and $\forall x \in X$ $|C_0(x)| = 0 \leq 0$ it follows that

$$C_0 \in B[X, \mathcal{A}, \mathbb{R}] \Rightarrow \emptyset = B[X, \mathcal{A}, \mathbb{R}]$$

Let $f, g \in B[X, \mathcal{A}, \mathbb{R}]$ then $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ and there exist a $M_1, M_2 \in [0, \infty[$ such that $\forall x \in X$ we have $|f(x)| \leq M_1$ and $|g(x)| \leq M_2$. Using [theorem: 21.245] it follows that $f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$, further we have $\forall x \in X$ that $|(f + g)(x)| \leq |f(x)| + |g(x)| \leq M_1 + M_2$ which proves that $f + g \in B[X, \mathcal{A}, \mathbb{R}]$. Hence we have

$$\forall f, g \in B[X, \mathcal{A}, \mathbb{R}] \quad f + g \in B[X, \mathcal{A}, \mathbb{R}]$$

If $\alpha \in \mathbb{R}$ then by [theorem: 21.249] we have $\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$, further $\forall x \in X$ we have $|(\alpha \cdot f)(x)| = |\alpha| \cdot |f| \leq |\alpha| \cdot M_1 \leq |\alpha| \cdot M_1 + 1$ which proves that $\alpha \cdot f \in B[X, \mathcal{A}, \mathbb{R}]$. Hence we have

$$\forall f \in B[X, \mathcal{A}, \mathbb{R}] \text{ we have } \alpha \cdot f \in B[X, \mathcal{A}, \mathbb{R}]$$

Using [theorem: 11.67] and [theorem: 11.60] it follows that

$$\langle B[X, \mathcal{A}, \mathbb{R}], +, \cdot \rangle \text{ is a vector space}$$

2. As $C_0 \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ [see example: 21.217] and $\forall x \in X \quad |C_0(x)| = 0 \leq 0$ it follows that

$$C_0 \in B[X, \mathcal{A}, \mathbb{C}] \Rightarrow \emptyset = B[X, \mathcal{A}, \mathbb{C}]$$

Let $f, g \in B[X, \mathcal{A}, \mathbb{C}]$ then $f, g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$ and there exist a $M_1, M_2 \in [0, \infty[$ such that $\forall x \in X$ we have $|f(x)| \leq M_1$ and $|g(x)| \leq M_2$. Using [theorem: 21.370] it follows that $f + g \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$, further we have $\forall x \in X$ that $|(f + g)(x)| \leq |f(x)| + |g(x)| \leq M_1 + M_2$ which proves that $f + g \in B[X, \mathcal{A}, \mathbb{C}]$. Hence we have

$$\forall f, g \in B[X, \mathcal{A}, \mathbb{C}] \quad f + g \in B[X, \mathcal{A}, \mathbb{C}]$$

If $\alpha \in \mathbb{R}$ then by [theorem: 21.370] we have $\alpha \cdot f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}]$, further $\forall x \in X$ we have $|(\alpha \cdot f)(x)| = |\alpha| \cdot |f(x)| \leq |\alpha| \cdot M_1 \leq |\alpha| \cdot M_1 + 1$ which proves that $\alpha \cdot f \in B[X, \mathcal{A}, \mathbb{C}]$. Hence we have

$$\forall f \in B[X, \mathcal{A}, \mathbb{C}] \quad \text{we have } \alpha \cdot f \in B[X, \mathcal{A}, \mathbb{C}]$$

Using [theorem: 11.67] and [theorem: 11.60] it follows that

$$\langle B[X, \mathcal{A}, \mathbb{C}], +, \cdot \rangle \text{ is a vector space}$$

3. Let $f \in B[X, \mathcal{A}, \mathbb{K}]$ then $\exists M \in [0, \infty[$ such that $\forall x \in X$ we have $|f(x)| \leq M$ so that M is a upper bound of $\{|f(x)| | x \in X\}$ which is not empty as $X \neq \emptyset$ by the definition of a measurable space [see definition: 21.32]. As $\mathbb{R}$ is conditional complete [see theorem: 10.18] it follows that

$$\sup(\{|f(x)| | x \in X\}) \in \mathbb{R} \text{ exist}$$

So the fnction

$$\| \cdot \|_{\infty}: B[X, \mathcal{A}, \mathbb{K}] \rightarrow [0, \infty[\text{ where } \|f\|_{\infty} = \sup(\{|f(x)| | x \in X\}) \quad (21.813)$$

is well defined. Let $f, g \in B[X, \mathcal{A}, \mathbb{K}]$ then we have then we have $\forall x \in X$ that

$$|(f + g)(x)| \leq |f(x)| + |g(x)| \leq \sup(|f(x)| | x \in X) + \sup(|g(x)| | x \in X) \leq \|f\|_{\infty} + \|g\|_{\infty}$$

so that $\|f\|_{\infty} + \|g\|_{\infty}$ is a upper bound of $\{|(f + g)(x)| | x \in X\}$. Hence

$$\|f + g\|_{\infty} = \sup(\{|(f + g)(x)| | x \in X\}) \leq \|f\|_{\infty} + \|g\|_{\infty}$$

which proves that

$$\forall f, g \in B[X, \mathcal{A}, \mathbb{K}] \quad \text{we have } \|f + g\|_{\infty} \leq \|f\|_{\infty} + \|g\|_{\infty} \quad (21.814)$$

Let $\alpha \in \mathbb{R}$ and $f \in M[X, \mathcal{A}, \mathbb{K}]$ then

$$\begin{aligned} \|\alpha \cdot f\|_{\infty} &= \sup(\{|\alpha \cdot f(x)| | x \in X\}) \\ &= \sup(\{|\alpha| \cdot |f(x)| | x \in X\}) \\ &\stackrel{[\text{theorem: 10.22}]}{=} |\alpha| \cdot \sup(\{|f(x)| | x \in X\}) \\ &= |\alpha| \cdot \|f\|_{\infty} \end{aligned}$$

hence we have

$$\forall \alpha \in \mathbb{R}, \forall f \in M[X, \mathcal{A}, \mathbb{K}] \quad \text{we have } \|\alpha \cdot f\|_{\infty} = |\alpha| \cdot \|f\|_{\infty} \quad (21.815)$$

If $f \in M[X, \mathcal{A}, \mathbb{K}]$ is such that $\|f\|_{\infty} = 0$ then we have $\forall x \in X$

$$0 \leq |f(x)| \leq \sup(\{|f(x)| | x \in X\}) = \|f\|_{\infty} = 0$$

proving that $\forall x \in X \quad |f(x)| = 0 = C_0(x)$. Hence

$$\forall f \in B[X, \mathcal{A}, \mathbb{K}] \quad \text{with } \|f\|_{\infty} = 0 \text{ we have that } f = C_0 \quad (21.816)$$

From [eqs: 21.813, 21.814, 21.815 and 21.816] it follows by definition that $\| \cdot \|_{\infty}$ is a norm on $B[X, \mathcal{A}, \mathbb{K}]$. $\square$

Next we show that all bounded measurable functions are integrable.

Theorem 21.474. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, μ a finite measure and $f \in B(X, \mathcal{A}, \mathbb{K})$ then

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{K}]$$

In other words if $f \in B[X, \mathcal{A}, \mathbb{K}]$ then $\int f d\mu$ exist.

Proof. For $\mathbb{K}$ we have either

$\mathbb{K} = \mathbb{R}$. Then $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ and there exist a $M \in \mathbb{R}$ such that $\forall x \in X$ we have $|f(x)| \leq M$. By [theorem: 21.323] $f^+, f^- \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$, further we have by [theorem: 21.325] that $\forall x \in X$ $f_+(x) \leq |f(x)| \leq M = C_M(x)$. So

$$\begin{aligned} \int^+ f^+ d\mu &\underset{[\text{theorem: 21.313}]}{\leq} \int^+ C_M d\mu \underset{[\text{example: 21.300}]}{\leq} M \cdot \mu(A) \underset{\mu \text{ is finite}}{<} \infty \\ \int^+ f^- d\mu &\underset{[\text{theorem: 21.313}]}{\leq} \int^+ C_M d\mu \underset{[\text{example: 21.300}]}{\leq} M \cdot \mu(A) \underset{\mu \text{ is finite}}{<} \infty \end{aligned}$$

Hence by [definition: 21.326] we have that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

$\mathbb{K} = \mathbb{C}$. Then $f \in \mathcal{M}[X, \mathcal{A}, \mathbb{C}] \xRightarrow{[\text{theorem: 21.368}]} \text{Re}(f), \text{Im}(f) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$ and there exist a $M \in \mathbb{R}$ such that $\forall x \in X$ we have $|f(x)| \leq M$. Then we have

$$\begin{aligned} \forall x \in X \text{ we have } |\text{Re}(f)(x)| &= |\text{Re}(f(x))| \underset{[\text{theorem: 10.85}]}{\leq} |f(x)| \leq M \\ \forall x \in X \text{ we have } |\text{Im}(f)(x)| &= |\text{Im}(f(x))| \underset{[\text{theorem: 10.85}]}{\leq} |f(x)| \leq M \end{aligned}$$

Using then the case $\mathbb{K} = \mathbb{R}$ on the above proves that $\text{Re}(f), \text{Im}(f) \in \mathcal{L}[X, \mathcal{A}, \mathbb{R}]$. Hence it follows from [definition: 21.372] that $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$. $\square$

Now we are ready to define integration using signed and complex measures:

Definition 21.475. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $\mu \in M[X, \mathcal{A}, \mathbb{R}]$ and $f \in B(X, \mathcal{A}, \mathbb{R})$ then we define $\int f d\mu$ as

$$\int f d\mu = \int f d\mu^+ - \int f d\mu^- \text{ where } (\mu^+, \mu^-) \text{ is the Jordon Decomposition of } \mu$$

Note 21.476. As $\mu \in M[X, \mathcal{A}, \mathbb{R}]$ we have by [theorem: 21.454] that μ^+, μ^- are finite so that by [theorem: 21.474] $f \in \mathcal{L}[X, \mathcal{A}, \mu^+, \mathbb{R}] \wedge f \in \mathcal{L}[X, \mathcal{A}, \mu^-, \mathbb{R}]$. Hence $\int f d\mu^+ - \int f d\mu^-$ is well defined.

Definition 21.477. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $\mu \in M[X, \mathcal{A}, \mathbb{R}]$ and $f \in B(X, \mathcal{A}, \mathbb{C})$ then we define $\int^{\mathbb{C}} f d\mu$ as

$$\int^{\mathbb{C}} f d\mu = \int^{\mathbb{C}} f d\mu^+ - \int^{\mathbb{C}} f d\mu^- \text{ where } (\mu^+, \mu^-) \text{ is the Jordon Decomposition of } \mu$$

Note 21.478. As $\mu \in M[X, \mathcal{A}, \mathbb{R}]$ we have by [theorem: 21.454] that μ^+, μ^- are finite measures so that by [theorem: 21.474] $f \in \mathcal{L}[X, \mathcal{A}, \mu^+, \mathbb{C}] \wedge f \in \mathcal{L}[X, \mathcal{A}, \mu^-, \mathbb{C}]$. Hence $\int^{\mathbb{C}} f d\mu^+ - \int^{\mathbb{C}} f d\mu^-$ is well defined.

Definition 21.479. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $\mu \in M[X, \mathcal{A}, \mathbb{C}]$ and $f \in B(X, \mathcal{A}, \mathbb{R})$ then we define $\int f d\mu$ as

$$\int f d\mu = \int f d\mu_r^+ - \int f d\mu_r^- + i \cdot \left(\int f d\mu_c^+ - \int f d\mu_c^- \right)$$

where $(\mu_r^+, \mu_r^-, \mu_c^+, \mu_c^-)$ is the Jordon Decomposition of μ .

Note 21.480. As $\mu \in M[X, \mathcal{A}, \mathbb{C}]$ we have by [theorem: 21.462] that $\mu_r^+, \mu_r^-, \mu_c^+, \mu_c^-$ are finite measures so that by [theorem: 21.474] $f \in \mathcal{L}[X, \mathcal{A}, \mu^+, \mathbb{R}] \wedge f \in \mathcal{L}[X, \mathcal{A}, \mu^-, \mathbb{C}]$. Hence $\int f d\mu_r^+, \int f d\mu_r^-, \int f d\mu_c^+, \int f d\mu_c^-$ are well defined.

Definition 21.481. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, $\mu \in M[X, \mathcal{A}, \mathbb{C}]$ and $f \in B(X, \mathcal{A}, \mathbb{C})$ then we define $\int^{\mathbb{C}} f d\mu$ as

$$\int^{\mathbb{C}} f d\mu = \int^{\mathbb{C}} f d\mu_r^+ - \int^{\mathbb{C}} f d\mu_r^- + i \cdot \left(\int^{\mathbb{C}} f d\mu_c^+ - \int^{\mathbb{C}} f d\mu_c^- \right)$$

where $(\mu_r^+, \mu_r^-, \mu_c^+, \mu_c^-)$ is the Jordan Decomposition of μ .

Note 21.482. As $\mu \in M[X, \mathcal{A}, \mathbb{C}]$ we have by [theorem: 21.462] that $\mu_r^+, \mu_r^-, \mu_c^+, \mu_c^-$ are finite measures so that by [theorem: 21.474] $f \in \mathcal{L}[X, \mathcal{A}, \mu^+, \mathbb{R}] \wedge f \in \mathcal{L}[X, \mathcal{A}, \mu^-, \mathbb{C}]$. Hence $\int f d\mu_r^+, \int f d\mu_r^-, \int f d\mu_c^+, \int f d\mu_c^-$ are well defined.

21.6.3.2 Radon-Nikodym Theorem

Definition 21.483. Let $\langle X, \mathcal{A} \rangle$ be a measurable space and μ, ν measures on $\mathcal{A}$ then ν is **absolute continuous with respect to μ** noted as $\nu \ll \mu$ if

$$\forall A \in \mathcal{A} \text{ we have if } \mu(A) = 0 \text{ then } \nu(A) = 0$$

Example 21.484. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then $\mu \ll \mu$

Proof. As $\forall A \in \mathcal{A}$ we have $\mu(A) = 0 \Rightarrow \mu(A) = 0$ it follows trivially that $\mu \ll \mu$ □

Example 21.485. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ then

$$\nu: \mathcal{A} \rightarrow [0, \infty] \text{ defined by } \nu(A) = \int^+ (\mathcal{X}_A \cdot f) d\mu$$

is a measure on $\mathcal{A}$ and

$$\nu \ll \mu$$

Proof. Using [theorem: 21.357] it follows that $\nu: \mathcal{A} \rightarrow [0, \infty]$ is a measure on $\mathcal{A}$. Let $A \in \mathcal{A}$ be such that $\mu(A) = 0$ then if $x \in \{x \in X \mid (f \cdot \mathcal{X}_A)(x) \neq 0\}$ we must have that $x \in A$ [for if $x \in X \setminus A$ then $(\mathcal{X}_A \cdot f) = \mathcal{X}_A(x) \cdot f(x) = 0$] which proves that $\{x \in X \mid (f \cdot \mathcal{X}_A)(x) \neq 0\} \subseteq A \in \mathcal{A}$ with $\mu(A) = 0$. Hence $\mathcal{X}_A \cdot f = 0$ μ -a.e.. Using [theorem: 21.312] it follows that $\nu(A) = \int^+ (\mathcal{X}_A \cdot f) d\mu = 0$. □

The following lemma explains why we use the name absolute continuity for $\nu \ll \mu$ and shows the similarity with absolute continuity on functions based on the ε - δ definition.

Lemma 21.486. Let $n \in \mathbb{N}$ then $\sum_{k=n}^{\infty} \frac{1}{2^k} = \frac{1}{2^{n-1}}$

Proof. For $n \in \mathbb{N}$ we have either:

$$n = 1. \text{ Then } \sum_{k=n}^{\infty} \frac{1}{2^k} = \sum_{k=1}^{\infty} \frac{1}{2^k} \text{ [example: 14.354]} = \frac{\frac{1}{2}}{1 - \frac{1}{2}} = 1 = \frac{1}{2^{1-1}} = \frac{1}{2^{n-1}}$$

$n \in \mathbb{N} \setminus \{1\}$. Then

$$\begin{aligned} 1 & \text{ [example: 14.354]} = \sum_{k=1}^{\infty} \frac{1}{2^k} \\ & \text{ [theorem: 14.358]} = \sum_{k=1}^{n-1} \frac{1}{2^k} + \sum_{k=n}^{\infty} \frac{1}{2^k} \\ & \text{ [lemma: 14.353]} = \frac{1}{2} \cdot \left(\frac{1 - \frac{1}{2^{n-1}}}{1 - \frac{1}{2}} \right) + \sum_{k=n}^{\infty} \frac{1}{2^k} \\ & = 1 - \frac{1}{2^{n-1}} + \sum_{k=n}^{\infty} \frac{1}{2^k} \end{aligned}$$

which proves that $\sum_{k=n}^{\infty} \frac{1}{2^k} = \frac{1}{2^{n-1}}$.

□

Theorem 21.487. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space and let ν be a **finite measure** on $\mathcal{A}$ then we have

$$\begin{aligned} \nu &\ll \mu \\ \Updownarrow \\ \forall \varepsilon \in \mathbb{R}^+ \exists \delta \in \mathbb{R}^+ \text{ such that } \forall A \in \mathcal{A} \text{ with } \mu(A) < \delta \text{ we have } \nu(A) < \varepsilon \end{aligned}$$

Proof.

$\Rightarrow$. We prove this by contradiction. So assume that there exist a $\varepsilon \in \mathbb{R}^+$ such that $\forall \delta \in \mathbb{R}^+$ there exist $A \in \mathcal{A}$ with $\mu(A) < \delta$ such that $\varepsilon \leq \nu(A)$. More specific $\forall k \in \mathbb{N}$ there exist a $A_k \in \mathcal{A}$ with $\mu(A_k) < \frac{1}{2^k}$ such that $\varepsilon \leq \nu(A_k)$. Define now

$$\{B_n\}_{n \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } B_n = \bigcup_{k \in \{n, \dots, \infty\}} A_k \text{ and } B = \bigcap_{k \in \mathbb{N}} B_k \in \mathcal{A}$$

Then we have $\forall n \in \mathbb{N}$ that

$$B_{n+1} = \bigcup_{k \in \{n+1, \dots, \infty\}} A_k \subseteq \bigcup_{k \in \{n, \dots, \infty\}} A_k = B_n$$

Further we have

$$\mu(B_1) = \mu\left(\bigcup_{k \in \mathbb{N}} A_k\right) \underset{[\text{theorem: 21.95}]}{\leq} \sum_{k=1}^{\infty} \mu(A_k) \underset{[\text{theorem: 20.98}]}{\leq} \sum_{k=1}^{\infty} \frac{1}{2^k} \underset{[\text{example: 14.354}]}{=} 1 < \infty$$

Hence we can use [theorem: 21.109] to get

$$\mu(B) = \mu\left(\bigcap_{k \in \mathbb{N}} B_k\right) = \lim_{k \rightarrow \infty} \mu(B_k) = \inf(\{\mu(B_i) | i \in \mathbb{N}\}) \quad (21.817)$$

Further, as ν is finite, we have by [theorem: 21.109] that

$$\nu(B) = \nu\left(\bigcap_{k \in \mathbb{N}} B_k\right) = \lim_{k \rightarrow \infty} \nu(B_k) = \inf(\{\nu(B_i) | i \in \mathbb{N}\}) \quad (21.818)$$

Also for $n \in \mathbb{N}$ we have

$$\mu(B_n) = \mu\left(\bigcup_{k \in \{n, \dots, \infty\}} A_k\right) \underset{[\text{theorem: 21.95}]}{\leq} \sum_{k=n}^{\infty} \mu(A_k) \underset{[\text{lemma: 21.486}]}{\leq} \frac{1}{2^{n-1}}$$

so that by [example: 14.297] and [theorem: 14.300] $\lim_{k \rightarrow \infty} \mu(B_k) = 0$ which combined with [eq: 21.817] gives $\mu(B) = 0$. As $\nu \ll \mu$ we must have also

$$\nu(B) = 0 \quad (21.819)$$

Now $\forall n \in \mathbb{N}$ we have $A_n \subseteq \bigcup_{k \in \{n, \dots, \infty\}} A_k = B_n$ so that $\varepsilon \leq \nu(A_n) \leq \nu(B_n)$. Hence ε is a lower bound of $\{\nu(B_n) | n \in \mathbb{N}\}$ from which it follows that $0 < \varepsilon \leq \inf(\{\nu(B_n) | n \in \mathbb{N}\}) \underset{[\text{eq: 21.818}]}{=} \nu(B)$ which contradicts [eq: 21.819]. So the assumption is wrong and we must have that

$$\forall \varepsilon \in \mathbb{R}^+ \exists \delta \in \mathbb{R}^+ \text{ such that } \forall A \in \mathcal{A} \text{ with } \mu(A) < \delta \text{ we have } \nu(A) < \varepsilon$$

$\Leftarrow$. Let $A \in \mathcal{A}$ such that $\mu(A) = 0$ and assume that $0 < \nu(A) \in \mathbb{R}^+$. Then by the hypothesis there exists a $\delta > 0$ such if $\mu(A) < \delta$ then $\nu(A) < \nu(A)$ a contradiction. Hence the assumption is wrong and we must have $\nu(A) = 0$ which proves that

$$\nu \ll \mu$$

□

We are now ready to prove the Radon-Nikodym theorem. This theorem states that given a measurable space $\langle X, \mathcal{A} \rangle$ and two σ -finite measures μ, ν on $\mathcal{A}$ such that $\nu \ll \mu$ then there exist a μ -a.e. unique non negative measurable function h such that $\nu(A) = \int_A^+ h d\mu = \int^+ (\mathcal{X}_A \cdot h) d\mu$. We do this in different steps.

1. First we prove that if ν is finite and $\forall A \in \mathcal{A} \int_A^+ h d\mu = \nu(A) = \int_A^+ f d\mu$ then $f = h$ μ -a.e.
2. We extended (1) to the cases where ν is σ -finite
3. Next we prove that there exist a h such that $\forall A \in \mathcal{A} \nu(A) = \int_A^+ f d\mu$

Lemma 21.488. *Let X be a set and $f: X \rightarrow \mathbb{R}$, $h: X \rightarrow \mathbb{R}$ be two functions then we have*

1. $(f - h)^+ = \mathcal{X}_{X, F} \cdot (f - h)$ where $F = \{f > h\} \stackrel{\text{def}}{=} \{x \in X \mid f(x) > h(x)\}$
2. $(f - h)^- = \mathcal{X}_{X, G} \cdot (h - f)$ where $G = \{f < h\} \stackrel{\text{def}}{=} \{x \in X \mid f(x) < h(x)\}$

Proof.

1. Let $x \in X$ then we have either:

$x \in F$. then $(f - h)(x) = f(x) - h(x) > 0$ so that

$$(f - h)^+(x) = \max((f - h)(x), 0) = (f - h)(x) = \mathcal{X}_{X, F}(x) \cdot (f - h)(x) = (\mathcal{X}_{X, F} \cdot (f - h))(x)$$

$x \in X \setminus F$. then $(f - h)(x) = f(x) - h(x) \leq 0$ so that

$$(f - h)^+(x) = \max((f - h)(x), 0) = 0 = \mathcal{X}_{X, F}(x) \cdot (f - h)(x) = (\mathcal{X}_{X, F} \cdot (f - h))(x)$$

proving that

$$(f - h)^+ = \mathcal{X}_{X, F} \cdot (f - h)$$

2. Let $x \in X$ then we have either:

$x \in G$. then $(f - h)(x) = f(x) - h(x) < 0$ so that

$$(f - h)^- = -\min((f - h)(x), 0) = h(x) - f(x) = \mathcal{X}_{X, G}(x) \cdot (h - f)(x) = (\mathcal{X}_{X, G} \cdot (h - f))(x)$$

$x \in X \setminus G$. then $(f - h)(x) = f(x) - h(x) \geq 0$ so that

$$(f - h)^- = -\min((f - h)(x), 0) = 0 = \mathcal{X}_{X, G}(x) \cdot (h - f)(x) = (\mathcal{X}_{X, G} \cdot (h - f))(x)$$

proving that

$$(f - h)^- = \mathcal{X}_{X, G} \cdot (h - f) \quad \square$$

Lemma 21.489. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, μ a measure on $\mathcal{A}$, ν a **finite** measure on $\mathcal{A}$ and $h, f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ such that*

$$\forall A \in \mathcal{A} \int_A^+ f d\mu = \nu(A) = \int_A^+ h d\mu$$

then

$$f = h \text{ } \mu\text{-a.e.}$$

Here $\int_A^+ f d\mu \stackrel{\text{definition: 21.302}}{=} \int^+ (\mathcal{X}_A \cdot f) d\mu$ and $\int_A^+ h d\mu \stackrel{\text{definition: 21.302}}{=} \int^+ (\mathcal{X}_A \cdot h) d\mu$

Proof. Let $A \in \mathcal{A}$ then as ν is finite we have $\nu(A) < \infty$ so that

$$\int^+ (\mathcal{X}_{X, A} \cdot h) d\mu = \int_A^+ h d\mu = \int^+ (\mathcal{X}_{X, A} \cdot f) d\mu = \int_A^+ f d\mu = \nu(A) < \infty$$

hence, using [theorem: 21.332] it follows that

$$\mathcal{X}_{X,A} \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \wedge \mathcal{X}_{X,A} \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

and

$$\int^+ \mathcal{X}_{X,A} \cdot h d\mu = \int \mathcal{X}_{X,A} \cdot h d\mu = \int^+ \mathcal{X}_{X,A} \cdot f d\mu = \int \mathcal{X}_{X,A} \cdot f d\mu$$

Using the linearity of $\int$ [see theorem: 21.339] it follows that

$$\mathcal{X}_{X,A} \cdot (f - h) = \mathcal{X}_{X,A} \cdot f - \mathcal{X}_{X,A} \cdot h \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

and

$$\int \mathcal{X}_{X,A} \cdot (f - h) d\mu = \int \mathcal{X}_{X,A} \cdot f d\mu - \int \mathcal{X}_{X,A} \cdot h d\mu = 0$$

or

$$\forall A \in \mathcal{A} \text{ we have } \int \mathcal{X}_{X,A} \cdot (f - h) d\mu = 0 \quad (21.820)$$

Define now $F = \{f > h\}$ and $G = \{f < h\}$ then $F, G \in \mathcal{A}$ [see theorem: 21.244] and

$$(f - h)^+ \underset{[\text{lemma: 21.488}]}{=} \mathcal{X}_{X,F} \cdot (f - h) \quad \text{and} \quad (f - h)^- \underset{[\text{lemma: 21.488}]}{=} \mathcal{X}_{X,G} \cdot (h - f) = -\mathcal{X}_{X,G} \cdot (f - h) \quad (21.821)$$

Then

$$\begin{aligned} & \int (f - h)^+ d\mu \underset{[\text{eq: 21.821}]}{=} \int (\mathcal{X}_{X,F} \cdot (f - h)) d\mu \underset{[\text{eq: 21.820}]}{=} 0 \\ & \int (f - h)^- d\mu \underset{[\text{eq: 21.821}]}{=} - \int (\mathcal{X}_{X,G} \cdot (f - h)) d\mu \underset{[\text{eq: 21.820}]}{=} 0 \end{aligned}$$

so that

$$\begin{aligned} & \int |f - h| d\mu \underset{[\text{theorem: 21.322}]}{=} \int ((f - h)^+ + (f - h)^-) d\mu \\ & \underset{[\text{theorem: 21.339}]}{=} \int (f - h)^+ d\mu + \int (f - h)^- d\mu \\ & = 0 + 0 \\ & = 0 \end{aligned}$$

Using now [theorem: 21.346] it follows that $f - h = 0$ μ -a.e. or using [theorem: 21.267] it follows that

$$f = h \text{ } \mu\text{-a.e.} \quad \square$$

Next we extend the previous lemma to the cases where ν is a σ -finite measure [see definition: 21.100].

Lemma 21.490. *Let $\langle X, \mathcal{A} \rangle$ be a measurable space, μ a measure on $\mathcal{A}$, ν a σ -finite measure on $\mathcal{A}$ and $f, h \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ such that*

$$\forall A \in \mathcal{A} \text{ we have } \int_A^+ h d\mu = \nu(A) = \int_A^+ f d\mu$$

then we have that

$$h = f \text{ } \mu\text{-a.e.}$$

Proof. As ν is σ -finite we have by [definition: 21.100] and [theorem: 21.94] that there exist a $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ pairwise disjoint such that

$$X = \bigsqcup_{i \in \mathbb{N}} A_i \text{ and } \forall i \in \mathbb{N} \text{ we have } \nu(A_i) < \infty \quad (21.822)$$

Let $i \in \mathbb{N}$ then and take the measure spaces [see theorem: 21.104]

$$\langle A_i, \mathcal{A}|_{A_i}, \nu|_{\mathcal{A}|_{A_i}} \rangle \quad \langle A_i, \mathcal{A}|_{A_i}, \mu|_{\mathcal{A}|_{A_i}} \rangle$$

where

$\mathcal{A}_{|A_i} = \{B \in \mathcal{A} | B \subseteq A_i\}$ and $\nu_{|A_i}, \mu_{|A_i}$ are the restrictions of ν, μ to $\mathcal{A}_{|A_i}$

Then for $C \in \mathcal{A}_{|A_i}$ we have $C \in \mathcal{A}$ and $C \subseteq A_i$ so that $\nu_{|A_i}(C) = \nu(C) \leq \nu(A_i) < \infty$ which proves that

$$\nu_{|A_i} \text{ is a finite measure} \quad (21.823)$$

Using [theorem: 21.262] and the fact that $f, h \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows that

$$f_{|A_i}, h_{|A_i} \in \mathcal{M}[A_i, \mathcal{A}_{|A_i}, \overline{\mathbb{R}}] \quad (21.824)$$

Let $C \in \mathcal{A}_{|A_i}$ then $C \in \mathcal{A}$ and $C \subseteq A_i$ then using [theorem: 21.260] that

$$\mathcal{X}_{A_i, C} \cdot f_{|A_i}, \mathcal{X}_{A_i, C} \cdot h_{|A_i} \in \mathcal{M}[A_i, \mathcal{A}_{|A_i}, \overline{\mathbb{R}}] \text{ [see definition: 21.256]}$$

so that the following is well defined

$$\begin{aligned} \int_C^+ h_{|A_i} d\mu_{|A_i} &\stackrel{\text{def}}{=} \int^+ (\mathcal{X}_{A_i, C} \cdot h_{|A_i}) d\mu_{|A_i} \\ &\stackrel{[\text{theorem: 21.257}]}{=} \int^+ (\mathcal{X}_{X, C} \cdot h)_{|A_i} d\mu_{|A_i} \\ &\stackrel{[\text{theorem: 21.304}]}{=} \int^+ (\mathcal{X}_{X, A_i} \cdot (\mathcal{X}_{X, C} \cdot h)) d\mu \\ &\stackrel{[\text{theorem: 21.257}]}{=} \int^+ (\mathcal{X}_{X, A_i} \cap C \cdot h) d\mu \\ &\stackrel{C \subseteq A_i}{=} \int^+ (\mathcal{X}_{X, C} \cdot h) d\mu \\ &\stackrel{\text{def}}{=} \int_C^+ h d\mu \\ &= \nu(C) \\ &\stackrel{C \in \mathcal{A}_{|A_i}}{=} \nu_{|A_i}(C) \\ \int_C^+ f_{|A_i} d\mu_{|A_i} &\stackrel{\text{def}}{=} \int^+ (\mathcal{X}_{A_i, C} \cdot f_{|A_i}) d\mu_{|A_i} \\ &\stackrel{[\text{theorem: 21.257}]}{=} \int^+ (\mathcal{X}_{X, C} \cdot f)_{|A_i} d\mu_{|A_i} \\ &\stackrel{[\text{theorem: 21.304}]}{=} \int^+ (\mathcal{X}_{X, A_i} \cdot (\mathcal{X}_{X, C} \cdot f)) d\mu \\ &\stackrel{[\text{theorem: 21.257}]}{=} \int^+ (\mathcal{X}_{X, A_i} \cap C \cdot f) d\mu \\ &\stackrel{C \subseteq A_i}{=} \int^+ (\mathcal{X}_{X, C} \cdot f) d\mu \\ &\stackrel{\text{def}}{=} \int_C^+ f d\mu \\ &= \nu(C) \\ &\stackrel{C \in \mathcal{A}_{|A_i}}{=} \nu_{|A_i}(C) \end{aligned}$$

which proves that

$$\forall C \in \mathcal{A}_{|A_i} \text{ we have } \int_C^+ h_{|A_i} d\mu_{|A_i} = \nu_{|A_i}(C) = \int_C^+ f_{|A_i} d\mu_{|A_i} \quad (21.825)$$

The above together with [eqs: 21.823, 21.824] allows us to apply the previous lemma [see lemma: 21.489] giving $h_{|A_i} = f_{|A_i} \mu_{|A_i}$ -a.e. hence as $i \in \mathbb{N}$ was chosen arbitray we have

$$\forall i \in \mathbb{N} \text{ we have } h_{|A_i} = f_{|A_i} \mu_{|A_i} \text{-a.e.} \quad (21.826)$$

Using the definition of $\mu|_{\mathcal{A}_{A_i}}$ -a.e. the above becomes

$$\forall i \in \mathbb{N} \exists N_i \in \mathcal{A}_{A_i} \subseteq \mathcal{A} \text{ such that } \{x \in A_i | h|_{A_i}(x) \neq f|_{A_i}(x)\} \subseteq N_i \text{ and } \mu|_{\mathcal{A}_{A_i}}(N_i) = 0 \quad (21.827)$$

Let now $x \in \{x \in X | h(x) \neq f(x)\}$ then as $X = \bigsqcup_{i \in \mathbb{N}} A_i$ there exist a $i \in \mathbb{N}$ such that $x \in A_i$ and $h|_{A_i}(x) = h(x) \neq f(x) = f|_{A_i}(x)$ so that by [eq: 21.827] $x \in N_i \subseteq \bigcup_{i \in \mathbb{N}} N_i$. Hence we have

$$\{x \in X | h(x) \neq f(x)\} \subseteq \bigcup_{i \in \mathbb{N}} N_i$$

which as also

$$\mu\left(\bigcup_{i \in \mathbb{N}_0} N_i\right) \leq \sum_{i=1}^{\infty} \mu(N_i) = \sum_{i=1}^{\infty} \mu|_{\mathcal{A}_{A_i}}(N_i) = \sum_{i=1}^{\infty} 0 = 0$$

proves that

$$h = f \text{ } \mu\text{-a.e.}$$

□

Next we prove the existence part of the Radon-Nikodym theorem for finite measures.

Lemma 21.491. (Radon-Nikodym Theorem (finite case)) *Let $\langle X, \mathcal{A} \rangle$ be a measurable space and let μ and ν be **finite** measures on $\mathcal{A}$ such that $\nu \ll \mu$ [in other words ν is absolute convergent in relation to μ] then there exist a $h \in \mathcal{M}^+[X, A, \mathbb{R}]$ such that*

$$\forall A \in \mathcal{A} \text{ we have } \nu(A) = \int_A^+ h d\mu \stackrel{\text{def}}{=} \int_A^+ (\mathcal{X}_{X,A} \cdot h) d\mu$$

Proof. Define

$$\mathcal{F} = \left\{ f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] | \forall A \in \mathcal{A} \text{ we have } \int_A^+ f d\mu \stackrel{\text{def}}{=} \int_A^+ (\mathcal{X}_{X,A} \cdot f) d\mu \leq \nu(A) \right\}$$

Take $f_1, f_2 \in \mathcal{F}$ then using [theorem: 21.252] it follows that

$$f_1 \vee f_2 \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.828)$$

Let $A \in \mathcal{A}$ and define

$$A_1 = \{x \in A | f_1(x) > f_2(x)\} = A \bigcap \{f_1 > f_2\} \stackrel{\text{[theorem: 21.244]}}{\in} \mathcal{A}$$

$$A_2 = \{x \in A | f_1(x) \leq f_2(x)\} = A \bigcap \{f_1 \leq f_2\} \stackrel{\text{[theorem: 21.244]}}{\in} \mathcal{A}$$

Then clearly we have

$$A = A_1 \bigcup A_2 \text{ and } A_1 \bigcap A_2 = \emptyset$$

Let $x \in X$ then we have either:

$x \in X \setminus A$. Then $x \in A \Rightarrow x \notin A_1, A_2$ so that

$$\begin{aligned} (\mathcal{X}_{X,A} \cdot (f_1 \vee f_2))(x) &= \mathcal{X}_{X,A}(x) \cdot \max(f_1(x), f_2(x)) \\ &= 0 \cdot \max(f_1(x), f_2(x)) \\ &= 0 \\ &= 0 \cdot f_1(x) + 0 \cdot f_2(x) \\ &= \mathcal{X}_{X,A_1}(x) \cdot f_1(x) + \mathcal{X}_{X,A_2}(x) \cdot f_2(x) \\ &= (\mathcal{X}_{X,A_1} \cdot f_1 + \mathcal{X}_{X,A_2} \cdot f_2)(x) \end{aligned}$$

$x \in A_1$. Then $f_1(x) > f_2(x)$ and $x \notin A_2$ so that $\max(f_1(x), f_2(x)) = f_1(x)$ hence

$$\begin{aligned} (\mathcal{X}_{X,A} \cdot (f_1 \vee f_2))(x) &= \mathcal{X}_{X,A}(x) \cdot \max(f_1(x), f_2(x)) \\ &= f_1(x) \\ &= \mathcal{X}_{X,A_1} \cdot f_1(x) + 0 \cdot f_2(x) \\ &= \mathcal{X}_{X,A_1}(x) \cdot f_1(x) + \mathcal{X}_{X,A_2}(x) \cdot f_2(x) \\ &= (\mathcal{X}_{X,A_1} \cdot f_1 + \mathcal{X}_{X,A_2} \cdot f_2)(x) \end{aligned}$$

$x \in A_2$. Then $f_1(x) \leq f_2(x)$ so that $\max(f_1(x), f_2(x)) = f_2(x)$ hence

$$\begin{aligned} (\mathcal{X}_{X,A} \cdot (f_1 \vee f_2))(x) &= \mathcal{X}_{X,A}(x) \cdot \max(f_1(x), f_2(x)) \\ &= f_2(x) \\ &= 0 \cdot f_1(x) + \mathcal{X}_{X,A_2}(x) \cdot f_2(x) \\ &= \mathcal{X}_{X,A_1}(x) \cdot f_1(x) + \mathcal{X}_{X,A_2}(x) \cdot f_2(x) \\ &= (\mathcal{X}_{X,A_1} \cdot f_1 + \mathcal{X}_{X,A_2} \cdot f_2)(x) \end{aligned}$$

which proves that

$$\mathcal{X}_{X \setminus A} \cdot (f_1 \vee f_2) = \mathcal{X}_{X,A_1} \cdot f_1 + \mathcal{X}_{X,A_2} \cdot f_2$$

As $f_1, f_2 \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows from [theorems: 21.260, 21.245, 21.252] that

$$\begin{aligned} \int_A^+ (f_1 \vee f_2) d\mu &= \int^+ (\mathcal{X}_{X,A} \cdot (f_1 \vee f_2)) d\mu \\ &= \int^+ (\mathcal{X}_{X,A_1} \cdot f_1 + \mathcal{X}_{X,A_2} \cdot f_2) d\mu \\ &= \int^+ (\mathcal{X}_{X,A_1} \cdot f_1) d\mu + \int^+ (\mathcal{X}_{X,A_2} \cdot f_2) d\mu \\ &= \int_{A_1}^+ f_1 d\mu + \int_{A_2}^+ f_2 d\mu \\ &\leq \nu(A_1) + \nu(A_2) \\ &= \nu(A_1 \cup A_2) \\ &= \nu(A) \end{aligned}$$

which proves that $f_1 \vee f_2 \in \mathcal{F}$. To summarize

$$\forall f_1, f_2 \in \mathcal{F} \text{ we have } f_1 \vee f_2 \in \mathcal{F} \quad (21.829)$$

By [example: 21.300] $C_0 \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ and $\forall A \in \mathcal{A}$

$$\int_A^+ C_0 d\mu = \int^+ (\mathcal{X}_{X,A} \cdot C_0) d\mu = \int^+ C_0 d\mu = 0 \leq \nu(A)$$

which proves that $C_0 \in \mathcal{F}$ so that

$$\mathcal{F} \neq \emptyset \quad (21.830)$$

From the above it follows that $\{\int^+ f d\mu \mid f \in \mathcal{F}\} \neq \emptyset$ so that by [theorem: 20.13]

$$\sup \left(\left\{ \int^+ f d\mu \mid f \in \mathcal{F} \right\} \right) \text{ exists [it could be } \infty] \quad (21.831)$$

Using [theorem: 20.82] there exist a $\{f_n\}_{n \in \mathbb{N}} \subseteq \mathcal{F}$ such that

$$\lim_{n \rightarrow \infty} \int^+ f_n d\mu = \sup \left(\left\{ \int^+ f d\mu \mid f \in \mathcal{F} \right\} \right) \quad (21.832)$$

Define $\{g_n\}_{n \in \mathbb{N}}$ recursively by

$$\{g_n\}_{n \in \mathbb{N}} \text{ by } g_n = \begin{cases} f_1 & \text{if } n = 1 \\ g_n = g_{n-1} \vee f_n & \text{if } n \in \{2, \dots, \infty\} \end{cases}$$

then we prove by induction that

$$\forall n \in \mathbb{N} \quad g_n \in \mathcal{F} \text{ and } \forall x \in X \quad 0 \leq f_n(x) \leq g_n(x) \leq g_{n+1}(x) \quad (21.833)$$

Proof. Take $\mathcal{S} = \{n \in \mathbb{N} \mid g_n \in \mathcal{F} \wedge f_n \leq g_n \wedge g_n \leq g_{n+1}\}$ then we have

$1 \in \mathcal{S}$. if $n = 1$ Then $g_1 = f_1 \in \mathcal{F}$ and

$$\forall x \in X \quad 0 \leq f_1(x) = g_1(x) \leq \max(g_1(x), f_2(x)) = (g_1 \vee f_2)(x) = g_2(x)$$

proving that $1 \in \mathcal{S}$.

$n \in \mathcal{S} \Rightarrow n+1 \in \mathcal{S}$. Then $g_n \in \mathcal{F}$ and using [eq: 21.829] we have that

$$g_{n+1} = g_n \vee f_{n+1} \in \mathcal{F}$$

Further $\forall x \in X$ we have $0 \leq f_n(x) \leq g_n(x)$,
 $n \in \mathcal{S}$

$$f_{n+1}(x) \leq \max(g_n(x), f_{n+1}(x)) = (g_n \vee f_{n+1})(x) = g_{n+1}(x)$$

and

$$g_{n+1}(x) \leq \max(g_{n+1}(x), f_{(n+1)+1}(x)) = (g_{n+1} \vee f_{(n+1)+1})(x) = g_{(n+1)+1}(x).$$

which proves that $n+1 \in \mathcal{S}$.

mathematical induction finishes the proof of [eq: 21.833] $\square$

Now, as $\forall n \in \mathbb{N}$ $g_n \in \mathcal{F}$, we have that $\int^+ g_n d\mu \leq \sup(\{\int^+ f d\mu | f \in \mathcal{F}\})$, further from [eq: 21.833] it follows using [theorem: 21.313] that $\int^+ g_n d\mu \leq \int^+ g_{n+1} d\mu$, hence $\{\int^+ g_n d\mu\}_{n \in \mathbb{N}}$ is increasing. So using [theorem: 20.91]

$$\lim_{n \rightarrow \infty} \int^+ g_n d\mu = \sup\left(\left\{\int^+ g_n d\mu | n \in \mathbb{N}\right\}\right) \leq \sup\left(\left\{\int^+ f d\mu | f \in \mathcal{F}\right\}\right) \quad (21.834)$$

Applying [theorem: 21.313] on [eq: 21.833] gives $\forall n \in \mathbb{N}$ that $\int^+ f_n d\mu \leq \int^+ g_n d\mu$. Using then [theorem: 20.84] and [eq: 21.832] it follows that $\sup(\{\int^+ f d\mu | f \in \mathcal{F}\}) = \lim_{n \rightarrow \infty} \int^+ f_n d\mu \leq \lim_{n \rightarrow \infty} \int^+ g_n d\mu$. Combining this with [eq: 21.834] proves that

$$\lim_{n \rightarrow \infty} \int^+ g_n d\mu = \sup\left(\left\{\int^+ f d\mu | f \in \mathcal{F}\right\}\right) \quad (21.835)$$

As $\forall x \in X$, $\forall n \in \mathbb{N}$ $g_n(x) \leq g_{n+1}(x)$ [see eq: 21.833] we have by [theorem: 20.91] that $\lim_{n \rightarrow \infty} g_n(x)$ exist and $\lim_{n \rightarrow \infty} g_n(x) = \sup(\{g_n(x) | n \in \mathbb{N}\})$. Using [theorem: 21.254] it follows that the function defined by

$$g = \lim_{n \rightarrow \infty} g_n: X \rightarrow \overline{\mathbb{R}} \text{ where } g(x) = \lim_{n \rightarrow \infty} g_n(x) = \sup(\{g_n(x) | n \in \mathbb{N}\}) \geq 0 \quad (21.836)$$

exist and

$$g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.837)$$

So we can use the Monotone Convergence Theorem [see theorem: 21.351] to get

$$\int^+ g d\mu = \int^+ \left(\lim_{n \rightarrow \infty} g_n\right) d\mu = \lim_{n \rightarrow \infty} \int^+ g_n d\mu \stackrel{[eq: 21.835]}{=} \sup\left(\left\{\int^+ f d\mu | f \in \mathcal{F}\right\}\right) \quad (21.838)$$

Let $A \in \mathcal{A}$ then as $\{g_n\}_{n \in \mathbb{N}} \subseteq \mathcal{F} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows from [corollary: 21.260] that

$$\{\mathcal{X}_{X,A} \cdot g_n\}_{n \in \mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$$

Further

$$\forall x \in X \quad \forall n \in \mathbb{N} \quad (\mathcal{X}_{X,A} \cdot g_n)(x) = \begin{cases} g_n(x) \leq g_{n+1}(x) & \text{if } x \in A \\ 0 & \text{if } x \in X \setminus A \end{cases} \leq (\mathcal{X}_{X,A} \cdot g_{n+1})(x)$$

Also for $x \in X$ we have either:

$$x \in A. \text{ Then } \lim_{n \rightarrow \infty} (\mathcal{X}_{X,A} \cdot g_n)(x) = \lim_{n \rightarrow \infty} g_n(x) = g(x) = (\mathcal{X}_{X,A} \cdot g)(x)$$

$$x \in X \setminus A. \text{ Then } \lim_{n \rightarrow \infty} (\mathcal{X}_{X,A} \cdot g_n)(x) = \lim_{n \rightarrow \infty} 0 = 0 = (\mathcal{X}_{X,A} \cdot g)(x)$$

proving that

$$\mathcal{X}_{X,A} \cdot g = \lim_{n \rightarrow \infty} (\mathcal{X}_{X,A} \cdot g_n)$$

Hence all conditions for the Monotone Convergence Theorem [see theorem: 21.351] are satisfied so that

$$\int_A^+ g d\mu \stackrel{\text{def}}{=} \int^+ (\mathcal{X}_{X,A} \cdot g) d\mu = \int^+ \left(\lim_{n \rightarrow \infty} (\mathcal{X}_{X,A} \cdot g_n)\right) d\mu = \lim_{n \rightarrow \infty} \int^+ (\mathcal{X}_{X,A} \cdot g_n) d\mu \stackrel{\text{def}}{=} \lim_{n \rightarrow \infty} \int_A^+ g_n d\mu$$

As $\forall n \in \mathbb{N} \ g_n \underset{[\text{eq: 21.833}]}{\in} \mathcal{F}$ we have by the definition of $\mathcal{F}$ that $\int_A^+ g_n d\mu \leq \nu(A)$, hence using [theorem: 20.84] we have that $\lim_{n \rightarrow \infty} \int_A^+ g_n d\mu \leq \nu(A)$. To summarize we have

$$\forall A \in \mathcal{A} \text{ we have } \int_A^+ g d\mu = \lim_{n \rightarrow \infty} \int_A^+ g_n d\mu \leq \nu(A) \underset{\nu \text{ is finite}}{<} \infty \quad (21.839)$$

In the special case of $A = X \in \mathcal{A}$ we have using the above that

$$\int^+ g d\mu = \int^+ (\mathcal{X}_{X,X} \cdot g) d\mu = \int_X^+ g d\mu < \infty \quad (21.840)$$

Using [eq: 21.837, 21.839] it follows from the definition of $\mathcal{F}$ that

$$g = \lim_{n \rightarrow \infty} g_n \in \mathcal{F} \quad (21.841)$$

As by [eq: 21.837] $g \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows from [theorem: 21.357] that

$$\rho: A \rightarrow [0, \infty] \text{ defined by } \rho(A) = \int_A^+ g d\mu \text{ is a measure on } \mathcal{A} \quad (21.842)$$

As $\forall A \in \mathcal{A} \ \rho(A) = \int_A^+ g d\mu \underset{[\text{eq: 21.839}]}{\leq} \nu(A) < \infty$ it follows that ρ is a finite measure, as also ν is finite [theorem: 21.438] applies so that

$$\nu_0 = \nu - \rho: \mathcal{A} \rightarrow [0, \infty] \text{ where } \nu_0(A) = \nu(A) - \rho(A) = \nu(A) - \int_A^+ g d\mu \text{ is a finite measure} \quad (21.843)$$

We prove now by contradiction that $\forall A \in \mathcal{A} \ \nu_0(A) \leq 0$. Assume that $\exists A_0 \in \mathcal{A}$ such that $0 < \nu_0(A_0)$. As $A_0 \subseteq X \Rightarrow 0 < \nu_0(X) \underset{\nu_0 \text{ is finite}}{\Rightarrow} \nu_0(X) \in \mathbb{R}^+$, further as μ is finite $\mu(X) + 1 \in \mathbb{R}^+$, hence $\varepsilon = \frac{\nu_0(X)}{2 \cdot (\mu(X) + 1)} \in \mathbb{R}^+$. For ε we have then $\varepsilon \cdot \mu(X) = \frac{\nu_0(X) \cdot \mu(X)}{2 \cdot (\mu(X) + 1)} < \frac{\nu_0(X)}{2} < \nu(X)$. To summarize we found a $\varepsilon \in \mathbb{R}^+$ such that

$$\varepsilon \cdot \mu(X) < \nu_0(X) \quad (21.844)$$

As ν_0 is a measure and $\varepsilon \cdot \mu$ is a measure [see theorem: 21.101] it follows from [theorem: 21.438] that

$$\nu_0 - \varepsilon \cdot \mu \text{ is a signed measure on } \mathcal{A} \quad (21.845)$$

Let (P, N) be a Hahn decomposition of $\nu_0 - \varepsilon \cdot \mu$ [see theorem: 21.452] then for $A \in \mathcal{A}$ we have $A \cap P \in \mathcal{A}$ and $A \cap P \subseteq P$ so that $0 \leq (\nu_0 - \varepsilon \cdot \mu)(A \cap P) = \nu_0(A \cap P) - \varepsilon \cdot \mu(A \cap P)$. As μ, ν_0 are finite measures it follows that

$$\forall A \in \mathcal{A} \text{ we have } \varepsilon \cdot \mu(A \cap P) \leq \nu_0(A \cap P) \quad (21.846)$$

Now for $A \in \mathcal{A}$ we have [taking in account that $\int_A^+ g d\mu, \nu_0(A)$ are finite] that

$$\begin{aligned} \nu(A) & \underset{[\text{eq: 21.843}]}{=} \int_A^+ g d\mu + \nu_0(A) \\ & \underset{\nu_0 \text{ is a measure}}{\geq} \int_A^+ g d\mu + \nu_0(A \cap P) \\ & \underset{[\text{eq: 21.846}]}{\geq} \int_A^+ g d\mu + \varepsilon \cdot \mu(A \cap P) \\ & \underset{[\text{example: 21.301}]}{=} \int_A^+ g d\mu + \int^+ (\varepsilon \cdot \mathcal{X}_{X, A \cap P}) d\mu \\ & \underset{[\text{theorem: 21.257}]}{=} \int^+ (\mathcal{X}_{X, A} \cdot g) d\mu + \int^+ (\mathcal{X}_{X, A} \cdot (\varepsilon \cdot \mathcal{X}_{X, P})) d\mu \\ & \underset{[\text{theorem: 21.313}]}{=} \int^+ (\mathcal{X}_{X, A} \cdot (g + \varepsilon \cdot \mathcal{X}_{X, P})) d\mu \\ & = \int_A^+ (g + \varepsilon \cdot \mathcal{X}_{X, P}) d\mu \end{aligned}$$

which using the definition of $\mathcal{F}$ proves that

$$g + \varepsilon \cdot \mathcal{X}_{X,P} \in \mathcal{F} \quad (21.847)$$

If $\mu(P) = 0$ then as $\nu \ll \mu$ we must have $\nu(P) = 0$ so that

$$\begin{aligned} \nu_0(X) - \varepsilon \cdot \mu(X) &= \nu_0(P) + \nu_0(N) - \varepsilon \cdot \mu(P) - \varepsilon \cdot \mu(N) \\ &= \nu_0(N) - \varepsilon \cdot \mu(N) \\ &= (\nu_0 - \varepsilon \cdot \mu)(N) \\ &\leq 0 \end{aligned}$$

(P, N is a Hahn decomposition of $\nu_0 - \varepsilon \cdot \mu$)

which contradicts [eq: 21.844]. Hence we must have that $0 < \mu(P)$ then we have

$$\begin{aligned} \int^+ (g + \varepsilon \cdot \mathcal{X}_{X,P}) d\mu &\stackrel{[\text{theorem: 21.313}]}{=} \int^+ g d\mu + \int^+ (\varepsilon \cdot \mathcal{X}_{X,P}) \\ &\stackrel{[\text{example: 21.301}]}{=} \int^+ g d\mu + \varepsilon \cdot \mu(P) \end{aligned}$$

As $\int^+ g d\mu < \infty$ [see eq: 21.840] and $0 < \varepsilon \cdot \mu(P)$ it follows that

$$\int^+ g d\mu < \int^+ (g + \varepsilon \cdot \mathcal{X}_{X,P}) d\mu$$

However

$$\int^+ (g + \varepsilon \cdot \mathcal{X}_{X,P}) d\mu \stackrel{[\text{eq: 21.847}]}{\leq} \sup \left(\left\{ \int^+ f | f \in \mathcal{F} \right\} \right) \stackrel{[\text{eq: 21.838}]}{=} \int^+ g d\mu$$

which leads to the contradiction $\int^+ g d\mu < \int^+ g d\mu$. Hence the assumption $\exists A_0 \in \mathcal{A}$ such that $0 < \nu_0(A_0)$ is false and we must have that $\forall A \in \mathcal{A} \nu_0(A) \leq 0 \stackrel{0 \leq \nu_0(A)}{\Rightarrow} \nu_0(A) = 0$. Hence $\forall A \in \mathcal{A}$ we have $\nu(A) - \int_A^+ g d\mu \stackrel{[\text{eq: 21.843}]}{=} \nu_0(A) = 0$ so that

$$\forall A \in \mathcal{A} \int^+ (\mathcal{X}_{X,A} \cdot g) d\mu = \int_A^+ g d\mu = \nu(A) < \infty \quad (21.848)$$

By [eq: 21.840] $\int^+ g d\mu < \infty$ so that by [theorem: 21.318] we have

$$M = \{x \in X | g(x) = \infty\} \in \mathcal{A} \text{ and } \mu(M) = 0$$

Define now $h = \mathcal{X}_{X, X \setminus M} \cdot g$ then we have $\forall x \in X$ either:

$$\mathbf{x} \in M. \text{ Then } (\mathcal{X}_{X, X \setminus M} \cdot g)(x) = 0 \cdot g(x) = 0 \in \mathbb{R}$$

$$\mathbf{X} \in X \setminus M. \text{ Then } (\mathcal{X}_{X, X \setminus M} \cdot g)(x) = g(x) \in \mathbb{R}$$

So $(\mathcal{X}_{X, X \setminus M} \cdot g)(X) \subseteq \mathbb{R}$ and as $g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \stackrel{[\text{theorem: 21.260}]}{\Rightarrow} \mathcal{X}_{X, X \setminus M} \cdot g \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ it follows that

$$h = \mathcal{X}_{X, X \setminus M} \cdot g \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \quad (21.849)$$

Let $A \in \mathcal{A}$ As $\mu(M) = 0$ we have by [theorem: 21.265] that $\mathcal{X}_{X, X \setminus M} \cdot (\mathcal{X}_{X,A} \cdot g) = \mathcal{X}_{X,A} \cdot g$ μ -a.e. so that by [theorem: 21.315] we have

$$\int^+ \mathcal{X}_{X, X \setminus M} \cdot (\mathcal{X}_{X,A} \cdot g) d\mu = \int^+ (\mathcal{X}_{X,A} \cdot g) d\mu \stackrel{[\text{eq: 21.848}]}{=} \nu(A) \quad (21.850)$$

Further we have

$$\int_A^+ h d\mu = \int^+ (\mathcal{X}_{X,A} \cdot h) d\mu = \int^+ (\mathcal{X}_{X,A} \cdot (\mathcal{X}_{X, X \setminus M} \cdot g)) d\mu = \int^+ (\mathcal{X}_{X, X \setminus M} \cdot (\mathcal{X}_{X,A} \cdot g)) d\mu$$

which combined with [eq: 21.850] proves that

$$\forall A \in \mathcal{A} \nu(A) = \int_A^+ h d\mu$$

the above together with [eq: 21.849] finishes the theorem. $\square$

Next step is to extend the above theorem to σ -finite measures.

Theorem 21.492. (Radon-Nikodym Theorem) Let $\langle X, \mathcal{A} \rangle$ be a measurable space and let μ, ν be σ -finite measures on $\mathcal{A}$. If $\nu \ll \mu$ [in other words ν is absolute convergent in relation to μ] then there exist a $h \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ such that

$$\forall A \in \mathcal{A} \quad \nu(A) = \int_A^+ h d\mu \stackrel{\text{def}}{=} \int_A^+ (\mathcal{X}_{X,A} \cdot h) d\mu$$

Further if there is another $f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ such that $\forall A \in \mathcal{A} \quad \nu(A) = \int_A^+ f d\mu$ then

$$f = h \quad \mu\text{-a.e.}$$

Proof. As μ, ν are σ -finite measures there exist by [theorem: 21.98] two pairwise disjoint families $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$, $\{B_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ such that $\forall i \in \mathbb{N} \quad \mu(A_i), \nu(B_i) \in \mathbb{R}$ and $\bigsqcup_{i \in \mathbb{N}} A_i = X = \bigsqcup_{i \in \mathbb{N}} B_i$. Using [theorem: 21.12] there exist a bijection $\beta: \mathbb{N} \rightarrow \mathbb{N} \times \mathbb{N}$ such that

$$X = \bigcup_{i \in \mathbb{N}} (A_{\beta(i)_1} \cap B_{\beta(i)_2}) \quad \text{where } \{A_{\beta(i)_1} \cap B_{\beta(i)_2}\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$$

Further if $i, j \in \mathbb{N}$ with $i \neq j$ then as β is a bijection $\beta(i) \neq \beta(j)$. For $\beta(i)_1, \beta(j)_1$ we have either

$\beta(i)_1 \neq \beta(j)_1$. Then we have

$$(A_{\beta(i)_1} \cap B_{\beta(i)_2}) \cap (A_{\beta(j)_1} \cap B_{\beta(j)_2}) \subseteq A_{\beta(i)_1} \cap B_{\beta(i)_2} = \emptyset$$

$\beta(i)_1 = \beta(j)_1$. Then we must have $\beta(i)_2 \neq \beta(j)_2$ so that

$$(A_{\beta(i)_1} \cap B_{\beta(i)_2}) \cap (A_{\beta(j)_1} \cap B_{\beta(j)_2}) \subseteq B_{\beta(i)_2} \cap B_{\beta(j)_2} = \emptyset$$

Further $\forall i \in \mathbb{N}$ we have $\mu(A_{\beta(i)_1} \cap B_{\beta(i)_2}) \leq \mu(A_{\beta(i)_1}) < \infty$ and $\nu(A_{\beta(i)_1} \cap B_{\beta(i)_2}) \leq \nu(B_{\beta(i)_2}) < \infty$. So if we define

$$\{C_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ by } C_i = A_{\beta(i)_1} \cap B_{\beta(i)_2}$$

then we have

$$\{C_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A} \text{ is pairwise disjoint, } X = \bigsqcup_{i \in \mathbb{N}} C_i \text{ and } \forall i \in \mathbb{N} \quad \mu(C_i) < \infty \wedge \nu(C_i) < \infty \quad (21.851)$$

Let $i \in \mathbb{N}$. Consider the measurable space $\langle C_i, \mathcal{A}_{|C_i} \rangle$ with measures $\mu_{|C_i}, \nu_{|C_i}$ [see theorem: 21.104]. Then if $A \in \mathcal{A}_{|C_i}$ we have $A \in \mathcal{A} \wedge A \subseteq C_i$ and $\mu_{|C_i}(A) = \mu(A) \leq \mu(C_i) < \infty$ and $\nu_{|C_i}(A) = \nu(A) \leq \nu(C_i) < \infty$ hence we have that

$$\mu_{|C_i} \text{ and } \nu_{|C_i} \text{ are finite measures on } \mathcal{A}_{|C_i}$$

If $A \in \mathcal{A}_{|C_i}$ such that $\mu_{|C_i}(A) = 0$ then $\mu(A) = 0$, as $\nu \ll \mu$ it follows that $\nu(A) = 0$, so that $\nu_{|C_i}(A) = \nu(A) = 0$. Hence we have that

$$\nu_{|C_i} \ll \mu_{|C_i}$$

So we can apply the finite version of the Radon-Nikodym Theorem [theorem: 21.491] to get

$$\forall i \in \mathbb{N} \quad \exists h_i \in \mathcal{M}^+[C_i, \mathcal{A}_{|C_i}, \mathbb{R}] \text{ such that } \forall A \in \mathcal{A}_{|C_i} \quad \nu_{|C_i}(A) = \int_A^+ h_i \cdot d\mu_{|C_i} \quad (21.852)$$

Let $i \in \mathbb{N}$. As $h_i \in \mathcal{M}[C_i, \mathcal{A}_{|C_i}, \mathbb{R}]$ we have, using [theorem: 21.306], that $(h_i)_{C_i \uparrow X} \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$. As further $\forall x \in X \quad (h_i)_{C_i \uparrow X}(x) = \begin{cases} h_i(x) \in [0, \infty[& \text{if } x \in C_i \\ 0 \in [0, \infty[& \text{if } x \in X \setminus C_i \end{cases}$ it follows that

$$\{(h_i)_{C_i \uparrow X}\}_{i \in \mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \quad (21.853)$$

Let $A \in \mathcal{A}_{|C_i}$ then $A \in \mathcal{A} \wedge A \subseteq C_i$ and by [theorem: 21.260] $\mathcal{X}_{C_i,A} \cdot h_i \in \mathcal{M}^+[C_i, \mathcal{A}_{|C_i}, \mathbb{R}]$. Applying then [theorem: 21.306] results in

$$\begin{aligned} (\mathcal{X}_{C_i,A} \cdot h_i)_{C_i \uparrow X} &\in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \\ \int^+ (\mathcal{X}_{C_i,A} \cdot h_i)_{C_i \uparrow X} d\mu &= \int^+ (\mathcal{X}_{C_i,A} \cdot h_i) d\mu_{|C_i} \end{aligned}$$

Using [theorem: 21.236] we have that $\mathcal{X}_{X,A} \cdot (h_i)_{|C_i \uparrow X} = (\mathcal{X}_{C_i,A} \cdot h_i)_{C_i \uparrow X}$ so that

$$\int^+ \mathcal{X}_{X,A} \cdot (h_i)_{C_i \uparrow X} d\mu = \int^+ (\mathcal{X}_{C_i,A} \cdot h_i)_{C_i \uparrow X} d\mu = \int^+ (\mathcal{X}_{C_i,A} \cdot h_i) d\mu_{|A|_{C_i}}$$

or

$$\int_A^+ (h_i)_{X_i \uparrow X} d\mu = \int_A^+ h_i s\mu_{|A|_{A_i}}$$

Further for $x \in X$ we have $((\mathcal{X}_{C_i,A} \cdot h_i)_{C_i \uparrow X})(x) = \begin{cases} (\mathcal{X}_{C_i,A} \cdot h_i)(x) \in \mathbb{R} & \text{if } x \in C_i \\ 0 \in \mathbb{R} & \text{if } x \notin C_i \end{cases}$ so that $(\mathcal{X}_{C_i,A} \cdot h_i)_{C_i \uparrow X} \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$. To summarize we have that

$$\{(\mathcal{X}_{C_i,A} \cdot h_i)_{C_i \uparrow X}\}_{i \in \mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \text{ and } \forall i \in \mathbb{N}, \forall A \in \mathcal{A}_{|C_i} \int_A^+ (h_i)_{X_i \uparrow X} d\mu = \int_A^+ h_i d\mu_{|A|_{A_i}} \quad (21.854)$$

Given $x \in X = \bigsqcup_{i \in \mathbb{N}} C_i$ there exist a **unique** $i \in \mathbb{N}$ such that $x \in C_i$ which allows us to define the following function:

$$h: X \rightarrow \overline{\mathbb{R}} \text{ by } h(x) = h_i(x) \text{ where } i \text{ is such that } x \in C_i$$

Then as $\forall i \in \mathbb{N} \ h_i \in \mathcal{M}[C_i, \mathcal{A}_{|C_i}, \mathbb{R}] \Rightarrow h_i(X) \subseteq [0, \infty[$ it follows that

$$h(X) \subseteq [0, \infty[\quad (21.855)$$

Let $A \in \mathcal{A}$ and $x \in X$. Let $\varepsilon \in \mathbb{R}^+$ then as $x \in X = \bigsqcup_{i \in \mathbb{N}} C_i$ there exist a $N \in \mathbb{N}$ such that $x \in C_N$ such that $h(x) = h_N(x)$ so that $(h_N)_{C_N \uparrow X}(x) \underset{x \in C_N}{=} h_N(x)$ and $\forall i \in \mathbb{N} \setminus \{N\}$ we have $x \notin C_i$ so that $(h_i)_{C_i \uparrow X}(x) = 0$. Let $n \in \{N, \dots, \infty\}$ then we have for $x \in C_N$ either:

$x \in A$. Then

$$\begin{aligned} \left| (\mathcal{X}_{X,A} \cdot h)(x) - \sum_{i=1}^n (\mathcal{X}_{X,A} \cdot (h_i)_{C_i \uparrow X})(x) \right| &= \left| h(x) - \sum_{i=1}^n (h_i)_{C_i \uparrow X}(x) \right| \\ &\underset{x \in C_N}{=} \left| h_N(x) - \sum_{i=1}^n (h_i)_{C_i \uparrow X}(x) \right| \\ &= |h_N(x) - h_N(x)| \\ &= 0 \\ &< \varepsilon \end{aligned}$$

$x \in X \setminus A$. Then

$$\begin{aligned} \left| (\mathcal{X}_{X,A} \cdot h)(x) - \sum_{i=1}^n (\mathcal{X}_{X,A} \cdot (h_i)_{C_i \uparrow X})(x) \right| &= 0 - \sum_{i=1}^n 0 \\ &= 0 \\ &< \varepsilon \end{aligned}$$

which proves that $\sum_{i=1}^{\infty} (\mathcal{X}_{X,A} \cdot (h_i)_{C_i \uparrow X})(x)$ exist and $\sum_{i=1}^{\infty} (\mathcal{X}_{X,A} \cdot (h_i)_{C_i \uparrow X})(x)$ Hence we have that

$$\forall A \in \mathcal{A} \text{ we have } \sum_{i=1}^{\infty} (\mathcal{X}_{X,A} \cdot (h_i)_{C_i \uparrow X}) = \mathcal{X}_{X,A} \cdot h \quad (21.856)$$

Further using [theorem: 21.260] on [eq: 21.853] it follows that

$$\{\mathcal{X}_{X,A} \cdot (h_i)_{C_i \uparrow X}\}_{i \in \mathbb{N}} \subseteq \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \quad (21.857)$$

So the conditions for the Beppo Levi's Theorem [see theorem: 21.355] from which it follows that

$$\mathcal{X}_{A,X} \cdot h = \sum_{i=1}^{\infty} (\mathcal{X}_{X,A} \cdot (h_i)_{C_i \uparrow X}) \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}] \quad (21.858)$$

and

$$\int^+ (\mathcal{X}_{X,A} \cdot h) d\mu = \int^+ \left(\sum_{i=1}^{\infty} (\mathcal{X}_{X,A} \cdot (h_i)_{C_i \uparrow X}) \right) d\mu = \sum_{i=1}^{\infty} \int^+ (\mathcal{X}_{X,A} \cdot (h_i)_{C_i \uparrow X}) d\mu \quad (21.859)$$

As $X \in \mathcal{A}$ and $\mathcal{X}_{X,X} \cdot h = h$ it follows from [eq: 21.858] and [eq: 21.855] that

$$h \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}] \quad (21.860)$$

Further we have $A = A \cap X = A \cap (\bigsqcup_{i \in \mathbb{N}} C_i) = \bigsqcup_{i \in \mathbb{N}} (A \cap C_i)$ where $\forall i \in \mathbb{N} \ A \cap C_i \in \mathcal{A} \wedge A \cap C_i \subseteq C_i$ so that $A \cap C_i \in \mathcal{A}|_{C_i}$. Hence

$$\begin{aligned} \nu(A) &= \nu\left(\bigsqcup_{i \in \mathbb{N}} (A \cap C_i)\right) \\ &= \sum_{i=1}^{\infty} \nu(A \cap C_i) \\ &= \sum_{i=1}^{\infty} \nu|_{\mathcal{A}|_{C_i}}(A \cap C_i) \\ &\stackrel{[\text{eq: 21.852}]}{=} \sum_{i=1}^{\infty} \left(\int_{A \cap C_i}^+ h_i d\mu|_{\mathcal{A}|_{C_i}} \right) \\ &\stackrel{[\text{eq: 21.854}]}{=} \sum_{i=1}^{\infty} \left(\int_{A \cap C_i}^+ (h_i)_{C_i \uparrow X} d\mu \right) \\ &\stackrel{=\text{def}}{=} \sum_{i=1}^{\infty} \left(\int^+ (\mathcal{X}_{X, A \cap C_i} \cdot (h_i)_{C_i \uparrow X}) d\mu \right) \\ &\stackrel{[\text{theorem: 21.257}]}{=} \sum_{i=1}^{\infty} \left(\int^+ (\mathcal{X}_{X, A} \cdot (\mathcal{X}_{X, C_i} \cdot (h_i)_{C_i \uparrow X})) d\mu \right) \\ &\stackrel{[\text{definition: 21.237}]}{=} \sum_{i=1}^{\infty} \left(\int^+ (\mathcal{X}_{X, A} \cdot (h_i)_{C_i \uparrow X}) d\mu \right) \\ &\stackrel{[\text{eq: 21.859}]}{=} \int^+ (\mathcal{X}_{X, A} \cdot h) d\mu \\ &\stackrel{=\text{def}}{=} \int_A^+ h d\mu \end{aligned}$$

Hence we have found a $h \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ [see eq: 21.860] such that $\forall A \in \mathcal{A}$ we have $\nu(A) = \int_A^+ h d\mu$ which proves existence. Now for uniqueness, assume that there exist a $f \in \mathcal{M}^+(X, \mathcal{A}, \mathbb{R})$ such that $\forall A \in \mathcal{A} \ \nu(A) = \int_A^+ f d\mu$ then by [lemma: 21.490] it follows that

$$f = h \ \mu\text{-a.e.} \quad \square$$

We extend now the Radon-Nikodym theorem to signed and complex measures. First we extend the concept of absolute continuity.

Definition 21.493. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then we define:

1. If ν is a signed measure on $\mathcal{A}$ then ν is **absolute continuous with respect to μ noted as $\nu \ll \mu$** if $|\nu| \ll \mu$ where $|\nu|$ is the variation of the signed measure ν [see theorem: 21.454].
2. If ν is a complex measure on $\mathcal{A}$ then ν is **absolute continuous with respect to μ noted as $\nu \ll \mu$** if $|\nu| \ll \mu$ where $|\nu|$ is the variation of the signed measure ν [see theorem: 21.463].

We have the following equivalent definition for absolute continuity on signed (complex) measures.

Theorem 21.494. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measure space then we have the following equivalences:

1. If ν is a signed measure on $\mathcal{A}$ with Jordan decomposition (ν^+, ν^-) [see theorem: 21.454] then we have

$$\nu \ll \mu \Leftrightarrow \nu^+ \ll \mu \wedge \nu^- \ll \mu$$

2. If ν is a complex measure on $\mathcal{A}$ with Jordan decomposition $(\nu_r^+, \nu_r^-, \nu_c^+, \nu_c^-)$ [see theorem: 21.462] then we have

$$\nu \ll \mu \Leftrightarrow \nu_r^+ \ll \mu \wedge \nu_r^- \ll \mu \wedge \nu_c^+ \ll \mu \wedge \nu_c^- \ll \mu$$

Proof.

1.

$\Rightarrow$. Let $A \in \mathcal{A}$ be such that $\mu(A) = 0$ then as $\nu \ll \mu$ we have $|\nu|(A) = 0$. As $|\nu|(A) = \mu^+(A) + \mu^-(A)$ and $0 \leq \mu^+(A), \mu^-(A)$ we must have $\mu^+(A) = 0 = \mu^-(A)$ which proves that $\nu^+ \ll \mu \wedge \nu^- \ll \mu$

$\Leftarrow$. Let $A \in \mathcal{A}$ with $\mu(A) = 0$ then as $\nu^+ \ll \mu \wedge \nu^- \ll \mu$ we have $\nu^+(A) = 0 = \nu^-(A)$ so that $|\nu| = \nu^+(A) + \nu^-(A) = 0$ which proves that $|\nu| \ll \mu$

2.

$\Rightarrow$. Let $A \in \mathcal{A}$ such that $\mu(A) = 0$. As $\nu \ll \mu$ it follows that $|\nu|(A) = 0$, so, as $|\nu|(A) \leq |\nu|(A)$ [see theorem: 21.465], it follows that $\nu(A) = 0$. So as

$$\nu(A) = (\nu_r^+(A) + \nu_r^-(A)) + i \cdot (\nu_c^+(A) + \nu_c^-(A))$$

we must have that

$$\nu_r^+(A) + \nu_r^-(A) = 0 = \nu_c^+(A) + \nu_c^-(A)$$

which as $0 \leq \nu_r^+(A), \nu_r^-(A), \nu_c^+(A), \nu_c^-(A)$ gives $\nu_r^+(A) = \nu_r^-(A) = \nu_c^+(A) = \nu_c^-(A) = 0$. Hence we have that

$$\nu_r^+ \ll \mu \wedge \nu_r^- \ll \mu \wedge \nu_c^+ \ll \mu \wedge \nu_c^- \ll \mu$$

$\Leftarrow$. Let $A \in \mathcal{A}$ such that $\mu(A) = 0$. As $\nu_r^+ \ll \mu \wedge \nu_r^- \ll \mu \wedge \nu_c^+ \ll \mu \wedge \nu_c^- \ll \mu$ we have that

$$\nu_r^+(A) = \nu_r^-(A) = \nu_c^+(A) = \nu_c^-(A) = 0$$

Take $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}$ pairwise disjoint such that $A = \bigsqcup_{i \in \{1, \dots, n\}} A_i$ then we have $\forall i \in \mathbb{N} \ \nu_r^+(A_i) \leq \nu_r^+(A) = 0, \ \nu_r^-(A_i) \leq \nu_r^-(A) = 0, \ \nu_c^+(A_i) \leq \nu_c^+(A) = 0$ and $\nu_c^-(A_i) \leq \nu_c^-(A) = 0$ so that $\nu_r^+ = \nu_r^- = \nu_c^+ = \nu_c^- = 0$. Hence

$$\begin{aligned} \sum_{i=1}^n |\nu(A_i)| &= \sum_{i=1}^n |\nu_r^+(A_i) - \nu_r^-(A_i) + i \cdot \nu_c^+(A_i) - i \cdot \nu_c^-(A_i)| \\ &\leq \sum_{i=1}^n (|\nu_r^+(A_i)| + |\nu_r^-(A_i)| + |\nu_c^+(A_i)| + |\nu_c^-(A_i)|) \\ &= \sum_{i=1}^n 0 \\ &= 0 \end{aligned}$$

so that

$$\begin{aligned} |\nu|(A) &= \sup \left(\sum_{i=1}^n |\mu(A_i)| \mid n \in \mathbb{N}_0 \wedge \{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A} \wedge A = \bigsqcup_{i \in \{1, \dots, n\}} A_i \right) \\ &= \sup(\{0\}) \\ &= 0 \end{aligned}$$

proving that

$$\nu \ll \mu$$

□

To prove the Radon-Nikodym theorem for signed or complex measures, we first prove uniqueness.

Lemma 21.495. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, μ a σ -finite measure on μ , ν a **finite signed measure** on $\mathcal{A}$ and $f, g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ [theorem: 21.383] $\mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{R}]$ satisfies

$$\forall A \in \mathcal{A} \quad \int_A f d\mu = \int_A g d\mu$$

then

$$f = g \text{ } \mu\text{-a.e.}$$

Proof. Let $A \in \mathcal{A}$ then we have by [theorems: 21.335, 21.339]

$$\begin{aligned} \int (\mathcal{X}_{X,A} \cdot (f - g)) d\mu &= \int (\mathcal{X}_{X,A} \cdot f - \mathcal{X}_{X,A} \cdot g) d\mu \\ &= \int (\mathcal{X}_{X,A} \cdot f) d\mu - \int (\mathcal{X}_{X,A} \cdot g) d\mu \\ &= \nu(A) - \nu(A) \\ &= 0 \end{aligned}$$

so that

$$\forall A \in \mathcal{A} \text{ we have } \int (\mathcal{X}_{X,A} \cdot (f - g)) d\mu = 0 \quad (21.861)$$

Define now $F = \{f > g\}$ and $G = \{f < g\}$ then $\{f < g\}, \{g < f\} \in \mathcal{A}$ [see theorem: 21.244] we have by [theorem: 21.488] that

$$(f - g)^+ = \mathcal{X}_F \cdot (f - g) \text{ and } (f - g)^- = \mathcal{X}_G \cdot (g - f) = -\mathcal{X}_G \cdot (f - g) \quad (21.862)$$

Next we have

$$\int |(f - g)^+| d\mu \underset{0 \leq (f - g)^+}{=} \int (f - g)^+ d\mu = \int \mathcal{X}_F \cdot (f - g) d\mu \underset{[\text{eq: 21.861}]}{=} 0$$

and

$$\int |(f - g)^-| d\mu \underset{0 \leq (f - g)^-}{=} \int (f - g)^- d\mu = - \int \mathcal{X}_G \cdot (f - g) d\mu \underset{[\text{eq: 21.861}]}{=} 0$$

Using [theorem: 21.346] we have then that $(f - h)^+ = 0$ μ -a.e. and $(f - h)^- = 0$ μ -a.e.. As by [theorem: 21.322] $(f - h) = (f - h)^+ - (f - h)^-$ it follows from [theorem: 21.266] that $(f - h) = 0$ μ -a.e.. Hence by [theorem: 21.267]

$$f = h \text{ } \mu\text{-a.e.}$$

which concludes the lemma. $\square$

We have a similar lemma for complex measures.

Lemma 21.496. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, μ a σ -finite measure on $\mathcal{A}$, ν a **complex measure** on $\mathcal{A}$ and $f, g \in \mathcal{L}[X, \mathcal{A}, \mathbb{C}] \underset{[\text{theorem: 21.383}]}{=} \mathcal{L}^1[X, \mathcal{A}, \mu, \mathbb{R}]$ such that

$$\forall A \in \mathcal{A} \text{ we have } \int_A^{\mathbb{C}} f d\mu = \nu(A) = \int_A^{\mathbb{C}} g d\mu$$

then

$$f = g \text{ } \mu\text{-a.e.}$$

Proof. Let $A \in \mathcal{A}$ then

$$\begin{aligned} \int \operatorname{Re}(\mathcal{X}_A \cdot (f - g)) d\mu + i \cdot \int \operatorname{Im}(\mathcal{X}_A \cdot (f - g)) d\mu &\underset{\text{def}}{=} \int^{\mathbb{C}} \mathcal{X}_A \cdot (f - g) d\mu \\ &\underset{[\text{theorem: 21.378}]}{=} \int^{\mathbb{C}} \mathcal{X}_A \cdot f d\mu - \int^{\mathbb{C}} \mathcal{X}_A \cdot g d\mu \\ &\underset{\text{def}}{=} \int_A^{\mathbb{C}} f d\mu - \int_A^{\mathbb{C}} g d\mu \\ &= \nu(A) - \nu(A) \\ &= 0 \end{aligned}$$

hence

$$\int \operatorname{Re}(\mathcal{X}_A \cdot (f - g)) d\mu = 0 \wedge \int \operatorname{Im}(\mathcal{X}_A \cdot (f - g)) d\mu = 0 \quad (21.863)$$

As $\mathcal{X}_A$ is real it follows from the above and [theorem: 21.374] that

$$\forall A \in \mathcal{A} \text{ we have } \int \mathcal{X}_A \cdot (\operatorname{Re}(f) - \operatorname{Re}(g)) d\mu = 0 \wedge \int \mathcal{X}_A \cdot (\operatorname{Im}(f) - \operatorname{Im}(g)) d\mu = 0 \quad (21.864)$$

Define

$$F_r = \{\operatorname{Re}(f) > \operatorname{Re}(g)\}, G_r = \{\operatorname{Re}(f) < \operatorname{Re}(g)\}, F_c = \{\operatorname{Im}(f) > \operatorname{Im}(g)\}, G_c = \{\operatorname{Im}(f) < \operatorname{Im}(g)\}$$

Using [definition: 21.372] and [definition: 21.326] we have

$$\operatorname{Re}(f), \operatorname{Re}(g), \operatorname{Im}(f), \operatorname{Im}(g) \in \mathcal{M}[X, \mathcal{A}, \mathbb{R}]$$

and it follows by [theorem: 21.244] that

$$F_r, G_r, F_c, G_c \in \mathcal{A} \quad (21.865)$$

Next we have S

$$\begin{aligned} \int |(\operatorname{Re}(f) - \operatorname{Re}(g))^+| d\mu & \stackrel{0 \leq (\operatorname{Re}(f) - \operatorname{Re}(g))^+}{=} \int (\operatorname{Re}(f) - \operatorname{Re}(g))^+ d\mu \\ & \stackrel{[\text{theorem: 21.488}]}{=} \int \mathcal{X}_{F_r} \cdot (\operatorname{Re}(f) - \operatorname{Re}(g)) d\mu \\ & \stackrel{[\text{eqs: 21.864, 21.865}]}{=} 0 \\ \int |(\operatorname{Re}(f) - \operatorname{Re}(g))^-| d\mu & \stackrel{0 \leq (\operatorname{Re}(f) - \operatorname{Re}(g))^-}{=} \int (\operatorname{Re}(f) - \operatorname{Re}(g))^- d\mu \\ & \stackrel{[\text{theorem: 21.488}]}{=} \int \mathcal{X}_{G_r} \cdot (\operatorname{Re}(f) - \operatorname{Re}(g)) d\mu \\ & \stackrel{[\text{eqs: 21.864, 21.865}]}{=} 0 \\ \int |(\operatorname{Im}(f) - \operatorname{Im}(g))^+| d\mu & \stackrel{0 \leq (\operatorname{Im}(f) - \operatorname{Im}(g))^+}{=} \int (\operatorname{Im}(f) - \operatorname{Im}(g))^+ d\mu \\ & \stackrel{[\text{theorem: 21.488}]}{=} \int \mathcal{X}_{F_c} \cdot (\operatorname{Im}(f) - \operatorname{Im}(g)) d\mu \\ & \stackrel{[\text{eqs: 21.864, 21.865}]}{=} 0 \\ \int |(\operatorname{Im}(f) - \operatorname{Im}(g))^-| d\mu & \stackrel{0 \leq (\operatorname{Im}(f) - \operatorname{Im}(g))^-}{=} \int (\operatorname{Im}(f) - \operatorname{Im}(g))^- d\mu \\ & \stackrel{[\text{theorem: 21.488}]}{=} \int \mathcal{X}_{G_c} \cdot (\operatorname{Im}(f) - \operatorname{Im}(g)) d\mu \\ & \stackrel{[\text{eqs: 21.864, 21.865}]}{=} 0 \end{aligned}$$

Using [theorem: 21.346] on the above gives

$$\begin{aligned} (\operatorname{Re}(f) - \operatorname{Re}(g))^+ &= 0 \quad \mu\text{-a.e.} \\ (\operatorname{Re}(f) - \operatorname{Re}(g))^- &= 0 \quad \mu\text{-a.e.} \\ (\operatorname{Im}(f) - \operatorname{Im}(g))^+ &= 0 \quad \mu\text{-a.e.} \\ (\operatorname{Im}(f) - \operatorname{Im}(g))^- &= 0 \quad \mu\text{-a.e.} \end{aligned}$$

As by [theorem: 21.322]

$$\operatorname{Re}(f) - \operatorname{Re}(g) = (\operatorname{Re}(f) - \operatorname{Re}(g))^+ - (\operatorname{Re}(f) - \operatorname{Re}(g))^-$$

and

$$\operatorname{Im}(f) - \operatorname{Im}(g) = (\operatorname{Im}(f) - \operatorname{Im}(g))^+ - (\operatorname{Im}(f) - \operatorname{Im}(g))^-$$

so it follows from [theorem: 21.266] that $\operatorname{Re}(f) - \operatorname{Re}(g) = 0$ μ -a.e and $\operatorname{Im}(f) - \operatorname{Im}(g) = 0$ μ -a.e.. Applying [theorem: 21.267] proves that gives $\operatorname{Re}(f) = \operatorname{Re}(g)$ μ -a.e. and $\operatorname{Im}(f) = \operatorname{Im}(g)$ μ -a.e. Finally using [theorem: 21.367] again proves that

$$f = g \quad \mu\text{-a.e.} \quad \square$$

We are now finally ready to prove the Radon-Nikodym Theorem for signed and complex measures.

Theorem 21.497. (Radon-Nikodym Theorem (Signed/Complex)) Let $\langle X, \mathcal{A} \rangle$ be a measurable space, μ a σ -finite measure on $\langle X, \mathcal{A} \rangle$ then we have

1. If ν is a **finite signed** measure on $\langle X, \mathcal{A} \rangle$ so that $\nu \ll \mu$ then there exists a $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ such that
 - a. $\forall A \in \mathcal{A}$ we have $\nu(A) = \int_A f d\mu$
 - b. If $g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ such that $\forall A \in \mathcal{A} \nu(A) = \int_A g d\mu$ then $f = g$ μ -a.e.
2. If ν is a **complex** measure on $\langle X, \mathcal{A} \rangle$ so that $\nu \ll \mu$ then there exists a $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ such that
 - a. $\forall A \in \mathcal{A}$ we have $\nu(A) = \int_A f d\mu$
 - b. If $g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ such that $\forall A \in \mathcal{A} \nu(A) = \int_A g d\mu$ then $f = g$ μ -a.e.

Proof.

1. As ν is a signed measure there exist a Jordan Decomposition [see theorem: 21.454] (ν^+, ν^-) of ν , so that $\nu = \nu^+ - \nu^-$. As ν is finite we have also that ν^-, ν^+ are finite measures on $\mathcal{A}$. Using the Radon-Nikodym theorem [see 21.492] there exists $f_+, f_- \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ such that

$$\forall A \in \mathcal{A} \quad \int (\mathcal{X}_{X,A} \cdot f_+) d\mu = \int_A^+ f_+ d\mu = \nu^+(A) < \infty \wedge \int (\mathcal{X}_{X,A} \cdot f_-) d\mu = \int_A^+ f_- d\mu = \nu^-(A) < \infty$$

Using [theorem: 21.332] on the above gives

$$\forall A \in \mathcal{A} \text{ we have } \mathcal{X}_{X,A} \cdot f_+, \mathcal{X}_{X,A} \cdot f_- \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \xrightarrow{\text{take } A=X} f_+, f_- \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

and

$$\forall A \in \mathcal{A} \text{ we have } \int_A f_+ d\mu = \int \mathcal{X}_{X,A} \cdot f_+ d\mu = \nu^+(A) \wedge \int_A f_- d\mu = \int \mathcal{X}_{X,A} \cdot f_- d\mu = \nu^-(A)$$

Take $f = f_+ - f_-$ so that $\mathcal{X}_{X,A} \cdot f = \mathcal{X}_{X,A} \cdot f_+ - \mathcal{X}_{X,A} \cdot f_-$ then by [theorem: 21.339] we have

$$\forall A \in \mathcal{A} \quad \mathcal{X}_{X,A} \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ and } f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$$

and

$$\forall A \in \mathcal{A} \quad \int_A f d\mu = \int \mathcal{X}_{X,A} \cdot f d\mu = \int \mathcal{X}_{X,A} \cdot f_+ d\mu - \int \mathcal{X}_{X,A} \cdot f_- d\mu = \nu^+(A) - \nu^-(A) = \nu(A)$$

Summarizing

$$\exists f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \text{ such that } \forall A \in \mathcal{A} \quad \int_A f d\mu = \nu(A)$$

Finally if there exists another $g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ such that $\forall A \in \mathcal{A} \int_A g d\mu = \nu(A)$ then using [lemma: 21.495] it follows that

$$f = g \text{ } \mu\text{-a.e.}$$

2. As ν is a complex measure there exists a Jordan Decomposition [see theorem: 21.462] $(\nu_r^+, \nu_r^-, \nu_c^+, \nu_c^-)$ of ν so that $\nu = (\nu_r^+ - \nu_r^-) + i \cdot (\nu_c^+ - \nu_c^-)$ where $\nu_r^+, \nu_r^-, \nu_c^+, \nu_c^-$ are finite measures on $\langle X, \mathcal{A} \rangle$. Using the Radon-Nikodym theorem [see 21.492] there exists $f_r^+, f_r^-, f_c^+, f_c^- \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ such that

$$\begin{aligned} \forall A \in \mathcal{A} \text{ we have } \quad & \int_A^+ \mathcal{X}_{X,A} \cdot f_r^+ d\mu = \int_A^+ f_r^+ d\mu = \nu_r^+(A) < \infty \\ & \int_A^+ \mathcal{X}_{X,A} \cdot f_r^- d\mu = \int_A^+ f_r^- d\mu = \nu_r^-(A) < \infty \\ & \int_A^+ \mathcal{X}_{X,A} \cdot f_c^+ d\mu = \int_A^+ f_c^+ d\mu = \nu_c^+(A) < \infty \\ & \int_A^+ \mathcal{X}_{X,A} \cdot f_c^- d\mu = \int_A^+ f_c^- d\mu = \nu_c^-(A) < \infty \end{aligned}$$

Using [theorem: 21.332] on the above gives

$$\forall A \in \mathcal{A} \text{ we have } \mathcal{X}_{X,A} \cdot f_+^r, \mathcal{X}_{X,A} \cdot f_-^r, \mathcal{X}_{X,A} \cdot f_+^c, \mathcal{X}_{X,A} \cdot f_-^c \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \quad (21.866)$$

and taking $A = X$ in the above

$$f_+^r, f_-^r, f_+^c, f_-^c \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \quad (21.867)$$

further

$$\begin{aligned} \forall A \in \mathcal{A} \text{ we have } \int_A f_+^r d\mu &= \int \mathcal{X}_{X,A} \cdot f_+^r d\mu = \nu_r^+(A) \\ \int_A f_-^r d\mu &= \int \mathcal{X}_{X,A} \cdot f_-^r d\mu = \nu_r^-(A) \\ \int_A f_+^c d\mu &= \int \mathcal{X}_{X,A} \cdot f_+^c d\mu = \nu_c^+(A) \\ \int_A f_-^c d\mu &= \int \mathcal{X}_{X,A} \cdot f_-^c d\mu = \nu_c^-(A) \end{aligned} \quad (21.868)$$

Take $f = f_+^r - f_-^r + i \cdot (f_+^c - f_-^c)$ then by combining [theorem: 21.339] and [eqs: 21.866, 21.867] we have for $A \in \mathcal{A}$

$$\begin{aligned} \operatorname{Re}(f) &= f_+^r - f_-^r \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \\ \operatorname{Re}(\mathcal{X}_A \cdot f) &= \mathcal{X}_A \cdot f_+^r - \mathcal{X}_A \cdot f_-^r \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \\ \operatorname{Im}(f) &= f_+^c - f_-^c \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \\ \operatorname{Im}(\mathcal{X}_A \cdot f) &= \mathcal{X}_A \cdot f_+^c - \mathcal{X}_A \cdot f_-^c \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}] \end{aligned}$$

which by definition of the integral of complex functions proves that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}] \wedge \mathcal{X}_A \cdot f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$$

and

$$\begin{aligned} \int_A f d\mu &= \int \mathcal{X}_A \cdot f d\mu \\ &= \int \operatorname{Re}(\mathcal{X}_A \cdot f) d\mu + i \cdot \int \operatorname{Im}(\mathcal{X}_A \cdot f) d\mu \\ &= \int (\mathcal{X}_A \cdot f_+^r - \mathcal{X}_A \cdot f_-^r) d\mu + i \cdot \int (\mathcal{X}_A \cdot f_+^c - \mathcal{X}_A \cdot f_-^c) d\mu \\ &= \int \mathcal{X}_A \cdot f_+^r d\mu - \int \mathcal{X}_A \cdot f_-^r d\mu + i \cdot \left(\int \mathcal{X}_A \cdot f_+^c d\mu - \int \mathcal{X}_A \cdot f_-^c d\mu \right) \\ &= \nu_r^+(A) - \nu_r^-(A) + i \cdot (\nu_c^+ - \nu_c^-) \\ &= \nu(A) \end{aligned}$$

Summarizing we have

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}] \text{ and } \forall A \in \mathcal{A} \text{ we have } \int f d\mu = \nu(A)$$

Finally if there exists another $g \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ such that $\forall A \in \mathcal{A}$ we have $\int_A g d\mu = \nu(A)$ then using [lemma: 21.496] we have that

$$f = g \text{ } \mu\text{-a.e.} \quad \square$$

For the Riemann Integral on a Banach space [see definition: 15.20] we have the Fundamental Theorem of Analysis [see theorem: 16.170]. This states that if a function $F: [a, b] \rightarrow X$ [where X is a Banach space] has a derivate F' on $[a, b]$ then $\int_a^b F' = F(b) - F(a)$. If we take the usual notation of $F' = \frac{dF}{dx}$ for the derivative and $\int_a^b f dx$ the Riemann integral this becomes

$$l([F(a) - F(b)]) = F(b) - F(a) = \int_a^b \frac{dF}{dx} dx$$

where $l([F(a) - F(b)])$ is the measure of the interval $[F(a) - F(b)]$. Compare this with the Radon-Nikodym theorem which says that for measures ν, μ with $\nu \ll \mu$ there exist a integrable function h such that

$$\nu(A) = \int_A h d\mu$$

Hence it seems logical to consider f as a kind of derivate and write f as follows $f = \frac{d\nu}{d\mu}$ so that we have

$$\nu(A) = \int_A \frac{d\nu}{d\mu} d\mu$$

This motivates the definition of the Radon-Nikodym derivative.

Definition 21.498. Let $\langle X, \mathcal{A} \rangle$ be a measurable space, μ a σ -finite measure on $\mathcal{A}$ then we have the following definitions:

1. If ν is a σ -finite measure on $\mathcal{A}$ then a Radon-Nikodym derivative of ν with respect to μ is a $f \in \mathcal{M}^+[X, \mathcal{A}, \mathbb{R}]$ such that $\forall A \in \mathcal{A}$ we have

$$\nu(A) = \int_A^+ f d\mu$$

2. If ν is a finite signed measure on $\mathcal{A}$ then a Radon-Nikodym derivative of ν with respect to μ is a $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{R}]$ such that $\forall A \in \mathcal{A}$ we have

$$\nu(A) = \int_A f d\mu$$

3. If ν is a complex measure on $\mathcal{A}$ then a Radon-Nikodym derivative of ν with respect to μ is a $f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$ such that $\forall A \in \mathcal{A}$ we have

$$\nu(A) = \int_A^{\mathbb{C}} f d\mu$$

Note 21.499. Using [theorems: 21.492, 21.497] it follows that if $\nu \ll \mu$ then there exist a Radon-Nikodym derivative of ν with respect to μ .

Note 21.500. A Radon-Nikodym derivative of ν with respect to μ is noted by $\frac{d\nu}{d\mu}$. Be aware that this notation is misleading as it suggest that there exist only on Radon-Nikodym while [theorems: 21.492, 21.497] ensure existence but not uniqueness. The best way to think of this notation is that $f = \frac{d\nu}{d\mu}$ is the same as saying that f is a Radon-Nikodym derivative so that

$$\forall A \in \mathcal{A} \text{ we have } \nu(A) = \begin{cases} \int_A^+ f d\mu & \text{if } \nu \text{ is a } \sigma\text{-finite measure} \\ \int_A f d\mu & \text{if } \nu \text{ is a } \sigma\text{-finite measure} \\ \int_A^{\mathbb{C}} f d\mu & \text{if } \nu \text{ is a complex measure} \end{cases}$$

Using this interpretation we have that if $f = \frac{d\nu}{d\mu}$ and $g = \frac{d\nu}{d\mu}$ then using [lemmas: 21.490, 21.495 and 21.496] we have that $f = g$ μ -a.e.

21.7 Product measures

In this section we examine how given a finite family of measurable spaces we can define a σ -algebra and measure on the product of these spaces. The prime objective is to show how a integral on the product of these spaces can be calculated based on the integrals on the measurable spaces.

21.7.1 Product of σ -algebras

Given a finite family $\{\langle X_i, \mathcal{A}_i \rangle\}_{i \in \{1, \dots, n\}}$ of measurable spaces we show how a σ -algebra can be defined on $\prod_{i \in \{1, \dots, n\}} X_i$. First we show how given a family $\{\langle X_i, \mathcal{A}_i \rangle\}_{i \in I}$ of measurable spaces, a set X and a family of mappings $\{f_i: X \rightarrow X_i\}_{i \in I}$ we can define on X a σ -algebra such that these mappings are measurable.

Definition 21.501. Let X, Y be sets, $f: X \rightarrow Y$ a function and $\mathcal{A} \subseteq \mathcal{P}(Y)$ then

$$f^{-1}[\mathcal{A}] = \{f^{-1}(A) | A \in \mathcal{A}\} \subseteq \mathcal{P}(X)$$

In other words $f^{-1}[\mathcal{A}]$ is the set of pre-images by f of sets in $\mathcal{A}$

Definition 21.502. Let I be a set, $\{\langle X_i, \mathcal{A}_i \rangle\}_{i \in I}$ a family of measurable sets, X a set and $\{f_i: X \rightarrow X_i\}_{i \in I}$ a family of functions then we define the σ -algebra $\sigma[f_i | i \in I]$ on X by

$$\sigma[f_i | i \in I] = \sigma \left[\bigcup_{i \in I} f_i^{-1}[\mathcal{A}_i] \right]$$

The benefit of the above σ -algebra is that it is the smallest σ -algebra on X such that every f_i is measurable.

Theorem 21.503. Let I be a set, $\{\langle X_i, \mathcal{A}_i \rangle\}_{i \in I}$ a family of measurable sets, X a set and $\{f_i: X \rightarrow X_i\}_{i \in I}$ a family of functions then we have for the σ -algebra on $\sigma[f_i | i \in I]$ on X that

$$\forall i \in I \ f_i: X \rightarrow X_i \text{ is } \sigma[f_i | i \in I], \mathcal{A}_i\text{-measurable}$$

Further if $\mathcal{A}$ is another σ -algebra on X such that $\forall i \in I \ f_i: X \rightarrow X_i$ is $\mathcal{A}, \mathcal{A}_i$ -measurable then

$$\sigma[f_i | i \in I] \subseteq \mathcal{A}$$

Proof. Let $i \in I$ then $\forall A \in \mathcal{A}_i$ we have that

$$f_i^{-1}(A) \in \{f^{-1}(A) | A \in \mathcal{A}_i\} = f^{-1}[\mathcal{A}_i] \subset \bigcup_{i \in I} f_i^{-1}[\mathcal{A}_i] \subseteq \sigma \left[\bigcup_{i \in I} f_i^{-1}[\mathcal{A}_i] \right] = \sigma[f_i | i \in I]$$

which proves that $f_i = \sigma[f_i | i \in I], \mathcal{A}_i$ -measurable. Hence

$$\forall i \in I \ f_i: X \rightarrow X_i \text{ is } \sigma[f_i | i \in I], \mathcal{A}_i\text{-measurable}$$

Let $\mathcal{A}$ be another σ -algebra on X such that $\forall i \in I \ f_i: X \rightarrow X_i$ is $\mathcal{A}, \mathcal{A}_i$ -measurable. Let $A \in \bigcup_{i \in I} f_i^{-1}[\mathcal{A}_i]$ then there exist a $i \in I$ such that $A \in f_i^{-1}[\mathcal{A}_i] = \{f_i^{-1}(A) | A \in \mathcal{A}_i\}$ then $\exists A' \in \mathcal{A}_i$ such that $A = f_i^{-1}(A')$. As f_i is $\mathcal{A}, \mathcal{A}_i$ -measurable it follows that $f_i^{-1}(A') \in \mathcal{A}$ so that $A \in \mathcal{A}$. Hence we have that $\bigcup_{i \in I} f_i^{-1}[\mathcal{A}_i] \subseteq \mathcal{A}$ so that

$$\sigma[f_i | i \in I] = \sigma \left[\bigcup_{i \in I} f_i^{-1}[\mathcal{A}_i] \right] \subseteq \mathcal{A} \quad \square$$

We are now ready to define the product of σ -algebras.

Definition 21.504. Let $n \in \mathbb{N}$, $\{\langle X_i, \mathcal{A}_i \rangle\}_{i \in \{1, \dots, n\}}$ be a finite family of measurable spaces then the product σ -algebra on $\prod_{i \in \{1, \dots, n\}} X_i$ noted as $\mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n$ is defined by

$$\mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n = \sigma[\pi_i: i \in \{1, \dots, n\}]$$

where $\forall i \in \{1, \dots, n\}$ $\pi_i: \prod_{i \in \{1, \dots, n\}} X_i \rightarrow X_i$ is the i -th projection map defined by $\pi_i(x_1, \dots, x_n) = x_i$ [see definition: 2.148]. The measurable space

$$\left\langle \prod_{i \in \{1, \dots, n\}} X_i, \mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n \right\rangle$$

is called the **product** of the measurable spaces $\{ \langle X_i, \mathcal{A}_i \rangle \}_{i \in \{1, \dots, n\}}$.

Convention 21.505. If $\forall i \in \{1, \dots, n\} \mathcal{A}_i = \mathcal{A}$ then

$$\underbrace{\mathcal{A} \otimes \dots \otimes \mathcal{A}}_n \underset{\text{notation}}{=} \mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n$$

A immediate consequence of [theorem: 21.503] is the following

Theorem 21.506. Let $n \in \mathbb{N}$, $\{ \langle X_i, \mathcal{A}_i \rangle \}_{i \in \{1, \dots, n\}}$ be a finite family of measurable spaces then

$$\forall i \in \{1, \dots, n\} \pi_i: \prod_{i \in \{1, \dots, n\}} X_i \rightarrow X_i \text{ is } \mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n, \mathcal{A}_i\text{-measurable.}$$

Further if $\mathcal{A}$ is another σ -algebra on $\prod_{i \in \{1, \dots, n\}} X_i$ such that $\forall i \in \{1, \dots, n\} \pi_i$ is $\mathcal{A}, \mathcal{A}_i$ -measurable then

$$\mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n \subseteq \mathcal{A}$$

Proof. This follows directly from [definition: 21.504] and [theorem: 21.503]. $\square$

Theorem 21.507. Let $n \in \mathbb{N}$, $\{ \langle X_i, \mathcal{A}_i \rangle \}_{i \in \{1, \dots, n\}}$ be a finite family of measurable spaces such that $\forall i \in \{1, \dots, n\} \mathcal{A}_i = \sigma[\mathcal{E}_i]$ and there exist a $\{E_{i,k}\}_{k \in \mathbb{N}} \subseteq \mathcal{E}_i$ such that $\forall k \in \mathbb{N} E_{i,k} \subseteq E_{i,k+1}$ and $X_i = \bigcup_{k \in \mathbb{N}} E_{i,k}$ then we have that

$$\mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n = \sigma \left[\left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} E_i \in \mathcal{E}_i \right\} \right]$$

Proof. First we prove that for any σ -algebra on $\prod_{i \in \{1, \dots, n\}} X_i$ we have

$$\forall i \in \{1, \dots, n\} \pi_i \text{ is } \mathcal{A}, \mathcal{A}_i\text{-measurable} \Leftrightarrow \left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} E_i \in \mathcal{E}_i \right\} \subseteq \mathcal{A} \quad (21.869)$$

Proof. We have

$\Rightarrow$. Let $E \in \left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} E_i \in \mathcal{E}_i \right\}$ then $E = \prod_{i \in \{1, \dots, n\}} E_i$ where $\forall i \in \{1, \dots, n\} E_i \in \mathcal{E}_i$. Now

$$\begin{aligned} (x_1, \dots, x_n) \in E = \prod_{i \in \{1, \dots, n\}} E_i &\Leftrightarrow \forall i \in \{1, \dots, n\} x_i \in E_i \\ &\Leftrightarrow \forall i \in \{1, \dots, n\} \pi_i(x_1, \dots, x_n) \in E_i \\ &\Leftrightarrow \forall i \in \{1, \dots, n\} (x_1, \dots, x_n) \in \pi_i^{-1}(E_i) \\ &\Leftrightarrow (x_1, \dots, x_n) \in \bigcap_{i \in \{1, \dots, n\}} \pi_i^{-1}(E_i) \end{aligned}$$

which proves that

$$E = \bigcap_{i \in \{1, \dots, n\}} \pi_i^{-1}(E_i)$$

As $\forall i \in \{1, \dots, n\} E_i \in \mathcal{E}_i \subseteq \mathcal{A}_i$ and π_i is $\mathcal{A}, \mathcal{A}_i$ -measurable we have that $\pi_i^{-1}(E_i) \in \mathcal{A}$. So it follows from the above and [theorems: 21.33, 21.28] that $E \in \mathcal{A}$. Hence we have proved that

$$\left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} E_i \in \mathcal{A}_i \right\} \subseteq \mathcal{A}$$

$\Leftarrow$. Fix $j \in \{1, \dots, n\}$ and take $E \in \mathcal{A}_j$. Define

$$\{F_k\}_{k \in \mathbb{N}} \text{ by } F_k = \prod_{i \in \{1, \dots, n\}} F_{k,i} \text{ where } F_{k,i} = \begin{cases} E \in \mathcal{E}_j \text{ if } i = j \\ E_{i,k} \in \mathcal{E}_i \text{ if } i \in \{1, \dots, n\} \setminus \{j\} \end{cases} \in \mathcal{E}_i$$

Then we have as $\forall k \in \mathbb{N} \ F_k = \prod_{i \in \{1, \dots, n\}} F_{k,i}$ and $\forall i \in \{1, \dots, n\} \ F_{k,i} \in \mathcal{E}_i$ that $F_k \in \left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} \ E_i \in \mathcal{E}_i \right\} \subseteq \mathcal{A}$, hence

$$\{F_k\}_{k \in \mathbb{N}} \subseteq \mathcal{A} \quad (21.870)$$

Further we have $\forall k \in \mathbb{N}$ that $\forall i \in \{1, \dots, n\} \ F_{k,i} = \begin{cases} E = F_{k+1,i} & \text{if } i = j \\ E_{i,k} \subseteq E_{i,k+1} & \text{if } i \in \{1, \dots, n\} \setminus \{j\} \end{cases} \subseteq F_{k+1,i}$ so that by [theorem: 2.141] $F_k = \prod_{i \in \{1, \dots, n\}} F_{k,i} \subseteq \prod_{i \in \{1, \dots, n\}} F_{k+1,i}$. To summarize

$$\forall k \in \mathbb{N} \ F_k \subseteq F_{k+1} \quad (21.871)$$

Define

$$G = \prod_{i \in \{1, \dots, n\}} G_i \text{ where } G_i = \begin{cases} E & \text{if } i = j \\ X_i & \text{if } i \in \{1, \dots, n\} \setminus \{j\} \end{cases}$$

Let $k \in \mathbb{N}$ then $\forall i \in \{1, \dots, n\} \ F_{k,i} = \begin{cases} E = G_i & \text{if } i = j \\ E_{i,k} \subseteq X_i = G_i & \text{if } i \in \{1, \dots, n\} \setminus \{j\} \end{cases} \subseteq G_i$ so that by [theorem: 2.141] we have $F_k \subseteq G$ from which it follows that

$$\bigcup_{k \in \mathbb{N}} F_k \subseteq G \quad (21.872)$$

Let $(x_1, \dots, x_n) \in G$. Take $i \in \{1, \dots, n\}$ then we have either:

$i = j$. Then $x_i \in G_i = E = F_{1,i}$ so if we take $k_i = 1$ we have $x_i \in F_{k_i,i}$

$i \in \{1, \dots, n\} \setminus \{j\}$. Then as $x_i \in G_i = X_i = \bigcup_{k \in \mathbb{N}} E_{i,k}$ there exist a $k_i \in \mathbb{N}$ such that $x_i \in E_{i,k_i} = F_{k_i,i}$

Hence if we take $k = \max(\{k_i \mid i \in \{1, \dots, n\}\})$ then $\forall i \in \{1, \dots, n\}$ we have $x_i \in F_{k_i,i} \subseteq F_{k,i}$ [eq: 21.872] so that $(x_1, \dots, x_n) \in \prod_{i \in \{1, \dots, n\}} F_{k,i} = F_k \subseteq \bigcup_{k \in \mathbb{N}} F_k$. Hence $G \subseteq \bigcup_{k \in \mathbb{N}} F_k$ which combined with [eq: 21.872] proves that

$$G = \bigcup_{k \in \mathbb{N}} F_k$$

As by [eq: 21.872] it follows from the above that

$$G \in \mathcal{A}$$

Now if $(x_1, \dots, x_n) \in G$ then $\pi_j(x_1, \dots, x_n) = x_j \in G_j = E$ so that $(x_1, \dots, x_n) \in \pi_j^{-1}(E)$. Likewise if $(x_1, \dots, x_n) \in \pi_j^{-1}(E) \subseteq \prod_{i \in \{1, \dots, n\}} X_i$ then $\forall i \in \{1, \dots, n\} \setminus \{j\}$ we have $x_i \in X_i = G_i$ and for $i = j$ $x_i \in E = G_i$ so that $x \in G$. Hence we must conclude that $\pi_j^{-1}(E) = G \in \mathcal{A}$. So we have have proved that

$$\forall j \in \{1, \dots, n\} \text{ we have } \forall E \in \mathcal{A}_j \text{ that } \pi_j^{-1}(E) \in \mathcal{A}$$

In other words

$$\forall j \in \{1, \dots, n\} \ \pi_j \text{ is } \mathcal{A}, \mathcal{A}_j\text{-measurable} \quad \square$$

As $\mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n$ is a σ -algebra on $\prod_{i \in \{1, \dots, n\}} X_i$ so that $\forall i \in \{1, \dots, n\} \ \pi_i$ is $\mathcal{A}, \mathcal{A}_i$ -measurable [see theorem: 21.506] it follow from [eq: 21.869] that

$$\left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} \ E_i \in \mathcal{E}_i \right\} \subseteq \mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n$$

hence

$$\sigma \left[\left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} \ E_i \in \mathcal{E}_i \right\} \right] \subseteq \mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n \quad (21.873)$$

Take $\mathcal{B} = \sigma \left[\left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} \ E_i \in \mathcal{E}_i \right\} \right]$ then as

$$\left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} \ E_i \in \mathcal{E}_i \right\} \subseteq \mathcal{B}$$

a σ -algebra it follows from [eq: 21.869] that $\forall i \in \{1, \dots, n\}$ π_i is $\mathcal{B}, \mathcal{A}_i$ -measurable. Hence using [theorem: 21.503] and [definition: 21.504] it follows that $\mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n \subset \mathcal{B}$ or

$$\sigma \left[\left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} \ E_i \in \mathcal{E}_i \right\} \right] \subseteq \mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n$$

which combined with [eq: 21.873] proves that

$$\mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n = \sigma \left[\left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} \ E_i \in \mathcal{E}_i \right\} \right] \quad \square$$

Corollary 21.508. *Let $n \in \mathbb{N}$, $\{X_i, \mathcal{A}_i\}_{i \in \{1, \dots, n\}}$ be a finite family of measurable spaces then we have that*

$$\mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n = \sigma \left[\left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} \ E_i \in \mathcal{A}_i \right\} \right]$$

Proof. Let $i \in \{1, \dots, n\}$ then by [theorem: 21.40] we have that $\mathcal{A}_i = \sigma[\mathcal{A}_i]$. Further if we define $\{E_{i,k}\}_{k \in \mathbb{N}} \subseteq \mathcal{A}_i$ by $E_{i,k} = X_i \in \mathcal{A}_i$ then we have $\forall k \in \mathbb{N}$ we have $E_{i,k} \subseteq E_{i,k+1}$ and $X_i = \bigcup_{k \in \mathbb{N}} E_{i,k}$. So all the conditions of the previous theorem [theorem: 21.507] are satisfied which proves

$$\mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n = \sigma \left[\left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} \ E_i \in \mathcal{A}_i \right\} \right] \quad \square$$

A application of [theorem: 21.507] is that we can write the Borel algebra $\mathcal{B}[\mathbb{R}^n]$ on $\mathbb{R}^n$ as a product of the Borel algebra's $\mathcal{B}[\mathbb{R}]$.

Theorem 21.509. *Let $n \in \mathbb{N}$ then*

$$\mathcal{B}[\mathbb{R}^n] = \underbrace{\mathcal{B}[\mathbb{R}] \otimes \dots \otimes \mathcal{B}[\mathbb{R}]}_n$$

Proof. Define $\{X_i, \mathcal{A}_i\}_{i \in \{1, \dots, n\}}$ by $X_i = \mathbb{R}$ and $\mathcal{A}_i = \mathcal{B}[\mathbb{R}]$ then

$$\mathbb{R}^n \stackrel{\text{definition}}{=} \prod_{i \in \{1, \dots, n\}} X_i$$

Further using [theorem: 21.52] we have that

$$\forall i \in \{1, \dots, n\} \ \mathcal{A}_i = \mathcal{B}[\mathbb{R}] = \sigma[\mathcal{I}_{[[]}]$$

Further define $\{[-k, k[\}_{k \in \mathbb{N}} \subseteq \mathcal{I}_{[[]}$ then we have trivially

$$\forall n \in \mathbb{N} \ [-n, n[\subseteq [-(n+1), n+1[$$

Further if $x \in \mathbb{R}$ then by [theorem: 10.30] there exist a $k \in \mathbb{N}$ such that $|x| < k$ so that $-x < k \wedge x < k$ hence $-k < x < k \Rightarrow x \in]-k, k[\subseteq [-k, k[\subseteq \bigcup_{k \in \mathbb{N}} [-n, n[$. Which as $\bigcup_{k \in \mathbb{N}} [-k, k[\subseteq \mathbb{R}$ proves that

$$\mathbb{R} = \bigcup_{k \in \mathbb{N}} [-k, k[$$

So all the conditions for [theorem: 21.507] are satisfied and we have

$$\underbrace{\mathcal{B}[\mathbb{R}] \otimes \dots \otimes \mathcal{B}[\mathbb{R}]}_n = \sigma \left[\left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} \ E_i \in \mathcal{I}_{[[]} \right\} \right] \quad (21.874)$$

Now if $E \in \left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} \ E_i \in \mathcal{I}_{[[]} \right\}$ then $E = \prod_{i \in \{1, \dots, n\}} [a_i, b_i[$ where $a_i, b_i \in \mathbb{R}$ and $a_i < b_i$ [see definition: 21.48] so that by [definitions: 21.63, 21.68] $E \subseteq \mathcal{R}_{[[]}^n$. Hence

$$\left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} \ E_i \in \mathcal{I}_{[[]} \right\} \subseteq \mathcal{R}_{[[]}^n \quad (21.875)$$

Also as $E \in \mathcal{R}_{||}^n$ then by [definitions: 21.63, 21.68] $E = \prod_{i \in \{1, \dots, n\}} [a_i, b_i[$ where $a_i, b_i \in \mathbb{R}$ and $a_i < b_i$ so that by [see definition: 21.48] we have that $E \in \left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} E_i \in \mathcal{I}_{||} \right\}$. Hence $\mathcal{R}_{||}^n \subseteq \left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} E_i \in \mathcal{I}_{||} \right\}$ which combined with [eq: 21.875] proves that

$$\mathcal{R}_{||}^n = \left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} E_i \in \mathcal{I}_{||} \right\}$$

Now

$$\mathcal{B}[\mathbb{R}^n] \underset{[\text{theorem: 21.189}]}{=} \sigma[\mathcal{R}_{||}^n] = \sigma \left[\left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} E_i \in \mathcal{I}_{||} \right\} \right]$$

and combining this with [eq: 21.874] proves finally that

$$\mathcal{B}[\mathbb{R}^n] = \underbrace{\mathcal{B}[\mathbb{R}] \otimes \dots \otimes \mathcal{B}[\mathbb{R}]}_n \quad \square$$

21.7.2 Product measures

Theorem 21.510. Let $n \in \{2, \dots, \infty\}$, $\{\langle X_i, \mathcal{A}_i, \mu_i \rangle\}_{i \in \{1, \dots, n\}}$ a finite family of measure spaces such that $\forall i \in \{1, \dots, n\}$ we have that $\exists \mathcal{E}_i \subseteq \mathcal{P}(X)$ such that

1. $\mathcal{A}_i = \sigma[\mathcal{E}_i]$
2. $\forall A, B \in \mathcal{E}_i$ we have $A \cap B \in \mathcal{E}_i$ [in other words $\mathcal{E}_i$ is $\cap$ -stable]
3. $\exists \{E_{i,k}\}_{k \in \mathbb{N}} \subseteq \mathcal{E}_i$ such that $\forall k \in \mathbb{N}$ we have $E_{i,k} \subseteq E_{i,k+1}$, $\mu_i(A_{i,k}) < \infty$ and $X_i = \bigcup_{k \in \mathbb{N}} E_{i,k}$

then if μ, ν are two measures on $\mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n$ such that

$$\forall \prod_{i \in \{1, \dots, n\}} E_i \in \left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} E_i \in \mathcal{E}_i \right\}$$

we have

$$\mu \left(\prod_{i \in \{1, \dots, n\}} E_i \right) = \prod_{i \in \{1, \dots, n\}} \mu_i(E_i) = \nu \left(\prod_{i \in \{1, \dots, n\}} E_i \right) \quad (21.876)$$

then

$$\mu = \nu$$

Proof. Let $\mathcal{E} = \left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} E_i \in \mathcal{E}_i \right\}$ then by [theorem: 21.507] we have that

$$\mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n = \sigma[\mathcal{E}]$$

Let $E, F \in \mathcal{E}$ then $E = \prod_{i \in \{1, \dots, n\}} E_i$ and $F = \prod_{i \in \{1, \dots, n\}} F_i$ where $\forall i \in \{1, \dots, n\} E_i, F_i \in \mathcal{E}_i$ then we have that

$$E \cap F = \left(\prod_{i \in \{1, \dots, n\}} E_i \right) \cap \left(\prod_{i \in \{1, \dots, n\}} F_i \right) \underset{[\text{theorem: 2.142}]}{=} \prod_{i \in \{1, \dots, n\}} (E_i \cap F_i)$$

As $\forall i \in \{1, \dots, n\} \mathcal{E}_i$ is $\cap$ -stable $E_i \cap F_i \in \mathcal{E}_i$ it follows that $\prod_{i \in \{1, \dots, n\}} (E_i \cap F_i) \in \mathcal{E}$ hence $E \cap F \in \mathcal{E}$. In other word

$$\mathcal{E} \text{ is } \cap\text{-stable} \quad (21.877)$$

Further if we define

$$\{F_k\}_{k \in \mathbb{N}} \subseteq \mathcal{E} \text{ by } F_k = \prod_{i \in \{1, \dots, n\}} E_{i,k} \in \mathcal{E} \quad (21.878)$$

then we have by [theorem: 2.141] and the fact that $\forall i \in \{1, \dots, n\} \forall k \in \mathbb{N} E_{i,k} \subseteq E_{i,k+1}$ we have that

$$\forall k \in \mathbb{N} F_k \subseteq F_{k+1} \quad (21.879)$$

Let $(x_1, \dots, x_n) \in \prod_{i \in \{1, \dots, n\}} X_i$ then $\forall i \in \{1, \dots, n\}$ we have that $x_i \in X_i = \bigcup_{k \in \mathbb{N}} E_{i,k} \Rightarrow \exists k_i \in \mathbb{N}$ such that $x_i \in E_{i,k_i}$. Take $m = \max(\{k_i | i \in \{1, \dots, n\}\})$ then we have $\forall i \in \{1, \dots, n\}$ $x_i \in E_{i,k_i} \subseteq E_{i,m}$ so that $(x_1, \dots, x_n) \in F_m \subseteq \bigcup_{k \in \mathbb{N}} F_k$. Hence $\prod_{i \in \{1, \dots, n\}} X_i \subseteq \bigcup_{k \in \mathbb{N}} F_k$. Further $\forall k \in \mathbb{N}$ we have that $F_k = \prod_{i \in \{1, \dots, n\}} E_{i,k} \subseteq \prod_{i \in \{1, \dots, n\}} X_i$ so that

$$\prod_{i \in \{1, \dots, n\}} X_i = \bigcup_{k \in \mathbb{N}} F_k \quad (21.880)$$

Further we have

$$\forall k \in \mathbb{N} \quad \mu(F_k) = \mu\left(\prod_{i \in \{1, \dots, n\}} E_{i,k}\right) = \prod_{i \in \{1, \dots, n\}} \mu_i(E_{i,k}) = \nu\left(\prod_{i \in \{1, \dots, n\}} E_{i,k}\right) = \mu(F_k) \quad (21.881)$$

As $\forall i \in \{1, \dots, n\}$ we have $\forall k \in \mathbb{N}$ that $\mu_i(E_{i,k})$ is finite we have from the above that

$$\forall k \in \mathbb{N} \quad \mu(F_k) < \infty \quad (21.882)$$

The conditions for [theorem: 21.125] are fulfilled by [eqs: 21.877, 21.878, 21.879, 21.880, 21.881 and 21.882], so using this theorem it follows that

$$\mu = \nu \quad \square$$

Corollary 21.511. *Let $n \in \mathbb{N}$, $\{\langle X_i, \mathcal{A}_i, \mu_i \rangle\}_{i \in \{1, \dots, n\}}$ a finite family of measure spaces such that $\forall i \in \{1, \dots, n\}$ μ_i is σ -finite and μ, ν are two measures on $\mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n$ such that*

$$\forall \prod_{i \in \{1, \dots, n\}} E_i \in \left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} \ E_i \in \mathcal{A}_i \right\}$$

we have

$$\mu\left(\prod_{i \in \{1, \dots, n\}} E_i\right) = \prod_{i \in \{1, \dots, n\}} \mu_i(E_i) = \nu\left(\prod_{i \in \{1, \dots, n\}} E_i\right)$$

Proof. For $i \in \{1, \dots, n\}$ take $\mathcal{E}_i = \mathcal{A}_i$ then

$$\sigma[\mathcal{E}_i] = \sigma[\mathcal{A}_i] = \mathcal{A}_i$$

and trivially we have

$$\forall A, B \in \mathcal{E}_i = \mathcal{A}_i \text{ we have } A \cap B \in \mathcal{A}_i = \mathcal{E}_i \text{ [in other words } \mathcal{E}_i \text{ is } \cap\text{-stable]}$$

As $\forall i \in \{1, \dots, n\}$ μ_i is σ -finite [theorem: 21.99] we have that $\forall i \in \{1, \dots, n\}$ there exist a

$$\{E_{i,k}\}_{k \in \mathbb{N}} \subseteq \mathcal{A}_i = \mathcal{E}_i \text{ with } \forall k \in \mathbb{N} \text{ we have } E_{i,k} \subseteq E_{i,k+1} \wedge \mu_i(E_{i,k}) < \infty \text{ and } X_i = \bigcup_{k \in \mathbb{N}} E_{i,k}$$

By the hypothesis we have

$$\forall \prod_{i \in \{1, \dots, n\}} E_i \in \left\{ \prod_{i \in \{1, \dots, n\}} E_i \mid \forall i \in \{1, \dots, n\} \ E_i \in \mathcal{A}_i = \mathcal{E}_i \right\}$$

we have

$$\mu\left(\prod_{i \in \{1, \dots, n\}} E_i\right) = \prod_{i \in \{1, \dots, n\}} \mu_i(E_i) = \nu\left(\prod_{i \in \{1, \dots, n\}} E_i\right)$$

Hence all the conditions for [theorem: 21.510] are satisfied so that we have

$$\mu = \nu \quad \square$$

This theorem does not prove existence of a measure on $\mathcal{A}_1 \otimes \dots \otimes \mathcal{A}_n$ satisfying [eq: 21.876] only that if such measure exist then it is unique. The remaining part of this section is to prove that such a measure exist. We first prove existence for $n=2$. First we introduce the idea of a section of a set.

Definition 21.512. *Let $\{X_i\}_{i \in \{1,2\}}$ be a family of two sets let $A \subseteq X_1 \cdot X_2$ then we define*

$$\forall x \in X_1 \quad A_{[1,x]} = \{y \in X_2 \mid (x, y) \in A\} \subseteq X_2$$

$$\forall y \in X_2 \quad A_{[2,y]} = \{x \in X_1 \mid (x, y) \in A\} \subseteq X_1$$

We call $A_{[1,x]}$ the 1, x -section of A and $A_{2,y}$ the 2, y -section of A

Note 21.513. $X_1 \cdot X_2$ is a short notation for $\prod_{i \in \{1,2\}} X_i$

Lemma 21.514. Let $\{X_i\}_{i \in \{1,2\}}$ be a family of two sets then we have:

1. $\forall x \in X_1 (X_1 \cdot X_2)_{[1,x]} = X_2$
2. $\forall y \in X_2 (X_1 \cdot X_2)_{[2,y]} = X_1$
3. $\forall x \in X_1$ that $\emptyset_{[1,x]} = \emptyset$ and $\forall y \in X_2$ we have $\emptyset_{[2,y]} = \emptyset$
4. $\forall x \in X_1, \forall A, B \subseteq X_1 \cdot X_2 (A \setminus B)_{[1,x]} = A_{[1,x]} \setminus B_{[1,x]}$
5. $\forall y \in X_2, \forall A, B \subseteq X_1 \cdot X_2 (A \setminus B)_{[2,y]} = A_{[2,y]} \setminus B_{[2,y]}$
6. If $\{A_i\}_{i \in I} \subseteq \mathcal{P}(X_1 \cdot X_2)$, $x \in X_1$ then $(\bigcup_{i \in I} A_i)_{[1,x]} = \bigcup_{i \in I} (A_i)_{[1,x]}$
7. If $\{A_i\}_{i \in I} \subseteq \mathcal{P}(X_1 \cdot X_2)$, $y \in X_2$ then $(\bigcup_{i \in I} A_i)_{[2,y]} = \bigcup_{i \in I} (A_i)_{[2,y]}$
8. Let $A_1 \subseteq X_1, A_2 \subseteq X_2$ then we have
 - a. $\forall x \in X_1$ we have $(A_1 \times A_2)_{[1,x]} = \begin{cases} A_2 & \text{if } x \in A_1 \\ \emptyset & \text{if } x \in X_1 \setminus A_1 \end{cases}$
 - b. $\forall y \in X_2$ we have $(A_1 \times A_2)_{[2,y]} = \begin{cases} A_1 & \text{if } y \in A_2 \\ \emptyset & \text{if } y \in X_2 \setminus A_2 \end{cases}$
9. Let $A, B \subseteq X_1 \cdot X_2$ and $x \in X_1$ then $(A \cap B)_{[1,x]} = A_{[1,x]} \cap B_{[1,x]}$
10. Let $A, B \subseteq X_1 \cdot X_2$ and $y \in X_2$ then $(A \cap B)_{[2,y]} = A_{[2,y]} \cap B_{[2,y]}$

Proof.

1. Let $x \in X_1$. If $y \in X_2$ then $(x, y) \in X_1 \cdot X_2$ so that $y \in \{y \in X_2 | (x, y) \in X_1 \cdot X_2\} = (X_1 \cdot X_2)_{[1,x]}$. Hence $X_2 \subseteq (X_1 \cdot X_2)_{[1,x]}$ and as by definition $(X_1 \cdot X_2)_{[1,x]} \subseteq X_2$ it follows that

$$(X_1 \cdot X_2)_{[1,x]} = X_2$$

2. Let $y \in X_2$. If $x \in X_1$ then $(x, y) \in X_1 \cdot X_2$ so that $x \in \{x \in X_1 | (x, y) \in X_1 \cdot X_2\} = (X_1 \cdot X_2)_{[2,y]}$. Hence $X_1 \subseteq (X_1 \cdot X_2)_{[2,y]}$ and as by definition $(X_1 \cdot X_2)_{[2,y]} \subseteq X_1$ it follows that

$$(X_1 \cdot X_2)_{[2,y]} = X_1$$

3. Let $x \in X_1$ then $\emptyset_{[1,x]} = \{y \in X_2 | (x, y) \in \emptyset\} = \emptyset$. Let $y \in X_2$ then $\emptyset_{[2,y]} = \{x \in X_1 | (x, y) \in \emptyset\} = \emptyset$.
4. Let $x \in X_1$ and $A, B \subseteq X_1 \cdot X_2$. Then we have

$$\begin{aligned} y \in (A \setminus B)_{[1,x]} &\Leftrightarrow y \in \{y \in X_2 | (x, y) \in A \setminus B\} \\ &\Leftrightarrow y \in X_2 \wedge (x, y) \in A \setminus B \\ &\Leftrightarrow y \in X_2 \wedge (x, y) \in A \wedge (x, y) \notin B \\ &\Leftrightarrow y \in \{y \in X_2 | (x, y) \in A\} \wedge y \notin \{y \in X_2 | (x, y) \in B\} \\ &\Leftrightarrow y \in A_{[1,x]} \wedge y \notin B_{[1,x]} \\ &\Leftrightarrow y \in A_{[1,x]} / B_{[1,x]} \end{aligned}$$

so that

$$(A \setminus B)_{[1,x]} = A_{[1,x]} \setminus B_{[1,x]}$$

5. Let $y \in X_2$ and $B \subseteq X_1 \cdot X_2$. Then we have

$$\begin{aligned} x \in (A \setminus B)_{[2,y]} &\Leftrightarrow x \in \{x \in X_1 | (x, y) \in A \setminus B\} \\ &\Leftrightarrow x \in X_1 \wedge (x, y) \in A \setminus B \\ &\Leftrightarrow x \in X_1 \wedge (x, y) \in A \wedge (x, y) \notin B \\ &\Leftrightarrow x \in \{x \in X_1 | (x, y) \in A\} \wedge x \notin \{x \in X_1 | (x, y) \in B\} \\ &\Leftrightarrow x \in A_{[2,y]} \wedge x \notin B_{[2,y]} \\ &\Leftrightarrow x \in A_{[2,y]} / B_{[2,y]} \end{aligned}$$

so that

$$(A \setminus B)_{[2,y]} = A_{[2,y]} \setminus B_{[2,y]}$$

6. Let $\{A_i\}_{i \in I} \subseteq \mathcal{P}(X_1 \cdot X_2)$ and $x \in X_1$ then we have

$$\begin{aligned} y \in \left(\bigcup_{i \in I} A_i \right)_{[1,x]} &\Leftrightarrow y \in X_2 \wedge (x, y) \in \bigcup_{i \in I} A_i \\ &\Leftrightarrow y \in X_2 \wedge \exists i \in I \text{ such that } (x, y) \in A_i \\ &\Leftrightarrow \exists i \in I \text{ such that } y \in \{y \in X_2 \mid (x, y) \in A_i\} \\ &\Leftrightarrow \exists i \in I \text{ such that } y \in (A_i)_{[1,x]} \\ &\Leftrightarrow y \in \bigcup_{i \in I} (A_i)_{[1,x]} \end{aligned}$$

so that

$$\left(\bigcup_{i \in I} A_i \right)_{[1,x]} = \bigcup_{i \in I} (A_i)_{[1,x]}$$

7. Let $\{A_i\}_{i \in I} \subseteq \mathcal{P}(X_1 \cdot X_2)$ and $y \in X_2$ then we have

$$\begin{aligned} x \in \left(\bigcup_{i \in I} A_i \right)_{[2,y]} &\Leftrightarrow x \in X_1 \wedge (x, y) \in \bigcup_{i \in I} A_i \\ &\Leftrightarrow x \in X_1 \wedge \exists i \in I \text{ such that } (x, y) \in A_i \\ &\Leftrightarrow \exists i \in I \text{ such that } x \in \{x \in X_1 \mid (x, y) \in A_i\} \\ &\Leftrightarrow \exists i \in I \text{ such that } x \in (A_i)_{[2,y]} \\ &\Leftrightarrow x \in \bigcup_{i \in I} (A_i)_{[2,y]} \end{aligned}$$

so that

$$\left(\bigcup_{i \in I} A_i \right)_{[2,y]} = \bigcup_{i \in I} (A_i)_{[2,y]}$$

8. Let $A_1 \subseteq X_1$, $A_2 \subseteq X_2$ then we have:

a. Let $x \in X_1$ then we have either:

$x \in A_1$. Then

$$\begin{aligned} y \in (A_1 \cdot A_2)_{[1,x]} &\Leftrightarrow y \in X_2 \wedge (x, y) \in A_1 \cdot A_2 \\ &\stackrel{x \in A_1 \wedge A_2 \subseteq X_2}{\Leftrightarrow} y \in A_2 \end{aligned}$$

which proves that

$$(A_1 \cdot A_2)_{[1,x]} = A_2$$

$x \in X_1 \setminus A_1$. Then if $y \in (A_1 \cdot A_2)_{[1,x]}$ we have that $(x, y) \in A_1 \cdot A_2 \Rightarrow x \in A_1$ which contradicts with $x \in X_1 \setminus A_1$. Hence we must have that

$$(A_1 \cdot A_2)_{[1,x]} = \emptyset$$

b. Let $y \in X_2$ then we have either:

$y \in A_2$. Then

$$\begin{aligned} x \in (A_1 \cdot A_2)_{[2,y]} &\Leftrightarrow x \in X_1 \wedge (x, y) \in A_1 \cdot A_2 \\ &\stackrel{y \in A_2 \wedge A_1 \subseteq X_1}{\Leftrightarrow} x \in A_1 \end{aligned}$$

which proves that

$$(A_1 \cdot A_2)_{[2,y]} = A_1$$

$y \in X_2 \setminus A_2$. Then if $x \in (A_1 \cdot A_2)_{[2,y]}$ we have that $(x, y) \in A_1 \cdot A_2 \Rightarrow y \in A_2$ which contradicts with $y \in X_2 \setminus A_2$. Hence we must have that

$$(A_1 \cdot A_2)_{[2,y]} = \emptyset$$

9. Let $x \in X_1$, $A, B \subseteq X_1 \cdot X_2$ then we have

$$\begin{aligned} y \in (A \cap B)_{[1,x]} &\Leftrightarrow y \in \{y \in X_2 \mid (x, y) \in A \cap B\} \\ &\Leftrightarrow_{x \in X_1} (x, y) \in A \cap B \\ &\Leftrightarrow (x, y) \in A \wedge (x, y) \in B \\ &\Leftrightarrow_{x \in X_1} y \in \{y \in X_2 \mid (x, y) \in A\} \wedge y \in \{y \in X_2 \mid (x, y) \in B\} \\ &\Leftrightarrow y \in A_{[1,x]} \wedge y \in B_{[1,x]} \\ &\Leftrightarrow y \in A_{[1,x]} \cap B_{[1,x]} \end{aligned}$$

which proves that

$$(A \cap B)_{[1,x]} = A_{[1,x]} \cap B_{[1,x]}$$

10. Let $y \in X_2$, $A, B \subseteq X_1 \cdot X_2$ then we have

$$\begin{aligned} x \in (A \cap B)_{[2,y]} &\Leftrightarrow x \in \{x \in X_1 \mid (x, y) \in A \cap B\} \\ &\Leftrightarrow_{y \in X_2} (x, y) \in A \cap B \\ &\Leftrightarrow (x, y) \in A \wedge (x, y) \in B \\ &\Leftrightarrow_{y \in X_2} x \in \{x \in X_1 \mid (x, y) \in A\} \wedge x \in \{x \in X_1 \mid (x, y) \in B\} \\ &\Leftrightarrow x \in A_{[2,y]} \wedge x \in B_{[2,y]} \\ &\Leftrightarrow x \in A_{[2,y]} \cap B_{[2,y]} \end{aligned}$$

which proves that

$$(A \cap B)_{[2,y]} = A_{[2,y]} \cap B_{[2,y]}$$

□

Lemma 21.515. Let $\langle X_1, \mathcal{A}_1 \rangle$, $\langle X_2, \mathcal{A}_2 \rangle$ be two measurable spaces and $A \in \mathcal{A}_1 \otimes \mathcal{A}_2$ then we have

1. $\forall x \in X_1 \ A_{[1,x]} \in \mathcal{A}_2$
2. $\forall y \in X_2 \ A_{[2,y]} \in \mathcal{A}_1$

Note 21.516. As $\mathcal{A}_1 \otimes \mathcal{A}_2$ is a σ -algebra on $X_1 \cdot X_2 = \prod_{i \in \{1,2\}} X_i$ so that $A \subseteq X_1 \cdot X_2$ as is required for this lemma to make sense.

Proof.

1. Let $x \in X_1$ and define

$$\mathcal{B} = \{A \subseteq \mathcal{P}(X_1 \cdot X_2) \mid A_{[1,x]} \in \mathcal{A}_2\} \quad (21.883)$$

Using [lemma: 21.514] we have that $(X_1 \cdot X_2)_{[1,x]} = X_2 \in \mathcal{A}_2$ which proves that

$$X_1 \cdot X_2 \in \mathcal{B} \quad (21.884)$$

Further if $B \in \mathcal{B}$ then $B_{[1,x]} \in \mathcal{A}_2$ and by [lemma: 21.514] $((X_1 \cdot X_2) \setminus B)_{[1,x]} = X_2 \setminus B_{[1,x]} \in \mathcal{A}_2$ so that $(X_1 \cdot X_2) \setminus B \in \mathcal{B}$. Hence

$$\forall B \in \mathcal{B} \text{ we have that } (X_1 \cdot X_2) \setminus B \in \mathcal{B} \quad (21.885)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{B}$ then $\{(A_i)_{[1,x]}\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_2$ so that $\bigcup_{i \in \mathbb{N}} (A_i)_{[1,x]} \in \mathcal{A}_2$. As by [lemma: 21.514] $(\bigcup_{i \in \mathbb{N}} A_i)_{[1,x]} = \bigcup_{i \in \mathbb{N}} (A_i)_{[1,x]}$ it follows that $(\bigcup_{i \in \mathbb{N}} A_i)_{[1,x]} \in \mathcal{A}_2$ hence $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{B}$. So

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{B} \text{ we have } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{B} \quad (21.886)$$

Combining [eqs: 21.884, 21.885, 21.886] proves that

$$\mathcal{B} \text{ is a } \sigma\text{-algebra on } X_1 \cdot X_2 \quad (21.887)$$

Let $E_1 \cdot E_2 \in \left\{ \prod_{i \in \{1,2\}} E_i \mid \forall i \in \{1,2\} E_i \in \mathcal{A}_i \right\}$ then $E_1 \in \mathcal{A}_1 \wedge E_2 \in \mathcal{A}_2$. Using [lemma: 21.514] we have then that $(A_1 \cdot A_2)_{[1,x]} = \left\{ \begin{array}{l} E_2 \in \mathcal{A}_2 \text{ if } x \in E_1 \\ \emptyset \in \mathcal{A}_2 \text{ if } x \in X_1 \setminus E_1 \end{array} \right\} \in \mathcal{A}_2$ so that $E_1 \cdot E_2 \in \mathcal{B}$. So we have proved that

$$\left\{ \prod_{i \in \{1,2\}} E_i \mid \forall i \in \{1,2\} E_i \in \mathcal{A}_i \right\} \subseteq \mathcal{B}$$

As by [corollary: 21.508] $\mathcal{A}_1 \otimes \mathcal{A}_2 = \sigma\left[\left\{ \prod_{i \in \{1,2\}} E_i \mid \forall i \in \{1,2\} E_i \in \mathcal{A}_i \right\}\right]$ we have using the above, [eq: 21.887] and [theorem: 21.39] that

$$\mathcal{A}_1 \otimes \mathcal{A}_2 \subseteq \mathcal{B}$$

Hence $\forall A \in \mathcal{A}_1 \otimes \mathcal{A}_2$ we have $A \in \mathcal{B}$ so that

$$A_{[1,x]} \in \mathcal{A}_2$$

2. Let $y \in X_2$ and define

$$\mathcal{B} = \{A \subseteq \mathcal{P}(X_1 \cdot X_2) \mid A_{[2,y]} \in \mathcal{A}_1\} \quad (21.888)$$

Using [lemma: 21.514] we have that $(X_1 \cdot X_2)_{[2,y]} = X_1 \in \mathcal{A}$ which proves that

$$X_1 \cdot X_2 \in \mathcal{B} \quad (21.889)$$

Further if $B \in \mathcal{B}$ then $B_{[2,y]} \in \mathcal{A}_1$ and by [lemma: 21.514] $((X_1 \cdot X_2) \setminus B)_{[2,y]} = X_1 \setminus B_{[2,y]} \in \mathcal{A}_1$ so that $(X_1 \cdot X_2) \setminus B \in \mathcal{B}$. Hence

$$\forall B \in \mathcal{B} \text{ we have that } (X_1 \cdot X_2) \setminus B \in \mathcal{B} \quad (21.890)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{B}$ then $\{(A_i)_{[2,y]}\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_1$ so that $\bigcup_{i \in \mathbb{N}} (A_i)_{[2,y]} \in \mathcal{A}_1$. As by [lemma: 21.514] $(\bigcup_{i \in \mathbb{N}} A_i)_{[2,y]} = \bigcup_{i \in \mathbb{N}} (A_i)_{[2,y]}$ it follows that $(\bigcup_{i \in \mathbb{N}} A_i)_{[2,y]} \in \mathcal{A}_1$ hence $\bigcup_{i \in \mathbb{N}} A_i \in \mathcal{B}$. So

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{B} \text{ we have } \bigcup_{i \in \mathbb{N}} A_i \in \mathcal{B} \quad (21.891)$$

Combining [eqs: 21.889, 21.890, 21.891] proves that

$$\mathcal{B} \text{ is a } \sigma\text{-algebra on } X_1 \cdot X_2 \quad (21.892)$$

Let $E_1 \cdot E_2 \in \left\{ \prod_{i \in \{1,2\}} E_i \mid \forall i \in \{1,2\} E_i \in \mathcal{A}_i \right\}$ then $E_1 \in \mathcal{A}_1 \wedge E_2 \in \mathcal{A}_2$. Using [lemma: 21.514] we have then that $(A_1 \cdot A_2)_{[2,y]} = \left\{ \begin{array}{l} E_1 \in \mathcal{A}_1 \text{ if } x \in E_2 \\ \emptyset \in \mathcal{A}_1 \text{ if } x \in X_1 \setminus E_2 \end{array} \right\} \in \mathcal{A}_1$ so that $E_1 \cdot E_2 \in \mathcal{B}$. So we have proved that

$$\left\{ \prod_{i \in \{1,2\}} E_i \mid \forall i \in \{1,2\} E_i \in \mathcal{A}_i \right\} \subseteq \mathcal{B}$$

As by [corollary: 21.508] $\mathcal{A}_1 \otimes \mathcal{A}_2 = \sigma\left[\left\{ \prod_{i \in \{1,2\}} E_i \mid \forall i \in \{1,2\} E_i \in \mathcal{A}_i \right\}\right]$ we have using the above, [eq: 21.892] and [theorem: 21.39] that

$$\mathcal{A}_1 \otimes \mathcal{A}_2 \subseteq \mathcal{B}$$

Hence $\forall A \in \mathcal{A}_1 \otimes \mathcal{A}_2$ we have $A \in \mathcal{B}$ so that

$$A_{[2,y]} \in \mathcal{A}_1 \quad \square$$

Lemma 21.517. Let $\langle X_1, \mathcal{A}_1, \mu_1 \rangle, \langle X_2, \mathcal{A}_2, \mu_2 \rangle$ be two measure spaces where μ_1, μ_2 are finite measures then we have $\forall Q \in \mathcal{A}_1 \otimes \mathcal{A}_2$ that

1. $f_{1,Q}: X_1 \rightarrow \overline{\mathbb{R}}$ defined by $f_{1,Q}(x) = \mu_2(Q_{[1,x]})$ we have that $f_{1,Q} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$
2. $f_{2,Q}: X_2 \rightarrow \overline{\mathbb{R}}$ defined by $f_{2,Q}(x) = \mu_1(Q_{[2,x]})$ we have that $f_{2,Q} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$

Note 21.518. As μ_1, μ_2 are finite measures it follows that $f_{1,Q}(X_1) \subseteq [0, \infty[\wedge f_{2,Q}(X_2) \subseteq [0, \infty[$

Proof. We use the concept of Dynkin systems to prove this theorem.

1. Let $x \in X_1$ then we have $f_{1, X_1 \cdot X_2}(x) = \mu_2((X_1 \cdot X_2)_{[1, x]}) \stackrel{[\text{lemma: 21.514}]}{=} \mu_2(X_2) \in \mathbb{R}$ so that

$$f_{1, X_1 \cdot X_2} = C_{\mu_2(X_2)} \quad (21.893)$$

which by [example: 21.217] proves that

$$f_{1, X_1 \cdot X_2} \in \mathcal{M}^+[X_1, \mathcal{A}_1, \mathbb{R}] \quad (21.894)$$

Let $A, B \in \mathcal{A}_1 \otimes \mathcal{A}_2$ then for $x \in X_1$ we have

$$\begin{aligned} f_{1, A \setminus B}(x) &= \mu_2((A \setminus B)_{[1, x]}) \\ &\stackrel{[\text{lemma: 21.514}]}{=} \mu_2(A_{[1, x]} \setminus B_{[1, x]}) \\ &\stackrel{[\text{theorem: 21.106}] \wedge \mu_2 \text{ is finite}}{=} \mu_2(A_{[1, x]}) - \mu_2(B_{[1, x]}) \\ &= f_{1, A}(x) - f_{1, B}(x) \\ &= (f_{1, A} - f_{1, B})(x) \end{aligned}$$

which proves that

$$\forall A, B \in \mathcal{A}_1 \otimes \mathcal{A}_2 \text{ we have } f_{1, A \setminus B} = f_{1, A} - f_{1, B} \quad (21.895)$$

In the special cases where $A = X_1 \cdot X_2$ the above becomes

$$\forall A \in \mathcal{A}_1 \otimes \mathcal{A}_2 \text{ then } f_{1, (X_1 \cdot X_2) \setminus A} = f_{1, X_1 \cdot X_2} - f_{1, A} \quad (21.896)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_1 \otimes \mathcal{A}_2$ be pairwise disjoint. Let $x \in X_1$ and $i, j \in \mathbb{N}$ with $i \neq j$ then we have $(A_i)_{[1, x]} \cap (A_j)_{[1, x]} \stackrel{[\text{lemma: 21.514}]}{=} (A_i \cap A_j)_{[1, x]} = \emptyset_{[1, x]} \stackrel{[\text{lemma: 21.514}]}{=} \emptyset$. Hence

$$\forall x \in X_1 \text{ we have } \{(A_i)_{[1, x]}\}_{i \in \mathbb{N}} \text{ is pairwise disjoint} \quad (21.897)$$

So for $x \in X_1$ we have

$$\begin{aligned} f_{1, \bigsqcup_{i \in \mathbb{N}} A_i}(x) &= \mu_2\left(\left(\bigsqcup_{i \in \mathbb{N}} A_i\right)_{[1, x]}\right) \\ &\stackrel{[\text{lemma: 21.514}]}{=} \mu_2\left(\bigsqcup_{i \in \mathbb{N}} (A_i)_{[1, x]}\right) \\ &\stackrel{[\text{eq: 21.897}] \wedge \mu_2 \text{ is a measure}}{=} \sum_{i=1}^{\infty} \mu_2((A_i)_{[1, x]}) \\ &= \sum_{i=1}^{\infty} f_{1, A_i}(x) \\ &= \left(\sum_{i=1}^{\infty} f_{1, A_i}\right)(x) \end{aligned}$$

which proves that

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_1 \otimes \mathcal{A}_2 \text{ pairwise disjoint we have } f_{1, \bigsqcup_{i \in \mathbb{N}} A_i} = \sum_{i=1}^{\infty} f_{1, A_i} \quad (21.898)$$

Define now

$$\mathcal{D} = \{D \in \mathcal{A}_1 \otimes \mathcal{A}_2 \mid f_{1, D} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]\}$$

Using [eq: 21.894] it follows that

$$X_1 \cdot X_2 \in \mathcal{D} \quad (21.899)$$

If $A \in \mathcal{D}$ then $f_{1, A} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$, further by [eq: 21.894] $f_{1, X_1 \cdot X_2} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$ so that by [theorem: 21.251] $f_{1, (X_1 \cdot X_2) \setminus A} \stackrel{[\text{eq: 21.896}]}{=} f_{1, X_1 \cdot X_2} - f_{1, A} \in [X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$. Hence

$$\forall A \in \mathcal{D} \text{ we have that } (X_1 \cdot X_2) \setminus A \in \mathcal{D} \quad (21.900)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{D}$ be pairwise disjoint then $\forall i \in \mathbb{N}$ we have that $f_{1,A_i} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$, as $\forall x \in X_1$ $f_{1,A_i}(x) = \mu_2(A_{[1,x]}) \in [0, \infty[$ it follows that $f_{1,A_i} \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$. Using Beppo's [theorem: 21.355] it follows that $\sum_{i=1}^{\infty} f_{1,A_i} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$, hence, as $f_{1,\bigsqcup_{i \in \mathbb{N}} A_i} \stackrel{[eq: 21.898]}{=} \sum_{i=1}^{\infty} f_{1,A_i}$, it follows that $\bigsqcup_{i \in \mathbb{N}} A_i \in \mathcal{D}$. To summarize

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{D} \text{ pairwise disjoint we have } \bigsqcup_{i \in \mathbb{N}} A_i \in \mathcal{D} \quad (21.901)$$

By [eqs: 21.899, 21.900, 21.901] it follows by [definition: 21.117] that

$$\mathcal{D} \text{ is a Dynkin system} \quad (21.902)$$

Take

$$\mathcal{E} = \left\{ \prod_{i \in \{1,2\}} E_i \mid \forall i \in \{1,2\} \ E_i \in \mathcal{A}_i \right\} \stackrel{[theorem: 21.507]}{\subseteq} \mathcal{A}_1 \otimes \mathcal{A}_2$$

Let $E = E_1 \cdot E_2 \in \mathcal{E}$ then $\forall x \in X_1$ we have either:

$x \in E_1$. Then by [lemma: 21.514] we have that $(E_1 \cdot E_2)_{[1,x]} = E_2$ so that

$$f_{1,E_1 \cdot E_2}(x) = \mu_2((E_1 \cdot E_2)_{[1,x]}) = \mu_2(E_2) = \mu_2(E_2) \cdot \mathcal{X}_{X_1, E_1}(x)$$

$x \in X_1 \setminus E_1$. Then [lemma: 21.514] we have that $(E_1 \cdot E_2)_{[1,x]} = \emptyset$ so that

$$f_{1,E_1 \cdot E_2}(x) = \mu_2((E_1 \cdot E_2)_{[1,x]}) = \mu_2(0) = \mu_2(E_2) \cdot \mathcal{X}_{X_1, E_1}(x)$$

hence we have that

$$f_{1,E_1 \cdot E_2} = \mu_2(E_2) \cdot \mathcal{X}_{X_1, E_1}$$

As $E_1 \in \mathcal{A}_1$ it follows from [theorems: 21.258, 21.249] that

$$f_{1,E_1 \cdot E_2} = \mu_2(E_2) \cdot \mathcal{X}_{X_1, E_1} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$$

which proves that $E = E_1 \cdot E_2 \in \mathcal{D}$. Hence we have proved that

$$\mathcal{E} \subseteq \mathcal{D} \quad (21.903)$$

If $E = E_1 \cdot E_2, F = F_1 \cdot F_2 \in \mathcal{E}$ then we have that $E_1, F_1 \in \mathcal{A}_1$ and $E_2, F_2 \in \mathcal{A}_2$ then we have

$$E \bigcap F \stackrel{[theorem: 2.142]}{=} (E_1 \bigcap F_1) \cdot (E_2 \bigcap F_2)$$

which, as $E_1 \bigcap F_1 \in \mathcal{A}_1, E_2 \bigcap F_2 \in \mathcal{A}_2$, proves that $E \bigcap F \in \mathcal{E}$. Hence we have

$$\forall E, F \in \mathcal{E} \text{ we have } E \bigcap F \in \mathcal{E} \quad (21.904)$$

Using then [theorem: 21.124] on [eq: 21.903, 21.904] gives

$$\mathcal{A}_1 \otimes \mathcal{A}_2 = \sigma \left[\prod_{i \in \{1,2\}} E_i \mid \forall i \in \{1,2\} \ E_i \in \mathcal{A}_i \right] = \sigma[\mathcal{E}] = \delta[\mathcal{E}]$$

As $\mathcal{E} \subseteq \mathcal{D}$ and $\mathcal{D}$ is a Dynkin system [see eq: 21.902] we have by [theorem: 21.122] that $\delta[\mathcal{E}] \subseteq \mathcal{D}$ so that $\mathcal{A}_1 \otimes \mathcal{A}_2 \subseteq \mathcal{D}$. Hence we have that

$$\forall Q \in \mathcal{A}_1 \otimes \mathcal{A}_2 \text{ we have } Q \in \mathcal{D} \text{ so that } f_{1,Q} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$$

2. Let $x \in X_2$ then we have $f_{2,X_1 \cdot X_2}(x) = \mu_1((X_1 \cdot X_2)_{[2,x]}) \stackrel{[lemma: 21.514]}{=} \mu_1(X_1) \in \mathbb{R}$ so that

$$f_{2,X_1 \cdot X_2} = C_{\mu_1(X_1)} \quad (21.905)$$

which by [example: 21.217] proves that

$$f_{2,X_1 \cdot X_2} \in \mathcal{M}^+[X_2, \mathcal{A}_2, \mathbb{R}] \quad (21.906)$$

Let $A, B \in \mathcal{A}_1 \otimes \mathcal{A}_2$ then for $x \in X_2$ we have

$$\begin{aligned}
 f_{2, A \setminus B}(x) &= \mu_2((A \setminus B)_{[2, x]}) \\
 &\stackrel{[\text{lemma: 21.514}]}{=} \mu_2(A_{[2, x]} \setminus B_{[2, x]}) \\
 &\stackrel{[\text{theorem: 21.106}] \wedge \mu_1 \text{ is finite}}{=} \mu_2(A_{[2, x]}) - \mu_2(B_{[2, x]}) \\
 &= f_{2, A}(x) - f_{2, B}(x) \\
 &= (f_{2, A} - f_{2, B})(x)
 \end{aligned}$$

which proves that

$$\forall A, B \in \mathcal{A}_1 \otimes \mathcal{A}_2 \text{ we have } f_{2, A \setminus B} = f_{2, A} - f_{2, B} \quad (21.907)$$

In the special cases where $A = X_1 \cdot X_2$ the above becomes

$$\forall A \in \mathcal{A}_1 \otimes \mathcal{A}_2 \text{ then } f_{2, (X_1 \cdot X_2) \setminus A} = f_{2, X_1 \cdot X_2} - f_{2, A} \quad (21.908)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_1 \otimes \mathcal{A}_2$ be pairwise disjoint. Let $x \in X_2$ and $i, j \in \mathbb{N}$ with $i \neq j$ then we have $(A_i)_{[2, x]} \cap (A_j)_{[2, x]} \stackrel{[\text{lemma: 21.514}]}{=} (A_i \cap A_j)_{[2, x]} = \emptyset_{[2, x]} \stackrel{[\text{lemma: 21.514}]}{=} \emptyset$. Hence

$$\forall x \in X_2 \text{ we have } \{(A_i)_{[1, x]}\}_{i \in \mathbb{N}} \text{ is pairwise disjoint} \quad (21.909)$$

So for $x \in X_2$ we have

$$\begin{aligned}
 f_{2, \bigsqcup_{i \in \mathbb{N}} A_i}(x) &= \mu_1\left(\left(\bigsqcup_{i \in \mathbb{N}} A_i\right)_{[2, x]}\right) \\
 &\stackrel{[\text{lemma: 21.514}]}{=} \mu_1\left(\bigsqcup_{i \in \mathbb{N}} (A_i)_{[2, x]}\right) \\
 &\stackrel{[\text{eq: 21.909}] \wedge \mu_1 \text{ is a measure}}{=} \sum_{i=1}^{\infty} \mu_1((A_i)_{[1, x]}) \\
 &= \sum_{i=1}^{\infty} f_{2, A_i}(x) \\
 &= \left(\sum_{i=1}^{\infty} f_{2, A_i}\right)(x)
 \end{aligned}$$

which proves that

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_1 \otimes \mathcal{A}_2 \text{ pairwise disjoint we have } f_{2, \bigsqcup_{i \in \mathbb{N}} A_i} = \sum_{i=1}^{\infty} f_{2, A_i} \quad (21.910)$$

Define now

$$\mathcal{D} = \{D \in \mathcal{A}_1 \otimes \mathcal{A}_2 \mid f_{2, D} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]\}$$

Using [eq: 21.906] it follows that

$$X_1 \cdot X_2 \in \mathcal{D} \quad (21.911)$$

If $A \in \mathcal{D}$ then $f_{2, A} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$, further by [eq: 21.906] $f_{2, X_1 \cdot X_2} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$ so that by [theorem: 21.251] $f_{2, (X_1 \cdot X_2) \setminus A} \stackrel{[\text{eq: 21.908}]}{=} f_{2, X_1 \cdot X_2} - f_{2, A} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$. Hence

$$\forall A \in \mathcal{D} \text{ we have that } (X_1 \cdot X_2) \setminus A \in \mathcal{D} \quad (21.912)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{D}$ be pairwise disjoint then $\forall i \in \mathbb{N}$ we have that $f_{2, A_i} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$, as $\forall x \in X_2$ $f_{2, A_i}(x) = \mu_1(A_{[2, x]}) \in [0, \infty[$ it follows that $f_{2, A_i} \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$. Using Beppo's [theorem: 21.355] it follows that $\sum_{i=1}^{\infty} f_{2, A_i} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$, hence, as $f_{2, \bigsqcup_{i \in \mathbb{N}} A_i} \stackrel{[\text{eq: 21.912}]}{=} \sum_{i=1}^{\infty} f_{2, A_i}$, it follows that $\bigsqcup_{i \in \mathbb{N}} A_i \in \mathcal{D}$. To summarize

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{D} \text{ pairwise disjoint we have } \bigsqcup_{i \in \mathbb{N}} A_i \in \mathcal{D} \quad (21.913)$$

By [eqs: 21.911, 21.912, 21.913] it follows by [definition: 21.117] that

$$\mathcal{D} \text{ is a Dynkin system} \quad (21.914)$$

Take

$$\mathcal{E} = \left\{ \prod_{i \in \{1,2\}} E_i \mid \forall i \in \{1,2\} \ E_i \in \mathcal{A}_i \right\} \underset{[\text{theorem: 21.507}]}{\subseteq} \mathcal{A}_1 \otimes \mathcal{A}_2$$

Let $E = E_1 \cdot E_2 \in \mathcal{E}$ then $\forall x \in X_2$ we have either:

$x \in E_2$. Then by [lemma: 21.514] we have that $(E_1 \cdot E_2)_{[2,x]} = E_1$ so that

$$f_{2,E_1 \cdot E_2}(x) = \mu_1((E_1 \cdot E_2)_{[2,x]}) = \mu_1(E_1) = \mu_1(E_1) \cdot \mathcal{X}_{X_2, E_2}(x)$$

$x \in X_2 \setminus E_2$. Then [lemma: 21.514] we have that $(E_1 \cdot E_2)_{[2,x]} = \emptyset$ so that

$$f_{2,E_1 \cdot E_2}(x) = \mu_1((E_1 \cdot E_2)_{[2,x]}) = \mu_1(\emptyset) = \mu_1(E_1) \cdot \mathcal{X}_{X_2, E_2}(x)$$

hence we have that

$$f_{2,E_1 \cdot E_2} = \mu_1(E_1) \cdot \mathcal{X}_{X_2, E_2}$$

As $E_1 \in \mathcal{A}_1$ it follows from [theorems: 21.258, 21.249] that

$$f_{2,E_1 \cdot E_2} = \mu_1(E_1) \cdot \mathcal{X}_{X_2, E_2} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$$

which proves that $E = E_1 \cdot E_2 \in \mathcal{D}$. Hence we have proved that

$$\mathcal{E} \subseteq \mathcal{D} \quad (21.915)$$

If $E = E_1 \cdot E_2, F = F_1 \cdot F_2 \in \mathcal{E}$ then we have that $E_1, F_1 \in \mathcal{A}_1$ and $E_2, F_2 \in \mathcal{A}_2$ then we have

$$E \bigcap F \underset{[\text{theorem: 2.142}]}{=} (E_1 \bigcap F_1) \cdot (E_2 \bigcap F_2)$$

which, as $E_1 \bigcap F_1 \in \mathcal{A}_1, E_2 \bigcap F_2 \in \mathcal{A}_2$, proves that $E \bigcap F \in \mathcal{E}$. Hence we have

$$\forall E, F \in \mathcal{E} \text{ we have } E \bigcap F \in \mathcal{E} \quad (21.916)$$

Using then [theorem: 21.124] on [eq: 21.915, 21.916] gives

$$\mathcal{A}_1 \otimes \mathcal{A}_2 = \sigma \left[\prod_{i \in \{1,2\}} E_i \mid \forall i \in \{1,2\} \ E_i \in \mathcal{A}_i \right] = \sigma[\mathcal{E}] = \delta[\mathcal{E}]$$

As $\mathcal{E} \subseteq \mathcal{D}$ and $\mathcal{D}$ is a Dynkin system [see eq: 21.914] we have by [theorem: 21.122] that $\delta[\mathcal{E}] \subseteq \mathcal{D}$ so that $\mathcal{A}_1 \otimes \mathcal{A}_2 \subseteq \mathcal{D}$. Hence we have that

$$\forall Q \in \mathcal{A}_1 \otimes \mathcal{A}_2 \text{ we have } Q \in \mathcal{D} \text{ so that } f_{2,Q} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}] \quad \square$$

We extend now the previous lemma to the case of σ -finite measures.

Lemma 21.519. *Let $\langle X_1, \mathcal{A}_1, \mu_1 \rangle, \langle X_2, \mathcal{A}_2, \mu_2 \rangle$ be two measure spaces where μ_1, μ_2 are σ -finite measures [see definition: measures] then we have $\forall Q \in \mathcal{A}_1 \otimes \mathcal{A}_2$ that*

1. $f_{1,Q}: X_1 \rightarrow \overline{\mathbb{R}}$ defined by $f_{1,Q}(x) = \mu_2(Q_{[1,x]})$ we have that $f_{1,Q} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$
2. $f_{2,Q}: X_2 \rightarrow \overline{\mathbb{R}}$ defined by $f_{2,Q}(x) = \mu_1(Q_{[2,x]})$ we have that $f_{2,Q} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$

Proof.

1. As μ_2 is σ -finite it follows from [definition: 21.100] and [theorem: 21.99] that there exist a sequence $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_2$ such that $\forall i \in \mathbb{N} \ A_i \subseteq A_{i+1}, \mu_2(A_i) < \infty$ and $X_2 = \bigcup_{i \in \mathbb{N}} A_i$. Let $i \in \mathbb{N}$ and define the measure [see theorem: 21.101(2)]

$$\mu_{i,2}: \mathcal{A}_2 \rightarrow [0, \infty] \text{ by } \mu_{i,2}(A) = \mu_2(A_i \bigcap A) \leq \mu_2(A_i) < \infty \quad (21.917)$$

then μ_2 is a finite measure and we can apply the previous lemma [lemma: 21.517] which proves that $\forall Q \in \mathcal{A}_1 \otimes \mathcal{A}_2$ we have for the function

$$f_{i,1,Q}: X_1 \rightarrow \overline{\mathbb{R}} \text{ defined by } f_{i,1,Q}(x) = \mu_{2,i}(Q_{[1,x]}) \underset{\text{eq: 21.917}}{=} \mu_2(A_i \cap Q_{[1,x]}) \quad (21.918)$$

that

$$f_{i,1,Q} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \quad (21.919)$$

Let $Q \in \mathcal{A}_1 \otimes \mathcal{A}_2$ and take $x \in X_1$ then we have for $\{A_i \cap Q_{[1,x]}\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_2$ that $\forall i \in \mathbb{N}$ $A_i \cap Q_{[1,x]} \subseteq A_{i+1} \cap Q_{[1,x]}$ and $Q_{[1,x]} = X_2 \cap Q_{[1,x]} = (\bigcup_{i \in \mathbb{N}} A_i) \cap Q_{[1,x]} = \bigcup_{i \in \mathbb{N}} (A_i \cap Q_{[1,x]})$. Using then [theorem: 21.109] it follows that

$$\mu_2(Q_{[1,x]}) = \sup(\{\mu_2(A_i \cap Q_{[1,x]}) | i \in \mathbb{N}\}) \underset{\text{eq: 21.918}}{=} \sup(\{f_{i,1,Q}(x) | i \in \mathbb{N}\}) \quad (21.920)$$

Define now

$$f_{1,Q}: X_1 \rightarrow \overline{\mathbb{R}} \text{ by } f_{1,Q}(x) = \mu_2(Q_{[1,x]})$$

then we have by [eq: 21.920] that $f_{1,Q}(x) = \sup(\{f_{i,1,Q}(x) | i \in \mathbb{N}\})$, hence

$$f_{1,Q} = \sup(\{f_{i,1,Q} | i \in \mathbb{N}\})$$

As $\forall i \in \mathbb{N}$ $f_{i,1,Q} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$ it follows using [theorem: 21.254] that

$$f_{1,Q} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$$

2. As μ_1 is σ -finite it follows from [definition: 21.100] and [theorem: 21.99] that there exist a sequence $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_1$ such that $\forall i \in \mathbb{N}$ $A_i \subseteq A_{i+1}$, $\mu_1(A_i) < \infty$ and $X_1 = \bigcup_{i \in \mathbb{N}} A_i$. Let $i \in \mathbb{N}$ and define the measure [see theorem: 21.101(2)]

$$\mu_{i,1}: \mathcal{A}_1 \rightarrow [0, \infty] \text{ by } \mu_{i,1}(A) = \mu_1(A_i \cap A) \leq \mu_1(A_i) < \infty \quad (21.921)$$

then μ_2 is a finite measure and we can apply the previous lemma [lemma: 21.517] which proves that $\forall Q \in \mathcal{A}_1 \otimes \mathcal{A}_2$ we have for the function

$$f_{i,2,Q}: X_1 \rightarrow \overline{\mathbb{R}} \text{ defined by } f_{i,2,Q}(x) = \mu_{2,i}(Q_{[2,x]}) \underset{\text{eq: 21.921}}{=} \mu_2(A_i \cap Q_{[2,x]}) \quad (21.922)$$

that

$$f_{i,2,Q} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}] \quad (21.923)$$

Let $Q \in \mathcal{A}_1 \otimes \mathcal{A}_2$ and take $x \in X_2$ then we have for $\{A_i \cap Q_{[2,x]}\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_1$ that $\forall i \in \mathbb{N}$ $A_i \cap Q_{[2,x]} \subseteq A_{i+1} \cap Q_{[2,x]}$ and $Q_{[2,x]} = X_1 \cap Q_{[2,x]} = (\bigcup_{i \in \mathbb{N}} A_i) \cap Q_{[2,x]} = \bigcup_{i \in \mathbb{N}} (A_i \cap Q_{[2,x]})$. Using then [theorem: 21.109] it follows that

$$\mu_1(Q_{[2,x]}) = \sup(\{\mu_1(A_i \cap Q_{[2,x]}) | i \in \mathbb{N}\}) \underset{\text{eq: 21.922}}{=} \sup(\{f_{i,2,Q}(x) | i \in \mathbb{N}\}) \quad (21.924)$$

Define now

$$f_{2,Q}: X_2 \rightarrow \overline{\mathbb{R}} \text{ by } f_{2,Q}(x) = \mu_1(Q_{[2,x]})$$

then we have by [eq: 21.924] that $f_{2,Q}(x) = \sup(\{f_{i,2,Q}(x) | i \in \mathbb{N}\})$, hence

$$f_{2,Q} = \sup(\{f_{i,2,Q} | i \in \mathbb{N}\})$$

As $\forall i \in \mathbb{N}$ $f_{i,2,Q} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$ it follows using [theorem: 21.254] that

$$f_{2,Q} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}] \quad \square$$

In the following we use the following convention to simplify notation

Convention 21.520. Let $\langle X, \mathcal{A}, \mu \rangle$ be a measurable space then we use the following simplifying conventions

1. The notation

$$\int^+ E(x) \mu(dx)$$

is equivalent with saying that for the function defined by

$$f: X \rightarrow \overline{\mathbb{R}} \text{ where } f(x) = E(x)$$

we have that

$$f \in \mathcal{M}^+[X, A, \overline{\mathbb{R}}]$$

and

$$\int^+ E(x) \mu(dx) = \int f d\mu$$

2. The notation

$$\int E(x) \mu(dx)$$

is equivalent with saying that for the function defined by

$$f: X \rightarrow \overline{\mathbb{R}} \text{ where } f(x) = E(x)$$

we have that

$$f \in \mathcal{L}[X, A, \mu, \overline{\mathbb{R}}]$$

and

$$\int E(x) \mu(dx) = \int f d\mu$$

3. The notation

$$\int^{\mathbb{C}} E(x) \mu(dx)$$

is equivalent with saying that for the function defined by

$$f: X \rightarrow \mathbb{C} \text{ where } f(x) = E(x)$$

we have that

$$f \in \mathcal{L}[X, \mathcal{A}, \mu, \mathbb{C}]$$

and

$$\int^{\mathbb{C}} E(x) \mu(dx) = \int^{\mathbb{C}} f d\mu$$

Theorem 21.521. Let $\langle X_1, \mathcal{A}_1, \mu_1 \rangle, \langle X_2, \mathcal{A}_2, \mu_2 \rangle$ be two measure spaces where μ_1, μ_2 are **σ -finite** then there exist a measure

$$\mu_1 \otimes \mu_2: \mathcal{A}_1 \otimes \mathcal{A}_2 \rightarrow [0, \infty]$$

such that:

$$\mu_1 \otimes \mu_2 \text{ is } \sigma\text{-finite}$$

$$\forall A_1 \in \mathcal{A}_1, \forall A_2 \in \mathcal{A}_2 \text{ we have } (\mu_1 \otimes \mu_2)(A_1 \cdot A_2) = \mu_1(A_1) \cdot \mu_2(A_2)$$

and

$$\forall Q \in \mathcal{A}_1 \otimes \mathcal{A}_2 \text{ we have } (\mu_1 \otimes \mu_2)(Q) = \int^+ \mu_2(Q_{[1,x]}) \mu_1(dx) = \int^+ \mu_1(Q_{[2,x]}) \mu_2(dx)$$

Further if there exist another measure

$$\pi: \mathcal{A}_1 \otimes \mathcal{A}_2 \rightarrow [0, \infty]$$

such that

$$\forall A_1 \in \mathcal{A}_1, \forall A_2 \in \mathcal{A}_2 \text{ we have } \pi(A_1 \cdot A_2) = \mu_1(A_1) \cdot \mu_2(A_2)$$

then

$$\pi = \mu_1 \otimes \mu_2$$

The measure $\mu_1 \otimes \mu_2$ on $\mathcal{A}_1 \otimes \mathcal{A}_2$ is called the product measure of μ_1 and μ_2 .

Note 21.522. Let $A_1 \in \mathcal{A}_1, A_2 \in \mathcal{A}_2$ then by [theorem: 21.507] $A_1 \cdot A_2 \in \mathcal{A}_1 \otimes \mathcal{A}_2$ so that $(\mu_1 \otimes \mu_2)(A_1 \cdot A_2)$ is well defined.

Note 21.523. We use the previous convention [see convention: 21.520] here, so

$$\forall Q \in \mathcal{A}_1 \otimes \mathcal{A}_2 \text{ we have } (\mu_1 \otimes \mu_2)(Q) = \int^+ \mu_2(Q_{[1,x]}) \mu_1(dx) = \int^+ \mu_1(Q_{[2,x]}) \mu_2(dx)$$

in the above is equivalent with the following. For the functions

$$f_{1,Q}: X_1 \rightarrow \overline{\mathbb{R}} \text{ defined by } f_{1,Q}(x) = \mu_2(Q_{[1,x]})$$

$$f_{2,Q}: X_2 \rightarrow \overline{\mathbb{R}} \text{ defined by } f_{2,Q}(x) = \mu_1(Q_{[2,x]})$$

we have that

$$f_{1,Q} \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \wedge f_{2,Q} \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$$

and

$$(\mu_1 \otimes \mu_2)(A) = \int^+ f_{1,Q} d\mu_1 = \int^+ f_{2,Q} d\mu_2$$

Proof. Let $Q \in \mathcal{A}_1 \otimes \mathcal{A}_2$ and define

$$f_{1,Q}: X_1 \rightarrow \overline{\mathbb{R}} \text{ defined by } f_{1,Q}(x) = \mu_2(Q_{[1,x]})$$

$$f_{2,Q}: X_2 \rightarrow \overline{\mathbb{R}} \text{ defined by } f_{2,Q}(x) = \mu_1(Q_{[2,x]})$$

then by [lemma: 21.519] we have that

$$f_{1,Q} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \wedge f_{2,Q} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}] \quad (21.925)$$

As $\forall x \in X_1$ $f_{1,Q}(x) = \mu_2(Q_{[1,x]}) \in [0, \infty]$ and $\forall x \in X_2$ $f_{2,Q}(x) = \mu_1(Q_{[2,x]}) \in [0, \infty]$ it follows from the above that

$$f_{1,Q} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \wedge f_{2,Q} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}] \quad (21.926)$$

So we can define the function

$$(\mu_1 \otimes \mu_2): \mathcal{A}_1 \otimes \mathcal{A}_2 \rightarrow [0, \infty] \text{ by } (\mathcal{A}_1 \otimes \mathcal{A}_2)(Q) = \int^+ f_{1,Q} d\mu_1 \stackrel{\text{notation}}{=} \int^+ \mu_2(Q_{[1,x]}) \mu_1(dx) \quad (21.927)$$

Let $x \in X_1$ then $f_{1,\emptyset}(x) = \mu_2(\emptyset_{[1,x]}) \stackrel{[\text{theorem: 21.514}]}{=} \mu_2(\emptyset) = 0$ which proves that $f_{1,\emptyset} = C_0$. Applying then [theorem: 21.300] we have that $\int^+ f_{1,\emptyset} d\mu_1 = \int^+ C_0 d\mu_1 = 0 \cdot \mu_1(X_1) = 0$ which proves that

$$(\mu_1 \otimes \mu_2)(\emptyset) = 0 \quad (21.928)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_1 \otimes \mathcal{A}_2$ be pairwise disjoint and take $x \in X_1$. Let $i, j \in \mathbb{N}$ with $i \neq j$ then

$$(A_i)_{[1,x]} \cap (A_j)_{[1,x]} \stackrel{[\text{theorem: 21.514}]}{=} (A_i \cap A_j)_{[1,x]} = \emptyset_{[1,x]} \stackrel{[\text{theorem: 21.514}]}{=} \emptyset$$

which proves that

$$\{(A_i)_{[1,x]}\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_2 \text{ is pairwise disjoint} \quad (21.929)$$

$$\begin{aligned} f_{1, \bigsqcup_{i \in \mathbb{N}} A_i}(x) &= \mu_2 \left(\left(\bigsqcup_{i \in \mathbb{N}} A_i \right)_{[1,x]} \right) \\ &\stackrel{[\text{theorem: 21.514}]}{=} \mu_2 \left(\bigsqcup_{i \in \mathbb{N}} (A_i)_{[1,x]} \right) \\ &\stackrel{[\text{eq: 21.929}]}{=} \sum_{i=1}^{\infty} \mu_2((A_i)_{[1,x]}) \\ &= \sum_{i=1}^{\infty} f_{1,A_i}(x) \end{aligned}$$

so that

$$f_{1, \bigsqcup_{i \in \mathbb{N}} A_i} = \sum_{i=1}^{\infty} f_{1, A_i}$$

Using the Beppo's Levi theorem [see theorem: 21.355] we have that

$$\sum_{i=1}^{\infty} f_{1, A_i} \in \mathcal{M}^+(X_1, \mathcal{A}_1, \overline{\mathbb{R}})$$

and

$$(\mu_1 \otimes \mu_2) \left(\bigsqcup_{i \in \mathbb{N}} A_i \right) = \int^+ f_{1, \bigsqcup_{i \in \mathbb{N}} A_i} d\mu_1 = \int^+ \left(\sum_{i=1}^{\infty} f_{1, A_i} \right) d\mu_1 = \sum_{i=1}^{\infty} \int^+ f_{1, A_i} d\mu_1 = \sum_{i=1}^{\infty} (\mu_1 \otimes \mu_2)(A_i)$$

Hence we have

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_1 \otimes \mathcal{A}_2 \text{ pairwise disjoint then } (\mu_1 \otimes \mu_2) \left(\bigsqcup_{i \in \mathbb{N}} A_i \right) = \sum_{i=1}^{\infty} (\mu_1 \otimes \mu_2)(A_i)$$

The above together with [eq: 21.928] proves that $\mu_1 \otimes \mu_2$ is a measure on $\mathcal{A}_1 \otimes \mathcal{A}_2$. To summarize

$$(\mu_1 \otimes \mu_2): \mathcal{A}_1 \otimes \mathcal{A}_2 \rightarrow [0, \infty] \text{ defined by } (\mathcal{A}_1 \otimes \mathcal{A}_2)(Q) = \int^+ f_{1, Q} d\mu_1 \text{ is a measure on } \mathcal{A}_1 \otimes \mathcal{A}_2 \quad (21.930)$$

Let $A_1 \in \mathcal{A}_1$, $A_2 \in \mathcal{A}_2$ then we have for $x \in X_1$ that either:

$$x \in \mathbf{A}_1. \text{ Then } f_{1, A_1 \cdot A_2}(x) = \mu_2([A_1 \cdot A_2]_{[1, x]}) \stackrel{[\text{theorem: 21.514}]}{=} \mu_2(A_2) = \mu_2(A_2) \cdot \mathcal{X}_{X_1, A_1}(x)$$

$$x \in \mathbf{X}_1 \setminus \mathbf{A}_1. \text{ Then } f_{1, A_1 \cdot A_2}(x) = \mu_2([A_1 \cdot A_2]_{[1, x]}) \stackrel{[\text{theorem: 21.514}]}{=} \mu_2(\emptyset) = \mu_2(A_2) \cdot \mathcal{X}_{X_1, A_1}(x)$$

which proves that

$$f_{1, A_1 \cdot A_2} = \mu_2(A_2) \cdot \mathcal{X}_{X_1, A_1}$$

Then

$$\begin{aligned} (\mu_1 \otimes \mu_2)(A_1 \cdot A_2) &= \int^+ f_{1, A_1 \cdot A_2} d\mu_1 \\ &= \int^+ (\mu_2(A_2) \cdot \mathcal{X}_{X_1, A_1}) d\mu_1 \\ &\stackrel{[\text{example: 21.301}]}{=} \mu_2(A_2) \cdot \mu_1(A_1) \end{aligned}$$

To summarize we have

$$\forall A_1 \in \mathcal{A}_1, \forall A_2 \in \mathcal{A}_2 \text{ we have } (\mu_1 \otimes \mu_2)(A_1 \cdot A_2) = \mu_1(A_1) \cdot \mu_2(A_2) \quad (21.931)$$

Now if π is another measure on $\mathcal{A}_1 \otimes \mathcal{A}_2$ such that $\forall A_1 \in \mathcal{A}_1, \forall A_2 \in \mathcal{A}_2$ we have $\pi(A_1 \cdot A_2) = \pi_1(A_1) \cdot \pi(A_2)$ then by [corollary: 21.511]

$$\pi = \mu_1 \otimes \mu_2 \quad (21.932)$$

As μ_1, μ_2 are σ -finite there exist by [theorem: 21.99] there exist $\forall i \in \{1, 2\}$ a

$$\{E_{i, k}\}_{k \in \mathbb{N}} \subseteq \mathcal{A}_i \text{ with } \forall k \in \mathbb{N} \ E_{i, k} \subseteq E_{i, k+1} \wedge \mu(E_{i, k}) < \infty \text{ and } X_i = \bigcup_{k \in \mathbb{N}} E_{i, k} \quad (21.933)$$

Let $x = (x_1, x_2) \in X_1 \cdot X_2$ then $x_1 \in X_1 \wedge x_2 \in X_2$ then by the above there exist $k, l \in \mathbb{N}$ such that $x_1 \in E_{1, k} \wedge x_2 \in E_{2, l}$ so that $x = (x_1, x_2) \in E_{1, \max(k, l)} \cdot E_{2, \max(k, l)} \subseteq \bigcup_{k \in \mathbb{N}} (E_{1, k} \cdot E_{2, k})$. As also $\forall k \in \mathbb{N} \ E_{1, k} \cdot E_{2, k} \subseteq X_1 \cdot X_2$ it follows that

$$\bigcup_{k \in \mathbb{N}} E_{1, k} \cdot E_{2, k} = X_1 \cdot X_2 \quad (21.934)$$

Further $\forall k \in \mathbb{N}$ we have by [theorem: 21.507] that $E_{1, k} \cdot E_{2, k} \in \mathcal{A}_1 \otimes \mathcal{A}_2$ and by [eqs: 21.931, 21.933] that $(\mu_1 \otimes \mu_2)(E_{1, k} \cdot E_{2, k}) = \mu_1(E_{1, k}) \cdot \mu_2(E_{2, k}) < \infty$, hence, taking in account [eq: 21.934], we have

$$\mu_1 \otimes \mu_2 \text{ is } \sigma\text{-finite}$$

Finally the only thing left to prove is that $(\mu_1 \otimes \mu_2)(Q) = \int^+ \mu_1(Q_{[2,x]}) \mu_2(dx)$. Define now

$$\pi: \mathcal{A}_1 \otimes \mathcal{A}_2 \rightarrow [0, \infty] \text{ by } \pi(Q) = \int^+ f_{2,Q} d\mu_2 \stackrel{\text{notation}}{=} \int^+ \mu_1(Q_{[2,x]}) \mu_2(dx)$$

Let $x \in X_2$ then $f_{2,\emptyset}(x) = \mu_1(\emptyset_{[2,x]}) \stackrel{[\text{theorem: 21.514}]}{=} \mu_1(\emptyset) = 0$ which proves that $f_{2,\emptyset} = C_0$. Applying then [theorem: 21.300] we have that $\int^+ f_{2,\emptyset} d\mu_2 = \int^+ C_0 d\mu_2 = 0 \cdot \mu_2(X_2) = 0$ which proves that

$$\pi(\emptyset) = 0 \quad (21.935)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_1 \otimes \mathcal{A}_2$ be pairwise disjoint and take $x \in X_2$. Let $i, j \in \mathbb{N}$ with $i \neq j$ then

$$(A_i)_{[2,x]} \cap (A_j)_{[2,x]} \stackrel{[\text{theorem: 21.514}]}{=} (A_i \cap A_j)_{[2,x]} = \emptyset_{[2,x]} \stackrel{[\text{theorem: 21.514}]}{=} \emptyset$$

which proves that

$$\{(A_i)_{[2,x]}\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_1 \text{ is pairwise disjoint} \quad (21.936)$$

$$\begin{aligned} f_{2, \bigsqcup_{i \in \mathbb{N}} A_i}(x) &= \mu_1\left(\left(\bigsqcup_{i \in \mathbb{N}} A_i\right)_{[2,x]}\right) \\ &\stackrel{[\text{theorem: 21.514}]}{=} \mu_1\left(\bigsqcup_{i \in \mathbb{N}} (A_i)_{[2,x]}\right) \\ &\stackrel{[\text{eq: 21.936}]}{=} \sum_{i=1}^{\infty} \mu_2((A_i)_{[2,x]}) \\ &= \sum_{i=1}^{\infty} f_{2,A_i}(x) \end{aligned}$$

so that

$$f_{2, \bigsqcup_{i \in \mathbb{N}} A_i} = \sum_{i=1}^{\infty} f_{2,A_i}$$

Using the Beppo's Levi theorem [see theorem: 21.355] we have that

$$\sum_{i=1}^{\infty} f_{2,A_i} \in \mathcal{M}^+(X_2, \mathcal{A}_2, \overline{\mathbb{R}})$$

and

$$\pi\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) = \int^+ f_{2, \bigsqcup_{i \in \mathbb{N}} A_i} d\mu_2 = \int^+ \left(\sum_{i=1}^{\infty} f_{2,A_i}\right) d\mu_2 = \sum_{i=1}^{\infty} \int^+ f_{2,A_i} d\mu_2 = \sum_{i=1}^{\infty} \pi(A_i)$$

Hence we have

$$\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}_1 \otimes \mathcal{A}_2 \text{ pairwise disjoint then } \pi\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) = \sum_{i=1}^{\infty} \pi(A_i)$$

The above together with [eq: 21.936] proves that π is a measure on $\mathcal{A}_1 \otimes \mathcal{A}_2$. To summarize

$$\pi: \mathcal{A}_1 \otimes \mathcal{A}_2 \rightarrow [0, \infty] \text{ defined by } (\mathcal{A}_1 \otimes \mathcal{A}_2)(Q) = \int^+ f_{2,Q} d\mu_2 \text{ is a measure on } \mathcal{A}_1 \otimes \mathcal{A}_2 \quad (21.937)$$

Let $A_1 \in \mathcal{A}_1$, $A_2 \in \mathcal{A}_2$ then we have for $x \in X_2$ that either:

$$\mathbf{x} \in \mathbf{A}_2. \text{ Then } f_{2,A_1 \cdot A_2}(x) = \mu_1([A_1 \cdot A_2]_{[2,x]}) \stackrel{[\text{theorem: 21.514}]}{=} \mu_1(A_1) = \mu_1(A_1) \cdot \mathcal{X}_{X_2, A_2}(x)$$

$$\mathbf{x} \in \mathbf{X}_2 \setminus \mathbf{A}_2. \text{ Then } f_{2,A_1 \cdot A_2}(x) = \mu_1([A_1 \cdot A_2]_{[2,x]}) \stackrel{[\text{theorem: 21.514}]}{=} \mu_1(\emptyset) = \mu_1(A_1) \cdot \mathcal{X}_{X_2, A_2}(x)$$

which proves that

$$f_{2,A_1 \cdot A_2} = \mu_1(A_1) \cdot \mathcal{X}_{X_2, A_2}$$

Then

$$\begin{aligned}\pi(A_1 \cdot A_2) &= \int^+ f_{2,A_1 \cdot A_2} d\mu_2 \\ &= \int^+ (\mu_1(A_1) \cdot \mathcal{X}_{X_1, A_1}) d\mu_2 \\ &\stackrel{[\text{example: 21.301}]}{=} \mu_1(A_1) \cdot \mu_2(A_2)\end{aligned}$$

To summarize we have

$$\forall A_1 \in \mathcal{A}_1, \forall A_2 \in \mathcal{A}_2 \text{ we have } \pi(A_1 \cdot A_2) = \mu_1(A_1) \cdot \mu_2(A_2) \quad (21.938)$$

Hence using [eqs: 21.937, 21.938 and 21.932] we have that $\pi = \mu_1 \otimes \mu_2$ or using the definition of π that

$$\forall Q \in \mathcal{A}_1 \otimes \mathcal{A}_2 \text{ we have } (\mu_1 \otimes \mu_2) = \int^+ f_{2,A_1 \cdot A_2} d\mu_2 \stackrel{\text{notation}}{=} \int^+ \mu_1(Q_{[2,x]}) \mu_2(dx) \quad \square$$

Having defined product measures it is time to define the integral of product measures. First we define sections of functions.

Definition 21.524. Let X_1, X_2, Y be sets and $f: X_1 \times X_2 \rightarrow Y$ a function then we define:

1. $\forall x \in X_1$ $f(x, \cdot): X_2 \rightarrow Y$ where $f(x, \cdot)(y) = f(x, y)$
2. $\forall y \in X_2$ $f(\cdot, y): X_1 \rightarrow Y$ where $f(\cdot, y)(x) = f(x, y)$

We call $f(\cdot, x)$ and $f(x, \cdot)$ the sections of f .

Applying the above definition on characteristic function we have.

Lemma 21.525. Let X_1, X_2, Y be sets then we have:

1. $\forall Q \subseteq X_1 \cdot X_2$ we have $\forall x \in X_1$ that $(\mathcal{X}_{X_1 \cdot X_2, Q})(x, \cdot) = \mathcal{X}_{X_2, Q_{[1,x]}}$
2. $\forall Q \subseteq X_1 \cdot X_2$ we have $\forall y \in X_2$ that $(\mathcal{X}_{X_1 \cdot X_2, Q})(\cdot, y) = \mathcal{X}_{X_1, Q_{[2,y]}}$

Proof.

1. Let $y \in X_2$ then we have either:

$y \in Q_{[1,x]}$. Then $y \in \{y \in X_2 | (x, y) \in Q\}$ so that $(x, y) \in Q$ hence we have that

$$(\mathcal{X}_{X_1 \cdot X_2, Q})(x, \cdot)(y) = \mathcal{X}_{X_1 \cdot X_2, Q}(x, y) = 1 = \mathcal{X}_{X_2, Q_{[1,x]}}(y)$$

$y \in X_2 \setminus Q_{[1,x]}$. Then $y \notin \{y \in X_2 | (x, y) \in Q\}$ so that $(x, y) \notin Q$ hence

$$(\mathcal{X}_{X_1 \cdot X_2, Q})(x, \cdot)(y) = \mathcal{X}_{X_1 \cdot X_2, Q}(x, y) = 0 = \mathcal{X}_{X_2, Q_{[1,x]}}(y)$$

which proves that $(\mathcal{X}_{X_1 \cdot X_2, Q})(x, \cdot) = \mathcal{X}_{X_2, Q_{[1,x]}}$.

2. Let $x \in X_1$ then we have either:

$x \in Q_{[2,y]}$. Then $x \in \{x \in X_1 | (x, y) \in Q\}$ so that $(x, y) \in Q$ hence we have that

$$(\mathcal{X}_{X_1 \cdot X_2, Q})(\cdot, y)(x) = \mathcal{X}_{X_1 \cdot X_2, Q}(x, y) = 1 = \mathcal{X}_{X_1, Q_{[2,y]}}(x)$$

$x \in X_1 \setminus Q_{[2,y]}$. Then $x \notin \{x \in X_1 | (x, y) \in Q\}$ so that $(x, y) \notin Q$ hence

$$(\mathcal{X}_{X_1 \cdot X_2, Q})(\cdot, y)(x) = \mathcal{X}_{X_1 \cdot X_2, Q}(x, y) = 0 = \mathcal{X}_{X_1, Q_{[2,y]}}(x)$$

which proves that $(\mathcal{X}_{X_1 \cdot X_2, Q})(\cdot, y) = \mathcal{X}_{X_1, Q_{[2,y]}}$. $\square$

If we want to integrate the sections of a function we have to show that sections are measurable which is indeed the case as the following lemma shows.

Lemma 21.526. Let $\langle X_1, \mathcal{A}_1 \rangle, \langle X_2, \mathcal{A}_2 \rangle, \langle Y, \mathcal{B} \rangle$ be measurable spaces and

$$f: X_1 \cdot X_2 \rightarrow Y$$

a $\mathcal{A}_1 \otimes \mathcal{A}_2, \mathcal{B}$ -measurable function then:

1. $\forall x \in X_1$ $f(x, \cdot): X_2 \rightarrow Y$ is a $\mathcal{A}_2, \mathcal{B}$ -measurable function.
2. $\forall y \in X_2$ $f(\cdot, y): X_1 \rightarrow Y$ is a $\mathcal{A}_1, \mathcal{B}$ -measurable function.

Note 21.527. In particular if $\langle Y, \mathcal{B} \rangle = \langle \overline{\mathbb{R}}, \mathcal{B}[\overline{\mathbb{R}}] \rangle$ then we have

If $f \in \mathcal{M}[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have $\forall x \in X_1$ $f(x, \cdot) \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$ and $\forall x \in X_2$ $f(\cdot, x) \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$
 If $f \in \mathcal{M}^+[X, \mathcal{A}, \overline{\mathbb{R}}]$ we have $\forall x \in X_1$ $f(x, \cdot) \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$ and $\forall x \in X_2$ $f(\cdot, x) \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$

Proof.

1. Let $x \in X_1$ and $B \in \mathcal{B}$ then we have

$$\begin{aligned} y \in (f(x, \cdot))^{-1}(B) &\Leftrightarrow f(x, \cdot)(y) \in B \\ &\Leftrightarrow f(x, y) \in B \\ &\Leftrightarrow (x, y) \in f^{-1}(B) \\ &\Leftrightarrow y \in \{y \in X_2 \mid (x, y) \in f^{-1}(B)\} \\ &\Leftrightarrow y \in (f^{-1}(B))_{[1, x]} \end{aligned}$$

which proves that

$$(f(x, \cdot))^{-1}(B) = (f^{-1}(B))_{[1, x]}$$

As f is $\mathcal{A}_1 \otimes \mathcal{A}_2, \mathcal{B}$ -measurable it follows that $f^{-1}(B) \in \mathcal{A}_1 \otimes \mathcal{A}_2$ so that by [lemma: 21.515] it follows that $(f^{-1}(B))_{[1, x]} \in \mathcal{A}_2$. Hence we have by definition that

$$f(x, \cdot) \text{ is } \mathcal{A}_2, \mathcal{B}\text{-measurable}$$

2. Let $y \in X_2$ and $B \in \mathcal{B}$ then we have

$$\begin{aligned} x \in (f(\cdot, y))^{-1}(B) &\Leftrightarrow f(\cdot, y)(x) \in B \\ &\Leftrightarrow f(x, y) \in B \\ &\Leftrightarrow (x, y) \in f^{-1}(B) \\ &\Leftrightarrow x \in \{x \in X_1 \mid (x, y) \in f^{-1}(B)\} \\ &\Leftrightarrow x \in (f^{-1}(B))_{[2, y]} \end{aligned}$$

which proves that

$$(f(\cdot, y))^{-1}(B) = (f^{-1}(B))_{[2, y]}$$

As f is $\mathcal{A}_1 \otimes \mathcal{A}_2, \mathcal{B}$ -measurable it follows that $f^{-1}(B) \in \mathcal{A}_1 \otimes \mathcal{A}_2$ so that by [lemma: 21.515] it follows that $(f^{-1}(B))_{[2, y]} \in \mathcal{A}_1$. Hence we have by definition that

$$f(\cdot, y) \text{ is } \mathcal{A}_1, \mathcal{B}\text{-measurable} \quad \square$$

Lemma 21.528. Let $\langle X_1, \mathcal{A}_1, \mu_1 \rangle, \langle X_2, \mathcal{A}_2, \mu_2 \rangle$ be measurable spaces such that μ_1, μ_2 are σ -finite and

$$f \in \mathcal{S}^+[X_1 \cdot X_2, \mathcal{A}_1 \otimes \mathcal{A}_2] \text{ [see definition: 21.280]}$$

then

$$\forall x \in X_1 \text{ we have } f(x, \cdot) \in \mathcal{S}^+[X_2, \mathcal{A}_2] \text{ and } \forall x \in X_2 \text{ we have } f(\cdot, x) \in \mathcal{S}^+[X_1, \mathcal{A}_1]$$

and for the functions

$$I_{f,1}: X_1 \rightarrow \overline{\mathbb{R}} \text{ defined by } I_{f,1}(x) = \int^S f(x, \cdot) d\mu_2 \underset{\text{[theorem: 21.299]}}{=} \int^+ f(x, \cdot) d\mu_2$$

$$I_{f,2}: X_2 \rightarrow \overline{\mathbb{R}} \text{ defined by } I_{f,2}(x) = \int^S f(\cdot, x) d\mu_1 \underset{\text{[theorem: 21.299]}}{=} \int^+ f(\cdot, x) d\mu_1$$

we have

$$I_{f,1} \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \wedge I_{f,2} \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$$

and

$$f \in \mathcal{M}^+[X_1 \cdot X_2, \mathcal{A}_1 \otimes \mathcal{A}_2, \overline{\mathbb{R}}]$$

$$\int^+ f d(\mu_1 \otimes \mu_2) = \int^+ I_{f,1} d\mu_1 = \int^+ I_{f,2} d\mu_2$$

Proof. As $f \in \mathcal{S}^+[X_1 \cdot X_2, \mathcal{A}_1 \otimes \mathcal{A}_2]$ there exist by [definition: 21.288] a $n \in \mathbb{N}$, $\{f_i\}_{i \in \{1, \dots, n\}} \subseteq [0, \infty[$ and $\{A_i\}_{i \in \{1, \dots, n\}} \subseteq \mathcal{A}_1 \otimes \mathcal{A}_2$ such that

$$f = \sum_{i=1}^n f_i \cdot \mathcal{X}_{X_1 \cdot X_2, A_i}$$

and

$$\int^S f d(\mu_1 \otimes \mu_2) = \sum_{i=1}^n f_i \cdot (\mu_1 \otimes \mu_2)(A_i) \quad (21.939)$$

Let $x \in X_1$ then we have $\forall y \in X_2$ that

$$\begin{aligned} f(x, \cdot)(y) &= \left(\sum_{i=1}^n f_i \cdot \mathcal{X}_{X_1 \cdot X_2, A_i} \right)(x, \cdot)(y) \\ &= \left(\sum_{i=1}^n f_i \cdot \mathcal{X}_{X_1 \cdot X_2, A_i} \right)(x, y) \\ &= \sum_{i=1}^n f_i \cdot \mathcal{X}_{X_1 \cdot X_2, A_i}(x, y) \\ &= \sum_{i=1}^n f_i \cdot (\mathcal{X}_{X_1 \cdot X_2, A_i})(x, \cdot)(y) \\ &\stackrel{[\text{lemma: 21.525}]}{=} \sum_{i=1}^n f_i \cdot \mathcal{X}_{X_2, (A_i)_{[1, x]}}(y) \\ &= \left(\sum_{i=1}^n f_i \cdot \mathcal{X}_{X_2, (A_i)_{[1, x]}} \right)(y) \end{aligned}$$

Likewise if $x \in X_2$ then we have $\forall y \in X_1$ that

$$\begin{aligned} f(\cdot, x)(y) &= \left(\sum_{i=1}^n f_i \cdot \mathcal{X}_{X_1 \cdot X_2, A_i} \right)(\cdot, x)(y) \\ &= \left(\sum_{i=1}^n f_i \cdot \mathcal{X}_{X_1 \cdot X_2, A_i} \right)(y, x) \\ &= \sum_{i=1}^n f_i \cdot \mathcal{X}_{X_1 \cdot X_2, A_i}(y, x) \\ &= \sum_{i=1}^n f_i \cdot (\mathcal{X}_{X_1 \cdot X_2, A_i})(\cdot, x)(y) \\ &\stackrel{[\text{lemma: 21.525}]}{=} \sum_{i=1}^n f_i \cdot \mathcal{X}_{X_1, (A_i)_{[2, x]}}(y) \\ &= \left(\sum_{i=1}^n f_i \cdot \mathcal{X}_{X_1, (A_i)_{[2, x]}} \right)(y) \end{aligned}$$

Hence we have that

$$\forall x \in X_1 \text{ we have that } f(x, \cdot) = \sum_{i=1}^n f_i \cdot \mathcal{X}_{X_2, (A_i)_{[1, x]}} \quad (21.940)$$

$$\forall x \in X_2 \text{ we have that } f(\cdot, x) = \sum_{i=1}^n f_i \cdot \mathcal{X}_{X_1, (A_i)_{[2, x]}} \quad (21.941)$$

Using [lemma: 21.515] we have $\forall i \in \{1, \dots, n\}$ that $\forall x \in X_1 (A_i)_{[1, z]} \in \mathcal{A}_2$ and $\forall x \in X_2 (A_i)_{[2, x]} \in \mathcal{A}_1$ which proves by [theorem: 21.284] that

$$f(x, \cdot) \in \mathcal{S}^+[X_2, \mathcal{A}_2] \text{ and } f(\cdot, x) \in \mathcal{S}^+[X_1, \mathcal{A}_1] \quad (21.942)$$

Using the definition of the integral of simple functions we have then that

$$\forall x \in X_1 \text{ we have that } I_{f,1}(x) = \int^S f(x, \cdot) d\mu_2 = \sum_{i=1}^n f_i \cdot \mu_2((A_i)_{[1, x]}) \quad (21.943)$$

$$\forall x \in X_2 \text{ we have that } I_{f,2}(x) = \int^S f(\cdot, x) d\mu_1 = \sum_{i=1}^n f_i \cdot \mu_1((A_i)_{[2, x]}) \quad (21.944)$$

Define

$$f_{1,A_i}: X_1 \rightarrow \overline{\mathbb{R}} \text{ where } f_{1,A_i}(x) = \mu_2((A_i)_{[1, x]}) \quad (21.945)$$

$$f_{2,A_i}: X_2 \rightarrow \overline{\mathbb{R}} \text{ where } f_{2,A_i}(x) = \mu_1((A_i)_{[2, x]}) \quad (21.946)$$

then we have

$$I_{f,1} = \sum_{i=1}^n f_i \cdot f_{1,A_i} \text{ and } I_{f,2} = \sum_{i=1}^n f_i \cdot f_{2,A_i} \quad (21.947)$$

Using [theorem: 21.521] we have that $\forall i \in \{1, \dots, n\}$

$$f_{1,A_i} \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \wedge f_{2,A_i} \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}] \quad (21.948)$$

and

$$(\mu_1 \otimes \mu_2)(A_i) = \int^+ f_{1,A_i} d\mu_1 = \int^+ f_{2,A_i} d\mu_2 \quad (21.949)$$

Using then [theorems: 21.313, 21.314] on the above equations [eqs: 21.947, 21.948, 21.949] that

$$I_{f,1} \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \wedge I_{f,2} \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$$

and

$$\begin{aligned} \int^+ I_{f,1} d\mu_1 &= \sum_{i=1}^n f_i \cdot \int^+ f_{1,A_i} d\mu_1 = \sum_{i=1}^n f_i \cdot (\mu_1 \otimes \mu_2)(A_i) \\ \int^+ I_{f,2} d\mu_1 &= \sum_{i=1}^n \int^+ f_{2,A_i} d\mu_2 = \sum_{i=1}^n f_i \cdot (\mu_1 \otimes \mu_2)(A_i) \end{aligned}$$

Combining the above with [eq: 21.939] we have that

$$\int^S f d(\mu_1 \otimes \mu_2) = \int^+ I_{f,1} d\mu_1 = \int^+ I_{f,2} d\mu_2$$

Finally using [theorem: 21.299] it follows that

$$f \in \mathcal{M}^+[X_1 \cdot X_2, \mathcal{A}_1 \otimes \mathcal{A}_2, \overline{\mathbb{R}}] \text{ and } \int^+ f d(\mu_1 \otimes \mu_2) = \int^+ I_{f,1} d\mu_1 = \int^+ I_{f,2} d\mu_2 \quad \square$$

Theorem 21.529. (Tonelli) Let $\langle X_1, \mathcal{A}_1, \mu_1 \rangle, \langle X_2, \mathcal{A}_2, \mu_2 \rangle$ be measurable spaces such that μ_1, μ_2 are σ -finite and

$$f: X_1 \cdot X_2 \rightarrow \overline{\mathbb{R}}$$

a function such that $f \in \mathcal{M}^+[X_1 \cdot X_2, \mathcal{A}_1 \otimes \mathcal{A}_2, \overline{\mathbb{R}}]$. Then we have for the functions

$$I_{f,1}: X_1 \rightarrow \overline{\mathbb{R}} \text{ defined by } I_{f,1}(x) = \int^+ f(x, \cdot) d\mu_2$$

$$I_{f,2}: X_2 \rightarrow \overline{\mathbb{R}} \text{ defined by } I_{f,2}(x) = \int^+ f(\cdot, x) d\mu_1$$

that

$$I_{f,1} \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \wedge I_{f,2} \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$$

and

$$\int^+ f d(\mu_1 \otimes \mu_2) = \int^+ I_{f,1} d\mu_1 = \int^+ I_{f,2} d\mu_2$$

Note 21.530. Using the convention [convention: 21.520] the above is equivalent with saying that

$$\begin{aligned} \int^+ f d(\mu_1 \otimes \mu_2) &= \int^+ \left(\int^+ f(x, \cdot) d\mu_2 \right) \mu_1(dx) = \int^+ \left(\int^+ f(x, y) \mu(dy) \right) \mu(dx) \\ \int^+ f d(\mu_1 \otimes \mu_2) &= \int^+ \left(\int^+ f(\cdot, y) d\mu_1 \right) \mu_2(dy) = \int^+ \left(\int^+ f(x, y) \mu(dx) \right) \mu(dy) \end{aligned}$$

Note 21.531. The condition that μ_1, μ_2 are σ -finite is necessary to ensure that $\mu_1 \otimes \mu_2$ is a measure on $\mathcal{A}_1 \otimes \mathcal{A}_2$ [see theorem: 21.521]

Note 21.532. By [lemma: 21.526] we have that $\forall x \in X_1$ that $f(x, \cdot) \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$ and $\forall x \in X_2$ that $f(\cdot, x) \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$ so that $\int^+ f(x, \cdot) d\mu_2$ and $\int^+ f(\cdot, x) d\mu_1$ are well defined.

Proof. As $f \in \mathcal{M}^+[X_1 \cdot X_2, \mathcal{A}_1 \otimes \mathcal{A}_2, \overline{\mathbb{R}}]$ there exist by [theorems: 21.311, 21.299] a sequence

$$\{f_i\}_{i \in \mathbb{N}} \subseteq \mathcal{S}^+[X_1 \cdot X_2, \mathcal{A}_1 \otimes \mathcal{A}_2, \overline{\mathbb{R}}] \quad (21.950)$$

such that

$$\forall (x, y) \in X_1 \cdot X_2 \text{ we have } \lim_{i \rightarrow \infty} f_i(x, y) \text{ exist and } f(x, y) = \lim_{i \rightarrow \infty} f_i(x, y) \quad (21.951)$$

$$\forall (x, y) \in X_1 \cdot X_2 \forall i \in \mathbb{N} \quad f_i(x, y) \leq f_{i+1}(x, y) \quad (21.952)$$

$$\lim_{i \rightarrow \infty} \int^+ f_i d(\mu_1 \otimes \mu_2) \text{ exist} \wedge \int^+ f d(\mu_1 \otimes \mu_2) = \lim_{i \rightarrow \infty} \int^+ f_i d(\mu_1 \otimes \mu_2) \quad (21.953)$$

Let $i \in \mathbb{N}$ then by the previous lemma [see lemma: 21.528] we have that

$$I_{f,i,1} \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \text{ where } I_{f,i,1}: X_1 \rightarrow \overline{\mathbb{R}} \text{ is defined by } I_{f,i,1}(x) = \int^+ f_i(x, \cdot) d\mu_2 \quad (21.954)$$

$$I_{f,i,2} \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}] \text{ where } I_{f,i,2}: X_2 \rightarrow \overline{\mathbb{R}} \text{ is defined by } I_{f,i,2}(x) = \int^+ f_i(\cdot, x) d\mu_1 \quad (21.955)$$

$$\int^+ f_i d(\mu_1 \otimes \mu_2) = \int^+ I_{f,i,1} d\mu_1 = \int^+ I_{f,i,2} d\mu_2 \quad (21.956)$$

Further we have

$$\forall x \in X_1 \forall y \in X_2 \text{ we have } \forall i \in \mathbb{N} \quad f_i(x, \cdot)(y) = f_i(x, y) \leq f_{i+1}(x, y) = f_{i+1}(x, \cdot)(y) \quad (21.957)$$

$$\forall x \in X_2 \forall y \in X_1 \text{ we have } \forall i \in \mathbb{N} \quad f_i(\cdot, x)(y) = f_i(y, x) \leq f_{i+1}(y, x) = f_{i+1}(\cdot, x)(y) \quad (21.958)$$

Let $x \in X_1$ then $\forall y \in X_2$ we have $f(x, \cdot)(y) = f(x, y) \stackrel{\text{[eq: 21.951]}}{=} \lim_{i \rightarrow \infty} f_i(x, y) = \lim_{i \rightarrow \infty} f_i(x, \cdot)(y)$. Also for $x \in X_2$ we have $\forall y \in X_1$ we have $f(\cdot, x)(y) = f(y, x) \stackrel{\text{[eq: 21.951]}}{=} \lim_{i \rightarrow \infty} f_i(y, x) = \lim_{i \rightarrow \infty} f_i(\cdot, x)(y)$ which proves that

$$\forall x \in X_1 \text{ we have } f(x, \cdot) = \lim_{i \rightarrow \infty} f_i(x, \cdot) \text{ and } \forall x \in X_2 \text{ we have } f(\cdot, x) = \lim_{i \rightarrow \infty} f_i(\cdot, x) \quad (21.959)$$

Further as $f \in \mathcal{M}^+[X_1 \cdot X_2, \mathcal{A}_1 \otimes \mathcal{A}_2, \overline{\mathbb{R}}]$ it follows from [lemma: 21.526] that

$$\forall x \in X_1 \quad f(x, \cdot) \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}] \text{ and } \forall x \in X_2 \quad f(\cdot, x) \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \quad (21.960)$$

The above [see eqs: 21.101, 21.958, 21.959 and 21.960] allows us to use the Monotone Convergence Theorem [see theorem: 21.351] to prove that

$$\forall x \in X_1 \int^+ f(x, \cdot) d\mu_2 = \lim_{i \rightarrow \infty} \int^+ f_i(x, \cdot) d\mu_2 \wedge \forall x \in X_2 \int^+ f(\cdot, x) d\mu_1 = \lim_{i \rightarrow \infty} \int^+ f_i(\cdot, x) d\mu_1 \quad (21.961)$$

Substituting [eqs: 21.954, 21.955] in the above gives

$$\forall x \in X_1 \int^+ f(x, \cdot) d\mu_2 = \lim_{i \rightarrow \infty} I_{f,i,1}(x) \text{ and } \forall x \in X_2 \int^+ f(\cdot, x) d\mu_1 = \lim_{i \rightarrow \infty} I_{f,i,2} \quad (21.962)$$

Define the functions

$$I_{f,1}: X_1 \rightarrow \overline{\mathbb{R}} \text{ by } I_{f,1}(x) = \int^+ f(x, \cdot) d\mu_2 \text{ and } I_{f,2}: X_2 \rightarrow \overline{\mathbb{R}} \text{ defined by } I_{f,2}(x) = \int^+ f(\cdot, x) d\mu_1$$

then we have by [eq: 21.962] that

$$I_{f,1} = \lim_{i \rightarrow \infty} I_{f,i,1} \text{ and } I_{f,2} = \lim_{i \rightarrow \infty} I_{f,i,2}$$

As by [eqs: 21.954, 21.955] $I_{f,i,1} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \wedge I_{f,i,2} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$ it follows from the Monotone Convergence theorem [see theorem: 21.351] and the above that

$$I_{f,1} \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \wedge I_{f,2} \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$$

and

$$\begin{aligned} \int^+ I_{f,1} d\mu_1 &\stackrel{[\text{theorem: 21.351}]}{=} \lim_{i \rightarrow \infty} \int^+ I_{f,i,1} d\mu_1 \\ &\stackrel{[\text{eq: 21.956}]}{=} \lim_{i \rightarrow \infty} \int^+ f_i d(\mu_1 \otimes \mu_2) \\ &\stackrel{[\text{eq: 21.953}]}{=} \int^+ f d\mu(\mu_1 \otimes \mu_2) \\ \int^+ I_{f,2} d\mu_2 &\stackrel{[\text{theorem: 21.351}]}{=} \lim_{i \rightarrow \infty} \int^+ I_{f,i,2} d\mu_2 \\ &\stackrel{[\text{eq: 21.956}]}{=} \lim_{i \rightarrow \infty} \int^+ f_i d(\mu_1 \otimes \mu_2) \\ &\stackrel{[\text{eq: 21.953}]}{=} \int^+ f d\mu(\mu_1 \otimes \mu_2) \end{aligned}$$

hence

$$\int^+ f d\mu(\mu_1 \otimes \mu_2) = \int^+ I_{f,1} d\mu_1 = \int^+ I_{f,2} d\mu_2 \quad \square$$

Lemma 21.533. Let X_1, Y_1 be sets and $f: X_1 \cdot X_2 \rightarrow \overline{\mathbb{R}}$ be a function then we have

$$\begin{aligned} \forall x \in X_1 \quad (f^+)(x, \cdot) &= (f(x, \cdot))^+ \text{ and } (f^-)(x, \cdot) = (f(x, \cdot))^- \\ \forall x \in X_2 \quad (f^+)(\cdot, x) &= (f(\cdot, x))^+ \text{ and } (f^-)(\cdot, x) = (f(\cdot, x))^- \end{aligned}$$

Proof. Let $x \in X_1$ then we have $\forall y \in X_2$ that

$$\begin{aligned} (f^+)(x, \cdot)(y) &= f^+(x, y) = \max(f(x, y), 0) = \max(f(x, \cdot)(y), 0) = (f(x, \cdot))^+(y) \\ (f^-)(x, \cdot)(y) &= f^-(x, y) = -\min(f(x, y), 0) = -\min(f(x, \cdot)(y), 0) = (f(x, \cdot))^-(y) \end{aligned}$$

hence we have

$$\forall x \in X_1 \quad (f^+)(x, \cdot) = (f(x, \cdot))^+ \text{ and } (f^-)(x, \cdot) = (f(x, \cdot))^-$$

Likewise, let $x \in X_2$ then we have $\forall y \in X_1$ that

$$\begin{aligned} (f^+)(\cdot, x)(y) &= f^+(y, x) = \max(f(y, x), 0) = \max(f(\cdot, x)(y), 0) = (f(\cdot, x))^+(y) \\ (f^-)(\cdot, x)(y) &= f^-(y, x) = -\min(f(y, x), 0) = -\min(f(\cdot, x)(y), 0) = (f(\cdot, x))^- (y) \end{aligned}$$

hence we have

$$\forall x \in X_2 \ (f^+)(\cdot, x) = (f(\cdot, x))^+ \text{ and } (f^-)(\cdot, x) = (f(\cdot, x))^- \quad \square$$

The extension of the Tonelli's theorem to integrable functions instead of non negative measurable functions is Fubini's theorem.

Theorem 21.534. (Fubini's Theorem) *Let $\langle X_1, \mathcal{A}_1, \mu_1 \rangle$, $\langle X_2, \mathcal{A}_2, \mu_2 \rangle$ be measurable spaces where μ_1, μ_2 is σ -finite and $f \in \mathcal{L}[X_1 \cdot X_2, \mathcal{A}_1 \otimes \mathcal{A}_2, \mu_1 \otimes \mu_2]$ then we have*

$$D_1 = \{x \in X_1 | f(x, \cdot) \in \mathcal{L}[X_2, \mathcal{A}_2, \mu_2]\} \wedge \mu_1(X_1 \setminus D_1) = 0$$

$$D_2 = \{x \in X_2 | f(\cdot, x) \in \mathcal{L}[X_1, \mathcal{A}_1, \mu_1]\} \wedge \mu_2(X_2 \setminus D_2) = 0$$

$$I_{f,1} \in \mathcal{L}[X_1, \mathcal{A}_1, \mu_1] \text{ where } I_{f,1}: X_1 \rightarrow \overline{\mathbb{R}} \text{ is defined by } I_{f,1}(x) = \begin{cases} \int f(x, \cdot) d\mu_2 & \text{if } x \in D_1 \\ 0 & \text{if } x \in X_1 \setminus D_1 \end{cases}$$

$$I_{f,2} \in \mathcal{L}[X_2, \mathcal{A}_2, \mu_2] \text{ where } I_{f,2}: X_2 \rightarrow \overline{\mathbb{R}} \text{ is defined by } I_{f,2}(x) = \begin{cases} \int f(\cdot, x) d\mu_1 & \text{if } x \in D_2 \\ 0 & \text{if } x \in X_2 \setminus D_2 \end{cases}$$

$$\int I_{f,1} d\mu_1 = \int I_{f,2} d\mu_2 = \int f d(\mu_1 \otimes \mu_2)$$

Note 21.535. *As $\forall x \in X_1 \setminus D_1$ we have $x \notin D_1 \Rightarrow f(x, \cdot) \notin \mathcal{L}[X_2, \mathcal{A}_2, \mu_2, \overline{\mathbb{R}}]$ and $\mu_1(X_1 \setminus D_1) = 0$ we have that*

$$f(x, \cdot) \text{ is } \mu_1\text{-a.e } \mu_2\text{-integrable}$$

Likewise, as $\forall x \in X_2 \setminus D_2$ we have $x \notin D_2 \Rightarrow f(\cdot, x) \notin \mathcal{L}[X_1, \mathcal{A}_1, \mu_1, \overline{\mathbb{R}}]$ and $\mu_2(X_2 \setminus D_2) = 0$ we have that

$$f(\cdot, x) \text{ is } \mu_2\text{-a.e } \mu_1\text{-integrable}$$

Proof. As $f \in \mathcal{L}[X_1 \cdot X_2, \mathcal{A}_1 \otimes \mathcal{A}_2, \mu_1 \otimes \mu_2]$ we have by definition [theorem: 21.326] that

$$f \in \mathcal{M}[X_1 \cdot X_2, \mathcal{A}_1 \otimes \mathcal{A}_2, \overline{\mathbb{R}}] \wedge f^+, f^- \in \mathcal{M}^+[X_1 \cdot X_2, \mathcal{A}_1 \otimes \mathcal{A}_2, \overline{\mathbb{R}}] \quad (21.963)$$

$$\int^+ f^+ d(\mu_1 \otimes \mu_2) < \infty \text{ and } \int^+ f^- d(\mu_1 \otimes \mu_2) < \infty \quad (21.964)$$

$$\int f d(\mu_1 \otimes \mu_2) = \int f^+ d(\mu_1 \otimes \mu_2) - \int f^- d(\mu_1 \otimes \mu_2) \quad (21.965)$$

Using Tonelli's Theorem [theorem: 21.529] on [eq: 21.963] proves that

$$\forall x \in X_1 \ (f^+)(x, \cdot) \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}] \text{ and } \forall x \in X_2 \ (f^-)(\cdot, x) \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \quad (21.966)$$

$$I_{f,1}^+ \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \text{ where } I_{f,1}^+: X_1 \rightarrow \overline{\mathbb{R}} \text{ is defined by } I_{f,1}^+(x) = \int^+ (f^+)(x, \cdot) d\mu_2 \quad (21.967)$$

$$I_{f,2}^+ \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}] \text{ where } I_{f,2}^+: X_2 \rightarrow \overline{\mathbb{R}} \text{ is defined by } I_{f,2}^+(x) = \int^+ (f^+)(\cdot, x) d\mu_1 \quad (21.968)$$

$$I_{f,1}^- \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \text{ where } I_{f,1}^-: X_1 \rightarrow \overline{\mathbb{R}} \text{ is defined by } I_{f,1}^-(x) = \int^+ (f^-)(x, \cdot) d\mu_2 \quad (21.969)$$

$$I_{f,2}^- \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}] \text{ where } I_{f,2}^-: X_2 \rightarrow \overline{\mathbb{R}} \text{ is defined by } I_{f,2}^-(x) = \int^+ (f^-)(\cdot, x) d\mu_1 \quad (21.970)$$

$$\int^+ I_{f,1}^+ d\mu_1 = \int^+ I_{f,2}^+ d\mu_2 = \int^+ f^+ d(\mu_1 \otimes \mu_2) \underset{[\text{eq: 21.964}]}{<} \infty \quad (21.971)$$

$$\int^+ I_{f,1}^- d\mu_1 = \int^+ I_{f,2}^- d\mu_2 = \int^+ f^- d(\mu_1 \otimes \mu_2) \underset{[\text{eq: 21.964}]}{<} \infty \quad (21.972)$$

Using [theorem: 21.318] on [eqs: 21.967, 21.968, 21.969, 21.970] and [eqs: 21.971, 21.972] results in

$$N_{f,1}^+ = \{x \in X_1 | I_{f,1}^+(x) \neq \infty\} \in \mathcal{A}_1 \wedge \mu(X_1 \setminus N_{f,1}^+) = 0 \quad (21.973)$$

$$N_{f,2}^+ = \{x \in X_2 | I_{f,2}^+(x) \neq \infty\} \in \mathcal{A}_2 \wedge \mu(X_2 \setminus N_{f,2}^+) = 0 \quad (21.974)$$

$$N_{f,1}^- = \{x \in X_1 | I_{f,1}^-(x) \neq \infty\} \in \mathcal{A}_1 \wedge \mu(X_1 \setminus N_{f,1}^-) = 0 \quad (21.975)$$

$$N_{f,2}^- = \{x \in X_2 | I_{f,2}^-(x) \neq \infty\} \in \mathcal{A}_2 \wedge \mu(X_2 \setminus N_{f,2}^-) = 0 \quad (21.976)$$

As $f \in \mathcal{M}[X_1 \cdot X_2, \mathcal{A}_1 \otimes \mathcal{A}_2, \overline{\mathbb{R}}]$ [see eq: 21.963] it follows from [lemma: 21.526] that

$$\forall x \in X_1 \ f(x, \cdot) \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}] \text{ and } \forall x \in X_2 \ f(\cdot, x) \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \quad (21.977)$$

Now we have the following equivalences

$$\begin{aligned} x \in D_1 &= \{x \in X_1 | f(x, \cdot) \in \mathcal{L}[X_2, \mathcal{A}_2, \mu_2, \overline{\mathbb{R}}]\} \\ &\Updownarrow \\ &f(x, \cdot) \in \mathcal{M}[X_2, \mathcal{A}_2, \overline{\mathbb{R}}] \text{ by [eq: 21.977]} \\ &\int^+ (f(x, \cdot))^+ d\mu_2 < \infty \wedge \int^+ (f(x, \cdot))^- d\mu_2 < \infty \\ &\Updownarrow \\ &\text{[lemma: 21.533]} \\ &\int^+ (f^+)(x, \cdot) d\mu_2 < \infty \wedge \int^+ (f^-)(x, \cdot) d\mu_2 < \infty \\ &\Updownarrow \\ &\text{[eqs: 21.967, 21.969]} \\ &I_{f,1}^+(x) < \infty \wedge I_{f,1}^-(x) < \infty \\ &\Updownarrow \\ &\text{[eqs: 21.973, 21.975]} \\ &x \in N_{f,1}^+ \bigcap N_{f,1}^- \end{aligned}$$

and

$$\begin{aligned} x \in D_2 &= \{x \in X_2 | f(\cdot, x) \in \mathcal{L}[X_1, \mathcal{A}_1, \mu_1, \overline{\mathbb{R}}]\} \\ &\Updownarrow \\ &f(\cdot, x) \in \mathcal{M}[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \text{ by [eq: 21.977]} \\ &\int^+ (f(\cdot, x))^+ d\mu_1 < \infty \wedge \int^+ (f(\cdot, x))^- d\mu_1 < \infty \\ &\Updownarrow \\ &\text{[lemma: 21.533]} \\ &\int^+ (f^+)(\cdot, x) d\mu_1 < \infty \wedge \int^+ (f^-)(\cdot, x) d\mu_1 < \infty \\ &\Updownarrow \\ &\text{[eqs: 21.968, 21.970]} \\ &I_{f,2}^+(x) < \infty \wedge I_{f,2}^-(x) < \infty \\ &\Updownarrow \\ &\text{[eqs: 21.974, 21.976]} \\ &x \in N_{f,2}^+ \bigcap N_{f,2}^- \end{aligned}$$

Using the above it follows that

$$D_1 = N_{f,1}^+ \bigcap N_{f,1}^- \text{ and } D_2 = N_{f,2}^+ \bigcap N_{f,2}^- \quad (21.978)$$

Now $X_1 \setminus (N_{f,1}^+ \bigcap N_{f,1}^-) \in \mathcal{A}_1$, $X_2 \setminus (N_{f,2}^+ \bigcap N_{f,2}^-) \in \mathcal{A}_2$ and

$$\mu_1(X_1 \setminus (N_{f,1}^+ \bigcap N_{f,1}^-)) = \mu_1((X_1 \setminus N_{f,1}^+) \bigcup (X_1 \setminus N_{f,1}^-)) \leq \mu_1(X_1 \setminus N_{f,1}^+) + \mu_1(X_1 \setminus N_{f,1}^-) = 0 \text{ and}$$

$$\mu_2(X_2 \setminus (N_{f,2}^+ \bigcap N_{f,2}^-)) = \mu_2((X_2 \setminus N_{f,2}^+) \bigcup (X_2 \setminus N_{f,2}^-)) \leq \mu_2(X_2 \setminus N_{f,2}^+) + \mu_2(X_2 \setminus N_{f,2}^-) = 0$$

which combined with [eq: 21.978] proves that

$$D_1 = \{x \in X_1 \mid f(x, \cdot) \in \mathcal{L}[X_2, \mathcal{A}_2, \mu_2, \overline{\mathbb{R}}]\} \in \mathcal{A}_1 \text{ and } \mu_1(X_1 \setminus D_1) = 0 \quad (21.979)$$

$$D_2 = \{x \in X_2 \mid f(\cdot, x) \in \mathcal{L}[X_1, \mathcal{A}_1, \mu_1, \overline{\mathbb{R}}]\} \in \mathcal{A}_2 \text{ and } \mu_2(X_2 \setminus D_2) = 0 \quad (21.980)$$

The above allows us to define

$$I_{f,1}: X_1 \rightarrow \overline{\mathbb{R}} \text{ by } I_{f,1}(x) = \begin{cases} \int f(x, \cdot) d\mu_2 & \text{if } x \in D_1 \\ 0 & \text{otherwise} \end{cases} \quad (21.981)$$

$$I_{f,2}: X_2 \rightarrow \overline{\mathbb{R}} \text{ by } I_{f,2}(x) = \begin{cases} \int f(\cdot, x) d\mu_1 & \text{if } x \in D_2 \\ 0 & \text{otherwise} \end{cases} \quad (21.982)$$

Take

$$N_1 = X_1 \setminus D_1 \in \mathcal{A}_1 \wedge N_2 = X_2 \setminus D_2 \in \mathcal{A}_2 \text{ so that } X_1 \setminus N_1 = D_1 \wedge X_2 \setminus N_2 = D_2 \quad (21.983)$$

As by [eqs: 21.967, 21.969] and [eqs: 21.968, 21.970] $I_{f,1}^+, I_{f,1}^- \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}]$ and $I_{f,2}^+, I_{f,2}^- \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}]$ it follows from [theorem: 21.260] that

$$\mathcal{X}_{X_1, X_1 \setminus N_1} \cdot I_{f,1}^+, \mathcal{X}_{X_1, X_1 \setminus N_1} \wedge f_{f,1}^- \in \mathcal{M}^+[X_1, \mathcal{A}_1, \overline{\mathbb{R}}] \quad (21.984)$$

$$\mathcal{X}_{X_2, X_2 \setminus N_2} \cdot I_{f,2}^+, \mathcal{X}_{X_2, X_2 \setminus N_2} \cdot f_{f,2}^- \in \mathcal{M}^+[X_2, \mathcal{A}_2, \overline{\mathbb{R}}] \quad (21.985)$$

Further we have as $\mu_1(N_1) = 0 = \mu_2(N_2)$ that by [theorems: 21.265, 21.315]

$$\int^+ (\mathcal{X}_{X_1, X_1 \setminus N_1} \cdot I_{f,1}^+) d\mu_1 = \int^+ I_{f,1}^+ d\mu_1 \underset{[\text{eq: 21.971}]}{<} \infty \quad (21.986)$$

$$\int^+ (\mathcal{X}_{X_1, X_1 \setminus N_1} \cdot I_{f,1}^-) d\mu_1 = \int^+ I_{f,1}^- d\mu_1 \underset{[\text{eq: 21.972}]}{<} \infty \quad (21.987)$$

$$\int^+ (\mathcal{X}_{X_2, X_2 \setminus N_2} \cdot I_{f,2}^+) d\mu_2 = \int^+ I_{f,2}^+ d\mu_2 \underset{[\text{eq: 21.971}]}{<} \infty \quad (21.988)$$

$$\int^+ (\mathcal{X}_{X_2, X_2 \setminus N_2} \cdot I_{f,2}^-) d\mu_2 = \int^+ I_{f,2}^- d\mu_2 \underset{[\text{eq: 21.972}]}{<} \infty \quad (21.989)$$

Further we have for $x \in X_1$ either:

$x \in N_1$. Then $x \in X_1 \setminus D_1$ so that

$$I_{f,1}(x) \underset{[\text{eq: 21.981}]}{=} 0 = 0 - 0 = (\mathcal{X}_{X_1, X_1 \setminus N_1} \cdot f_{f,1}^+ - \mathcal{X}_{X_1, X_1 \setminus N_1} \cdot f_{f,1}^-)(x)$$

$x \in X_1 \setminus N_1$. Then $x \in D_1$ so that

$$\begin{aligned} I_{f,1}(x) & \underset{[\text{eq: 21.981}]}{=} \int f(x, \cdot) d\mu_2 \\ & = \int^+ (f(x, \cdot))^+ d\mu_2 - \int^+ (f(x, \cdot))^- d\mu_2 \\ & \underset{[\text{lemma: 21.533}]}{=} \int^+ (f^+)(x, \cdot) d\mu_2 - \int^+ (f^-)(x, \cdot) d\mu_2 \\ & \underset{[\text{eqs: 21.967, 21.969}]}{=} I_{f,1}^+(x) - I_{f,1}^-(x) \\ & = (\mathcal{X}_{X_1, X_1 \setminus N_1} \cdot f_{f,1}^+ - \mathcal{X}_{X_1, X_1 \setminus N_1} \cdot f_{f,1}^-)(x) \end{aligned}$$

Likewise if $x \in X_2$ we have either:

$x \in N_2$. Then $x \in X_2 \setminus D_2$ so that

$$I_{f,2}(x) \underset{[\text{eq: 21.982}]}{=} 0 = 0 - 0 = (\mathcal{X}_{X_2, X_2 \setminus N_2} \cdot f_{f,2}^+ - \mathcal{X}_{X_2, X_2 \setminus N_2} \cdot f_{f,2}^-)(x)$$

$x \in X_2 \setminus N_2$. Then $x \in D_2$ so that

$$\begin{aligned}
 I_{f,2}(x) & \stackrel{[\text{eq: } \overline{21.982}]}{=} \int f(.,x) d\mu_1 \\
 & = \int^+ (f(.,x))^+ d\mu_1 - \int^+ (f(.,x))^- d\mu_1 \\
 & \stackrel{[\text{lemma: } 21.533]}{=} \int^+ (f^+)(.,x) d\mu_1 - \int^+ (f^-)(.,x) d\mu_1 \\
 & \stackrel{[\text{eqs: } \overline{21.968}, \overline{21.970}]}{=} I_{f,2}^+(x) - I_{f,2}^-(x) \\
 & = (\mathcal{X}_{X_2, X_2 \setminus N_2} \cdot f_{f,2}^+ - \mathcal{X}_{X_2, X_2 \setminus N_2} \cdot f_{f,2}^-)(x)
 \end{aligned}$$

From the above it follows that

$$I_{f,1} = \mathcal{X}_{X_1, X_1 \setminus N_1} \cdot f_{f,1}^+ - \mathcal{X}_{X_1, X_1 \setminus N_1} \cdot f_{f,1}^- \text{ and } I_{f,2} = \mathcal{X}_{X_2, X_2 \setminus N_2} \cdot f_{f,2}^+ - \mathcal{X}_{X_2, X_2 \setminus N_2} \cdot f_{f,2}^- \quad (21.990)$$

Taking in account [eqs: 21.984, 21.985, 21.986, 21.987, 21.988, 21.989 and 21.990] we can use [theorem: 21.330] it follows that

$$I_{f,1} \in \mathcal{L}[X_1, \mathcal{A}_1, \mu_1, \overline{\mathbb{R}}] \text{ and } \int I_{f,1} d\mu_1 = \int^+ (\mathcal{X}_{X_1, X_1 \setminus N_1} \cdot I_{f,1}^+) d\mu_1 - \int^+ (\mathcal{X}_{X_1, X_1 \setminus N_1} \cdot I_{f,1}^-) d\mu_1 \quad (21.991)$$

$$I_{f,2} \in \mathcal{L}[X_2, \mathcal{A}_2, \mu_2, \overline{\mathbb{R}}] \text{ and } \int I_{f,2} d\mu_2 = \int^+ (\mathcal{X}_{X_2, X_2 \setminus N_2} \cdot I_{f,2}^+) d\mu_2 - \int^+ (\mathcal{X}_{X_2, X_2 \setminus N_2} \cdot I_{f,2}^-) d\mu_2 \quad (21.992)$$

Now

$$\begin{aligned}
 & \int^+ (\mathcal{X}_{X_1, X_1 \setminus N_1} \cdot I_{f,1}^+) d\mu_1 - \int^+ (\mathcal{X}_{X_1, X_1 \setminus N_1} \cdot I_{f,1}^-) d\mu_1 \stackrel{[\text{eq: } \overline{21.986}, \overline{21.987}]}{=} \\
 & \quad \int^+ I_{f,1}^+ d\mu_1 - \int^+ I_{f,1}^- d\mu_1 \stackrel{[\text{eq: } \overline{21.971}, \overline{21.972}]}{=} \\
 & \quad \int^+ f^+ d(\mu_1 \otimes \mu_2) - \int^+ f^- d(\mu_1 \otimes \mu_2) \stackrel{[\text{eq: } \overline{21.965}]}{=} \\
 & \quad \int f d(\mu_1 \otimes \mu_2) \\
 & \int^+ (\mathcal{X}_{X_2, X_2 \setminus N_2} \cdot I_{f,2}^+) d\mu_2 - \int^+ (\mathcal{X}_{X_2, X_2 \setminus N_2} \cdot I_{f,2}^-) d\mu_2 \stackrel{[\text{eq: } \overline{21.988}, \overline{21.989}]}{=} \\
 & \quad \int^+ I_{f,2}^+ d\mu_2 - \int^+ I_{f,2}^- d\mu_2 \stackrel{[\text{eq: } \overline{21.971}, \overline{21.972}]}{=} \\
 & \quad \int^+ f^+ d(\mu_1 \otimes \mu_2) - \int^+ f^- d(\mu_1 \otimes \mu_2) \stackrel{[\text{eq: } \overline{21.965}]}{=} \\
 & \quad \int f d(\mu_1 \otimes \mu_2)
 \end{aligned}$$

which combined with [eqs: 21.991, 21.992] gives finally:

$$\int I_{f,1} d\mu_1 = \int I_{f,2} d\mu_2 = \int f d(\mu_1 \otimes \mu_2) \quad \square$$

21.8 Change of variables in $\mathbb{R}^n$

21.8.1 Regularity and Radon measures

21.8.1.1 Definition of regular and Radon measures

We examine now the properties of Borel measures.

Lemma 21.536. Let $\langle X, \mathcal{T} \rangle$ be a topological space and $\mu: \mathcal{B}[X, \mathcal{T}] \rightarrow [0, \infty]$ a **finite** measure on the σ -algebra $\mathcal{B}[X, \mathcal{T}] = \sigma[\mathcal{T}]$ and $A \in \mathcal{B}[X, \mathcal{T}]$ then we have

$$\mu(A) = \sup(\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\}) = \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$$

$$\Updownarrow$$

$$\forall \varepsilon \in \mathbb{R}^+ \exists U \text{ open}, \exists F \text{ closed with } F \subseteq A \subseteq U \text{ and } \mu(U \setminus F) < \varepsilon$$

Note 21.537. Using [theorem: 21.44] it follows that $\mathcal{B}[X, \mathcal{T}]$ contains all open and closed sets so that the above equivalences make sense.

Proof.

$\Rightarrow$. Let $A \in \mathcal{B}[X, \mathcal{T}]$ and take $\varepsilon \in \mathbb{R}^+$. As $\mu(A)$ is finite we have

$$\mu(A) - \frac{\varepsilon}{2} < \mu(A) = \sup(\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\})$$

so that there exist a F closed with $F \subseteq A$ such that

$$\mu(A) - \frac{\varepsilon}{2} < \mu(F) \Rightarrow -\mu(F) < -\mu(A) + \frac{\varepsilon}{2}$$

Likewise we have

$$\inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) < \mu(A) + \frac{\varepsilon}{2}$$

so that there exist a U open with $A \subseteq U$ such that

$$\mu(U) < \mu(A) + \frac{\varepsilon}{2}$$

Hence we have that

$$F \subseteq A \subseteq U$$

Further as μ is finite we have

$$\mu(U \setminus F) \stackrel{[\text{theorem: 21.106}]}{=} \mu(U) - \mu(F) < \mu(A) + \frac{\varepsilon}{2} - \mu(A) + \frac{\varepsilon}{2} = \varepsilon$$

hence

$$\mu(U \setminus F) < \varepsilon$$

$\Leftarrow$. Let $A \in \mathcal{B}[X, \mathcal{T}]$. Let F be a closed set such that $F \subseteq A$ then using [theorem: 21.106] we have that $\mu(F) \leq \mu(A)$. Hence $\mu(A)$ is an upper bound of $\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\}$ so that

$$\sup(\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\}) \leq \mu(A) \quad (21.993)$$

Assume that $\sup(\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\}) < \mu(A)$ then

$$\varepsilon = \mu(A) - \sup(\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\}) \in \mathbb{R}^+$$

By the hypothesis there exist a U open and a F closed such that

$$F \subseteq A \subseteq U \text{ and } \mu(U \setminus F) < \varepsilon$$

As $A \setminus F \subseteq U \setminus F$ we have by [theorem: 21.106] that $\mu(A) - \mu(F) \leq \mu(U \setminus F) < \varepsilon$ so that

$$\begin{aligned} \mu(A) &< \mu(F) + \varepsilon \\ &\leq \sup(\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\}) + \varepsilon \\ &= \sup(\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\}) + \mu(A) - \sup(\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\}) \\ &= \mu(A) \end{aligned}$$

which is a contradiction, hence the assumption is wrong and we must have that $\mu(A) \leq \sup(\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\})$. Combining this with [eq: 21.993] gives

$$\mu(A) = \sup(\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\})$$

Let U be a open set such that $A \subseteq U$ then using [theorem: 21.106] we have $\mu(A) \leq \mu(U)$. Hence $\mu(A)$ is a lower bound for $\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}$ so that

$$\mu(A) \leq \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) \quad (21.994)$$

Assume that $\mu(A) < \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$ then

$$\varepsilon = \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) - \mu(A) \in \mathbb{R}^+$$

So by the hypothesis there exist a U open and a F closed such that

$$F \subseteq A \subseteq U \text{ and } \mu(U \setminus F) < \varepsilon$$

As $F \subseteq A$ we have $U \setminus A \subseteq U \setminus F$ so that by [theorem: 21.106] $\mu(U) - \mu(A) \leq \mu(U \setminus F) < \varepsilon$ so that

$$\begin{aligned} \mu(A) &> \mu(U) - \varepsilon \\ &\geq \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) - \varepsilon \\ &= \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) - (\inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) - \mu(A)) \\ &= \mu(A) \end{aligned}$$

which is a contradiction, hence the assumption is wrong and we must have that $\inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) \leq \mu(A)$. Combining this with [eq: 21.994] proves that

$$\mu(A) \leq \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) \quad \square$$

Lemma 21.538. *Let $\langle X, ||| \rangle$ be a normed space with the norm topology $\mathcal{T}_{|||}$ and $\mu: \mathcal{B}[X, \mathcal{T}_{|||}] \rightarrow [0, \infty]$ a finite measure on the σ -algebra and $A \in \mathcal{B}[X, \mathcal{T}_{|||}]$ then $\forall \varepsilon \in \mathbb{R}^+$ there exist a open set U and a closed set F with $F \subseteq A \subseteq U$ such that $\mu(U \setminus F) < \varepsilon$.*

Proof. First note that by [theorem: 21.44] every open or closed set used in this proof is a element of $\mathcal{B}[X, \mathcal{T}_{|||}]$. Consider the set

$$\mathcal{A} = \{A \in \mathcal{B}[X, \mathcal{T}_{|||}] | \forall \varepsilon \in \mathbb{R}^+ \exists U \text{ open}, \exists F \text{ closed with } F \subseteq A \subseteq U \text{ such that } \mu(U \setminus F) < \varepsilon\} \quad (21.995)$$

We prove now that $\mathcal{A}$ is a σ -algebra on X . As X is open and closed, $X \subseteq X \subseteq X$ and $\mu(X \setminus X) = \mu(\emptyset) = 0 < \varepsilon \forall \varepsilon \in \mathbb{R}^+$ it follows that

$$X \in \mathcal{A} \quad (21.996)$$

If $A \in \mathcal{A}$ then given $\varepsilon \in \mathbb{R}^+$ there exists a open set U , a closed set F such that $F \subseteq A \subseteq U$. Take $F' = X \setminus U$ and $U' = X \setminus F$ then U' is a open set and F' is a closed set, further as $F \subseteq A \subseteq U$ we have $F' = X \setminus U \subseteq X \setminus A \subseteq X \setminus F = U'$, also $\mu(U' \setminus F') = \mu((X \setminus F) \setminus (X \setminus U)) \stackrel{[\text{theorem: 1.33}]}{=} \mu(U \setminus F) < \varepsilon$. Hence we conclude that $X \setminus A \in \mathcal{A}$ so that

$$\forall A \in \mathcal{A} \text{ we have } X \setminus A \in \mathcal{A} \quad (21.997)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ and take $\varepsilon \in \mathbb{R}^+$. Given $n \in \mathbb{N}$ we have as $A_n \in \mathcal{A}$ there exists a open set F_n and a open set U_n such that

$$F_n \subseteq A_n \subseteq U_n \text{ and } \mu(U_n \setminus F_n) < \frac{\varepsilon}{2^{n+1}} \quad (21.998)$$

Define $U = \bigcup_{n \in \mathbb{N}} U_n$ a open set and $S = \bigcup_{n \in \mathbb{N}} F_n$ [which is in general not closed] then we have

$$S \subseteq \bigcup_{n \in \mathbb{N}} A_n \subseteq U \quad (21.999)$$

Further we have

$$\begin{aligned}
 \mu(U \setminus S) &= \mu\left(\left(\bigcup_{n \in \mathbb{N}} U_n\right) \setminus S\right) \\
 &= \mu\left(\bigcup_{n \in \mathbb{N}} (U_n \setminus S)\right) \\
 &\stackrel{[\text{theorem: 21.95}]}{\leq} \sum_{n=1}^{\infty} \mu(U_n \setminus S) \\
 &\stackrel{F_n \subseteq S \Rightarrow U_n \setminus S \subseteq U \setminus F_n}{\leq} \sum_{n=1}^{\infty} \mu(U_n \setminus F_n) \\
 &= \sum_{n=1}^{\infty} \frac{\varepsilon}{2^{n+1}} \\
 &= \frac{\varepsilon}{2} \cdot \sum_{n=1}^{\infty} \frac{1}{2^n} \\
 &\stackrel{[\text{example: 14.354}]}{=} \frac{\varepsilon}{2}
 \end{aligned}$$

which proves that

$$\mu(U \setminus S) < \frac{\varepsilon}{2} \quad (21.1000)$$

If S would be closed then we are done but unfortunately this is not always true. To solve this we find a closed set that approximate S from below. Given $n \in \mathbb{N}$ consider the closed set $S_n = \bigcup_{i \in \{1, \dots, n\}} F_n$ then by [lemma: 21.6] we have that

$$S = \bigcup_{n \in \mathbb{N}} S_n \text{ and } \forall n \in \mathbb{N} \ S_n \leq S_{n+1} \text{ and as } \{F_n\}_{n \in \mathbb{N}} \subseteq \mathcal{A} \text{ we have also } S_n \in \mathcal{A}$$

Using then [theorem: 21.109] on the above we have

$$\mu(S) = \lim_{n \rightarrow \infty} \mu(S_n) = \sup(\{\mu(S_n) | n \in \mathbb{N}\})$$

As μ is finite we have by [theorem: 20.78] that $\exists N \in \mathbb{N}$ such that $\forall n \in \{N, \dots, \infty\} \ |\mu(S) - \mu(S_n)| < \frac{\varepsilon}{2}$, as $\mu(S_N) \leq \sup(\{\mu(S_n) | n \in \mathbb{N}\}) = \mu(S)$ we have that

$$S_N \in \mathcal{A}, \ S_N \subseteq S \text{ and } \mu(S \setminus S_N) \stackrel{\mu \text{ is finite} \wedge [\text{theorem: 21.106}]}{=} \mu(S) - \mu(S_N) < \frac{\varepsilon}{2}$$

Now

$$\begin{aligned}
 U \setminus S_N &\stackrel{S_N \subseteq U}{=} ((U \setminus S) \bigsqcup S) \setminus S_N \\
 &= ((U \setminus S) \setminus S_N) \bigsqcup (S \setminus S_N) \\
 &\stackrel{[\text{theorem: 1.31}]}{=} (U \setminus (S \cup S_N)) \bigsqcup (S \setminus S_N) \\
 &\stackrel{S_N \subseteq S}{=} (U \setminus S_N) \bigsqcup (S \setminus S_N)
 \end{aligned}$$

so that

$$\mu(U \setminus S_N) = \mu(U \setminus S_N) + \mu(S \setminus S_N) \stackrel{[\text{eq: 21.1000}]}{<} \frac{\varepsilon}{2} + \frac{\varepsilon}{2} < \varepsilon$$

Further using [eq: 21.1000] we have

$$S_N \subseteq S \subseteq \bigcup_{n \in \mathbb{N}} A_n \subseteq U$$

which proves that $\bigcup_{n \in \mathbb{N}} A_n \in \mathcal{A}$. Hence

$$\forall \{A_n\}_{n \in \mathbb{N}} \subseteq \mathcal{A} \text{ we have } \bigcup_{n \in \mathbb{N}} A_n \in \mathcal{A} \quad (21.1001)$$

From [eqs: 21.996, 21.997 and 21.1001] it follows that

$$\mathcal{A} \text{ is a } \sigma\text{-algebra} \quad (21.1002)$$

The next logical step is to prove that $\mathcal{T} \subseteq \mathcal{A}$. Let $U \in \mathcal{T}_{|||}$ then we have two possible cases:

$X \setminus U = \emptyset$. Then $U = X \in \mathcal{A}$

$X \setminus U \neq \emptyset$. Consider the disance function [see definition: 14.163]

$$\delta_{X \setminus U}: X \rightarrow \mathbb{R} \text{ where } \delta_{X \setminus U}(x) = \inf(\{\|x - y\| \mid y \in X \setminus U\})$$

Define now

$$\{F_n\}_{n \in \mathbb{N}} \text{ by } \delta_{X \setminus U}^{-1}\left(\left[\frac{1}{n}, \infty\right]\right)$$

Let $n \in \mathbb{N}$. Using the fact that $[\frac{1}{n}, \infty[$ is closed in $\mathcal{T}_{|||}$ [see theorem: 14.100], $\delta_{X \setminus U}$ is continuous [see theorem: 14.165] it follows from [theorem: 14.138] that F_n is a closed set. Further if $x \in F_n$ then $\delta_{X \setminus U}(x) \in [\frac{1}{n}, \infty[$ so that $\frac{1}{n+1} < \frac{1}{n} \leq \delta_{X \setminus U}(x) \Rightarrow \delta_{X \setminus U}(x) \in [\frac{1}{n}, \infty[$ or $x \in F_{n+1}$. To summarise

$$\forall n \in \mathbb{N} \text{ we have } F_n \text{ is closed and } F_n \subseteq F_{n+1} \quad (21.1003)$$

If $x \in F_n$ then $0 < \frac{1}{n} \leq \delta_{X \setminus U}(x)$. Assume that $x \in X \setminus U$ then $0 \in \{\|x - y\| \mid y \in X \setminus U\}$ so that $\delta_{X \setminus U}(x) = \inf(\{\|x - y\| \mid y \in X \setminus U\}) \leq 0$ contradicting $0 < \delta_{X \setminus U}(x)$, hence the assumption is false and we must have that $x \notin X \setminus U$ which proves that $x \in U$. So we conclude that

$$\forall n \in \mathbb{N} \ F_n \subseteq U \text{ from which it follows that } \bigcup_{n \in \mathbb{N}} F_n \subseteq U \quad (21.1004)$$

If now $x \in U$ then there exist a $\delta \in \mathbb{R}^+$ such that $B_{|||}(x, \delta) \subseteq U$, hence $\forall y \in X \setminus U$ we have that $y \notin B_{|||}(x, \delta) \Rightarrow \delta \leq \|x - y\|$ so that δ is a lower bound for $\{\|x - y\| \mid y \in X \setminus U\}$. In other words

$$0 < \delta \leq \delta_{X \setminus U}(x) = \inf(\{\|x - y\| \mid y \in X \setminus U\})$$

Using the Archimedean property of the real numbers [see theorem: 10.30] there exist a $n \in \mathbb{N}$ such that $0 < \frac{1}{n} < \delta \leq \delta_{X \setminus U}(x)$, hence $x \in \delta_{X \setminus U}^{-1}([\frac{1}{n}, \infty[) = F_n \subseteq \bigcup_{n \in \mathbb{N}} F_n$, this proves that $U \subseteq \bigcup_{n \in \mathbb{N}} F_n$ which combined with [eq: 21.1004] results in

$$U = \bigcup_{n \in \mathbb{N}} F_n \quad (21.1005)$$

Consider now $\{U \setminus F_n\}_{n \in \mathbb{N}} \subseteq \mathcal{B}[X, \mathcal{T}_{|||}]$ then we have

$$\forall n \in \mathbb{N} \text{ we have } U \setminus F_{n+1} \subseteq U \setminus F_n \quad [\text{eq: 21.1003}]$$

and

$$\bigcap_{n \in \mathbb{N}} (U \setminus F_n) = U \setminus \left(\bigcup_{n \in \mathbb{N}} F_n \right) \stackrel{[\text{eq: 21.1005}]}{=} U \setminus U = \emptyset$$

So the conditions for [theorem: 21.109] are satisfies [note that μ is finite] from which it follows that

$$\lim_{n \rightarrow \infty} \mu(U \setminus F_n) \text{ exist and } 0 = \mu(\emptyset) = \lim_{n \rightarrow \infty} \mu(U \setminus F_n)$$

Hence we have

$$\forall \varepsilon \in \mathbb{R}^+ \ \exists N \in \mathbb{N} \text{ such that } \mu(U \setminus F_N) < \varepsilon$$

As also $F_N \subseteq \bigcup_{n \in \mathbb{N}} F_n = U \subseteq U$ and F_N is closed it follows that

$$U \in \mathcal{A}$$

So in all cases we have $U \in \mathcal{A}$. In other words we have proved that

$$\mathcal{T}_{|||} \subseteq \mathcal{A}$$

As we have already proved that $\mathcal{A}$ is a σ -algebra on X it follows from [theorem: 21.39] that $\mathcal{B}[X, \mathcal{T}_{|||}] = \sigma[\mathcal{T}_{|||}] \subseteq \mathcal{A}$. Hence if $A \in \mathcal{B}[X, \mathcal{T}_{|||}]$ then $A \in \mathcal{A}$ so that

$\forall \varepsilon$ there exists a closed set F and a open set U such that $F \subseteq A \subseteq U$ and $\mu(U \setminus F) < \varepsilon$ $\square$

The above two lemmas can be summarized in the following corollary.

Corollary 21.539. *Let $\langle X, ||| \rangle$ be a normed space with topology $\mathcal{T}_{|||}$ and $\mu: \mathcal{B}[X, \mathcal{T}_{|||}] \rightarrow [0, \infty]$ a finite measure then $\forall A \in \mathcal{B}[X, \mathcal{T}_{|||}]$ we have*

$$\mu(A) = \sup(\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\}) = \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$$

Proof. This follows directly from [lemma: 21.536] and [lemma: 21.538]. $\square$

Unfortunately we can not use the above corollary on the Borel measures λ and λ^n because these measures are not finite. For this we introduce the concept of locally finite measures, compact finite measures, regular measures and Radon measures.

Definition 21.540. *Let $\langle X, \mathcal{T} \rangle$ be a topological space, $\mathcal{A}$ a σ -algebra on X with $\mathcal{B}[X, \mathcal{T}] \subseteq \mathcal{A}$ and $\mu: \mathcal{A} \rightarrow [0, \infty]$ a measure then we define:*

1. μ is **locally finite** if $\forall x \in X$ there exist a open set U such that $x \in U$ and $\mu(U) < \infty$
2. μ is **external regular** if $\forall A \in \mathcal{A}$ we have that $\mu(A) = \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$
3. μ is **internal regular** if $\forall A \in \mathcal{A}$ we have that $\mu(A) = \sup(\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\})$
4. μ is **regular** if μ is **external and compact internal regular**.
5. μ is a **Radon measure** if μ is **locally finite and regular**.

Definition 21.541. *Let $\langle X, \mathcal{T} \rangle$ be a **Hausdorff** topological space, $\mathcal{A}$ a σ -algebra on X with $\mathcal{B}[X, \mathcal{T}] \subseteq \mathcal{A}$ and $\mu: \mathcal{A} \rightarrow [0, \infty]$ a measure then we define:*

1. μ is **compact finite** if $\mu(K) < \infty$ for every compact set.
2. μ is **compact internal regular** if $\forall A \in \mathcal{A}$ we have

$$\mu(A) = \sup(\{\mu(K) | K \subseteq A \wedge K \text{ is compact}\})$$

Note 21.542. *The Hausdorff condition is essential as it ensures by [theorem: 14.234] that a compact set K is closed, hence a element of $\mathcal{A}$ so that $\mu(K)$ makes sense.*

Theorem 21.543. *Let $\langle X, \mathcal{T} \rangle$ be a topological space, $\mathcal{A}$ a σ -algebra on X with $\mathcal{B}[X, \mathcal{T}] \subseteq \mathcal{A}$ and $\mu: \mathcal{A} \rightarrow [0, \infty]$ a measure, $\alpha \in [0, \infty[$ then we have for the measure $\alpha \cdot \mu$ [see theorem: 21.101] that:*

1. If μ is locally finite then $\alpha \cdot \mu$ is locally finite.
2. If μ is external regular then $\alpha \cdot \mu$ is external regular.
3. If μ is internal regular then $\alpha \cdot \mu$ is internal regular.
4. If μ is a Radon measure then $\alpha \cdot \mu$ is a Radon measure.

Proof.

1. If $x \in X$ then as μ is locally finite there exist a open set U such that $x \in U$ and $\mu(U) < \infty$ so that $(\alpha \cdot \mu)(U) = \alpha \cdot \mu(U) < \infty$ which proves that $\alpha \cdot \mu$ is locally finite.
2. Let $A \in \mathcal{A}$ then as μ is external regular we have that $\mu(A) = \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$. Hence we have

$$\begin{aligned} (\alpha \cdot \mu)(A) &= \alpha \cdot \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) \\ &\stackrel{[\text{theorem: 10.22}]}{=} \inf(\{\alpha \cdot \mu(U) | A \subseteq U \wedge U \text{ is open}\}) \\ &= \inf(\{(\alpha \cdot \mu)(U) | A \subseteq U \wedge U \text{ is open}\}) \end{aligned}$$

3. Let $A \in \mathcal{A}$ then as μ is internal regular we have that $\mu(A) = \sup(\{\mu(F) | C \subseteq A \wedge F \text{ is closed}\})$. Hence we have

$$\begin{aligned} (\alpha \cdot \mu)(A) &= \alpha \cdot \sup(\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\}) \\ &\stackrel{[\text{theorem: 10.22}]}{=} \sup(\{\alpha \cdot \mu(F) | F \subseteq A \wedge F \text{ is closed}\}) \\ &= \sup(\{(\alpha \cdot \mu)(F) | F \subseteq A \wedge F \text{ is closed}\}) \end{aligned}$$

4. This follows from (2) and (3). $\square$

Theorem 21.544. Let $\langle X, \mathcal{T} \rangle$ be a topological space, $\mathcal{A}$ a σ -algebra on X with $\mathcal{B}[X, \mathcal{T}] \subseteq \mathcal{A}$ and $\mu: \mathcal{A} \rightarrow [0, \infty]$ a measure, $\alpha \in [0, \infty[$ then we have for the measure $\alpha \cdot \mu$ [see theorem: 21.101] that:

1. If μ is compact finite then $\alpha \cdot \mu$ is compact finite.
2. If μ is compact internal regular then $\alpha \cdot \mu$ is compact internal regular

Proof.

1. As μ is compact finite we have for every compact set K that $\mu(K) < \infty$ so that $(\alpha \cdot \mu)(K) = \alpha \cdot \mu(K) < \infty$ from which it follows that $\alpha \cdot \mu$ is compact finite
2. Let $A \in \mathcal{A}$ then as μ is compact internal regular we have that

$$\mu(A) = \sup(\{\mu(K) | C \subseteq A \wedge K \text{ is compact}\}).$$

Hence we have

$$\begin{aligned} (\alpha \cdot \mu)(A) &= \alpha \cdot \sup(\{\mu(K) | K \subseteq A \wedge K \text{ is compact}\}) \\ &\stackrel{[\text{theorem: 10.22}]}{=} \sup(\{\alpha \cdot \mu(K) | K \subseteq A \wedge K \text{ is compact}\}) \\ &= \sup(\{(\alpha \cdot \mu)(K) | C \subseteq A \wedge K \text{ is compact}\}) \end{aligned} \quad \square$$

The regularity of a measure tells us how a measure can be approximated by open, closed or compact sets which shows a relation between the measure and the topology. This can be used to prove uniqueness of measures.

Theorem 21.545. Let $\langle X, \mathcal{T} \rangle$ be a topological space, $\mathcal{A}$ a σ -algebra on X with $\mathcal{B}[X, \mathcal{T}] \subseteq \mathcal{A}$ then we have that:

1. If $\mu: \mathcal{A} \rightarrow [0, \infty]$ and $\nu: \mathcal{A} \rightarrow [0, \infty]$ are external regular measures such that for every open set U we have $\mu(U) = \nu(U)$ then $\mu = \nu$.
2. If $\mu: \mathcal{A} \rightarrow [0, \infty]$ and $\nu: \mathcal{A} \rightarrow [0, \infty]$ are internal regular measures such that for every closed set F we have $\mu(F) = \nu(F)$ then $\mu = \nu$.
3. If additional $\mathcal{T}$ is Hausdorff then we have: If $\mu: \mathcal{A} \rightarrow [0, \infty]$ and $\nu: \mathcal{A} \rightarrow [0, \infty]$ are compact internal regular measures such that for every compact set K we have $\mu(K) = \nu(K)$ then $\mu = \nu$.

Proof. The proof is trivial

1. Let $A \in \mathcal{A}$ then we have as μ, ν are external regular we have

$$\mu(A) = \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) = \inf(\{\nu(U) | A \subseteq U \wedge U \text{ is open}\}) = \nu(A)$$

which proves that $\mu = \nu$.

2. Let $A \in \mathcal{A}$ then we have as μ, ν are internal regular we have

$$\mu(A) = \sup(\{\mu(F) | F \subseteq A \wedge F \text{ is closed}\}) = \sup(\{\nu(F) | F \subseteq A \wedge F \text{ is closed}\}) = \nu(A)$$

which proves that $\mu = \nu$.

3. Let $A \in \mathcal{A}$ then we have as μ, ν are compact internal regular we have

$$\mu(A) = \sup \{ \mu(K) \mid K \subseteq A \wedge K \text{ is compact} \} = \sup \{ \nu(K) \mid K \subseteq A \wedge K \text{ is compact} \} = \nu(A)$$

which proves that $\mu = \nu$. $\square$

Theorem 21.546. Let $\langle X, \mathcal{T} \rangle$ be a **Hausdorff** topological space, $\mathcal{A}$ a σ -algebra on X with $\mathcal{B}[X, \mathcal{T}] \subseteq \mathcal{A}$ and $\mu: \mathcal{A} \rightarrow [0, \infty]$ a local finite measure then μ is compact finite.

Note 21.547. If $\mathcal{T}$ is a metric space or normed space then by [theorem: 14.205] $\mathcal{T}$ is Hausdorff so that the this theorem is also valid for metric and normed spaces.

Proof. Let K be a compact set then $\forall x \in K$ there exist by local finiteness a open set U_x with $x \in U_x$ and $\mu(U_x) < \infty$, hence $K \subseteq \bigcup_{x \in K} U_x$. As K is compact there exists a finite set $\{x_1, \dots, x_n\} \subseteq K$ such that $K \subseteq \bigcup_{i \in \{1, \dots, n\}} U_{x_i}$. Hence

$$\mu(K) = \mu\left(\bigcup_{i \in \{1, \dots, n\}} U_{x_i}\right) \stackrel{[\text{theorem: 21.96}]}{\leq} \sum_{i \in \{1, \dots, n\}} \mu(U_{x_i}) < \infty$$

which proves that $\mu(K)$ is finite. $\square$

Theorem 21.548. Let $\mathcal{A}$ be a σ -algebra on $\mathbb{R}$ with $\mathcal{B}[\mathbb{R}] = \mathcal{B}[\mathbb{R}, \mathcal{T}_{\square}] \subseteq \mathcal{A}$ and $\mu: \mathcal{A} \rightarrow [0, \infty]$ a compact finite measure then we have $\forall I \in \mathcal{I}_{\square} \cup \mathcal{I}_{\square} \cup \mathcal{I}_{\square} \cup \mathcal{I}_{\square} \cup \{\emptyset\}$ [see definition: 21.48] that

$$\mu(I) < \infty$$

and

$$\mu_{[I]}: \mathcal{A} \rightarrow [0, \infty] \text{ defined by } \mu_{[I]}(A) = \mu(A \cap I) \text{ is a finite measure}$$

Proof. Let $I \in \mathcal{I}_{\square}$ then $I = [a, b]$ where $a, b \in \mathbb{R} \wedge a \leq b$, using the Heine-Borel theorem [theorem: 14.236] $[a, b]$ is a compact set. As μ is compact finite it follows then that $\mu(I) < \infty$ or in other words

$$\forall I \in \mathcal{I}_{\square} \text{ we have } \mu(I) < \infty$$

Let $I \in \mathcal{I}_{\square} \cup \mathcal{I}_{\square} \cup \mathcal{I}_{\square} \cup \{\emptyset\}$ then either $I = \emptyset \Rightarrow \mu(I) = 0 < \infty$ or there exist $a, b \in \mathbb{R}$ with $a < b$ such that $I = [a, b[\vee]a, b] \vee]a, b[\subseteq [a, b]$ so that $\mu(I) \leq \mu([a, b]) < \infty$. Hence we have

$$\forall I \in \mathcal{I}_{\square} \cup \mathcal{I}_{\square} \cup \mathcal{I}_{\square} \cup \mathcal{I}_{\square} \cup \{\emptyset\} \text{ that } \mu(I) < \infty$$

Let $I \in \mathcal{I}_{\square} \cup \mathcal{I}_{\square} \cup \mathcal{I}_{\square} \cup \mathcal{I}_{\square} \cup \{\emptyset\}$ then we have

$$\mu_{[I]}(\emptyset) = 0$$

and $\forall \{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{A}$ pairwise disjoint that

$$\mu_{[I]}\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) = \mu\left(\left(\bigsqcup_{i \in \mathbb{N}} A_i\right) \cap I\right) = \mu\left(\bigsqcup_{i \in \mathbb{N}} (A_i \cap I)\right) = \sum_{i=1}^{\infty} \mu(A_i \cap I) = \sum_{i=1}^{\infty} \mu_{[I]}(A_i)$$

which proves that $\mu_{[I]}$ is a measure on $\mathcal{A}$. Finally as $\forall A \in \mathcal{A}$ we have $\mu_{[I]}(A) = \mu(A \cap I) \leq \mu(I) < \infty$ it follows that

$$\mu_{[I]} \text{ is a finite measure on } \mathcal{A} \quad \square$$

Theorem 21.549. Let $\mathcal{A}$ be a σ -algebra on $\mathbb{R}^n$ such that $\mathcal{B}[\mathbb{R}^n] = \mathcal{B}[\mathbb{R}^n, \|\cdot\|_n] \subseteq \mathcal{A}$ and $\mu: \mathcal{A} \rightarrow [0, \infty]$ a compact finite measure then we have $\forall R \in \mathcal{R}_{\square}^n \cup \mathcal{R}_{\square}^n \cup \mathcal{R}_{\square}^n \cup \mathcal{R}_{\square}^n \cup \{\emptyset\}$ that

$$\mu(R) < \infty$$

and

$\mu_{[R]}: \mathcal{A} \rightarrow [0, \infty]$ defined by $\mu_{[R]}(A) = \mu(A \cap R)$ is a finite measure

Note 21.550. Using [theorem: 21.87] we have that $\mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \{\emptyset\} \subseteq \mathcal{B}[\mathbb{R}^n]$ so that $\mu(R)$ is well defined.

Proof. Let $R \in \mathcal{R}_{||}^n$ then by [theorem: 21.70] R is a compact set. As μ is compact finite it follows then that $\mu(R) < \infty$ or in other words

$$\forall R \in \mathcal{R}_{||}^n \text{ we have } \mu(R) < \infty$$

Let $R \in \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \{\emptyset\}$ then either $R = \emptyset \Rightarrow \mu(R) = 0 < \infty$ or there exist a $a, b \in \mathbb{R}^n$ with $a < b$ such that $R = [a, b[\vee]a, b] \vee]a, b[\subseteq [a, b]$ so that $\mu(R) \subseteq \mu([a, b]) < \infty$. Hence we have

$$\forall R \in \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \{\emptyset\} \text{ that } \mu(R) < \infty$$

Let $I \in \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \mathcal{R}_{||}^n \cup \{\emptyset\} \subseteq \mathcal{B}[\mathbb{R}^n]$ then by [theorem: 21.101(3)]

$$\mu_{[R]}: \mathcal{A} \rightarrow [0, \infty] \text{ defined by } \mu_{[R]}(A) = \mu(A \cap R)$$

is a measure on $\mathbb{R}$. Finally as $\forall A \in \mathcal{A}$ we have $\mu_{[R]}(A) = \mu(A \cap R) \leq \mu(R) < \infty$ it follows that

$$\mu_{[R]} \text{ is a finite measure on } \mathcal{A}$$

□

21.8.1.2 λ and λ^n are Radon measures

We set out now to prove that the Borel measures λ and λ^n on $\mathbb{R}$ and $\mathbb{R}^n$ are Radon measures, for this we need the following two theorems that state that compact finite measures on $\mathcal{B}[\mathbb{R}]$ and $\mathcal{B}[\mathbb{R}^n]$ are regular.

Lemma 21.551. Let $\mu: \mathcal{B}[\mathbb{R}] = \mathcal{B}[\mathbb{R}, \mathcal{T}_{||}] \rightarrow [0, \infty]$ a compact finite measure then μ is regular.

Proof. First we prove external regularity. Let $A \in \mathcal{B}[\mathbb{R}]$ then we have the following possible cases to consider:

$\mu(A) = \infty$. If U is a open set with $A \subseteq U$ then by the monotonicity of μ [see theorem: 21.106] it follows that $\infty = \mu(A) \leq \mu(U) \leq \infty \Rightarrow \mu(U) = \infty$. Hence $\infty \in \{\mu(U) | A \subseteq U \wedge U \text{ is open}\}$ so that $\infty \leq \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) \leq \infty$ proving that $\inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) = \infty$. Hence

$$\mu(A) = \sup(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$$

$\mu(A) < \infty$. If $x \in \{\mu(U) | A \subseteq U \wedge U \text{ is open}\}$ then $x = \mu(U)$ where U is a open set with $A \subseteq U$. By the monotonicity of μ [see theorem: 21.106] it follows that $\mu(A) \leq \mu(U) = x$ so that $\mu(A)$ is a lower bound of $\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}$. Hence we have that

$$\mu(A) \leq \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) \quad (21.1006)$$

Assume that $\mu(A) < \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$. Let $\varepsilon \in \mathbb{R}^+$ and define $\{Q_i\}_{i \in \mathbb{N}} \subseteq \mathcal{I}_{||} \subseteq \mathcal{T}_{||}$ by $Q_i =]-i, i[$ then by [theorem: 21.548] we have for $i \in \mathbb{N}$ that

$$\mu_{[Q_i]}: \mathcal{B}[\mathbb{R}] \rightarrow [0, \infty] \text{ defined by } \mu_{[Q_i]}(A) = \mu(A \cap Q_i) \text{ is a finite measure}$$

Hence using [lemma: 21.538] we have that there exists a open U_i and a closed set F_i such that

$$F_i \subseteq A \subseteq U_i \text{ and } \mu_{[Q_i]}(U_i \setminus F_i) < \frac{\varepsilon}{2^i}$$

As $F_i \subseteq A$ we have $U_i \setminus A \subseteq U_i \setminus F_i$ it follows from the monotonicity of μ [see theorem: 21.106] that $\mu_{[Q_i]}(U_i \setminus A) \leq \mu_{[Q_i]}(U_i \setminus F_i) < \frac{\varepsilon}{2^i}$. To summarize we have

$$\forall i \in \mathbb{N} \text{ there exist a open } U_i \text{ such that } A \subseteq U_i \text{ and } \mu_{[Q_i]}(U_i \setminus A) < \frac{\varepsilon}{2^{i+1}} \quad (21.1007)$$

Define now $U = \bigcup_{i \in \mathbb{N}} (U_i \cap Q_i)$ which is open as $U_i, Q_i =]-i, i[$ is open. Let $x \in A$ then as $\bigcup_{i \in \mathbb{N}} Q_i = \bigcup_{i \in \mathbb{N}}]-i, i[\stackrel{[\text{corollary: 10.30}]}{=} \mathbb{R}$ there exist a $i \in \mathbb{N}$ such that $x \in Q_i$, as further $A \subseteq U_i$ by [eq: 21.1007], it follows that $x \in U_i \cap Q_i \subseteq U$, hence it follows that $A \subseteq U$. Further

$$\begin{aligned}
 \mu(U \setminus A) &= \mu\left(\left(\bigcup_{i \in \mathbb{N}} (U_i \cap Q_i)\right) \setminus A\right) \\
 &= \mu\left(\bigcup_{i \in \mathbb{N}} ((U_i \cap Q_i) \setminus A)\right) \\
 &\stackrel{[\text{theorem: 21.95}]}{\leq} \sum_{i=1}^{\infty} \mu((U_i \cap Q_i) \setminus A) \\
 &\stackrel{[\text{theorem: 1.33}]}{=} \sum_{i=1}^{\infty} \mu((U_i \setminus A) \cap Q_i) \\
 &= \sum_{i=1}^{\infty} \mu_{[Q_i]}(U_i \setminus A) \\
 &\stackrel{[\text{theorem: 14.378}] \wedge [\text{eq: 21.1007}]}{\leq} \sum_{i=1}^{\infty} \frac{\varepsilon}{2^{i+1}} \\
 &= \frac{\varepsilon}{2} \cdot \sum_{i=1}^{\infty} \frac{1}{2^i} \\
 &\stackrel{[\text{example: 14.354}]}{=} \frac{\varepsilon}{2} \\
 &< \varepsilon
 \end{aligned}$$

Summarized we have

$$\forall \varepsilon \in \mathbb{R}^+ \text{ there exist a open set } U \text{ with } A \subseteq U \text{ and } \mu(U \setminus A) < \varepsilon \quad (21.1008)$$

From the above it follows, by using $\varepsilon = 1$, that there exist a V open such that $A \subseteq V$ and $\mu(V) - \mu(A) \stackrel{[\text{theorem: 21.106}] \wedge \mu(A) < \infty}{=} \mu(V \setminus A) < 1$ so that $\mu(V) < \infty$. Hence

$$\inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) \leq \mu(V) < \infty$$

which proves that $\inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$ is finite. As we have assumed that $\mu(A) < \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$ we have that

$$\varepsilon = \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) - \mu(A) \in \mathbb{R}^+$$

So using [eq: 21.1008] there exist a open set U with $A \subseteq U$ such that $\mu(U \setminus A) < \varepsilon$. As $U \stackrel{A \subseteq U}{=} (U \setminus A) \sqcup A$, we have

$$\begin{aligned}
 \mu(U) &= \mu(U \setminus A) + \mu(A) \\
 &< \varepsilon + \mu(A) \\
 &= \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) - \mu(A) + \mu(A) \\
 &= \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) \\
 &\stackrel{A \subseteq U \text{ open}}{\leq} \mu(U)
 \end{aligned}$$

leading to the contradiction $\mu(U) < \mu(U)$ from which it follows that the assumption $\mu(A) < \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$ is false. Hence $\inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) \leq \mu(A)$ which combined with [eq: 21.1006] proves that

$$\mu(A) = \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$$

Hence we have proved that $\forall A \in \mathcal{B}[\mathbb{R}] \mu(A) = \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$ which by definition means that

$$\mu \text{ is external regular} \quad (21.1009)$$

Next we have to prove external regular. Let $A \in \mathcal{B}[\mathbb{R}]$ then we have two possible cases:

$\mu(A) < \infty$. Define $\{C_i\}_{i \in \mathbb{N}} \subseteq \mathcal{B}[\mathbb{R}]$ by $C_i = [-i, i]$ and consider the measures $\mu_{[C_i]}: \mathcal{B}[\mathbb{R}] \rightarrow [0, \infty]$ where $\mu_{[C_i]}(B) = \mu(B \cap C_i)$ then from [theorem: 21.548] it follows that $\mu_{[C_i]}$ are finite. Let $\varepsilon \in \mathbb{R}^+$ then by [lemma: 21.538] there exist a open U_i and a closed set F_i such that $F_i \subseteq A \subseteq U_i$ and $\mu_{[C_i]}(U_i \setminus F_i) < \frac{\varepsilon}{2}$ $\xrightarrow{A \setminus F_i \subseteq U_i \setminus F_i}$ $\mu_{[C_i]}(A \setminus F_i) < \frac{\varepsilon}{2}$. To summarize we have

$$\forall i \in \mathbb{N} \text{ there exist a closed set } F_i \text{ such that } F_i \subseteq A \text{ and } \mu_{[C_i]}(A \setminus F_i) < \frac{\varepsilon}{2} \quad (21.1010)$$

As for $\{C_i\}_{i \in \mathbb{N}}$ we have that $\forall i \in \mathbb{N} \ C_i = [-i, i] \subseteq [-(i+1), i+1] = C_{i+1}$ and $\mathbb{R} = \bigcup_{i \in \mathbb{N}} [-i, i] \subseteq \bigcup_{i \in \mathbb{N}} [-i, i] \subseteq \mathbb{R}$ so that $\mathbb{R} = \bigcup_{i \in \mathbb{N}} C_i$. Hence for $\{A \cap C_i\}_{i \in \mathbb{N}} \subseteq \mathcal{B}[\mathbb{R}]$ we have that $\forall i \in \mathbb{N} \ A \cap C_i \subseteq A \cap C_{i+1}$ and $A = A \cap \mathbb{R} = A \cap (\bigcup_{i \in \mathbb{N}} C_i) = \bigcup_{i \in \mathbb{N}} (A \cap C_i)$. Hence by [theorem: 21.109] we have that

$$\mu(A) = \lim_{i \rightarrow \infty} \mu(A \cap C_i)$$

As $\mu(A) < \infty$ it follows from [theorem: 20.78] that

$$\exists N_\varepsilon \in \mathbb{N} \text{ such that } \mu(A) - \mu(A \cap C_{N_\varepsilon}) = \mu(A \setminus C_{N_\varepsilon}) < \frac{\varepsilon}{2} \quad (21.1011)$$

Now

$$\begin{aligned} \mu(A) - \mu(F_{N_\varepsilon} \cap C_{N_\varepsilon}) &\stackrel{[\text{eq: 21.1011}]}{<} \mu(A \cap C_{N_\varepsilon}) + \frac{\varepsilon}{2} - \mu(F_{N_\varepsilon} \cap C_{N_\varepsilon}) \\ &= \mu_{[C_{N_\varepsilon}]}(A) - \mu_{[C_{N_\varepsilon}]}(F_{N_\varepsilon}) + \frac{\varepsilon}{2} \\ &\stackrel{\mu_{[C_{N_\varepsilon}]} \text{ is finite}}{=} \mu_{[C_{N_\varepsilon}]}(A \setminus F_{N_\varepsilon}) + \frac{\varepsilon}{2} \\ &\stackrel{[\text{eq: 21.1010}]}{<} \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \\ &= \varepsilon \end{aligned}$$

hence

$$\mu(A) - \mu(F_{N_\varepsilon} \cap C_{N_\varepsilon}) < \varepsilon \quad (21.1012)$$

As $F_{N_\varepsilon} \cap C_{N_\varepsilon} = F_{N_\varepsilon} \cap [-N_\varepsilon, N_\varepsilon]$ is a closed set and $F_{N_\varepsilon} \cap C_{N_\varepsilon} \subseteq [-N_\varepsilon, N_\varepsilon]$, which is compact by Heine Borell [see theorem: 14.236], it follows from [theorem: 14.235] that $F_{N_\varepsilon} \cap C_{N_\varepsilon}$ is compact. So if we take $K_\varepsilon = F_{N_\varepsilon} \cap C_{N_\varepsilon} \subseteq F_{N_\varepsilon} \subseteq A$ then we have that

$$\forall \varepsilon \in \mathbb{R}^+ \text{ there exist a compact set } K_\varepsilon \text{ such that } K_\varepsilon \subseteq A \text{ and } \mu(A) - \mu(K_\varepsilon) < \varepsilon \quad (21.1013)$$

Assume now that $\sup(\{\mu(K) | K \subseteq A \wedge K \text{ is compact}\}) < \mu(A)$ then

$$\varepsilon = \mu(A) - \sup(\{\mu(K) | K \subseteq A \wedge K \text{ is compact}\}) < \mu(A) \in \mathbb{R}^+$$

so that by [eq: 21.1013] there exist a compact K_ε such that

$$K_\varepsilon \subseteq A \text{ and } \mu(A) - \mu(K_\varepsilon) < \mu(A) - \sup(\{\mu(K) | K \subseteq A \wedge K \text{ is compact}\})$$

from which it follows that

$$\sup(\{\mu(K) | K \subseteq A \wedge K \text{ is compact}\}) < \mu(K_\varepsilon) \leq \sup_{K_\varepsilon \subseteq A}(\{\mu(K) | K \subseteq A \wedge K \text{ is compact}\})$$

which is a contradiction. Hence the assumption is wrong and we must have

$$\mu(A) \leq \sup(\{\mu(K) | K \subseteq A \wedge K \text{ is compact}\}) \quad (21.1014)$$

If $x \in \sup(\{\mu(K) | K \subseteq A \wedge K \text{ is compact}\})$ then there exist a compact set $K \subseteq A$ such that $x = \mu(K) \leq \mu(A)$. Hence $\mu(A)$ is a upper bound of $\{\mu(K) | K \subseteq A \wedge K \text{ is compact}\}$ which proves that $\sup(\{\mu(K) | K \subseteq A \wedge K \text{ is compact}\}) \leq \mu(A)$. Combing this with [eq: 21.1014] gives us $\mu(A) = \sup(\{\mu(K) | K \subseteq A \wedge K \text{ is compact}\})$. Hence we have proved that

$$\forall A \in \mathcal{B}[\mathbb{R}] \text{ with } \mu(A) < \infty \text{ we have } \mu(A) = \sup(\{\mu(K) | K \subseteq A \wedge K \text{ is compact}\}) \quad (21.1015)$$

$\mu(A) = \infty$. Define $\{A_i\}_{i \in \mathbb{N}}$ by $A_i = A \cap]-i, i[$ then we have that

$$\forall i \in \mathbb{N} \quad A_i \subseteq A_{i+1} \text{ and } A = A \cap \mathbb{R} \underset{[\text{coroll: 10.30}]}{=} A \cap \left(\bigcup_{i \in \mathbb{N}}]-i, i[\right) = \bigcup_{i \in \mathbb{N}} A_i$$

Hence using [theorem: 21.109] we have that

$$\infty = \mu(A) = \lim_{i \rightarrow \infty} \mu(A_i) \quad (21.1016)$$

As $\forall i \in \mathbb{N}$ we have $\mu(A_i) \underset{A_i = A \cap]-i, i[}{\leq} \mu(]-i, i[) \underset{[\text{theorem: 21.548}]}{<} \infty$ we can use [eq: 21.1015] to get

$$\forall i \in \mathbb{N} \text{ we have } \mu(A_i) = \sup(\{\mu(K) \mid K \subseteq A_i \wedge K \text{ is compact}\}) \quad (21.1017)$$

As $\forall i \in \mathbb{N} \quad \mu(A_i) - 1 \underset{\mu(A_i) < \infty}{<} \mu(A_i) = \sup(\{\mu(K) \mid K \subseteq A_i \wedge K \text{ is compact}\})$ we have by the definition of the supremum that

$$\forall i \in \mathbb{N} \text{ there exist a compact set } K_i \text{ such that } K_i \subseteq A_i \text{ and } \mu(A_i) - 1 < \mu(K_i) \quad (21.1018)$$

Assume now that $\sup(\{\mu(K) \mid K \subseteq A \wedge K \text{ is compact}\}) < \infty$ then as $\lim_{i \rightarrow \infty} \mu(A_i) \underset{[\text{eq: 21.1016}]}{=} \infty$ we have by [theorem: 20.78] that there exist a $N \in \mathbb{N}$ such that $\sup(\{\mu(K) \mid K \subseteq A \wedge K \text{ is compact}\}) + 1 < \mu(A_N)$, as also $\mu(A_N) < \infty$ we have that

$$\sup(\{\mu(K) \mid K \subseteq A \wedge K \text{ is compact}\}) < \mu(A_N) - 1$$

Using [eq: 21.1018] there exist a K_N such that $K_N \subseteq A_N$ and $\mu(A_N) - 1 < \mu(K_N)$ then we have

$$\mu(K_N) \underset{K_N \subseteq A \wedge K_N \text{ is compact}}{\leq} \sup(\{\mu(K) \mid K \subseteq A \wedge K \text{ is compact}\}) < \mu(A_N) - 1 < \mu(K_N)$$

leading to the contradiction $\mu(K_N) < \mu(K_N)$. Hence the assumption is false and we must have that

$$\sup(\{\mu(K) \mid K \subseteq A \wedge K \text{ is compact}\}) = \infty = \mu(A)$$

So we have

$$\forall A \in \mathcal{B}[\mathbb{R}] \text{ we have } \mu(A) = \sup(\{\mu(K) \mid K \subseteq A \wedge K \text{ is compact}\})$$

which proves that

$$\mu \text{ is compact internal regular} \quad (21.1019)$$

As μ is external regular and compact internal regular [see eqs: 21.1009, 21.1019] it follows by [definition: 21.540] that

$$\mu \text{ is regular} \quad \square$$

We have a similar theorem for $\mathcal{B}[\mathbb{R}^n]$.

Lemma 21.552. *Let $n \in \mathbb{N}$ and $\mu: \mathcal{B}[\mathbb{R}^n] = \mathcal{B}[\mathbb{R}^n, \mathcal{T}_{\|\cdot\|_n}] \rightarrow [0, \infty]$ a compact finite measure then μ is regular.*

Proof. First we prove external regularity. Let $A \in \mathcal{B}[\mathbb{R}^n]$ then we have the following possible cases to consider:

$\mu(A) = \infty$. If U is a open set with $A \subseteq U$ then by the monotonicity of μ [see theorem: 21.106] it follows that $\infty = \mu(A) \leq \mu(U) \leq \infty \Rightarrow \mu(U) = \infty$. Hence $\infty \in \{\mu(U) \mid A \subseteq U \wedge U \text{ is open}\}$ so that $\infty \leq \inf(\{\mu(U) \mid A \subseteq U \wedge U \text{ is open}\}) \leq \infty$ proving that $\inf(\{\mu(U) \mid A \subseteq U \wedge U \text{ is open}\}) = \infty$. Hence

$$\mu(A) = \sup(\{\mu(U) \mid A \subseteq U \wedge U \text{ is open}\})$$

$\mu(A) < \infty$. If $x \in \{\mu(U) \mid A \subseteq U \wedge U \text{ is open}\}$ then $x = \mu(U)$ where U is a open set with $A \subseteq U$. By the monotonicity of μ [see theorem: 21.106] it follows that $\mu(A) \leq \mu(U) = x$ so that $\mu(A)$ is a lower bound of $\{\mu(U) \mid A \subseteq U \wedge U \text{ is open}\}$. Hence we have that

$$\mu(A) \leq \inf(\{\mu(U) \mid A \subseteq U \wedge U \text{ is open}\}) \quad (21.1020)$$

Assume that $\mu(A) < \inf(\{\mu(U) \mid A \subseteq U \wedge U \text{ is open}\})$. Let $\varepsilon \in \mathbb{R}^+$ and define $\{Q_i\}_{i \in \mathbb{N}} \subseteq \mathcal{I}_1 \subseteq \mathcal{I}_2$ by $Q_i =]-i, i[^n \in \mathcal{R}_1^n$ then by [theorem: 21.549] we have for $i \in \mathbb{N}$ that

$$\mu_{[Q_i]}: \mathcal{B}[\mathbb{R}^n] \rightarrow [0, \infty] \text{ defined by } \mu_{[Q_i]}(A) = \mu(A \cap Q_i) \text{ is a finite measure}$$

Hence using [lemma: 21.538] we have that there exists a open U_i and a closed set F_i such that

$$F_i \subseteq A \subseteq U_i \text{ and } \mu_{[Q_i]}(U_i \setminus F_i) < \frac{\varepsilon}{2^i}$$

As $F_i \subseteq A$ we have $U_i \setminus A \subseteq U_i \setminus F_i$ it follows from the monotonicity of μ [see theorem: 21.106] that $\mu_{[Q_i]}(U_i \setminus A) \leq \mu_{[Q_i]}(U_i \setminus F_i) < \frac{\varepsilon}{2^i}$. To summarize we have

$$\forall i \in \mathbb{N} \text{ there exist a open } U_i \text{ such that } A \subseteq U_i \text{ and } \mu_{[Q_i]}(U_i \setminus A) < \frac{\varepsilon}{2^{i+1}} \quad (21.1021)$$

Define now $U = \bigcup_{i \in \mathbb{N}} (U_i \cap Q_i)$ which is open as $U_i, Q_i =]-i, i[^n$ is open [see theorem: 21.70] Let $x \in A$ then as $\bigcup_{i \in \mathbb{N}} Q_i = \bigcup_{i \in \mathbb{N}}]-i, i[^n \stackrel{[\text{proposition: 21.66}]}{=} \mathbb{R}^n$ there exist a $i \in \mathbb{N}$ such that $x \in Q_i$, as further $A \subseteq U_i$ by [eq: 21.1021], it follows that $x \in U_i \cap Q_i \subseteq U$, hence it follows that $A \subseteq U$. Further

$$\begin{aligned} \mu(U \setminus A) &= \mu\left(\left(\bigcup_{i \in \mathbb{N}} (U_i \cap Q_i)\right) \setminus A\right) \\ &= \mu\left(\bigcup_{i \in \mathbb{N}} ((U_i \cap Q_i) \setminus A)\right) \\ &\stackrel{[\text{theorem: 21.95}]}{\leq} \sum_{i=1}^{\infty} \mu((U_i \cap Q_i) \setminus A) \\ &\stackrel{[\text{theorem: 1.33}]}{=} \sum_{i=1}^{\infty} \mu((U_i \setminus A) \cap Q_i) \\ &= \sum_{i=1}^{\infty} \mu_{[Q_i]}(U_i \setminus A) \\ &\stackrel{[\text{theorem: 14.378}] \wedge [\text{eq: 21.1021}]}{\leq} \sum_{i=1}^{\infty} \frac{\varepsilon}{2^{i+1}} \\ &= \frac{\varepsilon}{2} \cdot \sum_{i=1}^{\infty} \frac{1}{2^i} \\ &\stackrel{[\text{example: 14.354}]}{=} \frac{\varepsilon}{2} \\ &< \varepsilon \end{aligned}$$

Summarized we have

$$\forall \varepsilon \in \mathbb{R}^+ \text{ there exist a open set } U \text{ with } A \subseteq U \text{ and } \mu(U \setminus A) < \varepsilon \quad (21.1022)$$

From the above it follows, by using $\varepsilon = 1$, that there exist a V open such that $A \subseteq V$ and $\mu(V) - \mu(A) \stackrel{[\text{theorem: 21.106}]}{=} \mu(V \setminus A) < 1$ so that $\mu(V) < \infty$. Hence

$$\inf(\{\mu(U) \mid A \subseteq U \wedge U \text{ is open}\}) \leq \mu(V) < \infty$$

which proves that $\inf(\{\mu(U) \mid A \subseteq U \wedge U \text{ is open}\})$ is finite. As we have assumed that $\mu(A) < \inf(\{\mu(U) \mid A \subseteq U \wedge U \text{ is open}\})$ it follows that

$$\varepsilon = \inf(\{\mu(U) \mid A \subseteq U \wedge U \text{ is open}\}) - \mu(A) \in \mathbb{R}^+$$

So using [eq: 21.1022] there exist a open set U with $A \subseteq U$ such that $\mu(U \setminus A) < \varepsilon$. As $U \stackrel{A \subseteq U}{=} (U \setminus A) \cup A$, we have

$$\begin{aligned} \mu(U) &= \mu(U \setminus A) + \mu(A) \\ &< \varepsilon + \mu(A) \\ &= \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) - \mu(A) + \mu(A) \\ &= \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) \\ &\leq \mu(U) \\ &\quad A \subseteq U \text{ open} \end{aligned}$$

leading to the contradiction $\mu(U) < \mu(U)$ from which it follows that the assumption $\mu(A) < \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$ is false. Hence $\inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\}) \leq \mu(A)$ which combined with [eq: 21.1020] proves that

$$\mu(A) = \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$$

Hence we have proved that $\forall A \in \mathcal{B}[\mathbb{R}^n]$ $\mu(A) = \inf(\{\mu(U) | A \subseteq U \wedge U \text{ is open}\})$ which by definition means that

$$\mu \text{ is external regular} \quad (21.1023)$$

Next we have to prove external regularity. Let $A \in \mathcal{B}[\mathbb{R}^n]$ then we have two possible cases:

$\mu(A) < \infty$. Define $\{C_i\}_{i \in \mathbb{N}} \subseteq \mathcal{B}[\mathbb{R}^n]$ by $C_i = [-i, i]^n$ and consider the measures $\mu_{[C_i]}: \mathcal{B}[\mathbb{R}^n] \rightarrow [0, \infty]$ where $\mu_{[C_i]}(B) = \mu(B \cap C_i)$ then from [theorem: 21.548] it follows that the measures $\mu_{[C_i]}$ are finite. Let $\varepsilon \in \mathbb{R}^+$ then by [lemma: 21.538] there exist a open U_i and a closed set F_i such that $F_i \subseteq A \subseteq U_i$ and $\mu_{[C_i]}(U_i \setminus F_i) < \frac{\varepsilon}{2}$ $A \setminus F_i \stackrel{\supseteq U_i \setminus F_i}{\Rightarrow} \mu_{[C_i]}(A \setminus F_i) < \frac{\varepsilon}{2}$. To summarize we have

$$\forall i \in \mathbb{N} \text{ there exist a closed set } F_i \text{ such that } F_i \subseteq A \text{ and } \mu_{[C_i]}(A \setminus F_i) < \frac{\varepsilon}{2} \quad (21.1024)$$

As for $\{C_i\}_{i \in \mathbb{N}}$ we have that $\forall i \in \mathbb{N}$ $C_i = [-i, i]^n \subseteq [-(i+1), i+1]^n = C_{i+1}$ and $\mathbb{R}^n \stackrel{=}{=} \bigcup_{i \in \mathbb{N}} [-i, i]^n = \bigcup_{i \in \mathbb{N}} C_i$. Hence for $\{A \cap C_i\}_{i \in \mathbb{N}} \subseteq \mathcal{B}[\mathbb{R}^n]$ we have that $\forall i \in \mathbb{N}$ $A \cap C_i \subseteq A \cap C_{i+1}$ and $A = A \cap \mathbb{R}^n = A \cap (\bigcup_{i \in \mathbb{N}} C_i) = \bigcup_{i \in \mathbb{N}} (A \cap C_i)$. So using [theorem: 21.109] we have that

$$\mu(A) = \lim_{i \rightarrow \infty} \mu(A \cap C_i)$$

As $\mu(A) < \infty$ it follows from [theorem: 20.78] that

$$\exists N_\varepsilon \in \mathbb{N} \text{ such that } \mu(A) - \mu(A \cap C_{N_\varepsilon}) \stackrel{A \cap C_{N_\varepsilon} \subseteq A}{=} |\mu(A) - \mu(A \cap C_{N_\varepsilon})| < \frac{\varepsilon}{2} \quad (21.1025)$$

Now

$$\begin{aligned} \mu(A) - \mu(F_{N_\varepsilon} \cap C_{N_\varepsilon}) &\stackrel{[\text{eq: 21.1025}]}{<} \mu(A \cap C_{N_\varepsilon}) + \frac{\varepsilon}{2} - \mu(F_{N_\varepsilon} \cap C_{N_\varepsilon}) \\ &= \mu_{[C_{N_\varepsilon}]}(A) - \mu_{[C_{N_\varepsilon}]}(F_{N_\varepsilon}) + \frac{\varepsilon}{2} \\ &\stackrel{\mu_{[C_{N_\varepsilon}]} \text{ is finite} \wedge [\text{theorem: 21.106}]}{=} \mu_{[C_{N_\varepsilon}]}(A \setminus F_{N_\varepsilon}) + \frac{\varepsilon}{2} \\ &\stackrel{[\text{eq: 21.1024}]}{<} \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \\ &= \varepsilon \end{aligned}$$

hence

$$\mu(A) - \mu(F_{N_\varepsilon} \cap C_{N_\varepsilon}) < \varepsilon \quad (21.1026)$$

As $F_{N_\varepsilon} \cap C_{N_\varepsilon} = F_{N_\varepsilon} \cap [-N_\varepsilon, N_\varepsilon]^n$ is a closed set and $F_{N_\varepsilon} \cap C_{N_\varepsilon} \subseteq [-N_\varepsilon, N_\varepsilon]^n$, which is compact by Heine Borell [see theorem: 14.236], it follows from [theorem: 14.235] that $F_{N_\varepsilon} \cap C_{N_\varepsilon}$ is compact. So if we take $K_\varepsilon = F_{N_\varepsilon} \cap C_{N_\varepsilon} \subseteq F_{N_\varepsilon} \subseteq A$ then we have that [eq: 21.1024]

$$\forall \varepsilon \in \mathbb{R}^+ \text{ there exist a compact set } K_\varepsilon \text{ such that } K_\varepsilon \subseteq A \text{ and } \mu(A) - \mu(K_\varepsilon) < \varepsilon \quad (21.1027)$$

Assume now that $\sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\}) < \mu(A)$ then

$$\varepsilon = \mu(A) - \sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\}) < \mu(A) \in \mathbb{R}^+$$

so that by [eq: 21.1027] there exist a compact K_ε such that

$$K_\varepsilon \subseteq A \text{ and } \mu(A) - \mu(K_\varepsilon) < \mu(A) - \sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\})$$

from which it follows that

$$\sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\}) < \mu(K_\varepsilon) \leq \sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\})$$

which is a contradiction. Hence the assumption is wrong and we must have

$$\mu(A) \leq \sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\}) \quad (21.1028)$$

If $x \in \{\mu(K)|K \subseteq A \wedge K \text{ is compact}\}$ then there exist a compact set $K \subseteq A$ such that $x = \mu(K) \leq \mu(A)$. Hence $\mu(A)$ is a upper bound of $\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\}$ which proves that $\sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\}) \leq \mu(A)$. Combing this with [eq: 21.1028] gives us $\mu(A) = \sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\})$. Hence we have proved that

$$\forall A \in \mathcal{B}[\mathbb{R}] \text{ with } \mu(A) < \infty \text{ we have } \mu(A) = \sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\}) \quad (21.1029)$$

$\mu(A) = \infty$. Define $\{A_i\}_{i \in \mathbb{N}}$ by $A_i = A \cap]-i, i[^n$ then we have that

$$\forall i \in \mathbb{N} \ A_i \subseteq A_{i+1} \text{ and } A = A \cap \mathbb{R}^n \stackrel{[\text{proposition: 21.66}]}{=} A \cap \left(\bigcup_{i \in \mathbb{N}}]-i, i[^n \right) = \bigcup_{i \in \mathbb{N}} A_i$$

Hence using [theorem: 21.109] we have that

$$\infty = \mu(A) = \lim_{i \rightarrow \infty} \mu(A_i) \quad (21.1030)$$

As $\forall i \in \mathbb{N}$ we have $\mu(A_i) \leq \mu(]-i, i[^n) \stackrel{[\text{theorem: 21.548}]}{<} \infty$ we can use [eq: 21.1029] to get

$$\forall i \in \mathbb{N} \text{ we have } \mu(A_i) = \sup(\{\mu(K)|K \subseteq A_i \wedge K \text{ is compact}\}) \quad (21.1031)$$

As $\forall i \in \mathbb{N} \ \mu(A_i) - 1 < \mu(A_i) = \sup(\{\mu(K)|K \subseteq A_i \wedge K \text{ is compact}\})$ we have by the definition of the supremum that

$$\forall i \in \mathbb{N} \text{ there exist a compact set } K_i \text{ such that } K_i \subseteq A_i \text{ and } \mu(A_i) - 1 < \mu(K_i) \quad (21.1032)$$

Assume now that $\sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\}) < \infty$ then we have from $\lim_{i \rightarrow \infty} \mu(A_i) \stackrel{[\text{eq: 21.1030}]}{=} \infty$ by [theorem: 20.78] that there exist a $N \in \mathbb{N}$ such that $\sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\}) + 1 < \mu(A_N)$, as also $\mu(A_N) < \infty$ we have that

$$\sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\}) < \mu(A_N) - 1$$

Using [eq: 21.1032] there exist a K_N such that $K_N \subseteq A_N$ and $\mu(A_N) - 1 < \mu(K_N)$ then we have

$$\mu(K_N) \leq \sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\}) < \mu(A_N) - 1 < \mu(K_N)$$

leading to the contradiction $\mu(K_N) < \mu(K_N)$. Hence the assumption is false and we must have that

$$\sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\}) = \infty = \mu(A)$$

So we have

$$\forall A \in \mathcal{B}[\mathbb{R}] \text{ we have } \mu(A) = \sup(\{\mu(K)|K \subseteq A \wedge K \text{ is compact}\})$$

which proves that

$$\mu \text{ is compact internal regular} \quad (21.1033)$$

As μ is external regular and compact internal regular [see eqs: 21.1023, 21.1033] it follows by [definition: 21.540] that

μ is regular $\square$

Lemma 21.553.

1. The Borel measure in $\langle \mathbb{R}, \mathcal{B}[\mathbb{R}], \lambda \rangle$ [see theorem: 21.177] is locally finite.
2. For $n \in \mathbb{N}$ the Borel measure in $\langle \mathbb{R}^n, \mathcal{B}[\mathbb{R}], \lambda^n \rangle$ [see theorem: 21.200] is locally finite.

Proof.

1. If $x \in \mathbb{R}$ then $x \in]x-1, x+1[$ so that

$$\lambda(]x-1, x+1[) \underset{[\text{theorem: 21.106}]}{\leq} \lambda([x-1, x+1]) \underset{[\text{theorem: 21.177}]}{=} \text{len}([x-1, x+1]) = 2 < \infty.$$

Hence $\lambda(]x-1, x+1[) < \infty$ which as $x \in]x-1, x+1[$ is open proves that λ is locally finite.

2. If $x = (x_1, \dots, x_n) \in \mathbb{R}^n$ then $x \in \prod_{i \in \{1, \dots, n\}}]x_i-1, x_i+1[$ a open set and

$$\begin{aligned} \lambda^n \left(\prod_{i \in \{1, \dots, n\}}]x_i-1, x_i+1[\right) &\underset{[\text{theorem: 21.106}]}{\leq} \lambda^n \left(\prod_{i \in \{1, \dots, n\}} [x_i-1, x_i+1[\right) \\ &\underset{[\text{theorem: 21.200}]}{=} \text{vol}^n \left(\prod_{i \in \{1, \dots, n\}} [x_i-1, x_i+1[\right) \\ &= \prod_{i=1}^n 2 \\ &= 2^n \\ &< \infty \end{aligned}$$

which proves that λ^n is locally finite. $\square$

Now we are ready to prove that λ and λ^n are Radon measures.

Theorem 21.554.

1. The Borel measure λ in $\langle \mathbb{R}, \mathcal{B}[\mathbb{R}], \lambda \rangle$ is a Radon measure.
2. Let $n \in \mathbb{N}$ then the Borel measure λ^n in $\langle \mathbb{R}^n, \mathcal{B}[\mathbb{R}^n], \lambda^n \rangle$ is a Radon measure.

Proof. First to that $\mathcal{T}_{||}$ and $\mathcal{T}_{|||n}$ are Hausdorff [see theorem: 14.214]

1. Using [lemma: 21.553] λ is locally finite so that by [theorem: 21.546] λ is locally compact, hence by [lemma: 21.551] λ is a Radon measure. As λ is also locally finite we have by [definition: 21.540] that λ is a Radon measure.
2. Using [lemma: 21.553] λ^n is locally finite so that by [theorem: 21.546] λ^n is locally compact, hence by [lemma: 21.552] λ^n is a Radon measure. As λ^n is also locally finite we have by [definition: 21.540] that λ^n is a Radon measure. $\square$

21.8.1.3 Translation invariance and Radon Measures

Theorem 21.555. Let $\langle X, ||| \rangle$ be a normed space with the norm topology $\mathcal{T}_{|||}$ then

1. $\forall x \in X$ and $\forall A \in \mathcal{B}[X, \mathcal{T}_{|||}]$ we have

$$x + A \in \mathcal{B}[X, \mathcal{T}_{|||}]$$

where $x + A = \{x + a \mid a \in A\} = \{a + x \mid a \in A\} = x + A.$

2. $\forall \alpha \in \mathbb{K}$ and $\forall A \in \mathcal{B}[X, \mathcal{T}_{|||}]$ we have

$$\alpha \cdot A \in \mathcal{B}[X, \mathcal{T}_{|||}]$$

where $\alpha \cdot A = \{\alpha \cdot a | a \in A\}$

Proof.

1. Take $x \in X$ then by [theorem: 14.162] $\delta_{-x}: X \rightarrow X$ defined by $\delta_{-x}(y) = -x + y$ is a continuous function. Hence by [theorem: 21.45] we have that

$$\forall A \in \mathcal{B}[X, \mathcal{T}_{|||}] \text{ that } \delta_{-x}^{-1}(A) \in \mathcal{B}[X, \mathcal{T}_{|||}] \quad (21.1034)$$

Further

$$\begin{aligned} y \in \delta_{-x}^{-1}(A) &\Leftrightarrow \delta_{-x}(y) \in A \\ &\Leftrightarrow -x + y \in A \\ &\Leftrightarrow y = x + (-x + y) \text{ where } (-x + y) \in A \\ &\Leftrightarrow y = x + a \text{ where } a \in A \\ &\Leftrightarrow y \in x + A \end{aligned}$$

which proves that $\delta_{-x}^{-1}(A) = x + A$. Combining this with [eq: 21.1034] proves that

$$\forall x \in X \text{ and } \forall A \in \mathcal{B}[X, \mathcal{T}_{|||}] \text{ we have } x + A \in \mathcal{B}[X, \mathcal{T}_{|||}]$$

2. Take $\alpha \in \mathbb{K}$ and $A \in \mathcal{B}[X, \mathcal{T}_{|||}]$ then we have two cases for α to consider:

$\alpha = 0$. For A we have either:

$$A = \emptyset. \text{ Then } \alpha \cdot A = \emptyset \in \mathcal{B}[X, \mathcal{T}_{|||}]$$

$A \neq \emptyset$. Then $\alpha \cdot A = \{0\}$ which is closed [see theorems: 14.205, 14.207] so that by [theorem: 21.44] $\alpha \cdot A \in \mathcal{B}[X, \mathcal{T}_{|||}]$.

$\alpha \neq 0$. Using [theorem: 14.145] the function $\mu_{1 \setminus \alpha}: X \rightarrow X$ by $\mu_{1 \setminus \alpha}(x) = \frac{1}{\alpha} \cdot x$ is a continuous function. Hence by [theorem: 21.45] we have that

$$\mu_{1 \setminus \alpha}^{-1}(A) \in \mathcal{B}[X, \mathcal{T}_{|||}] \quad (21.1035)$$

Further

$$\begin{aligned} y \in \mu_{1 \setminus \alpha}^{-1}(A) &\Leftrightarrow \mu_{1 \setminus \alpha}(y) \in A \\ &\Leftrightarrow \frac{1}{\alpha} \cdot y \in A \\ &\Leftrightarrow y = \alpha \cdot \left(\frac{1}{\alpha} \cdot y \right) \text{ where } \frac{1}{\alpha} \cdot y \in A \\ &\Leftrightarrow y = \alpha \cdot a \text{ where } a \in A \\ &\Leftrightarrow y \in \alpha \cdot A \end{aligned}$$

which proves that $\mu_{1 \setminus \alpha}^{-1}(A) = \frac{1}{\alpha} \cdot A$. Combining this with [eq: 21.1035] proves that

$$\alpha \cdot A \in \mathcal{B}[X, \mathcal{T}_{|||}]$$

In other words we have

$$\forall \alpha \in \mathbb{K} \text{ and } \forall A \in \mathcal{B}[X, \mathcal{T}_{|||}] \text{ that } \alpha \cdot A \in \mathcal{B}[X, \mathcal{T}_{|||}] \quad \square$$

Definition 21.556. Let $\langle X, ||| \rangle$ be a normed space with the normed topology $\mathcal{T}_{|||}$ then a measure $\mu: \mathcal{B}[X, \mathcal{T}_{|||}] \rightarrow [0, \infty]$ is translation invariant if $\forall x \in X$ and $\forall A \in \mathcal{B}[X, \mathcal{T}_{|||}]$ we have that

$$\mu(A + x) = \mu(A) \text{ where } A + x = \{a + x | a \in A\} = \{x + a | a \in A\} = x + A$$

Note 21.557. Using [corollary: 21.46] we have that $\forall x \in X$ we have $\forall A \in \mathcal{B}[X, \mathcal{T}_{|||}]$ that $x + A \in \mathcal{B}[X, \mathcal{T}_{|||}]$ so that $\mu(x + A)$ makes sense.

We prove now that λ and λ^n are translation invariant, first we need a little lemma:

Lemma 21.558. *Let X be a vector space, $x \in X$, I a set and $\{A_i\}_{i \in I} \subseteq \mathcal{P}(X)$ then we have:*

1. *If $\{A_i\}_{i \in I}$ is pairwise disjoint then $\{A_i + x\}_{i \in I}$ is pairwise disjoint.*
2. $(\bigcup_{i \in I} A_i) + x = \bigcup_{i \in I} (A_i + x)$

Proof.

1. Let $(i, j) \in I$ with $i \neq j$. Assume that $(A_i + x) \cap (A_j + x) \neq \emptyset$ then there exist a $y \in (A_i + x) \cap (A_j + x)$ from which it follows that there exists $a_i \in A_i$ and $a_j \in A_j$ such that $a_i + x = y = a_j + x$, hence $a_i = a_j$ which leads to the contradiction $a_i \in A_i \cap A_j = \emptyset$. Hence the assumption is false and we must conclude that $(A_i + x) \cap (A_j + x) = \emptyset$.
2. We have

$$\begin{aligned} y \in \left(\bigcup_{i \in I} A_i \right) + x &\Leftrightarrow \exists a \in \bigcup_{i \in I} A_i \text{ such that } y = a + x \\ &\Leftrightarrow \exists i \in I \text{ such that } a \in A_i \text{ and } y = a + x \\ &\Leftrightarrow \exists i \in I \text{ such that } y \in A_i + x \\ &\Leftrightarrow y \in \bigcup_{i \in I} (A_i + x) \end{aligned}$$

which proves that

$$\left(\bigcup_{i \in I} A_i \right) + x = \bigcup_{i \in I} (A_i + x) \quad \square$$

Theorem 21.559. *The Borel measure λ in the measure space $\langle \mathbb{R}, \mathcal{B}[\mathbb{R}], \lambda \rangle$ is translation invariant.*

Proof. Let $x \in \mathbb{R}$ and define

$$\lambda_x: \sigma[\mathcal{S}_{[]} = \mathcal{B}[\mathbb{R}] \rightarrow [0, \infty] \text{ by } \lambda_x(A) = \lambda(A + x)$$

where λ is the Borel measure on $\sigma[\mathcal{S}_{[]}]$ [see theorem: 21.177]. Then we have that

$$\lambda_x(\emptyset) = \lambda(\emptyset + x) = \lambda(\emptyset) = 0 \quad (21.1036)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{B}[\mathbb{R}]$ be pairwise disjoint then by [lemma: 21.558] we have that

$$\{A_i + x\}_{i \in \mathbb{N}} \subseteq \mathcal{B}[\mathbb{R}] \text{ is pairwise disjoint} \quad (21.1037)$$

and

$$\left(\bigsqcup_{i \in \mathbb{N}} A_i \right) + x = \bigsqcup_{i \in \mathbb{N}} (A_i + x) \quad (21.1038)$$

Hence we have

$$\begin{aligned} \lambda_x \left(\bigsqcup_{i \in \mathbb{N}} A_i \right) &= \lambda \left(\left(\bigsqcup_{i \in \mathbb{N}} A_i \right) + x \right) \\ &\stackrel{[\text{eq: 21.1038}]}{=} \lambda \left(\bigsqcup_{i \in \mathbb{N}} (A_i + x) \right) \\ &\stackrel{[\text{eq: 21.1037}] \wedge \lambda \text{ is a measure}}{=} \sum_{i=1}^{\infty} \lambda(A_i + x) \\ &= \sum_{i=1}^{\infty} \lambda_x(A_i) \end{aligned}$$

which together with [eq: 21.1036] proves that

$$\lambda_x: \sigma[\mathcal{S}_{[]} = \mathcal{B}[\mathbb{R}] \rightarrow [0, \infty] \text{ is a measure}$$

Let $A \in \mathcal{S}_{[]} = \mathcal{I}_{[]} \cup \{\emptyset\}$ then we have for A either:

$$A = \emptyset. \text{ Then } \lambda_x(A) = \lambda_x(\emptyset) = \text{len}(\emptyset) = \text{len}(A).$$

$A \in \mathcal{I}_{\mathbb{I}}$. Then there exists $a, b \in \mathbb{R}$ with $a < b$ such that $A = [a, b[$. Hence

$$\begin{aligned}
 y \in A + x &\Leftrightarrow y \in [a, b[+ x \\
 &\Leftrightarrow \exists y' \in [a, b[\text{ with } y = y' + x \\
 &\Leftrightarrow y - x \in [a, b[\\
 &\Leftrightarrow a \leq y - x \leq b \\
 &\Leftrightarrow a + x \leq y \leq b + x \\
 &\Leftrightarrow y \in [a + x, b + x[
 \end{aligned}$$

which proves that

$$A + x = [a + x, b + x[\quad (21.1039)$$

Nect

$$\begin{aligned}
 \lambda_x(A) &= \lambda(A + x) \\
 &\stackrel{[\text{eq: 21.1039}]}{=} \lambda([a + x, b + x[) \\
 &\stackrel{[\text{theorem: 21.177}]}{=} \text{len}([a + x, b + x[) \\
 &= b + x - (a + x) \\
 &= b - a \\
 &= \text{len}([a, b[)
 \end{aligned}$$

so that $\lambda_x(A) = \text{len}(A)$.

So we have proves that $\lambda_x|_{\mathcal{S}_{\mathbb{I}}} = \text{len}$ which by [theorem: 21.177] proves that $\lambda_x = \lambda$ or in other words we have

$$\forall A \in \mathcal{B}[\mathbb{R}] \text{ we have } \lambda(A + x) = \lambda_x(A) = \lambda(A) \quad \square$$

Theorem 21.560. *Let $n \in \mathbb{N}$, then the Borel measure λ^n in $(\mathbb{R}^n, \mathcal{B}[\mathbb{R}^n], \lambda^n)$ is translation invariant.*

Proof. Let $x \in \mathbb{R}^n$ and define

$$\lambda_x^n: \sigma[\mathcal{R}_{\mathbb{I}} \cup \{\emptyset\}] = \mathcal{B}[\mathbb{R}^n] \rightarrow [0, \infty] \text{ by } \lambda_x^n(A) = \lambda^n(A + x)$$

where λ^n is the Borel measure defined in [theorem: 21.200]. Then we have that

$$\lambda_x^n(\emptyset) = \lambda^n(\emptyset + x) = \lambda^n(\emptyset) = 0 \quad (21.1040)$$

Let $\{A_i\}_{i \in \mathbb{N}} \subseteq \mathcal{R}_{\mathbb{I}} \cup \{\emptyset\} = \mathcal{B}[\mathbb{R}^n]$ pairwise disjoint then by [lemma: 21.558]

$$\{A_i\}_{i \in \mathbb{N}} \text{ is pairwise disjoint} \quad (21.1041)$$

and

$$\left(\bigsqcup_{i \in \mathbb{N}} A_i \right) + x = \bigsqcup_{i \in \mathbb{N}} (A_i + x) \quad (21.1042)$$

Hence we have that

$$\begin{aligned}
 \lambda_x^n \left(\bigsqcup_{i \in \mathbb{N}} A_i \right) &= \lambda^n \left(\left(\bigsqcup_{i \in \mathbb{N}} A_i \right) + x \right) \\
 &\stackrel{[\text{eq: 21.1042}]}{=} \lambda^n \left(\bigsqcup_{i \in \mathbb{N}} (A_i + x) \right) \\
 &\stackrel{[\text{eq: 21.1041}]}{=} \sum_{i=1}^{\infty} \lambda^n(A_i + x) \quad \text{is a measure} \\
 &= \sum_{i=1}^{\infty} \lambda_x^n(A_i)
 \end{aligned}$$

which together with [eq: 21.1040] proves that

$$\lambda_x^n: \sigma[\mathcal{R}_{||}^n \cup \{\emptyset\}] = \mathcal{B}[\mathbb{R}^n] \text{ is a measure on } \mathcal{R}_{||}^n \cup \{\emptyset\}$$

Let $A \in \mathcal{R}_{||}^n \cup \{\emptyset\}$ then we have either:

$$A = \emptyset. \text{ Then } \lambda_x^n(A) = \lambda_x^n(\emptyset) = \lambda^n(\emptyset + x) = \lambda^n(\emptyset) = 0 = \text{vol}^n(\emptyset)$$

$$A = \mathcal{R}_x^n. \text{ Then there exist } a, b \in \mathbb{R}^n \text{ with } a < b \text{ such that } A = [a, b[. \text{ Hence we have}$$

$$\begin{aligned} y \in A + x &\Leftrightarrow y \in [a, b[+ x \\ &\Leftrightarrow \exists t \in [a, b[\text{ such that } y = t + x \\ &\Leftrightarrow \exists t \in \mathbb{R}^n \text{ such that } \forall i \in \{1, \dots, n\} \ a_i \leq t_i < b_i \text{ and } y_i = t_i + x_i \\ &\Leftrightarrow \forall i \in \{1, \dots, n\} \text{ we have } a_i \leq y_i - x_i < b_i \\ &\Leftrightarrow \forall i \in \{1, \dots, n\} \text{ we have } a_i + x_i \leq y_i < b_i + x_i \\ &\Leftrightarrow y \in [a + x, b + x[\end{aligned}$$

proving that

$$A + x = [a + x, b + x[\quad (21.1043)$$

Next

$$\begin{aligned} \lambda_x^n(A) &= \lambda^n(A + x) \\ &\stackrel{[\text{eq: 21.1043}]}{=} \lambda^n([a + x, b + x[) \\ &\stackrel{[\text{theorem: 21.200}]}{=} \text{vol}^n([a + x, b + x[) \\ &= \prod_{i=1}^n (b_i + x_i - (a_i + x_i)) \\ &= \prod_{i=1}^n (b_i - a_i) \\ &= \text{vol}^n([a, b[) \\ &= \text{vol}^n(A) \end{aligned}$$

$$\text{so that } \lambda_x^n(A) = \text{vol}^n(A).$$

So we have proved that $(\lambda_x^n)_{|\mathcal{R}_{||}^n \cup \{\emptyset\}} = \text{vol}^n$ from which it follows by [theorem: 21.200] that $\lambda_x^n = \lambda^n$. Hence if $A \in \mathcal{B}[\mathbb{R}^n] = \sigma[\mathcal{R}_{||}^n \cup \{\emptyset\}]$ then we have

$$\lambda^n(A + x) = \lambda_x^n(A) = \lambda^n(A) \quad \square$$

We prove now a surprising relation between all translation invariant Radon measures on $\mathbb{R}$ or $\mathbb{R}^n$ and the Borel measures λ and λ^n .

Theorem 21.561. *Let $\mu: \mathcal{B}[\mathbb{R}] \rightarrow [0, \infty]$ a translation invariant Radon measure then*

$$\forall A \in \mathcal{B}[\mathbb{R}] \text{ we have } \mu(A) = \mu([0, 1]) \cdot \lambda(A)$$

or in other words we have that

$$\mu = \mu([0, 1]) \cdot \lambda$$

Proof. First we calculate $\mu([0, 1])$ in terms of Dyadic intervals. Given $N \in \mathbb{N}$ consider the family $\{a_i\}_{i \in \{1, \dots, 2^N+1\}}$ by $a_i = \frac{i-1}{2^N}$ then we have $a_1 = 0 \wedge a_{2^N+1} = 1$ and $\forall i \in \{1, \dots, 2^N\}$ we have $a_i = \frac{i-1}{2^N} < \frac{i}{2^N} = a_{i+1}$. Then from [lemma: 21.192] it follows that

$$\forall N \in \mathbb{N} \text{ we have } \left\{ \left[\frac{i-1}{2^N}, \frac{i}{2^N} \right[\right\}_{i \in \{1, \dots, 2^N\}} = \{[a_i, a_{i+1}[]\}_{i \in \{1, \dots, 2^N\}} \text{ is pairwise disjoint} \quad (21.1044)$$

and

$$\forall N \in \mathbb{N} \text{ we have } [0, 1[= \bigsqcup_{i \in \{1, \dots, 2^N\}} [a_i, a_{i+1}[= \bigsqcup_{i \in \{1, \dots, 2^N\}} \left[\frac{i-1}{2^N}, \frac{i}{2^N} \right[\quad (21.1045)$$

Let $i \in \{1, \dots, 2^N\}$ then we have

$$\begin{aligned} y \in \left[\frac{i-1}{2^N}, \frac{i}{2^N} \right[&\Leftrightarrow \frac{i-1}{2^N} \leq y < \frac{i}{2^N} \\ &\Leftrightarrow 0 \leq y - \frac{i-1}{2^N} < \frac{1}{2^N} \\ &\Leftrightarrow y - \frac{i-1}{2^N} \in \left[0, \frac{1}{2^N} \right[\\ &\Leftrightarrow y \in \left[0, \frac{1}{2^N} \right[+ \frac{i-1}{2^N} \end{aligned}$$

so that

$$\mu\left(\left[\frac{i-1}{2^N}, \frac{i}{2^N}\right[\right) = \mu\left(\left[0, \frac{1}{2^N}\right[+ \frac{i-1}{2^N}\right) = \mu\left(\left[0, \frac{1}{2^N}\right[\right) \quad (21.1046)$$

Next

$$\begin{aligned} \mu([0, 1[) &\stackrel{[\text{eq: } 21.1045]}{=} \mu\left(\bigsqcup_{i \in \{1, \dots, 2^N\}} \left[\frac{i-1}{2^N}, \frac{i}{2^N}\right[\right) \\ &\stackrel{[\text{eqs: } 21.1044]}{=} \sum_{i=1}^{2^N} \mu\left(\left[\frac{i-1}{2^N}, \frac{i}{2^N}\right[\right) \\ &\stackrel{[\text{eq: } 21.1046]}{=} \sum_{i=1}^{2^N} \mu\left(\left[0, \frac{1}{2^N}\right[\right) \\ &= 2^N \cdot \mu\left(\left[0, \frac{1}{2^N}\right[\right) \end{aligned}$$

so that

$$\mu([0, 1[) = 2^N \cdot \mu\left(\left[0, \frac{1}{2^N}\right[\right) \quad (21.1047)$$

□

Chapter 22

Affine Spaces

22.1 Definition and properties

Definition 22.1. Let $n \in \mathbb{N}$ then a **real affine space of dimension n** is a pair $\langle \mathbb{A}^n, V \rangle$ where $\mathbb{A}$ is a set called the **set of points** and $\langle V, +, \cdot \rangle$ is a n -dimensional vector space over the field $\mathbb{R}$ called the **space of displacements** or the **space of free vectors** together with a operator

$$\ominus: \mathbb{A}^n \times \mathbb{A}^n \rightarrow V$$

satisfying:

1. $\forall P, Q, R \in \mathbb{A}^n$ we have $(P \ominus Q) + (Q \ominus R) = P \ominus R$
2. $\forall P \in \mathbb{A}^n, \forall \vec{v} \in V$ there exist a **unique** $Q \in \mathbb{A}^n$ such that $\vec{v} = Q \ominus P$. In other words if $Q \ominus P = \vec{v} = Q' \ominus P$ then $Q = Q'$.

Notation 22.2. We use the following notation conventions:

1. Elements of $\mathbb{A}^n$ are called points and are noted as upper case symbols. Examples are P, R, R, P_1, P_2 , etc.
2. Elements of V are called vectors and are noted with a lower case letter beneath a arrow. Examples are $\vec{v}, \vec{u}, \vec{v}_1$ etc.
3. If $(P, \vec{v}) \in \mathbb{A}^n \times V$ then the **unique** point $Q \in \mathbb{A}^n$ such that $\vec{v} = Q \ominus P$ is noted as $P \oplus \vec{v}$. Using this notation we have that $Q = P \oplus \vec{v} \in \mathbb{A}^n$ and $(P \oplus \vec{v}) \ominus P = \vec{v} \quad \forall (P, \vec{v}) \in \mathbb{A}^n \times V$
4. The operators $+, \cdot, -$ are always the traditional operators in the vector space $\langle V, +, \cdot \rangle$ and the field $\langle \mathbb{R}, +, \cdot \rangle$.

A trivial example of a affine space is the following

Example 22.3. Let $n \in \mathbb{N}$ then $\langle \mathbb{A}^n, V \rangle$ where $\mathbb{A}_1^n = \mathbb{R}^n$ the set of points and $\langle V, +, \cdot \rangle = \langle \mathbb{R}^n, +, \cdot \rangle$ and $\ominus = -$ is a real affine space of dimension n .

Proof. Using [theorem: 11.70] $\langle \mathbb{R}, +, \cdot \rangle$ is a vector space. Let $P, Q, R \in \mathbb{R}^n$ then $P = (p_1, \dots, p_n)$, $Q = (q_1, \dots, q_n)$ and $R = (r_1, \dots, r_n)$ then

$$\begin{aligned} (P \ominus Q) + (Q \ominus R) &= (P - Q) + (Q - R) \\ &= ((p_1, \dots, p_n) - (q_1, \dots, q_n)) + ((q_1, \dots, q_n) - (r_1, \dots, r_n)) \\ &= (p_1 - q_1, \dots, p_n - q_n) + (q_1 - r_1, \dots, q_n - r_n) \\ &= (p_1 - q_1 + q_1 - r_1, \dots, p_n - q_n + q_n - r_n) \\ &= (p_1 - r_1, \dots, p_n - r_n) \\ &= (p_1, \dots, p_n) - (r_1, \dots, r_n) \\ &= (P \ominus R) \end{aligned}$$

Hence

$$\forall P, Q, R \in \mathbb{R}^n \text{ we have } (P \ominus Q) + (Q \ominus R) = P \ominus R$$

Further if $P = (p_1, \dots, p_n) \in \mathbb{R}^n$ and $\vec{v} = (v_1, \dots, v_n) \in \mathbb{R}^n$ then if we take $Q = (p_1 + v_1, \dots, p_n + v_n)$ we have

$$Q \ominus P = (p_1 + v_1, \dots, p_n + v_n) - (p_1, \dots, p_n) = (p_1 + v_1 - p_1, \dots, p_n + v_n - p_n) = (v_1, \dots, v_n) = \vec{v}$$

Hence

$$\forall P \in \mathbb{R}^n \vec{v} \in \mathbb{R}^n \text{ there exists a } Q \in \mathbb{R}^n \text{ such that } Q \ominus P = \vec{v}$$

□

Theorem 22.4. Let $n \in \mathbb{N}$ and $n \in \mathbb{N}$ and $\langle \mathbb{A}^n, V \rangle$ a real affine space of dimension n then $\forall P, Q$ we have

$$P \oplus (Q \ominus P) = P$$

Proof. Let $P, Q \in \mathbb{A}^n$. For $\vec{v} = P \ominus Q \in V$ we have by [definition: 22.1] that there exist a **unique** R such that $R \ominus Q = \vec{v}$. By [definition: 22.1] $R = Q \oplus \vec{v}$ so that $(Q \oplus \vec{v}) \ominus Q = \vec{v} = P \ominus Q$ so that by uniqueness we have $P = Q \oplus \vec{v} = Q \oplus (P \ominus Q)$. $\square$

Theorem 22.5. Let $n \in \mathbb{N}$ and $n \in \mathbb{N}$ and $\langle \mathbb{A}^n, V \rangle$ a real affine space of dimension n then $\forall P, P', Q, Q \in \mathbb{A}^n$ such that $P \ominus Q = P' \ominus Q'$ we have $P \ominus P' = Q \ominus Q'$

Proof. As $P \ominus Q = P' \ominus Q'$ we have

$$\begin{aligned} (P \ominus Q) + (Q \ominus P') &= (P' \ominus Q') + (Q \ominus P') \Rightarrow (P \ominus P') = (P' \ominus Q') + (Q \ominus P') \\ &\Rightarrow (P \ominus P') = (Q \ominus P') + (P' \ominus Q') \\ &\Rightarrow P \ominus P' = Q \ominus Q' \end{aligned}$$

$\square$

Theorem 22.6. Let $n \in \mathbb{N}$ and $\langle \mathbb{A}^n, V \rangle$ a real affine space of dimension n then $\forall P \in \mathbb{A}^n$ we have that $P \ominus P = \vec{0}$ where $\vec{0}$ is the neutral element in V .

Proof. Let $P \in \mathbb{A}^n$ then $\forall \vec{v} \in V$ we have

$$(P \ominus P) + \vec{v} = (P \ominus P) + ((P \oplus \vec{v}) \ominus P) = ((P \oplus \vec{v}) \ominus P) + (P \ominus P) = (P \oplus \vec{v}) \ominus P = \vec{v}$$

which proves that $P \ominus P = \vec{0}$. $\square$

Theorem 22.7. Let $n \in \mathbb{N}$, $\langle \mathbb{A}^n, V \rangle$ a real affine space of dimension n and $P, Q \in \mathbb{A}^n$ then $(P \ominus Q) = -(Q \ominus P)$ where $-(Q \ominus P)$ is the additive inverse of the vector $Q \ominus P$.

Proof. As $(P \ominus Q) + (Q \ominus P) = P \ominus P \stackrel{[\text{theorem: 22.6}]}{=} \vec{0}$ it follows that $(P \ominus Q) = -(Q \ominus P)$. $\square$

Theorem 22.8. Let $n \in \mathbb{N}$, $\langle \mathbb{A}^n, V \rangle$ a real affine space of dimension n , $P \in \mathbb{A}^n$ and $\vec{v}, \vec{u} \in V$ then we have

$$(P \oplus \vec{v}) \oplus \vec{u} = P \oplus (\vec{v} + \vec{u})$$

Proof. As $\vec{u} = ((P \oplus \vec{v}) \oplus \vec{u}) \ominus (P \oplus \vec{v})$ and $\vec{v} = (P \oplus \vec{v}) \ominus P$ we have that

$$\vec{v} + \vec{u} = \vec{u} + \vec{v} = (((P \oplus \vec{v}) \oplus \vec{u}) \ominus (P \oplus \vec{v})) + ((P \oplus \vec{v}) \ominus P) = ((P \oplus \vec{v}) \oplus \vec{u}) \ominus P$$

as also $(P \oplus (\vec{v} + \vec{u})) \ominus P = \vec{v} + \vec{u}$ we have by uniqueness that

$$(P \oplus \vec{v}) \oplus \vec{u} = P \oplus (\vec{v} + \vec{u})$$

$\square$

Theorem 22.9. Let $n \in \mathbb{N}$, $\langle \mathbb{A}^n, V \rangle$ a real affine space of dimension n , $P, Q \in \mathbb{A}^n$ and $\vec{v} \in V$ then

$$P \ominus Q = (P \oplus \vec{v}) \ominus (Q \oplus \vec{v})$$

Proof. We have

$$\begin{aligned} (P \ominus Q) &= (P \ominus Q) + \vec{0} \\ &= (P \ominus Q) + (-\vec{v} + \vec{v}) \\ &= (P \ominus Q) + (-((Q \oplus \vec{v}) \ominus Q) + ((P \oplus \vec{v}) \ominus P)) \\ &\stackrel{[\text{theorem: 22.7}]}{=} (P \ominus Q) + ((Q \ominus (Q \oplus \vec{v})) + ((P \oplus \vec{v}) \ominus P)) \\ &\stackrel{V \text{ is a vector space}}{=} ((P \ominus Q) + (Q \ominus (Q \oplus \vec{v}))) + ((P \oplus \vec{v}) \ominus P) \\ &\stackrel{\text{affine space definition}}{=} (P \ominus (Q \oplus \vec{v})) + ((P \oplus \vec{v}) \ominus P) \\ &\stackrel{V \text{ is a vector space}}{=} ((P \oplus \vec{v}) \ominus P) + (P \ominus (Q \oplus \vec{v})) \\ &\stackrel{\text{affine space definition}}{=} (P \oplus \vec{v}) - (Q \oplus \vec{v}) \end{aligned}$$

$\square$

Definition 22.10. (Local Coordinate System) Let $\langle \mathbb{A}^n, V \rangle$ be a real affine space of dimension n then a **local coordinate system** on $\langle \mathbb{A}^n, V \rangle$ is a mapping

$$f: U \rightarrow \mathbb{R}^n$$

where $U \subseteq \mathbb{A}^n$ and $f(U)$ is a open set in $\langle \mathbb{R}^n, \|\cdot\|_n \rangle$ and f is injective. Let $P \in \mathbb{A}$ then $f(P)$ is of the form $f(P) = (x_1, \dots, x_n)$ we call $(x_1, \dots, x_n)$ the coordinates of P using the coordinate system f . If $U = \mathbb{A}^n$ then f is called a **global coordinate system** on $\langle \mathbb{A}^n, V \rangle$.

We prove now that every real affine space of dimension n has a **global coordinate system**.

Theorem 22.11. Let $n \in \mathbb{N}$, $\langle \mathbb{A}^n, V \rangle$ be a real affine space of dimension n , $O \in \mathbb{A}^n$ the set of points and $E = \{\vec{e}_1, \dots, \vec{e}_n\}$ a basis for V the set of displacements then

$$f: \mathbb{A}^n \rightarrow \mathbb{R}^n \text{ defined by } f(P) = (x_1, \dots, x_n) \text{ where } (P \ominus O) = \sum_{i=1}^n y_i \cdot \vec{e}_i$$

is a **bijection** that is a **global coordinate system** on $\langle \mathbb{A}^n, V \rangle$. We call this **global coordinate system** a **Cartesian coordinate system with origin O and axes $e_1, \dots, e_n$** .

Note 22.12. Although this theorem ensures that every real affine space of dimension n has at least one global coordinate system not every local coordinate system should be a Cartesian coordinate system. These local coordinate systems that are not Cartesian are called **curvilinear coordinate systems**.

Proof. Let $P \in \mathbb{A}^n$ then $P \ominus O \in V$ so there exist by [theorem: 11.141] a **unique** $\{y_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}$ such that $(P \ominus O) = \sum_{i=1}^n x_i \cdot \vec{e}_i$. Hence the function

$$f: \mathbb{A}^n \rightarrow \mathbb{R}^n \text{ defined by } f(P) = (x_1, \dots, x_n) \text{ where } (P \ominus O) = \sum_{i=1}^n x_i \cdot \vec{e}_i$$

is well defined. We prove now that

f is bijective

injectivity. If $f(P_1) = f(P_2) = (x_1, \dots, x_n)$ then

$$(P_1 \ominus O) = \sum_{i=1}^n x_i \cdot \vec{e}_i = (P_2 \ominus O)$$

and by the uniqueness in [defintion: 22.1] it follows that $P_1 = P_2$.

surjectivity. If $(y_1, \dots, y_n) \in \mathbb{R}^n$ then for $P = O \oplus (\sum_{i=1}^n y_i \cdot \vec{e}_i)$ we have

$$P \ominus O = \left(O \oplus \left(\sum_{i=1}^n y_i \cdot \vec{e}_i \right) \right) \ominus O \stackrel{[\text{theorem: 22.4}]}{=} \sum_{i=1}^n y_i \cdot \vec{e}_i$$

so that $f(P) = (y_1, \dots, y_n)$ which proves surjectivity.

Because of surjectivity we have that $f(\mathbb{A}^n) = \mathbb{R}^n$ a open set in $\langle \mathbb{R}^n, \|\cdot\|_n \rangle$. So by [definition: 22.10] f is a global coordinate system on $\langle \mathbb{A}^n, V \rangle$. $\square$

We examine now how Cartesian coordinate system transforms under a change of basis
TODO

Theorem 22.13. Let $n \in \mathbb{N}$, $\langle \mathbb{A}^n, V \rangle$ be a real affine space of dimension n and $E = \{\vec{e}_1, \dots, \vec{e}_n\}$, $E' = \{\vec{e}'_1, \dots, \vec{e}'_n\}$ are two bases of V . By [theorem: 11.348] there exist then a **invertable** matrix $M \in \mathcal{M}_{n,n}(\mathbb{R})$ such that

$$\forall i \in \{1, \dots, n\} \vec{e}_i = \sum_{j=1}^n M_{j,i} \cdot \vec{e}'_j \text{ and } \vec{e}'_i = \sum_{j=1}^n (M^{-1})_{j,i} \cdot \vec{e}_j$$

Let

$f: \mathbb{A}^n \rightarrow \mathbb{R}^n$ a Cartesian coordinate system with origin $O \in \mathbb{A}^n$ and axes E

$g: \mathbb{A}^n \rightarrow \mathbb{R}^n$ a Cartesian coordinate system with origin $O' \in \mathbb{A}^n$ and axes E'

then we have:

1. For $g \circ f^{-1}: \mathbb{R}^n \rightarrow \mathbb{R}^n$ and $f \circ g^{-1}: \mathbb{R}^n \rightarrow \mathbb{R}^n$ we have

$$\forall (x_1, \dots, x_n) \quad ((g \circ f^{-1})(x_1, \dots, x_n))_i = \sum_{j=1}^n M_{i,j} \cdot (x_j + b_j)$$

$$\forall (x'_1, \dots, x'_n) \quad ((f \circ g^{-1})(x'_1, \dots, x'_n))_i = -b_i + \sum_{j=1}^n (M^{-1})_{i,j} \cdot x'_j$$

where $(O \ominus Q') = \sum_{i=1}^n b_i \cdot \vec{e}_i$.

2. Let $P \in \mathbb{A}^n$ then if $(x_1, \dots, x_n)$ are the coordinates of P using f and $(x'_1, \dots, x'_n)$ are the coordinates of P using g then we have

$$\forall i \in \{1, \dots, n\} \text{ that } x'_i = \sum_{j=1}^n M_{i,j} \cdot (x_j + b_j)$$

$$\forall i \in \{1, \dots, n\} \text{ that } x_i = -b_i + \sum_{j=1}^n (M^{-1})_{i,j} \cdot x'_j$$

where $O \ominus Q' = \sum_{i=1}^n b_i \cdot \vec{e}_i$

Note 22.14. Using [theorem: 22.11] we have that f, g are bijections so that f^{-1} and g^{-1} are well defined. Further as $O \ominus O' \in V$ and $\{\vec{e}_1, \dots, \vec{e}_n\}$ is a basis for V there exist a $\{b_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}$ such that $O \ominus Q' = \sum_{i=1}^n b_i \cdot \vec{e}_i$.

Proof.

1. Let $(x_1, \dots, x_n) \in \mathbb{R}$ then for $P = O \oplus (\sum_{i=1}^n x_i \cdot \vec{e}_i)$ we have that

$$P \ominus O = \left(O \oplus \left(\sum_{i=1}^n x_i \cdot \vec{e}_i \right) \right) \ominus O \stackrel{[\text{theorem: 22.4}]}{=} \sum_{i=1}^n x_i \cdot \vec{e}_i \quad (22.1)$$

so that $f(P) = (x_1, \dots, x_n)$ hence

$$P = f^{-1}(x_1, \dots, x_n) \quad (22.2)$$

Now

$$\begin{aligned} P \ominus O' &= (P \ominus O) + (O \ominus O') \\ &\stackrel{[\text{eq: 22.1}]}{=} \sum_{i=1}^n x_i \cdot \vec{e}_i + \sum_{i=1}^n b_i \cdot \vec{e}_i \\ &= \sum_{i=1}^n (x_i + b_i) \cdot \vec{e}_i \\ &= \sum_{i=1}^n (x_i + b_i) \cdot \left(\sum_{j=1}^n M_{j,i} \cdot \vec{e}'_j \right) \\ &= \sum_{i=1}^n \left(\sum_{j=1}^n ((x_i + b_i) \cdot M_{j,i} \cdot \vec{e}'_j) \right) \\ &\stackrel{[\text{theorem: 11.45}]}{=} \sum_{j=1}^n \left(\sum_{i=1}^n ((x_i + b_i) \cdot M_{j,i} \cdot \vec{e}'_j) \right) \\ &= \sum_{j=1}^n \left(\sum_{i=1}^n ((x_i + b_i) \cdot M_{j,i}) \right) \cdot \vec{e}'_j \\ &= \sum_{j=1}^n \left(\sum_{i=1}^n M_{j,i} \cdot (x_i + b_i) \right) \cdot \vec{e}'_j \end{aligned}$$

hence we have that

$$\begin{aligned} (g \circ f^{-1})(x_1, \dots, x_n) &= (g(f^{-1}(x_1, \dots, x_n))) \\ &\stackrel{[\text{eq: 22.2}]}{=} g(P) \\ &= \left(\sum_{i=1}^n M_{1,i} \cdot (x_i + b_i), \dots, \sum_{i=1}^n M_{n,i} \cdot (x_i + b_i) \right) \end{aligned}$$

so that

$$\forall i \in \{1, \dots, n\} \quad ((g \circ f^{-1})(x_1, \dots, x_n))_i = \sum_{j=1}^n M_{i,j} \cdot (x_j + b_j) \quad (22.3)$$

Let $(x'_1, \dots, x'_n) \in \mathbb{R}^n$ then for $P = O' \oplus (\sum_{i=1}^n x'_i \cdot \vec{e}_i')$ we have that

$$P \ominus O' = \left(O' \oplus \left(\sum_{i=1}^n x'_i \cdot \vec{e}_i' \right) \right) \ominus O' \stackrel{[\text{theorem: 22.4}]}{=} \sum_{i=1}^n x'_i \cdot \vec{e}_i' \quad (22.4)$$

so that $g(P) = (x'_1, \dots, x'_n)$ hence

$$P = g^{-1}(x'_1, \dots, x'_n) \quad (22.5)$$

Now we have

$$\begin{aligned} P \ominus O &= (P \ominus O') + (O' \ominus O) \\ &\stackrel{[\text{theorem: 22.7}]}{=} (P \ominus O') - (O \ominus O') \\ &\stackrel{[\text{eq: 22.10}]}{=} \sum_{i=1}^n x'_i \cdot \vec{e}_i' - \sum_{i=1}^n b_i \cdot \vec{e}_i \\ &= \sum_{i=1}^n x'_i \cdot \left(\sum_{j=1}^n (M^{-1})_{j,i} \cdot \vec{e}_j \right) - \sum_{i=1}^n b_i \cdot \vec{e}_i \\ &= \sum_{i=1}^n \left(\sum_{j=1}^n x'_i \cdot ((M^{-1})_{j,i} \cdot \vec{e}_j) \right) - \sum_{i=1}^n b_i \cdot \vec{e}_i \\ &\stackrel{[\text{theorem: 11.45}]}{=} \sum_{j=1}^n \left(\sum_{i=1}^n x'_i \cdot ((M^{-1})_{j,i} \cdot \vec{e}_j) \right) - \sum_{i=1}^n b_i \cdot \vec{e}_i \\ &= \sum_{j=1}^n \left(\sum_{i=1}^n x'_i \cdot ((M^{-1})_{j,i} \cdot \vec{e}_j) \right) - \sum_{j=1}^n b_j \cdot \vec{e}_j \\ &= \sum_{j=1}^n \left(\sum_{i=1}^n x'_i \cdot (M^{-1})_{j,i} \right) \cdot \vec{e}_j - \sum_{j=1}^n b_j \cdot \vec{e}_j \\ &= \sum_{j=1}^n \left(-b_j + \sum_{i=1}^n x'_i \cdot (M^{-1})_{j,i} \right) \cdot \vec{e}_j \end{aligned}$$

hence we have

$$\begin{aligned} (f \circ g^{-1})(x'_1, \dots, x'_n) &= f(g^{-1}(x'_1, \dots, x'_n)) \\ &\stackrel{[\text{eq: 22.5}]}{=} f(P) \\ &= \left(-b_1 + \sum_{i=1}^n x'_i \cdot (M^{-1})_{1,i}, \dots, -b_n + \sum_{i=1}^n x'_i \cdot (M^{-1})_{n,i} \right) \end{aligned}$$

from which it follows that

$$\forall i \in \{1, \dots, n\} \quad \text{that } ((f \circ g^{-1})(x'_1, \dots, x'_n))_i = -b_i + \sum_{j=1}^n (M^{-1})_{i,j} \cdot x'_j \quad (22.6)$$

2. Let $P \in \mathbb{A}^n$, $(x_1, \dots, x_n) \in \mathbb{R}^n$ the coordinates of P using the coordinate system f and $(x'_1, \dots, x'_n) \in \mathbb{R}^n$ the coordinates of P using the coordinate system g . Then

$$f(P) = (x_1, \dots, x_n) \text{ and } g(P) = (x'_1, \dots, x'_n) \Rightarrow f^{-1}(x_1, \dots, x_n) = P = g^{-1}(x'_1, \dots, x'_n)$$

so that $\forall i \in \{1, \dots, n\}$

$$\begin{aligned} x'_i &= (g(P))_i \\ &= (g(f^{-1}(x_1, \dots, x_n)))_i \\ &= ((g \circ f^{-1})(x_1, \dots, x_n))_i \\ &\stackrel{[\text{eq: 22.3}]}{=} \sum_{j=1}^n M_{i,j} \cdot (x_j + b_j) \\ x_i &= (f(P))_i \\ &= (f(g^{-1}(x'_1, \dots, x'_n)))_i \\ &= ((f \circ g^{-1})(x'_1, \dots, x'_n))_i \\ &\stackrel{[\text{eq: 22.6}]}{=} -b_i + \sum_{j=1}^n (M^{-1})_{i,j} \cdot x'_j \end{aligned}$$

Summarized we have

$$\forall i \in \{1, \dots, n\} \text{ that } x'_i = \sum_{j=1}^n M_{i,j} \cdot (x_j + b_j) \text{ and } x_i = -b_i + \sum_{j=1}^n (M^{-1})_{i,j} \cdot x'_j \quad \square$$

Next we introduce the concept of transformations that preserves the affine structure of affine spaces.

Definition 22.15. Let $n_1, n_2 \in \mathbb{N}$, $\langle \mathbb{A}_1^{n_1}, V_1 \rangle$, $\langle \mathbb{A}_1^{n_2}, V_2 \rangle$ be two real affine spaces then a map

$$\psi: \mathbb{A}_1^{n_1} \rightarrow \mathbb{A}_1^{n_2}$$

is called a **affine transformation** if

1. $\forall P, Q \in \mathbb{A}_1^{n_1}$, $\vec{v} \in V_1$ $\psi(P \oplus_1 \vec{v}) \ominus_2 \psi(Q \oplus_1 \vec{v}) = \psi(P) \ominus_2 \psi(Q)$
2. The map $d\psi$ defined by

$$d\psi: V_1 \rightarrow V_2 \text{ defined by } d\psi(\vec{v}) = \psi(P) \ominus_2 \psi(Q) \text{ where } \vec{v} = P \ominus_1 Q$$

is a linear map.

Note 22.16. Of course we must prove that $d\psi$ is actual a function which will be proved now.

Proof. First as $\mathbb{A}_1^{n_1} \neq \emptyset$ there exist a $Q \in \mathbb{A}_1^{n_1}$ then there exist by [definition: 22.1] there exist a unique P such that $\vec{v} = P \ominus_1 Q$. Assume that there exist also a $P', Q' \in \mathbb{A}_1^{n_1}$ such that $\vec{v} = P' \ominus_1 Q'$. Then we have $P \ominus_1 Q = \vec{v} = P' \ominus_1 Q'$ so that $P = Q \oplus_1 \vec{v}$ and $P' = Q' \oplus_1 \vec{v}$ and

$$\begin{aligned} \psi(P) \ominus_2 \psi(Q) &\stackrel{[\text{definition: 22.1}]}{=} (\psi(P) \ominus_2 \psi(P')) + (\psi(P') \ominus_2 \psi(Q)) \\ &= (\psi(Q \oplus_1 \vec{v}) \ominus_2 \psi(Q' \oplus_1 \vec{v})) + (\psi(P') \ominus_2 \psi(Q)) \\ &\stackrel{(1)}{=} (\psi(Q) \ominus_2 \psi(Q')) + (\psi(P') \ominus_2 \psi(Q)) \\ &= (\psi(P') \ominus_2 \psi(Q)) + (\psi(Q) \ominus_2 \psi(Q')) \\ &\stackrel{[\text{definition: 22.1}]}{=} \psi(P') \ominus_2 \psi(Q') \end{aligned}$$

which proves $\psi(P) \ominus_2 \psi(Q) = \psi(P') \ominus_2 \psi(Q')$ so that $d\psi$ is well defined. $\square$

In the special case where the dimensions of the affine spaces are the same we can define a isomorphisme of affine spaces.

Definition 22.17. Let $n \in \mathbb{N}$, $\langle \mathbb{A}_1^n, V_1 \rangle$, $\langle \mathbb{A}_2^n, V_2 \rangle$ be two real affine spaces of dimension n then a function

$$\psi: V_1 \rightarrow V_2$$

is a **affine isomorphism** if ψ is a a affine mapping and a bijection,

Theorem 22.18. *Let $n \in \mathbb{N}$, $\langle \mathbb{A}_1^n, V_1 \rangle$, $\langle \mathbb{A}_2^n, V_2 \rangle$ be two real affine spaces of dimension n and $\psi: V_1 \rightarrow V_2$ a affine isomorphism then $\psi^{-1}: V_2 \rightarrow V_1$ is a affine isomorphism and $d\psi: V_1 \rightarrow V_2$ is a linear isomorphism.*

Proof. First we prove that

$$d\psi \text{ is injective} \quad (22.7)$$

Proof. Using [theorem: 11.169] we have that

$$0 \in \ker(d\psi) \quad (22.8)$$

Let $\vec{v} \in \ker(d\psi)$ then $d\psi(\vec{v}) = \vec{0}$ by definition of $d\psi$ there exist a $P, Q \in V_1$ such that $\vec{v} = P \ominus_1 Q$ and $\psi(P) \ominus_2 \psi(Q) = d\psi(\vec{v}) = \vec{0}$. Hence as also $\psi(Q) \ominus_2 \psi(Q) = \vec{0}$ we have by [definition: 22.1] that $\psi(P) = \psi(Q)$ $\xRightarrow[\psi \text{ is bijective}]{\text{def}}$ $P = Q$. So $\vec{v} = P \ominus_1 P$ which proves by [theorem: 22.6] that $\vec{v} = \vec{0}$. Hence $\ker(d\psi) \subseteq \{0\}$ which combine with [eq: 22.8] proves that

$$\ker(d\psi) = \vec{0}$$

Finally using the linearity of $d\psi$, the above and [theorem: 11.192] proves that $d\psi$ is injective. $\square$

Let $P, Q \in \mathbb{A}_2^n$ and $\vec{v} \in V_2$ then as ψ is a bijection there exist $P', Q' \in \mathbb{A}_1^n$ such that $P = \psi(P')$ and $Q = \psi(Q')$ or $P' = \psi^{-1}(P)$, $Q' = \psi^{-1}(Q)$. As ψ is a affine mapping we have that

$$\forall \vec{u} \in V_1 \quad \psi(P' \oplus_1 \vec{u}) \ominus_2 \psi(Q' \oplus_1 \vec{u}) = \psi(P') \ominus_2 \psi(Q') \quad (22.9)$$

Take $\vec{u} \in V_1$ by $\vec{u} = \psi^{-1}(P \oplus_2 \vec{v}) \ominus_1 P'$ then we have

$$d\psi(\vec{u}) \stackrel{\text{def}}{=} \psi(\psi^{-1}(P \oplus_2 \vec{v})) \ominus_2 \psi(P') = (P \oplus_2 \vec{v}) \ominus_2 P = \vec{v} \quad (22.10)$$

Take $\vec{w} \in V_1$ by $\vec{w} = \psi^{-1}(Q \oplus_2 \vec{v}) \ominus_1 Q'$ then we have

$$d\psi(\vec{w}) = \psi(\psi^{-1}(Q \oplus_2 \vec{v})) \ominus_2 \psi(Q') = (Q \oplus_2 \vec{v}) \ominus_2 Q = \vec{v} \quad (22.11)$$

As $d\psi$ is injective [see eq: 22.7] it follows from [eqs: 22.10 and 22.11] that

$$\vec{u} = \vec{w} \quad (22.12)$$

Using the definitions of $\vec{u}, \vec{w}$ on the above gives

$$\psi^{-1}(P \oplus_2 \vec{v}) \ominus_1 P' = (\psi^{-1}(Q \oplus_2 \vec{v}) \ominus_1 Q')$$

so that by [theorem: 22.5]

$$\psi^{-1}(P \oplus_2 \vec{v}) \ominus_1 \psi^{-1}(Q \oplus_2 \vec{v}) = P' \ominus_2 Q' = \psi^{-1}(P) \ominus_1 \psi^{-1}(Q)$$

To summarize we have

$$\forall P, Q \in \mathbb{A}_2^n \text{ and } \vec{v} \in V_2 \text{ we have } \psi^{-1}(P \oplus_2 \vec{v}) \ominus_1 \psi^{-1}(Q \oplus_2 \vec{v}) = \psi^{-1}(P) \ominus_1 \psi^{-1}(Q) \quad (22.13)$$

Next we prove that $d\psi^{-1}$ is a bijection. Let $\vec{v} \in V_1$ then $d\psi(\vec{v}) = \psi(P) \ominus_2 \psi(Q)$ where $\vec{v} = P \ominus_1 Q$ so that by definition $d\psi^{-1}(d\psi(\vec{v})) = \psi^{-1}(\psi(P)) \ominus_1 \psi^{-1}(\psi(Q)) = P \ominus_1 Q = \vec{v}$. Hence

$$d\psi^{-1} \circ d\psi = \text{Id}_{V_1}$$

Likewise if $\vec{v} \in V_2$ then $d\psi^{-1}(\vec{v}) = \psi^{-1}(P) \ominus_1 \psi^{-1}(Q)$ where $\vec{v} = P \ominus_2 Q$. Then we have by definition $d\psi(d\psi^{-1}(\vec{v})) = \psi(\psi^{-1}(P)) \ominus_2 \psi(\psi^{-1}(Q)) = P \ominus_2 Q = \vec{v}$ which proves that

$$d\psi \circ d\psi^{-1} = \text{Id}_{V_2}$$

Hence by [theorem: 2.72] $d\psi$ is a bijection and as $d\psi$ is linear it follows that

$$d\psi \text{ is a linear isomorphism}$$

From the above and [theorem: 11.176] it follows that

$$d\psi^{-1} \text{ is also a linear isomorphism}$$

Combing the above with [eq: 22.13] proves that

$$\psi^{-1} \text{ is a affine isomorphism}$$

$\square$

A usefull criteria to determine if a affine mapping between two affine spaces of the same finite dimension is a isomorphism is stated in the following theorem.

Theorem 22.19. *Let $n \in \mathbb{N}$, $\langle \mathbb{A}_1^n, V_1 \rangle$, $\langle \mathbb{A}_2^n, V_2 \rangle$ be two real affine spaces of dimension n , $\psi: \mathbb{A}_1^n \rightarrow \mathbb{A}_2^n$ a affine mapping and $O \in \mathbb{A}_1^n$ then we have*

$$\forall P \in \mathbb{A}_1^n \text{ we have } \psi(P) = \psi(O) \oplus_2 d\psi(P \ominus_1 O)$$

Further we have

$$\psi \text{ is injective} \Leftrightarrow \psi \text{ is surjective}$$

In other words if ψ is either injective or surjective then ψ is a affine isomorphism.

Proof. Let $O \in \mathbb{A}_1^n$ then for every $P \in \mathbb{A}_1^n$ we have for $\vec{v} = P \ominus_1 O \in V_1$ by definition of $d\psi$ that $d\psi(\vec{v}) = d\psi(P \ominus_1 O) = \psi(P) \ominus_2 \psi(O)$. Hence we have by [definition: 22.1] that

$$\psi(P) = \psi(O) \oplus_2 d\psi(\vec{v}) = \psi(O) \oplus_2 d\psi(P \ominus_1 O)$$

So we have proved that

$$\forall P \in \mathbb{A}_1^n \text{ we have } \psi(P) = \psi(O) \oplus_2 d\psi(P \ominus_1 O) \quad (22.14)$$

Next we prove that

$$\psi \text{ is injective} \Leftrightarrow d\psi \text{ is injective} \quad (22.15)$$

Proof. As $\mathbb{A}_1^n \neq \emptyset$ there exist a $O \in \mathbb{A}_1^n$

$\Rightarrow$. Let $\vec{v}_1, \vec{v}_2 \in V_1$ be such that $d\psi(\vec{v}_1) = d\psi(\vec{v}_2)$. By [definition: 22.1] there exists P_1, P_2 such that $\vec{v}_1 = P_1 \ominus_1 O$ and $\vec{v}_2 = P_2 \ominus_1 O$ then we have

$$\psi(P_1) \ominus_2 \psi(O) = d\psi(\vec{v}_1) = d\psi(\vec{v}_2) = \psi(P_2) \ominus_2 \psi(O)$$

so that by [theorem: 22.5] $\psi(P_1) - \psi(P_2) = \psi(O) - \psi(O) \underset{[\text{theorem: 22.6}]}{=} \vec{0} \underset{[\text{theorem: 22.6}]}{=} \psi(P_2 \ominus_1 P_1)$ which by uniqueness in [definition: 22.1] proves that $\psi(P_1) = \psi(P_2)$. As ψ is injective we have that $P_1 = P_2$ so that $\vec{v}_1 = P_1 \ominus_1 O = P_2 \ominus_1 O = \vec{v}_2$ which proves that $\vec{v}_1 = \vec{v}_2$. Hence $d\psi$ is injective.

$\Leftarrow$. Let $P_1, P_2 \in \mathbb{A}_1^n$ such that $\psi(P_1) = \psi(P_2)$ then we have by [eq: 22.14] that

$$\psi(O) \oplus_2 d\psi(P_1 \ominus_1 O) = \psi(P_1) = \psi(P_2) = \psi(O) \oplus_2 d\psi(P_2 \ominus_1 O)$$

so that by [theorem: 22.1] we have

$$d\psi(P_1 \ominus_1 O) = (\psi(O) \oplus_2 d\psi(P_1 \ominus_1 O)) \ominus_{12} \psi(O) = (\psi(O) \oplus_2 d\psi(P_2 \ominus_1 O)) \ominus_{12} \psi(O) = d\psi(P_2 \ominus_1 O)$$

which as $d\psi$ is injective proved that $P_1 \ominus_1 O = P_2 \ominus_1 O$. Using the uniqueness in [definition: 22.1] it follows that $P_1 = P_2$. Hence ψ is injective. $\square$

Next we prove that

$$\psi \text{ is surjective} \Leftrightarrow d\psi \text{ is surjective} \quad (22.16)$$

Proof. As $\mathbb{A}_1^n \neq \emptyset$ there exist a $O' \in \mathbb{A}_1^n$. Take $O = \psi(O') \in \mathbb{A}_1^n$

$\Rightarrow$. Let $\vec{v} \in V_2$ then by [definition: 22.1] there exist a $P \in V_2$ such that $\vec{v} = P \ominus_2 O$. As ψ is surjective there exist a $P' \in \mathbb{A}_1^n$ such that $P = \psi(P')$. Then we have for $\vec{\mu} = P' \ominus_1 O' \in V_1$ that $d\psi(\vec{\mu}) = d\psi(P' \ominus_1 O') = \psi(P') \ominus_2 \psi(O') = P \ominus_2 O = \vec{v}$ which proves that $d\psi$ is surjective.

$\Leftarrow$. Let $P \in \mathbb{A}_2^n$ then for $\vec{v} = P \ominus_2 O$ we have as $d\psi$ is surjective there exist a $\vec{\mu} \in V_1$ such that

$$\vec{v} = d\psi(\vec{\mu})$$

Using [definition: 22.1] there exist a $P' \in \mathbb{A}_1^n$ such that $\vec{\mu} = P' \ominus_1 O'$ then we have by [eq: 22.14] that

$$\psi(P') = \psi(O') \oplus_2 d\psi(P' \ominus_1 O') = \psi(O') \oplus_2 d\psi(\vec{\mu}) = O \oplus_2 \vec{v} = O \oplus_2 (P \ominus_2 O) \underset{[\text{theorem: 22.4}]}{=} P$$

which proves surjectivity of ψ $\square$

Finally we prove that

$$\psi \text{ is injective} \Leftrightarrow \psi \text{ is surjective}$$

Proof.

- $\Rightarrow$. As ψ is injective it follows from [eq: 22.15] that $d\psi: V_1 \rightarrow V_2$ is injective. As also $\dim(V_1) = \dim(V_2) = n$ it follows from [theorem: 11.198] that $d\psi$ is surjective. Hence by [eq: 22.16] that ψ is surjective.
- $\Leftarrow$. As ψ is surjective it follows from [eq: 22.16] that $d\psi: V_1 \rightarrow V_2$ is surjective. As also $\dim(V_1) = \dim(V_2) = n$ it follows from [theorem: 11.202] that $d\psi$ is injective. Hence by [eq: 22.15] that ψ is injective. $\square$

We can express a affine transformation using Cartesian coordinates as follows.

Theorem 22.20. *Let $n, m \in \mathbb{N}$, $\langle \mathbb{A}_1^n, V_1 \rangle$, $\langle \mathbb{A}_2^m, V_2 \rangle$ be two real affine spaces then we have:*

1. *Let $\psi: \mathbb{A}_1^n \rightarrow \mathbb{A}_2^m$ be a affine mapping then for*

$f_1: \mathbb{A}_1^n \rightarrow \mathbb{R}^n$ a Cartesian coordinate system with origin O_1 and axes $E = \{\vec{e}_1, \dots, \vec{e}_n\}$

$f_2: \mathbb{A}_2^m \rightarrow \mathbb{R}^m$ a Cartesian coordinate system with origin O_2 and axes $F = \{\vec{f}_1, \dots, \vec{f}_m\}$

we have that

- a. *For $f_2 \circ \psi \circ f_1^{-1}: \mathbb{R}^n \rightarrow \mathbb{R}^m$ there exist a $L \in \mathcal{M}_{m,n}(\mathbb{R})$ and a $\{c_i\}_{i \in \{1, \dots, m\}} \subseteq \mathbb{R}$ such that*

$$\forall i \in \{1, \dots, m\} \text{ we have } ((f_2 \circ \psi \circ f_1^{-1})(x_1, \dots, x_n))_i = c_i + \sum_{j=1}^n M_{i,j} \cdot x_j$$

- b. *If $P \in \mathbb{A}_1^n$ has coordinates $(x_1, \dots, x_n)$ using the coordinate system f_1 and $\psi(P) \in \mathbb{A}_2^m$ has coordinates $(y_1, \dots, y_m)$ using the coordinate system f then we have*

$$\forall i \in \{1, \dots, m\} \text{ we have } y_i = c_i + \sum_{j=1}^n M_{i,j} \cdot x_j$$

2. *Let $\psi: \mathbb{A}_1^n \rightarrow \mathbb{A}_2^m$ be a mapping such that there exist a $L \in \mathcal{M}_{m,n}(\mathbb{R})$, a $\{c_i\}_{i \in \{1, \dots, m\}} \subseteq \mathbb{R}$ and 2 coordinate systems*

$f_1: \mathbb{A}_1^n \rightarrow \mathbb{R}^n$ a Cartesian coordinate system with origin O_1 and axes $E = \{\vec{e}_1, \dots, \vec{e}_n\}$

$f_2: \mathbb{A}_2^m \rightarrow \mathbb{R}^m$ a Cartesian coordinate system with origin O_2 and axes $E' = \{\vec{f}_1, \dots, \vec{f}_m\}$

such that

$$\forall i \in \{1, \dots, m\} \text{ we have } ((f_2 \circ \psi \circ f_1^{-1})(x_1, \dots, x_n))_i = c_i + \sum_{j=1}^n M_{i,j} \cdot x_j$$

then ψ is a affine mapping.

Proof.

1. We have:

- a. As $\psi: \mathbb{A}_1^n \rightarrow \mathbb{A}_2^m$ is a affine mapping we have that

$$\forall P, Q \in \mathbb{A}_1^n \text{ and } \forall \vec{v} \in V_1 \text{ we have } \varphi(P \oplus_1 \vec{v}) \ominus_2 \psi(Q \oplus_1 \vec{v}) = \psi(P) \ominus_2 \psi(Q) \quad (22.17)$$

$$d\psi: V_1 \rightarrow V_2 \text{ by } d\psi(\vec{v}) = \psi(P) \ominus_2 \psi(Q) \text{ where } \vec{v} = P \ominus_1 Q \text{ is a linear mapping} \quad (22.18)$$

As $d\psi$ is a linear mapping and E is a basis for V_1 and F is a basis for V_2 it follows from [theorem: 11.335] that there exist a $M \in \mathcal{M}_{m,n}[\mathbb{R}]$ such that

$$\forall i \in \{1, \dots, m\} \text{ that } d\psi(\vec{e}_i) = \sum_{j=1}^m M_{j,i} \cdot \vec{f}_j \quad (22.19)$$

Let $(x_1, \dots, x_n) \in \mathbb{R}^n$ then for $P = f^{-1}(x_1, \dots, x_n)$ we have as $f(P) = (x_1, \dots, x_n)$ and f_1 a Cartesian coordinate system with origin O_1 and axes E we have that

$$P \ominus_1 O_1 = \sum_{i=1}^n x_i \cdot \vec{e}_i \quad (22.20)$$

As $\psi(O_1) \ominus_2 O_2 \in V_2$ and F a basis for V_2 there exist a $\{c_i\}_{i \in \{1, \dots, m\}} \subseteq \mathbb{R}$ such that

$$\psi(O_1) \ominus_2 O_2 = \sum_{j=1}^m c_j \cdot \vec{f}_j \quad (22.21)$$

$$\begin{aligned} \psi(P) \ominus_2 O_2 &= (\psi(P) \ominus \psi(O_1)) + (\psi(O_1) \ominus_2 O_2) \\ &\stackrel{[\text{eq: 22.20}]}{=} (\psi(P) \ominus \psi(O_1)) + \sum_{j=1}^m c_j \cdot \vec{f}_j \\ &= d\psi\left(\sum_{i=1}^n x_i \cdot \vec{e}_i\right) + \sum_{j=1}^m c_j \cdot \vec{f}_j \\ &= \sum_{i=1}^n x_i \cdot d\psi(\vec{e}_i) + \sum_{j=1}^m c_j \cdot \vec{f}_j \\ &\stackrel{[\text{eq: 22.19}]}{=} \sum_{i=1}^n x_i \cdot \left(\sum_{j=1}^m M_{j,i} \cdot \vec{f}_j\right) + \sum_{j=1}^m c_j \cdot \vec{f}_j \\ &= \sum_{i=1}^n \left(\sum_{j=1}^m x_i \cdot (M_{j,i} \cdot \vec{f}_j)\right) + \sum_{j=1}^m c_j \cdot \vec{f}_j \\ &\stackrel{[\text{theorem: 11.45}]}{=} \sum_{j=1}^m \left(\sum_{i=1}^n x_i \cdot (M_{j,i} \cdot \vec{f}_j)\right) + \sum_{j=1}^m c_j \cdot \vec{f}_j \\ &= \sum_{j=1}^m \left(\sum_{i=1}^n x_i \cdot (M_{j,i})\right) \cdot \vec{f}_j + \sum_{j=1}^m c_j \cdot \vec{f}_j \\ &= \sum_{j=1}^m \left(\sum_{i=1}^n M_{j,i} \cdot x_i\right) \cdot \vec{f}_j + \sum_{j=1}^m c_j \cdot \vec{f}_j \\ &= \sum_{j=1}^m \left(c_j + \sum_{i=1}^n M_{j,i} \cdot x_i\right) \cdot \vec{f}_j \end{aligned}$$

As f_2 is a Cartesian coordinate system with origin $\psi(O)$ and axes F it follows that

$$f_2(\psi(P)) = \left(c_1 + \sum_{j=1}^n M_{1,j} \cdot x_j, \dots, c_m + \sum_{j=1}^n M_{m,j} \cdot x_j\right)$$

which as $(f_2 \circ \psi \circ f^{-1})(x_1, \dots, x_n) = f_2(\psi(f^{-1}(x_1, \dots, x_n))) = f_2(\psi(P))$ proves that

$$\forall i \in \{1, \dots, m\} \text{ we have } ((f_2 \circ \psi \circ f^{-1})(x_1, \dots, x_n))_i = c_i + \sum_{j=1}^n M_{i,j} \cdot x_j \quad (22.22)$$

- b. If P has coordinates $(x_1, \dots, x_n)$ using f_1 and $\psi(P)$ has coordinates $(y_1, \dots, y_m)$ then we have $P = f_2^{-1}(x_1, \dots, x_n)$ and $f_2(\psi(P)) = (y_1, \dots, y_m)$ so that

$$(f_2 \circ \psi \circ f^{-1})(x_1, \dots, x_n) = f_2(\psi(f^{-1}(x_1, \dots, x_n))) = f_2(\psi(P)) = (y_1, \dots, y_m)$$

so that by [theorem: 22.22] we have

$$\forall i \in \{1, \dots, m\} \text{ we have } y_i = c_i + \sum_{j=1}^n M_{i,j} \cdot x_j$$

2. Let $\psi: \mathbb{A}_1^n \rightarrow \mathbb{A}_2^m$ be a mapping such that there exist a $L \in \mathcal{M}_{m,n}(\mathbb{R})$, a $\{c_i\}_{i \in \{1, \dots, m\}} \subseteq \mathbb{R}$ and 2 coordinate systems

$f_1: \mathbb{A}_1^n \rightarrow \mathbb{R}^n$ a Cartesian coordinate system with origin O_1 and axes $E = \{\vec{e}_1, \dots, \vec{e}_n\}$

$f_2: \mathbb{A}_2^m \rightarrow \mathbb{R}^m$ a Cartesian coordinate system with origin O_2 and axes $F = \{\vec{f}_1, \dots, \vec{f}_m\}$

such that

$$\forall i \in \{1, \dots, m\} \text{ we have } ((f_2 \circ \psi \circ f_1^{-1})(x_1, \dots, x_n))_i = c_i + \sum_{j=1}^n M_{i,j} \cdot x_j \quad (22.23)$$

Let $P, Q \in \mathbb{A}_1^n$ and $\vec{v} \in V_1$. As E is a basis for V_1 there exist a $\{v_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}$ such that

$$\vec{v} = \sum_{i=1}^n v_i \cdot \vec{e}_i \quad (22.24)$$

As $P \ominus_1 O_1, Q \ominus_1 O_1 \in V_1$ and E is a basis we have that $\exists \{p_i\}_{i \in \{1, \dots, n\}}, \{q_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}$ such that

$$P \ominus_1 O_1 = \sum_{i=1}^n p_i \cdot \vec{e}_i \wedge \ominus_1 O_1 = \sum_{i=1}^n q_i \cdot \vec{e}_i \quad (22.25)$$

so that

$$f_1(P) = (p_1, \dots, p_n) \wedge f_1(Q) = (q_1, \dots, q_n) \quad (22.26)$$

or

$$P = f_1^{-1}(p_1, \dots, p_n) \wedge Q = f_1^{-1}(q_1, \dots, q_n) \quad (22.27)$$

Hence $\forall i \in \{1, \dots, m\}$ we have

$$\begin{aligned} (f_2(\psi(P)))_i &\stackrel{[\text{eq: 22.27}]}{=} (f_2(\psi(f_1^{-1}(p_1, \dots, p_n))))_i \\ &= ((f_2 \circ \psi \circ f_1^{-1})(p_1, \dots, p_n))_i \\ &\stackrel{[\text{eq: 22.23}]}{=} c_i + \sum_{j=1}^n M_{i,j} \cdot p_j \\ (f_2(\psi(Q)))_i &\stackrel{[\text{eq: 22.27}]}{=} (f_2(\psi(f_1^{-1}(q_1, \dots, q_n))))_i \\ &= ((f_2 \circ \psi \circ f_1^{-1})(q_1, \dots, q_n))_i \\ &\stackrel{[\text{eq: 22.23}]}{=} c_i + \sum_{j=1}^n M_{i,j} \cdot q_j \end{aligned}$$

As f_2 is a Cartesian coordinate system with origin O_2 and axes F we have from the above that

$$\psi(P) \ominus_2 O_2 = \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot p_j \right) \cdot \vec{f}_i \quad (22.28)$$

$$\psi(Q) \ominus_2 O_2 = \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot q_j \right) \cdot \vec{f}_i \quad (22.29)$$

so that

$$\begin{aligned} \psi(P) \ominus_2 \psi(Q) &\stackrel{[\text{definition: 22.1}]}{=} (\psi(P) \ominus_2 O_2) + (O_2 \ominus_2 \psi(Q)) \\ &\stackrel{[\text{theorem: 22.7}]}{=} (\psi(P) \ominus_2 O_2) - (\psi(Q) \ominus_2 O_2) \\ &= \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot p_j \right) \cdot \vec{f}_i - \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot q_j \right) \cdot \vec{f}_i \\ &= \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot p_j - \left(c_i + \sum_{j=1}^n M_{i,j} \cdot q_j \right) \right) \cdot \vec{f}_i \\ &= \sum_{i=1}^m \left(\sum_{j=1}^n M_{i,j} \cdot p_j - \sum_{j=1}^n M_{i,j} \cdot q_j \right) \\ &= \sum_{i=1}^m \left(\sum_{j=1}^n M_{i,j} \cdot (p_j - q_j) \right) \cdot \vec{f}_i \end{aligned}$$

which proves that

$$\psi(P) \ominus_2 \psi(Q) = \sum_{i=1}^m \left(\sum_{j=1}^n M_{i,j} \cdot (p_i - q_i) \right) \cdot \vec{f}_i \quad (22.30)$$

Now

$$\begin{aligned} (P \oplus_1 \vec{v}) \ominus_1 O_1 &\stackrel{[\text{definition: 22.1}]}{=} ((P \oplus_1 \vec{v}) \ominus_1 P) + (P \ominus_1 O_1) \\ &\stackrel{[\text{theorem: 22.1}] \wedge [\text{eq: 22.25}]}{=} \vec{v} + \sum_{i=1}^n p_i \cdot \vec{e}_i \\ &\stackrel{[\text{eq: 22.24}]}{=} \sum_{i=1}^n v_i \cdot \vec{e}_i + \sum_{i=1}^n p_i \cdot \vec{e}_i \\ &= \sum_{i=1}^n (v_i + p_i) \cdot \vec{e}_i \\ (Q \oplus_1 \vec{v}) \ominus_1 O_1 &\stackrel{[\text{definition: 22.1}]}{=} ((Q \oplus_1 \vec{v}) \ominus_1 Q) + (Q \ominus_1 O_1) \\ &\stackrel{[\text{theorem: 22.1}] \wedge [\text{eq: 22.25}]}{=} \vec{v} + \sum_{i=1}^n q_i \cdot \vec{e}_i \\ &\stackrel{[\text{eq: 22.24}]}{=} \sum_{i=1}^n v_i \cdot \vec{e}_i + \sum_{i=1}^n q_i \cdot \vec{e}_i \\ &= \sum_{i=1}^n (v_i + q_i) \cdot \vec{e}_i \end{aligned}$$

So that

$$f_1(P \oplus_1 \vec{v}) = (v_1 + p_1, \dots, v_n + p_n) \text{ and } f_1(Q \oplus_1 \vec{v}) = (v_1 + q_1, \dots, v_n + q_n) \quad (22.31)$$

hence

$$P \oplus_1 \vec{v} = f_1^{-1}(v_1 + p_1, \dots, v_n + p_n) \text{ and } Q \oplus_1 \vec{v} = f_1^{-1}(v_1 + q_1, \dots, v_n + q_n) \quad (22.32)$$

So we have $\forall i \in \{1, \dots, m\}$

$$\begin{aligned} (f_2(\psi(P \oplus_1 \vec{v})))_i &\stackrel{[\text{eq: 22.32}]}{=} (f_2(\psi(f_1^{-1}(v_1 + p_1, \dots, v_n + p_n))))_i \\ &= ((f_2 \circ \psi \circ f_1^{-1})(v_1 + p_1, \dots, v_n + p_n))_i \\ &\stackrel{[\text{eq: 22.23}]}{=} c_i + \sum_{j=1}^n M_{i,j} \cdot (v_i + p_i) \\ (f_2(\psi(Q \oplus_1 \vec{v})))_i &\stackrel{[\text{eq: 22.32}]}{=} (f_2(\psi(f_1^{-1}(v_1 + q_1, \dots, v_n + q_n))))_i \\ &= ((f_2 \circ \psi \circ f_1^{-1})(v_1 + q_1, \dots, v_n + q_n))_i \\ &\stackrel{[\text{eq: 22.23}]}{=} c_i + \sum_{j=1}^n M_{i,j} \cdot (v_i + q_i) \end{aligned}$$

As f_2 is a Cartesian system with origin O_2 and axes F it follows that

$$\psi(P \oplus \vec{v}) \ominus_2 O_2 = \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot (v_i + p_i) \right) \cdot \vec{f}_i \quad (22.33)$$

$$\psi(Q \oplus \vec{v}) \ominus_2 O_2 = \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot (v_i + q_i) \right) \cdot \vec{f}_i \quad (22.34)$$

so that

$$\begin{aligned} \psi(P \oplus_1 \vec{v}) \ominus_2 \psi(Q \oplus_1 \vec{v}) &= \\ (\psi(P \oplus_1 \vec{v}) \ominus_2 O_2) + (O_2 \ominus_2 \psi(Q \oplus_1 \vec{v})) &\stackrel{[\text{theorem: 22.7}]}{=} \\ (\psi(P \oplus_1 \vec{v}) \ominus_2 O_2) - (\psi(Q \oplus_1 \vec{v}) \ominus_2 O_2) &\stackrel{[\text{eqs: 22.33, 22.34}]}{=} \end{aligned}$$

$$\begin{aligned}
\sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot (v_i + p_i) \right) \cdot \vec{f}_i - \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot (v_i + q_i) \right) \cdot \vec{f}_i &= \\
\sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot (v_i + p_i) - \left(c_i + \sum_{j=1}^n M_{i,j} \cdot (v_i + q_i) \right) \right) \cdot \vec{f}_i &= \\
\sum_{i=1}^m \left(\sum_{j=1}^n M_{i,j} \cdot (v_i + p_i) - \sum_{j=1}^n M_{i,j} \cdot (v_i + q_i) \right) \cdot \vec{f}_i &= \\
\sum_{i=1}^m \left(\sum_{j=1}^n M_{i,j} \cdot (v_i + p_i - (v_i + q_i)) \right) \cdot \vec{f}_i &= \\
\sum_{i=1}^m \left(\sum_{j=1}^n M_{i,j} \cdot (p_i - q_i) \right) \cdot \vec{f}_i & \stackrel{[\text{eq: 22.30}]}{=} \\
\psi(P) \ominus_2 \psi(Q) &
\end{aligned}$$

Hence we have that

$$\forall P, Q \in \mathbb{A}_1^n \text{ and } \vec{v} \in V_1 \text{ we have } \psi(P \oplus_1 \vec{v}) \ominus_2 \psi(Q \oplus_1 \vec{v}) = \psi(P) \ominus_2 \psi(Q) \quad (22.35)$$

Let $\vec{u}, \vec{v} \in V_1$ and $\alpha \in \mathbb{R}$ then by [definition: 22.1] there exists $P, Q, R, S \in \mathbb{A}_1^n$ such that

$$\vec{u} = P \ominus_1 O_1 \wedge \vec{v} = Q \ominus_1 O_1 \wedge R \ominus_1 O_1 = \alpha \cdot \vec{v} \wedge S \ominus_1 O_1 = \vec{u} + \alpha \cdot \vec{v} \quad (22.36)$$

hence as E is a basis for V_1 there exist $\{p_i\}_{i \in \{1, \dots, n\}}, \{q_i\}_{i \in \{1, \dots, n\}} \subseteq \mathbb{R}$ such that

$$P \ominus_1 O_1 = \vec{u} = \sum_{i=1}^n p_i \cdot \vec{e}_i \wedge Q \ominus_1 O_1 = \vec{v} = \sum_{i=1}^n q_i \cdot \vec{e}_i \wedge R \ominus_1 O_1 = \alpha \cdot \vec{v} = \sum_{i=1}^n (\alpha \cdot q_i) \cdot \vec{e}_i$$

so that

$$S \ominus_1 O_1 = \vec{u} + \alpha \cdot \vec{v} = \sum_{i=1}^n p_i \cdot \vec{e}_i + \sum_{i=1}^n (\alpha \cdot q_i) \cdot \vec{e}_i = \sum_{i=1}^n (p_i + \alpha \cdot q_i)$$

Further

$$O_1 \ominus_1 O_1 \stackrel{[\text{theorem: 22.6}]}{=} \vec{0} = \sum_{i=1}^n 0 \cdot \vec{e}_i$$

As f_1 is a Cartesain coordinate system with origin O_1 we have that

$$\begin{aligned}
f_1(P) &= (p_1, \dots, p_n) \\
f_1(Q) &= (q_1, \dots, q_n) \\
f_1(R) &= (\alpha \cdot q_1, \dots, \alpha \cdot q_n) \\
f_1(S) &= (p_1 + \alpha \cdot q_1, \dots, p_n + \alpha \cdot q_n) \\
f_1(O_1) &= \left(\underbrace{0, \dots, 0}_n \right)
\end{aligned}$$

So that

$$\begin{aligned}
P &= f_1^{-1}(p_1, \dots, p_n) \\
Q &= f_1^{-1}(q_1, \dots, q_n) \\
R &= f_1^{-1}(\alpha \cdot q_1, \dots, \alpha \cdot q_n) \\
S &= f_1^{-1}(p_1 + \alpha \cdot q_1, \dots, p_n + \alpha \cdot q_n) \\
O_1 &= f_1^{-1}\left(\underbrace{0, \dots, 0}_n\right)
\end{aligned}$$

So for all

$$\begin{aligned}
 (f_2(\psi(P)))_i &= (f_2(\psi(f_1^{-1}(p_1, \dots, p_n))))_i \\
 &= ((f_2 \circ \psi \circ f_1^{-1})(p_1, \dots, p_n))_i \\
 &\stackrel{[\text{eq: 22.23}]}{=} c_i + \sum_{j=1}^n M_{i,j} \cdot p_j
 \end{aligned} \tag{22.37}$$

$$\begin{aligned}
 (f_2(\psi(Q)))_i &= (f_2(\psi(f_1^{-1}(q_1, \dots, q_n))))_i \\
 &= ((f_2 \circ \psi \circ f_1^{-1})(q_1, \dots, q_n))_i \\
 &\stackrel{[\text{eq: 22.23}]}{=} c_i + \sum_{j=1}^n M_{i,j} \cdot q_j
 \end{aligned} \tag{22.38}$$

$$\begin{aligned}
 (f_2(\psi(R)))_i &= (f_2(\psi(f_1^{-1}(\alpha \cdot q_1, \dots, \alpha \cdot q_n))))_i \\
 &= ((f_2 \circ \psi \circ f_1^{-1})(\alpha \cdot q_1, \dots, \alpha \cdot q_n))_i \\
 &\stackrel{[\text{eq: 22.23}]}{=} c_i + \sum_{j=1}^n M_{i,j} \cdot (\alpha \cdot q_j)
 \end{aligned} \tag{22.39}$$

$$\begin{aligned}
 (f_2(\psi(S)))_i &= (f_2(\psi(f_1^{-1}(p_1 + \alpha \cdot q_1, \dots, p_n + \alpha \cdot q_n))))_i \\
 &= ((f_2 \circ \psi \circ f_1^{-1})(p_1 + \alpha \cdot q_1, \dots, p_n + \alpha \cdot q_n))_i \\
 &\stackrel{[\text{eq: 22.23}]}{=} c_i + \sum_{j=1}^n M_{i,j} \cdot (p_j + \alpha \cdot q_j)
 \end{aligned} \tag{22.40}$$

$$\begin{aligned}
 (f_2(\psi(O_1)))_i &= \left(f_2 \left(\psi \left(f_1^{-1} \left(\underbrace{0, \dots, 0}_n \right) \right) \right) \right)_i \\
 &= \left((f_2 \circ \psi \circ f_1^{-1}) \left(\underbrace{0, \dots, 0}_n \right) \right)_i \\
 &\stackrel{[\text{eq: 22.23}]}{=} c_i + \sum_{j=1}^n M_{i,j} \cdot 0 \\
 &= c_i
 \end{aligned} \tag{22.41}$$

As f_2 is a Cartesian coordinate system with origin O_2 with axes F we have that

$$\psi(P) \ominus_2 O_2 \stackrel{[\text{eq: 22.37}]}{=} \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot p_j \right) \cdot \vec{f}_i \tag{22.42}$$

$$\psi(Q) \ominus_2 O_2 \stackrel{[\text{eq: 22.38}]}{=} \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot q_j \right) \cdot \vec{f}_i \tag{22.43}$$

$$\psi(R) \ominus_2 O_2 \stackrel{[\text{eq: 22.39}]}{=} \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot (\alpha \cdot q_j) \right) \cdot \vec{f}_i \tag{22.44}$$

$$\psi(S) \ominus_2 O_2 \stackrel{[\text{eq: 22.40}]}{=} \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot (p_j + \alpha \cdot q_j) \right) \cdot \vec{f}_i \tag{22.45}$$

$$\psi(O_1) \ominus_2 O_2 \stackrel{[\text{eq: 22.41}]}{=} \sum_{i=1}^m c_i \cdot \vec{f}_i \tag{22.46}$$

So that

$$\begin{aligned}
 d\psi(\vec{u} + \alpha \cdot \vec{v}) &\stackrel{[\text{eq: 22.36}]}{=} \psi(S) \ominus_2 \psi(O_1) \\
 &\stackrel{[\text{definition: 22.1}]}{=} (\psi(S) \ominus_2 O_2) + (O_2 \ominus_2 \psi(O_1)) \\
 &\stackrel{[\text{theorem: 22.7}]}{=} (\psi(S) \ominus_2 O_2) - (\psi(O_1) \ominus_2 O_2)
 \end{aligned}$$

$$\begin{aligned}
& \stackrel{[\text{eqs: 22.45, 22.46}]}{=} \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot (p_j + \alpha \cdot q_j) \right) \cdot \vec{f}_i - \sum_{i=1}^m c_i \cdot \vec{f}_i \\
& = \sum_{i=1}^m \left(\sum_{j=1}^n M_{i,j} \cdot p_j \right) \cdot \vec{f}_i + \alpha \cdot \sum_{i=1}^m \left(\sum_{j=1}^n M_{i,j} \cdot q_j \right) \cdot \vec{f}_i \quad (22.47)
\end{aligned}$$

$$\begin{aligned}
d\psi(\vec{u}) & \stackrel{[\text{eq: 22.36}]}{=} \psi(P) \ominus_2 \psi(O_1) \\
& \stackrel{[\text{definition: 22.1}]}{=} (\psi(P) \ominus_2 O_2) + (O_2 \ominus_2 \psi(O_1)) \\
& \stackrel{[\text{theorem: 22.7}]}{=} (\psi(P) \ominus_2 O_2) - (\psi(O_1) \ominus_2 O_2) \\
& \stackrel{[\text{eqs: 22.42, 22.46}]}{=} \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot p_j \right) \cdot \vec{f}_i - \sum_{i=1}^m c_i \cdot \vec{f}_i \\
& = \sum_{i=1}^m \left(\sum_{j=1}^n M_{i,j} \cdot p_j \right) \cdot \vec{f}_i \quad (22.48)
\end{aligned}$$

$$\begin{aligned}
d\psi(\alpha \cdot \vec{v}) & \stackrel{[\text{eq: 22.36}]}{=} \psi(R) \ominus_2 \psi(O_1) \\
& \stackrel{[\text{definition: 22.1}]}{=} (\psi(R) \ominus_2 O_2) + (O_2 \ominus_2 \psi(O_1)) \\
& \stackrel{[\text{theorem: 22.7}]}{=} (\psi(R) \ominus_2 O_2) - (\psi(O_1) \ominus_2 O_2) \\
& \stackrel{[\text{eqs: 22.44, 22.46}]}{=} \sum_{i=1}^m \left(c_i + \sum_{j=1}^n M_{i,j} \cdot (\alpha \cdot q_j) \right) \cdot \vec{f}_i - \sum_{i=1}^m c_i \cdot \vec{f}_i \\
& = \sum_{i=1}^m \left(\sum_{j=1}^n M_{i,j} \cdot (\alpha \cdot q_j) \right) \cdot \vec{f}_i \\
& = \alpha \cdot \sum_{i=1}^m \left(\sum_{j=1}^n M_{i,j} \cdot q_j \right) \cdot \vec{f}_i \quad (22.49)
\end{aligned}$$

Using then [eqs: 22.47, 22.45 and 22.49] it follows that

$$d\psi(\vec{u} + \alpha \cdot \vec{v}) = d\psi(\vec{u}) + \alpha \cdot d\psi(\vec{v})$$

hence

$$d\psi: V_1 \rightarrow V_2 \text{ is linear}$$

The above together with [eq:22.35] proves that ψ is a affine mapping. $\square$

We define now the concept of a line in a affine space.

Definition 22.21. Let $n \in \mathbb{N}$, $\langle \mathbb{A}^n, V \rangle$ be a real affine space of dimension n , $O \in \mathbb{A}^n$, $\vec{v} \in V$ then a **line l with origin O and tangent vector $\vec{v}$** is the map

$$l: \mathbb{R} \rightarrow \mathbb{A}^n \text{ defined by } l(t) = O \oplus (t \cdot \vec{v})$$

If $a, b \in \mathbb{R}$ with $a < b$ then the maps

$$\begin{aligned}
l|_{[a,b]}: [a, b] & \rightarrow \mathbb{A}^n \\
l|_{[a,b]}:]a, b[& \rightarrow \mathbb{A}^n \\
l|_{[a,b]}: [a, b[& \rightarrow \mathbb{A}^n \\
l|_{[a,b]}:]a, b] & \rightarrow \mathbb{A}^n
\end{aligned}$$

are called **segments of the line l** .

What is special of affine mappings is that they maps lines to lines.

Theorem 22.22. Let $n, m \in \mathbb{N}$, $\langle \mathbb{A}_1^n, V_1 \rangle, \langle \mathbb{A}_2^m, V_2 \rangle$ be a real affine spaces and $\psi: \mathbb{A}_1^n \rightarrow \mathbb{A}_2^m$ is a affine mapping then if l is a line with origin O and tangent vector $\vec{v}$ then $\psi \circ l$ is a line with origin $\psi(O)$ and tangent vector $d\psi(\vec{v})$.

Proof. As l is a line with origin O and tangent vector $\vec{v}$ we have that

$$l: \mathbb{R} \rightarrow \mathbb{A}_1^n \text{ is defined by } l(t) = O \oplus_1 (t \cdot \vec{v})$$

Let $t \in \mathbb{R}$ then by [definition: 22.1] $t \cdot \vec{v} = (O \oplus_1 (t \cdot \vec{v})) \ominus_1 O = l(t) \ominus_1 O$ so that

$$t \cdot d\psi(\vec{v}) \underset{d\psi \text{ is linear}}{=} d\psi(t \cdot \vec{v}) = \psi(l(t)) \ominus_2 \psi(O) = (\psi \circ l(t)) \ominus_2 \psi(O)$$

So we have that

$$\psi(O) \oplus_2 (t \cdot d\psi(\vec{v})) = \psi(O) \oplus_2 (\psi \circ l(t)) \ominus_2 \psi(O) \underset{[\text{theorem: 22.4}]}{=} (\psi \circ l)(t)$$

so we have that

$$\psi \circ l: \mathbb{R} \rightarrow \mathbb{A}_2^m \text{ is defined by } (\psi \circ l)(t) = \psi(O) \oplus_2 (t \cdot d\psi(\vec{v}))$$

which proves that $\psi \circ l$ is a line with origin $\psi(O)$ and tangent vector $d\psi(\vec{v})$. $\square$

22.2 Euclidian space

To be able to define distances, angles, areas, we need the additional structure of an inner product on the set of displacements of an affine space. This leads to the definition of a Euclidean space.

Definition 22.23. (Euclidean Space) Let $n \in \mathbb{N}$ then $\langle \mathbb{E}^n, V, \langle \rangle \rangle$ is a **real Euclidean Space of dimension n** if $\langle \mathbb{E}^n, V \rangle$ is a real affine space of dimension n and $\langle V, \langle \rangle \rangle$ is an inner product space [see definition: 18.1]

Definition 22.24. Let $n \in \mathbb{N}$ $\langle \mathbb{E}^n, V, \langle \rangle \rangle$ be a real Euclidean Space of dimension n then a Cartesian coordinations system with origin $O \in \mathbb{E}^n$ and axes $E = \{\vec{e}_1, \dots, \vec{e}_n\}$ is **orthonormal** if E is an **orthonormal basis** [see definition: 18.26].

The inner product on the space of displacements allows us to define a metric on a Euclidean space.
